Preface: How the Handbook Came into Being

It all started on December 1, 2009, with an e-mail from Yoka Janssen (Springer), who invited me (Paul Smeyers) to edit an international handbook on methods in philosophy of education. Though appealing, I immediately had reservations concerning the particular topic. Following Wittgenstein and many other philosophers, I was not sure whether there was such a thing as a method in that area. But even the plural, “methods,” which Wittgenstein does use, has in my opinion the wrong connotations. My skepticism was not refuted by the publication in the same year of a special issue (*Journal of Philosophy of Education*, 2009, ed. by Claudia Ruitenberg) with the provocative title “What do philosophers of education do? (And how do they do it?).” I held and still hold the belief that it is difficult to speak of a method in the sense that we normally attach to that word when talking about educational research. But there was something we could do in this area I thought. Some 10 years earlier, I co-edited a collection with Bas Levering (*Opvoeding en onderwijs leren zien* [Teaching to see education and child rearing]) addressing various qualitative methods used in educational research. Typically in that book authors would not only describe their theoretical stance and the method they used for their investigation (e.g., a case of action research) but also, and to a large extent, deal with an example of their particular research, showing what they actually did. For many years, I made use of this collection in my own teaching in the context of a course on qualitative research methods in the M.A. educational sciences degree at KU Leuven. This proved to fulfill its intended purpose of providing: an initiation into research which exemplifies what it is exactly that a researcher bears in mind, the possible pitfalls, the problems, the tensions, and much more that needs to be taken into account when engaging in trying to make sense of a particular educational context. I took this idea with me when I discussed Springer’s question with Yoka Janssen, and Springer was excited about it, not in the least because I told them that that particular collection was highly successful, as was shown by the thousands of copies that Boom sold (not only in Belgium but in The Netherlands as well) since it was published in 1998.

It was overwhelmingly clear that it would be impossible for me to take on the editorship just on my own. It so happened that in January 2010 David Bridges and

I were together in Addis Ababa preparing for the forthcoming biennial conference of the International Network of Philosophers of Education, and so I talked to him about the project. Going through what we thought could be part of an international handbook, it furthermore became clear that it would not be a bad idea to look for a team of general editors, say four, to combine our expertise and to be able to cope with such a demanding task. I approached Morwenna Griffiths who gladly accepted, mentioning among other things that she would like to work with us, because of the kinds of discussion that she thought we would surely have. In the discussion I subsequently had with Springer in February 2010, various ideas were exchanged; Nick Burbules, who was delighted to be part of this, was added as a general editor and we were strongly encouraged by Springer to put a formal proposal together for the handbook. Thus the four of us met in June 2010 and decided that the focus of the handbook would be on interpretation in educational research methods and that extensive use would be made in all chapters of examples of educational research, and reflections on the role of interpretation in that research, whatever the methods. We were also very much occupied with realizing a truly international collection. Moreover, we would explicitly try to balance the gender of the authors. The lengthy proposal was sent out to six reviewers by Springer, and slightly amended based on the comments that were received. It reached its final shape in September of that year. Now we could really start.

As we were fully aware of the high level of specific methodological expertise that was required, we decided to look for contributing or section editors who could help us in identifying authors for the various approaches of educational research. Though our initial plan was to finalise everything within 3 years or so, we experienced several delays. It was not easy to find experts in a particular genre or approach who could also deal with the eight substantive fields of educational research we had in mind (e.g., learning, or teaching and teacher education; see the introduction for a detailed discussion of genre and field). The plan was indeed to put a collection (an 8 by 8 matrix) together that could be read either with a focus on a particular genre or methodological approach (such as narrative or history) or by reference to a particular substantive field (such as curriculum and hidden curriculum or educational organizations and leadership). Moreover, for some genres the editors encountered quite frustrating challenges, and thus it took us 5 years to finalise everything. After hundreds and hundreds of e-mail exchanges, we finally got there. The resulting handbook, with the collaboration of more than 100 authors from 27 countries worldwide, is around 760,000 words.

We are grateful to our section editors for their substantial work in guiding the authors to what the focus of this collection is. Without their suggestions and comments it would not have been possible to produce an international collection that in each genre presents excellent work reflecting the various kinds of educational research. And we are indebted to the authors who took on the task not only to present their work, but to discuss extensively at the beginning and at the end of their chapters; where and how interpretation plays an important role, to show the reader how they proceeded when setting up the research, collecting their data, interpreting these, justifying their conclusions, and offering a meta-level reflection. Due to

delays that we were confronted with at various stages, some of the authors had to wait a long time before they could see the publication of their work. Some genres were already finished after 2 years; others things were more difficult and more time was required. We learned to be patient, and appreciated that it was frustrating not only for us, but more importantly for our section editors and many of the authors. However at last we were able to produce something like what we had wanted to produce. For us, the general editors, it was not only an intellectually very stimulating experience, but moreover and at a more personal level a very engaging, demanding, and rewarding endeavor. Though we worked efficiently, we needed each other's encouragement and we always looked forward to the many meetings we organized and the face-to-face discussions which we enjoyed both academically as well as socially. Without each other's support it would never have been possible to bring this to a good end.

Finally, we thank Yoka Janssen, Annemarie Keur, and all the other staff from Springer. It was a pleasure to work with them. And we thank the universities of Ghent and Leuven, Cambridge, Edinburgh, and Illinois (Urbana-Champaign) for their support in this task that was much more demanding than we ever expected. We are confident that this book will assist junior researchers (at master's and Ph.D. level) and our colleagues who are teaching methodology courses to highlight the utmost importance of interpretation at all levels and stages of educational research. We are also confident that it will stimulate and challenge more experienced researchers, as it has challenged and stimulated the four of us, to think again about the processes and purposes of educational research more generally.

Nicholas C. Burbules

General Introduction

**Morwenna Griffiths, David Bridges, Nicholas C. Burbules,
and Paul Smeyers**

This book helps researchers to understand better the role of interpretation in educational research—and we hope to understand better the variety of ways that interpretation enters into the research process. It focuses on the specifics of interpretation in the actual doing of educational research, but it is not a how-to book.¹ *The International Handbook*

¹ The title of this collection could give occasion to some confusion for the reader. According to *The New Oxford Dictionary of English* (Pearsall 1998) a “handbook” is “a book giving information such as facts on a particular subject or instructions for operating a machine.” It is derived from the Old English *handboc* translated from the Latin *manualis*. There is another term in English that is derived from this Latin word, i.e., “manual,” which refers to “a book of instructions, especially for operating a machine or learning a subject” (ibid.). Similar references are found in Dutch, where “handboek” refers to a publication which gives the state of the art in a discipline or sub-discipline, or in the German “*Handbuch*” which refers to an organized compilation of fragments of human knowledge which can be used as a reference book.

of Interpretation in Educational Research does not offer specific instruction about how to proceed when engaging in educational research, but rather offers the possibility of what Lave and Wenger called “legitimate peripheral participation” in witnessing a variety of forms of research covering a broad range of issues and settings. Educational research pursues different kinds of theoretical interests and uses a diversity of modes of explanation. The Handbook reflects this variety through its international array of authors, settings, questions, and methods, emphasizing that the field of education includes some very diverse objects of inquiry and that researchers in different parts of the world give priority to different aspects of educational policy and practice as well as to different ways of investigating them. It is in the focus on *interpretation* that we try to bring these different approaches into conversation with each other.

Focusing on interpretation necessarily draws one into philosophy. Yet what we offer is not a philosophical discussion of interpretation as such, though there is some of that, both in the introductory chapters in the part we labeled “The Theoretical Landscape” as well as in some of the chapters further on in the book. No single answer to the question of the role interpretation plays in educational research is offered here. Instead the approach of the collection should be seen more in a Wittgensteinian spirit of, “assembling reminders for a particular purpose” (Wittgenstein 1953, pp. I, # 127). Or as he himself writes about the *Philosophical Investigations*,

The philosophical remarks in this book are, as it were, a number of sketches of landscapes which we made in the course of these long and involved journeyings. (ibid., p. vii)

He says that his thoughts were soon crippled

... if I tried to force them on in any single direction against their natural inclination – And this was, of course, connected with the very nature of the investigation. For this compels us to travel over a wide field of thought criss-cross in every direction. (ibid., p. vii)

What we wanted the authors to focus on is how interpretation is conceived in the actual doing of it, in practice, when they are doing their work: we invited them to *show* what interpretation means in the very act of doing research. For us, then, what is offered are “reminders” that range “over a wide field of thought criss-cross in every direction.” This distinct mode of argument and presentation is one suited, we believe, to a more open-ended examination of a theme, and not a prescription of the “right” or “best” way of doing things. It is through observing and comparing the different ways that the authors deal with interpretation that an understanding of its nature and role in the research process emerges—but then it is also a consequence that different readers will discover this in different ways.

We want to say something in this introduction about how the Handbook can be used, but this requires first detailing how it has been set up, clarifying the various steps that were taken in order to achieve what we have in mind. This Handbook focuses on the often-neglected dimension of interpretation in educational research. It argues that all educational research is in some sense “interpretive,” and that understanding this issue belies some usual dualisms of thought and practice, such as the sharp dichotomy between “qualitative” and “quantitative” research. On our

view, interpretation extends from the very framing of the research task, through the sources which constitute the data, the process of their recording, representation, and analysis, to the way in which the research is finally or provisionally presented to others. The thesis of the Handbook is that interpretation cuts across all forms of research, philosophically, organizationally, and methodologically. Thus, for example, not only qualitative researchers, or philosophers, historians, and cultural theorists, but also quantitative researchers rely on interpretation and cannot avoid it.

By covering a comprehensive range of research approaches and methodologies, the Handbook gives educational researchers, including novices and early career researchers, a set of signposts to the complex landscape of educational research, indicating something of what particular genres of approach can offer for the investigation of a number of enduring issues, or “fields” as we call them (see below). A glance at the contents list will show something of this range, and also of the many settings in which the research took place, from Swedish school classrooms to the street children of Indonesia, from artisan stonemasons in Italy to videogame design in North America, from teacher education in the UK to citizenship testing in Colombia. Each chapter provides a full description and explanation of why specific research choices were made in particular circumstances, together with reflections on the benefits or shortcomings of these choices—combined in each case with consideration of the role of interpretation in the research process.

The Handbook selects examples of a large number of methods traditionally classified as “qualitative,” “interpretive” or “quantitative,” across the broad area of the study of education. Along one dimension of organization, we commissioned research studies across eight “fields”:

- Learning
- Teaching and teacher education
- Curriculum and hidden curriculum
- Evaluation and assessment
- Educational organizations and leadership
- Equity, justice, and diversity
- Policy
- Non-formal education and informal education

Along a second dimension of organization, we divided the book into eight sections marked as much by the variety of approaches within them as by the differences between the sections. We describe these clusters of methods as *genres* or *approaches*:

- Narrative approaches
- Analysis of language and significations
- Ethnography *of* education: sociological and anthropological approaches
- Ethnography *in* educational research: applying ethnographic methods in educational inquiry
- Historical approaches

- Philosophical approaches
- Quantitative approaches
- Cultural-transgressive approaches

Within each genre, we tried to provide at least one example addressing each of the fields.

It will thus be possible to use the Handbook to explore either a field of educational inquiry and an overview of genres used in that field, or to use particular genres to examine different fields of enquiry within the theory and practice of education. The following table (genre number followed by chapter number in that genre) gives a starting point for doing that.

Genre	Learning	Teaching teacher education	Curriculum hidden curriculum	Evaluation assessment	Organization leadership	Equity justice diversity	Policy	Non-formal informal
Narrative	1.5	1.6	1.3	1.4	1.1	1.8	1.7	1.2
Language significations	2.6	2.8	2.2	2.4	2.7	2.3	2.1	2.5
Ethnography of education	3.1	3.3	3.5	3.6	3.8	3.7	3.4	3.2
Ethnography in educational research	4.2	4.7	4.1	4.8	4.6	4.3	4.5	4.4
Historical	5.3	5.2	5.5	5.4	5.1	5.6	5.7	5.8
Philosophical	6.1	6.2	6.3	6.4	6.5	6.6	6.7	6.8
Quantitative	7.1	7.7	7.2	7.3	7.4	7.5	7.6	7.8
Cultural-transgressive	8.1	8.7	8.8	8.4	8.5	8.2	8.6	8.9
	8.3							

By including a research report in each chapter, the Handbook offers not just an outline of particular methods but a concrete example of the way these have been applied in research practice. Throughout, authors are also self-conscious about the role of interpretation in the selection and execution of particular genres of research, and thus on the “why” questions underlying the “how” questions of actually doing the research.

There are many good handbooks on methods in educational research within either a quantitative or qualitative stance, and there are many good books dealing with meta-theoretical issues. However, hardly any of them focus particularly on interpretation and its centrality in the process of research and research writing. We think it is remarkable how little attention the process of interpretation itself receives either in the index or text of most of these books, even books that claim to be dealing with “qualitative and interpretive” research. In usual practice, we have found, “interpretive” just becomes a synonym for “qualitative,” or with specific qualitative methods without being explained or defined very clearly. Finally, although a significant number of educational research studies include both quantitative and qualitative methods, few books include both, except to contrast them. We want to emphasize their continuities as well as their differences, which also gives this book a distinctive niche.

Many handbooks also give a lot of space to history, i.e., how methods have been used in the past. Others focus predominantly on philosophical meta-theories, especially ontology and epistemology. Typically they do not include examples of actual research which has been carried out in diverse educational contexts. If one wants to know more about that, one is obliged to turn to books which address the use of a method in a particular educational area—but this goes with the disadvantage that the researcher has to go through several books in order to learn enough to make an informed decision about what is appropriate for her particular research. It goes without saying that this also confronts university lecturers who teach Methodology courses with the difficult task of selecting published material that is apt for their purposes.

Finally, there is another dimension that is largely lacking in the material that is available and which is important for the study of education, i.e., the international. Education is typically one of those areas that is given shape within particular societal contexts. An “international handbook” on educational research, therefore, should give examples from across the globe, thus exemplifying the different “opportunities and constraints” that educational research has to confront in different societies. And this became a third organizational strand, trying to the greatest extent possible to represent research from a variety of national and cultural settings. Having done so, it then became a principled choice to reflect this diversity of site and context wherever possible in the titles of the chapters. What is offered here is the work of more than 100 scholars from all continents. Around 60 % of them are female, around 30 % are from the UK, again around 30 % are from the rest of Europe, slightly over 20 % are from the USA or Canada, slightly less than 20 % are from other parts of the world. In the Afterword, we discuss some of the issues raised by this endeavor to represent the “international” in this Handbook.

The themes that are addressed by the authors and the way they have set up their research exemplifies the enormous variety of what is offered nowadays in the study of the education. Thus—and the following should only be seen as a list of examples organized in the order of the various genres—Michael Watts deals with Life History Research in Higher Education; Kate Pahl with literacy practices through ethnography; Francesca Gobbo offers a methodological ethnological autobiography; whereas György Mészáros presents an autoethnography, a critical interpretation of the subject (the “Gay Eye” of a researcher and a student in a Hungarian school); the history of secondary education is interpreted by Gary McCulloch; philosophical approaches to justice, democracy, and education are dealt with by Janet Orchard; Elias Hemelsoet addresses the quantification of irregular migrants but also deals with “knowing how to go on” and what this implies for the kind of research one engages in; whereas Olena Fimyar foregrounds the place for autoethnography in the study of education policy in Kazakhstan. Within each of the eight genres, these essays provide clear examples of the very different ways that interpretation enters the research process.

In order to identify and recruit this large and diverse range of authors, the four editors invited colleagues, authorities in their respective areas, to take the lead as section editors in identifying authors who could contribute to the particular approaches

they represented. Their international perspectives and networks of colleagues were indispensable to giving this collection the diversity and scope that it achieved. Of course, to avoid overlapping, and to ensure that as much ground as possible was covered, the general editors were also involved in identifying contributors.²

As described, we began this project with a fairly discrete 8×8 matrix in mind. Not surprisingly, as the contributions came in, these strict boundaries and sharp category distinctions proved not sustainable. Research in all these genres or approaches is characterized by what might be termed crossover research, creating a rich array of hybrids. Individual chapters often address more than one educational field, and their positioning in a discrete genre, though not entirely arbitrary, was nevertheless not as straightforward as we expected. In some respects, their positioning was a challenge to our model of classification as much as a confirmation of it. This was overwhelmingly clear for genres 3 and 4 (ethnography), but also surfaced in other genres.

The contributing or section editors asked authors to provide a chapter that *shows* that a problem in an educational area has successfully been addressed through research—in other words that this research made a difference. This could mean among other things that solutions are presented, that future similar problems can be anticipated, that a present context or situation has been viewed critically and not as “natural” or “inevitable,” or that future research, perhaps from a different conceptual schema, is necessary to yield a fuller understanding of the issue. All of the research presented here is, we believe, of exemplary quality in terms of the use of a particular method (or methods)—but sometimes too in showing the limits of certain methods, or the need to experiment with less conventional approaches. The chapters are written in a way that they could each be read on their own, but as we have tried to show, the 65 chapters can just as well be clustered in ways that suit a reader interested in a particular setting or context (e.g., research about Roma/travelers/migrants, or about teaching and learning using IT and e-learning), or by regional authorship, or by specific method (e.g., the use of interviews, visual data, or autoethnography).

The Handbook starts off with four introductory chapters intended to give an overview of the theoretical landscape. In “Varieties of interpretation in educational research: How we frame the project” the four editors offer their own framework for thinking about interpretation in educational research. This essay lays out the overall rationale of the Handbook project and addresses the reasons why the supposed dualism between quantitative and qualitative research has to be reframed as related dimensions of inquiry as opposed to a dichotomy. It offers a careful examination of the varied meanings and functions of “interpretation” in inquiry. It develops the idea that it is important to *show* how research in the educational field is conducted, and not just to identify meta-reasons for choosing particular methods.

² This worked well for most of the genres. In one case (quantitative), for various reasons a different route had to be followed.

This framing chapter fulfilled another crucial role: an earlier version was sent to all contributors to use as the overall point of reference for developing their own contributions. While individual accounts certainly differ or even disagree with certain aspects of the framing argument, it helped to provide greater coherence to the Handbook as a whole. This framing chapter is followed by three in-depth discussions of interpretation focusing on epistemological issues (Kerdeman), ethical issues (LeCompte), and the purposes of educational research as a change agent (Peters).

In the main part of the Handbook, 65 chapters³ are offered organized within the mentioned eight genres and addressing eight educational fields. Each chapter of the book provides a reflective account of a particular research project carried out by the author. Though, as outlined above, this is not a “How to . . .” guide, it does include, however, sufficient description of how the researcher actually carried out his or her work for new researchers to see what was involved in the actual doing of it. Each chapter describes the topic that is addressed and makes the research transparent (i.e., what is going on in a particular research approach, and why.) Each chapter consists of a description of the problem that is addressed, the focus of the research, identifies sources, data (raw material), and answers questions such as: “What did you do as investigator and author?” “How did you get the data?” “What processes did you follow (and why did you select these)?” “What theoretical frameworks did you use?” “How did you interpret your results?” and “How and why did you decide to present your results in the way you did?” Each chapter makes explicit the reasons for choosing an approach (and not another), whether for theoretical, political, philosophical, or autobiographical considerations, and/or because of contextual constraints. Each chapter pays attention to how the researcher justifies an approach, why he or she thinks this was the best approach; and what the limitations, constraints, strengths and weaknesses, and impact of that approach might be. Chapters also identify other important publications related to the “method” or the use of it in the educational field.

At the forefront of this reflective account is the role of interpretation and what it meant in the context of each kind of study that was done, and at various stages of the research process. Each chapter thus addresses how one sets about teasing out an interpretation of the data, thus making transparent what an educational researcher actually does when he or she successfully addresses a problem.

The table cross-linking educational fields and research genres clarifies how particular educational issues can be dealt with using different methods, as well as how particular methods can be applied across different fields of educational research. All examples highlight *educational* research and not just any area where a particular method is applied. Together they foreground the application of educational research across a range of different international settings. Moreover, they contain a range of educational contexts drawn from different age-levels and from compulsory, post-compulsory, and informal education contexts. Thus the

³ True to the spirit of its title, the cultural-transgressive section ended up with an extra chapter.

Handbook adopts itself a “case study” approach; it gives examples, but deeply reflects upon and analyses those.

Finally, in the “Afterword” the editors reflect on the material that is offered in this Handbook, and what we learned from putting it together. Details about the authors, editors, and finally an author and subject index assist the reader to contextualize the research that is dealt with and to locate specific cross-cutting issues. As we have noted, readers will see patterns of organization that might parallel, or might diverge from, our own. To facilitate these alternative systems of organization, and to allow some customization of the text for teaching purposes, the publisher of this volume will allow users to design and order organized subsets of the essays published here, to be used in different configurations for different courses, whether classes in specific research methods, or more analytical courses designed to orient novice researchers to the epistemological and normative issues implicit in their methodological choices.

Of course, we also expect that these reflective insights from real examples will be beneficial to experienced researchers as well, by showing a broad range of research possibilities and approaches that each have something to teach us.

The Theoretical Landscape

Varieties of Interpretation in Educational Research: How We Frame the Project

Nicholas C. Burbules, David Bridges, Morwenna Griffiths,
and Paul Smeyers

Interpretation and the Research Enterprise

The thesis which has shaped this handbook is that interpretation is central to all kinds of educational research and enters into it at every stage of the process. The selection of the focus of inquiry depends on a certain reading, an interpretation, of the arena of policy and practice and of the existing research and other literatures as well as of the interests of the researcher. The formulation of a research question or questions draws upon conceptual and value assumptions that frame a particular version or interpretation of the world. The selection of a mode or method of enquiry, of sites for the research, of participants, and of the forms of data or other resources to be assembled depends on an understanding, an interpretation, of the nature of the matter to be investigated and of the kinds of conclusions that different forms of enquiry can be expected to yield. Some of the data assembled will themselves be constituted by

participants' interpretations of events and experiences—their responses to new educational programs or teaching styles, their life histories, their understandings of policy requirements, etc. The processes of organizing data, identifying what is important and worth paying attention to, selecting what will be reported, and trying to make sense of it all through some appropriate form of analysis or argument all entail interpretive judgments. The write-up of research results, and choices about the forms and media for representing those results, requires interpretation. And finally, the uses made of research, the conclusions drawn for policy and practice, and the formulation of further research questions are all interpretive at their heart. These conclusions are themselves the product of interpretations not only of the research but of the place of research within wider educational theories.

It is important to say at the outset that the phrase “collection of data and other resources” emphasizes that educational research is not simply a social science or one of the humanities. Rather, it is a field of study that draws on a range of disciplines including social sciences and humanities, while itself remaining a discipline distinguishable from any of them.¹ The set of “genres” that have been identified as structuring the book indicate this clearly, including not only ethnographic and quantitative methods but also historical and philosophical approaches. Interpretative frameworks are thus (i) brought to a piece of research, (ii) embodied in the data and resources we assemble through research, (iii) generated out of interaction between the theoretical frameworks that the researcher brings to the research and all that he or she encounters through the research process, and (iv) reflected in the kinds of writing and publication of outcomes, given the particular audience for which they are intended. As is discussed later in this chapter, educational research is often carried out in order to make a difference or an improvement within educational settings, so researchers are necessarily required to interpret how that might best be achieved. Interpretation, as we deal with it here, is not a method in itself, but a characteristic of any research method—indeed of the research process itself. And while our examples in this text are all drawn from educational research, we believe that these arguments pertain to research in every domain, from the social to the natural sciences, from the humanities to astrophysics.

This is the framework of expectations that we put to our editorial team and authors, along with an invitation to test out that framework in relation to specific worked examples of research from a wide range of approaches to educational inquiry. These would demonstrate, we believed, the importance of interpretation across all forms of educational research, as well as illustrating some of the different ways in which interpretation plays out in different research traditions. This has been borne out in the different chapters of the handbook. The Introduction gave some examples of how educational researchers have reflected on their own interpretations in the course of a single piece of research or of a set of connected projects, or in some cases nearly a lifetime of research. How far these differences are constrained and affected by different research approaches is something to which we return in the Afterword.

Qualitative/Quantitative Dichotomies

Given the attention it gives to a multiplicity of research genres and its focus on interpretation, this handbook has to position itself in relation to the ongoing debate in the social sciences about clusters of approaches that are typically described (roughly) as qualitative and quantitative traditions in educational research. We see four predominant positions in the field. The first argues for the irreconcilability of the two traditions: that qualitative and quantitative perspectives represent Kuhnian paradigms that are incommensurable, in which advocates of each can neither understand nor appreciate the value of the other. Egon Guba and Yvonna Lincoln were probably the best-known advocates of this position, though not the only ones.² Interpretation, in these accounts, is usually seen as a feature particular to qualitative approaches to research or, in some cases, as one of the defining characteristics of qualitative research:

Qualitative research is a situated activity that locates the observer in the world. Qualitative research consists of a set of interpretive, material practices that make the world visible. These practices transform the world.³

The other three positions argue against a duality, emphasizing ways in which the two sets of approaches can be seen to be reconcilable and offering perspectives from which they can be seen as more similar than different. A second stance is mixed methods inquiry, in which researchers argue for the compatibility of qualitative and quantitative methods on the grounds of their complementarity.⁴ Each gathers and analyzes data that the other neglects, so that a fuller account is gained by, for example, interdisciplinary projects that study a problem—especially a large and complex problem, such as school dropouts or adult literacy campaigns—through multiple lenses. The evidence and associated understanding gained from one approach can enrich the evidence and understanding gained from the other. Of course, the use of mixed methods also introduces an extra stage of interpretation. When methods are mixed, they can produce conflicting results, and researchers have to make a judgment about how to reconcile them. This is discussed in the chapter by Vanderhoven, Raes, and Schellens. Such conflict is part of a more general problem of mixing methods, regardless of how “quantitative” or “qualitative” they

Greene, *Mixed Methods in Social Inquiry* (Jossey-Bass, 2008), John W. Cresswell and Vicki L. Plano Clark (Eds.) *Designing and Conducting Mixed-Methods Research* (Sage, 2010).

are, as Snell and Lefstein explain in their chapter about using both video and ethnographic methods of “lurking and soaking.”

From a third position, researchers argue that the two sets of approaches are compatible because of their similarities. They argue that all methods are at heart empirical, and so the basic rules of evidence apply to all.⁵ Different things may be done with this evidence, but the pursuit of evidentiary support forces any mode of inquiry into broadly similar methodological constraints: a research question frameable as a hypothesis, collection, and analysis of data, accountability to evidence of agreement or disagreement with the hypothesis, and correction of a hypothesis or of initial assumptions in the light of unexpected counterevidence. From this angle, (so-called) qualitative research depends on the same fundamental epistemic conditions as does (so-called) quantitative research.

The fourth position, the one elaborated in this project, sidesteps these arguments. It emphasizes the significance of interpretation in all forms of research: whether or not an approach comes from a particular epistemic paradigm and whether or not different methods can be seen as complementary or basically equivalent. It could be argued that this fourth position runs the equivalency of the third position in the other direction: (so-called) quantitative research depends on the same fundamental epistemic conditions as does (so-called) qualitative research. However, what these processes of interpretation look like and how they are carried out, differ in their particulars. We undertook this project with the expectation that this investigation would reveal similarities as well as differences among different approaches to research—and, in this, undo some of the fruitless dualities that have often kept educational researchers from reading and learning from each other’s work, let alone seeing a basis for more constructive relationships.

Hence, we have tried to avoid language that identifies “interpretive” with “qualitative,” as if they meant the same thing or as if only qualitative research involves interpretation, or, indeed, as if only empirical research involved interpretations. In this, our view is similar to Norman Denzin and Yvonna Lincoln, when they say, “All research is interpretive. It is guided by a set of beliefs and feelings about the world and how it should be understood and studied.”⁶ Our difference here is to try to give interpretation a more grounded and practical meaning than just “a set of beliefs and feelings about the world.” Here we want to focus the discussion on what researchers *do*; and in this doing, they are involved with multilayered interpretation throughout the process of the research endeavor, regardless of their methodology or theoretical outlook.

Abstractions Versus Practices

Another theme running throughout this book is that relentlessly meta-level discussions have often impeded understanding of these disputes about research approaches. We would hardly deny the importance of philosophical, and specifically epistemological, considerations in evaluating and choosing research approaches. But meta-level discussions are abstractions, and abstractions necessarily hide some features at the same time as they bring others into focus. So we do not think that these meta-level considerations can ever settle the issue of which approach, or approaches, is suitable for the different kinds of questions or problems. The very idea that a second-order argument could ever universally settle the question of how to do research is itself a kind of ontological error. The issues are too complex and plural to be encapsulated into a few tidy abstract categories. Complex and sometimes seemingly interminable disputes about ontological and epistemological abstractions in research need grounding in particular, we believe. The practice of research entails choices about the kinds of information that are relevant to answering questions: which methods of analysis will provide what kinds of guidance to help us decide what to do and what normative and value commitments are relevant to drawing conclusions? All of these choices vary depending on context and circumstance—for example, on the level of analysis: what an individual teacher needs to know and understand in order to help a particular student with a reading difficulty must be different from what a state-level policy board needs to know in deciding upon and implementing a broad-scale reform. These choices, as we have mentioned, provide a framework for the interpretation and evaluation of data. Dewani's chapter illustrates narrative research with the potential to influence policy, at least within the NGOs working with street children in Indonesia but also more widely. On the other hand, Wihlborg's study is not intended to affect policy at all, but rather to enable a rethinking of justice, equality, and diversity in relation to academic poststructuralist writing practices.

Methodological choices are often seen as grounded on prior ontological and epistemological assumptions about the nature of the research field and what methods of inquiry will produce answers that are more likely to be taken as true, reliable, trustworthy, or giving a warrant for action. (And all of these terms are themselves subject to fierce, abstract, conceptual dispute.) Gallons of printer ink have been squandered over these debates: some scholars accuse others of sloppy, loose methods that substitute anecdote and impressionistic conclusions for systematic inquiry; opponents say that cold, numbers-driven approaches lose touch with a deeper human reality. Overall, stereotypes, oversimplifications, and forced dualities abound. The pragmatic approach we draw from here emphasizes that human needs and purposes differ in the doing of research, and while rigor and accuracy matter, there is no single approach that always offers the *kinds* of rigor and accuracy needed that sometimes a large sweeping account is more useful and at other times too general and not contextually specific enough; similarly, an intense study of particulars may provide rich contextual understandings, but require a different, perhaps

“naturalistic,” kind of generalizability⁷ which those more accustomed to statistical probabilities might find uncomfortable. Focusing on these questions of purpose should help tone down the often highly charged, partisan and blinkered way in which different theoretical and research traditions characterize one another.

Another aspect of this pragmatic approach is to focus on what researchers do when they are doing research. Rigor and accuracy come not from choosing one method over another, but from applying an appropriate method carefully, with integrity, skill, and experience. We use the word “discipline” to describe fields of investigation for a reason: methods and traditions of inquiry, a body of literature, and a scholarly community of peers support and provide structure to the discipline of inquiry for any individual scholar. One of the crucial dimensions of this discipline, we are arguing here, is the reflective self-awareness of the role of interpretation and judgment in the processes of inquiry.

Interpretation and the Understandings Which Are Brought to Research

All research traditions acknowledge that researchers do not embark on their research as blanks whose ideas and understandings are shaped exclusively by the data that they collect, unaffected by any previous experience or presuppositions. Indeed, it is a good thing that researchers bring all sorts of experience, scholarship, rigorous training and theoretical and practical understandings to their research. But with all this they bring preformed, preestablished “horizons,” as Gadamer might refer to them preexisting interpretive frameworks, and these very same horizons can become impediments, biases, or blind spots. We asked contributors to consider what frameworks they brought to the research that they carried out and how they affected the development and outcomes of their research. It is interesting to compare, for instance, the reflections on assumptions in two chapters in the quantitative approach sections. Bowbrick, an insider to quantitative methods, discusses a range of assumptions that need to be taken into account by anyone collecting and analyzing large data sets; Smeyers, an outsider, discusses some assumptions about simplicity and causality that underpin any quantitative approach in educational research.

Different research traditions have of course different ways of dealing with such interpretive frameworks. In the traditions of the natural sciences and in those social science traditions which aspire to the condition of the natural sciences, the presence of the researcher and all his or her preexisting understandings, expectations, and

⁷Stake, R.E. & Trumbull, D. (1982) Naturalistic generalisations, *Review Journal of Philosophy and Social Science* 7, 1–12 and see Bridges, D. (2010) n=1: The Science and art of the single case in educational research in eds P. Smeyers & M. Depaep, *Educational research: The ethics and aesthetics of statistics*, Springer, Dordrecht.

interpretive frameworks can be viewed as potentially biasing the research. In these contexts the aim is as far as possible to neutralize any such biases. Thus the research genre requires, for example, experimental controls that neutralize the presence of the researcher and any influence that he or she might exercise on the events being studied. In cases where the observer changes the situation simply by observing (as in many areas of natural science), an attempt is usually made to eliminate the effect of any specific individual observer, as opposed to a generalized observer. Thus, even the reporting style of such research attempts to render the researcher un-present by the use of the third person (“the researcher” rather than “I” or “we”) and the passive voice (“the sample was taken” rather than “I/we took the sample”).

Researchers working within some other genres of research acknowledge the inevitability of such presuppositions and personal commitments and do not seek to neutralize them. However they attempt to minimize the effects of individual subjectivities through a scrupulous exercise of personal reflection and self-scrutiny, rendering possible a kind of distance and objectivity. How a person conducts an interview, for example, and tries to identify comments or values quite different from one’s own, or tries to give fair credence to positions they personally disagree with, is an indicator of an attempt to acknowledge one’s own horizons but then avoid being trapped by them. These researchers take the view that the subjectivity of the researcher is both a help and a hindrance. As Shuman puts it in her chapter, explicitly likening it to physicist Karen Barad’s approach, “we can view the researcher’s lens of observation as a tool, like other tools, requiring attention to its limits and usefulness.”

Yet other genres of research are predicated on the view that such attempts to eliminate or avoid such pre-understandings are in principle doomed to failure and so prefer instead to have them acknowledged and disclosed explicitly. Sometimes this involves laying out a series of theoretical assumptions and categories guiding the research study. Sometimes it takes the form of a “biographical positioning” of the researcher vis-a-vis the research topic or research subjects. Sometimes it involves comments of a more personal nature, disclosing the investment and commitments a researcher brings to an investigation. Whatever form it takes, an open and honest acknowledgment of the researcher’s interests, commitments, background, and assumptions can enable the reader to take account of such positioning or perspective in their own reading and interpretation of what is presented. On this account, it is the failure to acknowledge the presence of a specific researcher that leads to bias.⁸

Another way in which researchers bring their understandings to educational research has to do with the values inherent within education. Education cannot be understood at all in the absence of values about what is ethically and epistemologically worthwhile for an individual, or for a whole society. Hence, the conduct of

⁸ Griffiths, M. *Educational Research for Social Justice: Getting off the Fence* Buckingham: Open University Press 1998; ‘Research and the Self’ in Biggs, M. and Karlsson, H. (eds.) *Routledge Companion to Research in the Arts* Routledge, 2010.

the research will have additional constraints precisely because, as was remarked earlier, the educational research is usually intended to make some kind of difference or improvement to the understandings within and conduct of educational practices and policies. Thus few educational researchers simply choose to investigate what intrigues them, as LeCompte implies for some areas of social science. Instead they focus on what matters to them within education.

What is significant for our current purposes in this handbook is the point that different genres of research acknowledge in different ways that researchers inevitably bring frameworks of understanding to their research. A researcher's stance towards such frameworks will affect the way that research is conducted, affecting not only the collection of data but also how they are analyzed and the conclusions that are drawn from them. We say more about this below in discussing how interpretation enters into the focus, the analysis, and the presentation of the research.

On Interpretations as the Material Which Is the Focus of the Research

Some research explicitly seeks out as its data what it sees as people's understandings, experiences, or, in this sense, interpretations of events. On some views, interpretations of events are the *only* data that the researcher has to work with. There is nothing accessible beyond such interpretations: "what happened" is wholly constituted by such interpretations. Ethnography may use key informants from a particular community to explain or interpret the practices, rituals, and symbols of that community. In their introduction to Part IV, Beach and Lahelma say that researchers in ethnography of education "observe, learn and understand local cultures through their own experiences in the field." In some cases the intention is to gather and represent different stakeholders' experiences of and perspectives on educational programs as a basis for mutual understanding of "what has happened" from different points of view. In their chapter, Holm, Londen, and Mansikka explore the different ways in which Finland–Swedish teenagers position themselves as members of a minority group in Finland. Some participant research takes this further. Sometimes the research is carried out in such a way that the researchers' own practices, rituals, and symbols are in question during the research, as much as those of the other participants. This can be seen across different genres, for instance, in the chapters by Lapping, by Milstein, and by Amalia, Mardones, Johnston-Parsons, Shen, Shin, and Swanson. All parties may then change their understandings during the research process, a change which itself is subject to interpretation. Historical research and scholarship could be said to be concerned with primary sources (like diaries, letters, contemporary accounts of events) which represent one layer of interpretation, and with secondary sources that include other historians' attempts to make sense of the primary sources—on all of which the present researchers then impose a third layer of interpretation, which is their own.

Philosophical approaches are not only interpretations of the world but always also interpretations of other theoretical and philosophical interpretations. Self-study, personal narrative, and autoethnography appear in several of the sections; all of them rely on the researcher's memory for the material of the research. See, for instance, the chapters by Asgedom and Ridley, Mészáros, Mackinlay, and Fimyar.

As noted at the outset, it is sometimes suggested that this is what separates qualitative from quantitative research: crudely, that qualitative research is occupied with this rather soft and elusive data, whereas quantitative research seeks to develop accounts based on measurable, hard facts—and, as far as possible, observable evidence. But such a crude distinction underestimates the extent to which interpretations are embedded in quantitative as well as qualitative data. For example, even if the scored responses to a questionnaire end up as apparently clear numbers, that apparent clarity may conceal the constructions the researcher has carried into the formation of the questionnaire itself. Also easily concealed is the extent to which the respondents had to interpret the questions in order to render them meaningful and intelligible for the purposes of the responses, what assumptions the respondents made about the purposes of the research, and how it would be used (with or without any explanation from the researcher). One of the editors innocently asked a headteacher in Ghana how many children there were in his school. "It depends who wants to know," came the reply. Classroom observation schedules and their outcomes may tell us as much about the interests of the researcher and the framework of understanding he or she brought to the observation as about the events in the classroom itself. Even when a team of researchers try to use exactly the same observation schedule, they need to agree among themselves about how to interpret specific sets of observations before they can assign them to one category or another. The data from such enquiry must already be regarded as an interpretation of events, even before the researcher begins to analyze the data for its wider significance and meaning.

On Interpretation as a Product of Research

Another way in which interpretation enters the research process is in our attempts to analyze, to make sense of, or to give meaning to the data, evidence, argument, scholarly work, and other material that we collect in the process of inquiry. But what does interpretation itself mean and involve in such contexts?

We see the term as arising in a host of contexts, for instance:

- Interpreting numerical data, e.g., how to aggregate subsets of data
- Interpreting text, e.g., in responses to questionnaires, or historical documents
- Interpreting speech, e.g., in interview data, especially if reported in a language other than the interview
- Interpreting visual data, e.g., still photographs or moving images

- Interpreting works of verbal, visual, or performative art, e.g., in children’s poems, role-play, and drawings
- Interpreting body language, e.g., if a student is on task
- Interpreting a gesture, a facial expression, and an intonation, e.g., in a teacher’s whole class teaching
- Interpreting a policy document, e.g., in an internal school report or a government publication
- Interpreting the significance of a historical event, e.g., in oral history
- Interpreting the theory or theories which are the matter of the research
- Interpreting one’s own memories, for instance, as found in a research log or journal
- Interpreting the effect of an intervention on an educational setting, through an assemblage of changes within it
- Interpreting absences, showing what is *not* being seen or talked about
- Even, as in the case of one chapter here, interpreting one’s own dreams

The project of this book assumes that we are not going to make much progress by assuming that all these uses of the term denote exactly the same process, simply being applied to different kinds of evidence, or for different purposes. Any account at such a level of generality would be useless (e.g., “making an inference from some evidence to draw conclusions of meaning”). More likely, we are going to see something like a Wittgensteinian relation of “family resemblances,” with similarities and differences establishing a broad kinship of conceptions, without any specific defining qualities applying to every instance. If there is such a kinship, it will come from a closer scrutiny of what people actually do when they try to interpret something, looking at particulars of practice and activity rather than seeking out root definitions or essential features. Collecting and documenting such particulars is what this handbook is all about.

An interpretation is a kind of argument, but the ways in which evidence is marshaled in support of that argument differ. The idea is to show the significance of something that is not immediately apparent: an interpretation often asks the audience to see things in a particular way, or from a particular vantage point. The interpretation is a kind of case that needs to be made: an effective interpretation helps the audience to see connections or implications that they did not see before. It does so in *how* the case is made as much as through the evidence garnered in support. Usually, an interpretation refers to something important (note that the term “significance” here relates to both the idea of importance and the idea of meaning)—something that is worth attending to. This process of showing things in a particular way is distinct from the idea of getting an answer “right” in the sense of there being one correct—and true—answer. Some interpretations have other uses, revealed by the adjectives attached to them, like “illuminating,” “trustworthy,” “provocative,” “political,” or “insightful.” Other kinds of interpretation may provide a range of possible “right” answers: there may be more than one way to interpret a racist or sexist comment, for example, each one representing a different facet of understanding or point of view. Equally, there is also a range of possible “wrong” answers.

Some interpretations of complex data, such as works of art or personal narratives, may draw upon conceptions of truth different from the kind of conception found in a correspondence theory of truth, or a requirement to “just stick to the facts.” For instance, they may draw upon ideas of “individual truth” (“that is my truth, now tell me yours”) or of the significance of “truthfulness” rather than “truth,” as suggested by Bernard Williams.⁹

As noted, the rhetorics of interpretative argument also differ. Sometimes they take the form of a literal argument, with evidence marshaled in support of a logical inference. Sometimes they are more oblique, amassing and presenting particulars that have a cumulative effect in changing the way one understands something. Sometimes they are more invitational, suggesting “If you look at it *this way*, you will see the thing differently.” Sometimes, an interpretation has qualities in common with the thing being interpreted: explaining the meaning of gestures or expressions by repeating them, or by pantomiming others, explaining a poem through a style of expression that is itself poetic, and casting doubt on a viewpoint using mimesis. This link between rhetorics of interpretation and the rhetorics of the things to be interpreted partly explains why their styles are so varied and irreducible to a single method. An interpretation stands in between an audience and an object, mediating an understanding in the same way that a translator mediates between speakers of two different languages (and, of course, we often call translators “interpreters”). This intermediary role itself entails obligations, because for many audiences the only appreciation of the object will come through the interpreter’s efforts at explaining it. And so a certain honesty or integrity in the interpreter needs to be relied upon.

On Interpretation as Presentation of Educational Research

For educational researchers there is an additional complexity, though not one directly about the process of interpretation in the collection or analysis of data, so much as the interpretation of its purposes. As with any form of social inquiry, educational research is bound by fidelity to the evidence, clear argumentation, respect for other points of view, and so on. Educational research can be conceived as a second-order activity, equivalent to sociological or philosophical research on, for example, political structures or human relationships. But in many people’s minds, educational research (especially when it is funded by government grant money, foundation support, or public subsidies) has the added expectation of being *educational* itself, that is, promoting or advancing the social aim of improving educational processes and institutions. If interpretations are judged partly by whether they are “useful,” then in this context educational import is a criterion for what constitutes “usefulness”: helping us to educate more learners, better (in the

⁹ Williams, Bernard (2004) *Truth and Truthfulness*, Princeton University Press.

same way that the purpose of medical research is ultimately to improve health). While it is not our main focus here, we are acutely aware of the increasingly strong expectation of close links between educational research and educational policies and practices and between the funders of research and a set of expectations of what that research is expected to enable them to do. What constraints does this linkage have for the range of possibilities of interpretation in educational research? These expectations run counter to what is clear to most researchers: that educational research is unlikely to provide simple or straightforward means of raising examination scores or ensuring compliant students. Yet does the power of these expectations implicitly drive conclusions towards the conventional or the more easily heard? Does the expectation of “relevance” or “what works” (in the context of educational institutions and practices as they are) constrain interpretations that are more provocative or “outside the box”? Whose interpretations carry the most weight in a policy-driven (and policy-driving) endeavor? And if interpretations are not right or wrong, but good or bad, it is inevitable that some will ask: Good or bad *for whom?*¹⁰

The concerns about funders’ expectations can be seen as part of a wider, inescapable issue for educational research. In some areas of scholarship, researchers are mainly concerned to address their own community of scholars. Educational research is different. Many, perhaps most, educational researchers want their research to make a difference to education. Most were drawn to a particular focus because it concerns something they see as of practical, political, or ethical significance. Some researchers want to affect those directly engaged in practice, while others want to affect national policy makers, while yet others want to affect the understanding of the community of educators about what is at stake in an educational issue. So researchers are seeking to have an influence on any or all of the students, teachers, parents, community workers, NGOs, local governments, national governments, student teachers, and educational researchers and scholars. The question then must always be how best to do that.

Key to influencing the intended audience is the presentation of the research. This affects decisions about the style of writing up research results, the use of diverse modes of representation, and where the research is published or disseminated. The first step is to interpret the reactions of a specific audience to a mode of presentation. Statistics can be presented graphically in ways that make them clear and persuasive to nonspecialists, or they can be presented in tables with all the caveats clearly marked in a way which will make sense to specialists. Evidence gained through interviews can be represented in sound bites, in poetic form, carefully marked linguistically, or as a performance. Life history research can be presented as individual biography or as indications of social trends. All of these decisions are related to who the audience(s) are thought to be.

¹⁰ See Bridges, D., Smeyers, P. & Smith, R.D. eds. (2009) *Evidence-based education policy: What evidence? What basis? Whose policy?*, London, Wiley-Blackwell.

Most research will have several audiences. For instance, there may be a report to the funders, a press release to newspapers, and notices on social media, all alongside a research article for an academic journal or the publication of a book. This has ethical implications that affect what can be said. For example, in her chapter, Juzwik describes how she tailored her account of the findings in order to behave responsibly to the teacher with whom she had worked. Other ethical considerations are in play in policy research: what can be said in a report to government policy makers is influenced by what the policy makers think the national newspapers will make of it. Philosophers no less than social scientists make interpretations of audience in deciding how to present their work.¹¹

This Handbook

What, then, makes an interpretation “good”? The criteria, naturally, are themselves subject to different understandings (one reason why people argue over interpretations, multiply them, and overlay “meta-” interpretations upon interpretations). What is the “best” interpretation of Hamlet? What would that mean? There can be no single answer for this and never could be. Or what did you mean by that remark? You and I can go around for hours about that—and the opinions of third parties may only add to the complexity. The idea has been long discredited that data or textual evidence mean something specific and that the role of interpretation is to discover that (fixed) meaning. There are as many legitimate interpretations as there are good cases to be made, given the evidence. And sometimes the mark of a “good” interpretation is that it opens up the possibility of new interpretations.

In many cases, it is easier to talk about the ways in which an interpretation can go wrong: it lacks fidelity to the evidence; it is repetitive, or a cliché, and adds no new understanding to the matter; it fits some particulars, but neglects aspects of the chronology of events, the context, or the whole; similarly, an interpretation can be tendentious and incomplete, driven by a conclusion rather than an attempt to provide a comprehensive view; or it can be useless and irrelevant to the needs of the moment; or it can be uninteresting and boring. Just as an interpretation can be good in many ways, it can be bad in many ways. And so matters of judgment come into the discussion, matters of need and purpose, matters of individual interests, and matters of context and circumstance. Interpretation is not only an “essentially contested concept”—it is at the essence of why there are “essentially contested concepts.”¹²

All these arguments underpin the importance we have attached to examining particulars, and this is the basic approach of this handbook. As we said at the outset,

¹¹ See, for instance, Morwenna Griffiths (2014) Re-thinking the Relevance of Philosophy of Education for Educational Policy Making, *Educational Philosophy and Theory*, 46:5, 546–559.

¹² W. B. Gallie, ‘Essentially Contested Concepts’ *Proceedings of the Aristotelian Society*, vol. 56, 1956, pp. 167–198.

we think it is a mistake to use the term “interpretation” or “interpretive” to mark out a specific kind of research inquiry (or to use it as a synonym for “qualitative” research). Interpretation plays a role in all kinds of research: quantitative and qualitative, causal and textual, realist and constructivist, predictive or explanatory, and conceptual or empirical. Our point is that these entail interpretations of different sorts. We are not saying that there are no significant differences between these approaches; of course there are. But their differences cannot be captured by the dichotomy of “interpretive” versus “non-interpretive” approaches. Particulars of method, sources and types of evidence, and what we have called the rhetorics of interpretive argumentation clearly differ enormously. Theoretical stances further differentiate even work of similar method or discipline. We have endeavored in this handbook to do justice to that eclecticism while maintaining the connecting thread of interpretation to give the text an overall thematic unity.

We have tried to do justice to these considerations in the conception and design of this handbook. We begin, first of all, with case studies of the doing of interpretation, in all its multiplicity. We have asked the authors to provide not just examples of research inquiry (preferably their own), but reflections also on the ways in which interpretation played a role in that inquiry. We have relied on this process of *showing* to provide the particulars of interpretation at work—and the various works that interpretation does in inquiry. We have urged the authors to include reflections on the difficulties and challenges of interpretation and accounts of how they tell if an interpretation is a good one or not. We have tried to represent a broad range of research topics, methods, and theoretical approaches, across a wide range of research genres.

This is, if you will, an exercise in “mid-level” theory: informed by philosophical analysis and the literature on interpretation and its role in social inquiry, but not primarily concerned with elaborating those arguments for their own sake. Rather, the emphasis on case studies and situated reflections is intended to provide more of a “bottom-up,” rather than a “top-down” investigation. At this “mid-level,” philosophical abstractions and generalities encounter practical realities (and constraints), each informing and being informed by the other. For the editors, we have purposely chosen this way of making the case, in part to get past some of the unproductive antinomies of some previous presentations of these issues.

This is not a “how to” book, however, at least not in the sense of providing a prescription or recipe for how to do interpretation in educational research the “right” way. What could that mean, anyway, especially across the spectrum of fields and approaches encompassed here? Nevertheless, we hope that this collection does reveal something important and useful in a different way: that across these “showings” of interpretation at work, and across these reflective understandings of how the “doing” of interpretation and its challenges, emerges a “family resemblance” picture of interpretation that we come to see interpretation, in one form or another, as one of the unifying ideas underlying the practice of research itself.

Interpretation, Social Science, and Educational Research

Deborah Kerdeman

Can it make sense to ask the human sciences to overcome the conditions of our own nature? There is something disturbingly paradoxical about a science that has for its subject the agent that creates the science. How are we to stand back from being human in order to observe what it is to be human? Even to attempt this standing back—and there are many ways in which it has been undertaken in pursuit of scientific truth—is a way of being human that, in turn, some other person will be able to study. Are we then condemned to travel in self-reflecting circles, to create knowledge of human beings only to find that what has been done is to create another mode of life rather than a lasting truth?

Smith 1997, p. 13

Introduction

In response to a request from the US federal government to clarify the norms and practices that make educational research scientific, the American National Research Council released a report in 2002 entitled, *Scientific Research in Education*. The NRC report drew a number of conclusions, three of which are noteworthy for this essay. First, no one method could answer all questions about education. Certain questions are appropriate for quantitative investigation; other questions are better suited to qualitative study. Second, quantitative methods should not be privileged over qualitative methods. On the contrary, quantitative and qualitative researches “are epistemologically quite similar. . . as we recognize that both can be pursued rigorously, we do not distinguish between them as being different forms of inquiry” (Shavelson and Towne 2002, p. 19). Finally, the report concluded that the systematic study of education is shaped by the contexts in which education occurs. This fact “requires close attention to powerful contextual factors in the research process” (Feuer et al. 2002, p. 7).

e-mail: kerdeman@uw.edu

Almost immediately, the NRC report sparked controversy. Critics charged that it privileged quantitative research over qualitative research, minimized the scientific nature of qualitative studies, and failed to account for the fact that educational research takes place in diverse dynamic settings that mitigate against a definition of science that presumably applies across contexts. Some critics wondered whether qualitative research should aspire to be a science at all. Perhaps the humanities are a more appropriate model for interpretive inquiry. (See, e.g., the 2005 symposium on scientific research in education published in *Teachers College Record*. Also see Eisenhart 2006.)

The controversy generated by the NRC report echoes debates that raged during the nineteenth century. Prior to that time, systematic studies of the human condition largely fell to scholars in fields such as jurisprudence, religious thought, and moral philosophy. By the nineteenth century, however, science had achieved enormous success in explaining the natural world. Many people began to think that science also could help scholars, policy makers, and ordinary citizens understand, regulate, and improve social life. The institutionalization of the modern social sciences in universities during the nineteenth century signified faith that this hope would imminently be realized.

Then, as now, achieving rigorous knowledge of the social world through social science proved to be challenging. A key challenge for social science concerns the fact that the social world is innately meaningful and must be *interpreted*. Clifford Geertz likens the social world to a “web of significance,” a network of socio-cultural–historical meanings that are expressed and embodied in values, customs, traditions, religious symbols, political practices, etc. (Geertz 1973/2000, p. 5). In the course of their everyday lives, human beings constantly interpret the social worlds in which they live.

The fact that interpretation is a necessary and ineradicable feature of social life raises two important questions for social science: (1) Does interpretation in social science differ from interpretation that transpires in ordinary (nonscientific) circumstances? (2) Can social scientists achieve rational, valid, objective interpretations (i.e., interpretive knowledge) of the social worlds they inhabit? How one answers these questions depends in part on how one defines interpretation.

One definition frames interpretation in terms of epistemology (the philosophy of knowing and knowledge). From this perspective, interpretation is a method or cognitive strategy we employ to clarify or construct meaning. The goal is to produce valid understanding of the meaningful “objects” that comprise the social world, such as texts, artifacts, spoken words, experiences, and intentions. The epistemological view of interpretation posits that interpretation in social science differs from interpretation in everyday life. Whereas ordinary “folk” interpretations tend to be pre-reflective, unexamined, and frequently biased, interpretation in social science must and in principle can become rational, objective, and valid knowledge.

The second definition frames interpretation in terms of ontology (the philosophy of being and existence). On this view, interpretation is not an act of cognition, a

special method, or a theory of knowledge. Interpretation instead characterizes how human beings experience the world. Realized through our moods, concerns, self-understanding, and practical engagements with people and things we encounter in our sociohistorical contexts, interpretation is a mode of lived experience, an unavoidable and uniquely human way of existing in the world. The ontological view of interpretation posits that interpretation in social science does not differ from the sort of interpretations that arise in everyday life. Both forms of interpretation are modes of lived experience. Moreover, the quest to transform ordinary lived interpretation into scientific knowledge is wrong headed. Scientific knowledge remains indebted to the ordinary “lived” interpretations it seeks to clarify and correct. This is true of quantitative as well as qualitative modes of inquiry.

The epistemological and ontological views of interpretation interact as “sibling rivals.” Debates about the aims, norms, and practices of social science reflect and perhaps also perpetuate this hermeneutic rivalry. To appreciate how both epistemological and ontological views of interpretation have influenced the development of social science, it is helpful to examine each view in greater detail and to trace their rivalry over time.

Our examination begins in the nineteenth century with Wilhelm Dilthey (1833–1911), a German Protestant theologian who devoted his life to developing the *Geisteswissenschaften* (German for social science, also translated as the human or moral sciences, or sciences of mind or of the human spirit). Dilthey argued that interpretation is both a pre-reflective mode of everyday lived experience and also is the method and theory of knowledge for social science. Ultimately, Dilthey intuited that as a mode of lived experience, interpretation could not easily be transformed into reflective scientific knowledge. Dilthey’s quest to develop social science consequently foundered.

During the twentieth century, the implications of lived understanding for science and social science were examined from two different perspectives. One perspective is known as post-positivist philosophy. Post-positivist philosophers include Ludwig Wittgenstein (1889–1951), Hans Reichenbach (1891–1953), Karl Popper (1902–1994), Imre Lakatos (1922–1974), Norwood R. Hanson (1924–1967), and Thomas Kuhn (1922–1996). The second perspective draws on the philosophy of understanding and interpretation known as hermeneutics. The German philosopher, Hans-Georg Gadamer (1900–2002), was largely responsible for developing the contemporary hermeneutic view of social science.

Post-positivist philosophers and Gadamer agree that human beings always and necessarily pre-reflectively understand and interpret the social worlds they inhabit. They draw different lessons from this fact, however, and believe that it poses different challenges for social science. These differences stem in part from the fact that post-positivist philosophers regard interpretation in epistemological terms, whereas Gadamer defines interpretation in ontological terms. Nonetheless, post-positivist social science and Gadamerian social science share some interesting similarities.

In the sections that follow, I will sketch how Dilthey sought to ground social science in interpretation. I then will briefly examine post-positivist epistemological

social science and Gadamer's ontological social science, highlighting their similarities and differences. In conclusion, I will consider some practical implications and challenges that post-positivist and Gadamerian social science pose for educational research. (For another analysis of these issues, see Kerdeman 2014.)

Social Science and Interpretation: Dilthey's Dilemma

Dilthey's vision of social science is grounded in the ontological premise that human beings naturally express their understanding of their life experience by creating meaningful objects such as texts, works of art, and various cultural expressions. These meaningful objects must be interpreted to maintain social life, Dilthey argued. Social science thus should not follow the methods of physical science but instead requires a hermeneutic method. Social science also requires an epistemology of interpretive knowledge, not a theory of knowledge concerned with causal explanation. The German word *Verstehen* (interpretation) captures Dilthey's contention that interpretation is central to the social sciences and distinguishes the social sciences from the physical sciences. While the two forms of science are distinct, Dilthey insisted that they are equally rigorous.

Dilthey based his ideas on the "hermeneutic circle," a method of interpretation that had become prominent during the Reformation, when Protestant theologians sought to interpret the Bible without appealing to the Catholic church to determine the meaning of problematic passages or resolve interpretive disputes. As its name suggests, the hermeneutic method assumes that interpretation is circular. Because the meaning of the Bible was thought to be unified and self-consistent, the meaning of any specific passage could be determined by referring to the text as a whole. But since understanding the text as a whole presumes understanding its problematic passages, determining the meaning of a problematic passage depends on a preliminary intuitive grasp of the text's entire meaning. Biblical exegesis thus revolves in a continuous cycle of anticipation and revision. Interpreting the meaning of any part of the Bible depends on having already grasped the meaning of the Bible as a whole, even as one's understanding of the entire Bible will be reshaped as one clarifies the meaning of its constituent parts.

Another Protestant theologian, Friedrich Schleiermacher (1768–1834), had maintained that the hermeneutic circle could ensure understanding not only of the Bible but also of all written and oral expressions. Using this method correctly, interpreters could understand the meaning of linguistic expressions better than the authors who produced them. Schleiermacher transformed the hermeneutic circle from a method of Biblical exegesis into a general theory of interpretation that explained how understanding could be achieved in ordinary circumstances.

Extending Schleiermacher, Dilthey argued that the hermeneutic circle not only helps people reflectively interpret others' meaningful expressions—it also enables people to understand themselves and their own lived experience. This is because life experiences do not unfold in linear fashion but instead are related to one another as parts are related to wholes. On the one hand, we understand specific life

experiences in terms of how we understand the meaning of our life as a whole. At the same time, the way we understand our life as a whole depends on how we understand specific life experiences. Understanding specific experiences thus both shapes and is shaped by understanding the overall meaning of our lives, even as understanding our life's overall meaning both shapes and is shaped by how we understand specific life experiences.

Applying the hermeneutic circle to life, Dilthey realized that understanding is temporal. Past experiences constitute the "parts" of one's biography. The future makes it possible to fathom one's life in toto. Interpreting the meaning of the future depends on and reshapes one's understanding of the past, even as interpreting the meaning of the past anticipates and revises one's understanding of the future. This is a different kind of "hermeneutic circle."

Interpreting the meaning of time therefore is integral to interpreting the meaning of lived experience. It is important to note that at the pre-reflective level of interpreting lived experience, time is not an *object* for interpretation. It is impossible to freeze or objectify the past in order to interpret it. Neither is the future a stationary target at which interpretation aims. One rather interprets the meaning of time as one moves through time. Where lived experience is concerned, interpreting time and experiencing time arise together.

Dilthey drew two conclusions from this insight. First, the meaning of life experience is fluid. With the passage of time, the meaning of the past and the future shifts. At different points in the future, one's past will mean different things. The meaning of the future also changes, depending on the particular stage of life from which the future is anticipated.

Second, interpreting lived experience does not produce understanding that is abstracted from the experience of living. We cannot escape our situation in order to interpret it. Nor can we interpret our life and *then* experience it. Rather, we are practically engaged in living the life that we interpret. Pre-reflective interpretation, in short, is situated, partial, practical, and personal.

Dilthey believed that pre-reflective understanding of one's own lived experience could evolve into reflective theoretical knowledge of how other people understand their life experience. Theoretical knowledge thereby extends and refines pre-theoretical practical understanding. But Dilthey recognized that because theoretical knowledge is rooted in pre-theoretical understanding, knowledge in the social sciences, particularly in history, differs from knowledge in the physical sciences. The historian who reflectively examines the meaning of historical events himself is a historical being. The meaning of the past therefore cannot be established once and for all but instead varies with the perspective of the historian who studies it. Moreover, theoretical understanding remains rooted in the pre-theoretical understanding it aims to clarify, even as pre-theoretical understanding is changed by the theoretical understanding that it grounds. Interpretation consequently revolves in a never-ending circle, rendering historical knowledge provisional and incomplete.

While Dilthey believed that the interpretive social sciences could be as rigorous as the physical sciences, the character of knowledge in interpretive social science

nonetheless vexed him. What kind of scientific knowledge is possible when the meaning of that which is studied constantly changes? Such knowledge is relative, not general and valid. Moreover, insofar as the historian “belongs” to the history he studies, historical knowledge cannot be objective. Historical knowledge instead is subjective, provisional, and partial. The circularity of interpretation raises the possibility that historical “knowledge” simply proves what it presupposes.

In an effort to reconcile understanding lived experience with scientific knowledge, Dilthey turned to his younger contemporary, Edmund Husserl (1859–1938). Husserl demonstrated that science grows out of particular “lifeworlds” and necessarily presupposes nonscientific understandings. But while Husserl argued that scientific knowledge depends on pre-reflectively understanding particular lifeworlds, he also subjected the lifeworld to phenomenological analysis in order to discover “essences” in lived experience that make theoretical knowledge of the lifeworld possible. In so doing, Husserl encountered a contradiction.

On the one hand, Husserl concluded that pre-theoretical understandings are relative to particular lifeworlds. On the other hand, he believed that phenomenological analysis could produce knowledge of the lifeworld that is universal and unconditionally valid. It was unclear how phenomenological analysis could both transcend and also remain indebted to pre-theoretical understanding. Phenomenological analysis of the lifeworld thus seemed necessary but impossible. In the end, Husserl did not solve Dilthey’s dilemma; instead he exposed another aspect of it.

Twentieth-Century Science and Social Science: Reconceiving Dilthey’s Dilemma

Arguing that pre-reflective lived understanding is ineradicable, Dilthey believed an impassable gulf separated pre-theoretical lived understanding from rigorous social science. Pre-reflective lived understanding is subjective, practical, situated, partial, and temporal. Scientific interpretation, by contrast, is objective, theoretical, generalizable, stable, and certain.

During the twentieth century, thinkers from a variety of disciplines began to challenge the pessimism surrounding social science. These thinkers did not dispute Dilthey’s insight into the inevitability of lived understanding. On the contrary, they embraced the view that human beings cannot but help interpret the meaningful social worlds in which they live. They also acknowledged that ordinary lived understandings necessarily are situated and typically are unexamined. But these facts about lived understanding do not make social science impossible, as Dilthey thought. They *do* require us to rethink our definition of “science” and to reframe the norms and practices of social science.

Two reconceptualizations of science proved to be especially important for the development of social science. Post-positivist philosophers reconceived social science by showing how epistemology and science could accommodate the

inevitable influence of lived understanding. By contrast, Hans-Georg Gadamer argued that the inevitable presence of lived understanding means that social science is not subject to epistemology but instead must be reconceived in ontological terms. Because readers likely are more familiar with post-positivist philosophy, I will discuss it first. I then will turn to Gadamer's ontological hermeneutics.

Post-Positivist Science: Epistemology and Lived Understanding

Post-positivist thinkers developed complex and sometimes competing positions. Taken together, however, their ideas pose deep challenges to nineteenth-century beliefs about science. Many nineteenth-century scholars, including Dilthey, thought that science must be based on a foundation of impartial observation and that conclusions could not be deemed true unless they were indubitable. Post-positivists challenge both of these assumptions.

As a matter of principle, post-positivists maintain observation cannot be impartial or free from the influence of interpretation. (For an account of the developments that led to this position, see Phillips and Burbules 2000.) On the contrary, observation always is theory laden. Denis Phillips explains: "What an observer sees, and also what he or she does not see, is influenced by the background knowledge of the observer—the theories hypotheses, assumptions, or conceptual schemes that the observer harbors" (Phillips and Burbules 2000, p. 15). Stephen J. Gould adds that scientific observations are influenced by a scientist's personal understandings of experience and also by the intersubjective understandings of experience that imbue the scientist's social world. Gould writes: "Facts are not pure and unsullied bits of information; culture also influences what we see and how we see it. Theories, moreover, are not inexorable inductions from facts. The most creative theories are often imaginative visions imposed upon facts; the source of imagination is also strongly cultural" (Gould 1981/1996, pp. 53–54).

Following Phillips and Gould, we can say that when scientists observe the world, they do not see a set of "bare" facts or "brute" data. Observation instead necessarily is filtered through a set of "interpretive lenses" that reflect personal as well as socio-cultural understandings. But if observation cannot be distinguished from interpretation, how can scientists be sure they are seeing what "really is there," not what they *think* or *hope* is the case?

According to post-positivists, the inevitability of interpretation does not doom observation to being biased. The fact that we cannot "remove" our interpretive lenses does not mean that interpretive lenses necessarily circumscribe or dictate ways of seeing. If interpretive lenses influence observation, so interpretive lenses also can be clarified and, if necessary, corrected through critical examination and reflective reason.

Objectivity for post-positivists thus does not signify that one's pre-reflective interpretations have been dissolved. Achieving objectivity remains possible, because observations can be publicly scrutinized and tested. Claude Steele maintains that engaging in science is a compelling way to clarify interpretive lenses and critically examine bias. He writes:

One of the first things one learns as a social psychologist is that everyone is capable of bias. We simply are not, and cannot be, all knowing and completely objective. Our understandings and views of the world are partial, and reflect the circumstances of our particular lives. This is where a discipline like science comes in. It doesn't purge us of bias. This is where I would stake my claim, at any rate. The constant back-and-forth between ideas and research hammers away at bias and, just as important, often reveals aspects of reality that surpass our original ideas and insights. (Steele 2010, pp. 13–14)

Thus for Steele, science will not completely dispel the ordinary unexamined interpretations that researchers necessarily bring to their work. But, Steele insists the process of “hammering away” at assumptions that otherwise would operate behind our backs, beyond the reach of conscious awareness, can help scientists critically examine the interpretive assumptions that influence not only observation but also all phases of research.

Formulating research questions, for example, requires the scientist to reflect on the purpose of his study and to think hard about the type and scope of evidence he must collect. Analyzing data provides another opportunity to anticipate and address alternative or competing interpretations and arguments. Subjecting conclusions to public scrutiny also can surface assumptions that scientists might otherwise miss. Reviewers who are not invested in a study likely will spot interpretive influences that researchers might have overlooked. Reviewers' perspectives also may differ from researchers' perspectives. Considering findings from multiple perspectives can be another effective strategy for revealing bias.

Critically evaluating interpretive assumptions not only helps research become more objective: it also helps scientists evaluate the validity of their claims. Attempting to refute—not prove—a conclusion is key, post-positivists contend. It always is possible to find evidence that proves one's hypotheses and arguments. Recognizing evidence that *refutes* one's conclusions is a stronger test of validity, however. When a claim withstands rigorous attempts to disprove it, we can feel more confident that it is warranted. Of course, eliminating error is not the same as proving truth. Claims that we warrant today can be refuted tomorrow; human judgment is prone to error, and the history of science is replete with examples of claims that have been overturned. Nevertheless, some claims *are* better than others and qualify as being true, at least, for now.

Truth claims for post-positivists thus are not absolute, irrefutable, or certain. Rather, they are provisional, partial, and fallible. This does not mean that evidence is either absolute or unnecessary. It *does* mean that determining whether evidence justifies a claim is a conjectural process that relies on imperfect judgment.

In sum, post-positivists acknowledge the inevitability of lived understanding but argue that science and epistemology can accommodate this fact. Objectivity does not signify that interpretation ceases to influence observation. Objectivity instead means that interpretive influences have been critically examined. Validity is not

ascribed to claims that are certain or self-evidently true. Validity instead must be determined, and this requires scientists to exercise interpretive judgment. Because interpretive judgment is fallible and prone to error, a claim that we deem true may turn out to be false. It does not follow, however, that one claim is as good as another or that truth is captive to social contexts and reducible to cultural meaning. Truth remains a regulative ideal to which scientists can and should aspire. As Gould notes: “Science cannot escape its curious dialectic. Embedded in surrounding culture, it can, nonetheless, be a powerful agent for questioning and even overturning the assumptions that nurture it. . .” (Gould 1981/1996, p. 55).

The centrality of human judgment for science makes science a quintessentially *human* enterprise. Gould writes: “But creative thought in science is exactly this—not mechanical collection of facts and induction of theories, but a complex process involving intuition, bias, and insight from other fields. Science, at its best, interposes human judgment and ingenuity in all its proceedings. It is, after all (though we sometimes forget it), practiced by human beings” (Gould 1977, p. 125). Echoing Steele’s belief about science, Gould suggests that engaging in science both requires and also cultivates certain dispositions, including critical self-awareness, the capacity to live with uncertainty and doubt, and a willingness to accept the possibility that one’s hard-won conclusions could be wrong. In this respect, science not only is an avenue for achieving knowledge. Engaging in science also can be personally transformative.

Post-Positivism and Education Research

Denis Phillips argues that the post-positivist conceptualization of physical science applies to norms and practices in *social* science, including educational research. Of course, social scientists pre-reflectively interpret the social worlds they reflectively study; research thus necessarily is mediated by the researcher’s sociocultural situation. This fact, however, does not negate the possibility of studying the social world scientifically. Nor does it absolve social scientists from trying to achieve valid objective knowledge. Objectivity will not be “pure,” and the truth of research conclusions cannot be guaranteed. But acknowledging the inevitable influence of lived understanding makes it more—not less—possible for fallible human beings to try and achieve rigorous knowledge of the social worlds they inhabit.

According to Phillips, the need to identify and agree upon standards to assess the objectivity and validity of research claims is the paramount task confronting educational researchers. All educational researchers must address this epistemological challenge, Phillips insists. Nevertheless, addressing this challenge poses different practical issues for quantitative and qualitative researchers.

For quantitative researchers, a key problem is to identify which variables are relevant and may need to be controlled. Given the complexity of the contexts in which education occurs, these judgments can be difficult to make. Quantitative researchers also must address the conundrum of how to make generalizations

meaningful for the complex, varied, and dynamic social contexts in which education occurs (Phillips 2014, p. 10).

People who are enamored of quantitative research sometimes forget or ignore these difficulties, Phillips notes, and expect quantitative research to provide fool-proof solutions for educational problems. From a post-positivist perspective, this expectation is immodest and unreasonable. Numbers are not “brute” data; determining statistical significance is probabilistic and conjectural, not definitive. Moreover, quantitative research is not an unassailable formula for success (i.e., randomized field trials). Like all social science, quantitative methods depend on interpretive judgment. Denying this fact confuses science with fantasy and results in a phenomenon that Phillips (following Arthur Kaplan) calls “methodolatry” (Phillips 2006, pp. 25–26).

A different set of practical issues confronts post-positivist qualitative researchers. Qualitative researchers endeavor to interpret how “cultural insiders” interpret the meaning of their own experiences and contexts. Thus for qualitative research, interpretation is both the *focus* of research and also the *method* of research. The “doubly hermeneutic” character of qualitative inquiry raises the following sorts of questions:

- The meaning or purpose of an event, encounter, or experience can be difficult or impossible to construe outside the setting in which it transpires. Meaning, moreover, can vary from context to context. Are interpretations of meaning generalizable beyond the particular local contexts in which they arise? What does generalizability “look like” and require with respect to interpretations of contextual meaning?
- How should qualitative researchers think about objectivity in light of the fact that they are the “instruments” of inquiry (Wolcott 1997, p. 332) who not only observe contexts but also participate in them? How—and how much—can or should a researcher’s own lived understandings be checked or controlled? Are there methods that can help researchers address challenges to self-reflection that arise in the field? If so, which methods should researchers adopt and under which circumstances?
- Do researchers’ interpretive conclusions differ in important ways from interpretations that are articulated or assumed by the people whom researchers study? If so, what is the relationship between ordinary understanding and scholarly interpretive theory? Does scholarly theory illuminate or obscure quotidian understandings?

The plethora of responses to the National Research Council’s 2002 report illustrates the conceptual complexity of these epistemological issues. But while the issues are complex, they must be addressed, Phillips concludes. Qualitative researchers, no less than their quantitative colleagues, must aspire to critically examine their assumptions in order to produce conclusions that are warranted by appropriate evidence.

Gadamer's Ontological Social Science

Embracing lived understanding, post-positivists significantly alter definitions of objectivity and truth. The post-positivist reconceptualization of epistemology and science is not a direct response to Dilthey. Had post-positivists responded to Dilthey, however, they might have said that he was stymied by an extreme view of objectivity (objectivism). They also might have said that he was seduced by the hubris that fallible human beings can definitively grasp truth.

Gadamer believes that Dilthey was stymied by a different set of beliefs. Specifically, two epistemological assumptions led Dilthey astray: (1) reflective interpretation and pre-reflective lived understanding are distinct; and (2) pre-reflective lived understanding is unreliable and therefore cannot be the basis for social science. Gadamer counters that pre-reflective understanding is not necessarily unreliable or erroneous. Rather, pre-reflective understandings (“prejudices,” to use Gadamer’s terminology) “are biases of our openness to the world. They are simply conditions whereby we experience something—whereby what we encounter says something to us” (Gadamer 1966/1976, p. 9). In other words, before we can explain a phenomenon, we must already have understood it on a pre-theoretical practical level. This does not mean that pre-reflective understanding always is perspicacious and cannot be narrowed or mistaken. On the contrary, Gadamer argues pre-reflective understanding *must* be critically questioned. But critical reflective understanding necessarily remains indebted to the pre-reflective understandings it clarifies and corrects.

Before discussing how Gadamer’s beliefs about understanding shaped his views of social science, it is helpful to clarify what “science” means in the context of his philosophy. Like many continental European thinkers, science for Gadamer does not refer exclusively to the physical sciences or to the systematic observation of the empirical world. Neither does science exclude the humanities. Rather, science connotes reflective study in fields as diverse as theology, archeology, and politics. The term social science (moral science, human science) thus signifies reflective study of the human social world. But what does reflection in social science mean, exactly? Gadamer’s answer to this question was heavily influenced by the work of his teacher, Martin Heidegger (1889–1976). To appreciate Gadamer’s vision of social science, it is necessary to briefly explore its roots in Heidegger.

Heidegger

In his book, *Being and Time* (1927/1962), Heidegger probed two of Dilthey’s important insights: (1) we experience the life that we pre-reflectively interpret; and (2) pre-reflective understanding exhibits a circular temporal structure. Dilthey believed that these two conditions are contingent and apply only to pre-reflective

understanding. Heidegger demonstrated that both conditions are necessary and characterize all understanding, including critical reflection.

Heidegger began by considering the question of existence. To exist, Heidegger reasoned, is to live in the present. As Dilthey showed, the present does not arise in a historical vacuum but instead always implicates the future and the past. Living in the present, we cannot help anticipate the future based on where we have been, even as our expectations for future experience color our understanding of the life we have lived. Heidegger used the term “historicity” to underscore the idea that human understanding is an *inescapably* temporal experience.

Insofar as understanding is an inescapably temporal experience, we do not choose to start (or stop) understanding at a particular point in (or out of) time. Rather, understanding is *a way of being* that always is already going on (to use Heidegger’s phrase). It is true that understanding sometimes is mistaken. But breakdowns in understanding signify *mis*understanding, not an *absence* of understanding, according to Heidegger.

As an experience that is always already happening, understanding does not grasp the meaning of objects that are “present at hand,” distinct from our interests and concerns. Understanding instead signifies being intimately involved with people and things. Our world is composed of implements that are “ready to hand,” tied to our purposes, moods, interests, etc. Heidegger described engaged practical ongoing understanding in terms of “fore-having,” “foresight,” and “fore-conception.” The prefix “fore-” signifies that we are able to engage with implements in our world because we pre-reflectively sense how they are implicated with our interests and how they fit within the context of meaningful relations in which we find them.

The fact that we pre-reflectively understand meaning does not imply that understanding is stuck in the past. Pre-reflective understanding can change as human beings move into the future, reconsider prior understandings, and anticipate new possibilities. Heidegger insisted that pre-reflective understanding could become critical and reflective. But critical reflection does not produce understanding where none had previously existed. Critical reflection instead remains indebted to the pre-understandings it clarifies and corrects.

Heidegger coined the term “thrown projection” to describe understanding as an experience of being involved in the world. The term “thrown” indicates that we do not construct the meaningful context(s) in which we live. Rather, we are born into a social world that is inherently meaningful and that already has been interpreted by others. Interpretation is possible, because the world discloses meaning through the medium of language. We inherit this social web of meaning as a linguistic “horizon” within which the construal of meaning for our own lives becomes possible. Heidegger’s “projection” is not synonymous with “planning.” Projection instead indicates that understanding is a dynamic experience of anticipating future possibilities. Because expectations for the future necessarily arise in the present, we cannot see them in their entirety or with absolute clarity. Moreover, while future possibilities are open, they nonetheless are partially circumscribed- by possibilities that already have been fulfilled.

The human being who experiences understanding as a cycle of “thrown projection” is *Dasein*, Heidegger said. *Dasein* means “there being.” Unlike the

autonomous epistemological subject who leverages interpretation in order to grasp the meaning of objects (including objectified experiences), *Dasein* is not an independent agent who confronts discrete objects, the meaning of which he must deliberately choose to discover or construct. *Dasein* rather is “there” in the world, spontaneously involved with things that *Dasein* understands prior to any distinction between subjects and objects. *Dasein* does not initiate understanding and does not regulate the production of meaning. The fact of existing in an inherently meaningful and already interpreted world—not *Dasein*’s own initiative—is the condition that makes both pre-reflective and reflective understanding possible.

Gadamer’s Social Science

Heidegger’s claim that understanding is a temporally conditioned way of experiencing the world carries profound implications for social science, Gadamer concludes. He worked out these implications in his magnum opus, *Truth and Method* (1975/1989). Following Heidegger, Gadamer argues that interpretation in social science is a temporally conditioned experience or “event” we live through, not a kind of knowledge we achieve by methodologically regulating our life experience or by abstracting and justifying critical reflection outside of ordinary understanding. Understanding and interpretation in social science are no different from understanding and interpretation in daily life, Gadamer contends. In both cases, we experience understanding and interpretation as a dialogue or conversation.

The notion that social science is a conversation might seem startling. We typically think that social scientists collect and analyze data. But for Gadamer, people and texts are not data or “objects” in which meaning resides. People and texts instead are conversation partners who embody dynamic linguistic horizons that disclose meaning over time. Gadamer’s social scientist starts to understand a text when she recognizes that it voices a question or issue that comes down through tradition and also concerns her. Similarly, the social scientist starts to understand another person, not because she empathizes with him or is able to leap out of her own body to get inside the other’s head. Understanding instead begins when the social scientist recognizes that the question or issue that concerns the other person concerns her as well.

Of course, neither party in the conversation can escape the situation into which each has been “thrown.” Understanding therefore does not aim to capture *the* meaning of a question. The meaning of a question rather is co-determined by the horizons of the conversation partners who interpret it. Insofar as horizons are temporal and change over time, the “same” question will be understood differently every time it is interpreted.

If we necessarily rely on our own horizon to understand an issue, how can we recognize the horizon of our partner? What prevents us from appropriating our partner’s perspective or conflating it with our own? Gadamer proposes two answers. First, he notes that horizons are porous, not self-enclosed. In principle, therefore, horizons can interpenetrate.

Gadamer's second answer concerns the disposition of conversation partners. In a successful conversation, each party is open to the possibility that the other's perspective is true and may challenge and even refute one's own perspective. Gadamer insists that one's own perspective cannot be clarified or corrected as long as one entertains the other's perspective from afar and continues to maintain the truth of one's own position. Change instead requires one to *risk* one's assumptions and to actually *experience* the negation of one's understanding. Gadamer acknowledges that negative experiences are uncomfortable. But he maintains that negative experiences can be an invitation to critically reflect on one's prior understandings and realize new insights.

Thus, like pre-reflective understanding, critical reflection for Gadamer is an experience we undergo. In successful conversations, both parties are open to risking their assumptions. As a consequence of being challenged, the pre-reflective understandings of both parties can become more encompassing, perspicacious, critical, and reflective. Gadamer calls the reflective dimension of conversation a "fusion of horizons." Neither party can predict in advance how its horizons will be fused. When one party tries to direct the conversation or claims to know what the other is thinking, "talk" becomes something other than conversation (e.g., a lecture or a debate). But when a fusion of horizons genuinely happens, both parties come to understand a truth about life's meaning that neither party could realize outside of actually participating in the conversation.

In sum, Gadamer reframes social science in terms of a conversation that we experience with others. Gadamer's social scientist does not try to empathize with the people and texts that she studies. Neither does she regard them as exotic and distant. Rather the social scientist endeavors to recognize a question or issue that she and her partner share. The meaning of the question cannot be determined "objectively" but instead is co-determined by the horizon of both the social scientist and her partner.

The new insights that both parties realize in the course of their conversation also are co-determined and change with each interpretive event. New insight cannot arise if the social scientist attempts to regulate her self-understanding or keep it out of play. Gadamer's social scientist instead must allow her self-understanding to be affected by her partner, who presents a different and perhaps opposing perspective on the question that concerns them both. The partner's self-understanding is affected as well. Significantly, neither party can direct this experience or predict the new insight that a conversation will disclose. Both parties instead participate in a transformative event, the outcome of which neither can imagine in advance. Framing social science as a conversation that we necessarily experience with others can rehabilitate the moral dimension of the human (moral) sciences, Gadamer concludes.

A number of contemporary scholars are working to develop the philosophical and practical implications of Gadamer's social science. In his influential essay, "Interpretation and the sciences of man" (1971), Charles Taylor (1931–) argues that social scientists are "self-interpreting animals" who always pre-reflectively understand their theoretical conclusions and who inevitably appeal to intuitions and self-understanding to justify their findings. Ruth Behar (1956–) provides a practical

example of ontological social science. Behar's book, *The Vulnerable Observer* (1996), does not explicitly reference hermeneutics or Gadamer. Nonetheless, it argues that anthropological insight necessarily implicates the anthropologist's own self-understanding. The anthropologist's self-understanding, moreover, is vulnerable to (and affected by) the people whom she studies.

Jürgen Habermas (1929–) articulates a second response to Gadamer. Like Taylor and Behar, Habermas appreciates Gadamer's insight into the ontological nature of social science. Critical reflective understanding is irreducibly contextual, historical, and bound up with the interpreter's own self-understanding and presuppositions. The social scientist consequently belongs to the social world he interprets. Social science theories issue from the pre-theoretical practices they strive to explain.

But while Habermas agrees with Gadamer that critical reflection is connected to lived experience and understanding, he questions Gadamer's faith in the power of language and conversation to disclose truth and promote critical examination. Language is not simply a communicative medium for understanding meaning, Habermas argues. Material conditions and power interests can systematically and insidiously distort meaning in ways that language does not make apparent. Hence reflection must do more than simply *clarify* lived understanding by means of conversation. Critical reflection also must help people *distinguish* lived understanding from ideology. Becoming liberated from ideology requires methods and theories that can explain the genesis of distortion by rationally appealing to evident causes.

Gadamer's Ontological Social Science and Education Research

Few educational researchers explicitly reference Gadamer to describe their work. Nonetheless, it is possible to detect two Gadamerian themes in educational research. The first theme imagines research as a collaborative conversation. The second theme concerns whether and how a researcher's self-understanding is or should be implicated in his or her work. I will discuss each theme in turn, including questions and challenges for research that each theme raises.

Research Is a Conversation

Some scholars, including collaborative action researchers and those who engage in design experiments, argue that effective research is a collaborative conversation between researchers, community members, school personnel, and other stakeholders. Researchers and local actors participate as equal partners in conversations about the design, implementation, and evaluation of new understandings and findings. For example, questions must be of mutual concern to both researchers and local actors and must arise in contexts of practice. Questions will change and

evolve as researchers and local actors together arrive at new insights and clarify previously unforeseen problems. Kris Gutiérrez and William Penuel sum up this model of research. Focusing on design experiments, they write: “These models do not require researchers to specify ahead of time all the elements of an intervention, since practitioners participate in the design, and implementation data inform an iterative design process that often transforms interventions. It is important to ask, What is a partnership if the research plan is fully predefined by researchers?” (Gutiérrez and Penuel 2014, p. 21).

Conceiving of research as a collaborative conversation between researchers and local actors suggests new and interesting questions that Gutiérrez and Penuel do not consider. For example, if researchers and local actors are equal partners, what exactly distinguishes the perspective or horizon of researchers from the horizons of local actors with whom they collaborate? Does each researcher bring an individual horizon to the research conversation, or can we identify a perspective that is common to all (or most) researchers? What does developing a “research horizon” require?

Most significantly, Gutiérrez and Penuel make the *epistemological* assumption that specifying or developing specific *methodologies* is necessary in order to bring stakeholders together to deliberate problems that arise during research. Gadamer, by contrast, makes an *ontological* argument: successful research conversations cannot arise unless partners are open to *being affected* and possibly challenged by one another. The understanding that arises during these challenging experiences cannot be specified in advance. Insofar as method regulates understanding, relying on method may not facilitate research conversations, as Gutiérrez and Penuel assume. Relying on method instead may *prevent* mutual understanding from developing.

Some researchers argue that while collaborative conversation may be an ideal to which researchers should aspire, it is unclear how or whether this ideal should be enacted. Most university IRB regulations distinguish researchers from research subjects and stipulate that the rights of research subjects must be protected. This epistemological assumption makes it difficult if not impossible to approach research as a Gadamerian conversation that regards subjects and researchers as equal partners.

Other scholars raise questions about research as conversation, which echo concerns that Habermas voices. These scholars point to a legacy of privilege and marginalization and warn that seemingly openhearted conversations can exploit subjects. Relying exclusively on interpretation to examine social meaning thus is inadequate. The meaning of social practices instead must be interrogated and exposed through political struggle. Whether social science can accommodate political advocacy and remain a science is a compelling question for many educational researchers.

Scholars of color who conduct research in their home communities raise a third concern regarding research as conversation. These scholars discuss how their university status distances them from people with whom they were able to converse easily before they became researchers. For these scholars, the unforeseen insights that arise during research conversations can be experiences of alienation, not Gadamerian solidarity. (See, e.g., Villenas 2000).

Researchers' Self-Understanding

The second Gadamerian theme that is evident in educational research concerns the self-understanding of researchers. Michael Agar, an ethnographer whose work is familiar to many qualitative researchers, explores this issue. Drawing on Gadamer, Agar coins the term “rich point” to describe unexpected breakdowns in understanding. According to Agar, rich points present opportunities for ethnographers to question their *own* understanding and self-understanding. He writes: “The rich point, you assume, isn’t *their* problem; it’s *your* problem. The rich point doesn’t mean that *they’re* irrational or disorganized; it means that *you’re* not yet competent to understand it. There is, you assume, a point of view, a way of thinking and acting, a *context* for the action, in terms of which the rich point makes sense” (Agar 1996, pp. 31–32). Whereas an epistemologically oriented ethnographer might work to *control* or at least reflectively account for his self-understanding so that he can accurately interpret his subject’s understanding of the world, Agar’s ontologically oriented ethnographer *engages* his self-understanding, allowing it to be (hopefully) transformed through the experience of being challenged by research participants.

While Agar argues that ethnographers must engage, not control, their self-understanding, he ultimately conceives of self-understanding in epistemological terms. Agar’s rich point seems to apply only to ethnographers, not to research participants. Additionally, Agar develops a method by which ethnographers can surface, analyze, and address rich points. The epistemological assumption that researchers can and must reflectively account for and regulate their self-understanding continues to exert a strong hold, even on ontologically oriented scholars. It remains to be seen whether or how far educational researchers will take up the Gadamerian premise that research is an experience in which one’s self-understanding is challenged in ways that the researcher cannot control or direct.

Comparing and Contrasting Post-Positivists and Gadamer

Acknowledging that interpretation is an ineradicable feature of social life, post-positivists and Gadamer reach a number of similar conclusions about social science. For both, social science is a human endeavor, undertaken by imperfect beings in cultural contexts, who critically reflect on unexamined assumptions to better understand their situation. Critical reflection both requires and also cultivates certain dispositions, including humility, openness to doubt, and a willingness to accept the possibility that one’s understanding might be wrong. While critical reflective understanding is partial, fallible, and subject to revision, it nonetheless can be more perspicacious and less narrow or distorted than pre-reflective understanding. Engaging in social science for both post-positivists and Gadamer is a way of life that can be personally transformative.

These similarities regarding the practices and aims of social science are significant and tend to be overlooked. They derive from the fact that both post-positivists and Gadamer recognize the centrality of interpretation for human life and hence for social science. But while post-positivists and Gadamer agree that interpretation is central for social science, they nonetheless differ with respect to a central issue. This issue concerns the relationship between critical reflection and method.

Gadamer insists that critical reflection does not arise as a consequence of a social scientist's actions or intentions. Critical reflection rather is a fusion of horizons in which the pre-reflective understandings of both social scientists and those with whom they converse are challenged in ways that neither party can bring about or foresee. The fusion of horizons necessarily varies, depending on the time and place in which a conversation occurs and the particular parties whom it involves. In this respect, critical reflection according to Gadamer remains indebted to the circumstances in which it arises.

Thus for Gadamer, critical reflection does not require a specialized set of practices or methods but instead can and does arise in the course of everyday life. Believing that we need methods to help us reflectively clarify our situation distances us from our lived experience, Gadamer fears. Social science becomes an intellectual exercise, not an experience that *affects* people. In place of honing methodological expertise and skill, Gadamer wants social scientists to focus on their self-understanding, take risks with their conversation partners, and trust that new insight "happens to us over and beyond our wanting and doing" (Gadamer 1975/1989, p. xxvi).

Post-positivists such as Denis Phillips argue, *contra* Gadamer, that method supplies resources for critical reflection, which are not necessarily available to pre-reflective lived understanding. Employing method does not automatically bring about critical reflection or ensure that critical reflection will be correct. This is because method is susceptible to human interpretation and judgment and therefore cannot be reduced to formula or rules that researchers unthinkingly follow. Nevertheless, method can *support* critical reflection by providing guidelines and schema that can extend *beyond* particular research experiences and also across contexts.

In short, Phillips contends that claims about the empirical world must be distinguished from insights into the meaning of lived experience. The latter may implicate self-understanding. The former do not. Openness to being challenged may help social scientists recognize when their conclusions are wrong. But claims about the empirical world can be wrong, *whether or not social scientists acknowledge that their claims are wrong*. Claims about the empirical world can and must be assessed on their own merit, Phillips stresses, irrespective of their origin or the self-awareness of the researcher who produced them.

The difference between Phillips and Gadamer concerning interpretation, method, and critical reflection ultimately may reflect two different worries or fears. Viewing social science through the lens of post-positivist epistemology, Phillips worries about "confirmation bias," the inability to distinguish the conclusions of critical reflection from the pre-reflective beliefs and hopes social scientists

bring to research. Viewing social science through the lens of ontology, Gadamer worries less about the tendency to *conflate* reflective and pre-reflective understanding than about the possibility that social science will *alienate* social scientists from the ordinary life experiences they investigate. Both concerns have merit. It is possible that one concern may be more urgent than the other, depending on the nature of one's research questions, purposes, and circumstances. It also is possible that at any given time, both concerns may be equally salient. Wrestling with both of these possibilities will require educational researchers to continue to think deeply about the questions and challenges that interpretation poses for social science.

Conclusion

Examining the interpretive dimension of social science and educational research illuminates two views of interpretation: epistemological and ontological. While these two views share similarities, they also differ in significant ways and often conflict with each other. Some believe that conflicts between epistemological and ontological interpretation doom educational research to sloppy findings produced by a community in disarray. We take a different view. We argue that appreciating the challenges that interpretation poses for social science can inspire educational researchers to think deeply about profoundly meaningful questions. It also can invite all who are interested in improving education to continually reexamine and reimagine the practices and aims of educational research.

Ethical Problems of Interpretation in Educational Research

Margaret D. LeCompte

Introduction

Ethics are principles that dictate how people should act so as not to be harmful to others. They are enshrined in cultural norms, religious documents, the common law, and codified legal treatises, and they are informed by philosophies that support a variety of rationales for their existence and implementation (Deyhle et al. 1992). All behavior, even the behavior of researchers in the field, is governed to some degree by the ethical principles extant in people's cultures. Researchers now find their behavior increasingly constrained by the codes of their professional "tribe" or culture, which require investigators to act in ways that do as little harm as possible to both the people and animals that they study.

Consideration of ethics in the purposes and conduct of educational research raises a number of questions. Considering the ethical implications of interpretation in research raises other questions. The first category involves how research is done; the second involves the ethical implications of how and what kind of sense researchers make of the research results. This chapter addresses both ethics in the conduct of research and the less familiar topic of ethics in interpretation.

So What Are Research Ethics?

If ethics are principles that dictate how people should act in ways that are not harmful to others, and if ethics also guide how questions of the "good" are addressed and how the benefits and disadvantages accrued in society are earned

and distributed, then in research, ethical considerations concern how such everyday and principled concerns about the “good” translate into research practice. Most typically, ethical concerns have primarily addressed *how* research is done, and what will happen to participants during its conduct, rather than what happens to the data after they are collected, what meaning is assigned to them, how they are used, and what consequences those interpretations have for human beings. In this chapter, ethical concerns about how research is done are roughly divided into *procedural* or formal matters and *everyday* or ordinary (Lambek 2010) matters. In the pages that follow, we first address the differences between formal or procedural and informal or everyday ethics. We also consider whether epistemological differences mandate different approaches to ethics. We then examine the less often addressed issues of what interpretation really means and how it provides a fertile arena for the exploration of ethics. Finally, we explore what some standard concerns about ethics mean in the twenty-first century, as they are redefined when researchers must address concerns of groups, not individuals, in their studies.

Procedural Ethical Matters

Procedural or formal ethics are embodied in formal codes that primarily govern *how* research is done, *by whom*, *for what reasons*, and *what happens* to people as a consequence of their being studied in a research project. They are embodied in institutional rules governing the care of human subjects and the procedures that researchers must follow to assure the beneficent, socially just, and non-oppressive treatment of living subjects of research. For example, existing rules preclude researchers from engaging in research on people who have not consented, or who cannot consent, to participation in the investigation. Researchers cannot engage in research involving deception of research subjects, except where the research both has great social and scientific value, and the research cannot be carried without such deception regarding the actual purpose of the research. Further, participants must not agree to participation in research because they are coerced, either directly or indirectly, such that they hope for a reward for participation, even if it is not promised. Teachers who wish to study their own students, for example, must guard against having students agree to be studied because they believe that not doing so might adversely affect their grades (or the contrary, that participating will benefit their grades). Researchers must inform potential participants of the risks of participating in a study, including risks attendant to the public disclosure of an individual’s identity or private behavior. These rules are enforced by governmental requirements governing researcher conduct carried out by anyone affiliated with an institution that receives federal funds, whether for the specific research project or not. As well, formal ethical principles govern contractual relationships in which researchers engage and what happens to data after they are collected. These contractual relationships involve who can use the data for their own purposes and publication, who gets credit for having implemented and written up the results

of the project, and to whom and how research results can be disseminated. As will be described later, conformity with these codes is monitored by agencies at the federal and local level. Formal, procedural ethical considerations also are embodied in codes of disciplinary practice established by professional associations.

Procedural ethics are of critical concern in the initial stages of developing and getting approval for a study. They also affect every single step of a research process, from the choice of research site, design, and methods, through the personal stance of the researcher and the roles played in the field, to the strategies used for the analysis of data and, ultimately, the way analyzed data are interpreted and disseminated. Procedural ethics also can, as we shall argue, affect how data are interpreted and how those interpretations are used.

Do Different Kinds of Research Require Different Ethical Considerations?

Key questions for the conduct of research include whether or not different kinds of ethics or ethical treatments are mandated for different kinds of research or different research subjects, groups, and sites, the extent to which ethics mandated in research conduct differ from those mandated in everyday life and upon whom or to what ethical considerations must be focused. Framing the question of ethics in the conduct of research as above is a departure from practice in past eras, when the sole ethical responsibility of researchers simply was to conduct high-quality research that generated findings that were credible within disciplinary guidelines and to professional peers. Viewed this way, researchers first and foremost owed ethical allegiance to their discipline, or to science in general. Such a concern foregrounds the overall methodological rigor with which studies were conducted and the integrity of the researcher. Unethical research, then, was research that was poorly conducted or falsified; it compromised the truth value not only of that particular investigation but of science in general.

In the twentieth century, however, the focus of ethic considerations began to shift. While disciplinary *integrity* still was the gold standard for good research, adherence to impeccable disciplinary *practice* no longer provided the sole guideline for ethical research. Rather, the prevention of physical harm to human research participants, rather than simply to disciplinary rigor, began to assume greater and greater importance. Concern for human subjects of research focused initially on medical research and the harm it could do to the living beings upon which experimentation was conducted. From the yellow fever studies of Dr. Walter Reed in the 1900s, in which humans first were asked for their consent to participate in medical research (Pierce and Writer 2005) through the infamous Tuskegee syphilis studies (Jones 1981; Rothman 1982) and Nazi medical experiments, in which the prisoners who were used as research subjects not only did not give their consent but were unwitting or unwilling subjects of horrific experimentation

(Baumslag 2005; Annas 1992; Hagstrom et al. 1969; Haney et al. 1973; Krugman and Ward 1961), to more contemporary studies of nutrition and HIV/AIDS (Levine 1998; Lurie and Wolfe 1997), the rules for conduct of medical research have become more and more stringent as the level of harm that could be inflicted upon human and animal subjects of medical experiments was revealed.

Arising from the Nuremberg Tribunal, the Nuremberg Code of 1947 was the first to establish conditions for the ethical conduct of research involving human subjects, with an emphasis on the absolute requirement that participation in research studies be voluntary. The Declaration of Helsinki (DoH) (World Medical Association 1997), promulgated by the United Nations in 1964, provided not only ethical guidelines for physicians engaged in research but also required that there be independent review of research protocols to assure that the proposals were ethical and consent was given by participants themselves or their legal guardians, in the case of participants who were minor children or mentally incompetent. The International Ethical Guidelines for Biomedical Research Involving Human Subjects reinforced these standards. However, none of these declarations provided any enforcement mechanisms.

As a remedy, in the late 1970s, the United States government created the Commission for the Protection of Human Subjects of Biomedical and Behavioral Research, the first public national body to shape bioethics policy in the USA. Popularly called the Belmont Commission, this group produced the *Belmont Report*, a set of guidelines for the ethical conduct of research on humans. It also created the Office of Human Research Protection, a federal governmental agency to guide and enforce the report's provisions. Belmont Report's guidelines have been written into the United States Code of Federal Regulations (CFR) as Title 45, Part 46 (United States Code of Federal Regulations 2009).

Most researchers are aware of the ethical guidelines outlined in the Belmont Report (<http://ohsr.od.nih.gov/guidelines/belmont.html> 1978). The principles detailed in that report provide a foundation for ethical oversight regarding principles of volunteerism, beneficence, and equity. These have been translated roughly into issues of informed consent of participants, avoidance of unnecessary risk to research participants, protection of the privacy and identity of participants, voluntary participation, the humane and just treatment of participants, and a social justice requirement that no single group should alone reap the benefits or bear the risks of participation in research. Like the concerns of the Nuremberg Tribunal and those underpinning the Declaration of Helsinki, the ethical focus in the Belmont Report echoed that of the medical profession; its understanding of research design, which generally was limited to controlled experiments and randomized clinical trials; and its definition of risk as that of physical harm. Its tenets required that researchers seek to do no harm to research participants beyond the risks experienced in everyday life; where risk was necessary, it should, in all cases, be minimized, and consent to any incurred risk at all, including the mere fact of donating time for participation in a project, must be given by research participants prior to the research experience.

No researcher whose institution receives funding from the United States government is exempt from the Belmont Principles or the oversight of Institutional Review Boards (IRBs) at individual research institutions and universities; these boards approve, oversee, and monitor research practice to assure that human subjects are appropriately and ethically treated, whether the research is carried out in the USA or other countries.

Identifying Risk Issues in Social and Behavioral Research

Because they seldom involved issues of life or death, or even had the potential for causing physical harm, the social sciences and behavioral sciences were not initially defined as involving serious risk. However, and important for educational researchers, many social and behavioral studies ultimately were shown to have great potential for harming their participants. The Milgram experiments (1973) which revealed how subjects could be influenced to engage in harmful treatment to other humans when pressured by an “authority figure” demonstrated that participation in research can be both emotionally and psychologically risky to humans. Humphries’ (1970) study of gay men in public places highlighted the importance of maintaining privacy for research subjects engaged in stigmatized or illegal behavior, and a whole range of other studies made it clear that human beings can incur social, emotional, psychological, financial, legal, or cultural harm from participating in research. Studies of political participation can, for example, reveal which people stand in opposition to dictators and subject participants to punishment; studies of school enrollments can disclose which children are themselves, or have parents who are, undocumented residents subject to deportation. Even studies as apparently benign as those involving children’s activities (Schensul et al. 1996) or teachers’ notions of child development (Deyhle and LeCompte 1994) could stigmatize populations whose exercise patterns or ideas about age-appropriate responsibilities diverge from what is considered mainstream, and therefore acceptable, practice or identify groups engaged in illegal activities such as shoplifting and smoking (Adler and Adler 1998). Thus, the guidelines established by the Belmont Report now are applied to the conduct of social science and behavioral research. Space does not allow full coverage of how the focus for ethics in research practice has expanded and been brought under increasing institutional and governmental surveillance. With IRBs often imposing increasingly stringent requirements for how researchers can obtain consent and interact with participations, including the requirement of very long and often arcane consent forms, researchers have begun to push back against what has been characterized as IRB “mission creep.” Many of the expanded requirements evolved because IRBs are afraid of being audited by the Office of Human Research Protection. Researchers argue, however, that what they are being asked to do unnecessarily complicates the researcher/researched relationship and intimidates potential participants, even those asked to join with benign studies. They also argue that the lengthy descriptions of procedures

and safeguards required use language that is poorly understood by participants. (See http://papers.ssrn.com/sol3/papers.cfm?abstract_id=902995 and <http://qix.sagepub.com/content/13/5/617.short>)

Everyday Ethical Matters

“Everyday” or ordinary ethics involve those principles that address everyday “doing good” in interactions with research participants, audiences for research, and fellow researchers. They are of particular concern for researchers working in natural field settings who need to understand what norms govern everyday good behavior among people in the culture they are studying and who must employ culturally appropriate good manners, social understanding, and empathy for others in order to be successful in their investigations. Field situations create a somewhat artificial residence for ethnographers and qualitative researchers; they live *in* a community and share its everyday life, but they do not intend to be a part *of* it for the long term. Even if they are true participant researchers and hold membership in the community under study, they still have to hold themselves somewhat apart from everyday behavior, even while they live permanently within the community. The state of being in but not of a community has long posed dilemmas for researchers whose work was still informed by positivistic principles mandating neutrality and detachment from research results.

In earlier eras, researchers were admonished to avoid any interactions that could contaminate the “natural” behavior they wished to study. Anthropologists and researchers who engaged in participatory or ethnographic investigations, in particular, struggled with whether or not their involvement and intimacy with participants in the field constituted a violation of positivistic tenets regarding “objectivity.” They struggled to translate “normal” everyday good behavior into the somewhat artificial relationships obtaining in a study site. Emblematic of these struggles, the *Anthropology Newsletter* of the American Anthropological Association has regularly published columns on what could be called everyday ethical dilemmas. The *Newsletter* covered topics such as how deep a researcher’s friendship with participants could go without compromising the authenticity of behavior observed or the validity of the researcher’s interpretation of that behavior. Questions raised included such issues as: Could researchers date their informants, fall in love with them, or even have sex with them without compromising their work? Could they become public advocates for the community they studied? Or did doing so compromise their “neutrality”? Would their close relationships affect how objective their interpretations and observations would be? Other issues had to do with compensating informants, such as whether or not providing needed medicines to

participants who could otherwise not obtain them was a violation of principles of “objectivity.” At what point did reciprocity—exchange of goods and services for access to information—become fee for service or bribery? Would providing an antibiotic ointment to parents in the field site whose child suffered from trachoma violate the tenet that a certain distance be maintained between participant and researcher? What about paying school fees so that an informant’s child could attend school? Or helping participants pay school fees for their children by organizing friends in the USA to purchase the participants’ handicrafts? Was it ethical to pay for information? If so, how much should be paid? Was it ethical to use information that had in some way been bought? Were data obtained through purchase or bribery less likely to be accurate? Were they less likely to be interpreted accurately?

Because of their long-term residence in the field and the often informal contexts in which they interact with participants, participatory researchers have access to much private information about their informants. As devoted listeners and skillful interlocutors, they often become confidantes of participants and privy to “secrets” that ordinary friends would not have. Does an ethnographer studying school reform really need to know that one of the district principals was suspected of having a mental illness? Or that a particular family used illicit drugs? What if that family were the source of allegations of sexual abuse by a teacher? What should a researcher do upon learning that a trusted informant on linguistic issues was suffering the ill effects of an unsafe abortion or in love with a person with whom contact was taboo in their society? How does such information relate to or affect the outcomes for the study in question?

These are relatively ordinary requests and situations, the kind that occur in everyday life. They acquire their ethical profundity only when they are seen as disturbing a nearly neutral stance of the researcher towards the participants as people—a positivistic stance we hold is impossible to maintain—or when the requests involve commitments that researchers find unable to honor. Such a case arose for Ariana Mangual Figueroa (2014) at the end of her 2-year study of an undocumented Mexican family living illegally in the USA. Fearing deportation and consequent separation from their three children, all of whom were US citizens because they had been born in the USA, the parents asked Ariana if she would sign a *carta de responsabilidad*, a document stating that she would assume care and legal guardianship for the children were the parents deported. Although she recognized that this request was a sign of the deep trust the parents had in her, Ariana reluctantly decided that she could not sign such a document. Several weeks before she left her field site, she explained to the parents that she was about to graduate, had obtained a new job that would require her to move to the other side of the country, and was about to be married and begin her own family. Given those factors, she felt she could not take on the possibility—however remote—of also raising the three children in her host family. The mother and father looked disappointed but did not reproach her, and the subject did not arise again (2014). However, the parents’ request, and her refusal to accede to it, has remained distressing to Mangual Figueroa. It is unlikely that a quantitative researcher, or one who engages in experimental research, would develop relationships with

informants as close as those Manual Figueroa developed with her host family. However, such situations did not infrequently arise in the course of any study involving long-term ethnographic research. Other than a decision *not* to complete, or not to publish the results of, a study because doing so would anger, embarrass, or endanger informants, these are among the most difficult ethical dilemmas faced by investigators.

This author faced just such a dilemma after completing a number of years of fieldwork, investigating attempts at school reform in a school district serving an American Indian reservation. The focus of the study had been why many tribal communities which had developed their own teaching methods and curricula, ones that were responsive to their particular language and culture, so easily abandoned their own efforts when confronted by mainstream and whitestream demands for comprehensive school reform (Aguilera 2003). LeCompte argued that tribal communities were so accustomed to having their own efforts deprecated by whites that they lacked the self-confidence—and funding—to withstand pressure to abandon their native language instruction and instructional content in favor of a Eurocentric, English-only approach. The school district LeCompte was studying had spent 5 years working on a language and culture approach, but then dropped it overnight for an approach called “The Modern Red School House.” Developed by E. D. Hirsch and promoted by the Hudson Institute, a conservative think tank, the Modern Red School House is a Comprehensive School Reform Model that emphasizes high achievement and a core curriculum (www.mrsh.org). She had intended to point out that the disparity of esteem between whites and Native Americans impeded effective school reforms more generally, but learned that her research would be taken as highly critical of Native Americans [not at all her intent] after a confrontation with two Native Americans who were visitors at a professional conference where she described the research. While neither of the two individuals came from the community LeCompte had studied [they were, in fact, school bus drivers who worked in an adjacent community and were pursuing college degrees near the conference venue], they felt that LeCompte’s conclusions were racist because they implied that all Native Americans suffered from low self-esteem. They particularly objected to LeCompte’s use of the metaphor, “circling the wagons”—a term which she used to describe how resistant mainstream educators were to indigenous efforts to support their own culture. Aware that other indigenous people might have concluded similarly, LeCompte dropped the metaphor, and she ultimately abandoned the idea of publishing her findings because the topic was too controversial and likely to be viewed as a negative critique of individuals who still worked in the school district under investigation—people who did not deserve such treatment (LeCompte 1993a, b).

Conventionally, all of the above-described concerns have been framed as one-way interactions, in which the researcher has the power to decide how to respond. Thus, power flows *from* the researcher *to* those being studied in ways that perpetuate the asymmetry between researcher and researched, no matter how much researchers might try to articulate the concerns of participants or downplay

the authorial voice of the researcher. While such top-down interaction still characterizes the relationships described in research methods texts and the practices of Institutional Review Boards, they do not fully address the dynamics of current collaborative participatory research, many kinds of action research, or research that is approved and monitored by groups from the participant communities themselves. While the kinds of personal relationships developed through long-term fieldwork—as described above—still can arise, problematic power asymmetries are less likely to exist. However, reducing power asymmetries does not eliminate the difficulties of achieving a coherent [read: single] interpretation of data when different stakeholders view the world differently (Gibson 1985).

Research Quality as an Ethical Consideration

It always has been true that doing ethical research requires, first and foremost, doing competent research, regardless of whether research is informed by disciplines in the physical or socio-behavioral sciences, or in more applied and multidisciplinary fields of study such as education, community studies, and public health and the environment. Leaving aside research whose investigators deliberately falsified data or faked their conclusions, doing sloppy research is unethical because, even seen in the best light, it wastes the time of those investigated. At its worst, sloppy research can lead to false conclusions or baseless interpretations which, if acted upon, could do harm to the populations studied. Further, the conclusions of poorly conducted research do nothing to advance knowledge or solve practical problems. In fact, poorly designed research or research that is conducted by an unskilled investigator can itself be considered a risk factor for human participants if the design proposed will not answer the research question or if the researcher is too unskilled or too little knowledgeable about the topic or culture to carry out the study adequately. In addition, it is not ethical to ask people to participate in research that is unlikely to generate anything useful, and it also is unethical to so overwork a participant population that they may be unwilling to participate in other, more valuable, studies. Thus, it is an ethical imperative that researchers know how to do what they propose to do, that they demonstrate familiarity with literature in the field and previous studies, and that they have a well-reasoned rationale for their study, one that either promises to advance knowledge or provide practical solutions to human problems. This imperative holds, regardless of the type or topic of the research proposed.

It is important to state here that no specific kind of research inherently poses greater or fewer ethical challenges than others. The crucial issue is that whatever the type or topic, research projects should adhere closely to best practices dictated by the discipline that informs them. Notwithstanding, conventional wisdom often posits that some kinds of research lead to more ethical problems than others. We next address and dismiss this concern.

Ethics and Epistemology: Do Some Kinds of Research Face Greater Ethical Challenges than Others?

It is certainly true that qualitative researchers usually have considerably more social contact than quantitative researchers with the people they study and, as a consequence, have more opportunities to run afoul of social situations with ethical valence. These are the types of situations that raise issues of everyday ethics. Qualitative researchers also experience increased face-to-face exposure to the personalities and culture of research participants, exposure that is likely to help them develop greater sensitivity to culture than quantitative researchers and therefore to be more attuned to certain ethical issues. That said, there is no inherent difference between the two kinds of research with regard to difficulties in adhering to ethical standards.

A better way of thinking about the real differences in research types and their designs may be to consider the nature of the data they use. Quantitative research generates “hard” or easily measurable numeric data because it is concerned with directly observable phenomena: how many of what kinds of units do how many things, or how many units possess what degree of a specific characteristic. Qualitative data, by contrast, are considered to be “softer,” in that they are concerned with phenomena that can only be measured indirectly. The presence or absence of such phenomena can only be identified by assessing their *impact* on empirically observable phenomena, which requires defining them in such a way that their manifestations can be observed. Observing its manifestations, rather than a phenomenon itself, can lead to accusations that the investigations lack rigor or that they are “soft.” Do the indicators chosen to represent a phenomenon actually measure them? Does the fact that researchers invent indirect measures for a phenomenon raise questions about researcher subjectivity? What if the researcher simply lacks knowledge of how phenomena might be made manifest? While this hard/soft distinction between types of data is indeed an accurate portrayal of data characteristics and whether they are based on direct or indirect measurement, the hard/soft distinction does not constitute a real dichotomy with regard to fundamental differences in research designs. This is because *all* quantitative research begins with qualitative evidence that has been transformed into numeric information (LeCompte and Schensul 2010; Schensul, J et al. 2013; Schensul and LeCompte 2013) or numbers that do not reflect “real” quantities. For example, Likert scales generate data that resemble numbers, but they actually represent *ranges of qualities*, not real quantities. Similarly, math, science, and language test scores look like the most quantitative of data, but they are based upon qualities and degrees of understanding, not real measurements of a fixed quantity. So-called quantitative measures still are based upon specific understandings and interpretations held by researchers as to what exists, what is worth studying, and how it might be operationalized and rendered observable.

Who Consents? Individuals? Groups? Or Communities?

One area in which a greater sensitivity to culture can make some researchers more attuned to ethical dilemmas is in the area of “consent.” Increasingly, researchers are asked to consider the ethical implications of their work for whole communities. And in some cases, for example, in field-based substance abuse or violence research, the research ethics section of a proposal describes the risks and protections for study staff as well as community residents and the community as a whole. Below we discuss the variety of permissions that might be required for the approval of the procedures to be followed; we then examine how these consent procedures do not match very well with cultures built upon collective will and communal consent.

Conventional Practice for Procedural Ethics

Researchers generally are required to obtain a variety of formal permissions before entering the field. The more stakeholders involved in a study, the more complicated this process can be. Both students and experienced researchers will need the approval of Institutional Review Boards (IRBs) or Institutional Ethics Committees (IECs). IRBs are bodies associated with universities and research organizations that review proposals for human subjects and research ethics concerns. *It is usually not the responsibility of IRBs to comment on the scientific merit of the proposal*—unless the project is so poorly designed as to be harmful to potential participants; rather, the task of IRBs is to review all aspects of the study from the perspective of *protecting human subjects from harm*.

IRBs are especially concerned with the parts of proposals related to sampling and recruitment, types and intrusiveness of data collection procedures, how accurately the researcher represents the study to potential participants, and the measures taken to assure the security of data and the privacy of personal information collected from those studied. They also review and approve interview schedules, both open ended and closed ended, and other protocols for collecting elicitation and geographic data, material culture, and local archival data. IRBs always review the written consent forms and oral consent scripts to be used with individual respondents or study participants in order to ensure that participant participation is voluntary, not coerced, and that participants can comprehend the purposes of the study and what researchers plan to do with and to them. In joint or collaborative projects, IRBs in each of the partner institutions will usually want to review the study independently. Some Institutional Review Boards or Institutional Ethics Committees have more rigorous and detailed requirements than others, especially those in medical schools or clinical settings that typically review clinical trial or treatment protocols. These reviews can take time, often weeks and even months, to be completed, especially if more than one review committee is involved. Without IRB or IEC approvals, data collection in the field cannot begin.

Researchers may have to obtain formal permissions other than those granted by their own IRBs or IECs. Most school districts and hospitals have their own IRBs; seeking to carry out research within their facilities will require approval by these bodies. Many Native American or First Nations groups in the USA and Canada have their own procedures for reviewing studies, formal collaboration and cost sharing, and ethical review. Cross-institutional collaborations generally involve contracts or formal documents granting permission to work together, to collect data in the institution, and to comply with institutional requirements. International work may require a substantive review of a study at the national level and permission granted through the applicant country's embassy before a project will be funded. Obtaining these formal permissions requires good contacts and relationships both at the governmental and community level and can take a long time to complete. Researchers should start early to build their relationships, identify and obtain the necessary approvals, and prepare and submit their studies for ethics review by the proper bodies. It is not unheard of that a researcher may have to wait beyond the period for which a study was funded to obtain all approvals required for the initiation of the project—a situation to be avoided at all costs. Discussions with other researchers who have worked in a setting or country as well as project funders while in the development phase of a project can help to avoid such problems.

Consent Beyond the Individual: “Traditional” Versus “Modern” Notions of Consent

Procedures enforced by all of the above-described agencies are built on the idea that the consenting unit whose privacy, safety, and agency must be protected is a single individual—or that individual's guardian, where the potential participant is deemed unable to grant consent by virtue of age, disability, or custodial status. Most of our “ethical” guidelines are “self-centering,” imbued with concerns for the primacy of individual free will, privacy rights, and agency that conform to Western philosophical traditions. Because concerns over ethical treatment of human subjects arose originally from medical and experimental research procedures, these concerns are understandable; such research attends primarily to individual differences among groups with varying degrees of susceptibility, pathology, or response to treatment. The *Belmont Report*, which informs the procedures followed by Institutional Review Boards (IRBs), also was modeled on the concept of individual agency and consent. Thus, the definition of consent and how it is granted and acted upon is based on the participation, consent, protection, and treatment of an *individual* subject or participant. However, most social and behavioral scientists study *groups*, and initial consent from and protection of privacy for an individual frequently does not protect the privacy, safety, and agency of groups whom those individuals represent. Though the unit studied in most research is an individual, research *results* are reported in terms of the characteristics of the *groups* from which individual subjects are selected, not merely the individuals themselves. Further, interpretive

research focuses on the culture, behavior, and beliefs of groups, not single individuals, and the consequences of the research could accrue to the entire group under study, not just its individual members. In addition, differences between the above-described Western concepts of individuality and those of other cultures mean that the former concepts often do not have the same power for many cultural groups that they do with Western researchers. Often no single person is empowered to speak for or give consent on behalf of a group. The literature is replete with examples in which government officials, researchers, or social service agencies obtained consent from someone who purported to have the authority to speak on behalf of a group and who in fact represented only certain interests, or even only themselves. Further, the results of research can have profound and stigmatizing impact on whole groups, even though those studied were individuals.

A rather notorious case involved a study of diabetes among the Hualapai tribe of Native Americans, a group living in extreme isolation in the Grand Canyon of Arizona. The Hualapai, whose people had very high rates of diabetes, had developed considerable trust with the researchers and their anthropologist intermediaries and gave them access to a very wide range of sensitive information, including DNA samples and life histories of social, behavioral, and dietary practices as well as measures of social dysfunction and mental illness. Only the issue of diabetes was to be addressed by the researchers. Unfortunately, the laboratory that ran the assays of DNA material sold the data to other researchers outside of the study, without consent of the original researchers or the Hualapai. The Hualapai sued the university sponsoring the research, the researchers, the IRB at the university, and everyone involved over violations of the rules of consent and promises of confidentiality. The original researchers from the University of Northern Arizona ultimately were exonerated when the source of the violations turned out to be the contracted laboratory. But the damage already had been done. An entire people had been stigmatized, since research on a few Hualapai was generalized, whether legitimately or not, to all Hualapai.

The Hualapai case raises issues concerning how, and even if it is possible, to obtain consent, act responsibly, and represent a group accurately and appropriately. At one level, researchers face the issue of gatekeepers and decision makers. Who within the community has the power to grant access to a population, under what conditions, and for what purposes? Is it a single individual? Or do different individuals have responsibilities for different aspects of community life? Have decisions been delegated to a particular body, such as a community ethics board or research access agency? Or are decisions made collectively, by the entire community *en banque*? Can the researchers' own notions of what constitutes a gatekeeper or even consent serve as guides for interacting with cultural groups of which researchers are not a part? To what extent can researchers be sure that other parties involved in a study, however peripherally, will adhere to the same ethical standards as the principal investigator and his or her team? Researchers working with First Nations groups in Canada have been pioneers in exploring and addressing how to conduct research in such circumstances (see Noe et al. 2006; Trimble and Fisher 2006).

These issues become especially relevant when groups are demographically heterogeneous or divided in their opinions about the course of action to take with

regard to participation in a research project. In many cases, divided opinion may, in fact, represent serious cleavages within the community over whether or how to adhere to traditional practice or embrace change. Some groups, especially among indigenous people, increasingly are establishing their own controls over access to their communities, controls based on understandings of their own needs and culture; these include IRB-like bodies of their own from which researchers are required to obtain clearance prior to beginning a study. However, even these bodies may not represent all constituencies in a community. How to proceed in such circumstances raises both practical and ethical considerations.

Some of the practical considerations include whether or not to proceed at all with a project that uses only those members of the group who have given consent—if, indeed, issues of access under such conditions can be overcome. Having a few uncooperative or unwilling community members might not create design or validity problems. However, if those few represent all of a particular sector, or if they are particularly powerful individuals, risks to the study are both practical and methodological. Obviously, the lack of cooperation from a large proportion of a community, or of a powerful segment of whatever size, is problematic. Such a practice runs the risk of generating results that only represent a particular sector of the population and also of having the non-consenting individuals choose to sabotage further actions in the project through persuading others in the community of the evil or non-beneficent intentions of the researcher.

Aside from practical ones, ethical considerations involve whether or not to do the study at all if significant objection to it is expressed by potential participants. In these cases, it is not possible to simply plan a top-down research project and impose it on a community, no matter how worthwhile it might seem to be. In fact, no kind of participatory research at all can be undertaken with and among the unwilling. However, skilled participatory researchers may be able to learn enough about the culture and its dynamics, as well as to devote sufficient time to develop rapport and trust within the community, that a project eventually can be implemented. While this slower but more certain way of proceeding is not how many Western-trained researchers are accustomed to operate, contemporary cultural dynamics now dictate increased parity between researchers and the researched. This means that researchers increasingly are required to privilege the sensibilities of community participants over their own customary practices and scientific or academic needs.

Interpretation of Research

What Is Interpretation?

Interpretation means going beyond “just the facts” of the data, whether quantitative or qualitative. By themselves, data that have been analyzed but left

uninterpreted are mere results. Alone, they have very little meaning. The mere fact that a particular community was divided in how it explained a series of disasters occurring in its school district is not very meaningful. Neither is the fact that different stakeholders' experience of and perspectives regarding "what happened" during particular educational reforms vary widely. This would be expected, given stakeholders' different points of view, ways of articulating with the reforms, and particular vested interests. In a sense, such results often only explicate the obvious. To go beyond the obvious, researchers must respond to the questions: "So what?" and "Why is this important?" and "What do these findings mean for future actions?"

Researchers "go beyond" results by explaining them to a variety of readers using various levels of theory. The process begins with the conceptual framework that initially informed the study and its research questions; it may include additional concepts and theories that were not anticipated at the beginning of the study, but emerge as crucial as data collection and analysis proceed. It then links findings to existing literature and paradigmatic understandings. The first level of interpretation consists of local theory, or concrete explanations of specific events given by local people and participants. Higher-level, middle-range, or substantive theories step away from the local scene and explain events in terms of the wider community and the discipline informing the study. The third, or paradigmatic, level examines the findings in terms of what the social sciences generally say when comparing studies in similar situations that generated similar results. This requires examination of prior literature as well as theory. As the explanations they generate go from the local and concrete to more abstract and generalizable, studies become more and more capable of altering or modifying existing understandings and even generating new theoretical explanations. In this way, knowledge is advanced.

Another way of looking at interpretation involves researcher stance. For positivists, the three levels of theory outlined above are sufficient as a guide to interpretation. Their primary allegiance is to science and their own discipline's notions of rigor and validity and also to ideas of individual rights and the assumed equality between researchers and participants (D'Andrade 1995). As we have discussed, such a position is congruent with Western notions of the primacy of the individual and the "self-centering" of the researcher's perspective on the field. Interpretive and critical researchers, by contrast, owe greater allegiance to solidarity with the community under study, issues of justice, and responsibility for improving the conditions in which research participants live (Scheper-Hughes 1995). Such a stance recognizes the power that having knowledge of other people gives to researchers and argues that researchers have a primary responsibility to those "others" in all aspects of their investigation. These differing stances have profound impact on how interpretation is viewed and used. Before we go beyond the epistemological differences described above, however, we should discuss the degree to which interpretation is recognized as required in all, or only part, of the research process.

Interpretation in Research Design

All of the data researchers collect are themselves essentially interpretations of events, either because they are filtered through the experiences, memories, aspirations, and agendas of informants as they are recounted to investigators or because they are filtered through the experiences, memories, aspirations, and agendas of the researchers themselves. Further, researchers interpret their results by assigning meanings to whatever data are generated by a study, and at their best, they do so for a variety of audiences. Given the foregoing, we hold that *all research is interpretive*, if only because researchers act on interpretations of phenomena to determine what they will find intriguing to study. Nevertheless, some kinds of research rely more on researcher judgment than others. For example, historical research is inherently interpretive, given the nature of the data historians rely upon. These include primary sources (like diaries, letters, newspapers, and other contemporary accounts of events) for which researchers must provide an initial layer of interpretation; to the extent that the research uses secondary sources that already have been analyzed and interpreted by a different researcher, a second level of interpretation is added. Usually, these resources are all historians have to work with as regards data. Historians then impose yet a third layer of interpretation—their own understanding of what makes sense as well as that of their discipline—on the data they do have. In some regards, these layers of interpretation parallel the stages of theory building just enumerated: from local explanations to middle-range or substantive theory and from there to paradigmatic and discipline-based explanations. The story historians tell, then, is a fabric of their weaving, embroidered upon the work of previous investigators and linked to theories extant in their discipline. Reality, or what “really happened,” is no more and no less than the scholar’s interpretation of a documentary composite and his or her account of how it makes sense; except in oral histories, rarely are living participants available to provide a direct “I was there!” account of events.

Other research designs explicitly seek out as data what are seen as the understandings and experiences of contemporary people. Such research, which collects the interpretations of participants in the events, can be characterized as interpretive, depending on the degree to which the research results foreground the interpretations or meaning makings of research participants. Interpretive research designs, including ethnography, clinical psychology, and field sociology, rely on face-to-face interviews, notes of observations in human settings, and other modalities that produce data that are in close temporal proximity to the event being studied. Drawing on Max Weber’s (1949, 1968) concept of *verstehen* or intersubjective understanding (Ryles 1949) and drawing from the hermeneutic tradition of Wilhelm Dilthey, such research has been called “interpretive” because its focus is on eliciting the particular world view and understandings of participants, rather than relying only on what researchers thought they saw and understood. Weber’s notion of *verstehen* required researchers to hold their own sense making, values, and personal reactions in abeyance until they could “stand in the shoes” or “get into

the head” of the particular informants. This is because what the researcher observed had little valid meaning without being connected to what local people thought and did. However, once a portrayal of the participants’ world view had been constructed, researchers could then step back into their own discipline and tell their story. The point of the fieldwork, then, was to elicit information that would bring readers into touch with the lives of strangers and make them familiar to outsiders (Geertz 1973, p. 16).

Unfortunately, what the “story” to be told is not always straightforward or obvious. Ethnographers often struggle with how best to portray a combination of their own or disciplinary understandings—often referred to as *etic* perspectives—and the stories told and understandings held by informants, referred to as an *emic* perspective, when the two sets of understandings and explanations are in conflict. An example of this kind of dilemma was faced by this researcher while studying and working with communities on the Navajo Nation in the southwestern USA.

The Pinnacle school district had experienced a number of disasters: the roof on the brand-new gym leaked and ruined the very expensive basketball floor—a key issue in a community in which basketball was a very important sport. A teacher had tried to commit suicide by jumping off the roof of one of the school buildings. A well-respected and very popular student had died in car accident. And rumors swirled about pedophilia and drug use among teachers. Why these misfortunes occurred was explained differently by two constituencies in the communities. Most of the Anglo administrators and staff members in the school district felt that the explanations—and hence, the solutions to the problems—were issues of contractor incompetence, mental instability on the part of the teachers, inexperience on the part of the teenaged driver, and a group of disaffected and very traditional parents initiating rumors. These explanations were based on rational, scientific, and technical insights such as those which initially were held by this researcher and which constituted an *etic* understanding. By contrast, the Navajo teachers, staff members, and key components in the community felt that all of the seemingly unconnected adverse events could be attributed to an underlying factor: a lack of harmony, or *hozho*, in the community. Balance in the universe had been deranged because taboos had been violated and important cultural norms transgressed—an *emic* explanation rooted in local cultural understandings. Only a traditional Blessing Way ceremony would restore the balance of harmony in the community and end the string of disasters. The two communities resolved the conflict in cultural explanations by implementing two sets of solutions. The technical rational response from the administration included instituting better screening for contractor competence and a program of more closely scrutinizing potential teachers for mental health problems and potential instability. Anti-drinking campaigns for students also were initiated, and discussions were held with parents to better understand what some of their concerns about relationships between teachers and students were. By contrast, the more traditional Navajos in the community organized a week-long Blessing Way ceremony, and the superintendent of schools, a Navajo, represented the district by volunteering to be the “patient” whose disconnection with the universe needed to be restored in the ceremony. The researchers ended up by telling both stories

(LeCompte and McLaughlin 1994) as an illustration of the complexities involved in figuring out “what’s going on” during fieldwork. However, they were not called upon to come up with a single solution to the problems, as often is the case.

The problem which the example above highlights is, “Which story should be foregrounded?” Such a question poses considerable difficulty for positivists, who long held that some kind of underlying truth is present in all phenomena; the task of researchers simply was to uncover that truth and to get the story “right.” This meant transforming the “other” into something that is the “same” as, or at least familiar to, the “self” of the researcher—erasing differences, in a sense. However, interpretive research often involves studying groups, and groups rarely are homogeneous with regard to opinions, values, or perspectives, as the example above demonstrates. Interpretive researchers more and more frequently find that what the field “says” to them consists of a cacophony of stories that disagree with and contest each other, depending upon the vantage points, experiences, and positionality of both participants and researchers. No collective and uniform story from the field exists; thus no one story really is “right.” The task of interpretation is greatly complicated by the fact that all communities subsume multiple truths and multiple realities, including that of the researcher. Which one should be reported? Whose sense of reality is privileged over another?

In the Pinnacle community, the conflict in explanations troubled the researcher more than the community, which implemented two solutions, thus according equal importance to both traditional and bureaucratic rational explanations. Such an approach is increasingly realistic in a world where multiple, powerful, and competing realities require more delicate treatment than a simple declaration of winners and losers.

Epistemological Considerations: Emic and Etic Approaches

Anthropology has long addressed some parts of these questions—as the community in Pinnacle did—by recognizing the legitimacy of insider–outsider, or emic/etic positions. Emic, or insider, perspectives are those embedded in the culture and experiences of the people studied; they constitute what “makes sense” in their local setting. Etic, or outsider, perspectives are those applied to the community being studied by researchers or others external to the community. Insider–outsider or emic/etic positions affect what story is told, to whom, and for which purposes. Given the heterogeneity of groups and communities, and the contested nature of many phenomena in which interpretive researchers are interested, issues of validity arise regarding the fit between what researchers find and understand (the etic) and the research participants’ own experiences and understandings (the emic). Interpretations based on the cultural frames and understandings of the participants only (the emic perspective) can be internally consistent and perfectly logical, but in direct contradiction to the cultural frames and understandings of wider cultural, political, or legal communities (the etic perspective) in which the “little

community” (Redfield 1956) is embedded—and which therefore is externally invalid. Thus, interpretation has come to involve more than simply finding or generating a theory which seems to fit with or explain what happened in the site from the researcher’s perspective; rather, questions now focus on whose story should be foregrounded and how. These problems are particularly acute when the language and/or culture of the researcher differ substantially from that of the researched. This lack of congruity can morph into ethical issues when the political, legal, or cultural consequences of the story or stories told for the participants are considered. Polygamy among Mormons, homeschooling among evangelical Christians, initiation rituals involving scarification and circumcision among African tribes, migration across national boundaries in search of better economic circumstances, wearing of headscarves by Muslim female students, the limited schooling permitted by Amish communities for their children, and the granting of “personhood” to rivers and mountains by indigenous groups (or, for that matter, the granting of personhood to corporations in the USA, as was advocated by one of the candidates in the 2012 US presidential election) all can be explained in terms of their practical and survival value for a specific people, a culture or its beliefs. Most have been declared illegal by the “larger community” for reasons of conflict with the culture, economics, religion, or politics of dominant groups in society. Thus, interpretations always have consequences for the people being studied; the political economics and power asymmetries within a community affect which set of reasons or interpretations should prevail. If communities are isolated, these practices may be able to survive without interference. However, to the extent that they overlap with more powerful communities, such practices can be outlawed in the interests of the “greater good” of the mainstream—as is the case when bodies of water held sacred by indigenous groups are polluted and destroyed by mining corporations because they contain gold. Clearly, those interpretations with the greatest power behind them are more likely to be accepted. However, other interpretations which represent emerging constituencies or power groups can pose a threat to existing power relationships, especially insofar as they threaten the values and structure of privilege in the larger community. In these cases, prevailing regimes can make their adherents into scapegoats to deflect criticism—as is the case when religious or cultural minorities are held responsible for social unrest. Looking at the differences in these interpretations often can help to identify serious cleavages in the society and, as well, areas in which researchers could identify the greatest weakness in the prevailing regime.

Good Interpretation

Contemporary researchers, then, face a serious question: what, then, makes an interpretation “good?” As we have pointed out, in the not-too-distant past, researchers could posit that good interpretation served to discover some single foundational and fixed meaning underpinning data or textual evidence. Such a single and fixed meaning could not be identified in the Pinnacle community.

As is increasingly the case, particularly in the social sciences, interpretation resides in more pragmatic, temporally bounded, polyvocal, and dynamic presentations. What *is* now is conceived of as dynamic, often contextual, and even more frequently multiple. Meaning making is the province of all stakeholders in an investigation, from researchers to participants to users of findings. More common than the search for a single interpretation is the question whether an interpretation is, “Good for whom or good for what?” For funding agencies? For the discipline? For the applied field in question—education, for example? For the people studied? For which sectors among the people studied? For the individual researcher’s career? The criteria for determining the answers to such questions, naturally, are themselves subject to different understandings.

Criteria for Goodness

So far in this work we have suggested that good interpretations involve:

- (a) Being true to the data
- (b) Providing a coherent interpretation
- (c) Remaining true to, or respecting, the subjects’ view of things, at least insofar as member checks are done to assure the validity of the researcher’s interpretation
- (d) Articulating the views of the multiple voices in the field setting and being fair in representing emic, etic, and other versions of what happened
- (e) In action or collaborative research, *privileging* participant perspectives
- (f) In collaborative and participatory action research, empowering participants to become researchers of their own communities and contexts

However, regardless of the researcher’s epistemological stance, at one level, criteria for assessing the quality of interpretation rest with definitions of good research in general. Good interpretation is linked closely to and supported by evidence. It is based on clear and plausible argumentation. It makes sense at the local level (emic) and to external constituencies (the etic level). It is supported by theoretical understandings from the disciplines, or grounded logically in data from the field, or both. It considers all points of view. It advances understanding of the specific phenomenon under study, and in some cases, it “does good” by promoting or improving educational processes and human institutions. It also takes into consideration the different cultural conditions and contexts in which the study was embedded. And, as will be discussed later, it also depends on the degree to which ethical principles are considered in the consequences that could emanate from turning interpretations into policies and applying them in practice.

Handling the Task of Recounting Multiple Realities

Whether they like it or not, and regardless of the ethics involved in arrogating the voice of others, researchers always find themselves in a position of asymmetrical power vis-à-vis the community they study. *They* tell the story. And in so doing, they create a reality for the participants vis-à-vis the outside world that can speak more powerfully and for longer periods than anything participants can articulate. Weber's suggestion that researchers "bracket" their own persona and moral concerns, separating them from an objective consideration of and portrayal of events, is insufficient. It also is insufficient to simply "step in" and then "step out" of participants' lives and perspectives, as Weber's notion of *verstehen* suggests doing. Even if they are "studying up" to elite groups or people with more structural power than their own, the stories, in the end, still are created by the researcher, whose interpretation—however elaborate—stands as the last word. No matter how much research participants contribute to a story, *what* researchers study, and the data they collect always are filtered in such a way as to create at least an implicit narrative, and their recounting of that narrative creates the final portrayal of the community—at least until contradicted or modified by subsequent research.

The Researcher, the Self, and the "Other"

In earlier eras, that the researcher created the story to be told was not problematic; it was, in fact, the researcher's primary task. However, critical and postmodern researchers now ask researchers to take sides. They argue that it is unethical and arrogant to speak for a community that is not one's own, and that doing so silences the voices of true community participants (Said 1979, 1994; Spivak 1988). This raises the problem of the "self" and the "other" and is called the essentially colonizing force that is constituted by defining a research site as a field for study and then imposing on the site and its inhabitants a new structure or a set of definitions deriving from the researchers' disciplinary concepts and logics. Clearly this is a direct assault on the "etic" approach itself. Rather than taking the site as it is named by and exists in the minds and lives of participants, the colonizing aspects of fieldwork remap a territory that ethnographers in large part already have drawn up, based on the frameworks of their discipline (Abu-Lughod 1991, p. 37). It is this redefinition of participant reality that critical researchers find to be an arrogation of control over participants' voice. Citing the work of the philosopher Emmanuel Levinas (1981) and Benson and Lewis O'Neill (2007) also suggest that the "other," defined as "outside of [normal] being," often is so singular, so apart from mainstream experience that it stands alone. It cannot be synthesized, summarized, and made equivalent to the understandings or world views of outsiders. How to portray the outside-of-normal [Western researchers'] experience? How to explain the unintelligible and the seemingly irrational? These questions frame the struggles

that researchers have over “story” and “legitimacy” in a postmodern intellectual world that remains uneasy with the use of raw power and force to resolve differences in perspective, behavior, belief, and status. These questions require that researchers struggle to engage in an ethical redress of balance in the field by doing more than simply developing intersubjective understanding (Ryles 1949; Weber 1949, 1968) with participants, writing up their results, and then leaving.

Contemporary postmodern researchers call for disciplined and critical self-reflection—at least. They also require incurring a new kind of risk—that of letting the “other” touch researchers in ways that changes them. Rather than mere intersubjective understanding, what is required is engagement, care, and openness to being marked by the other’s knowledge and experience. Scheper-Hughes (1995) suggests that such a stance makes the researcher accountable, responsible for, and answerable to the “other” in ways that are prior to any other allegiance. Further, to adopt a stance of neutrality or so-called objectivity is to mark oneself as sovereign, closed off to what matters to and that, in turn, brings death of the imagination and of the ability to care.

Perhaps most unsettling is that being “marked by the other” involves more than a commitment to help communities solve overwhelming social problems. It also requires researchers to include participants in ways that render incomplete researchers’ control over the direction and conclusions of the research. This can be both irritating and emotionally risky, since it forces researchers into critical reflection on the cultural, moral, ideological, and even methodological assumptions guiding their work and on the consequences of its findings. However, actively maintaining openness to being touched by the “other” can lead to better research, because it permits researchers to entertain competing explanations and models, to take seriously what others might consider to be “folk theories,” and to explore alternative epistemologies.

Who to Foreground

One tactic researchers have used to resolve at least part of the power asymmetry has been to eliminate the researcher’s own story altogether in the write-up. By refusing to provide an interpretation, investigators try to let the data “speak for themselves.” The problem is that no data speak for themselves, if only because they have been collected in selective ways that reflect, however unconsciously, the researchers’ own filters. Further, as simple “results,” unanalyzed data mean very little. They are simply the raw materials with which researchers work, using filters from their discipline, experience, feedback from their field, and cultural notions of common sense (Geertz 1973) to determine what is important and what sense can be made of the data. All researchers base what they produce on what they believe audiences will understand and be able to use; these beliefs are, at their heart, simply interpretations of particular perspectives, presented in and for specific contexts.

Further, eschewing interpretation not only is virtually impossible to achieve in any kind of study—some would even say that it represents an abdication of responsibility (Geertz 1989/1990); it also abandons readers to determine the meaning of the story by themselves, deprives them of insights the researcher might have contributed, and makes it impossible to interrogate researcher biases and omissions that might have influenced the story. While not exactly arguing for the primacy of the researcher’s story, Geertz (1989/1990) holds that omitting a carefully argued interpretation by the investigator simply creates poor scholarship.

Other postmodern investigators have tried to establish parity among the “voices” in the field (Lather and Smithies 1997; Bloom 2003; Foley 1994, 1995; LeCompte and McLaughlin 1994) by creating co-constructed or “bi-vocal” and “multivocal” texts that present everybody’s story. These efforts can be effective in presenting multiple versions or interpretations of a story, and they have resulted in creative, dialogical texts, but they do not always tell a coherent story, or, and perhaps more importantly, provide guidance for problem solving, policy formation, or advances in theoretical understanding.

Since all kinds of policy decisions can be made on the basis of their interpretations, researchers have an ethical imperative to make sure that their interpretations are as fair and humanely put as possible. Only the integrity of the researcher in exposing his or her own biases and those of the data sources can protect research from bias, and hence from running the risk of being unethical because it is of poor quality.

When the Field Talks Back

Ethnographers once could be fairly confident that whatever they wrote about a community would remain primarily within the scholarly community. Most of the people whom they studied never would read what they wrote. However, the individuals and communities ethnographers study increasingly are literate, well-connected and educated. Sometimes, they can even write and publish their own accounts of a project, ones that contradicts that of the researcher (Medicine 2001; Gibson 1985). Community leaders, educational administrators, and target populations—all participants in research ventures—also are increasingly politicized (Brosted et al. 1985; Whyte 1991; Greaves 1994; Manderson et al. 1998, LeCompte et al. 1999; LeCompte and Schensul 2015; Schensul and LeCompte 2015). They have learned that they have the right to question, and that research, if conducted properly, can work to their advantage. They also have something to say about how best to carry out aspects of the research since they know their constituents better than the researchers do. The Internet offers to communities from one end of the globe to the other the power of instant communication and access to information never before available. Further, many local communities have had unfortunate interactions with researchers and their projects and are well aware of the adverse consequences that might ensue from participating in a research project.

This history not only might make participants reluctant to become part of a research study, but it also might make the researcher wary of trying to “speak for” or “as if they were members of” a community being studied.

Consequences of Interpretation

This chapter has summarized some of the issues involved in adhering to ethical principles in the *conduct* of research. Beyond the fieldwork phases of research, however, are further ethical issues involving how the *interpretation* of research results will later affect participants. Interpretations of research can have good consequences for some and not for others. In these cases, one must return to philosophy—does one adhere to the principle of the greatest good for the greatest number? Or to compensatory logics that argue for the greatest good going to those who have suffered most? Or those most capable of wresting it from others? Is there some notion of “fairness” or equity that should apply? Should local notions of how good should be apportioned be paramount? Or do mainstream notions of the good prevail? With the Belmont Principle of beneficence in mind, we call for a great deal of cultural historical sensitivity and a certain degree of clairvoyance among researchers with regard to future impacts of their work on the people they study.

Further, while qualitative researchers might originally have more difficulty working through ethical issues in everyday interaction with participants simply because they *do* interact with them daily and over long periods of time, no researchers, no matter what their particular epistemological bent is, are exempt from considering the ethical consequences of their interpretations. Because all research is a human enterprise, all research effectively is interpretive. We hold, therefore, that ethical considerations regarding interpretation apply equally to every research modality and any purpose for which research is put. Every step of any research project is informed by the interpretations researchers make about what is worth studying, how studies should be carried out, and how their results should be understood and applied. Thus, no meaningful distinction can be made between how ethics are handled in qualitative or interpretive, and quantitative or positivistic, research. Although researchers may approach the resolution of ethical problems differently, the fundamental issues faced are similar, regardless of the approach taken. All researchers formulate guiding questions or hypotheses, collect data, and transform it into evidence in support, or for the development, of propositions. Further, all researchers must first generate sets of meaning for their data at the local level, then seek to explain what consequences the propositions might have for middle-range or substantive theory within a discipline, and finally integrate these understandings and consequences into existing paradigmatic and theoretical understandings within science as a whole. All of these steps involve interpretation of what is important to study, how it might best be studied, what theories are most meaningfully applied, and what significance the results actually have. All of these questions can be answered only through the value system and sets of cultural

and personal meanings informing the researcher's work, whether that work is considered to be "qualitative" and "interpretive" or "quantitative" and "logico-deductive" (Sherman and Webb 1988).

Researchers must be cognizant that their research results can both positively and adversely affect the entire people being studied, far beyond the consequences of a study for any given individual. These consequences require special care by researchers with regard to which story is being told, about whom, to whom, and why. We have noted that important concepts to be considered include researcher positionality, conflicts between insider and outsider perspectives, levels of power within a community and between it and the outside world, and questions about the agendas extant in agencies that support and fund research. Fundamentally, the ethical imperative of all interpretation returns to the Belmont Principle of beneficence. This requires researchers to consider the consequences of their research for all levels of human organization and human beings. As we have argued in this chapter, interpretation of research results is an integral part of the research process, and as such, what the research results *mean*, or their interpretation, therefore is not exempt from the ethical test of consequence.

Reflection

This review has shown that ethics enters into the research process in a number of different ways. Some are more conventional: in the responsible conduct of research, researchers must not falsify data or plagiarize; in the responsible treatment of research subjects, risk no harm to subjects which has not been anticipated and to which participants have not consented; remember to respect privacy and confidentiality of participants; and do not claim as valid interpretations which participants have not first vetted. Also conventional, but more pertaining to everyday interaction with participants, researchers are ethically bound to interact fairly and decently with other human beings, in accordance not only with the values of the researcher but also with the norms and practices of the community under study.

Less conventional are more postmodern concerns, which require researchers to reflect whether, in the processes of interpretation, the obligation laid upon researchers is to try to get their interpretations "right" or, if that isn't possible, to adhere to their responsibility to respect and represent a range of interpretations. And most important in the view of these authors is that researchers have an ethical responsibility to be aware of the effects of research and the uses to which research might be used—particularly within the culture where the study was carried out.

In this review, I have resisted the suggestion that some sorts of research face especially difficult or intrinsic kinds of research problems. But I have tried to highlight examples of how researchers who have a greater sensitivity to cultural issues (as, e.g., ethnographers do) are more likely not only to be attuned to certain ethical issues but also to be more able to come to valid conclusions about what actually happened and, further, to suggest ways in which the multiplicity of

descriptions and explanations can serve not to obfuscate in a polyphony of voices but to aid in a more nuanced presentation of the reality in which participants live.

In this text, I hope to have highlighted a range of cultural considerations that ought to be of concern to all kinds of researchers, especially those concerned with the meaning and processes of interpretation—even those who do not think they actually are studying “culture.” The key point of this work is to argue that all research is interpretive, and in this sense, all researchers must be aware of, and interrogate, what they are doing when they interpret data. Most important is that those interpretations have profound consequences for the people in whose histories, values, norms, and behaviors they are embedded. Those consequences are, in fact, the principal focus for ethical considerations in the interpretation of research results.

“A Demand for Philosophy”: Interpretation, Educational Research, and Transformative Practice

Michael A. Peters

it is men [sic] who change circumstances, and . . . the educator himself needs educating.

—Karl Marx

Marx and Heidegger

In *Theses on Feuerbach* written in the spring of 1845 and the outline of the first chapter of *The German Ideology*, Marx famously writes: “The philosophers have only interpreted the world, in various ways; the point is to change it.”¹ He begins by bemoaning the chief defect of all forms of materialism to date: that it is conceived objectively as an idea rather than subjectively, as a sensuous human practice, which is the basis for Marx of practical–critical activity. This is in effect the contemporary basis of what we today might call social practice theory, including such varieties as action research. We can get a clearer idea of what is involved when we read the second thesis where Marx writes:

The question whether objective truth can be attributed to human thinking is not a question of theory but is a practical question. Man must prove the truth—i.e. the reality and power, the this-sidedness of his thinking in practice. The dispute over the reality or non-reality of thinking that is isolated from practice is a purely *scholastic* question.

I want to highlight the impact on *transformative social change* rather than *revolution*. For Marx, as he indicates throughout *Theses on Feuerbach* and as he says directly in VIII, “All social life is essentially practical,” and from the viewpoint of the new materialism, the standpoint is “social humanity.”

The touchstone for Marx is, of course, the concept of labor, broadly considered as the means of self-realization and creative self-development. In Marx's anthropology the concept of labor prefigures the human body as the source of social life. Thus, Marx "does not explain practice from the idea but explains the formation of ideas from material practice" (1947, p. 58). The materialist view of history that Marx embraces holds that "social being" determines consciousness: as he writes "Life is not determined by consciousness, but consciousness by life" (1947, p. 47) or "it is not the consciousness of men that determines their being, but on the contrary, their social being that determines their consciousness" (1963, p. 182). Yet as he says in *The Eighteenth Brumaire*: "Men make their history, but they do not make it just as they please; they do not make it under circumstances chosen by themselves, but under circumstances directly encountered, given and transmitted from the past" (1968, p. 97).

Now, the famous Eleventh Thesis, "The philosophers have only interpreted the world, in various ways; the point is to change it," has bedeviled philosophy ever since and caused a rift between philosophy, on the one hand, as those merely involved in "interpretation" and "practice" or "self-transformative" practice as Marx terms it, on the other. In other words, this statement seemingly consigns philosophy to interpretation that has little to do with transformative practice. For educational philosophers and for educational theorists, this is a bad rap because on Marx's view it limits philosophy to works of interpretation. For educational researchers more generally, it poses the challenge of how research influences, and improves, the world of educational policy and practice.

Famously, Heidegger, *the* philosopher of interpretation, argues for two distinct styles of hermeneutics. He went on German television in 1969 to rebut Marx's claim, arguing that philosophy is essential in any "concept" of sociopolitical change, including, of course, Marx's own concept of a classless society.² When asked by Richard Wisser, "Do you think philosophy has a social mission?" Heidegger replied:

No! One can't speak of a social mission in that sense! To answer that question, we must first ask: "What is society?" We have to consider that today's society is only modern subjectivity made absolute. A philosophy that has overcome a position of subjectivity therefore has to say no in the matter.

He continued:

Another question is to what extent we can speak of a change of society at all. The question of the demand for world change leads us back to Karl Marx's frequently quoted statement from his Theses on Feuerbach. I would like to quote it exactly and read out loud: "Philosophers have only interpreted the world differently; what matters is to change it." When this statement is cited and when it is followed, it is overlooked that *changing the world presupposes a change in the conception of the world. A conception of the world can only be won by adequately interpreting the world.* (My italics)

That means: Marx's demand for a "change" is based upon on a very definite interpretation of the world, and therefore this statement is proved to be without foundation. It gives

² <http://www.youtube.com/watch?v=jQsQQqa0UVc> Uploaded on Jan 26, 2007.

the impression that it speaks decisively against philosophy, whereas the second half of the statement presupposes, unspoken, a demand for philosophy.

In a clear sense *Theses on Feuerbach*, which was written in exile—Marx was deported from France in February 1845 to find sanctuary in Belgium—is the first flowering of Marx’s concept of *historical materialism*, posed as a critique of the *contemplative* materialism of the Young Hegelians, including Feuerbach. It would become the basis of Marx’s new philosophy elaborated in *The German Ideology*, which was published for the first time in 1932, and its Eleventh Thesis is engraved on his epitaph at Highgate Cemetery in London.

In Marx’s broader critique of Hegel, he is often interpreted as instituting a break between theoretical philosophy and political or practice philosophy. Against Hegel’s idealism and his view of world history, Marx, according to Engels, turned “the dialectic of Hegel . . . upside down, or rather it was placed upon its feet instead of on its head,”³ emphasizing again the centrality of material conditions and only ideas, and argued that humankind has the capacity to determine history through their collective actions. The pursuit of Reason is not to be found in the objective unfolding of history and in “the spirit of the age,” as Hegel thought, but in the philosophy of action, practice, and the possibility of change.

This idea is particularly important to strands of education that adopt a Marxist position or are committed to social transformation through collective action. But what does it mean for more ordinary educational research and praxis and for the bases for action-oriented research in education more generally? In what sense can action-oriented philosophy encompass a view of interpretation that does not sublimate the importance of practice and practical reason to the importance of theory, or regard interpretation merely as a theoretical exercise divorced from practical politics?

Marxism is often taken to be a philosophy of *praxis* and understood as “critical theory” in the sense that validity in philosophy is seen in how philosophy is manifested in practice. But the significance of these issues is certainly not limited to Marxists, and the origins of a concern with praxis go long before Marx. In Aristotle there are three kinds of knowledge: *theoria*, directed toward truth; *poiesis*, oriented to production; and *praxis*, to which the end was action. Aristotle also made a distinction between *eupraxia* (good praxis) and *dyspraxia* (bad praxis).

The Turn to Practice

A number of philosophers have criticized the emphasis on contemplation as opposed to action in the Western tradition: Karl Marx, Hannah Arendt, John Dewey, Martin Heidegger, Ludwig Wittgenstein, and Paulo Freire all argue for the priority of practice and practical reason over theory or theoretical reason as the

³ Engels, Feuerbach: The Roots of Socialist Philosophy (Chas. H. Kerr & Co., Chicago, 1908) 96.

basis of everyday life; this axiom is also tied more broadly to conceptions of politics, citizenship, and participatory democracy as demonstrations of human freedom.

Praxis is also explicitly appealed to by educators to describe the iterative process of experiential learning and, sometimes, lifelong learning or workplace learning. It also contains, as with Marx, the idea that authentic social practice is also linked with transformation—transformation of the individual, via learning, and transformation of the society toward reform and improvement. Freire, for example, defines praxis in *Pedagogy of the Oppressed* as “reflection and action upon the world in order to transform it” (p. 33).

The problem is that the notion of *practice* often appears as an unanalyzed “given” in educational research and theory. It is seen as the bedrock of educational activities that are often taken as self-evident. This fetishizes “practice”: the presuppositions of the term are not examined critically or clarified, and rarely is it acknowledged that “theories of practice” not only shape what we accept as “true” and “normal” but also implicitly constitute a set of political and ethical choices. In educational research and theory, the term “practice” threatens to become part of a new orthodoxy, prioritizing the practical over the theoretical in policy, in programs of teacher education, and elsewhere. In short, the emphasis on “the practical” constitutes its own framework for the interpretation and evaluation of educational research.

The concept of *practices* is, perhaps, the neglected underlying concept that signals elements that frame educational research as it has developed the so-called new pedagogy. The notion of educational practices includes an emphasis on cultural construction and postempiricist theory (if I can use this abbreviation) that describes the new constellation of studies in educational research as they have developed over the postwar period and especially since the 1970s. The term first reflects the central importance of “culture”—the importance of “cultures” in the plural (e.g. learning and knowledge cultures, evidence-based cultures, organizational cultures) and of “cultures” in the anthropological and sociological literatures that talk of indigenous cultures or identify elements of “cultures” in relation to youth. The term also implies a central focus on “the practitioner” and practitioner knowledge, for example, as it has been theorized in the “reflective practitioner” dating from the work of Donald Schön (1987, 1995) and Chris Argyris (1999).

This use is carried over to the so-called communities of practice (e.g., Wenger 1998), part of a burgeoning literature together with associated notions like “situated learning” (Lave and Wenger 1991). In relation to both these developments—the “cultural turn” and the reflective practitioner—the term “practice” has been used to signal the priority of the practical over the theoretical in educational research, theory, and institutional activities. This means, among other things, that educational activities are viewed primarily as practical engagements-with-others-in-the-world; and it sometimes is taken to imply that learning and teaching are fundamentally social activities, “doings,” or performances without “inner” processes.

The stress on practices also accords with and partially explains the currency of the now taken-for-granted distinction between Mode 1 and Mode 2 knowledge first proposed by Gibbons et al. (1994) with its emphasis on applied knowledge and

“contexts of use.” Gibbons and his colleague writing on “the new production of knowledge” focus on “context-driven research which is problem focussed and multidisciplinary as opposed to scientific research pursued for its own sake” (Mode 1). By contrast, Mode 2 knowledge is generated by multidisciplinary teams that work on specific problems in the real world, knowledge that is more applied, more practical, more self-consciously contextual.

Less obviously, perhaps, these overlapping tendencies in philosophy and theory that have infiltrated education tend to focus on the increasing importance of an understanding of the *body* to education, not just the emotions or embodied knowledges or rationalities but the body itself as a formation of self and sociopolitical order. Finally, the emphasis on practices also highlights *pragmatics* in general, in both linguistic and cognitive theory (i.e., practices as pragmatically grounded). These theoretical tendencies derive from a largely unexamined shift in philosophy and social theory to focus on *practices* as the underlying concept of cultures and communities, which coordinates sociopolitical order and structures social reality. As a framework for interpretation, it tends to generate a series of questions posed within and against educational research: questions such as, “What difference does this research make?” “Whose interests are advanced by this research?” “How will this research improve the conditions of learning?” and, in the extreme, “What works?”

The practice can also be framed in relation to the combined influence of a group of contemporary theorists such as Bourdieu, Foucault, and Derrida, as well as the American phenomenologically oriented thinkers such as Schön and Argyris and others like Max van Manen. For them, in various ways, theories of practice are embedded in the priority of practical engagement with the world, a view which assumes a materialist social ontology and a view of language as practice based. This broad view has a broad resonance with the account of practical reason in Aristotle’s *Nicomachean Ethics* (Book VI) that talks of *phronesis* as the ability to use the intellect practically. Practical reason is to be distinguished from theoretical reason in that the former is directed to a practical and especially a moral outcome and results in an action rather than a proposition or new belief. Yet all of these proceed from different sources of interpretation or interpretive activity that theorize practice in quite different ways, as the table below summarizes (Fig. 1):

Practice as <i>phronesis</i> or practical judgment (Aristotle)
Practice as <i>praxis</i> (Marx, later Freire)
Practice as <i>problem solving</i> (Dewey)
Practice as <i>lived experience</i> (Heidegger, Berger, & Luckmann)
Practice as <i>lebensformen</i> (forms of life) (Wittgenstein, Winch)
Practice as <i>habitus</i> (Bourdieu)
Practice as <i>reflection in action</i> (Schön & Argyris)

Fig. 1 Theories of practice

In the introduction to a collection entitled *The Practice Turn in Contemporary Theory*, it indicates that the adoption of the term *practice* in contemporary theory expresses a desire to move away from dualistic ways of thinking. He characterizes the philosophical work of Ludwig Wittgenstein, as well as Hubert Dreyfus and Charles Taylor (both heavily influenced by Heidegger) as attempting to overcome the object/subject dualism and to “highlight non-propositional knowledge and illuminate the conditions of intelligibility” (p. 1). Talk of practices for sociologists such as Pierre Bourdieu and Anthony Giddens and the ethnomethodologists, he had advised us, is a way of avoiding the dualism of action and structure as well as the determinism of objectified social structures and systems. In the hands of “cultural theorists” like Michel Foucault and Jean-Francois Lyotard, Schatzki maintains that *practices* provide a means for theorizing language as a discursive activity, in contrast to structuralist and semiotic notions of language as a structure or system.

This brings the discussion back to interpretation, language, meaning, and interpretation *as* a practice. Certainly if we view the emergence of meta-textual commentary in relation to the history of Abrahamic religions in the west, then we get an impression of the idea of interpretation as a cultural practice that emerged with the development of writing and the culture of the text, including the interpretation of biblical texts. Social scientific studies of science that picture science also as a meaning-making activity (in the work, for instance, of Andrew Pickering and Joseph Rouse) use the notion of practices to counter representational accounts of science and to challenge “humanist dichotomies between human and nonhuman entities” (p. 1). Here interpretation is highlighted *as* a practice, and the concept and presumed context of practice becomes a framework for the interpretation of data and other concepts.

Interpretation is also practical and historical practices lie at its foundation. In particular, we might hypothesize that the important move here was the move away from the assumptions of literalism, a fundamentalist ideology that insisted on an evangelical hermeneutical approach to scripture based on historical–grammatical analysis that secures the—“revealed”—meaning of the text. This fundamentalist view of interpretation can be contrasted with other hermeneutical approaches that view interpretation as a historical and cultural practice that emerged and grew up with the invention of writing and the development of meta-commentary, including bibliographical conventions. Anthony Garton’s (1999) *The Footnote: A Curious History* provides an excellent example. He demonstrates how the lowly footnote, along with marginalia, took hold during the nineteenth century not simply through the work of the German historian Leopold von Ranke but also through more diverse and ancient origins in speculative treatises by the likes of Athanasius Kircher, Pierre Bayle, and Edward Gibbon, who created philosophical and literary approaches to history.

Clearly, then, there has been a major paradigm shift in contemporary thought linked to theorizations of practice. While there is, as Schatzki (2001) claims, “no unified practice approach” (p. 2), most theorists identify practices as fields of human activity defined as the skills or “tacit knowledges” or presuppositions that underlie activities. And while most theorists focus on *human* activities, there is a

significant posthumanist trend especially in science and technology studies that wants to construe practices as involving an interface with machines and scientific instruments. As Schatzki (2001, p. 2) contends:

most practice theorists would agree that activity is embodied and that nexuses of practices are mediated by artefacts, hybrids and natural objects, disagreements reign about the nature of embodiment, the pertinence of thematizing it when analyzing practices, the sorts of entities that mediate activity, and whether these entities are relevant to practices than mere intermediaries among humans.

Forms of human activity are anchored in accounts of the body, and typically theorists will maintain that “bodies and activities are “constituted” within practices” (p. 2). In so doing practice theorists tend to adopt a materialist social ontology that emphasizes the way human activity depends on shared skills or understandings, which is typically viewed as embodied. The fundamental philosophical claim asserts the priority of practical engagement and understanding of the world over forms of theoretical contemplation, understanding, or speculation. The priority of practical engagement and understanding, in turn, follows from an emphasis on the body and on knowledge, rationality, and understanding, which takes place through the acquisition of shared embodied know-how.

If actions are embedded in practices and individuals are constituted within practices, then practice theory pits itself against contemporary theoretical approaches that privilege the individual, language as a signifying system, the life world, and the role of institutions, structures, or systems in defining the social. In practice theory these phenomena can only be correctly elucidated and analyzed through the field of what Schatzki defines as “the total nexus of interconnected human practices” (p. 2). Schatzki also addresses the problem of social order in terms of practices but raises the question of what orders the field of practices itself.

As Harrison Hall (1993, p. 128) notes, “The practical world is the one that we inhabit first, before philosophizing or engaging in scientific investigation” and “The world in the traditional sense can be understood as derivative from the practical world.” Heidegger’s emphasis on the priority of the relational context of practical activity is also mounted as a critique of traditional Cartesian ontology which pictures the world as comprising subjects as minds whose mental representations (ideas) attempt to capture an independent (material) reality. Philosophy and science on this view are concerned with ways of guaranteeing the accuracy of our representations. We can only avoid the problem of knowledge (skepticism) and the problem of value (how things have value) by avoiding traditional Cartesian metaphysics that wants to privilege the thinking subject (Hall 1993, p. 129). In particular, Heidegger questions the claim made by Plato that moral knowledge must be explicit and disinterested. As Hubert Dreyfus (1993, pp. 293–4) summarizes it:

Heidegger questions both the possibility and the desirability of making our everyday understanding totally explicit. He introduces the idea that the shared everyday skills, concerns, and practices into which we are socialized provide the conditions necessary for people to make sense of the world and of their lives. All intelligibility presupposes something that cannot be fully articulated – a kind of knowing-how rather than a knowing-that. At the deepest level such knowing is embodied in out social skills rather

than our concepts, beliefs, and values. Heidegger argues that our cultural practices can direct our activities and make our lives meaningful only insofar as they are and stay unarticulated background practices. As Heidegger puts it in a later work, “The Origin of the Work of Art,” “Every decision . . . bases itself on something not mastered, something concealed, confusing; else it would never be a decision.”

Wittgenstein too came to accept in his later work that philosophy, like language, was, as Rorty (1993, p. 344) expresses the point, “just a set of indefinitely expandable social practices.” Rorty (1993, pp. 347–8) goes on to make the comparison between Heidegger and Wittgenstein explicit:

Early Heidegger and late Wittgenstein set aside the assumption (common to their respective predecessors, Husserl and Frege) that social practice – and in particular the use of language – can receive a noncausal, specifically philosophical explanation in terms of conditions of possibility. More generally, both set aside the assumption that philosophy, might explain the unhidden on the basis of the hidden, and might explain availability and relationality on the basis of something intrinsically unavailable and unrelational.

David Bloor (2001) explains that rationalism is the philosophical tradition that accords priority to theory over practice and conservatism is the tradition sometimes referred to that accords practice priority over theory. I prefer Bloor’s alternative descriptions—Enlightenment and Romantic—for the reason that not all accounts of the priority of practice are conservative (witness, for instance, the accounts by Bourdieu and Foucault). As Bloor indicates, rule following would seem to be a paradigm case of rationalism, yet for Wittgenstein rule following is a practice and its normative aspect derives from the consensus between different rule followers which can be understood only in naturalistic terms as facts about our “natural history.”

Returning to the theme of interpretation and the significance of the preceding discussion for practice, we need to address ourselves philosophically to the notion of background social practices against which other things make sense. For example, one argument would be how the demands of “practice” often constitute constraints on the possibilities of interpretation or provide a kind of criterion for “good” interpretations both in educational research and of educational research. These background practices are themselves the basis for competing views *of* practices, as we explore next.

Dreyfus and Five Competing Views of Practices

Following the American phenomenological philosopher Hubert Dreyfus, it is possible to identify five competing views of practice and the extent to which they are unified or dispersed and integrated or disseminatory. The outline of these five approaches sets up a rich set of connections between theories of practice and the ethical and political commitments they embody. Perhaps, what is required in the interpretation of educational research, theory, and practice, above all, is a different account of *practices*.

The following five points are taken from an essay by David Stern, drawing in turn from a lecture given by Dreyfus at the NEH Summer Institute on Practices on July 24, 1997, under the title “Conclusion: How background practices and skills work to ground norms and intelligibility: the ethico-political implications”:

Stability (drawing from Wittgenstein, Bourdieu). Here practices are relatively stable and resist change. Change may be initiated by innovators or be the result of “drift,” but there is no inherent tendency in the practices for this to happen. The consequent is either a conservative acceptance of the status quo or revolutionary prescription of change.

Articulation (drawing from Hegel, Merleau-Ponty). Here the practices have a *telos* of clarity and coherence and become increasingly more refined as our skills develop. This leads to political progressivism and Whiggish history, albeit with the recognition that the path to progress will not always lead in that direction.

Appropriative gathering, Ereignis (drawing from Dreyfus’s own reading of later Heidegger). When practices run into anomalies, we make an originating leap, drawing on marginal or neighboring practices and so revising our cultural style. This supports those who can best bring about such change within a liberal democratic society, such as entrepreneurs, political associations, charismatic leaders, and cultural figures.

Dissemination, difference (drawing from Derrida). Here there are many equally appropriate ways of acting, and each new situation calls for a leap in the dark. The consequence is a sensitivity to difference, to loosen the hold of past norms on present and future action, and to become aware of the leaps we make rather than covering them up with Whiggish history.

Problematization (drawing from Foucault). Here practices develop in such a way that contradictory actions are felt to be appropriate. Attempts to fix these problems lead to further resistance. This leads to a hyperactive pessimism: showing the contingency of what appears to be necessary and engaging in resistance to established order.

Building upon these distinctions, we may, therefore, begin to distinguish between at least seven broad theoretical approaches to the interpretation of educational practices (Fig. 2).

The central question is to determine whether and the extent to which these different accounts necessarily overlap in their definition of practice or share similar assumptions. Each entails ethical, political, and epistemological elements that are based in turn on implicit or explicit philosophical assumptions. These assumptions need to be brought forth and scrutinized: the notion of “practice” is in no way primary or *sui generis*. In education the term “practice” is used in many different contexts that leave these assumptions unquestioned—professional practice, educational practices, and the like. The sense of practice elaborated here, which focuses on preferred ways of acting, tacit knowledge, presuppositions, traditions, and so forth, differs from the traditional meaning of practice as “the practical” or as merely “applied theory” and requires a more active process of interpretation that emphasizes “the demand for philosophy.”

- | |
|---|
| <ol style="list-style-type: none"> 1. Phenomenological (Wittgenstein, Heidegger, Dreyfus): practices as noncognitive, nonconceptual, and prelinguistic 2. Marxist (Bourdieu and Passeron): practice as telic or praxical 3. Positivist: practice as “practical” or “applied theory” 4. Cognitive: practice as “reflection in action” (Schön) 5. Ethical (Aristotle, Kant): practice as practical judgment or engagement 6. Deweyan pragmatism: practice as problem solving 7. Poststructuralist: practice as problematization (Foucault) or difference (Derrida) |

Fig. 2 An interpretation of educational practices

To conclude with the theme of interpretation in educational research, each of these seven theoretical approaches would yield distinct views of the nature and role of interpretation in educational research, how it proceeds, *and what it is for*. These differences highlight the ethical and political choices that are evident in the work of various researchers writing in this handbook. These competing views of practice also provide a way of clarifying and distinguishing how different kinds of interpretation enter at every stage of the educational research process: in the practices of problem definition, the literature survey, the choice and treatment of research subjects, the selection of appropriate methods for collecting data, the analysis of results, and the identification of appropriate modes of representing the research (genres of writing, visual representations, and so on)—and even choices about the venues in which that research should be published, presented, and taught.

To paraphrase Richard Rorty, it’s interpretation all the way down.

Genre 1 Narrative Approaches

Introduction

Marilyn Johnston-Parsons and Michael F. Watts

Both narratives and narrative research engage with the construction of meaning through the organization and interpretation of experience—whether the experience of individuals, communities, or countries. Narratives help us make sense of the world and communicate our understanding of it. Bruner (Bruner 1986; Connelly and Clandinin 1990) suggests that the power of narrative is to render “the exceptional and the unusual into comprehensible form” (p. 47); Connelly and Clandinin (1990) claim that people tell stories because they “lead storied lives” (p. 2). Narrative is the form by which we think of ourselves and others; we generate stories as a way of constructing our lives.

Researchers use narrative methods to address questions where individual experience within particular social and historical contexts is of interest. Ancient in format and importance, narrative inquiry was for a time overwhelmed by positivist requirements for “objectivity” and “reliability.” It has reemerged in the last few decades in the context of what some have called the “narrative turn” (Czarniawska 2004; Polkinghorne 1988), as reflectivity and social phenomena gained researchers’ interest. Goodson and Gill (2011) describe this as “a new wave of philosophical discussion of the relationships between self, others, community, social, political and historical dynamics” (p. 18).

Narrative research is highly interpretive. It may include interviews, published narratives, documents, and other contextually important data, but is always more than just the stories. Gathering narrative data from individuals or groups requires

more than recounting a story someone tells someone else. It is rather a co-construction of the narrative situated within a particular social dynamic; it is an interpretive task that reveals as much about the researcher as the storyteller. Uninterpreted narratives offer little to our understanding of contexts or issues. Interpreted through contextualized retellings, they gain power; they become stories about social, ethical, and political issues and reveal multiple, and even conflicting, perspectives. They connect the personal to the social and invest it with authority. They “give shape and expression to what would otherwise be untold about ‘our lives’” (Greene 1988, p. x). We learn from this what we could not have known from other research methods; we can address the question of “why” things happen, go wrong, or are oppressive.

The retelling can take different forms. Johnston-Parsons and Wihlborg provide examples of collaborative and dialogic narrative inquiry and Shuman of conversational narrative. They highlight the need to articulate the personal and communal perspectives on the world(s) from which the stories are constructed, if individual experiences are to inform pedagogic processes and learning. Stories are co-constructed in light of a dialogue between storyteller and researcher; sometimes stories are combined and compared, and joint understandings emerge from their interaction, as Wihlborg’s collective biography writing using poststructuralist discourse practices, Johnston-Parsons use of dialogue as inquiry, or Shuman’s conversational narratives. Harnessed as research tools, such methods lend immediacy to the sharing of experience and connect the reader—and even the policy maker—with what is being researched. The intimacy they generate makes them a persuasive and powerful methodology.

Interpretive retelling of stories gives life to them, revealing the variability, complexity, and multi-perspectival nature of social life. It makes answers to the question “why?” accessible and exposes layers of complexity that might otherwise be overwhelmed by the desire for straightforward accounts and simplistic responses.

Ethical Power of Reinterpretation

The power of reinterpreted narratives can be seen in the way they can challenge orthodox interpretations. They often question the ethical assumptions inherent in research methods that claim to be an objective account of someone else’s experience. In these chapters, for instance, they reveal the everyday cultural prejudices that disenfranchise street children in Indonesia (Dewayani) and teachers in Tanzania (Tao). They give voice to faculty members silenced by institutional hierarchies (Asgedom and Ridley), or young people seeking to enter universities in the UK (Watts). The power of such narratives imposes an ethical imperative on their use in research, as Juzwik highlights in her work on the rhetoric employed when teaching students about the Holocaust.

Interpreting narrative accounts requires a relation between researcher and participant that contrasts with the more objective stance of quantitative research methods. Close relations raise complex ethical questions about informed consent, the power to make decisions about interpretations, and the competing objectives researchers and participants may bring to a research project. Josselson (1995) explains it this way:

Narrative research consists of obtaining and then reflecting on people's lived experience and, unlike objectifying and aggregating forms of research, is inherently a relationship endeavour. Every aspect of the work is touched by the ethics of the research relationship. (Quoted in Goodson and Gill 2011, p. 29)

Rules for ethical behavior in narrative research must be co-constructed as the research unfolds, meaning as the relationships develop. Context and power relations between researchers and participants often raise ethical issues. Asgedom and Ridley, Dewayani, and Tao address research in places that, to paraphrase Neville Chamberlain, are far away and about whose people we know little. Our interpretations are likely to be dominated by simplistic conceptions of deficiency and dependence, which may make interventions ineffective (complicated by the fact that all three countries—Ethiopia, Indonesia, and Tanzania—receive significant financial support from the international community). Narratives from far away places, or from the silenced spaces in more local contexts, have the power to expose underlying issues. “Detailed studies of individuals’ lives . . . allow stories to function as political responses, broadcasting ‘voices’ that are excluded from or neglected within dominant political structures and processes” (Goodson and Gill 2011, p. 20), as in Watts’ life history account of social and political structures related to student access to Oxbridge universities. Contextualized and interpreted stories thus have the power to inform, reveal, critique, and/or extend the social discourse, and concurrently they raise complex ethical issues that must be addressed collaboratively, in the midst of doing the research.

Interpretation and Credibility

Narrative is highly interpretive, intensely personal, profoundly ethical, and deeply embedded in a social context. If the power of narrative inquiry is to question and interpretations are to be harnessed for research purposes, it will need to be rigorous enough to withstand the scrutiny of its detractors, including those with a vested interest in maintaining the status quo. Researchers must examine their methods, interpretations, and analytic frameworks to situate the stories that are told. To be rigorous is different from being objective; credibility here is established by careful methods, analytic precision, reflectivity, and theoretical framing of contexts and interpretations.

Narratives have the potential to shape educational policies and practices and to support or critique current practice. The chapters by Juzwik and Watts offer

concrete examples of the difference that narrative research can make to offer a critique: Work by Watts has informed the access policies and practices of some UK universities, and Juzwik's research encourages a more cautious use of rhetoric in US classrooms. If this work has made only small differences (we do not want to overstate them), it points to the potential power of narrative. Perhaps, then, the biggest difference these research projects have made—individually and collectively—is to highlight the significance of narrative research. These projects also demonstrate ways that rich interpretations of narratives can illuminate disenfranchised groups and issues of ethical importance.

Chapter Summaries

Amare Asgedom and Barbara Ridley consider the theme of educational organization and leadership through a study of Addis Ababa University in three distinct phases of Ethiopia's recent history: feudalism, socialism, and democratic federalism. The focus of the study lends itself to the use of historical narratives, and they consider a major interpretative problem for such research: Our understanding of the past is influenced by more recent events. They address this by looking at the significance of contemporary archival materials to examine the uneasy relationship between the university and the state. That uneasiness has been framed by highly charged political environments, and they pay particular attention to the importance of confidentiality when considering personal stories in the construction of historical narratives.

Sophie Dewayani employs counter-narratives to explore nonformal education in Indonesia. Stories collected from street children and their families are used to develop a meta-narrative about their lives and their negotiation of dominant discourses about them. Such discourses typically frame the construction of their identities, allowing them to be written out of what is often taken for granted, including formal education. The counter-narrative approach to this research interprets and reinterprets issues of power and representation in Indonesian society and is examined here as a means of learning to locate the self within in-between spaces of escaping the "here" and "there" that is the dualistic categorization implicitly imposed upon underserved urban communities and commonly reproduced by the media.

Mary Juzwik's chapter focuses on the teaching of a Holocaust unit in a US middle-school classroom. She addresses the theme of curriculum through the rhetorical analysis of narrative. She argues that the rhetorical analysis of everyday classroom narratives can not only reveal the aesthetic and poetic shaping of course subject matter but also the profound moral socialization that may occur as teachers tell stories to their students. Here, the rhetorical analysis enables engagement with the persuasive and the identifying functions of language in use. It is used to illuminate

and address a multidimensional and complex interpretation of the ethical problems raised by teacher narratives about a morally weighty past.

The teacher–student relationship is characterized by dialogue, but because it is such a commonplace practice, it can be easily overlooked as a process meriting close interpretation. In the spirit of dialogue as an iterative process of construction and interpretation between teacher and student, *Marilyn Johnston-Parsons*' chapter is coauthored with four of her doctoral students to explore collaborative narratives that address the theme of evaluation and assessment. Drawing on supervisory dialogues, they focus on the collection and examination of narratives that influence the doctoral students' research and learning. Dialogue is used as a democratic inquiry process in the development of collaborative narrative inquiry in a highly interpretive process; and the collaboration that produced their chapter mirrors the research examples used from their ongoing re-emerged research.

Over a period of 30 years, *Amy Shuman* has conducted an ethnography of the artisan stone carvers of Pietrasanta, Italy. The artisans have a centuries-long tradition of marble carving passed down from one generation to another. Using informal interviewing in a conversational setting, she situates her work methodologically at the intersection of sociolinguistics, literary narratives, folklore, and oral histories. Calling this approach conversational narrative analysis, she has collected communication in this community to address the question of how personal life history narratives become part of the collective memory of a community. From her position as a folklorist, she argues that the personal, ordinary, local narratives that people tell about their experiences are fundamental for understanding the complexity of larger events.

Sharon Tao addresses the theme of teaching through an ethnographic study of primary school teaching in Tanzania. Particular attention is paid to the use of different research methods in the construction of ethnographic narratives and the problems of interpreting those narratives when the primary data is told in a language other than English. Her chapter considers how the conditions framing the professional and personal lives of teachers in Tanzania shape their narratives of well-being (defined through the analytic framework of the capability approach as the substantive freedoms to choose valued ways of being) and how this might lead to different interpretations of their teaching, especially when contrasted with meta-narratives that seek to portray their practices as deficient.

Encouraging and enabling more young people to progress to higher education from historically underrepresented social groups is a major policy concern in the UK and around the world. In the UK, access to the universities of Oxford and Cambridge is a particularly public and politicized matter and so acts as a litmus test of widening participation policies. *Michael Watts* engages with these policy issues through life history research with students who possess relatively low volumes of what Bourdieu refers to as cultural capital. The narratives of such students are used to consider the significance of how the symbolic value of their academic and cultural capital is interpreted within the wider context of sociopolitical narratives.

Monne Wihlborg uses collective biography to explore and unpack the concept of the feminist subject. Her consideration of the processes of subjectification calls attention to the narrative construction of issues of equity, justice, and diversity and to the power of narrative methodologies to deconstruct normalized interpretations. Collective biography can be an intense experience for those involved because it demands the use of one's own body—as a signifier of emotions and experiences—as a text to be read and critiqued. Interpreted through and framed as/by collective biography writing, the researcher is not separated from her data but is emphasized by it.

1.1 Historical Narratives in Ethiopia

Amare Asgedom and Barbara Ridley

The Research Project

This chapter considers how historical and contemporary narratives can be used to interpret issues of educational organization and leadership. The research on which it is based sought to understand academic freedom and institutional autonomy through a case study of Addis Ababa University (AAU) between 1950 and 2005. This 55-year period saw three markedly different political regimes: feudalism (1950–1974), socialism (1974–1991), and democratic federalism (1991–2005). Historical narratives must make sense of stories told over time. The stories told during this study included contemporaneous archival materials narrating the points of view of the different political regimes in power and the leaderships of AAU and the reflective narratives of academics, including the lead researcher, Amare, who had lived through these periods.

This research was undertaken as Amare’s doctoral thesis, with Barbara acting as his supervisor (along with David Bridges as co-supervisor). Here, though, we adopt the roles of Amare as lead researcher and Barbara as critical friend.

The research asked whether or not academic freedom and autonomy were attainable in a context of mutual support: the university that was responsible to the state that supported and funded it but, at the same time, the university itself that played a central role in national politics. The nature of relationships between university and state is complex. The importance of academic freedom and institutional autonomy was made clear by the UNESCO statement asserting that “higher

education teaching personnel should have the rights and opportunities, without discrimination of any kind, to take part in the governing bodies and to criticize the functioning of higher education institutions” (1997, p. 9). However, the requirements to be free and accountable at the same time create tensions, especially when viewed from the point of view of the different ideas of the university (Barnett 1997). More pragmatically, if the university depends on the state both for its funding and for defining its value in serving society, then also stating itself to be independent of that same state is unrealistic (Pring 1995).

The heavy dependence of African universities on government funding results in a severe erosion of autonomy due to the attitude that “[He] who pays the piper calls the tune” (Okebukola 1998, p. 310). It is not clear how this tension between academic freedom and accountability can be resolved, especially in the context of “the attitude of African leaders who view the university as part and parcel of a political structure that requires it to be loyal and to promote government policies and, to be an instrument of the political system instead of its critic” (Federici et al. 2000, p. xix).

Examined through the lens of academic freedom and autonomy, the research reported here illustrated how the changing political regimes affected the organization and leadership of the university and, conversely, how that leadership was instrumental in those same regime changes. The tensions between both sides are made worse in the context of the academics’ aspirations to be fully independent like their old colleagues in the west (UNESCO 1994, p. 19); even those ancient universities are slowly changing under pressure from national and transnational regulations such as the Bologna Process and the influence of ideas and methods from the corporate sector (Jansen 2007; Paradeise et al. 2009). Ethiopia typically draws from overseas policies to develop its higher education system, but the symbiotic relationship of AAU and national politics remains pertinent. It is evident from the Ethiopian case study that the state could not tolerate criticism that called into question the legitimacy of state power. It is not, however, clear to what extent the university could be critical of the state and still maintain trust and support from it.

The narratives that are the focus of this chapter suggest a case of fractured state–university relationships with a high demand for academic freedom by the faculty and its denial by the state and also, paradoxically, a case of self-imposed constraints by the academic community. The high aspiration of the academic community for academic freedom and institutional autonomy might originate in the traditional Ethiopian intellectual culture that found expression in the founding principles of AAU, but the actual practice of academic freedom remains something to be desired. Academic freedom at AAU is really a myth, a sustaining religious-like belief of the academy, but the reality is that the academic community has opposed itself to this freedom.

Academic freedom and institutional autonomy are important features of the higher education discourse. As Finkin and Post point out, academics have a duty to look for truth, honoring “the virtues of reason, fairness, and accuracy” (2009, pp. 42–43). The freedom to search for—and determine—notions of truth is embodied in the founding motto of AAU: to *deliberate freely on all matters and hold onto the best* has always stood as an iconographic representation of academic intellectual life in Ethiopia (Levine 2004; Seyoum 2000), and many Ethiopian scholars use it as a vignette in their scholarly contributions to academic journals.

Three key questions guided this research. What were the forms of expression (or repression) of academic freedom and institutional autonomy under the three political regimes? How did the relationship between the university and the state affect these freedoms in each period? What was the effect of this external relationship on the erosion or expression of academic freedom within the university itself? Academic freedom was studied mainly in terms of the relationship between the university and the state and of how the state erodes the academic freedom of the academic community. The study highlighted the importance of exploring how the faculty and students spoil their own academic environment of free scholarship and free enquiry by resorting to the use of power to deal with political and academic problems. The narratives generated during the research told of the use of power to solve academic and political problems. This was found to deter the development of a critical intellectual culture—something that continues to deprive the country of its ancient values of dialogue, the questioning stance, and deliberativeness.

The literature within Ethiopia itself shows that little research has been conducted on its higher education and none on academic freedom and on state–university relationships. Balsvik (2005) examined student activities in Ethiopian politics and considered how such activities bridged the gap between organized political parties in Ethiopia. She clearly demonstrates the climax of student activism to fight the age-long aristocratic government, which was very slow in introducing reforms regarding social justice and democracy, but this study was limited to the era of feudalism in Ethiopia. Teshome (1990) describes the development process of higher education in Ethiopia and how this process contributed to the provision of trained manpower for modern institutions before the 1974 Ethiopian Revolution. It gives some—though inadequate—coverage of higher education in the context of the revolution but stops short of the democratic period.

While its focus was on Ethiopia, this research has lessons for the international community in that the politicization of the university deters the development of intellectual culture. Although it is focused on one university, the narratives illustrate universal issues about the relationship between higher education and the state and, indeed, about the internal organization and leadership of higher education itself. The study of this relationship in Ethiopia also sheds light on the recent and dramatic political experience of Ethiopia itself as it has passed through the regimes of a feudal emperor, a Stalinist dictator, and a new government struggling with the politics of a liberal economy and democratic polity—all within a single life span. The research is important in understanding the political dimension of education in general and higher education in particular.

The Research Data

In order to explore the evolution of the university as it interacted within its context over more than half a century, including its participation in the political revolutions of the country, the research made extensive use of historical and contemporary

narratives. The research data comprised archival material and formal and informal interviews with academic staff at AAU. Each of these sources represented partial and conflicting views that were interrogated and triangulated. Amare's own experiences necessarily informed his interaction with these other sources and the way in which he interpreted them; and he arranged to be interviewed himself in order to more objectively incorporate his experiences into the data. In a way, this research constituted a rewriting of his own professional history in Addis Ababa University.

Formal interviews were carried out with 41 members of AAU. They all had diverse academic experiences in research, teaching, administration, and public service and had served the university from a minimum of 5 to a maximum of 30 years. Their academic profiles varied from the highest academic rank of full professor to the lowest rank of lecturer. Research participants also assisted in identifying other potential participants who might have similar or different opinions regarding issues of university governance and academic freedom. Graduate assistants and assistant lecturers were not included in the sample because it was presumed they had limited experience of and engagement with the main activities of the university. Participants were selected from most academic fields in order to provide balanced evidence from the two major streams in AAU: the natural sciences and the social sciences (or what are sometimes referred to as the cultural sciences) with the latter including languages, the humanities, the arts, and education. The selection process was not arbitrary but proceeded selectively until perspectives were simply repeated and no new insight was to be obtained from new participants. Importantly, this also included actively seeking potential participants who held contrary or dissenting views, identified with help from other interviewees. The number of interviews (41 academic staff members) was determined by reaching saturation (Goodson and Sikes 2001, p. 23).

Although narratives generated by members of AAU were an important source of evidence, storying their personal experiences and memories of the state–university relationship, further evidence was needed from other perspectives if the approach were to be described as historical narrative, not simply life history. Life history centers on the personal stories told and situates them within the social and cultural context; historical narrative sees those stories as one form of data, one of a range of sources which illuminate the period under exploration. Moreover, given the malleability of memory, particularly when recalled through the lens of different political regimes, these additional sources were important sources of evidence themselves (although they, too, had to be interpreted through their historical constructions). Archival sources provided a window upon the narratives told by those in power. At the university, they were found in the form of management information systems, policy guidelines, and presidential annual reports. Unpublished, official documents, memos, senate, and faculty minutes were extremely valuable. Compiled in the form of Presidential Reports, Academic Vice-Presidential Reports, and Administrative Vice-Presidential Reports, they were voluminous and full of annexes. These documents were archived in the president's office as well as in the Institute of Ethiopian Studies. As a high-ranking insider, Amare had no problem accessing these documents. Notices displayed

around the university and newsletters were also a source of data. More widely, public proclamations, newspapers, and fliers, as well as the more obvious official sources of information, such as the legal newspaper *Negarit Gazeta*, were also collected. A nationally televised 3-week consultation with the prime minister was another source. Thus the archival documents represented all forms of print media, audio recordings, and audiovisual materials, mainly archived in the Ethiopian Collection Section of the Institute of Ethiopian Studies, Addis Ababa University.

These sources contained not only the contemporary narratives of the public face of the state and its relationship with institution throughout the three periods but also internal records of the purposes and justifications of the decisions made and policies implemented. Policies, procedures, and annual reports of the activities of government and universities were often found in published forms. Unpublished monographs, statistical abstracts, and other reports were rich sources of information on the intentions of managers and governors. The rich description of cases and contexts was made possible with the use of such documents.

These documents—from the Annual Plans and Performance Reports of the university, faculty, and departments to newspaper reports and the publications of the underground press—gave insight into a range of perspectives over the three periods. Importantly, they offered different perspectives of the contemporary matters they addressed. The AAU senate and faculty minutes provided information about routine activities, plans, and evaluation reports, while the publications of teacher and student unions were critical of the three systems (although the publications of the teacher unions tended to endorse the Derg regime). A particularly significant source of data, gathered by the curator of the Institute of Ethiopian Studies, was the collection of pamphlets of the political opposition that had been distributed secretly in Ethiopia and found in the libraries of Italy, England, and the Arab countries.

Some pertinent audiovisual records, made available by the IES at AAU, from the earlier periods were available. However, these were especially valuable for the third period (1991–2005) and included 3-week deliberations of all academic staff (including librarians) of AAU with the then prime minister, Meles Zenawi (this discussion with the prime minister is popularly known as the “Summer Discussions”), recordings of panel discussions on the occasion of the 50th Anniversary of Addis Ababa University, and academic staff discussions with the former Addis Ababa University Management with regard to the review of what was called the “consensus” reached between academic staff of the university and the prime minister during the “Summer Discussions.” Also, the lead research made a series of personal recordings of a 1-week conference of the New Addis Ababa University Management with all academic staff on the issue of the “new mission and vision for strategic planning.”

The audiovisual recordings included debates between the government, university management, and teachers with regard to policy perspectives, procedures, and actions about the country, its development, politics, and education. They were therefore very helpful in providing contemporary accounts of the politics and power sources in Ethiopia (although they contained much more information than what was needed for the purpose of this study). They gave insight into how the leadership

of AAU responded to government perspectives in a public forum which could in turn be related to how—and if—those same perspectives became implemented in practice. The debates on issues related to accountability, transparency, competence, brain drain, campus democracy (fair representation of ethnic groups in university management), granting of the university charter, autonomy, academic freedom, student handling, remuneration, research funding, and sabbatical leave were all very informative. The videocassettes were already made and publicly available through the Ethiopian TV broadcasting. The copies were the property of Institute for Educational Research library and accessible to any researcher. Data relevant to the research was sought from these videocassettes analyzed with other data. Irrelevant sections of these cassettes were ignored.

The formal interviews were carried out in two stages. A prior meeting, or preinterview, introduced the purpose of the research and requested consent for participation. Appointments were then made to carry out the formal interview. As Amare was an insider, access was not an issue. It was free and permission from officials of the university was not needed. These formal interviews usually lasted several hours and took the form of discussions on emerging issues instead of being based on a predetermined set of questions. Their purpose was to obtain narratives concerning the participants' memories of—and reflections on—academic freedom and institutional autonomy at AAU.

The interviews used unstructured open-ended questions. Interview protocols were prepared to direct the discussion and conduct the interview. Discussions were held with the academics on how AAU has operated in its day-to-day activities in teaching, research, public service, and administration. Much time was spent in each interview on questions that emerged from these ideas, and they were probed further to elicit detailed information. Almost all participants were enthusiastic in discussion, and many noted that such issues were of significant concern to them. Field notes were used to record key points raised by participants and to record observations of their tacit knowledge, such as that expressed through tone and gestures. These nonverbal communications were critical to interpreting and therefore understanding what the participants meant by the verbal responses given during the interviews. The field notes also recorded observations of the settings, which provided important data for the context of the study.

All the participants were important actors in the Ethiopian higher education system and so the data that were generated were politically sensitive for them. As Aduugna notes:

In Ethiopia, there is a strong tradition of reservation, reinforced by experience in political regimes under which it was dangerous to express any opinion of your own. There are, in fact, proverbs with contradictory ideas in Amharic [the official working language of Ethiopia]. The proverb that advocates reservation from explaining things in depth is “Zim bale af zinb aygebam” “Flies do not enter into closed mouths”, while the proverb that encourages explanation of things in depth is “Kale menager Dejazmachinet yikeral” which means “he who speaks less misses Dejazmach (lordship)”. It is certainly the first of these proverbs which most people take seriously. (2008, p. 144)

For this reason, ethical issues around anonymity and data security had to be particularly stringent: confidentiality and anonymity are highly regarded

requirements in the Ethiopian culture, particularly as the views people express can easily be abused by distortion, attribution, or even accusation. Thus, care was taken to ensure that potential participants knew that they were protected and that their views were secure. This included both the raw data collected during the interviews and the subsequent reporting when it was necessary to make it impossible for particular opinions to be attributed to specific individuals.

Some of these interviews, particularly those with long-serving academics, covered a time span of up to 50 years. It is important to acknowledge that the powers of observation and recall of these individuals were limited. Moreover, although the lead researcher had been part of the university throughout the three distinct periods covered by the study—something that could be seen as an advantage for evaluating the accuracy of recorded or memorized data from other research participants—his own memory was no less fallible nor less prone to constructing and reconstructing the meaning of past experiences than anyone else's. However, Amare's own memories provided another narrative, another source of data. In order to create a written text for analysis, he asked a colleague to interview him. This allowed the representation of his own experience in a more objective form, and it was read and analysed alongside data gathered from other sources.

Ethiopia has a long tradition as an oral culture; and educated and less educated people depend mainly on opinion leaders for news and political opinion. The Ethiopian academy is no different and spends a lot of time discussing controversial issues informally during socialization in lunch and tea breaks, with the morning and afternoon tea breaks being important elements of the daily academic ritual. Amare drew on this oral tradition to initiate discussions related to the study during periods of socialization, particularly at tea breaks. These informal interviews were extensively used as sources of data alongside the formal interviews and were excellent opportunities to triangulate and cross-check the narratives obtained through those formal interviews.

Other informally collected data came from colleagues spontaneously arriving wanting to talk more about these issues, initiating discussions regarding the fate of Addis Ababa University as part of their general concerns. This added additional depth to the narrative and further legitimated the use of informally collected data. It also highlighted how the situatedness in a research setting obliterates the field-home distinction: sometimes data flows in when the researcher is not actively and formally engaged in data collection processes. Other colleagues left personal notes or new official letters (e.g., a letter written by a senior officer of the university instructing a department head to change the grade of a student who had complained was slipped under the door of Amare's office). New evidence continued to flow even after the formal data collection period seemed to have finished. This served as a reminder that such work needs more effort to achieve a peak of quality, posing the kind of dilemma expressed in Alexander Solzhenitsyn's book *The First Circle* about the moment of *the realm of the last inch*, "not to leave it undone in the moment of temptation to stop" (Solzhenitsyn 1968, p. 173).

Constructing the Historical Narrative

The interviews ranged over the three regimes and sought to uncover historical and contemporary perspectives and the relationships between them. The analysis of this data aimed to locate tensions that might accrue as a result of multiple responsibilities—responsibilities which might or might not conflict with their beliefs in and aspirations to academic freedom. The interviews encouraged them to describe possible sources of satisfaction or frustrations in their careers as university teachers, to understand the ways in which they lacked or enjoyed academic freedom and autonomy in determining their teaching and research. Issues of authority and power regarding academic decision-making processes were also covered, together with the more recent higher education expansion reforms and how this influenced their freedoms in terms of whom and what they taught.

Authenticating the recorded data, memory-generated data and archival integrity were a challenge in this research and were addressed through careful cross-checking. Triangulation and interpretation were crucial to this process. The case data consisted of research notes collected from different types of documents and transcripts obtained from interview and archival records. The research notes were originally filed into 110 folders, using the filing criterion of sources (usually authors or institutions). Sometimes, the same author or institution could have several folders depending on the year of publication. Transcript folders were arranged on the basis of authors or events and totalled nearly 60 folders. Thus, the case data for the whole of the empirical research constituted almost 170 folders.

After the data collection stage and the organization of the empirical data, the analysis proceeded by creating a new filing system based on general themes, such as infringement of academic freedom, stress, conflicts, curriculum, teaching learning, brain drain, and power. These categories were derived from reading and rereading the different files and focusing on the most salient themes to emerge from the data. To generate the case records, a new filing system was created on the basis of different data sources (including Amare's personal reflections) that supported the coded themes. This served the purpose of bringing together the different sources of data for a given general theme (such as freedom, power, curriculum, and so on). Understanding the patterns (in terms of answering the research questions) in the data, and of the relationships between themes, constituted the historical case study report in this research.

The final stage of the analysis was to combine the classical historical analytical strategy of narrative sequence of events and analysis—in the sense of comparing and interrelating events and facts for actually testing a hypothesis, the possibility of maintaining a status of institutional autonomy and academic freedom, in the context of critical university–state relationships. Historical reasoning consists neither in deductive reasoning (from the general to the particular) nor in inductive reasoning (from the particular to the general). “Instead it is a process of *adductive* reasoning in the simple sense of adducing answers to specific questions, so that a satisfactory explanatory fit is obtained” (Smith 1981, p. 315). Adduction permits the researcher

to respond to the research questions. The process was thus to explore patterns in each historical epoch (1950–1974, 1974–1991, and 1991–2005) and then make an inter-epoch analysis of the three temporal cases in an attempt to provide provisional answers to the research questions. This led to a generalization about what constitutes the idea of higher education in Ethiopia in the context of academic freedom and autonomy.

Two key areas of theory guided the construction of the overall narrative. The first was employed to understand, in general terms, the notions of academic freedom and accountability. Academic freedom as a general theory (Bligh 1982, p. 119) refers to general civil liberties (or what are called intellectual freedoms) such as freedom of speech or freedom of expression and freedom of conscience of citizens as human rights applicable to any citizen. Academic freedom as a special theory (Bligh 1982, p. 119), on the other hand, is the “autonomy of the scholar to enjoy teaching the higher learning and expanding its frontiers” (Brubacher 1977, p. 39). It involves the freedom to teach and undertake research as the academic sees fit (O’Hear 1988, p. 7). Both definitions have impact on the organization and leadership of an institution: accountability measures implemented by the management (or implicit within the organizational ethos) must take into consideration the needs, interests, and preferences of individual academics to pursue their scholarly endeavors.

The principle of academic freedom is deeply embedded in the Ethiopian culture (Abebe 1991; Bridges et al. 2004; Getachew 1994). But institutional autonomy can be seen as distinct from academic freedom. Goedegebuure and his colleagues (1994) defined academic freedom as:

that freedom of the individual scholar in his/her teaching and research to pursue truth wherever it seems to lead without fear of punishment or termination of employment for having offended some political, religious or social orthodoxy. (p. 8)

These issues and their importance in higher education are, however, inseparable from different ideas about what a university *is* and what it is *for* and, therefore, what is its proper relationship with the society in which it is located. In turn, these different conceptions will impact on how the leadership of an institution sees its role and how the university should be organized to enact it. So the second key theoretical framework was drawn from Barnett’s three constructs of the relationship between the university and society: a university *in* society, a university *of* society, and a university *for* society (1997b, pp. 37–38).

In this study, it was necessary to make a distinction between the state and society, because the power of the state does not always emerge from delegation of authority by the grass-root communities (such as ordinary citizens, civil societies, professional associations.). In the Western literature, the two concepts, the state and society, might be interchangeably used. In Africa, and particularly in Ethiopia, the two concepts are distinct. In Ethiopian society, the state is often viewed as distinct from the society, and government bureaucracy constitutes the former. The three constructs differ in their claims to academic freedom, institutional autonomy, and accountability. The competing ideas about the relationship between the university

and society (and the university and the state) have featured very strongly in the recent history of higher education in Ethiopia—and so have their implications for academic freedom and accountability and for leadership.

The analysis of the data went on to explore how they have been expressed in the different ideologies, practices, and experiences of the three contrasting regimes across the 55-year period. In summary, threats to academic freedom and institutional autonomy (both internal and external) were rampant in all political histories of the Ethiopian University. Erosion of academic freedom took the form of abridgement of the faculty's right for self-rule and the perpetuation of different types of threats (ideological, financial, and administrative) invariably in all regimes. However, the intensity of the problem differed across the three periods with the Marxist regime experiencing the most tyrannical type of governance and absence of any trace of academic freedom.

Presenting the Research

The data and its analysis were presented as three separate narratives, one for each period. The first covered the history of modern higher education in feudal Ethiopia (1950–1974) and its implications for academic freedom and accountability. The narrative situated the origins of the modern system within the context of traditional higher education which can be traced back to the time of the Axumite kingdom after the introduction of Christianity from the Middle East in the fourth century (Teshome 1990, p. 31). Both faculty and students enjoyed academic freedom and institutional autonomy, indicating a benevolent leadership during the period from 1950 to the early 1960s. These freedoms were eroded during the crisis years of the feudal system when mistrust and conflict replaced the old values, trust, service, cooperation, and, above all, deliberative democracy (Enslin and Kissak 2005).

This first narrative also traces the beginnings of state-university conflict in the student publications of the 1950s. Traditional Amharic poetry had, in the face of autocratic suppression, developed a technique through which the message was wrapped in a language rich in ambiguities (*Kene* and *Wuste Weira*)—a rhetoric that had considerable significance for the interpretation of the data generated during this research. *Kene* means a message with double meaning where one of the meanings is hidden by the second meaning to shelter the speaker or the writer from risks of political repercussion. *Wuste Weira* means a hidden meaning. These techniques started challenging the government authorities through the publication of long poems in Amharic. The poems, which were not only part of a university contest but also printed and sold to the public, were very critical of the monarchy and sympathetic of the Ethiopian poor farmer, who was portrayed as patriotic, a taxpayer but always exploited by the rulers. Readers were therefore eager to seek the hidden meanings (Balsvik 2003, p. 4; Kiflu 1993, p. 36). These stories and contributions reflected their sympathy with the poor (AAU 2002; Alula 2002) and are consistent with the idea of a university *for* society. These and other student

activities also had to be seen in relation to the wider contexts such as growing nationalist movements, African liberation fronts, and the post-war (World War II) radical ideas from Marxist and Socialist movements in Asia and the Soviet Union.

The second case narrated changes that took place in academic autonomy and the traditional professional accountability as a result of the new political power systems and ideology of the revolutionary government established after 1974. The narrative started with brief coverage of the revolution and its causes to contextualize the changes addressed in the case. Using memories of AAU professors (who were very enthusiastic to discuss these issues), consulting legal documents (such as proclamations), reading related reports, and using Amare's own experience, the narrative showed how the university lost its traditional autonomy and how its faculty became fragmented along lines of ideology between those who readily accepted the implementation of the new policy and those who resisted inwardly but complied outwardly in a kind of dramaturgical compliance (Barrow 1999). Organizational and leadership issues—including measures taken to restructure the university, curricular changes, administrative and academic controls, and indoctrination efforts, including the effect of the Red Terror project—were discussed to show how the traditional self-government of the academy was replaced by stiff political controls from within and from without the university. It described how such controls constrained the creation, expounding, and dissemination of knowledge to which the Ethiopian modern higher education system had been professionally accountable since its creation in the 1950s.

The third case described the period from 1991 to 2005, the transition to democratic Ethiopia and the various political—and university—crises that followed. As with the second case, it drew heavily on empirical data from members of the university as well as a range of contemporary documents. Understanding the new role of the university with a changed paradigm, that is, its operation in the context of knowledge partnership with the government, seemed to be difficult for AAU. Its history had shown that it had pioneered intellectual, political, and technical knowledge in modern Ethiopia. It had resisted and fought dictators, both in action and in its dissenting position during the monarchy and the Derg period. In spite of these pressures, however, the university was generally less violent with the new administration—until the 2005 Third National Elections. When the opposition contested the polling results that favored the ruling EPRDF (Ethiopian People's Revolutionary Democratic Front) party, university students were the first to take action in protest at the results. During the rule of the EPRDF, AAU was fraught with tension and conflicts that often resulted in closures of the university, faculty and student dismissals, and the short life span of university administrators. This hostile external relationship was accompanied by deteriorating internal relationships within the academic community, with collegial fragmentation causing different types of threats to the academic freedom of individual members and groups. Reflecting on the political and violent nature of AAU which, in turn, contributed to self-imposed constraints to academic freedom, one professor taking part in this research, saddened by the political tragedy, said "I wish there were no elections in Ethiopia at all."

The final section of this third case focused on contemporary perceptions of the academic freedom in AAU. It explored different types of threats to academic

freedom which were closely related to their day-to-day duties as perceived by the lecturers and professors. The analysis was presented as three units which drew on the fourth, fifth, and sixth of Bligh's classification framework (1982, pp. 118–137) of six types of specific freedoms of the academy: (a) freedom of inquiry—freedom to pursue the truth unhindered, by methods including doubt, criticism, discussion, and testing of any belief, (b) freedom to disseminate the truth as one sees it, (c) freedom to express doubts and criticisms of any belief, (d) freedom to decide who should be members of one's own academic institutions, (e) freedom to decide the content of academic courses, and (f) freedom to decide upon the competence and certification of others.

The next stage in the analytical process, and that which steered the study towards a comprehensive historical narrative framed by the research questions, examined threats to institutional autonomy and academic freedom (both as a general and special theory) across the three case histories of AAU (i.e., the cases of AAU under feudalism, socialism, and federalism). It examined how the diverse agents—the state, managers, the faculty, and students—contributed to the erosion of institutional autonomy and academic freedom and how these erosions illustrated pertinent issues of educational leadership. Three major perspectives were used in the analysis of these threats to academic freedom and institutional autonomy: governance threats, external threats, and internal threats.

Finally, while the main research and analysis were primarily backward looking, examining 55 years of turbulent history in the complex relations between AAU and the Ethiopian State under these three distinctive political regimes, the last section looked forward. It drew on the insights from the research to look to the future development of those relationships in the hope of achieving the conditions under which a flourishing university intellectual culture might better serve a flourishing and democratic Ethiopian society.

The Reasons for Choosing Historical Narrative

A stranger is lost and asks for directions. The local he turns to replies “Well, I wouldn't start from here.” It is an old joke, but it is also a rationale for the use of historical narratives. Tobias addresses the question of why construct a historical narrative more succinctly when she observes that to “access the current scholarship . . . it is important for us to note the past historical narrative” (cited in Mattingly 2004, p. 582). If the influence of the past on the present is complex, it is more complex still in Ethiopia where different political regimes have sought to shape the understanding of recent history. But what is the “past historical narrative” and how is it constituted? As Barthes notes, narrative “is present at all times, in all places, in all societies; indeed narrative starts with the very history of mankind [sic]; there is not, there has never been anywhere, any people without narrative” (1975, p. 237). There is a long tradition of historical narratives, both secular and sacred, that, sanctified by repetition through retold histories, can lead to the establishment of a

canon—such as the presumption of a golden age from which more recent events deviate or earlier chaos from which there has been an escape. Moreover, narratives emerging from the Global South (which, ironically, may have longer historical pedigrees) may also be distorted by their otherness (Bhabha 1991; Said 1998).

The desire to understand the history of AAU and its relationship with the state, particularly here in order to understand issues of educational organization and leadership, demanded a historical perspective. Munslow suggests that “narrative is central to historical explanation as the vehicle for the creation and representation of historical knowledge and historical explanation,” (2000, p. 169). To understand the process of higher education in Ethiopia and, in particular, the attitudes towards academic freedom and institutional autonomy, it is necessary to understand the political experiences the country has undergone. The corollary is that the history of AAU itself provides an important window onto these political experiences. For Polkinghorne, “narrative meaning is created by noting that something is a ‘part’ of a whole, and that something is a ‘cause’ of something else” (1988, p. 6). There are significant links between past and present, no matter how much habituation to our own understandings of history transforms that significance into little more than the commonplace. This research, with its concern to map the history of AAU through the three distinct phases of recent Ethiopian history, disrupts the commonplace acceptance of history and emphasizes its significance. The purpose of the study was to generate an understanding of the history of AAU—and so, here, illuminate issues of educational organization and leadership—through the experiences and memories of those who worked there through those historical phases. It can therefore be seen to be shaped by Lyotard’s argument that the grand narratives that previously served to legitimate ideological and institutional forms of knowledge have given way to the *petit récits* of little personal narratives (1984).

Hannah Arendt (1958) argues that we need to know a person’s biography if we are to know who he or she is. But such biographies are shaped by context: to understand the world in which that person fits requires an understanding of the stories told about that world (Bruner 1996). However, Mattingly, discussing the renegotiation of historical narratives with fellow historians, and perhaps being deliberately provocative, suggests that the extreme tolerance of the canon presiding over higher educational history in the USA, which incorporates little personal narratives, can lead to the omission of connections with wider discourses and that the “cumulative effect of this scholarship ‘from below’ tends to erode any general consensus on central problems” (2004, p. 577). Gadamer’s (1989) notion of historicity—that history is not an objective past that is external to us but a dynamic force that ineluctably permeates our understanding—offers a bridge over the dynamic tension between the meta- and the personal narratives that iteratively shape our understanding of the relationship between the individual and the history which both shapes and is shaped by her. Here, then, the use of a historical narrative offers a means of understanding where we come from in order to develop a greater understanding of how we may get to where we are going.

That understanding was generated, in part, through the remembered histories of those academics living through those historical phases. MacIntyre suggested that:

I can only answer the question “What am I to do?” if I can answer the prior question “Of what story or stories do I find myself a part?” We enter human society, that is, with one or more imputed characters – roles into which we have been drafted – and we have to learn what they are in order to be able to understand how others respond to us and how our responses to them are apt to be construed. (1981, p. 216)

For Foucault (1977), educational narratives are generated by and through power issues, about what can be said and done and thought. Foucault focused on the outcasts of society—the insane and the imprisoned—and the power issues he identified are not always obviously evident in educational studies. In Ethiopia’s recent history, though such power—the meaning and the discourse about education that imparted knowledge about education—has been an ever-present and obvious concern, an ever-present threat to academic freedom manifests in the organization and leadership of AAU. However, this generates particular problems that needed careful negotiation through the historical narrative approach taken in this study. What the participants—including Amare—had to say, what they remembered, was shaped by the fallible and contingent nature of memories.

There is, in these accounts told in the present, an ongoing and inevitable relationship with the past. Ricoeur (2004) argues that there can be no definitive historical knowledge. The individual has her own memory and also a collective memory; but the individual memory may be shaped by popular narratives of collective memory. A recent study of British Prime Minister Winston Churchill’s wartime speeches (Toye 2013) suggests that many people “remember” hearing him deliver his famous “We shall fight them on the beaches” speech from the House of Commons in June, 1940, but although it was reported by a news announcer and widely reported in the press, it was not broadcasted. That is, they “remembered” hearing something they could not have heard. Collective memory is a social process and so subject to social processes: it can be interconnected with what society and the state define and officially sanction as correct. Historiographical operation—that is, the conduct of historical research—is to engage with collective memory and, by offering a framework for engaging with the fallible and contingent nature of memory, leads to an understanding predicated on credibility rather than certainty.

The three distinct phases marking recent history in Ethiopia, and their influence on individual narratives, highlight the significance of contemporaneous accounts and address the filters through which the past is seen. It is important to know what individuals remember, but memory alone is not enough. Different events can be perceived differently, and because perceptions can be influenced through historical distortion, the archival material used to create this historical narrative was important. The research sought to tell the story of academic freedom and institutional autonomy through a study of AAU from 1950 to 2005 and, as Stone notes, “historians have always told stories” (1979, p. 3). But, asks Munslow, “Do historian’s re-tell *the* narrative of past events, or do historians invent *a* narrative in order

to impose a conceptual sense of order on the sublime character of what once was and is now irrevocably gone?" (2000, p. 14, original emphases). The position taken by the historian determines the approach to the evidence; and it also determines the perceived level of interpretation required.

This research took a case study approach based on three cases distributed over historical time in the same socio-spatial setting instead of the conventional approach examining cases in different socio-spatial settings at roughly the same time. It might be argued that the research could have been constructed around a time series analysis of a single case rather than a comparison of three cases. Both options, it could be argued, would have taken historical and narrative approaches to the development of AAU. However, the political changes taking place in the period studied were, quite literally, revolutionary ones and resulted in dramatic political transformations. These transformations created distinct cases of higher education systems with each case representing a unique type of higher education that had a clear implication for a different type of expression or erosion of academic freedom. The contrast between the three political regimes under which the issues of autonomy and accountability were redefined was sufficiently stark and clearly bounded to make it possible to treat them as three cases. There was, however, unavoidably a temporal dynamism between and within these three cases (in spite of the drastic ruptures) that necessitated a consideration of the historical method of inquiry. The inquiry in this project, therefore, necessarily demanded a combination of case study and historical research. The latter relies on the use of documentary and other records and the memories of individuals who lived in and through those historical epochs rather than relying on the sources appropriate to contemporary case study designs. That is, the research design foregrounded contemporary events rather than the memory of those events.

Lloyd (2003) suggests that "the present has to be understood as contingent and transformative. Present and past are organically connected so that in fact there is no real distinction between them" (2003, p. 85). Narratives derived from across the periods considered in this study contribute to understanding these connections. But, according to Lynd, contemporary accounts are particularly valuable. By way of example, he asserts that "anyone wanting to write the history of the post-world war II civil rights movement could undoubtedly write it better now than 5 years from now and better 5 years from now than a quarter a century hence" (1968, p. 102). Stenhouse also asserts that the study of contemporary history appears to offer the best opportunity to enhance our understanding of the past "in the sense that it is an account of a past as close to our present – or perhaps better said to our future – as we can make it" (1980, p. 4). In telling their own stories, in sharing their memories and reflections, participants were creating contemporary historical accounts.

Nonetheless, the nature of historical enquiry is in itself a contested field. Stone defines the main differences between narrative and structural history as the difference between the emphasis of the former on description, on humans, and the specific rather than the essentially analytical approach of the latter which is concerned with circumstances, the general, and the statistical. The nature and role of narrative has, according to Roberts (2001), been central to arguments around the philosophy of

history since the 1960s. Kiser (1996) explains that in structural history, narrative is used in two “limited” ways: to provide descriptions of initial conditions that can then be used to “set the stage” for causal arguments and, secondly, to describe details to amplify causal arguments (1996, p. 252). Narrativists, he argues, stress temporality and making temporal order “leads many narrativists to emphasise the path-dependent nature of social processes” (1996, p. 255). Marwick (2001) also draws attention to what he terms the “battle of basic assumptions” that lies beneath any discussion of the nature of history. The “battle” can be seen in Munslow’s (2000) three main approaches to historical enquiry: reconstructionist, constructionist, and deconstructionist. The first of these approaches seeks to find *the* past as it was through the disinterested historian who can impartially evaluate and compare the evidence. A constructionist approach assumes history as a conceptualization of the evidence formed through a “dialogue between the historian and the past” (Munslow 2000, p. 53). Finally, deconstructionist history seeks to interrogate discourses on the premise that history is based in the power of language in representation. The research described in this chapter sought to tread a middle path while acknowledging the inherent problems in pursuing historical enquiry.

The Role of Interpretation in This Research

Three key issues framed the interpretation of this data. The first was the personal role of the lead researcher, Amare, who lived through the events described in the research and was caught up in them. The second was the significance of the archival data—itself partial and politicized—as a means of contextualizing and understanding the remembered accounts of the research participants. When set within a context where repeated violent revolutionary action has discouraged open talking and, furthermore, a culture that prizes ambiguity, interpretation is complex. Third, and permeating these other issues, is the oral tradition of telling stories, including historical stories, that is framed by the concept of *sam-enna warq* or “wax and gold.”

“All thought is fundamentally mediated by power relations that are socially and historically constituted” (Kincheloe and McLaren 2003, p. 452). As the lead researcher of, and a participant in, many of the events described, Amare’s own memories of his experiences inevitably colored the interpretations of the data. Nor could he claim neutrality in the shift from old to current Ethiopian politics—which many call ethnic politics. The establishment calls it federalism grounded in the idea of “nation-nationalities” or what Huntington (1996) calls the demand for cultural sovereignty. Whatever the semantics, it is a kind of governance based on the philosophy of power sharing among the ethnic groups—the antithesis of the Ethiopian nation state that had survived for several millennia. These fundamental issues were mitigated to some extent by the collaboration of the authors, but they could not fully escape the influence of the politics and ethnicity that are core aspects of Ethiopian life and that therefore inevitably affect research in and of the Ethiopian higher education sector.

Amare belongs to an ethnic minority, the Tigrians. The prime minister at the time the research was conducted, Meles Zenawi, belonged to that same ethnic group, and this raises the question of whether, in a highly charged political situation, the non-Tigrian professors interviewed felt able to speak freely and openly. Might there have been some restraint on their part to involve themselves in such sensitive political issues? How far did political allegiances influence the narratives they told? Although no self-restraint was observed on the part of these participants (irrespective of their ethnic identities), this might have been because of their personal relationship with the lead researcher. This was, as he understood it, positive and grounded in a collegiality based on relationships that predated the research. However, it might also have been connected with the freedom of speech attained after 1991 and the uninhibited inclination of the public to speak whatever it wants. Had the research been conducted after the 2005 election, which precipitated ethnic tension, presumably the cooperation demonstrated by colleagues would not have been the same.

This issue of politicized ethnicity could have also influenced the research through the selection of participants and the significance attached to the narratives they shared. In terms of professional experience, political allegiance, and living through revolutionary change, the lead researcher was caught up in what Adler and Adler call the “ultimate existential dual role” (1987, p. 73). This had the potential to generate role conflict for Amare as researcher and as insider and so to influence the interpretation of the data. Acknowledging this potential problem, he turned to Barbara who, as an outsider, was in a position to act as a critical friend and so mitigate this possible bias. Moreover, the report specifically identified the political allegiance of Amare, as lead researcher, to enable the reader to take this into account in assessing the evidence and the ideas that were advanced.

The use of memories is another way in which interpretation plays a role: the data was drawing on the recollections of life at AAU under the different political regimes. Tosh and Lang note the difference between memory and what they term the “more disciplined awareness of the past that characterizes an awareness of history” (2006, p. 1). They argue that while memories are a source of data, they are also a way of making sense of one’s own life story and that any society has its own collective memory that acts in a similar way. Just as personal memories are fallible, subject to change through the overlaying of current events, collective memories share the same distortions, since “our current priorities lead us to highlight some aspects of the past and exclude others” (p. 1). When it comes to political issues, they assert that “memory is highly selective and sometimes downright erroneous” (p. 2). In spite of the triangulation between accounts and against other sources, the interpretation—and reinterpretation—of the raw data, the interpretative bias resulting from the lead researcher’s own political affiliations cannot be ignored. It was accepted that “all interpretations are culturally situated” (Kincheloe and McLaren 2003, p. 447), and again, this was mitigated to some extent by the involvement of the second researcher who, despite her long-standing association with Ethiopia, was outside its sociopolitical milieu. Moreover, Amare strove for quality and verification in the research process while trying to understand the problem by personally engaging with research participants and spending extensive time in the research setting (Creswell 1998, p. 193). The evidence was rigorously

scrutinized through comparisons of the different sources and counterchecks by subjecting it to public critical scrutiny (Stenhouse 1978, p. 5) and by returning the case record to the research participants for their feedback.

The research on which this chapter is based tried to avoid the excesses of the scientific tradition which views historical enquiry as what Carroll (1998) calls *narrativising*—the attempt to create an exact representation of reality. Narrativizing historians castigate historical narratives as being mere products of the historians' imagination and which derive their meaning not just from the so-called facts they describe but from the narrative form into which they fit those facts (White 1998, p. 16). It also sought to avoid the extreme standpoint of the rhetorical attitude (Fay 1998) which views historical narratives as mere constructions of a social reality contingent upon power and social class and which reflects the epistemic view of a multiplicity of constructed social realities, thus rendering historical narrations as mere reproductions of the ideology of the dominant groups (Kincheloe and McLaren 2003, pp. 436–438).

The extreme form of the rhetoric attitude undermines the value of objective historical evidence, which can be established through exposure to public criticism and triangulation. “Not only is all research an act of interpretation but. . . perception is itself an act of interpretation” (Kincheloe and McLaren 2003, p. 443). However, Lawrence Stenhouse writes of research as “systematic and sustained enquiry made public” (1980, p. 5), and for philosophers in the liberal tradition like Karl Popper, the exposure to public scrutiny of one's ideas provides a testing ground. Popper argued that:

truth is not manifest, and it is not easy to come by. The search for truth demands at least: (a) imagination; (b) trial and error; and (c) the gradual discovery of our prejudices by way of (a) and (b) and of *critical discussion*. (1963, p. 352, emphasis added)

The credibility of Amare's ideas—that is, his interpretation of the data—was tested through ongoing discussions with the research participants (particularly the more informal talks held during the tea breaks) and with Barbara who acted as a critical friend throughout.

The use of archival material presented a particular interpretive problem. Smith (1984) notes that an event becomes part of an official record through a bureaucratic recording process. The process confers apparent authenticity of the event by giving it an officially approved status, making the event apparently “fact.” However, that process is itself open to negotiation and the use of approximation if necessary (Garfinkel and Bittner 1967). There are always questions such as which events were recorded, which were not, why, and through what process did that recording take place? So a key challenge in using such material was the requirement to evaluate authenticity because, as Lloyd observes, “History should no more be a discipline resting on *common sense* than are biochemistry, neurophysiology, astrophysics or any other empirical science” (2003, p. 85). Merriam (1988, p. 107) has produced a long list of questions for validating documents, including completeness, history, accuracy, and authenticity (such as whether or not documents were tampered with), and they all need to be considered. Their interpretation needs to take into

account that documents do not exist in a vacuum; they were created by someone with a particular purpose in mind. Further questions that were asked of these archival materials and that were particularly important given the changing politics were as follows: What was the context of their production? What were the motivations of their sources? Who were the intended readers and why? Such questions were addressed through a dialectic of interpreting the past through the present (the thoughts and reflections of the participants on events previously recorded and archived) and of the present through the past (comparing those reflections with the recordings).

These problems, though, were further compounded by the word play at the heart of the Ethiopian oral culture and its influence upon the telling of stories. The Amharic language is ideal for word play: the notion of—and skill in—the use of ambiguity is a deeply embedded cultural feature of Ethiopian society and its literary traditions. The Amharic poetic tradition had, in the face of political suppression, developed a tradition for wrapping the message in a language rich in ambiguities such as *Kene* and *Wuste Weira* (inside the olive tree), and people were eager to seek the hidden messages (Balsvik 2003, p. 4; Kiflu 1993, p. 36). This is known as the tradition of wax and gold and permeates the oral culture of Ethiopia:

Sam-enna warq ('wax and gold') is the formula used by the Amhara to symbolise their favourite form of verse. It is a form built on two semantic layers. The apparent, figurative meaning of the words is called 'wax'; their more or less hidden actual significance is the 'gold.' (Levine 1965, p. 5)

The practice of wax and gold served a number of functions. It could add humor, deliver insults, be used as a way of sending information privately, and also function as a safety valve when open speech could be very dangerous (Levine 1965, p. 9). Yet, as Levine asserts, wax and gold is not just a method of communicating; it is a way of life: ambiguity is the core of traditional Amhara life with words routinely having double meanings and utterances constantly interrogated for underlying secrets.

Any interpretation of data must be aware of potential double meanings within the use of language. Levine goes on to argue that wax and gold might be considered as both an opposition to the modernization of Ethiopia and yet, at the same time, a vital part of that modernization. However, by 2007, Levine's position was much more negative: that the habitual use of ambiguity through wax and gold serves as a source of deep distrust in the society, the "endemic suspiciousness" that he saw as the root of Ethiopia's inability to make peaceful, democratic change (Levine 2007). Messay Kebede (1999) criticizes Levine, suggesting he does not emphasize the notion of wax and gold, but rather stresses the importance of authority in Amhara society. He complains that Levine's analysis only raises ambiguity and duplicity, being used to support James Bruce's (1964) claim that "dissimulation, in all ranks of these people, is as natural as breathing" and that he fails to identify any positive qualities (p. 181). This, he argues, does not articulate with other aspects of Amhara culture such as their complete lack of dissimulation in the area of authority which is displayed "ostentatiously" and "without courtesy" and their deep adherence to

religion, especially Christianity. Rather, he suggests that wax and gold might have its roots in religion itself, in trying to find the deeper meanings and spiritual mysteries beyond the religious text itself. He links the tradition to Western ways of thinking by reference to the allegory of Plato's cave in which the chained prisoners who can see only shadows, once released and shown their source from the fire, would in time increase their knowledge and concludes that the wax and gold process is quite near to this principle (p. 182).

Whatever their differences, Levine and Messay both agree on the profound impact wax and gold has had on Ethiopian culture. Within this context, correctly interpreting meaning from data required the insider's understanding of the tradition, that what is said may well contain far more hidden meanings than might normally be expected by people (including critical friends) from outside the country. As an experienced insider, Amare was able to lead us through this difficult terrain, explaining the workings of *Kene* and *Wuste Weira*, illustrating the ambiguities in practice through the data.

Conclusion

Leadership and organization in the Ethiopian case study suggest the absence of distance between the state and the university. By claiming a responsibility for political change, the revolutionary university had extended itself to the state. Not only through its criticisms but also through its violent actions, it represented a threat to the freedom of the state to govern. In this way, the university had prepared the ground for its destruction by the state. As the university denied the freedom of the state to rule, the state had also denied the university independence (of the state), institutional autonomy, and academic freedom.

It is believed that academic freedom and institutional autonomy are necessary conditions for the practice of higher education—teaching, research, learning, and public service (Bligh 1982; Goedegebuure et al. 1994; Finkin and Post 2009). Realizing these qualities, however, demands a common vision between the state and university and about the definition and validation of knowledge. In this connection, Mazrui (1978) said:

What a university owes to government is neither defiance nor subservience. It is intelligent cooperation, respecting the academic's right to be skeptical without being subversive, sympathetic without being subservient. (p. 275)

It demands a deliberative culture where everyone has the right to participate freely in debates and conversations using reasoned argument supported by evidence and respecting the freedom of others (for free conversations) without resort to the use of power. This Ethiopian case study demonstrated an excessive use of power to resolve political and epistemological problems. A serious problem observed with the academic community and, of course, with the state is adherence to the belief in and commitment to a single truth as if this truth were a certainty. A culture of tolerance that emerges from the recognition of the existence of multiple truths (or at least multiple

(continued)

perspectives on truth) appeared to be alien in the Ethiopian academic culture. The epistemology of a single authoritative truth or a strong commitment to one's own truth was the single most important epistemological constraint in Ethiopia that sustained a poor intellectual culture over the years. This problem still continues to destabilize and de-intellectualize the university.

The historical study explored in this chapter recognized the power of narratives to not merely describe the world but to construct it (Kincheloe and McLaren 2003, p. 441). It rejected the possibility of a single authoritative truth and sought, instead, to recognize the multiplicity and complexity of the different narratives constituting the overall narrative. The irony of this can, perhaps, be seen as an instance, recognized through academic study, of the Amharic notion of *sam-enna warq*—the “wax and the gold” of surface meaning and hidden intent that shaped the narrative interpretation of the histories that were told.

1.2 Interpreting Street Narratives of Children and Parents in Indonesia

Sophie Dewayani

This chapter provides a methodological reflection on the researcher's role in narrative inquiry when approaching marginalized, stereotyped, and underrepresented communities. Particularly, my inquiry focused on two questions:

1. In what ways do the participants construct their identity in relation to the researcher's approach?
2. What is the role of interpretation in understanding participants' narrative construction within the power relations in Indonesian society?

The Research Project

The context of the study includes an overview of the issue of street children in Indonesia, the societal narrative about street children constructed by the government and the media, and the theoretical framework of the study. I present the street narratives and describe the data collection process. Further I justify the discourse analysis approach that I employed as well as discuss its contribution to critiquing the wider meta-narrative constructed about the street culture in Bandung, Indonesia, by the dominant culture. While my participants rarely provided me with extended narratives about their lives on the street or their short periods in the public schools, their discourse overtime provided a cumulative narrative, what I am here calling an evolving meta-narrative, about their lives and perspectives related to the dominant discourse about them. This narrative contrasts with the dominant discourse about them. Their counter voices represent Bakhtin's "carnival" (Bakhtin 1981)

S. Dewayani (✉)

Bandung Institute of Technology, Taman Bumi Prima K-6, Cimahi West Java 40513, Indonesia
e-mail: sofhani@gmail.com

in which the dominant values and truth are being contested by normally suppressed voices and energies. The street family narratives in this chapter are understood using a framework of Bakhtinian dialogic (Bakhtin 1981) in which participants respond in ways that reflect their social positions (Wortham 2001):

“What do you think? You like it?” The lady, one of the orphanage committee members, asks an eight-year old girl from Pasundan. “You will like it here. Lots of nice friends, books, toys, and you will go to a nice school.”

The girl smiles shyly. We walk back to the living room, but instead of sitting on an empty couch or rugs, the parents prefer to sit down on the cold ceramic floor. The lady asks them to move to the couch, but they decline, arguing that they like the cold floor better.

“So what do you think?” the lady asks a father. “Sending one of your daughters here will make things easier for you. You do not have to worry about one more mouth to feed. Look at this girl [she points to one of the orphanage girls]. She came here dirty, shabby, and skinny. But look at how chubby and clean she is now. Don’t you want your daughter to be like that?”

The father nods and smiles politely, “I guess I want to but [.] I’ll think about it,” he says.

The lady replies, “You have time to think but please consider what’s best for your children.”

“Will we be allowed to visit our kids?” a mother from Pasundan asks.

“Of course, but after some times. Please consider that your kids also need time to adjust. After a few months, then you can come for a visit Oh, kids are just like that, don’t worry. They have a hard time when they come, but if you endure [not to visit them while they’re still adjusting], they will get over it. They’ll like it here. This one [mentioning a name of a girl] even didn’t want to go back home during the *Eid* break. Even when she’s at her family’s home, she couldn’t wait to go back here,” the lady laughs. But none of the parents laugh.

“What if she forgets about us then?” the mother asks again.

Oh, of course not. We always teach the children to obey and respect their parents. That’s the way it is in Islam, right?

The vignette above occurred on a hot afternoon in an orphanage in a middle-class neighborhood in Bandung. It took place when the orphanage committee invited some “street families” in Pasundan. The purpose was to see if the children would be interested in living in the orphanage, which was described by the committee lady as “a much better home.” A day following the families’ visit, I asked a social worker, who happened to join the visit, whether any of the parents accepted the offer to have their children taken care of at the orphanage, to which she replied that the father (in the quote above) was worried that his daughter would not recognize him as her parent. “[After living there] What if she’s embarrassed having me as her dad. Will she ever want to live in this house, in this slum, again?” the father told the social worker as he declined the offer.

In what follows, I present street narratives in an evolving dialogic context that involves me, the researcher, the street families, the NGO working with the street families, and the dominant Indonesian society, as represented by the government and in the media. These interactions reflected a dominant discourse that situated the street community, my narrators, on the margins of society. I define street narratives as stories constructed over time in and about the street, by families working in the street intersections. The Indonesian government labels the families, living in Pasundan, Bandung, as “street communities.”

The narratives in this study are focused on the children's schooling, constituted of conversations from the children's, parents', and tutors' perspectives. During 6 months of intensive fieldwork, I spent time with the street families and was involved in the communities' conversations. I also approached the orphanage committee members in the neighborhood where I live, who conducted charity activities such as distributing food and other basic needs to the Pasundan street community as well as inviting the children to stay in the orphanage. I listened to their opinions regarding the street families. This ethnographic approach involving various groups, situated within the government's policy toward street children, provided me with a complicated picture of a meta-narrative bringing together their opinions about schooling within a larger sociopolitical and discursive context of Indonesian society.

From the perspective of the dominant group, families were enacting abusive parenting by allowing their children to drop out of school and work in the streets; in contrast, the parents valued education strongly even as their children worked in the streets. In my research I show how the street children and their parents responded to the dominant narrative by deliberately distancing and dissociating themselves from this stereotyped portrayal.

About the Study

This chapter uses narrative inquiry to capture the diverse perspectives surrounding the issue of child-rearing practices, particularly related to how Indonesian street families allow their children to work in the street. The backdrop for the study is the government's policies as well as the dominant society's perception of them. This chapter documents narratives constructed by children and their families, mostly in street settings. Unlike the conversation in an orphanage above, the street settings allowed parents and children to offer an alternative meaning to the dominant society belief that the street children were abandoned and exploited.

I came to realize the discursive nature of this particular context when I asked the Pasundan resident participants in my fieldwork: "What do you do for living?" I asked this question because they and their children rely on street work such as begging, dusting stopped vehicles, selling knick-knacks, and playing music as the traffic lights turned red at intersections to support their daily living expenses. To my surprise, I did not receive descriptions of the aforementioned jobs, but instead the common answer was *serabutan* or "miscellaneous." "Miscellaneous jobs" entail temporary low-paid, on-demand jobs, which may include temporary security jobs, street cleaning, lawn trimming, or housekeeping. The basic notion that characterizes these jobs is temporality. I initially understood the street family responses as a way of obscuring their identification with the "street community" constructed by the government and the nongovernmental organization (NGO) that assisted them. My participants interpreted what I assumed to be a neutral question soliciting demographic information as a judgment of their situation. This complicated my

initial participant selection method. If they did not want to be identified as members of the street community, would they be willing to participate in my research?

Even though the term *serabutan* can include street jobs, it is commonly associated with off-street jobs by the street community. Thus, I eventually came to the conclusion that the self-identified *serabutan* jobs referred to the participants' wish for job positions. However, such opportunities were rare, so in order to make ends meet, the parents and the children spent most of their time working in the street.

This study involved the narratives of seven children, as well as their parents, who worked as street dusters and musicians in the street intersection near where they lived in Pasundan, Bandung. The Rainbow Foundation, an NGO that assisted the families in literacy learning, facilitated my access to the families. The literacy learning was part of the Indonesian government's campaign to reduce the number of children working in the street. The government, in the 2010 Social Ministry's Children Social Welfare Program, asserted that sending children to school, rather than allowing them to work in the street, was their attempts to fulfill the children's basic needs.

Tujuan program bagi anak terlantar dan anak jalanan adalah bahwa orang tua/keluarga tidak menelantarkan anak (memberikan perawatan, pengasuhan dan perlindungan bagi anak) sehingga hak-hak dasarnya semakin terpenuhi, serta anak tidak dieksploitasi untuk tujuan mengemis/meminta-minta. Selain itu, bagi anak jalanan tidak lagi melakukan aktivitas ekonomi di jalanan, anak kembali sekolah. [Translation: The purpose of this program is that parents/families do not abandon their children. This can be done by taking care of, nurturing, and giving them protection so that their basic needs can be fulfilled. In addition, children should not be allowed to beg and work in the street, and parents should make sure that children return to school].

Children who work in the street comprised 2.8 % of the child population nationwide in 2009. Of this, there are as many as 8,000 such children living in Bandung, the capital of West Java province, with a population of 2.4 million. The Indonesian Social Ministry reported that poverty is the major factor causing children to work in the streets. Data released by the Rainbow Foundation confirmed that urban slum residents living near the main street intersections contributed the majority of the street children population in West Java.

The existence of families as the basic unit of the children's street activities thus differentiates the participants in this study from those in Yogyakarta, Indonesia (Berman 2000; Beazley 2002a, b), who live separated from their families. In Bandung, street children not only live with their families, but the data also reveal that children as young as 6–15 years old often functioned as the economic backbone of the families due to the parents' unemployment.

Children's participation in working for their families can be traced back to the history of child labor in Indonesia. Studies showed that Javanese children were considered economically valuable as they worked with adults in agricultural activities in rural areas (Nag et al. 1978). Children participated voluntarily in both paid jobs and domestic work. This was confirmed by Koentjaraningrat's (1989) findings that children were viewed as beneficial in Javanese families. Societal perception concerning child work, however, has shifted. While child work in the past had been valued and considered to improve children's sense of responsibility, child

labor—including work in the streets—is currently viewed as exploitive as evidenced in the government’s policy and the dominant societal view. However, as my interviews revealed, the street families themselves did not see it the same way.

In an attempt to assure child protection, Indonesia, along with many other developing countries, has ratified the United Nations Convention on the Rights of the Child (UNCRC) (Fink 2004) and the International Convention of Child Labor. This convention prohibits children from working in hazardous workplaces, such as streets. In addition, the government, as reported by the media, circulated a notion that children have been forced to work in the street by their parents. According to the media, parents do this with the purpose of evoking people’s sympathy. Following this claim, the government intervened in parental decisions by distributing educational funding to some families with the condition that parents would prohibit their children from working in the street. In the following section I present some social stigmas concerning street children and their parents, which serve as the context for the construction of the street narratives in this chapter.

Societal Narratives Concerning Street Life

Are they [the children’s activities in the streets] organized by adults?

This question was often asked by my neighbors, residents in a middle-class housing complex in Bandung, when commenting on my research participants. Being “organized” referred to the possibility that adults forced the children to work. The prejudice that children are organized to work in the streets has obscured the issues of poverty that these children’s families are experiencing. Working in the street has been viewed by the dominant society as a sign of apathy and laziness, often associated with the “culture” of poor people. It was commonly believed that instead of competing in the job market, poor parents would rather take advantage of their children’s innocent looks to earn money in the streets. Furthermore, it had also become a popular assumption that giving money to children in the street perpetuates a “begging habit,” a mental state attributed to poor families.

“Come home my dear children, the street is not your place to work and play,” the government called out to the “street children” through street billboards. Even though many children in the street were living with and being taken care of by their families, the government considered them “lost” and living in an “inappropriate” space. “Street” reflected the contesting discourse of childhood and thus served as a domain in which the government and the dominant society dictated to poor parents how they should properly raise their children in order to better develop the future nation state.

One of the ways the government responded to the suspected “child exploitation” was by conducting “street people” roundups. The authorities usually targeted women carrying babies with a suspicion that the babies were rented—with some money paid to the biological mothers—for begging purposes. It is also assumed that

the street children's "bosses" supervised these children's activities from a distance (Winarno Detik Online News July 8, 2010, para. 8). The media also reported that the syndicate transported the street people from their village in the outskirts of big cities such as Jakarta and Bandung in trucks (Haryanto, Detik Online News, para. 6). Further, the Social Minister warned that charity would perpetuate a "poverty culture." He argued that it would be better to give charity to orphanages rather than to the street communities (Widhi Detik Online News, August 10, 2010, para. 1–2).

Having shaped societal perceptions toward the poor families' attitudes and behaviors, the Indonesian media perpetuated Ruby Payne's stereotype of "the culture of poverty." The use of vocabulary such as exploitation, crime syndicate, deceitful, and laziness has developed dominant society stereotypes that negatively judge the mental state, work performance, and parenting approach of families living in poverty (Bomer et al. 2008).

The same stigma was further embedded in government policy documents. For example, the Presidential Instructions (number, 3 and 10, 2010) regarding children's welfare and social development indicated that parents who involved children in the family's income-generating activities were violating the law. This policy implies that caregiving practices in low-income families are situated in a public domain, and therefore open to be evaluated and examined by the government through the use of legal instruments. The childcare practices, and further the conception of childhood, were assumed to be singular (Jenks 2004), as children from low-income families were prohibited from participating in a family's economic activities. Yet throughout the nation, children did participate in society but in ways defined by the dominant groups.

The community's parenting practice became a space where society should intervene. Street children were to be "cared for" as if they were the society's children. The "rights" and "child care needs" of these children were appropriated by state agencies and the society through the enactment of laws, policies, and practices in ways that subjected children to state control.

State institutional control further embodied the international pressure and universally accepted conception of childhood formulated through, to name a few, the United Nations Convention on the Rights of the Child (UNCRC, see, e.g., Fink 2004) and the International Convention of Child Labor. White (1994) points out that pressures exist in economic sanctions and boycotts that are used to "bully" developing countries into ratifying international conventions on child labor and rights. Hence, the so-called street children in developing countries are under the gaze of the international society through discursive practices that Foucault (Rabinow 1984) would consider "disciplinary techniques." These include institutionalized regulations, administrative measures, scientific statements, as well as societal perceptions embedded in the interactions with street children and their parents. The street families are thus marginalized by state policies as well as the global discourse on childhood. Thus, international forces may have played a bigger role in national policy formulation than the seemingly political will to educate street children or eradicate poverty.

Framework of the Study

Narratives range from life histories and stories of selves to solicited interview responses. Along with these options, there has been a shift from *content* to *context* analysis (Riessman 1993) using narrative to understand particular cultures and social structures. The study of the narratives of marginalized groups focuses on the power relations embodied in issues of inequalities, oppression, and social injustice, which are often silenced and/or taken for granted by dominant groups in a society. The street narratives revealed the situated cultural practices, the nature of interactions between the street community and the researcher, as well as the power relations in the society that have situated the “street” as a marginalized space.

The street narratives I gathered were not given in the form of life histories or interview responses. Children and adults in the street community did not tell elaborated stories about their lives, at least not to me. There was only one adult participant who told me extensive narratives. Positioning of herself as the storyteller, however, was not typical and tended to be enacted only by “respected” figures in the community. My data were more snippets of discourse collected over 6 months while in the midst of the street families activities, particularly within the context of the work of the NGO working with the street children.

I employed Fairclough’s (1989) discourse analysis framework to examine the discourse reflected in the language switching, vocabulary, and rhetorical strategies used by the participants. Fairclough’s approach to analysis reflects the idea that language and discourses embody ideologies and therefore constitute social identities, social relations, and worldviews. The researcher seeks to understand how discourse is enacted and organized as practices that reflect class structures within a society, in this case those who have and do not have access to economic resources and power. My research investigated my participants’ embodiment of societal structures, related to what Foucault (1984) deemed the production of power and knowledge, which in this case allowed for the confinement and objectification of street children in particular ways through policies and dominant Indonesian society discourses.

Participants’ attitudes in constructing their narratives thus set the research in a different light than was evident in the narrative research with homeless participants conducted by Snow and Anderson (1987). The homeless participants in this research provided elaborated narrative responses reflecting distancing, embracement of selves, and fictive storytelling. Although some features of identity constructions were similar in my study, the participants in the Pasundan street community situated themselves primarily within the moral landscape of parenting practices.

There has been growing attention in educational research to the narratives of underrepresented populations (Corsaro and Rosier 1992; Dyson 1993; Goodwin 2006; Heath 1983; Hicks 2005; Labov 1973; Michaels 1981; Miller 1994; Newkirk 2002; Yosso 2006). These studies define “underrepresented narrators” as those whose narratives have been devalued, especially by school systems and the dominant culture. The researchers call for more attention to the diverse modes of children’s language diversity and for schools to provide a nurturing space for children to develop their communicative competence.

My research is also related to studies of children's narratives investigating how children are socialized into narratives at home, school, and other social settings where adults play various roles (Howard 2008; Miller et al. 2002; Sandel 2003). Miller et al. (2002) studied how adults organize their narratives around the cultivation of self-esteem or shame in a moral landscape. Through documenting adults' narratives of parents, teachers, and NGO social workers, I was able to describe a framework of moral values into which the children were socialized. Moral values were reflected in their narrative discourse about schooling and working.

Some studies have investigated the voices of street children in Indonesia as counter-narratives. Berman's ethnography (2000) of street children in Indonesia revealed that the street children construct a discourse of violence as a strategy of survival. Berman studied the written narratives of 10–17-year-old street children that were published in a bulletin. Their writings reflected their evaluations of power enforced by authoritative adults in which they initially portrayed themselves as victims. Berman argued that the street children's stories provided a means of sharing survival strategies. She demonstrates how they transformed their conceptions of self, moving from victim to author. Here, narrative served as a means to portray a new agency in a situation where their access to power was limited.

A study by Beazley (2002a) revealed how another group of Indonesian street children used narratives to mark and identify the spatial boundaries in relation to their comfort zones. Having lived with peers on the street, the street children emphasized in their drawings and maps places such as traffic lights, bus terminals, railroad, and other public spaces that served as their territories or hangout sites. They excluded certain spaces where they had experienced verbal abuse, evictions, arrests, beatings, and tortures by the police officers. The fact that street children used narratives and mappings to conceptualize their territories demonstrated the interweaving of cognitive and narrative competence in constructing their identities.

Studies of counter-narratives that challenge dominant narratives bring previously devalued narratives of minority children to academic attention. They shine a light on the issue of those who are marginalized. Counter-narratives reveal how marginalization is unconsciously pervasive and maintained in a society and the impact it has on the construction of minority and nonminority children's identities. Marginalization emerges in different forms across cultures. For example, while schoolchildren's narratives in the USA reflect how they negotiate the power structures inherent in school curricula and peer relationships (Corsaro 2003; Dyson 1994, 2009), Indonesian street children's narratives in these studies revealed their struggles with government officials' violent treatment in everyday life (Berman 2000; Beazley 2002a, b).

In a Bakhtinian (1981) perspective, the counter-narratives are responding to the "unitary language"; counter-narratives decentralize dominant ideologies. The unification of language creates a "social heteroglossia" (p. 271) within which diversity is built, reflecting dynamic and even conflicting linguistic forces. Taking a metaphor of a novel as a "mundane reality," Bakhtin's dialogical notion represents the complexity of narratives as a means of understanding self, the relationship of self

and others, and the connections of self and the world. Within this complexity, the self is constructed dialogically by acquiring internalized cultural norms or producing agency, by receiving or resisting. Self is a site where dialogic forces occur through the use of language. The parents and street children created a “social heteroglossia” within which I conducted this research.

One part of the wider heteroglossia is “the societal narrative,” that is, the dominant circulating narratives concerning street children that served as a context for the street community’s narrative. The dominant discourses, which are embedded in the Indonesian media and the narratives of a middle-class group of society, were analyzed to describe the larger discursive contexts (Gee 1989; Riessman 1993). My focus of situating the children’s perspectives within the societal narrative extends studies of Indonesian street children’s narratives conducted by Berman (2000) and Beazley (2002a, b) that focused on the discourse embedded in the children’s narratives alone. By framing the street narratives in the wider social context, it is possible to illustrate how narratives respond to and resist the dominant narrative concerning children working in the street.

Informal Literacy Learning

The informal learning activities organized by the NGO foundation were intended for children who had dropped out of formal elementary schools. In addition, the foundation helped children return to formal schooling by enrolling them in schools, providing school supplies, and helping them with their homework. The narratives from the children and their parents thus were situated in a context where most child participants had experienced some formal schooling and were attending informal literacy learning organized by the Rainbow Foundation. There were only two of the children, however, who attended an elementary school in the mornings before they worked in the street.

The informal learning was conducted on the street median, sidewalk, parking lot, or any space in or near the street intersection where the children wished. Assisted by tutors, literacy assistance included math, copying writing, and learning to read. The nature of learning reading, writing, and math was mechanical; children were given textbooks or problems corresponding to their competence levels. As these competence levels varied depending on how long they had been out from schools, almost all instruction was conducted one on one. In addition to the mechanical literacy instruction, writing composition was included once in a while. Rainbow tutors regarded writing composition as significant for facilitating children’s organization of thoughts and ideas. Furthermore, writing helped to maintain penmanship, vocabulary, and reading skills.

Despite being valued by tutors, writing composition was considered difficult by most children. The writing assignments tended to produce children’s groans, “Oh, that’s difficult!” to which the tutor replied by providing encouragement: “Of course you can do it. It doesn’t have to be long. Just tell a story.” Even though the children

were asked to “just tell a story,” most children did not start to write until the tutor modeled what they could write on certain topic.

Despite the reluctance in the beginning, the writing process itself occurred in a permeable, relaxed environment. Children were free to move from one spot to another on the sidewalk, and they were allowed to chat and ask or teach their friends. One day, I caught Santi (a seventh grader) dictating sentences for Ellis (a 10-year old) to write. Ellis seemed to be confused when listening to Santi’s sentences. And noticing this, Santi grabbed Ellis’ notebook and wrote for her.

The topic for composing writing ranged from daily experience to specific topics, such as “What do you want to be when you grow up?” The following is Idang’s (a 14-year-old boy) writing in response to the latter topic.

In the future I want to become an artist because I like to paint I want to be admired by
people I hope when I grow up I will be a successful artist, amen
May God grant this [wish]
Pray for me please. . .

Despite dropping out of fourth grade 4 years ago, Idang wrote that he wanted to become an artist. The direct communicative strategy that he used to conclude his writing signposted an oral communicative style, which was sometimes used in writings intended for others, demonstrating that he wanted to reach the readers. As they were writing that day, for example, Ima, the tutor, explained to the children. “For instance, you want to be a doctor [then you write] why you want to be a doctor. So you can help people. You can cure people. Like that.” Thus, although guided in writing their compositions, the children did compose their texts. However, there were aspects of copying in the children’s writing, which dominated both formal and informal literacy learning in elementary grades. This was evident in children imitating the tutor’s example as well as following the style of more capable friends. This is also typical of emerging writers where they use the writing and skills of others to scaffold the development of their own text.

Selecting the Participants: Moral Landscape and Identity Construction

Fini, a 15-year-old street musician, preferred to work in the street at night because, she said, “It feels cooler at night, and it’s less dusty too.” Responding to this, a social worker from the NGO, Yuma, commented, “She’s embarrassed to be seen on the street at daytime. She can’t stand people’s stares and everything.” Most of street girls I observed generally quit working in the street by the time they turned 15. The social workers testified that shame figured into personal decisions about working in the street. Street activities were considered “appropriate” only for little children. When girls reached 15, they were expected to work for a regular income, such as working in factories.

Another street norm was the moral boundaries separating working and begging activities. Dusting cars or *ngelap*, even though it consisted only of some light strokes on the cars, was considered “working.” Similarly, *ngamen*, which was singing while clapping hands or playing simple music instruments, was considered “working.” Working was regarded as respectable. Begging, by contrast, was associated with sluggishness and thus embarrassing. The justification for this contrast comes from Islamic belief. Working is viewed as part of spiritual deeds that God will reward in the hereafter. A prophet saying even equates hard work with fighting in a battle; a death while doing hard work would grant one paradise in the hereafter.

The street norm contrasting working and begging figured into how participants wanted to be framed in my research. Participants did not want to be caught begging in the street. Begging was usually an activity participants did far away from the Pasundan area where they lived. For example, I saw some participants begging when I was in the Bandung downtown 10 km from Pasundan. Social workers gave me additional information about my participants’ begging activities.

Hildred Geertz (1959) discusses the complexity of the conception of “shame” in Javanese culture as reflected in vocabularies describing its intensity; *sungkan*, *isin*, and *saru* all represent embarrassment at different degrees, from the mildest to the most intense. In my research, the concept of shame was a silent voice undergirding practices and collective choices. Begging for money was embarrassing (*isin*, or even *saru*), particularly for parents because it showed they were not able to meet their children’s basic needs. In addition, allowing children to work in the street was viewed by the dominant society as the parents’ failure (at the same level of *isin* or *saru*). The feeling of embarrassment of the parents was apparent as they interacted with me.

As my fieldwork unfolded, I found “shame” an invisible thread woven in the “webs of significance” (Geertz 1977) of street cultural practices. It was embedded in one of Yuma’s comments on Fini’s decision to work at night as I noted above. “That’s the thing you can’t get from just asking. She may answer one thing, but then at another time she tells you something different. I just knew that. She used to tell me everything,” Yuma, from the NGO, told me. Regarding why other children older than 15-year old generally stopped working in the street, especially in daytime, was related to shame. Many Rainbow facilitators who have been working with these children for years confirmed this.

Yuma was a street girl herself when she was a child. Thus, the notion of “things we can’t get just from asking” may resemble her insight of having experienced a feeling of being marginalized. In addition, it represents the depth of cultural patterns in which “moods, motivation, affects, and activities constitute symbolic interrelation in the cultural system” (Sewell 1999).

Wikan (1984) claims that “shame” applies to an act and that it is ascribed through social interactions. I found that shame was situated within a particular context of interactions. Participating in casual conversations, attendance community events, and listening to participants’ opinions about others helped me to understand the depth of shame embedded in their decisions and behaviors. As a qualitative researcher, I also understand that shame reflects the larger dimension of societal moral landscape, which generally devalues the practices of the marginalized community (Ortner 1999).

Negotiating the Membership of the Street Community

I asked one of the mothers how she would feel about having her children described as “street children.” “*Nyeri* [It hurts inside],” she answered while tapping her chest. The term “street children” is a common term used by outsiders, including the media, government, most street users, and academic scholars. Despite the fact that a majority of children in Pasundan work in the street, the local people and the NGO staff members rarely addressed them as “street children.” Rather, “children who work in the street” was the term used to distinguish them from those who did not. The West Java governor defines “street children” as “children who constantly wander around in the streets or other public places for at least 4 h in a day, each day, for at least a month” (retrieved from the official governor’s website, May 2010). This definition would apply to children who spent their time playing in the street or young children who had to follow their parents who work in the street. All purposes of going to the street, for economy and leisure, fell under the NGO’s definition of children who “have been in and potentially go to the street and therefore are in need of assistance.” Within what the society considered “the street community,” I found membership was negotiated; members constructed boundaries by drawing distinction and similarities.

Mari: I never care for [how much] money my children get. . . I’m here because there’s a lot of bad influence in the street. . . Kids over there are much older, they *ngelem* [sniff glue] and everything.

Mari, whose four out of eight children worked in the street, countered the common notion that parents were present in the street in order to ensure that children would obtain a certain amount of minimum income. Mari explained that it was her parental responsibility to be in the street. In addition to distancing herself from the stereotypical notion of a parental role attached to the street community, she also separated herself from the children occupying the other side of street intersection who worked beyond the “supervision” of their parents.

The social stigma also affected the Pasundan residents who were economically vulnerable—those who met the government’s criteria of “street community”—but never actually worked in the street. One day, one of the children, who was in grade ten of high school, was asked to represent the Pasundan community in a Bandung government-funded Children’s Forum meeting. The foundation had complained that the forum had been “an exclusive gathering only involving chosen mainstream kids from public school and gave only limited space for poor and street children.” After several attempts to negotiate, the foundation was allowed to send a “street child” to attend the forum. The decision then fell to a schoolgirl, a member of Pasundan community, who never worked in the streets.

The next day, the mother told me that after returning from the forum, her daughter was annoyed. She reported, “My daughter doesn’t like the way they questioned her. It’s like they have their thoughts about street children first and they expect my daughter to fit into that. My daughter doesn’t know much about street children’s life, she’s not one of them.” The mother was countering the

generalized social and media-constructed assumptions and making distinctions about who should be identified as street children.

It was challenging in my research to decide who would be categorized as members of this “street community.” I found the boundary of the street community to be fluid. Some community members distinguished themselves from the community in pointing out the negative practices of others. For example, one mother said, “You may want to talk to so and so whose children go to the street because my children do not,” while in fact I happened to see the narrator’s children working in the street. Some parents revealed that they worked in the street whenever donations, intended for those “working in the street,” were distributed in Pasundan.

At first, I relied on the demographic information provided by Eje, the head of the community. There were about 116 families listed in the Pasundan community database. Eje anticipated that this was less than the actual number due to high mobility and migration. Seventy percent of the families were suspected of working in the street. Eje, the head of community, admitted that the occupation information was gained through personal observation. He explained that he went to the Pasundan intersection to see who was working once every 2 or 3 months because the data changed frequently.

In the research I used the term “Pasundan community” to include, but not be limited to, families living in the Pasundan neighborhood who worked in the street, either on a daily basis or seasonally, based on the information I received from Pak Eje as well as my own observations. My definition of the “Pasundan community,” therefore, was not informed by an administrative or geographical conception but by a sociocultural one. I also included information that I obtained from the social workers to understand the community demographic information. In interactions and interviews, however, only those who seemed to be interested in participating were invited. I was aware that my role as a scholar could serve as coercion. Therefore, I looked for participants’ gesture and unspoken messages while we were talking to reflect their potential willingness rather than asking for verbal approval. I do not intend to say that those willing to participate were receptive to the societal notion of the “street community.” As my research revealed, they employed constructed meanings of street norms that contradicted the dominant society’s beliefs about their street behavior.

Data Collection

I came to the field bringing a genuine curiosity about the participants’ experiences and perceptions of children’s schooling. While I was aware that the theme of schooling might marginalize my participants in some ways, I was equipped with a list of questions that guided the way I observe the street activities and how I would interact in the street community. I was cautious about the possible roles I could enact. Should I imitate the didactic, directive roles of the social worker, or should I enact the permissive role of a “friend”? I did not assume that the social workers

were judgmental toward the street community they were assisting. Having served as literacy tutors, the social workers carried their own institutional agenda; I brought a certain “agenda” too, i.e., my research questions. My dilemma was how to make this agenda fit an appropriate approach, given the character of the community and their cultural beliefs.

The choices for my roles, however, were confined by procedures of research ethics. For example, the human subject protection’s protocol required me to introduce myself as a researcher on the first visit. The initial approach to research participants then entailed explanations of research procedure and how I would position myself within the street activities. The most distancing part of this was revealing my identity. As I had expected, my participants looked amazed and anxious at the same time. I felt a distance grow between us. Finding this reaction, I decided to stop telling them about my education, specifically, the US university where I was a doctoral student.

The spirit of a literacy campaign was apparent when I visited participants in the intersection and in their houses along with the social workers. The social workers would remind children that they should study and that it was important that they return to school. Parents asked the social workers about short courses and the schedules for equivalency exams. Trying not to be intrusive, I just listened to the conversations and wrote them down. The following is an example of a conversation between a social worker, Sri, and Emi, a 15-year-old girl.

Sri: When did you start *ngamen*? [*translation: street work, particularly singing*]

Emi: I started *ngamen* when I was about 3 or 4 years old. It’s on my own will. My parents didn’t know that I went. I remember my mom asked me where I got my money. She got mad when she knew it’s from *ngamen*. I was only four. I didn’t care. I just wanted to make them happy.

Sri: Who took you to the street back then?

Emi: I was just by myself.

As I was negotiating my role during the first visits, my preconceived notions about the community’s perception toward education were challenged. Parents and children regarded education seriously, and children often expressed their wish to return back to school. This contradicted the dominant notion that the street families had little interest in education. While social workers kept reminding parents and children of the importance of formal schooling, the issue of *why* schooling had failed these children remained untouched. Participants’ limited access to schooling was seen as a problem, and yet the root of the problem, the fact that they are living in poverty, was left unsolved.

Conversations addressing education entailed discursive contexts that situated participants as failures. I found that the participants felt marginalized when it came to the topic of schooling. For example, when responding to a social worker’s question of why her son had missed school, Udin’s mother provided an extensive answer that sounded defensive.

He [Udin] keeps wanting to go to the street. . . I told him that his teacher would be looking for him [if he misses classes, but he insists on skipping school]. I don't know. He got a lot of friends [in the street]. Maybe because he feels sorry for me too. His dad is unemployed. He is the one who wants to [work in the street]. "Now [I have to admit] that the whole family depends on him [Udin]. I don't like [the fact that it happens that way] but what can I do?"

Children were encouraged to enroll in schooling, and yet the school curriculum and the social stigma embedded in school interactions, which partially figured into children's detachment from school, were never taken into narrative. This is evidenced in a mother's explanation of why her daughter, who was 15 at that time, quitted school 7 years previously.

Rika quit school at third grade . . . She's embarrassed. Her friends kept teasing her. Telling her like, ooh, you're in the street. So she told me, "I'm embarrassed, friends keep teasing me." I told her nothing to be ashamed of. But she can't stand it. I don't know why only she was being teased while there were a few other friends who went to the street too. I don't know . . . But the teachers were nice. I never heard that they told her that thing. Even in school break she was invited to one of teachers' home and was advised to return to school. But she insists on not going.

Parents' defensive responses shown by, for example, demonstrating their attempts in preventing their children's dropout appeared to me as anxiety toward the topic of schooling. My research aimed at documenting this anxiety, and yet, being a qualitative researcher, I was committed to conduct my research so as not to marginalize my participants (Wolcott 2005).

This was when I was struggling to determine how I should interact with my participants. I did not want to use an authoritative voice because I was still an outsider. A researcher, however, can never be neutral; neither can her relationship with underrepresented participants be equal. I was conscious that my background might encourage them to try to conform to what they thought was my personal opinion regarding education. This justified the naturalistic inquiry I chose. I sat down among mothers, listened to their stories, and showed support and approval of their opinions. I shifted the conversations into my interview protocol carefully, only if they provided me with elaborative and enthusiastic responses.

On the first visits in the street, I observed and documented conversations involving the participants and the social workers. Since the relationships built among the participants and the social workers were based on education issues, conversations about schooling were common. In the first weeks, I came to the intersection two to three times a week for the observations. Additionally, I selected some parents who were willing to share their stories.

Most of the time, the conversations were conducted in a group. I found that the participants were more relaxed when being interviewed in a group. There were some participants, though, whom I visited at their homes. These were the parents and children with whom I developed a closer acquaintance. With these participants, I asked them to elaborate their stories related to their children's experiences at school. Sometimes, the children were present and added their stories too.

All participants were aware that all conversations were recorded. In personal interviews at home, I asked permission to record their stories. In the intersection,

I noted in the first meeting that I would have my recorder on every time I met them. Due to the noise level in the street, the audio quality was not always good, so I wrote notes once I got back home from the field.

I believe that there is no such thing as objective observations. My educational background and my perceptions framed how I interpreted the cultural practices in the street. My subjectivity as a researcher was also partially enabled by reflections and analytical comments I added in the margin of my field notes. In order to control the authoritative voice of my perception, I discussed my theoretical comments with the social workers and key informants to see how their experiences and insights might challenge or confirm them. In so doing, I saw the analytical process as naturally emergent from a dialectical process between occurrences in the street, my theoretical frameworks, feedback from the social workers, and the participants' perspectives. Here, I found interpretive work a co-constructive process, enabled by my subjectivity, the social workers' experiences and perceptions, as well as the participants' subjective understanding of what they are and what they do.

In trying to offer a context with which to understand the street community's narratives deeper, I also provided the narratives of Rainbow staff members as well as those of a middle-class community, an orphanage's committee, I happened to know. I was aware that these narratives constituted the ways in which Indonesian society constructed their perception toward the street children, in addition to government's policy and news article I had collected. I obtained the Rainbow facilitators' narratives through casual interviews and journals I collected with their consent. In the meantime, the orphanage committee's narratives were documented in observation notes during their interactions with the street community.

The Role of Interpretation

One element that constitutes the "art" of doing the fieldwork is a "tolerance of ambiguity" (Wolcott 2005, p. 86). Participants' narratives are taken as truths within the situated context. They are treated as one source of data, along with researcher's interpretations of the observed cultural practices, as well as information provided by other participants and key informants. In this research, the participants' "ambiguity" in providing information about their membership in the street community is located in discursive contexts where their practices are marginalized.

Parents generally expressed a negative stance toward begging and forcing children to work in the street. Despite the evidences that they themselves begged in disguised appearance or begged in faraway places, they regarded begging as sinful, embarrassing, and irresponsible. For example, one of the parents convinced me that she never thought of begging in the street, "For the sake of God, I would never embarrass myself like that. It's a sin." Yet a few days before, I had seen her begging with almost her whole face covered in a scarf and a hat. Some other parents also told me the same thing, and yet I met them begging at a downtown area in Bandung, far away from their homes.

In addition, parents complained that it was difficult to ask children to leave the street activities. Children were said to insist on working on their own. Parents admitted that they preferred children to attend school, and yet they could not help with children's nagging to work in the street. The parents' narratives described the ways they tried to make sure that children participated in school as expected; this included taking them and picking them up, helping with homework, and communicating with teachers.

I have to take and pick up Udin and his brother everyday from school otherwise they wouldn't go. The school is across the big street and I'm worried if they have to cross the street by themselves. But if I'm sick and my husband offers to take them, they would rather not go to school. Especially Udin. He would have run to the street. (Interview with Bu Nina, October 29, 2010)

Teachers, on the other hand, narrated a different story where children missed school frequently. In responding to this, children complained that sometimes school materials were too difficult to learn. "I do not fit in school. It's too difficult," Fini, a 15-year-old girl, explained why she quit school at fifth grade of elementary school. Siti, a 10-year old who just returned to second grade, described that some subjects such as Indonesian and science were too difficult to follow.

Parents whose children dropped out of school wished that their children would return. They also complained that the children had lost interest in schooling, and I was convinced that they tried to persuade them.

Of course as a parent my wish is to see my children graduate from school. I myself am a school dropout, and I do not want to see my children become one. But Emi dropped out of school when she was at fifth grade. That time school was not free like right now. But now that she's been off from school for three years, she's no longer interested in it. (Interview with Emi's mother)

In the meantime, some social workers believe that parents in Pasundan could have pushed their children more. "They have to say that in the interview with you but for me, they are not trying hard enough to push their children," Anang, a social worker, told me. Ima, a social worker, wrote in her journal, "Most of Pasundan parents do not try enough to motivate their children to go to school. If children begged not to go to school, then parents just say okay. Children wouldn't have motivation [for school] that way."

The children seemed to lack confidence in adjusting to formal schooling. Some children who did return quit after a few months because they felt inferior and embarrassed. Additionally, children admitted that they worried about who would work if they went to school. Children, as parents also acknowledged, demonstrated their sense of caring for the family. What was not articulated was that this is family's responsibility. Adding this to the decontextualized classroom curriculum and negative discursive interactions when they were in school seemed to explain the children's detachment from schooling. The parent participants argued that the children's work in the street did not detract from their enrollment in schooling. However, what they may not have realized was that there was a discursive system, embedded in the national curriculum and learning organization of the classroom, that was alienating and influenced their children's perceptions of schooling.

I considered the divergent narratives of parents, children, teachers, and social workers as data. I sought to interpret how these narratives were enabled and limited by the complex pattern of discursive practices in which the participants were marginalized. For example, observations in classrooms in which some children participated informed my interpretations of the interactions they experienced in schools. Additionally, a record of middle-class parents' conversations provided me with insights into the stereotypical stigmas about the street children's parents.

I developed themes and categories emerging from the observational field notes, interview transcripts, writing and drawing products, as well as the work produced by the children. Even though the discourse of schooling and working in the street was embedded throughout the data, I separated conceptions of learning, the importance of formal schooling, moral values, and motivations for working in the street. I organized all the "perception" data in a way to develop theoretically rich themes. For instance, for the theme "participation," I looked for how the government officer viewed participation in the street as articulated in his speech, and I juxtaposed it with the parents' stance regarding the similar issue. These theoretically based themes emerged from the initial coding, and I broke down each theme with further coding to uncover more topics hidden in the larger subcategory. In doing the coding, I looked for recurrent vocabularies and topics addressed by the participants and analyzed whether others approached these topics differently.

The final stage of analysis was to look for patterns of relationships among discourses undergirding the participants' constructions of childhood, schooling, and working in the street in order to construct interpretations. I revisited the contesting discourses, for instance, the discourse of "working," as it was differently conceptualized by participants, and then constructed how they might figure into certain social phenomena, such as children's attitudes toward schooling. I drew ideas from my theoretical frame to my interpretations of these patterns within a particular sociocultural context.

The role of interpretation here depends on the extent to which theory informs my data interpretations. I entered the field not with an empty mind, but rather was equipped with a set of conceptual frame, as I had talked to social workers previously, as well as theoretical understanding of, for example, the power issues usually embedded within the relationship between the marginalized communities and the dominant ones. Further, as the fieldwork unfolded, the social phenomenon and participants' perceptions emerged not as something anew, but rather as patterns and organization to confirm, expand, or challenge my preconceived theory-based inquiries. Interpretation thus allowed me to draw together patterns built upon dialogues between theoretical understandings and social practices so that one informed the other.

The Reasons for a Narrative Approach

On my first visit I had to tell community members that what I did basically was to sit somewhere, listen to conversations, and take notes. One of them then commented that a researcher would usually ask them questions while referring to a sheet of

paper, which later I learned was a questionnaire. An NGO staff then told me that demographic questions in a survey format were a type of inquiry that researcher collected from street community members in Pasundan. The participants and the NGO related my study to their previous experiences with surveys and structured interviews. One of the NGO staff members worried that such an approach would be uncomfortable for the child participants.

Research on street children in Indonesia is typically focused on hygienic and medical topics. In Bandung, researchers asked the street children and their families to respond to demographic questions as well as their cleanliness habits. “They [the children] looked exhausted and bored,” the staff member testified. I managed to observe some questionnaire-based research and also thought the children and parents showed disinterest demonstrated by their facial expression and body gestures. Detachment toward the research was never expressed verbally. It seemed that even though they were told about their rights to decline or withdraw their participation, their bargaining positions within the power relation with the researcher obliged them to participate.

Medical and hygiene research about children in the street seemed to be an urgent priority for the Indonesian government. Children in the street are exposed to ambient air pollution. The NGO also noted that respiratory-, dental-, and skin-related infections were common diseases of these children. There were also a few cases of traffic accidents. Research intended to improve the quality of life for abandoned children, as noted by the Indonesian government, was undeniably necessary. It appeared that the government had to take over because they considered parents incapable of providing food, education, fresh air, and a safe environment for their children.

One could ask what narrative research can contribute to the everyday life of the street community, particularly what narrative research can do to inform policy makers regarding how to better approach the issue of street children in Indonesia. First, I argue that narratives can be used to deconstruct the deficit stigma concerning the street children and their families. Stories of resistance are important to counter what has been constructed as their “basic needs.” Employing narrative research that is respectful of the street community’s perspectives provides a fuller understanding upon which to build government policies.

The second reason to use narrative research with underserved children is to articulate the children’s subjectivities and allow them space to grow. Underserved children in Indonesia are situated within a public space where society claims the right to educate and teach them. Children are novice members of society, and the general intent is to provide the “protection” that adults in the dominant society think the children deserve. In teaching these children, however, adults often do not recognize the messages conveyed through language that marginalizes them. For example, using the label of “street children” in face-to-face communications is a way to use language to marginalize them. The label situates them in a vulnerable space, i.e., the street, thus justifying management by the dominant society.

In this respect, the definition of “street children” in Indonesia is somewhat murky. While the Indonesian government and the NGOs extend the definition to include all children who are raised by poor families and are exposed to street

activities and address them in their policies, popular notion is that “street children” applies only to those who live in the street separate from their biological families and are involved in criminal conduct and unaccepted behaviors (i.e., *ngelem*, free sex, pick pocketing, lying in order to earn money, wandering around dirty, and rarely taking a bath). The hesitance of some children and their parents in accepting such a label can be viewed as a denial of this stereotype. In so doing, the parents constructed counter-narratives by reproducing the dominant cultural expectation of what it means to be good parents. Narrative research has the potential to bring these counter-narratives into the view of policy makers as well as the general public.

A Critical Lens in an Interpretive Framework

In a Bakhtinian (1981) perspective, the dialogical notion represents the complexity of narratives as a means of understanding self, relationship of self and others, and the connections of self with the world. Within this complexity, self is constructed dialogically by internalizing cultural norms or producing agency, by receiving or resisting. In a social landscape, self is a site where dialogic forces occur through the use of language.

The identity construction of the street community thus took place amidst such a discursive context where interpretation is required. When asking the street community members to participate in research, a researcher invites them to evaluate and to situate themselves within their relationships with the researcher and, further, within what they perceive as their role and place in the society at large. Thus narrative research is a discursive practice and highly interpretive.

Our intellectual understandings are informed by the paradigms we use to capture and interpret a social phenomenon. My choice of a critical lens, represented by the use of discourse analysis in examining participants’ narratives, thus entails a discursive and interpretive purpose. By selecting, organizing, and framing the narratives of these “unheard” children and their families, I wanted to challenge the dominant narratives of childhood enacted in government policies and society’s approach to dealing with children who work in the street.

Using a discourse analysis framework, I investigated how societal narratives used language to represent the “street children” as a “problem.” By doing so, I adopted the idea that discourses embody ideologies and therefore constitute social identities, social relations, and worldviews (Fairclough 1989). Further, my intent was to understand how discourse was enacted as a practice involving the issue of social class in society, in this case, those who do not have privileged access to economic resources and power. I also used this lens to understand the embodiment of societal structure, in terms of what Foucault (1984) deems the production of power and knowledge, which in this case allows the confinement and objectification of “street children” in particular ways.

The Role of Interpretive in the Construction of Street Culture

My initial curiosity with the issue of street children in Indonesia was embodied in one naïve question: why the implementation of many government policies for street children did not seem to work. For example, the number of street children that drop out of school remains high despite the funding the government has distributed to the street communities. The interpretation of my narrative data suggests that the answer did not rest with addressing issues of poverty alone, but more fundamentally on the failure to understand the discursive systems that supported the street community's beliefs and the social construction of them.

By sharing their narratives, participants make their values and understandings available to others to interpret. Access to such insights not only enables interpretations of how identity is constructed but also the contextual discourses that sustained the embodiment of such responses. Further, counter-narratives can lead to a reflective evaluation, what we, as a society, have contributed to the reproduction of discursive notion conceptualizing the street children and their families. This brings me back to my theory framework.

I argue that interpretation is always contextual and the dominant societal understandings of the street community will figure into the street families' interpretations; it will be embedded in their narratives. In addition, how the dominant society interprets the stories of the street families may not be what the families intended. This is where the researcher has to contextualize, analyze, and interpret the narratives in ways that will challenge the taken-for-granted ideas dominant narratives. Still, a researcher's interpretation may still not be read the same by all readers.

Ethnographic studies of "street children" have acknowledged the children's agency in producing cultural practices countering the idealized childhood the dominant society has conceptualized. The cultural practices, as some studies have noted, include, for instance, the collaborative use of language that marks the group norms, ways of behaving, style of clothing, music taste, and the use of drugs or glue sniffing to establish a communal identity (Beazley 2002b; Davies 2008; Naterer and Godina 2011). Scholars define these cultural features as a "subcultural identity," within which children negotiate their resistance to the dominant culture that views childhood in certain ways.

When particular subcultural practices are used by the dominant society to homogenize all "street children," the subculture resists in order to differentiate self from the stereotyped others. "I'm not a street kid," a remark by Amir, strongly suggests a sense of subjectivity, which demonstrates his attempt to resist the collective identity. Scholars have described ways that "street children" have established stable social groups in order to survive the challenges of street life (Davies 2008). While confirming children's agency, this notion may disregard the idea that culture is not a communal feature that can be associated with a static group, but rather a site where agencies and subjectivities are negotiated and contested. In this regard, the "street children's" social groups are not stable, but are stratified as the members construct fluid boundaries while negotiating their subjectivities.

Children's responses toward the dominant societal discourse in this study were interpreted within the notion that cultures are active and constitutive (Briggs 1992; Gaskins et al. 1992). For instance, children's attempts to conform to literacy expectations can be seen as a response to the societal view that street children are "slow" and "uninterested in schooling." As my observations revealed, the few children who were attending school got criticized by their teachers for not being able to complete worksheets. Teachers' critiques usually were followed by advice that children should reduce their time in the street and pay attention more seriously to learning. Such advice negated the realities of their lives and the ways they were marginalized within schools and in society.

Additionally, children and their families constructed moral boundaries that can be seen as attempts to differentiate themselves from the established stereotypes that "street children" are "wild" and "immoral." Their narratives revealed the complexity inherent in the "street children's subculture," at the same time acknowledging their roles and perspectives within their social group, the wider street family community, and the stereotypes of them by the dominant society. The interpretation of these street narratives offers the children's subjectivity/positionalities in responding to the dominant stereotypes and social practices meant to "help" and/or manage them. A narrative interpretive approach can offer counter-narratives as a way to raise a society's consciousness about its disenfranchised groups.

To conclude, the street narratives highlight the ways in which the societal term of "street children" should not be taken for granted. Any societal term is discursive, and instead of co-constructively created by each members of society, it is produced by the dominant groups to situate the marginalized ones in such a way. The narrative approach can provide a space for the underrepresented communities to reflect on their own selves, organize their understanding toward the world around them, and, further, join in the "carnavalesque" in which their voices are heard and interact with the voices of others. As other studies portraying marginalized communities, this study hopes for a moment where this community's voice is not only expressed but also shape the formulation of the dominant voice reflected in the government's policy and the society's attitude toward them.

1.3 A Rhetorical Approach to Classroom Narrative Study: Interpreting Narration as an Ethical Resource for Teaching in the USA

Mary M. Juzwik

In this chapter, I discuss a narrative methodology that falls within the broader category of “discourse analysis” or the study of “language in use”—a substantially developed and widely used methodology in educational scholarship.¹ More narrowly, it falls within *narrative* discourse analysis, the study of narrative language in use. Another influence on my work is rhetoric, defined for my purposes as the study of the available means of persuasion in a given situation (Aristotle 1991). Discourse analysis is a broad term signifying the study of “language in use.” Rhetoric is a more focused interpretive framework that concerns itself with the persuasive and, as Burke (1969) insists, the identifying functions of language in use. Here I focus specifically on how a rhetorical approach to narrative interpretation can enrich understandings of *teaching in formal educational settings*.

The Research Project

To present a model for interpreting narrative language in use from a rhetorical perspective, I draw from one classroom example of teacher storytelling in unit on the Holocaust in a Midwestern US middle school literacy classroom. This approach entails multifunctional interpretation of narrative discourse, meaning interpretation of the different ways narrative language is functioning—what narrative language is doing—in classroom events (e.g., Jakobson 1971). More specifically, I focus on how narrative language works (a) to represent the world (referential), (b) to enact interpersonal relationships and positions in interaction (performative),

¹ I use the terms “method” and “methodology” interchangeably here.

M.M. Juzwik (✉)

e-mail: mmjuzwik@msu.edu

(c) to craft expressively stylistic language for students' enjoyment (poetic), and (d) to socialize students into the teachers' (and broader societal) views on what is good and proper—the moral order (ethical). While interpreting teachers' narrative talk as multilayered rhetorical action may be a new idea for educational research, the idea of teaching as persuasion has an ancient lineage in the history of pedagogy. Teaching as persuasion dates at least to the traveling sophists in Greece during the fourth and fifth century BC, who taught rhetoric for pay to striving pupils who lacked access to rhetorical education (deRomilly 1998).²

If rhetoric is so ancient, why introduce rhetoric now into the work of narrative inquiry in education? A rhetorical interpretive approach illuminates how narratives can be mobilized as dynamic resources that teachers put to use for a variety of purposes in their classrooms. While each of the four narrative functions matters for the overall interpretive model presented here, illuminating the moral uses of narrative is the most important insight, a culmination of what the model offers. Some may believe that interpreting teaching from an ethical perspective is antiquated in an era when local and national standards work to obscure how values shape teaching. In response I contend that it is impossible to “empty” teaching of its moral nature and, indeed, that studying the moral nature of teaching is *especially* critical in an era of standardization.

What do I mean when I say that teacher narratives take moral stances? Or that teachers use narratives to take moral stances? Or that teacher narratives do moral work? I assume that narrative practices in classrooms have an inherently ethical valence or value.³ They involve persons staking claims about what is right and what is wrong, what persons ought to do or not do in the world. Sometimes the moral stances taken up in narratives are tentative and exploratory, other times they are more certain and fixed (Ochs and Capps 2001). One of the profound powers of both written and oral narrative discourse is that moral claims and ethical stances can be implicitly embedded in a story world, without direct didactic stances being taken or “thou shalt” and “thou shalt not” being decreed. Perhaps nowhere is this power more evident than in storybooks written for children. Such stories can serve a powerful moral socialization function in childhood (Applebee 1978). These moral stances are themselves interpretations advanced about worlds, persons, and events—rather than simple recounts of “what happened.”

The moral stances in classroom narrative practices are not necessarily *intentional* on the part of the teacher or other speakers (Bakhtin 1990, 1993). Nor do teachers and students deploy their “morals” as a static entity. I am making the assumption that moral stances dynamically develop and respond to particular, socially situated others—an orientation captured in Bakhtin's (1990, 1993) notion of answerability. Answerability focuses on the agentive, morally weighty work of

²The Sophists were also despised and disdained by Plato, Aristotle, and other philosophers for a lack of commitment to philosophical truth and for pandering to the illiterate masses.

³I follow the general practice in analytic moral philosophy of using the terms “moral” and “ethical” interchangeably. See Margalit (1998), who distinguishes between “moral” and “ethical” obligations, for one exception in this general usage.

linguistic appropriation, a once-occurrent responsive and responsible event in which a particular self-within-the-dialogic-world acts. In Bakhtin's framework, all utterances (not just grand moral pronouncements) are taken on ethical weight. But the material of moral stance-taking is appropriated from others; at the same time, moral stances are also addressed towards, or *performed for*, others. Thus I view moral stance-taking as an active, interactional accomplishment.

In keeping with my guiding rhetorical framework and with previous work on moral stance-taking processes in narrative interactions, I place the social interactional dimensions of narrative at the center of ethical interpretation (see also Juzwik 2004b; Ochs and Capps 2001). On this view, narrative performances can sometimes spawn unintended consequences, and any given narrative performance may simultaneously do curricular and ethical work in a classroom situation.

Methodological Decisions

With the overall framework and rationale for the chapter introduced, let me now introduce the study to which I will refer in the remainder of the chapter.

Data Sources

The data sources included video- and audiotapes of classroom interactions, curricular documents, and student work and writing during a 6-week Holocaust unit in a mixed-age (grade 7 and 8) public middle school classroom in the Midwestern USA. I also included teacher and student interviews as data, although they are not discussed here because they were not a focus of sustained rhetorical narrative analysis. Note that interview data might, if desired, be used as evidence for claims about teacher intentionality in the sort of interpretive approach to teacher narrative advanced here. Earlier reports of the research include amplified discussions of data generation methods and practices (i.e., Juzwik 2004a, 2006, 2009).

Participants and Researcher

Participants in the research included Jane Connor (a pseudonym), a 25-year-old white woman in her third year of English teaching. Jane's students were white seventh and eighth graders in a socio-economically diverse school. As a researcher, I positioned myself as an interested colleague, curious about how students and teachers make sense of sensitive and disturbing topics, such as the Holocaust or workplace harassment, together. I set up the video camera and lurked in the back of the classroom taking copious field notes on most days.

Data Analysis

In my view, the interpretive process begins with data generation, a term used in contrast with data “collection” to acknowledge the active process of selecting what to count as data (place in the foreground) and what to ignore (place in the background). Ochs (1979) describes the significance of this understanding in her seminal piece on transcription: While video may provide the illusion that discourse data generation is unmediated reality, in fact many selection decisions must be made, such as camera angle, what to video record, and so on.

My next step was transcription, conceptualized as a critical point of interpretive decision making in narrative scholarship (see Juzwik 2006 for more detail). I transcribed all narrative talk and focused my analysis on a corpus of narratives identified in the classroom talk during the unit. One key interpretive move in the transcription process was to define what counted as narrative data, as opposed to non-narrative data. Literary scholar James Phelan (1996) offers one useful rhetorical definition of narrative: “the act of somebody telling somebody else on a particular occasion for some purpose that something happened” (p. 218). However, I found it necessary to refine that definition further for my interpretive purposes. I took a cue from Labov (1972) to define as narrative any temporally sequenced series of clauses that included evaluation or an evaluative stance taken on events and/or persons. This broad definition includes, however, types of stories that Labov did not study, what Georgakopoulou (2007) and Bamberg (2006) call “small stories,” narratives told in passing everyday conversations, often about the present or a hypothetical past or future time, often vicarious, i.e., not about events that happened to the speaker. Small stories are often quite short in duration; they are often told to make something happen in the future, as opposed to only referencing the past or present. Looking at “small stories” broadens the purview for narrative analysis far beyond the standard of past tense personal experience narratives generated in typical research interviews (e.g., Labov 1972).

I then subjected my narrative data to multilayered rhetorical analysis, examining the available means of persuasion in the “given situation” of teacher narrative language in the focal Holocaust unit (Aristotle 1991; Burke 1969). My rhetorical study of these data employed four levels of language function, already introduced, each accompanied by a distinct set of interpretive moves and accompanying transcriptions and (re)transcriptions.

- **Referential.** The first level is referential, in which I examine the representational content of the narratives. Some inquiries into teacher narratives within curriculum studies focus exclusively on this level. My initial interpretation entailed documenting and describing the topics and themes of the stories, as well as coding themes and interpreting patterns across the narrative data. For this level of interpretation, prose transcription capturing just the words sufficed.
- **Performative.** The next level, performative interactional interpretation, looks at how narratives do interactional positioning work, in keeping with Bakhtin’s (1981) sense of the “dialogic” nature of written and spoken texts being shot

through with conflicting social languages and voices. For this interpretive layer, I found it useful to transcribe in lines and stanzas, so as to capture—by using white space on the page—how the narrative talk emerged.

- **Poetic.** The third layer, poetic interpretation, examines the expressive stylistic resources used in telling narratives, building upon transcription conventions established in the field of ethnopoetics (e.g., Gee 1985; Hymes 1981; Quasha and Rothenberg 1973; Tedlock 1983; Poveda 2002). This level used a more detailed and thematically driven set of line and stanza divisions.
- **Ethical.** While a concern for how moral stance-taking is constructed and contested runs through the referential, poetic, and performative analyses, the final interpretive layer is ethical. I ask such questions as, “Who is harmed and who benefits from such narrative construals? What might be the virtues and harms of such forms of talk?” At this level, the transcription choices draw upon those in the previous three layers. As mentioned, earlier, the ethical layer is a culmination of the interpretive model, made possible by and building upon the previous layers. It involves asking moral questions about what has been found in the prior interpretive work.

Research Findings

The findings section is organized around the above four layers. In presenting findings, I am necessarily selective, encapsulating an approach developed elsewhere into a short amount of space to illustrate what a narrative rhetorical approach can entail.

Referential Analysis: Referencing Storylines About the Holocaust to Fulfill Curricular Goals

I conducted open coding to locate themes across the body of narratives told in Jane’s Holocaust unit. This interpretive work led me to see how, in her teaching narratives, Jane responded to widely circulating, morally acceptable storylines—that is, to broader cultural narratives—about the Holocaust. Those storylines, in turn, sought to fulfill three curricular subtexts or goals of Holocaust study in that classroom: (a) commemoration of the Holocaust, (b) identification with the Holocaust, and (c) moral response to the Holocaust. Open coding across all narrative texts, both students and teachers, led me to the theme of commemoration, a common purpose for teaching about the Holocaust in US schools. During the time Jane taught the unit in question (1999–2000), that goal was especially visible because of a set of widely publicized cases of Holocaust denial in the news. One of Jane’s stated goals for the unit was to prepare her students to respond to

Holocaust deniers. For example, in a discussion of Ruth Minsky Sender's book, *The Cage*, Jane narrated the importance of remembering in the face of denial: "This actually happened, ladies and gentlemen, and don't let anyone tell you it didn't. There are some who say it didn't. That's why we have this class. So you can remember this happened, so you can tell your kids and grandkids" (1/7/00).

On my interpretation, Holocaust commemoration in Jane's classroom also seemed aimed at a politically liberal goal of constructing a "shared memory" of the Holocaust in the face of what moral philosopher Avishai Margalit (2002) calls "radical evil." That intention of creating a globally shared memory of the Holocaust was implicit in the narrative quote above. Jane was even more explicit about commemoration in the course syllabus than she was in the stories she told to students: "Our examinations of autobiographies, biographies, oral narratives, diaries, and letters will no doubt bring the Holocaust down to *the most basic level of humanity*: the lives of individual human beings, *the you and me of generations past*" (12/2/99, p. 1, emphasis added). The commemorative work of narratives in the class struck me as especially poignant against the backdrop of a common theme in the student talk that the elder generation in families, especially those who fought in the Second World War, rarely spoke of their experiences in the war.

The syllabus excerpt also illustrates a second curricular goal that emerged in my open coding of narrative content: identification. Through telling stories to students, and through inviting students to tell stories of their own, Jane sought to help students identify themselves with events and persons in the past, a pervasive aim of US history teaching (Barton and Levstik 2004). Through oral narratives, Jane and her students identified with their family members. For example, Annie shared a story about her great-uncle as she showed her classmates a collection of medals, newspaper articles, maps, and photographs:

The purple heart is because he was injured. He went deaf in one ear when he was in the war. He got shot. . .The bronze star. . .he got when they were in Germany, their tanks were too big to fit through some of the trees. And he led all of his men. He got out with just a pistol and led 'em through an entire army of Germans. (1/18/00)

But student and teacher narratives also identified with the nation and with distant others. For example, in narrating how the USA refused asylum to European Jewish refugees aboard the Saint Louis, Jane used the first person plural "we" to cue a constructed dialogue signaling her identification with the USA: "*We* [the U.S.] also said, No, *we're* not going to take you, *we* don't want you in the United States, either" (12/8/99). Not only did Jane identify with a national collective, then, she also temporally transplanted herself for a spell in what amounted to a conflation of past and present. In making this rhetorical move, she further implicates herself (and possibly also students) as part of a collective "we" that reprehensibly denied asylum to the Jews who were aboard the Saint Louis and who were likely later killed in Europe. The most frequent identification in Jane's narratives, however, was with non-American figures or groups from the past (including Jews, Nazis, Hitler, political leaders, and so on). In Jane's narratives, the second-person "you" especially seemed to invite students to identify with, or imagine themselves as part

of, past events. One key interpretive strategy in looking at identification involved my paying attention to shifting pronouns and the shifting meanings of pronouns. This is a strategy to which we will also return in subsequent interpretive layers.

I next turned my interpretive attention to moral stances on the past. In studying Jane's narrative rhetoric, I located six storylines, or moral stances on the past that seemed to pervade the narrative discourse as a whole. I then articulated these storylines as moral commands (i.e., "you shall. . ."), borrowing the language of historian Yehuda Bauer (2001) to make those stances vivid, and parallel, for readers:

1. "You, your children, and your children's children shall affirm that tolerance and diversity are good; that hate and racism are wrong" (Novick 1999; see also Short and Reed 2004; Spector 2007).
2. "You, your children, and your children's children shall never be passive onlookers to mass murder, genocide, or. . .a Holocaust-like tragedy" (Bauer 2001; see also, Novick 1999).
3. "You, your children, and your children's children shall never become perpetrators who blindly obey authority to commit atrocity" (Bauer 2001; Fermaglich 2006).
4. "You, your children, and your children's children shall remember the presence of evil in the world" (Margalit 2004; Novick 1999).
5. "You, your children, and your children's children shall vigilantly wipe out anti-Semitic ideology" (Bauer 2001; Novick 1999; Short and Reed 2004; Spector 2007).
6. "You, your children, and your children's children shall be sensitive to other Holocaust-like atrocities (including hate crimes, mass murder, and genocide) in the present and future" (Novick 1999).

As I interpreted the Holocaust narratives in Jane's classroom, I discovered an unstated goal, which Jane confirmed in our interview conversations. She believed that listening to her narratives, as well as reading written narratives and viewing films, would result in substantive ethical changes to students' future life trajectories. I return to this strong ethical claim about the impact of narrative rhetoric below.

Performative Analysis: Constructing Dialogues About the Holocaust

How did teacher narrative discourse position the teacher, students, and curricular content in relation to one another? To answer that question, I called upon Goffman's (1974, 1981) notion of framing. This perspective led me to conceptualize narrative events as "frame spaces" offering a set of interpretive frameworks in which the roles of speakers and listeners are typically enacted. As Goffman (1981) puts it, "When the individual speaks, he [sic] avails himself of certain options and forgoes others" (p. 23). Goffman's perspective further suggests a distinction between (a) the interactional "here and now" in which a narrative is told, or the *narrative event*,

and (b) the *narrated events* (e.g., Bauman 1986; Jakobson 1971). The latter are the events within a story world, for example, Red Riding Hood walking through the deep dark forest to visit her grandmother. The performative interpretive level draws particular attention to the interactional “here and now” (the narrative event) and, potentially, to the parallelism between the narrative event and the narrated events (Wortham 2006).

More specifically, examining what Tannen (1989) calls “constructed dialogues” in teacher narrative discourse allowed me to see how narratives were functioning to position the teacher, the students, and the curricular content. Constructed dialogue is one “frame” within narratives where speakers obviously move from reporting or recounting events of the past to enacting those events, such as Jane as teacher narrator fully shifted into a dramatic role, embodying and animating the words of others. The term “constructed dialogue” emphasizes how narratives do more than simply represent events of the past; they also do interpersonal work in a social “here and now.”

Jane frequently performed voices for her students through narrative discourse. Consider, for example, the difference between the following two bits of discourse:

1. “1936. The Gestapo becomes the supreme police agency in Nazi German. They have exclusive rights to make arrests.” (field notes, 12/15/99)
2. Narrative: “The Rights of the Gestapo”
 - (1) Courts?
 - (2) What courts?
 - (3) Judge?
 - (4) What judge?
 - (5) Jury of your peers?
 - (6) What jury of your peers?
 - (7) I’m just going in there
 - (8) And I’m going to arrest you
 - (9) And I’m going to throw you in a concentration camp somewhere.
 - (10) What are you going to do about it?
 - (11) There’s nothing you CAN do about it.
 - (12) I don’t like the way you looked at me the other day.
 - (13) I’m going to come into your house at night,
 - (14) And arrest you
 - (15) AND your brother,
 - (16) Just because I want to.
 - (17) What are you going to do about it? (12/15/99)

Jane read the first example (1.) aloud from a Timeline she was presenting to students during a note-taking activity. The following moment, in what I interpret as a frameshift to “narrative performance,” Jane temporarily transformed herself into a member of the Gestapo in example (2.).

We return again to an interest in pronouns, introduced in the referential layer of interpretation. Note the shifting meaning of the pronouns “I” and “you.” No longer

is “I” the referent for Jane the teacher; now it refers to a cruel Gestapo agent in Nazi Germany. No longer does “you” refer to students; it now refers to vulnerable persons in Nazi Germany. The interpretive frame of the teacher talk shifts here into an *aesthetic* rather than purely referential or didactic frame. Reading, listening to, and viewing the narrative as a shift in framing led me to infer an implicit assumption at work: Jane expected students to shift into a role of experiencing the discourse as an aesthetic event (Rosenblatt 1938), more so than as a communication with the referential content at the center. In “The Rights of the Gestapo,” a “constructed monologue” is the whole of the narrative; however, Jane more typically embedded constructed dialogue in a longer narrative, as in the following account of how the Second World War began:

“This is how World War II basically started. We have Germany. Germany goes into the Sudetenland, gets the Sudetenland. They get the Rhineland province. So they’re growing this – Let me do this, this one’s a little better.” Jane places a different overhead transparency map on the overhead projector.

So they’re growing in this direction,” she reports, pointing to the map. “You see France right here, France doesn’t like it. France doesn’t like how close Germany’s getting, scares them. But then they don’t do anything about it. Now after [Hitler] gets the Rhineland, and he gets the – , he goes into Austria. Austria believes in Hitler, agrees with his theory, says ‘You don’t even need to fight us, you can come into our country.’”

“Austria is right down here.” Jane points to the map again, “Sorry.”

They go into Austria. ‘Yes, come on in, we welcome you with open arms.’

Then, goes into Czechoslovakia. Has a bit of a fight in Czechoslovakia, but is able to take over Czechoslovakia as well. So far, no one’s doing anything in opposition to him. All right.

So, then, they invade Poland. Bad! Bad move! Here you invade Poland. Poland does not want to be invaded. Poland puts up quite a fight.

Also, Great Britain finally says, ‘Okay, I’m sick of this, Hitler, You cannot keep doing this. You’ve gotten Austria, you’ve gotten all these other countries. We haven’t gotten involved. If you try and go into Poland, if you attack Poland in any way, you will start World War II.’

‘Ah, Let’s really see if he means it.’ Goes into Poland. Huge battle ensues. . . .

I made constructed dialogues visible for the performative layer of interpretation through re-transcription of the discourse as a dramatic script. First, I transcribed narratives into lines, showing where pauses occurred in the story performance (Scollon and Scollon 1981). I also used ALL CAPS to show emphasized words (e.g., Wortham 2001). Finally, to show the dramatic properties of constructed dialogues, I removed narrative lines that were not constructed dialogues, to make the dramatic dimensions of the narrative look like a dramatic script, as follows:

Austria: You don’t even need to fight us,
 You can come into our country.
 Yes,
 Come on in,
 We welcome you with open arms.

Great Britain: Okay
 I’m SICK of this
 Hitler,

You can NOT
 Keep doing this.
 You've gotten Austria,
 You've gotten all these other countries.
 We haven't gotten involved.
 If you try and go into Poland,
 If you attack Poland in any way
 You will start World War Two.

Hitler:

Ah
 Let's really see if he [Great Britain] means it.
 [the story and the dialogue continue for a few more minutes]

In the analysis, I first coded all constructed dialogues (N = 122) in the set of all teacher narratives (N = 65). I next examined how Jane mobilized semantic, formal, and performative resources to shift the frame into constructed dialogue (here it was necessary to look at the entire narrative events, not just constructed dialogues). The resources I identified included:

- Intonation shifts (e.g., to signify the differences between the voices of Britain and Hitler)
- Changes in tempo (e.g., short words like “Ah,” above, can speed up the tempo)
- Direct address (e.g., “You will start World War Two,” above)
- Shifting meanings of pronouns, discussed already

I also coded types of constructed dialogue, including:

- Indirect discourse
- Quasi-direct discourse
- Direct discourse

In all 122 constructed dialogues identified in the data set, I coded 2 instances of indirect discourse, 5 instances of quasi-direct discourse, and 115 instances of direct discourse. I discuss each in turn.

I coded indirect discourse when constructed dialogue was introduced by a mitigating word such as “that” signaling a paraphrase rather than direct quote—even though, as already discussed, none of these constructed dialogues can be accurately called “direct quotes.” For example, in the story about the USA turning away the *Saint Louis* (the ship with Jewish refugees seeking asylum from Nazi Germany), Jane narrated:

21. Well, the *Saint Louis*
22. Didn't give up
23. QUITE that easily.
24. It sailed past Florida,
25. Asking the United States
26. To take them in.

Indirect discourse was signaled by the gerund “asking” in line 25 (“ask” or “asked” is a typical quotative verb used to introduce constructed dialogue that takes the form

of a question) and by the auxiliary “to” in line 26. In this narrative, the ship becomes an agent asking, or advocating, on behalf of its Jewish passengers. This example reveals Jews being positioned in subordinate, rather than subject, positions, a trend I found throughout the data set. I return to this issue in the ethical interpretive layer, as I critically examine potentially harmful representations of Jews in the narratives.

Quasi-direct discourse blends indirect and direct discourse, as in

23. Well, NOW
24. We’re going to make it
25. A LITTLE harder for you.
26. Now you also can’t hold
27. Certain jobs,
28. And you can’t buy certain things
29. And those kind –
30. And
31. Those types (clears throat)
32. Of restrictions (12.9.99)

While Jane articulates lines 23–28 in Hitler’s voice and from Hitler’s perspective, that voice became considerably weakened—if not dissolved altogether—in lines 30–32. This change seems accentuated by the *repair* in lines 29–32, where Jane broke off and then started again to repeat and reword her utterances, signaled by a dash in the transcription. In these lines, Jane seemed almost to stumble in enacting Hitler’s voice. The now-ness of the narrated event, with Hitler as a speaking subject dictating acts of restricting employment and shopping rights to Jews [“you” in lines 25 and 26], begins to dissolve in these lines. As I read them from a framing perspective, Jane signals the dissolution of the narrated event frame by the generality of both the pronoun “those” (line 31) and the phrase “types of restrictions” (lines 31–32). The final four lines blend the narrative frame of the past and the historical knowledge of the present, when such actions are termed “restrictions” and can be categorized as “types” in broad patterns of historical activity.

In the direct discourse that pervaded the data set, Jane separated the constructed dialogues from prior and subsequent discourse through quotatives and the other resources detailed above (intonation shifts, tempo change, direct address, and shifting meanings of indexicals). In the story about how World War Two began, above, we saw several examples of such direct discourse.

Finally, I examined the constructed dialogues to identify the speaking subjects. Hitler ($n = 35$) was by far the most prominent speaking subject, with Jewish persons or Jews ($n = 15$), Nazis ($n = 13$), individual students in Jane’s class ($n = 11$), the United States ($n = 6$), German civilians ($n = 4$), and no one ($n = 4$) following behind. All other speaking subjects occurred three times or less in the collection of 122 constructed dialogues I examined.

Looking closely at constructed dialogue in Jane’s teaching reveals one key framing strategy through which narratives become *performative* resources for her teaching. Through the constructed dialogues among European countries, Jane figuratively lifted the map off the page and dramatically breathed it to life for her

students. Through the theatrical capacities of dialogue, Jane brought students into an imagined figurative world, much like the that worlds novel readers or theatergoers would expect to enter. Indeed, the performative frame of dialogue put the very act of speaking—and the speaker, Jane—on display. It seems that this kind of performative dialogue within narrative was especially intended to heighten experience for the student audience, to involve them in the telling (cf. Bauman 1986; Hymes 1981; Tannen 1989). While Jane would soon return to the main frame of the narrated event or the lesson, perhaps “in the performative moment” she could deepen or change students’ understandings through the aesthetic experience she created.

Looking closely at the constructed dialogues in her narrative discourse, Jane used narrative as a hybridized improvisational arena where the “free-wheeling, self referential. . . essential fancifulness” of language could be put on display (Goffman 1981). Jane’s dramatic styling of constructed dialogue contributed to a fluid, flexible *ethos* that emerged across her narrative discourse in the unit.

Poetic Analysis: Expressive Styling of Teacher Narrative

How did teacher narratives function to *stylistically express* moral stances on the past? A third poetic layer of analysis takes a cue from performance artist Anna Deavere Smith:

From time to time we are betrayed by language, if not in the words themselves, in the rhythm with which we deliver our words. Over time, I would learn to listen for those wonderful moments when people spoke a kind of personal music, which left a rhythmic architecture of who they were. I would be much more interested in those rhythmic architectures than in the information they might or might not reveal. (Smith 2001, p. 36)

In examining the expressive style and rhythm of teacher narrative, I turned to the Russian linguist Roman Jakobson and to ancient and contemporary rhetorical theorists, especially those who developed the rhetorical canon of style (e.g., Anonymous 1954; Corbett and Connors 1999). This scholarship provided a descriptive vocabulary to study the poetics of teacher narrative. I focus here on how a single narrative works as a parallel poetic system. In the rhetorical and functional linguistic tradition, parallelism is “repetition with systematic variation, the comingling of variant and invariant elements in the construction of a poetic work” (Bauman 1986, p. 96).

To begin interpretation, I transcribed using ethnopoetic conventions to construe the narrative telling in the following form (for more details on transcription method, see Juzwik 2009, pp. 108–109):

Narrative: “Violence Was the Way to Go”

FRAME

All right, let’s see. He [Hitler] realizes now that the German people will not resist him. Possibly more important, the church won’t resist him either.

BEGINNING

1. I mean, a lot of horrible things have happened before 1938, to be sure.
2. But this was a government policy,
3. Where, not that we're just going to call you noncivilians
4. not that we're just going to say
5. You're Jews
6. Where you're going to have to wear badges.
7. But now, we're going to destroy everything you own
8. We're going to beat you up,
9. We're going to burn your synagogues.

MIDDLE

10. This was a violent act to the extreme
11. And no one stepped up and said,
12. All right, we've had enough
13. You've done all this,
14. We can't let you do any more.
15. This kind of showed him that violence is the way to go,
16. or can be the way to go.
17. Because no one's going to stand up and say
18. It's wrong

END

19. They haven't to this point, and they're not going to,
20. Even when violence is incorporated.
21. They're just going to walk on their merry way, and ignore the whole thing
22. As much as they can.

Parallelism in the narrative works at the levels of sound, word, syntax, stanza, and theme to fashion a moral stance about the Holocaust. Specifically, the narrative communicated two of the moral lessons or storylines discussed in the referential analysis: (a) We should not become perpetrators who blindly obey authority to commit atrocity. (b) We should not become passive onlookers to mass murder, genocide, or a Holocaust-like tragedy. I began interpretation with small-scale poetic features and radiated outward to considerations of theme and pedagogy. Here I am going to focus on the levels of word, syntax, stanza, and theme.

I analyzed parallelism at the level of the *word*, noticing relationships of opposition and contiguity, as well as verbal similarity or repetition. In the interest of space, I'll restrict observations to the first stanza. The repetition of "where" (lines 3 and 6) functions to cluster lines 3–5 together and make the cluster parallel to line 6. Lines 3 and 4 feature the *anaphoric* (repetition of same word or group of words at beginnings of successive clauses) "not that we're just going to." Moreover, "we're" is a homonym of "where," deepening the lexical relations within the stanza. Jane also recruits relationships of contiguity as a resource in narrative stylization. For example, lines 7–9 are bound together not only through the anaphora, "we're going to," but also through three verbs that construct semantic relationships among their objects: "destroy," "beat," and "burn." The final phrases of each line include:

destroy everything you own (7)
 beat you up (8)
 burn your synagogues (9)

Each verb has as its object either “you” (i.e., the Jews of Germany) or extensions of personhood and identity, including material possessions (everything you [Jews] own) and places of worship (your [Jewish] synagogues). On this reading, line 8 functions as the anchor of violent acts, for this pronouncement represents the most direct assault on Jewish personhood; it is designed to strip away physical health and lead, perhaps, to death. The verse and object phrases in lines 7 and 9 are parallels to that physical attack, reaching beyond an affront on physical well-being to assault material and spiritual well-being: “Everything you own” functions as the direct object of “destroy,” while “your synagogues” is the object of “burn.” Repetitions of pronouns “you” and “your” in each object phrase—alongside the related meanings of those phrases—weaves the three contiguous lines into a densely parallel relationship. The lines are parallel due to semantic and lexical relationship as well as to a relationship of similarity created by the anaphoric links.

At the *syntactic* level, I examined how various juxtapositions or equivalences of contrasting or similar grammatical patterns may suggest Jane’s tacit “way of thinking” about the Holocaust. Such patterns are morally consequential because they define parameters for students’ interpretations of the Holocaust narrative that “constituent sequences by themselves [did] not carry” (Jakobson 1968, p. 604). I made a chart (see Table 1) to render the narrative into subject–predicate structures that became the basis for syntactic interpretation.

The syntactic structures of lines 2 and 10 are equivalent, with the same words repeated, except that the morally loaded phrase “a violent act to the extreme” (stanza 2) replaces the morally neutral “government policy” (stanza 1). Lines 5 and 18 likewise show syntactic parallelism with present tenses of the verb “to be” parallel, with variation in the subject and object:

You are (Jews) (line 5)
 It is (wrong) (line 18)

The parallelism is deepened because the lines follow quotative words “says” and “say” and are followed by constructed dialogues. Within Jane’s narrative performance, the speech acts were enacted as commands leading to actions by others. The accusation “you are Jews” brought horrific consequences to those upon whom it was cast in Nazi-controlled Europe. Jane suggested that, if uttered, the speech act, “It is wrong,” might have intervened in the Nazi terror regime. As Nazis (stanza 1) are made syntactically equivalent to “no one” (stanza 2), equivalence is suggested between the wrong done by Nazi violence and the wrong done through silence and inaction. That is, the storylines commanding not to be perpetrator and not to be a bystander to genocide are juxtaposed.

At the level of *stanza*, an examination of pronouns reveals shifting psychological subjects, those vantage points or subject positions from which each line or stanza is uttered. The first stanza presents the predominant point of view of the Nazi

Table 1 Line-by-line subject–predicate conjugation

Line#	Subject	Predicate
1	Things	Have happened
2	This	Was
3	We	Are not going to call
4	We	Are not going to say
5	You	Are
6	You	Are going to have to wear
7	We	Are going to destroy
8	We	Are going to beat up
9	We	Are going to burn
10	This	Was
11	No one	Stepped (up) and said
12	We	Have had
13	You	Have done
14	We	Cannot let
	You	do
15	This	Showed
	Violence	Is
16	[Violence] ^a	Can be
17	No one	Is going to stand (up) and say
18	It	Is
19	They	Have not [stood (up) and said] Are not going to [stand (up) and say] ^a
20	Violence	Is incorporated
21	They	Are going to walk and ignore
22	They	Can [ignore] ^a

^aBrackets [] indicate an elliptical subject or verb that has been included

government in Germany during November 1938. In lines 1 and 2, “I” refers to Jane herself in the classroom here and now. In line 3, she shifted away from the psychological stance of the orienting couplet: “We” in line 3 refers to those already carrying out “horrible things” (line 1) and those just committing a “violent act to the extreme” (line 10) in the “government policy” (line 2) of Kristallnacht. Lines 3–9 include five sets of contrasts between “we” and “you,” where “we” refers to the “government policy” of Kristallnacht and “you” to Jews (line 5).

In the second stanza, however, Jane shifted point of view to critically rename “this” government policy “a violent act to the extreme,” a phrase establishing that she was no longer discussing the event from the moral perspective of perpetrators. The negative pronoun “no one” is repeated in the already-discussed parallel lines 11 and 17 and emerges as the chief psychological subject of the stanza.

The framing discourse suggests that “no one” refers to the “German people” (bystanders) and “the church.” Again, a contrast between “we” and “you” appears, only here “we” refers to German people/church, whereas “you” seems to refer to

Table 2 Enthymematic argument structure

Premise 1	Stanza 1
Premise 2	Stanzas 2 and 3
Implied conclusion	

Hitler. Despite the contrasts, the two stanzas are knitted together stylistically through the parallel structures of quotation and constructed dialogue (lines 2 and 7–9; lines 12–14 and 18). Jane construes temporal movement and causal relationship through the dialogue between the two stanzas. Stanza 3 further critiques the constructed dialogue of “no one” (stanza 2), as the psychological subject shifts to the teacher/critic with a historical perspective. That psychological subject indicts the German people and church (“them”) for a sin of omission, in comparison with the sin of commission enacted in stanza 1.

At the level of *theme*, we begin to see how the previously discussed patterning may contribute to thematic “coherence” (Ochs and Capps 2001), a well-documented property of narrative discourse. In light of the stance in stanza 3, I conclude that the antihero of the narrative is the “no one” of stanza 2, who fails to “step up and say the violence is wrong.” Jane suggests an implicit moral lesson through the micro-linguistic patterning of narrative structure, not unlike a fairy tale or parable. Through such narrative form, Jane encouraged students—perhaps through “poetic delight in verbal structures” (Jakobson 1968, p. 608)—to identify themselves with the situation of Kristallnacht. In so doing, she invites them to imagine becoming the kinds of citizens who, in a future parallel situation to Kristallnacht, might stand up and say what “no one” dared to say. Through possible future action, then, students may be implied moral heroes standing in contrast with the antiheroes of the story. Grounded in the poetic interpretation, as well as in the curricular background (see Juzwik 2009, ch. 2), I interpret the narrative as an argument in the shape of an enthymeme, known as a “rhetorical syllogism,” defined here as a syllogism with one part (one of the premises or the conclusion) missing. Jane’s enthymeme includes two propositions and a missing conclusion (see Table 2).

My reading thus proposes that Jane shaped an implicit moral lesson from the two explicit premises presented through stylized narrative poetics. On this reading, the narrative invokes potential value-laden parallels between the evildoers and bystanders of the Holocaust (the psychological subjects of the narrative) and students in the classroom (the audience of the narrative performance). The narrative subjects were “no ones,” saying and doing “nothing”; however, through her narrative rhetoric, Jane seemed to suggest that students might one day become “someones” in future situations paralleling Kristallnacht.

The Ethics of Holocaust Narratives

Finally, I pose a set of ethical questions to the data and to the findings of previous interpretive layers: In any given situation, how is a narrative event harmful or

virtuous? To whom might the narrative be beneficial? To whom might the narrative do harm? How might such virtues or harms be enacted, either intentionally or unwittingly? In this level of analysis, my interpretation takes up a concern not only with benefits and harms to students or teachers in classrooms but also to individuals and groups of people far beyond a given classroom. Given that my research did not exhaustively probe participant perspectives through ethnographic interviews, I cannot claim access to individual participants' assessments of any benefits and harms of narrative as a resource for teaching about the Holocaust. Therefore, my claims deal with potential benefits and harms, based on my interpretations of the oral narrative texts, classroom activities, and other artifacts.

As already suggested, this final interpretive level is of a different order than the previous three, because it is made possible by the previous interpretations. In putting my ethical questions to the previous interpretive levels—in interpreting my interpretations—I first ask what the virtues of teachers telling Holocaust narratives might be. I then ask what harm might be done.

Regarding the virtues, or benefits, of telling Holocaust narratives, several seem possible. First, narrative rhetoric can contribute to teacher authority (see also Juzwik 2006). Towards that end, Jane's narrative practices demonstrated a verbal virtuosity that can be conceptualized within traditions of oratory and the arts of discourse as a kind of "vernacular eloquence" (Howard 2005). Such eloquence is well known to be a tool for positive social change, as, for example, in the work of pastors in US pulpits (e.g., the speeches and sermons of Dr. Martin Luther King, Jr.). Second, teacher narrative discourse may cultivate the development of coherent and meaningful connections among past, present, and future. Through oral narrative, Jane "revivified" the past (to borrow a wonderful verb from moral philosopher Avishai Margalit (2002)). She recruited the capacity of narrative to evoke identification with persons in distant times and places, with family members, and with national figures. Jane made the past come alive in the present, collapsing the distance between us and them, now and then, and here and there. While this collapse is problematic, it can engage students who too often find learning about the past to be difficult or irrelevant (Barton and Levstik 2004).

Third, narrative forms of talk may provide a safe space for exploring difficult topics and perplexities such as the Holocaust. Narratives such as Jane's may be instances of verbal "poetry. . . produced for purposes of comfort . . . undertaken as equipment for living, as a ritualistic way of arming [young people] to confront perplexities and risks . . . it would protect us" (Burke 1941/1973, p. 61). That protective capacity, I believe, depends on the evaluative moral stance and "lesson" asserted through narrative talk. Certainly dominant storylines were presented in single narrative utterances. However, unlike the overarching moral storylines in religious classrooms studied by Simone Schweber (e.g., Schweber and Irwin 2003), no single storyline was presented in Jane's classroom across the unit. In fact, conflicting storylines sometimes circulated. Yet Jane did consistently evoke six widely available cultural storylines about the Holocaust across the narratives, as established in the referential interpretation. Rather than a single storyline about the Holocaust, i.e., an authoritative interpretation, multiple and competing

possibilities circulated. Students therefore needed to critically navigate among conflicting accounts. This seems to be an appropriate challenge for middle school students attending public school within a pluralistic society.

A final pedagogical virtue of narrative was the kind of curricular permeability it seemed to invite. By “curricular permeability,” I refer to curriculum that is open to students’ voices and life experiences, such as writing curriculum that flexibly invites primary-aged urban writers to bring their own life worlds and discourses into the classroom forum (Dyson 1993). Jane’s narrative rhetoric modeled a way for students to potentially participate in classroom talk. Indeed, during the final 2 weeks of the unit, the number of student narratives about the Holocaust and related events sharply increased, while the number of teacher narratives decreased (Juzwik 2009). Narrative events thus became a potential curricular resource for students to integrate their out-of-school lives with the happenings and curriculum within the classroom. More generally, teacher narratives have potential to create opportunities for teachers to recognize and build upon the funds of knowledge that populate students’ life worlds beyond school (Gonzalez and Moll 1995) even while fulfilling curricular goals. Despite these potential virtues, using narratives has the potential to do harm, especially about a past as difficult as the Holocaust. A narrative exchange among Jane and two of her students brings that potential into sharp relief:

Narrative: Hitler Did Not Intentionally Set Out to Kill Six Million Jews (1/6/00)

Jane: When Hitler invaded Poland, that’s when the war started.

Nathan: Wasn’t it also like, you couldn’t adopt the Holocaust, you couldn’t just like kill two million Jewish people and then say, Oh now they’re fine. They’ve like learned their lesson? You have to do this, you have to kill every single one?

Jane: Right, right, I mean, there’s no—Hitler did NOT intentionally set out to kill six million Jews. He just wanted ‘em gone, folks, And I can’t stress that enough. He just wanted them to leave. He just didn’t want them, in, basically in Europe, because he was to try and take over all of Europe, that living space policy he had. But he didn’t necessarily want ‘em dead, that was never his intention. The camps and all those things were never his intention. He didn’t set out to DO that. He just didn’t WANT them there. But when no one else would take them. He had to find other methods of getting rid of them. And the ghettos only worked for so long too. It was very slow (said slowly). It was a very slow process. He was kind a forced into getting bigger and bigger and bigger and bigger. And at a certain point, Nathan’s right, you can’t just all of a sudden shut down all the, shut down all the camps and say, “We’re not doing it any more. It’s over.” It was impossible. In fact, they kept it up until 45, even though it probably meant—that was probably one of the big reasons why they lost the war. They had a LOT of trains that could have been used for the war purposes used for Jews being sent to camps. It was, it became somewhat impractical, what was going on. But by that point, there’s question over Hitler’s mental state at a certain point too. And how much it was all in his

control, how much he lost control, how much sanity remained at the end when he killed himself. And we're never going to know those things. We're NEVER going to know. And that's all just fictionalized and I can't really tell you about that stuff. I don't know. But it was NEVER his intent to do that. And that's proven, Nathan. He NEVER intended just to kill all these, especially like that. Winona?

Winona: If he didn't intend to kill all those people, why did he write a book how he was going to be a mass

Jane: (laughing). Okay Winona, I've never read *Mein Kampf*.

Although not highlighted by my transcription choice here, the narrative is artful in many of the ways discussed already, in the poetic and performative layers of analysis. Yet, its central claim is false: Credible historians are generally agreed that, by the time of the Wannsee Conference, Hitler's intentions had coalesced around the Final Solution, the systematic, state-sponsored murder of the Jews. While it might be tempting to interpret the narrative as an instance of Holocaust denial, other data in the unit—including Jane's explicitly stated goal of preparing students to debunk Holocaust denial, discussed already—discourage that interpretation. Jane made an error here, not surprisingly given her lack of historical training.

Yet this example points out a central problem with narratives as resources, at least for teaching about a past as complex and morally distressing as the Holocaust. As narratives, they hold potential to falsify, oversimplify, and essentialize events of the past. Rather than exploring multiple explanations, narratives as typified utterances often tend to present clear, coherent storylines (Mink 1978). Here, for example, a crystal-clear evaluation of Hitler's intentions is tightly woven into an unwavering false storyline. However, Winona and the other students had prior and conflicting information available: They had viewed a video titled *Hitler: The Criminal*, which made an opposite claim about Hitler's intentions. That conflicting information led her to confidently question the veracity of the storyline. Clearly enough, Jane made a vivid mistake and a student called her on that mistake. This may seem to some like "just a mistake." However, I would argue that the mistake has much to do with the *narrative resources* Jane is recruiting to teach about the Holocaust. The same coherence-producing devices that can make narratives rhetorically powerful may also lead to inadvertent falsification, at least in the case of an early-career English teacher without training in modern European history. I see such mistakes as carrying ethical weight in classroom curriculum, whatever the teacher intentions (Juzwik 2004a, b). Even when inadvertent, such mistakes can lead to falsification of the past, a moral problem when teaching about the Holocaust, especially given the insidious persistence of Holocaust denial.

This example further illustrates a problem noted with the interpretive layers discussed above: it places Jews and Jewish persons as objects being acted upon, rather than as subjects who themselves actively experienced and interpreted the horrors of the Holocaust. This objectification has potential to harm Jews as a collective group in the USA and globally. To explore the extent of such representations, I tallied the identity and frequency of various collectives represented in teacher and student narratives. Unsurprisingly, the most frequently referenced group was Jews (mentioned 349 times throughout the 75 narratives). Other groups

referenced included Germany (147 mentions), participants' families (130 mentions), and Nazis (121 mentions). Hitler was mentioned 297 times. Taken together, Hitler, Germany, and Nazis (perpetrators) were mentioned 573 across the narrative corpus. A dominant narrative perspective seemed to be that of "what Hitler did" rather than, for example, "what Jews experienced." Across the narrative data, Nazis/Germans/Hitler and Jews were protagonists.

I sought to deepen this interpretation by looking more closely at the acting of social groups and individuals and who were acted upon in the narrative rhetoric. In the problematic narrative above, for example, Hitler was the superordinate agent (the one doing the acting) in fifteen instances (e.g., "Hitler did NOT/intentionally set out to kill 6 million Jews"). Hitler is the subject of the sentence. By contrast, Jews were subordinate (acted upon) in ten different instances, for example, "He just didn't want them in, basically in Europe." In this example, the designation for Jews, "them," occupies the object, rather than subject, position of the sentence. While denying Hitler's intentionality, Jane somewhat ironically endowed Hitler with agency through such construals. Indeed, some might feel that, through getting "inside the head" of Hitler and the Nazi logic, Jane might have invited students to identify with Hitler, rather than with Jewish victims.

In systematic coding of teacher and student narratives across the full data set (see Juzwik 2009, p. 138), an analysis not detailed here, I discovered a more general pattern of Nazis or Hitler or Germans acting (in the subject positions of clauses) and Jews being acted upon (in the object positions of clauses). Such representations of Jews and Jewish persons are troubling and should cause us to be careful about joyfully celebrating teacher narratives as only virtuous. Rather than critiquing Jane, taking a closer look at her use of narrative invites a deeper consideration of what the (unintended) consequences of oral narratives about the Holocaust might be for American Jews and also Jews beyond the USA. Given that many in public school classrooms are not Jewish and given that non-Jewish students may not encounter representations of Jews elsewhere in the language arts or history curriculum, these representations may have potential to do harm. Not only can they diminish Jewish memory or experiences, they can also figure contemporary Jews inaccurately, for example, as perpetual victims (Novick 1999). This is especially a problem for non-Jewish students who may have little exposure to contemporary Jewish culture and life.

Why Rhetoric?

Rhetoric has not, to my knowledge, been heretofore considered a viable approach to the study of narrative in educational scholarship.⁴ I believe, however, that the case study presented here, considered alongside the fuller report (Juzwik 2009), can

⁴ See Varenne (1978) for a rhetorical analysis of interactions between high school teachers and administrators in the USA.

reveal the interpretive power of rhetoric for studying classroom narratives. I specifically show how teacher narrative discourse enacts, counteracts, and otherwise interacts with curricular goals. In focusing on the rhetoric of teaching, however, I found it necessary to background issues of student learning and “outcomes,” which may be seen as a weakness of the overall approach in an outcome-driven era. While not prepared to claim that a rhetorical approach to narrative study was the “best” approach to these data, my hope is that the findings and the method might prove generative to narrative inquiry.

Because of the steady stream of concerns in rhetorical studies with the ethical dimensions of persuasive language (e.g., Aristotle 1991; Isocrates 1961; Perelman and Olbrecht-Tyteca 1991; Quintilian 1958), taking a rhetorical approach to these data pushed me to consider the ethical dimensions of teacher narratives told about a morally weighty past. If Jane’s Holocaust narratives simultaneously did referential, interpersonal, poetic, and moral work in her classroom, as I argue, the findings suggest a more general hypothesis for further consideration: Moral talk in classrooms is more pervasive and under the radar than people assume. Jane made strong claims for students’ ethical learning through Holocaust study; she truly believed that the unit would impact their future life trajectories. And the moral stances advanced in her narrative rhetoric seemed, with some exceptions, to support those stated aims. Confirming what moral learning happened in Jane’s classroom as a result of Holocaust study is beyond the scope of the study; nonetheless, narrative discourse offers a rich site for examining the ethical dimensions of teaching and curriculum.

The Role of Interpretation in the Study

Four key interpretive issues shaped the research just presented: (a) deciding what counted and what did not count as “narrative” in my data set, (b) transcribing and therefore “seeing” the narrative data for different layers of rhetorical analysis, (c) establishing my *ethos* in conducting and writing up the research, and perhaps most significantly, (d) responsibly presenting the teacher, Jane, so that she did not appear morally reprehensible, which I believe she was not.

First, to frame the discussion, I conceptualized my research as a cultural and interpretive process in which I was constantly making decisions about what to place in the foreground as “text,” what to place in the background as relevant “context,” and what to relegate as irrelevant context “beyond the scope of the study” (see also Bauman and Briggs 1990; Silverstein and Urban 1996). I see such decisions as critical interpretive questions in rhetorical and discourse analytic research. Making the responses to those questions explicit can build credibility of interpretation. It also creates potential for an interpretation to travel beyond disciplinary or sub-disciplinary confines and impact subsequent scholarship.

I needed to decide, then, what counted as a “narrative” in my data set. In most narrative scholarship in literacy studies, the term “narrative” often gets invoked, but

is rarely defined, in methodologies (Spector et al. 2007). Therefore, it was not straightforward to decide how to define narrative for my purposes. While Phelan's definition offered a general rhetorical orientation to narrative discourse, it didn't offer criteria for de-contextualizing narrative discourse from the swirling sea of classroom language. Sociolinguistic narrative research, especially Labov's (1972) seminal study, provided an interpretive pathway through the data set: to quote above, "any temporally sequenced series of clauses that included evaluation or an evaluative stance taken on events and/or persons."

A second interpretive concern in my work involved decisions about how to transcribe narratives for various analytic and interpretive purposes. While some argued that there is one correct approach, I have been guided by a rhetorical perspective. This view holds that transcriptions do analytic and rhetorical work and should be driven by the purpose of an analysis, by the current state of scholarship in the field, and by the intended audience (Mishler 1991; Ochs 1979). I have therefore attempted to show how my transcription choices became significant interpretive decisions. For example, in my poetic analysis, the decision to transcribe into lines and stanzas allowed me, and the readers of my entextualization, to see the poetic and parallel qualities of the narrative in the way that a prose transcription would not. In the process of the research, I did all the transcription work myself to develop an intimate relationship with the narrative data, in preparation for the "real" interpretive work of coding. Discourse-oriented work with narrative, as I have described here, is enormously time-consuming for the researcher and often results in deep reports of small amounts of data or data generated over a relatively short period of time.

A third issue relates to my construal of researcher *ethos* throughout the project. *Ethos* is a concept from rhetoric that is useful for considering issues of researcher reflexivity in the process of interpretation. I define *ethos*, following Aristotle (1991), as the discursive construction and performance of identity. So in this particular project, I had to ask myself, what *ethos* would be relevant and persuasive, given the nature of the project? How would I present myself at different phases of the project? How might my *ethos* shape my interpretation of data in intended and unintended ways? Like the teacher I was studying, I had an *ethos* problem in studying and writing about the Holocaust: I was not Jewish and I was not an expert in modern European history. My studies of Holocaust representation and history, however, had led me to see interpreting Holocaust discourse as a rhetorical and ethical minefield (e.g., Bernard-Donals and Glejzer 2001; Spiegelman 2011). And so, I did the best I could. While generating data for the project, I was in my first semester of graduate study and a short time away from being a middle school English teacher myself. It was therefore easy to position myself with Jane as a colleague. I had a bit more experience than Jane (6 years, as opposed to Jane's 2.5 years). In writing about the study (e.g., Juzwik 2009), I also tended to emphasize my *ethos* as a former English teacher who had struggled to lead students into responsible transactions with Holocaust texts. In this handbook chapter, given the audience and purpose of the volume, I have chosen to emphasize my *ethos* as a narrative researcher and scholar.

A final interpretive challenge of my rhetorical approach was presenting the focal teacher, Jane Connor, in a responsible manner. I wanted to discourage readers from jumping to the conclusion that she was a morally reprehensible person or a terrible teacher, as some have done upon seeing the narrative about Hitler's intentions. That challenge, in turn, led me to consider the importance of her status as a relatively early-career teacher in interpreting the data set. It prompted me to carefully consider how I should frame excerpts of her talk, so that readers might have sufficient contextual information. For example, I included the information that Jane had shown students a movie *Hitler: The Criminal* that argued for Hitler's intention in designing the Final Solution previous to telling the narrative about Hitler not intending to kill the Jews. It pushed me to *qualify* my interpretations (e.g., to use language such as "On my reading. . ."). Presenting Jane in an engaging and sympathetic manner required an imaginative leap, an effort to put myself in the shoes of various potential reviewers. It involved constantly imagining the critical reader lurking over my shoulder. Of course, hearing and reading responses from living and breathing real-life readers made this imaginative work much easier. In the process, my research imagination was enlivened by the voices, social languages, and ideologies of others.

Conclusion

In an era of standardization, when questions of value in education tend to be obscured by talk about outcomes, rhetorical inquiry into the value-laden nature of teaching is needed more than ever. Towards this end, I have worked within the broader framework of narrative discourse analysis to present a rhetorical approach to studying classroom narratives and particularly narratives told by teachers as part of instruction. The approach included a multi-functional, layered interpretation of the referential, performative, poetic, and ethical work that narratives talk can do in classrooms. The first three interpretive layers make possible the final and most important layer, focused on the ethical dimensions.

1.4 Dialogue in Narrative Inquiry: Collaboration in Doctoral Study in the USA

**Yuni Sari Amalia, Daniel F. Johnson-Mardones,
Marilyn Johnston-Parsons, Wendi Shen, Yun-Sun (Ellie) Shin,
and Jason A. Swanson**

*Where consciousness began, there dialogue began. (p. 40)
When dialogue ends, everything ends (p. 252).*

(Bakhtin 1981)

In this chapter we describe a process of using dialogue to construct interpretations in narrative inquiry. We see narrative and dialogue as partners in the pursuit of learning, what Bakhtin called “consciousness.” This is an approach to inquiry that is collaborative and well suited to research that is multivocal and socially critical.

Here we focus on dialogue and its centrality to narrative inquiry. Dialogue requires interpretation throughout as we try to listen and learn from others. Dialogue can be eminently useful regardless of the other methods used in the research. It has its own benefits and burdens as an approach to inquiry and we acknowledge both here. We give research examples from educational contexts but the method is applicable in any research context that involves narrative.

The literature is replete with acknowledgements that conversation, interviews, and discourse are a natural part of narrative inquiry and that reciprocal learning is often the result. Collecting stories, life histories, or other forms of narrative data requires talking. Reciprocity and joint efforts are often described. Some researchers advocate collaboration throughout the process of telling stories and constructing interpretations; others collect data and then do the analysis and interpretive work on their own, including their own perspectives, to make clear their interpretive role. Our main example will demonstrate the former—long-term collaborative work. We also provide other examples from dissertation projects.

Dialogue, for the purpose of our research method, is not just ordinary talk. Its focus is learning and learning leads to new understandings about the stories of individuals and groups, which in turn can lead to re-storying and multivocal interpretations. Dialogue is best sustained in democratic contexts where different perspectives are encouraged, trust is nurtured, and norms of social justice are maintained. Benjamin Barber (1984) claims: “At the heart of strong democracy is talk” (and by “talk” he means what we call “dialogue”) (p. 173). We often run into multiple terms for similar meanings and different meanings for similar terms. Dialogue is a common term but users don’t always mean what we intend here, whereas Barber uses the term “talk” and his association of talk and democracy closely parallels what we mean by dialogue. Democracy is closely aligned with our concept of dialogue because it benefits from the expression of different points of view, talking through issues, and learning from this process.

However, as many suggest (Burbules and Bruce 2001; Habermas 1984; Houston 2004), the differences that emerge in dialogue offer as many opportunities for misunderstanding as for learning:

... dialogue creates an opportunity for some to learn from and with others. Such diversity, however, does not only create a set of possibilities and opportunities; it also constitutes a potential barrier – for it is these very same differences that can lead to misunderstandings, disagreements, or speaking at cross-purposes. (Burbules and Bruce 2001, p. 1112)

We use *dialogue* to identify a particular kind of talking and learning. For us, dialogue is more than comfortable talk or questions on an interview protocol; it requires a willingness to ask hard questions and learn from differences and a willingness to change one’s mind. It is nurtured by trust and openness. Dialogue carries ethical considerations and is burdened by the acknowledgement that learning involves taking risks and will likely call one’s assumptions and meanings into question. In dialogue, with Freire, we learn to “read the world” in ways that can enhance our humanity, including being critical of oppression and injustice in our lives and our research. We understand interpretation to be an integral and

concurrent aspect of dialogue. Dialogue requires that we listen intently, deal with differences, and examine our assumptions and these are highly interpretative tasks.

We use *narrative* to reference the initial telling of stories within a dialogue. Narratives offer accounts of the lived experiences of individuals and these are considered within the dialogue. The dialogue usually begins with “stories” initially constructed by individuals, and these evolve through the dialogue into life histories and other literary forms (poetry, drama, readers’ theater, songs). Throughout this process, interpretations are made; connections are made with both personal issues and larger ones in the social context and beyond.

We understand *inquiry* to include all forms of questions and searching related to individuals in social contexts. We see *narrative inquiry* as a natural process of asking questions and making interpretations and as a set of research methods reflecting research epistemologies and controversies. The former occurs through the telling of stories, the latter through more systematic procedures and the building of more general interpretations.

We, the authors, are a professor (Marilyn) and five doctoral students from many different places in the world. Jason is a student in educational leadership, while the other students are in the department of curriculum and instruction at the University of Illinois at Urbana-Champaign. Marilyn is the adviser of the students. We self-consciously used dialogue as a process of doing inquiry while writing this chapter. It supported our thinking in a way that is reflected in the content and the narrative structure of this chapter.

In one of our weekly narrative study group meetings, we were trying to summarize the characteristics of dialogue, to identify the qualities by which one knows when dialogue is happening. Following the initial offering of “participatory,” we began, partly in play, to list adjectives that started with “p.” It is challenging to define something that is so fluid and changeable—dialogue is influenced by context, participants, and purposes—but we’ve found these descriptors useful. Any particular dialogue might have more of one quality than another, but it is not “dialogue,” in the sense we are discussing it here, without many of these qualities being present.

Provocative: Dialogue is provocative in that it leaves you wondering and hungering for more. It seldom feels finished; it often leads to further issues and questions. It leaves one hungry in the way that Dewey speaks of inquiry leading one to new aims. “The quality of any experience has two aspects. There is an immediate aspect of agreeableness or disagreeableness, and there is its influence upon later experiences . . . they promote having desirable future experiences (Dewey 1938, p. 27). Experiences provoke responses and lead to future aims, a continuous cycle that at its best is provocative.

Purposes: Dialogue requires shared purposes—at least initially it is about something. Yet it is the differences that emerge in dialogue that push us to re-examine both individual and group purposes. Dialogue can be instrumentally oriented but it is not usually so. It has a more fluid sense of purposes that arrive, shift, and are moderated by the dialogue. Purposes are challenged and often

rearranged or reinterpreted through dialogue. Participants often leave dialogue still thinking and wondering about their purposes.

Place-based: Dialogue is situated within a specific location, and this placement provides references and experiences that matter to the dialogue, especially in long-term collaborative projects. Place-based education has been connected with ecological education, education in rural, urban, and indigenous communities, and the purpose is often to learning within this place in order to give back to it. Place grounds *what* is studied and discussed, but also *who* is doing the studying. It matters what this place is like and the cultural and political practices within it. “Place . . . foregrounds a narrative of local and regional politics that is attuned to the particularities of where people actually live, and that is connected to global development trends that impact local places ” (Gruenewald, 2003, p. 3). Yet place, like other concepts, is a leaky idea and will reflect the multiple interpretations of those in a particular place. Dialogue as a place-based process brings forth situated and multiple interpretive viewpoints. Its will reflect diverse issues and critiques than are both drawn from and influence the place and persons in the dialogue.

[Un]Predictable: The results of dialogue are *not* predictable. As ideas are shared and new perspectives or challenges are offered, the understandings that emerge from the dialogue cannot be determined ahead of time. It is a creative and open-ended process. Understandings between persons or within persons cannot be predicted or contained, and misunderstandings are always possible. In a critique of the often-idealized discussions of “community,” I. M. Young asserts:

... sharing however, is never complete mutual understanding and reciprocity. Sharing, moreover, is fragile. The other person may at the next moment understand my words differently from the way I meant them, or carry my actions to consequences I do not intend. The same difference that makes sharing between us possible also makes misunderstanding, rejection, withdrawal, and conflict always possible conditions of social being. (Young 1986, pp. 10–11)

The potential for misunderstandings requires further dialogue and whether this will bring understanding is not predictable.

The potential for misunderstanding is related to the very nature of language. Bakhtin argues that all understanding is dialogical and that our understandings only evolve as our utterances are juxtaposed with the utterances of others. We need others and their utterances in order to comprehend and construct our own understandings. Understandings happen in the space between persons, in the dialogue. For Bakhtin, discourse and understandings are interindividual and cannot be attributed to the speaker alone. As he famously has said, “the word in language is half someone else’s.” If language is shaped in social spaces, we have less control over our utterances and what they will become.

Feminist poststructuralist theories also see language as constructed within social contexts. They focus on the relation of language, subjectivity, social organization,

and power. Weedon (1987) describes the connection of language and power relations:

The plurality of language and the impossibility of fixing meaning once and for all are basic principles of post-structuralism. This does not mean that meaning disappears altogether but that any interpretation is at best temporary, specific to the discourse within which it is produced, and open to challenge. The degree to which meanings are vulnerable at a particular moment will depend on the discursive power relations within which they are located. To subscribe to the provisional nature of meaning is not to imply that it does not have real effects. (pp. 85–86)

On this view, words develop meaning through language use within particular contexts, and meaning is constructed within language rather than reflected by it. Language is no longer transparent or stable but is dependent on contexts of use. An important part of those contexts are the relations of power between participants. In dialogue, we can confront those power relations and this is one reason why dialogue is democratic and also can be uncomfortable (Lugones and Rosezelle 1995; Nicholson 1990; Weedon 1987). It requires acknowledging the power relations between participants.

A post-structural account also asserts that language constructs subjectivities in context-specific ways, rather than being just their expression (Richardson 1994). Subjectivity is constructed as speakers adopt positionalities in particular discourses and discourse communities. This is also an effect that can be confronted in dialogue, as attention is called to the way particular uses of language have influenced participants. And again, it is a reason why dialogue may be uncomfortable and also can challenge our deeper beliefs. It calls into question the idea of one's unified, rational, and conscious subjectivity and requires a critical kind of listening, interrogating ourselves, accepting differences, and working to understand each other, however difficult all this may be.

Participatory: One can sit quietly and still be involved in the dialogue, but dialogue requires mindfulness. Engagement and focus happen because the issues matter, and their importance keeps participants processing, sharing, and critiquing the words and ideas.

Praxis: The interplay of practice and theory is typical of dialogue. Dialogue is not just a theoretical enterprise; the learning that takes place is tied to one's feelings, thinking, and practices. It moves between practice and theory in ways that demonstrate their interaction. The stories we tell are eminently practical in that they are about our lives; at the same time they reflect our deepest desires, identities, and questions, i.e., our theories. Bakhtin (1984) writes:

To live means to participate in dialogue: to ask questions, to heed, to respond, to agree, and so forth. In this dialogue a person participates wholly and throughout his whole life; with his eyes, lips, hands, soul, spirit, with his whole body and deeds. He invests in discourse, and this discourse enters into the dialogic fabric of human life, into the world symposium. (p. 293)

Positional: Participants in a dialogue often feel themselves shifting positions. Dialogue is not about a debate where one side convinces another wins, or about

convincing someone else that you are right; yet, as Swindler (1990) claims, “Clear strong positions are the stuff of dialogue” (p. 32). Dialogue is about sharing differences and finding them provocative of learning. Because of the dialogue, we often play with new ideas, change our minds, and find ourselves changed.

Perspective-taking: Peter Senge argues that “each person’s view (a way of looking at reality) is a unique perspective on a larger reality. If I can ‘look out’ through your view and you through mine, we will each see something we might not have seen alone” (p. 248). In dialogue, viewpoints are examined as if they belong to the group, not just to the individual. And each perspective is a window into the possibilities for interpretation within the group; it is food for thought and holds the potential for new insights.

Precarious: Dialogue can feel precarious. When our deepest assumptions get questioned in a public space, it can feel disquieting and disruptive. Cobb (1990) argues that “confrontation can contribute reliably to real gains only when it leads to dialogue . . . We confront with the conviction that others have something to say to us—that we need to listen as well as speak” (p. 1–2). To balance the precariousness that comes from confrontation and change, there is the *interest* generated by new ideas that attracts us and provides opportunities for new insights. This is not always easy, but it often rewarding. Dialogue needs to balance a safe space with risk-taking, and this requires both support and challenge within the dialogic space.

Political: Dialogue about schooling is always political (Bruner 1996). Stories about pedagogy and schooling inevitably lead to ethical issues, the influence of power, and the willingness or unwillingness of others to collaborate. Narrative inquiry itself raises political issues. Elbaz-Luwisch (1997) suggests: “The conduct of narrative research gives rise to a range of political issues which include the validation of narrative knowledge, the relationships of power and authority among research participants, and the distinction between the public and private domains” (p. 75).

Power: There is the inevitable challenge of the power relations that influence the dialogue space and can cause intimidation and injury. These need not be obvious and can influence participants in a group differently. Not everyone may feel injured or ignored, but those with power can dominate the group. On the other hand, participants with different roles or institutional status can have a dialogue as long as the differences are seen as assets and a means to learn from each other. Freire (1970) writes eloquently about how dialogue requires certain attitudes, which result in more horizontal relationships: “Founding itself upon love, humility, and faith, dialogue becomes a horizontal relationship of which mutual trust between the dialoguers is the logical consequence” (pp. 79–80). While it is never possible to remove power ascribed by our institutional roles and contexts, it is possible to critique it and work towards equitable relations within the dialogue.

On the other hand, narrative inquiry may be used for colonizing purposes, rather than for critique and liberation. Colonizers can use discourses to construct an “inferior other” to justify colonization (Said 1979). Narratives can be collected in order to inform and justify surveillance of the “other” (Foucault 1979) and to justify

exclusion (Jones 1999). Group stories can bind communities together and justify unjust purposes and practices as, for example, in a band of thieves or Nazi sympathizers, especially when they are isolated and bar critique (Wenger 1998). A critique of power must be sustained in order for dialogue to be possible.

Theme: Assessment and Evaluation

The theme for our chapter is assessment and evaluation, topics that are not typically seen as the purview of narrative. Tests and evaluation reports are usually done to us, not with us; they usually tell us about ourselves, rather than ask us to narrate our own stories. Assessment and evaluation reports are typically expressed in paradigmatic modes such as mathematics, logic, and science, which Bruner contrasts with narrative modes (1986, pp. 11–43). Using narrative modes of assessment and evaluation in education would allow researchers to bring forth what Bruner calls “the vicissitudes of human intentions” (p. 16) because narrative digs into the experiences of people and can capture complexity and context that is often missing in paradigmatic modes. Narratives have the power to engage readers in empathetic ways; story and metaphor are powerful means by which to influence human feeling and action. Dialogue in narrative inquiry would influence assessment and evaluation in profound ways.

When we add dialogue and narrative to assessment and evaluation, we create a negotiated process rather than an externally described outcome. More democratic assessments are likely to depend on dialogue and narrative. In response to quantitative approaches to evaluation, scholars have long proposed more democratic approaches (Greene 2006). Dialogue and narratives in evaluation invite stories and questions; everyone is expected to learn from an analysis of the issues and processes.

Dialogue can accommodate insider and outsider voices and it benefits from differences in perspective and opinion. Assessment and evaluation within a dialogic narrative inquiry takes time and a willingness to uncover complexities hidden by generalized test scores and program evaluations. Compared to more traditional outcomes of assessments dependent on statistical analyses, democratic and dialogic approaches reflect pervasive interpretation and will likely produce diverse as well as shared evaluation outcomes.

In the following research example of Marilyn’s, teachers narrate their encounters in their school with assessment practices that were bureaucratic and autocratic. Their stories reflect their frustration with mandated curriculum and evaluation from a school-district-level program, which in turn, reflect national and global trends of authoritarian assessment and evaluation. The teachers’ narrative assessments of practices and policies give voice to their points of view, and their evaluation is strengthened by the power of narrative to create empathy. *Dialogue in narrative inquiry* provides insider views that are often absent from assessment and policy-making.

The Research Project

When Marilyn began thinking about writing this chapter, she invited us (the doctoral students) to meet and talk about what she was intending to write. She intended some gentle mentoring about writing and publishing, but it eventually moved into a more collaborative project. She first shared with us one of her inquiry projects, as an example of a collaborative, narrative project grounded in dialogue. The explicit focus on dialogue was different than how most of us had thought about narrative inquiry, and it stimulated a lot of thinking as we compared our own research projects to hers and each other's.

As our weekly meetings progressed, we found ourselves immersed in trying to define the process Marilyn had used in her collaborative research. She had done a lot of collaborative inquiry and had written about *dialogue as inquiry* (Johnston-Parsons and PDS Colleagues 2012). The more we talked about the application of this type of dialogue to narrative, the more complications arose. We were changing our minds about various aspects of this process and our own research projects, a good sign that dialogue was taking place among us too. We eventually decided that the phrase *dialogue in narrative inquiry* best represented the method we are proposing here. It is a method—a dialogic approach to narrative inquiry—that we arrived at by discussing Marilyn's previous research and by applying it to our own research projects.

As burgeoning researchers we (the doctoral students) have collected data in different locations around the world, using different methods, theoretical frameworks, and approaches to interpretation. What ties us together in writing this chapter is our focus on dialogue and interpretation within narrative inquiry and the learning that ensues for researchers and participants. As we describe our varied research projects, you will see dialogue used in different ways and at different stages of the research, narrative as more or less at the center of the research, and collaboration more or less present.

We start with Marilyn's project; it was the beginning of our dialogues together. Later we will each describe what we learned about our own research through this dialogue and the ways we have redesigned, designed, or imagined our research in line with using a *dialogue in narrative inquiry* framework.

Marilyn's Project

In the first of our narrative study group meeting, I (Marilyn) shared with the doctoral student group a project I did over a 2-year period (Johnston-Parsons et al. 2007), and we discussed it at length. My own interest was to better understand how to bring a particular kind of *dialogue* into narrative inquiry and have it play an explicit and central role in the inquiry process. Using it as a contextualized narrative example, we focused on different stages of the research process and the ways in

which dialogue and interpretation were integral to the research. I could describe the outcome of our dialogue as re-storying my research narrative in light of this new framework—*dialogue in narrative inquiry*.

Marilyn's Collaborative and Narrative Interests

Throughout my teaching and research life, I have been drawn to collaborative contexts. I was hired as the teacher when a free school, parent cooperative was started in the 1960s in Salt Lake City. The Open Classroom is still a wonderful program, and a collaboratively written book was organized by Barbara Rogoff and two of the teachers includes narrative accounts describing program goals and history (Rogoff et al. 2001). After teaching there for 8 years and earning a PhD, I took a position at the University of Utah where I organized a collaborative venture with the local school district to do a “cooperative masters program.” Groups of teachers from three schools went through a 2-year program together. During this time, my research on professional development moved from doing research *on* teachers to doing it *with* them. When I moved to Ohio State some years later, I co-coordinated a school/university collaborative teacher education program, a Professional Development School, for 10 years and we collaboratively wrote narrative accounts of our work together (Johnston-Parsons and PDS Colleagues 2012; Johnston-Parsons et al. 2007).

I am drawn to collaborative inquiry because I am fascinated by what happens in democratic and dialogic contexts. I find both the process and outcomes fascinating for their complexity. After all these years, collaborative projects still keep me on a steep learning curve. I am continually intrigued with the relation of democracy and dialogue and more recently by the implications of the narrative structure of much of this dialogue. This was my beginning interest when we began our narrative study group. At the first meeting, I told them about my last collaborative project, which follows.

Marilyn's Research Example

In 2002, I was asked to provide an action research course for the teachers in a densely urban school close to my university. One of the teachers had been in a previous course and had convinced the teachers that a course would be a good use of their professional development time. The first night in this “class” with about 18 teachers sitting around a large table in their staff room proceeded in a typical way describing the syllabus and the broad outlines of action research. Then I asked them to each talk about some potential issues and interests they had related to their classrooms. For the next 2 h, I listened to a wide variety of rich stories about their classrooms. Soon they were talking to each other, not to me. It was clear that they were used to talking with

each other about important topics. As their narratives unfolded, other teachers jumped in to extend and connect their stories. They knew each other's students and there were complex family and community connections. The narratives moved back and forth between their classrooms, the school, and the larger conflicts in the school district reflecting pressures from national testing policies.

I drove home from this "class" speculating about how to change the syllabus to accommodate these rich narratives. I made significant changes but even these melted away as the narratives continued making course requirements seem superfluous. Whenever we met, there were more stories, both compelling and developing. Individual stories were told and everyone learned from them. Sometimes there were proposals about how to solve a problem with a particular child, but more often there were lots of issues to discuss. I saw my role as asking questions, suggesting potential data collection to seek answers to the questions, and probing for themes and bigger issues. The teachers interviewed others in the school to get their perspectives, collected surveys, and conducted interviews with students to better understand their perspectives, but mostly there was continued dialogue about teaching and about policy impositions on the school. This process required the ongoing construction of interpretations as we tried to make sense of the data we were collecting as well as our continuing individual and group narratives.

This school had a strong sense of community. Teachers talked to each other in the hallway, in the teachers' room, and after school. Their talk was often in narrative form as they described their students and ways to better help them and their families. There was no deficit thinking here; they were focused on creating successful learners and sustaining a strong sense of community in the school and with families.

Many of the teachers' stories focused on a recent policy developed by the school district, which was intended to produce higher reading test results in the district. The program was scripted and rigid. A couple of the teachers had been invited to help create this curriculum during the previous summer. After they found out about the constraints of what they were to develop, they resigned. Nevertheless, other teachers and district personnel put a curriculum together that appeared in the fall in large notebooks and contained disjointed lessons. There was a schedule indicating lessons to be taught at particular times at each grade level. Timers sat on teachers' desks and there were unscheduled observations by district officials, whom the teachers nicknamed the "police." Quick messages circulated across the school whenever they were sighted in the building.

The stories slowly became more complex and varied as our dialogue continued. Interpretations differed and stimulated more dialogue. We started looking for common themes as well as unique aspects in the narratives. Each week the teachers came with more stories to share, which now were written and then shared. Stories were rewritten to reflect what was learned from the dialogue. While we used more analytic systematic approaches to code our interview data and catalogue the narratives, *dialogue* and *interpretations* permeated every step of the way. We inquired into teaching practices and the influence of oppressive policies that crept into classrooms like an invisible wet blanket. Policies were subverting the very

practices teachers had worked for years to perfect. They felt that they had honed effective pedagogies to teach children to read, to integrate the arts into their curriculum, and to build culturally relevant curriculum in their classrooms; much of this was smothered by the new mandates and timers.

In the process of this extended dialogue, newer teachers were apprenticed into the school culture and given narratives from which to begin to construct their professional lives. In the beginning they mostly listened and asked questions. Their stories came eventually as they gained confidence and trusted that it was safe to describe both successes and failures within the group. The seasoned teachers were describing ways they felt de-professionalized, policed, and restricted by policies outside their classrooms; they were both angry and quietly subversive. Some of the newer teachers did not object to the structure and requirements in the same way, as it provided guidance and security for them. The differences in perspectives were critical to dialogue and learning within the group.

As the stories developed in richness and diversity, I broached the subject of writing a book. They were initially quite incredulous but the idea sat waiting as we continued developing our stories. By the end of the official course period, we had accumulated many pieces of narrative with various analyses and data to support them. A majority of the group decided to continue to meet, without course credit. We were now talking explicitly about a book and that increased a sense of focus. What would this book be about? Did our narratives hold together? What were they about as a whole?

Many of the issues we discussed had political implications. One was the political implication of publishing these stories. Would the teachers get in trouble in the school district? Did anyone else know that we were writing this book? Could they get fired? Would it matter if they did? Would the teachers' union support them? The dialogue around these personal and political issues was rich and diverse. We were aware that different audiences could interpret our narratives in different ways. We proceeded with the book-writing project while the political threats swam below the surface. Only occasionally was there serious consideration about abandoning the project.

I had known from the first week's meeting that the teachers were attentive to the larger issues of schooling. The school was labeled a "failing school," as measured by standardized test scores; from the teachers' point of view, this label did not reflect the difficulties of their students' lives, their successful learning, nor what they considered important in their teaching. They were cognizant of the pressures put on the principal by the school district, a principal they greatly admired. They also recognized the pressures of national policies that were bearing down on district administrators. In this hierarchy, they felt voiceless and disempowered.

One result of the dialogue within this narrative inquiry was determination and focus; it did not vanquish the fears or the differences, but I saw clear evidence that they were learning from their experiences, becoming more sharply critical as they worked together, and they were creating a strong sense of identity related to producing this book.

My role within the group shifted as the dialogue took different directions. Sometimes I felt like an insider and other times excluded. I tried to ask questions, to provoke critical thinking, and to encourage those who were more reticent to

share. I was a resource for their questions about research methods, I offered them ways to justify narrative as “real research,” and I suggested new issues to consider. They doubted that they had anything to say that would be of any interest to others. As an outsider, and situated as an “expert from the university,” I assured them they did. Many were skeptical.

In the end we gathered the narrative accounts together in a book. We called it *Success Stories from a Failing School*. But the *successes* were short lived. The principal, who had nurtured the collegial spirit among the teachers and the school’s close ties with the community, was transferred to a new school just as the book was about to be completed. Families and teachers were devastated by the news, which arrived 5 days before the end of school. Was he transferred because the teachers didn’t implement the curriculum as prescribed? Probably not, but they wondered. Was he transferred because he did a good job and his skills were needed in a less “successful” school? No one knew.

A year later, the school itself was closed, part of a series of school closings as student numbers dwindled in the city. The teachers, rather than being transferred to the nearby school where most of the children would be attending, were obliged to apply for new jobs across the district. Only a few were interviewed for the transfer school. This completed the breakup of the community; relationships between school and families were lost in the shuffle.

We still get together when I am in town. I now teach at a different university. We’ve all moved to new places and we talk about how our lives have changed as we’ve moved. Around dinner and glasses of wine we slide easily into a continuing dialogue about schools and politics. Many issues continue, as others things change. In a recent email, one of the teacher authors wrote:

Things are different, yet the same in [the school district]; now we’re being encouraged, at least in my [special education] feeder patten, to teach through projects—even better, service projects! How the pendulum swings! It seems to me however that we’re still treated as though teachers don’t know anything, and we’re not given the resources we need to accomplish the desired results (email, 1/22/12).

The narratives continue, as do our storied lives (Clandinin and Connelly 2004).

The Doctoral Student Research Projects

As our narrative study group continued to dialogue about *dialogue in narrative inquiry*, we examined each of the doctoral students’ research projects. Some had been designed as narrative inquiry and others had used interviews to collect their data. The latter studies led to discussions of when interviews turned into dialogue and when not. We had a rich dialogue about how each of these projects might become more fully dialogic and how that would change them.

This dialogue included issues of interpretation. We wondered whether dialogue in narrative inquiry required more interpretation than a more formal interview study

where questions are set ahead of time and the interviewer does not interject his/her own experiences. We were aware of the continual interpretive demands of our own dialogue; we were thinking hard about each other's perspectives and both agreeing and disagreeing with them. This was more than passive participation or listening to Marilyn. We've concluded that democratic and dialogic modes carry heavy demands for continual interpretation. Of course, interpretation takes place whenever we are talking, reading, or thinking, but our understanding of dialogue in narrative inquiry required attention to interpretation in a pervasive way.

Initially we had a tendency to think "the more dialogue and collaboration the better." But we now want to dispel this expectation. Dialogue throughout a project is not always possible, especially as we begin a research project or when we choose to step away from a dissertation project to do data analysis and writing. Likewise, collaboration throughout the entire inquiry project is not always possible. Our participants may not sustain an interest in our research questions, they may tire of the demands of continued collaboration, or they may not have the institutional rewards that propel those of us at universities to continue our research. In addition, doctoral students must demonstrate that they can do research, which may be questioned if everything they do is collaborative. This may limit what is learned but we cannot always control institutional expectations for degree-bearing work. Our dialogue around the writing of this chapter included discussions of these issues.

Wendi's Research Story

It was a usual weekend for me. Two of my good friends and I were sitting comfortably in a restaurant with dim lights and soft music. Although the restaurant was about to close, we did not feel like leaving. We had started the meal with random chatting but ended up in an intense dialogue about whether to return to China after we completed our studies. The husband and the wife held different positions and I was undecided. We discussed the pros and cons and different factors to consider. During the conversation we stated our opinions, challenged each other, compared, paused, and rephrased. I learned through this dialogue that it is not only concrete factors that influence people's decisions, but also one's values and sense of worth. We left feeling we had a more complex understanding of each other and the issues.

At that time, I had just finished collecting data for my pilot project on expatriate faculty's experience on returning to China, which included one question about motivations for returning. The interviews were conducted in a traditional way, with the interviewees doing most of the talking and me trying not to intervene. My conversations with my friends and our narrative study group have led inspired me to consider using dialogue and narrative for my dissertation.

My research will explore the living experiences of Chinese junior faculty in their cross-cultural journeys home after studying in the USA. In a dialogue, the researcher and participants together identify the issues, tell their separate stories,

challenge each other, and negotiate meanings. The research creates a space for open discourse where learning for both the researcher and participants takes place. For example, if reverse culture shock comes up as an issue for one of the expatriate junior faculty, we would continue a dialogue to explore this issue more deeply. My participants and I would compare our experiences from multiple perspectives, challenge our assumptions, and construct individual and collaborative interpretations, and new issues would surface. This process creates an ecological cycle where collaborative and reciprocal learning takes place in a social learning environment. It would be similar to the dinner dialogue I had with my friends discussed earlier.

Yun-Sun's Research Narrative

From my field notes, February 15th:

It was a cold late afternoon in mid-February. I arrived at a local coffee shop early to reserve a table for us. As I finished ordering a cup of coffee, a middle-aged Asian woman and two young children came into the coffee shop. I assumed they were the ones, so I approached them and we introduced each other in Korean. We sat at the table and started a conversation about my study. I gave the children a piece of paper and pencils so they could occupy themselves.

After we finished the conversation, I saw what Alice had written on her paper. She had scribbled alphabet letters, and interestingly, she copied what I had written on my paper. Although she did not spell all the words correctly, the letters looked very similar to my handwriting. It was an unexpected and delightful moment for me. I felt like the 8-week journey I was about to take with this lovely bilingual family would be a pleasant one.

My study was on the language development of two Korean emergent bilingual children, focusing on their home literacy environment. Andy, age 10, and Alice, age 7, were native South Koreans who spoke Korean (L1) primarily at home. Alice especially showed a high level of writing ability. They had had formal English (L2) instruction in Korea before they started public education in the USA. The children's mother, the key participant in my study, had a doctoral degree in crop sciences and was working as a university research fellow.

I did observations three times a week. I wrote field notes, audio-recorded data, and collected the children's written materials. I conducted the interviews in Korean with both the mother and children, to establish rapport (Patton 1990).

I used typical semi-structured interview questions about the mother's support for L2 learning and the children's linguistic and academic background. Her responses were typically told as stories about her family and children but I did not reciprocate with my own stories.

Our first two interviews went as planned. The mother answered the questions willingly. Her answers were focused yet not elaborated. During our third interview, the mother was more engaged, especially when we talked about topics such as "early study abroad" and English education policies in Korea. Unlike the previous interviews, she asked me many questions about US English as a second language (ESL) programs and how to promote her children's L2 learning. We enjoyed sharing both our stories and compared our perspectives. Although it was not my

intention, the interview became a dialogue where we were working to understand our different perspectives. The remaining interviews followed in this “dialogic” way. When I analyzed my data, I saw mutual learning taking place.

In talking about dialogue in narrative inquiry in our study group, we discussed different cultural perspectives related to dialogue. East Asian countries are typically hierarchical societies. When I began my research, I was concerned about issues of age, gender, and social class. I was much younger than the children’s mother and the mother was a coworker with my fiancé. I worried that I would not be able to talk openly about certain matters because it would be considered impolite based on Korean cultural norms. However, there was a significant range of topics we could talk about when we moved from an interview to a dialogue.

As a doctoral student, this home literacy project and the experience of using dialogue in narrative inquiry pushed me to think deeply about the type of research methodology I will use to frame my future dissertation. I am also wondering about how dialogue can be nurtured within rather hierarchical Korean norms.

Daniel’s Research Story

Perhaps we can say one other thing: any story one may tell about anything is better understood by considering other possible ways in which it can be told.

(Bruner 1987/2004, p. 709)

As Clandinin and Connelly have pointed out, “as researchers, we come to each new field living our stories” (2004, pp. 63–64). In the midst of my academic worries, carrying my own stories, I met some beginning history teachers and asked them for their life stories. We shared our stories while studying at a public university in Santiago, Chile. I had come there 2 years before to get my master’s degree in curriculum studies. The stories would form part of my master’s thesis, which focused on the process of becoming a teacher and which I titled *Beginning Teachers’ Identity and Teacher Education: A Biographical-Narrative Approach*.

I wanted to look at the process of learning to be a teacher as a “complicated conversation” about our educational experience, a *currere* (Pinar 2009). I used biographical narratives to gain access to their experiences. However, it was not until we talked about dialogue in our narrative study group that the relationship between dialogue as a method of inquiry and the concept of teacher education curriculum as a “complicated conversation” became evident.

In our conversations I heard things like: “I never thought of that before, but now as we are talking . . .” This showed me how our dialogue involved self-discovery and meaning production for both of us. The storytelling was creating new meanings for the teller and the listener. Our dialogue was more than a “field text” to be interpreted later on; it became a moment of interpretation for both of us. The story told to me was also a story retold for them. Our dialogue became a stop in the participant’s life, a moment in which self-reflection took place by asking and being

asked. It was not just a one-way road; “life history . . . involves conversation and narrative exchanges between two people engaging in a collaborative process of reflexivity and meaning making” (Goodson and Gill 2011, p. 44).

In the midst of those dialogues, I became aware of how important listening to stories had always been in my life. Other people’s narratives were a way of learning to understand my life and the world. These beginning teachers’ stories had become part of my research. We “shared, discussed and tested” (Goodson and Gill 2011, p. 44) our life stories together. My own beginning teacher story was reflected in these beginning teachers’ stories and this led me to question my own understandings about becoming a teacher. I was thinking in the midst of these encounters, in the midst of my story, and in the midst of their stories. In this in-between land, our dialogue became an epistemological place where lived experience came back to life, transforming both the teller and the listener, and being transformed in the exercise of its telling.

To complete my thesis, I analyzed the data by coding it, building categories, and articulating the relations between them, in short, by reducing the data. This missed an important part, the *narrative* of each teacher’s story. So I included a second analysis that I called “narrative.” To justify this, I followed Bruner’s distinction between paradigmatic and narrative modes of thought that I had found in a paper by Bolivar (2002). The result was a reconstructed text that combined the narratives and my interpretations of them. I kept in mind Goodson and Gill’s idea of contextualizing the story in wider social issues, which is the difference between life story and life history. However, I felt uncomfortable taking the teachers’ narratives and putting them in my voice as the interpreter. Certainly, the narratives were there; but the dialogue between us was missing. A decision to frame my research as *dialogue in narrative inquiry* would have required that our dialogue be part of the final text.

Sari’s Research Narrative

What’s your story? We asked.

She told. He told. We retold.

Mine? Yours? We are all in the sea of storied lives.

I am from Indonesia, a doctoral student specializing in teacher education. In 2009, I did my master’s research on Indonesian teachers’ perceptions of the Indonesian government’s mandate for a decentralized and competence-based curriculum. I surveyed 62 Indonesian teachers of English from private and public schools and interviewed 8 of them.

Teachers’ responses to the survey and interviews were all supportive of the reform. This puzzled me. As an Indonesian and a teacher, I suspected that politics and culture were influencing these responses. Our Indonesian educational system had been heavily centralized for 59 years prior to the decentralization shift in 2004.

In this centralized system, teachers, as civil servants, were expected to support the government's agenda. Perhaps teachers still felt that they "must" agree with a reform initiated by the government. They seemed cautious. Many of them asked me if I was an evaluator or teacher assessor. I talked to Marilyn about these issues and we decided that I should talk more with some of the teachers. To begin, I called several times just to say hello and to learn about their personal lives. Soon the teachers began to open up with me and trust me with their stories. The result was that almost all were critical of some parts of the reform, especially of the policies about standardized testing. For example, one teacher said:

The government initiates decentralization, but why is the evaluation of the students centralized? We cannot generalize the abilities of students from Sabang to Merauke! They need to reform this unfair standardized testing. Many teachers have requested the reform of the exam policy, but nothing changes if the people in power do not want to change it. (Interview with Prima)

Dialogue with my research participants made my interpretations more complex. The more I learned from the teachers' narratives, the more questions I had. This puzzlement, however, increased my criticality and helped me to better read the teachers' world (Freire 1970). In doing the initial interviews, I'd often bit my tongue trying not to influence the teachers with my opinions. I wanted them to tell me their own, "uninfluenced" stories. My follow-up conversations and of the discussions of the narrative study group have given me new possibilities to consider. For my dissertation research, I am now convinced that if I use dialogue as a medium to learn from the teachers' narratives, I will have a deeper learning experience. Perhaps it would increase the teachers' criticality as well.

In talking with the teachers, I will position myself as a dialogue partner. I will be an equal counterpart in reinventing their stories and mine. Having a more reciprocal dialogue will provide a conduit to increase our critical consciousness. Dialogue is the space where the teachers' voices are respected and valued, where *their narratives matter*.

My aim as a researcher is to grow from someone who only whispered thoughts quietly inside my head to someone, now in the USA, who is encouraged to state my thoughts openly. I want my research participants to believe that their voices—their struggles, puzzlement, and stories—matter. I want our dialogue about their narratives to become our shared story, a process in which we both learn to speak loudly and critically about our lives as educators.

Jason's Research Narrative

I am a doctoral student in the Department of Educational Policy, Organization and Leadership and in the middle of doing my dissertation research. My colleagues in the student cohort are principals, associate superintendents, directors of curriculum and instruction, and other types of administrators. I maintain an insider/outsider

perspective in this research as a full-time doctoral student aspiring to work in the public schools as an administrator. As part of the program, I completed two internships in the same school district where I am doing my research, one as a principal and another as a superintendent. Both internships were enriching experiences; it was another opportunity to work closely with my classmates to better understand their role and contexts.

I chose to do a case study of one principal in this same school district for my dissertation research because I admire his passion and commitment to issues of social justice. Here I will call him “Robert.” He is supported by the goals of all levels of administration. The goal of the district is to provide more equitable outcomes for students of poverty and students of color. This level of support is unusual.

Our doctoral program promotes leadership for social justice and this influences many students. For example, Robert, a high school principal, said that his mission is to help his school community become more inclusive in light of the changing demographics. My own experience as a young child living in poverty and my critical orientation as a researcher have drawn me to study the complex nexus of sociopolitical forces, dialogue, and leadership for social justice in my case study.

Dialogue between Robert and myself is supported by our history of taking courses together and frequent social outings. He is a professional colleague and a good friend. There is undoubtedly trust and mutual respect that makes me comfortable raising sensitive issues of race and social class.

The primary focus of my research is to study how principals engage in dialogues with parents, students, and staff members to deconstruct assumptions about issues of race and social class.

To begin my research, I selected five complex cases found in the peer-reviewed *Journal of Cases in Educational Leadership*. Each case describes an amalgam of sociopolitical forces, the marginalization of children of poverty and children of color, and the challenging decisions required of the principal. I asked Robert to respond in writing to the scenarios. I analyzed his written responses to develop a series of topics for dialogue in order to reconstruct my analysis and to capture his voice in my interpretations. Our dialogue flourished. We discussed stories about his leadership and school culture, the dialogue flowing comfortably because of our friendship. After an ample period of dialogue, I gathered the data and represented the complex vision of this principal to the best of my ability.

I close with a coda on my research. As in a musical composition, it is often the silence that speaks volumes; silence can be as important as the melody, harmony, and form. However, silence is often overlooked in dialogue. But in my experience the periods of silence in between our dialogue sessions were points of incubation and reflection, in which I deconstructed and reconstructed ideas and thought of more follow-up questions. One of my discoveries is that dialogue is not the process of one 45-min session. Rather, it is the whole process of analyzing texts, continuing to build richer interpretations together through dialogue, and taking time to reflect, reassess findings, and continuing to question.

The Reasons for Choosing Our Approach

We chose to focus on *dialogue in narrative inquiry* because we found it to be a powerful way to learn and do research. The dialogue to construct this chapter nurtured our own learning and research.

Narratives are a frequent format for talking to others. We structure our lives as teachers and researchers within educational contexts in narrative modes. There are many ways to use narrative in research, but there is not much explicit analysis of the role of dialogue in narrative research contexts. Dialogue is a strong focus in other areas of inquiry, for example, in discussions of pedagogy (Burbules 1993; Goodson and Gill 2011), in theology, (Barnes 2002; Buber 2000; Swindler and Cobb 1990), and in psychotherapy (Bohm 1992; White 2007). The argument here is that we can learn much from promoting dialogue that pushes us to think more deeply about the stories we tell individually and collectively.

One characteristic of dialogue is that it is *not* dominated by the need to solve practical problems. Of course, there are plenty of “practical problems” related to teaching and learning and what is learned through dialogue may have implications for actions. In dialogue, however, the process looks more like inquiry than problem solving, a search for learning rather than solutions. The questions are usually more complex and there is a sense that important issues are at hand. There is less focus on the needs of practice and more on voicing doubts, probing issues, examining assumptions, reflecting on learning, and periodically, studying the group’s interactions. Narratives are often a part of dialogue and discussing the issues that arise from the narratives can push the group in many directions and offer different possibilities.

Peter Senge (1990) claims that dialogue and discussion are quite different. The purpose of discussion is to have one’s views accepted by the group, while “the purpose of dialogue is to go beyond any one individual’s understanding ... In dialogue, individuals gain insights that simply could not be achieved individually” (p. 241). In a dialogue, according to Senge, we become observers of our own thinking. Participants must “suspend” their assumptions, literally to hold them “as if suspended before us” (quoted in Senge 1990, p. 243). Senge argues that in order to suspend our assumptions, we must not only be aware of our assumptions, but we must also be aware that “our views are based on assumptions, rather than incontrovertible fact” (p. 243). Dialogue helps participants to see their assumptions as different from others and malleable; both of these help build an awareness of how we all construct, and can change, the implicit ideas we have assimilated from social contexts.

The Role of Interpretation

In this final section on the role of interpretation in our method, we make three claims that are evident in our approach. First, that narrative is inseparable from interpretation. Second, that the interaction between storyteller and researcher requires interpretation. And, third, that dialogue, as we have defined it, leads to

the reconstruction and reconceptualization of our methods and interpretations. The first is a broad understanding that applies to narrative in general, the second describes some aspects of interpretation related to our particular approach to using dialogue in narrative inquiry, and the third is the claim that this kind of dialogue in narrative inquiry is a learning process that leads to change, and thus a process steeped in interpretation.

Narrative as Interpretation

First, we see narrative as inseparable from interpretation. At the deepest level, narratives are told in words. If narratives are told in pictures, dance, or mime, the interpretive need is even more obvious, but the construction of meanings, requiring language, proceeds in the same way. We think and speak through language and that itself is an interpretive act. Postmodern views speak of how meanings constructed through language are continually in flux and must be continually interrogated. Interpretations evolve within a fluid process where individuals interact to create shared meanings and differences emerge that requires further interpretation. In this dialogic process, meanings are constantly adjusted and assumptions (what Gadamer calls “fore-projections”) are challenged. Gadamer (1989) writes:

Every revision of the fore-projection is capable of projecting before itself a new projection of meaning; rival projects can emerge side by side until it becomes clearer what the universe of meaning is; interpretation begins with fore-conceptions that are replaced by more suitable ones. This constant process of new projection constitutes the moment of understanding and interpretation. (Quoted in Goodson and Gill 2011, p. 75)

But language can also distort and mislead, often without intent to mislead. In a post-structuralist world, we cannot assume that language is transparent, a carrier of direct reference and clear meanings. There are issues of power, gender, culture, and norms that influence the use and interpretation of language (Weedon 1987; Butler 1990). Our interpretations are directed by these influences and in ways we may not always recognize. As we reflect on these, we come to see the cultural and personal shaping of our perspectives. Interpreting these influences on our storytelling often raise issues of social justice. Whose rights are to be considered, who is being disenfranchised by our inquiry, who is silenced in the dialogue, and what are the most socially justice ways to proceed with our research (Griffiths 1998)? Debates about these issues are highly interpretive and challenging to negotiate.

Teller and Listener as Interpreters

Second, as interpretation is inseparable from narrative, so is the interaction between teller and listener, or storyteller and researcher, a thoroughly dialogic and interpretive task. As we tell our stories, others listen. As we listen, we try to understand.

Using dialogue means that both the narrative telling and listening are negotiated; these are interpretive tasks throughout.

We initially talked a lot about dialogue within a group of storytellers (Marilyn's research example). Our engagement in the power of stories and the ease with which we seem to understand what is being said can mask the complexities of interpretation in a postmodern world. These cautions require us to be vigilant, to keep the dialogue open and fluid; they suggest we probe deeply and listen carefully, critique our interpretations, and acknowledge the uncertainty of what we seem to know. It also required a certain degree of trust in the group to accept our stories as gifts to be shared even when our interpretations of them differ. It also requires that we acknowledge the cultural influences on our storytelling and listening, watching that these differences are not used to silence some in favor of more comfortable stories and easier interpretations.

An important aspect of dialogue is difference and contradiction. Sorting these out is food for interpretation. Bakhtin (1981) asserts that a kind of enduring internal dialogized learning develops from contradictions. "A dialogized word can never be *zaverseno* (completed). The resonance or oscillation of possible meanings within it is not only not resolved (*nezaversenno*), but must increase in complexity as it continues to live" (Bakhtin, p. 426). This "continuing to live" is the interpretive process of dialogue within narrative contexts.

Often participants in this kind of dialogue feel more confused than they do comforted. It is not easy to have your ideas challenged and basic assumptions called into questions as we make decisions about how to tell our stories to others. Added to this is the postmodern suggestion that confusion, complexity, contradiction, and fluidity are inherent aspects of language and interpretation. This leads to the further claim that all stories are partial and re-tellable. As we create our identities in storytelling, we could as easily tell a story about other possible identities.

Not everything that is said is clear; not everyone agrees. Interpreting ourselves through these confusions can be either frustrating or compelling, or both, but overall we are constructing meanings and learning. Ideas and positions constructed within the group dialogue are not necessarily reflective of any one person's thinking but a melding of ideas, interpreted by individuals. Gadamer (1984) calls this the "fusion of horizon." Yet, the main characteristic of the dialogue is learning. When dialogue occurs, there is a sense that we have learned something important, even as we hold to postmodern cautions about fluidity, difference, and caution.

Proceeding with caution is not the same as despair. It would be easy to slide into relativistic hopelessness within postmodern theorizing, but this is too easy. We continue to experience life, make choices, and construct meanings, however dire the postmodern musings. Dewey (1938) long ago argued for the importance of experience. He focused on experience over outcomes and aims over answers. Dialogue and interpretation are tools for sorting out our experiences. It is in the experience that we construct meanings and learn. We are thus locked in a paradox where we must proceed as if we can truthfully tell each other stories and interpret them as listeners, even as we acknowledge the "partial" truths in narrative (Clifford and Marcus 1986) and the slipperiness of meanings within a post-structural world (Britzman 1991; Lather 1996).

Dialogue Leads to Reconstruction and Reconceptualization

Third, the dialogic process we have described aims to use narrative inquiry as a process to reconstruct and reconceptualize our methods and our interpretations. As a group talking about our individual research projects, we had a shared interest in narrative inquiry, and, over several months of regular meetings, we used dialogue both to re-story the way we thought about a particular methodological approach and to reconstruct our individual research projects. This was both a theoretical and methodological project that involved a particular approach to *dialogue in narrative inquiry* that was necessarily highly interpretation throughout.

The process of reconstructing and re-storying narratives through inquiry is frequently described in the literature (Clandinin and Connelly 2004; Goodson and Gill 2011). Our focus was on what it was like in the process of this re-storying and what might facilitate learning during this process. Dialogue, as we describe here, is a process that promotes learning—it is a process that challenges, examines, critiques, and compares our narratives in ways that surfaces new perspectives. It involves more than asking questions and listening well. It is meant to be interruptive and designed to promote reconstruction of ideas and methods. These purposes make it a highly interpretive process.

What we individually learned about our narrative aims and research methodologies was reconstructed through dialogue within our group; this led to new ways to think about the process of dialogue in narrative inquiry as well as new methods to make our research more thoroughly narrative. We reconstructed what dialogue was like in this kind of narrative, investigative framework. The claims we make about this approach to dialogue in narrative inquiry acknowledge both our genuine desire to understand this method and the complexity and fluidity of our interpretations. In the process we became clearer about a particular slant on dialogue, the central role of interpretation in narrative inquiry, and ways that dialogue in narrative inquiry as a method might enrich the process of learning.

1.5 Narrative and the Transmission of Traditions: Informal Learning Among Italian Artisan Stone Carvers

Amy Shuman

Narratives are one of the ways people pass on knowledge and express their understandings of the meaning and value of their experiences; narrative is always more than information, always more than an account of what happened. To understand narrative as a process of performance and transmission, this chapter focuses on both the poetics of how a story is put together and on the social conventions for telling and listening.

Narrative Inquiry

Many of the assumptions made about narrative are best understood as questions, for example: Is it the case that the moment is remembered more easily in narrative form? Does telling the experience as a narrative provide more impact and call attention to the significance of what happened? Or do narratives provide an available form for us to make sense out of our experiences? These questions are difficult to answer, but we can begin to address them by observing how narrative works in social interaction.

Studying narrative interaction means studying narrative as part of communication, not only between tellers and listeners in a particular social context but also as one of many available resources for communication. People have a variety of forms (or genres) of communication, including, arguing, making lists, telling jokes, providing instructions, and singing; narrative is one among many genres. Narrative most often occurs in occasions that also include other genres, so, for

example, a narrative might be part of a speech, a ceremony, a meeting with a friend, or part of learning situations. Conversational narrative is one form of narrative interaction. Not all conversational narrative research considers the questions of memory and larger historical events relevant to oral history. Similarly, not all oral history research considers the interactional settings in which the narratives are collected. My work, utilizing informal interviewing in a conversational setting, addresses narrative interaction by attending to how the narrators position themselves with regard to both the immediate context and the larger historical context. I combine the approaches developed in narrative interaction and oral history. This combined approach affords the possibility of considering how people remember and relate events from the past not only by identifying *what* they talk about, the themes and topics, but also *how* they narrate, including the cultural conventions for reporting on events, for displaying certainty and uncertainty, and for appealing to various authorities for credibility (Norrick 2005; Cashman 2012, pp. 181–185).

My methodology begins with two fundamental endeavors. First, I collect narratives as part of social interactions, and even when I use interview techniques, I attempt to ask questions as part of the flow of conversation. I always record the conversations and then transcribe the recordings. When possible I also do video recording; when not, I supplement the audio recordings with notes about nonverbal communication. Second, I undertake an ethnography of communication in the community to better understand the varieties, resources, registers, norms, and genres of interaction. In this chapter about a community of artisan stone carvers in Italy, I describe methods for studying personal narratives told by artisans and foreign sculptors about particular experiences, community narratives told by the artisans about historical changes, and explanatory/historical narratives told by local historians. I suggest that these narratives work dialogically, producing intersecting and different understandings. Rather than mine narratives for information, I explore how narratives can contribute to a more complex understanding of how knowledge circulates and how narrators position themselves and the community within ongoing negotiated understandings of their experiences and practices. Thus, my goal is not to identify a narrative and then determine the relevant context for understanding it. Instead, I attempt to understand the conditions in which narratives are produced as part of interactions. I will first review some of the history of this approach to narrative research and then turn to my study of the artisans' narratives.

Conversational Narrative Research

Conversational narrative study grew out of conversational analysis, an approach to the study of everyday life initiated by sociolinguists Harvey Sacks, Emanuel Schegloff, and Gail Jefferson in the 1960s (Silverman 1998). Sacks and Schegloff were students of Erving Goffman, who observed how people manage ordinary social encounters (Goffman 1959). The key factor in this approach is the study of

interaction rather than the analysis of texts.¹ The goal of studying conversation, or related informal modes of communication, was to understand how social relationships are negotiated. In contrast to how sociologists study and categorize behavior, often as deviant, conversational analysts have been interested in more microanalyses of, for example, how people manage social hierarchies in a particular social interaction. Whenever possible, conversational analysts take into consideration not just the audible features of talk but also the visual and other sensory dimensions of gesture and the uses of spaces, technologies, and other environmental aspects of interaction. People involved in an interaction are often not consciously aware of the features that conversational analysts observe, and at the same time, in interaction, people demonstrate extraordinary competence of both the ability to use and understand others' use of these features. For example, people know how to take the floor for a longer turn at talk, necessary for telling a story, and listeners know that a speaker has done this. Over the past decades, conversational analysts have established a large body of scholarship that identifies some of the most familiar features of interaction (Schiffrin 1990).

Like conversational analysis, conversational narrative research focuses on interaction and attempts to identify some of the fundamental features, usually culturally specific, that speakers and listeners use in interaction (Ochs and Capps 2001). Some of these are (a) the development of a story by combining a series of events with evaluative comments that orient the listener by providing background information and that tell the listener what the narrator considers to be important or meaningful about the events (Labov 1972); (b) the use of reported speech to refer to multiple voices (Tannen 1989; Shuman 1986, 2005); (c) the negotiation of the positions of the narrator, listeners, and people in the story in relation to each other and to the events (Bamberg 1997; De Fina 2000; Mishler 1999); and (d) understanding the narrative within the larger framework of an ethnography of communication, including the repertoires, genres, norms of interaction, and registers that play a role in interaction (Gumperz and Hymes 1972).

Conversational narrative analysis is a method for studying narrative in interaction. By attending to the structural dimensions of the narrative itself and to the structural features of interaction, this method can be helpful for understanding how people use narrative to make meaning out of the situations they confront in their everyday lives. At the same time, this method can help to identify where narrative breaks down, that is, where narrative is sometimes insufficient to account for events, especially traumatic and horrifying events.

Oral History and Life History Narrative Research

Conversational narrative overlaps with other areas of narrative study, especially narratives told informally, for example, oral history and life history narrative. As oral historian Ronald Grele (1985) wrote, "People have always told their histories

¹ Charles Briggs and Richard Bauman discuss the process researchers use to create texts out of the flow of interaction as "entextualization," "decontextualization," and recontextualization" (1990).

in conversation” (p. xv). Oral history began with an interest in establishing archives and augmenting historical records with the testimonies of people who experienced or witnessed events. In the past few decades, oral history scholars have become increasingly interested in how people narrate and in the relationship between narrative and memory. Alessandro Portelli (2009) defines oral history as

a work of relationships; in the first place, a relationship between the past and the present, an effort to establish, through memory and narrative, what the past means to the present; then a relationship between the interviewer and the interviewee, and between the oral form of the narrative and the written or audiovisual form of the historian’s product. (p. 21)

Dialogic Narrative

Narrative scholarship today occurs in somewhat segregated disciplinary fields, each with its own history. In my work, I attempt to work at the intersection of the (a) sociolinguistic approach, which combines conversational analysis and the ethnography of communication; (b) the literary narrative approach built on the work of the Russian formalists who were, like the sociolinguists, interested in the structure of narrative; (c) folkloristic approaches that combine structural and ethnographic studies of narrative; and (d) studies of oral history, which have for the most part been more interested in how ordinary people describe their experiences than in either interaction or narrative form. The concept of dialogic narrative is one way to bring these approaches together. Dialogic narrative considers how people position themselves in relation to events and to each other by observing how stories (especially versions of accounts of a particular event) are in dialogue with each other.

Edward Bruner and Phyllis Gorfain (1984) describe dialogic narration as the process in which various tellings and interpretations either attempt to “fix meanings and stabilize order” or offer “challenging voices [that] question established meanings and tend to be deconstructive” resulting in “ongoing discourse that emerges from the exchange of authoritative tellings and, in turn, supports a historically situated debate over the interpretation and uses of the story” (p. 58).

To illustrate how this works, in this essay, I focus on the concept of tellability, which works at all levels of analysis. At the level of interaction, a narrator establishes tellability by framing the narrative as, for example, relevant to the conversation, newsworthy, or as a personal experience. Structurally, claims for tellability can be identified throughout the narrative. Using ethnographic observation, in a comparison of different people’s accounts of events, we can observe which accounts are available, which are dismissed, which are tellable in some circumstances but not others, which are dominant, and which ones critique the dominant understandings. I return to illustrations of tellability in the final section of the chapter.

The Research Project

I have studied conversational narratives in a variety of settings, from informal dinner table conversations to schools to a large-scale ethnography. For this chapter, I focus on my research among Italian artisans, a project that both integrates conversational narrative, oral history, and dialogic narration and that demonstrates how narrative research can be used to understand pedagogical practices.

Over a period of 30 years, I have documented the artisan stonemasons of Pietrasanta, Italy. The artisans have a centuries-long tradition of marble carving passed down from one generation to another. Pietrasanta, located at the base of the Carrara Mountains in Northwest Tuscany, became a center for marble carving in the eighteenth century when studios employing hundreds of artisans produced marble and bronze sculpture, marble altars, and other architectural features for the cathedrals of the New World. By the time I arrived in Pietrasanta, in 1982, there had been several significant changes. Foreign artists were engaging the artisans to produce abstract monumental marble sculptures, and although figurative carving continued, new clients in the Far East and Middle East had replaced the Catholic Church as a central patron.

I conducted all of my research in Italian, almost always with the assistance of a young artisan; I return to questions of methodology below, but by having an artisan present, I was able to reduce my outsider status. As a folklorist, I was interested in documenting how traditions change and how a community accounts for and documents collective memories. I observed artisans at work and did extensive background research on the community, but my primary means of research was the collection of narratives in open-ended informal interviews and conversations. My questions included: (1) how does a personal life history narrative become part of the collective memory of a community? (2) In other words, how does the personal, individual, story become an allegory for the community's past? (3) If the skills described are no longer practiced, how does the story transmit values about ways of acquiring knowledge? (4) What can these stories tell us about the relationships between form and value, that is, between narrative as a form and the meanings or significance they convey? (5) How can these examples be generalized to better understand the connections between form and value in life history narrative research?

Artisan educational practices, often involving face-to-face, generational transmission of information and requiring imitation and practice as primary methods of learning, are a significant but less frequently studied domain of educational ethnographic research (Glassie 1999; Mishler 1999). The pedagogical documents I collected include interviews about learning practices, stories about learning experiences, written manuals, and descriptions based on my ethnographic observation of tools, technologies, the circulation of knowledge, and differentiations in competency.

One dimension of my research on artisan educational practices focused on the interface between technology and pedagogy. Combining observation of artisans carving with conversations about how they learned to carve helped me to understand these complex connections. The interface is historically deep, including, Renaissance

artisan and writer Giorgio Vasari's accounts and centuries of descriptions of the technologies used to produce marble sculpture. Some of the interfaces between technologies and pedagogy are codified and others are less explicit. Pedagogies can direct practices and also can respond to innovations in technology. An example of pedagogy driving practice is the choice of particular foundational tasks in instruction. An example of pedagogy responding to technology is engaging young apprentices in menial tasks necessary for the operation of a tool and incorporating their labor as a way of introducing them to the workplace. Interfaces between technology and pedagogy also contribute to and are inextricably connected to how knowledge circulates and how competency is assessed in the artisan workplace. Conversational narratives and life stories are part of that circulation.

Identifying a Dialogic Narrative

In addition to collecting the life stories of the artisans, I collected the many published and oral narratives about the history of the artisan community. Each of these narratives had a purpose and an audience, sometimes explicitly stated. For example, the artisan school published a history on the occasion of its 150th anniversary. Although the different narratives don't necessarily contradict each other, by highlighting particular historical moments, they posit different understandings of significant change in the community. Using the framework of dialogic narrative, my attempt has been to sustain the multiple voices of these different narratives rather than to collapse them into a summary. Importantly, a dialogic narrative can include individual life histories as one of the sustained voices in contrast to a model that might view the published historical narratives as bearing more weight or as serving as background or context. As I will discuss, this framework has consequences for considering what counts as knowledge and facts.

Narratives about artisan experiences intersect with many other narratives, both large historical narratives and other narratives of work and life. Identifying those narratives and understanding their intersections has been an ongoing part of my research. Part of my interpretive task was to decide where to begin my account and how to avoid telling a singular story that would undercut the multiple, dialogic voices that constitute the community's narratives. Not all of the narratives told in the community were conversational. For example, some were recorded in local history books, included in websites for tourists, told in ceremonies to honor or remember a community member, or included in my written ethnographic record, which includes conversational narrative but is itself not conversational.

In the written, non-conversational narratives, the most common starting point was the monumental geography of the region. This was literally the most imposing place to start given the location of the artisan workshops, at the base of the Carrara Mountains, the source of what is arguably the finest white marble, as well as other marbles, for carving sculpture. Visually, the mountains, white with marble that makes them look snow-covered in the summer, are an obvious place to start.

Starting with place, or location, has been a mainstay of ethnographic research, but it belies the reality of how people, things, and ideas move, how the status of “insider” or local changes over time, and how places are not islands independent of interaction beyond their sometimes changing borders.

Pietrasanta is currently and always has been a place for the export of marble sculpture; it is not an isolated artisan town. Alternatively, my account could begin with how the livelihood of Pietrasanta’s artisans has depended on changing historical, political, and economic interactions. Indeed the community’s own story about itself, another very legitimate starting point, is the fact that Michelangelo went to Pietrasanta in 1515 where he opened up a road to one of the quarries to procure stone for the façade of the Church of San Lorenzo in Florence. Everyone in Pietrasanta knows this story; the road was built, but Michelangelo was called away by the Pope, and to this day, the Church of San Lorenzo does not have a façade. The politics driving that story, in particular rivalry between the Pope and the Florentine Medici family, are also part of the story of Pietrasanta, as are many other narratives about sovereignty, politics, landownership, and even (or perhaps especially), Roman Catholic policies about sculptures, altars, and the furnishing of churches and cathedrals.

In other words, Pietrasanta has many narratives that, for the most part, do not contradict each other, but not surprisingly, the artisans’ narrative life story narratives, told in conversation rather than in history books, have been obscured by the grand historical political narratives. Folklorists and oral historians long have argued that understanding the personal, ordinary, local narratives that people tell about their experiences is fundamental for understanding the complexity of larger events. More recently, postmodernists have critiqued the legitimacy of the “grand narratives,” which are, of necessity, produced and constrained by the discourses of particular cultural, political contexts, for example, Jean-François Lyotard’s (1984) attention to the *petit recits*, or local narratives told by ordinary people.

Discussions of the relationship between grand narratives and local narratives, or between the histories written by historians and the local histories documented by lay historians or collected by oral historians and folklorists, raise questions about the truth of narratives based on experience. The oral historian and folklorist Jan Vansina (1985) addressed these questions in his study of the veracity of histories recounted by African tribes that did not have written forms of documentation. Vansina observed that histories recounted in ceremonial moments, such as in the transfer of power from one leader to another, were shaped to legitimate the ascendancy of the new leader. This may not be so different than the written histories produced in literate communities in which, as many have observed, the victor controls the representation of what happened.

Walter Benjamin (1968) takes this point further in his argument, “There is no document of civilization which is not at the same time a document of barbarism. . . . The state of exception in which we live is not the exception but the rule” (p. 278). Applying this argument to the ordinary stories told by artisans as part of their collective memories, deeply implicated in the larger historical narratives of wars, recessions, and politics, we could at the very least observe that people rarely see

their lives as exceptions; if we examine the conversational narratives told by people about their experiences, we find a very different configuration of the relationship between exception and rule. For example, for the artisans today, the earlier period extending from the mid-nineteenth to early twentieth centuries when dozens of studios made saints and sculptures for the cathedrals of the New World serves as a golden age, a “rule” with which to measure the departure or exception of today, when there is still plentiful work but few apprentices entering the trade. Benjamin is more particularly cautioning us against seeing Fascism as an exception, and his work provides a useful critique to the nostalgic narratives of a golden age.

These discussions create an awareness of the symbolic value of narrative or the ways that any narrative, personal or historical, can become an allegory for expressing a particular moral viewpoint (Shuman 2005). Hayden White (1987) points out that the moral dimension of narrative compromises claims to objectivity and makes it difficult if not impossible to determine what we mean by objective historical truth (p. 23).

As Roland Barthes (1970) argues, historical discourse is always about interpretation. “Historical discourse is essentially a product of ideology, or rather of imagination” (p. 153). Efforts to point to the “reality” of documented events point to what he calls “the *reality effect* . . . historical discourse does not follow reality, it only signifies it; it asserts at every moment: *this happened*, but the meaning conveyed is only that someone is making that assertion” (p. 154). Narratives about personal experience are also and in today’s climate perhaps even more open to uncritically claiming what Barthes refers to as “the prestige of *this happened*” (p. 154). Joan Scott (1991) has commented on how reports of personal experience can become taken-for-granted knowledge:

When experience is taken as the origin of knowledge, the vision of the individual subject (the person who had the experience or the historian who recounts it) becomes the bedrock of evidence on which explanation is built. Questions about the constructed nature of experience, about how subjects are constituted as different in the first place, about how one’s vision is structured—about language (or discourse and history)—are left aside. The evidence of experience then becomes evidence for the fact of difference, rather than a way of exploring how difference is established, how it operates, how and in what ways it constitutes subjects who see and act in the world. (p. 777)

Different versions of an experience do not necessarily point to a lack of veracity in the narrator’s account. The idea that subjects are constituted does not mean that they are mere constructions, not based in reality, not suitable for providing evidence. To the contrary, Scott is suggesting that narrative provides more information, more evidence, accessible if we attend to the position of the narrator (and other subjects). In a sense, by offering more complex subjectivity, through understanding the position that the narrators and others occupy, narrative offers a more complex and more adequate kind of evidence. In the following discussion, I will consider how narrators position themselves in telling a familiar story about learning to be an artisan.

Positioning in the Artisans' Narratives

Each of the following three narratives positions the artisans slightly differently. In the first narrative, an elderly artisan describes his experiences as a not-so-responsible student. The second narrative, told by a foreign artist, describes similar experiences from the position of admiration for the patience required of the apprentices. The third narrative, told by a local historian, describes the historical apprenticeship experience as part of a rhythm of work belonging to an earlier epoch.

One of the core narratives told by artisans describes young artisans new to working in a studio who are assigned menial tasks such as sweeping up marble dust or sharpening tools before they were given any carving tasks. I heard these stories often, in response to different questions. In answer to my questions about how marble carving artisans learned their craft, I heard many narratives about experiences at the artisan school, about how the school was insufficient for giving one the proficiency necessary for working competently enough to earn a salary, and about learning as part of growing up in a studio.

Many foreign artists go to Pietrasanta, either to learn how to carve marble, to have their sculptures carved by the artisans, or a combination of both, in which they work alongside an artisan in the production of their work also tell a version of this story doing menial tasks before being given marble to carve. Fred X. Brownstein, an American sculptor who lived in Pietrasanta for more than a decade, told the following story. Fred embeds his own story, of his apprenticeship to a master carver, within the familiar narrative. He first noted that although the artisans completed many years of study at school, they still needed to start over and learn to carve when they went to work at a studio. Fred's narrative, describing the master artisan who taught him, is represented using conventional transcription methods that attempt to preserve some of the dimensions of oral communication. Capitalization indicates emphasis; question marks indicate rising intonation; each line break indicates a pause. Such transcription can be enormously useful for close examination of narrative. For example, sociolinguists have done extensive study of the use of "you know," as a discourse marker.

Fred: He had to start all over again.
 He said that
 Well he didn't know ANYthing.
 That the guys who worked in the studio
 The REAL Craftsmen?
 They didn't do it the way they did it in the school
 And they started from scratch
 And then he started talking about his experience in the laboratory
 In the Studio
 I had very similar experiences
 Except I wasn't quite
 But the same kind of thing where they made the guys
 They treated them really badly

You know
 Made them sweep up around
 You know
 The
 You Know
 They would say like
 “Boy!
 Chips!
 Sweep them up”
 You know.

Amy: Don't they do it to you too?

Fred: Well, no
 They didn't do that to me
 But I got other treatments
 And then they would take their tools
 And they would say
 You know
 “Sharpen the chisel
 They better be sharp
 And they better be done right
 Otherwise you're going to do them all over again”
 You know
 It's like we're fifteen years old
 And he has to sharpen
 I mean you know
 You do them on a stone by hand
 That's the way to do them
 And they just treated these guys that had been all through school
 And they were supposed to know how to do it
 You know

In this narrative, Brownstein positions himself as someone who is familiar with the experiences of the artisans; although his own experience was not exactly like that of the apprentice: “They didn't do that to me”, he “got other treatments.” Fred positions himself as learning the hard way, which is the only way, through years of practice. Things one might have learned in school are not helpful, and the apprentice has to be willing to “start over.”

It is important to point out that narratives about this form of apprenticeship refer to an earlier period. The apprentices were paid very little for their menial tasks, and today labor laws prevent a studio from continuing such practices. Narratives about how the artisans worked for very little money doing very menial tasks are intertwined with both narratives about the consequences of changes in labor law and narratives about the emerging middle class and its preference for white-collar jobs, rather than the labor-intensive artisan work.

The narratives about menial labor continue to be told and not only nostalgically, recalling earlier times. A local historian, Constantino Paolicchi (1981), perhaps the most knowledgeable historian of the area, told a version of the story that helped me to understand its greater significance. For the most part, the narratives I heard about performing menial tasks were told about working in marble carving studios. Paolicchi told his narrative as part of our conversation about the fact that in the 1980s when we spoke, there were many highly skilled already pensioned artisans who were not only still available to work but whose skill was prized and coveted, in comparison to very few apprentices. Paolicchi was talking generally about some of the complexities of transmitting the skills from one generation to the next, or, more precisely, the factors that contribute to the lack of transmission of skills to the next generation when he described how a young boy would first be introduced to the quarry. As in Brownstein's narrative, above, Paolicchi's narrative refers to doing menial skills such as carrying water, transporting wood, and monitoring the machine with the cutting wires, before working with marble. Paolicchi's narrative additionally describes this introduction into the workplace as a means of introducing a young worker to the flow of the workplace, the synergy of relations between workers with different skills, and the patience required to meet the demands of doing a job right.

Like Brownstein, Paolicchi is describing an earlier time. Before the advent of diamond-encrusted wires to cut blocks of stone in the quarries, there was a barrel filled with massive quantities of sand, and the wire would pass through the barrel and become coated with the sand. A young apprentice would monitor the barrel to be sure that the wire emerged sufficiently coated. (The following narrative is translated from the Italian, so the line breaks approximate those in the original language.)

The young people, but this is not only in the artistic arena.

Also the young people used to come [to work] in the quarries

Also one can say they were introduced/entrusted to the flow of the system of production

Also with modest roles

There was a type of synergy that was created between the skilled workers and the less skilled workers, the professional workers, the owner who, imagine, also worked a bit.

And the young person was introduced, maybe, began by bringing water, my father-in-law told me. He was a quarrier.

When he first stepped foot in the quarry, his task was to bring water from the fountain and bring it to the quarriers. As soon as he finished, the water needed to be replenished, so he went to the fountain, and that's how it went.

He did "il boccia insomma"[he passed] as we say in dialect.

Then slowly, slowly, he was inserted in the cycle.

The second stage was to bring wood to the men working the saws.

The third stage was to stay near the barrel of sand to monitor the helical cord.

And then he gradually became a quarrier.

This required patience on the part of the young people, a rhythm more than patience.

A rhythm that was part of the system that consented that the youth be included, slowly.

Also in the artistic realm, this rhythm of productivity doesn't exist now.

Paolicchi's larger point is to observe that the loss of the practice of having young people perform menial tasks has had consequences for what he calls "the rhythm of productivity." As in the stone carving studio, in the quarries, a young boy began with modest tasks. Importantly, the young boy not only learned some of the skills, he also became part of the rhythm of work. Needing to constantly replenish water has a rhythm, the same rhythm of more complex but constantly repeated tasks. The patience Paolicchi refers to is first of all the patience of doing menial tasks before being taught to do anything more interesting and second the patience that is part of artisan work. He observes that acquiring this patience was essential for the young boy's acceptance into the workplace. He is accepted into the rhythm of the work. The concluding coda, "this rhythm of productivity doesn't exist now," returns us to the present day. As William Labov (1972) and others, building on his work, have pointed out, the coda reveals or reinforces the meaning of the story. Its position serves as a link between the time of the story and the time of the storytelling event (p. 365).

Brownstein and Paolicchi both describe the menial tasks assigned to young artisans new to the studio or quarry, but the codas of the two narratives point to different, though not necessarily contradictory, meanings. Paolicchi's coda was: "This required patience on the part of the young people, a rhythm more than patience." This points to how the young apprentice learned patience and to his (Paolicchi's) larger concern about how the rhythm of the studio is changed without that process. Brownstein probably would not disagree with this, but his coda was:

And they just treated these guys that had been all through school
And they were supposed to know how to do it

This was about how an apprentice is treated as knowing nothing, even though he has completed the artisan school training. Further, Brownstein positions himself as someone who was similarly treated that way. Brownstein came to Pietrasanta as a young man and worked for years with one of the most skilled artisans of the area. He earned the respect of the artisans by being willing to accept this treatment, by being patient, observant, and hardworking. Very few foreign artists take this route, but Brownstein, a figurative sculptor, was invested in becoming as proficient as the artisans, using their methods, and following their traditions of learning.²

According to Paolicchi, the menial tasks were a small part of the larger goal of introducing the artisan to the workplace so that they became accustomed to the rhythms of the studio, learned to practice patience, and acquired skills of observation. In my interviews, many artisans described being given tasks such as sweeping the studio or other non-carving jobs. For example, before the introduction of electric drills, the artisans who worked on bas-relief used manually driven drills

² See also Peter Rockwell's extensive exploration of the artisan stonemasonry practices of the region (1993).

that required the assistance of one or two small boys who pulled the ropes that spun the gears. Ledo Tartarelli, one of the artisans who described this practice, pointed out that it had several advantages. The young apprentices had to watch the work closely to be able to moderate the speed of their pulling accurately, and through observation, they learned many of the techniques of bas-relief. Also, although Tartarelli long had become accustomed to the electric drill by the time I interviewed him, he noted that the electric drill had only three speeds, but the young apprentices could be trained to manage at least 12 different speeds, contributing to the precision of his work.

Narrative and the Transmission of Artisan Knowledge

Narratives about how young apprentices are assigned menial tasks intersect with other narratives, whether the larger political economic narratives of changes in labor law or the more localized narratives about the sensibilities that are particular to the artisan workshop. Thus, artists who have not engaged, as Brownstein has, in a form of apprenticeship, nonetheless position themselves in relation to the more general story of how one earns the respect of the artisans. In a conversation with Keara McMartin, the Dutch artist, Eppe de Haan recounts his many years of working in Studio Sem, one of the leading studios for abstract art:

I have built my relationships with Studio Sem artisans over more than a decade, and now we have developed a special communication that needs no words. We watch each other work and when they see that I can benefit from a new technique, they simply step up, suggest it could be done better and show me how. I think I have earned their ultimate respect because I am privileged to be loaned the special tools that the young artisans had inherited from their revered masters; that to me is a true badge of honor and respect that I am very proud of.

De Haan positions himself as an artist who not only benefits from but is respected by the artisans. He is not in the position of the young artisan waiting to deserve to be given a tool and a marble carving task but rather excerpts a part of the larger narrative about what artisans impart and, in this case, lend, and applies it to his situation.

In each of the narratives I have discussed above, the narrator positions himself in relation to the tradition of artisan stonemasonry. Narratives about artisans are, in turn, positioned in relation to several other narratives. For example, artisan narratives are, in part, about how knowledge circulates and is transmitted from one person or group to another. As part of my research I explored how artisan narratives intersect with narratives about cultural circulation more generally, including how knowledge circulates, how the things people make circulate, and how economies, politics, cultural practices, and social relations afford or constrain circulation.

Many scholars have studied how people learn and pass on their knowledge about making things. In a comparative study of potters in Bangladesh, Sweden, Georgia, Acoma, Turkey, Japan, and Hagi, Henry Glassie (1999) begins by describing the study of art as “the process of discovering through objects the values of their makers

and users” (p. 18). In other words, in our research on how people learn to make things, we cannot separate the how-to knowledge of how to make things from the values that are also part of an artist/artisan’s knowledge. He describes the goal of his comparative study of potters “to illustrate how common clay is made to carry value” (p. 19). Glassie’s book is about potters and the pots they make. It doesn’t tell us how potters learn what they know, but it does provide clues to understanding what we need to know before we ask questions about that knowledge. The book is a collection of narratives, mostly detailed profiles about the potters and how they think about and talk about their work. For example, the potter Hirohisa Tatebayashi says, “Among the potters, most pass their days in dull labor, but a few dedicate themselves to greatness and climb to the summit of their realm of endeavor, becoming equal to the greatest professor or noodle shop man or political leader.” Here the potter as laborer is positioned in relation to other workers, all capable of greatness.

The Pietrasanta artisans’ narratives do not address these questions of the status of the work. Instead, the stonecarvers describe an embodied knowledge, acquired from years of practice and requiring years of practice to continue. They describe particular dispositions towards patience, observation, and excellence.

The Pietrasanta artisans’ narratives contradict some of the widely held views about artisans. For example, Richard Sennett (2008) writes, “The greatest dilemma faced by the modern artisan-craftsman is the machine. Is it a friendly tool or an enemy replacing the work of the human hand?” (p. 81). The machine is not at all a dilemma for the artisans of Pietrasanta. Sennett’s excellent discussion of many dimensions of craftsmanship historically and in contemporary life does not include any narratives by craftsmen or craftswomen.

One goal of ethnographic narrative research is to identify the significant differentiations that operate in communities. Communities are not isolated entities with homogeneous worldviews, so part of the task is to understand the multiple overlapping, intersecting, sometimes conflicting differentiations, at multiple levels, conveyed through narrative. Conversational and life history narratives provide a useful tool for identifying these differentiations, especially if we understand narrative as itself part of a repertoire of ways of communicating ideas and performing relationships.

In Pietrasanta, any differentiation made between craft and art is not made in isolation from other differentiations, for example, between craft and kitsch. Until Vatican II, in 1962, the Catholic Church was the primary client for Pietrasanta’s flourishing studios producing copies of Renaissance, Classical, and Romantic art and images of saints. One of the decrees in Vatican II stated (to oversimplify) that churches should no longer spend money on purchasing marble and bronze sculptures of saints, and overnight, Pietrasanta lost its major client. Many studios went out of business; some were able to retain the business of making sculptures for cemeteries; others found new foreign clients. Some marble artisans applied their skills to the production of small onyx objects such as fruit, telephones, or ashtrays, a trade that still has remnants in the town today. The onyx objects, mostly referred to as trinkets or kitsch, were considered a waste of the artisans’ talents and a travesty compared to the revered trade of marble carving.

I found it useful to ask artisans to tell me about the onyx production because, by contrast, the discussion articulated the value of marble carving. Onyx does not come from the area and does not have the strong connection to the region that marble does. Onyx did not lead to stories about Michelangelo and the quarries, apprenticeship, or technical accomplishment, except by comparison. Onyx production was, in the eyes of the artisan, only about the marketplace and the conspicuous consumption of goods. The artisans of Pietrasanta are well known for their reproductions of Renaissance work, especially Michelangelo's *David*, and they regard the reproduction, in marble, of monumental works, to be entirely different than the mass production of copies. This was, for them a crucial differentiation that challenges some and complements other conceptualizations of art and craft.

The artisan narratives of Pietrasanta provide a counter-narrative to the idea that technology has displaced artisan work. The artisan's counter-narrative to Sennet's argument is that the technology or machine narrative is over-simplified. The machine does not present a "dilemma" but instead represents an ongoing and changing relationship, part of the symbiosis at the heart of the artisan studio, rather than an intervening outside force. Not all of the artisans' local, experiential narratives are counter-narratives. Instead, many support dominant narratives. The personal can serve as a counter-narrative by insisting on the validity of experience against overgeneralized claims. However, as I suggested above, claims to experiential knowledge are not necessarily more valid.

My research on the narratives told by the artisan stonemasons challenged me to rethink several other frameworks that I can only briefly reference here. Although my research was local and ethnographic, the community I studied has a global reach. Their enterprise is based on export, first in the export of sculpture and architectural marble to the New World and in the last few decades on export to the Far East, Middle East, and elsewhere. The community is composed of people who have lived there for generations as well as artists from many parts of the world. In other words, the categories of local and global collapse. Artisan technologies are both traditional and contemporary, another collapse of categories. Discussions of art, technology, material, skill, politics, natural resources, and economies are interwoven at all levels, from personal narratives to historical discourses.

Selecting a Research Approach: Researching Learning as Practice and the Narrative of Stealth Learning

One of my goals was to understand how artisans learned their trade, how their knowledge circulated, what were the obstacles to circulation, and how the craft managed the balance of adherence to tradition and innovative creativity. The first thing I learned, an important but also difficult lesson, was that the artisans did not impart their knowledge directly. They did not learn their practice by listening to someone explain how to do something. Instead, learning was about practice. I was

interested not in becoming a stone carver myself but instead in learning how they learned, how their learning practices had changed, and what they learned in the largest sense, the values as well as the skills.

The central advantage of a longitudinal study such as mine is the possibility of observing change. When I first arrived in Pietrasanta, in 1982, the central part of the city had dozens of stone carving studios. Walking around the town, I constantly heard the sound of chisels and air hammers. Today, stone carving has moved outside the historical district, and only a few studios, located at the edges of the town with a fragile hold on their centuries-old location, still operate. I have been able to observe the success and failure of programs designed to promote apprenticeship as well as municipal obstacles (from the perspective of the artisans), and the transformation of the town from a working-class artisan community to a chic area of restaurants, galleries, and shops catering to tourists who, in the 1980s, stayed mostly on the seaside, 3 km away.

My research on the narratives told by artisans was enabled by the fact that they are extremely articulate and thoughtful about their practice as well as about the politics and history of the area. To some extent, my interviews afforded conversations that might not otherwise occur in everyday life (Shuman and Modan 2011), but for the most part, my research on local pedagogies was a matter of prompting and listening to familiar discourses. As an example, I will briefly discuss how narrative was useful to my understanding of the informal pedagogical practices in the community, or what might be called “stealth learning.” By definition, informal learning practices are not codified or assembled into educational manuals; instead, skills are acquired through observation and practice.

One of the central pedagogical discourses among the artisans uses the metaphor of “stealth” to describe acquiring a skill. They do not mean stealing in the sense of deception or of taking something that belongs to someone else but instead refer to carefully observing a master artisan at work without disturbing him, though he would undoubtedly be aware he was watched. Stealth learning requires acute attention, the kind of attention necessary for doing excellent work. As Keara McMartin, an American artist who now directs one of the major abstract marble carving studios observes, “can’t just put a chisel in your hand and put my hand over your hand; I can’t teach you how to hit the stone that way. Stone is a natural material. You have to discover the bedding plane [the lay of the stone] on your own.”

Other scholars have similarly observed stealth learning among artisans. Marjorie Hunt (1999), who studied the artisans who carved the ornamental work on the Washington Cathedral, writes:

The skills of the trade were conveyed not by formal instruction but by ‘precept and example’ in the workshop. “You don’t teach anybody to carve,” stated Roger. “You give them the fundamentals of carving, like you take a hammer and a point and you hit, you take a chisel and cut. But the main thing in carving, you *steal* carving. When I say steal, you see, like you’re in the shop and there are seven or eight apprentice boys. One would be a little better than the other, and you have two or three carvers working in the same place, so you watch one, you watch the other; you steal a little bit from one, you steal a little bit from the other. Then you put it all together yourself. You develop your own technique.” (p. 40)

Michael Herzfeld (2004) collected narratives about the idea of stealing a craft, though the clothiers he studied had a different point to make:

But learning was the apprentice's problem, not the master's, and this is another important lesson: "It is difficult for someone to show how a craft is done. You have to steal it on your own; they didn't show you, except when [the master] really liked you enough to show you the craft. So you are at it for many years . . . they didn't let you into the work at all . . . they would have you as their apprentice forever. (p. 117)

Jean Lave (2011) points out the inadequacy of the "binary politics of formal and informal education with its polarized assumptions about 'situations,' and penchant for treating contexts as forms or containers of knowledge" (p. 143). She describes the "situated learning" of artisan tailors (p. 88), which similarly included observation. "Apprentices told me that the way to learn was to watch until you know how to make all of a garment" (p. 72).

Unlike the clothiers and tailors, the stonecarving artisans' narratives describe the many years it takes to acquire the skills necessary to be deserving of pay. Each specialization in the stone carving studio requires a different kind and length of apprenticeship, and it can take as many as 10 years to become a "sculptor" the specialist who carves faces, breasts, and hands on a figurative sculpture.

Together, these and other narratives about stealth learning offer pedagogical resources that are possibly useful not only in the artisan workplace but also, as Lave argues, in the contemporary classroom. In the Pietrasanta narratives, stealth learning is described in *contrast* to school learning. Learning in the artisan studio is corporeal learning, what we sometimes understand as muscle memory, though it includes not only acquiring the skill to become a successful carver but also learning the subtleties and sensibilities particular to the Pietrasanta artisan workplace. Becoming a carver is, in the end, an individual skill acquired through a shared tradition of learning. Keara McMartin says, "When you pick up the subbia in your hand, everyone has a unique rhythm; the hammer hitting the chisel is a different piece of music that each person creates."

Interestingly, this corporeal, experiential way of learning is also a part of scientific learning. Essentially, the idea is that some forms of learning require practice. The physicist Karen Barad (2007) uses the familiar word "know-how" to describe scientific practice: "The separation of fact from artifact deepens on the proper execution of each of these steps and requires skill and know-how achieved through experience" (53).

I view my research on the artisans within a larger conversation on "know-how," that encompasses not only work in occupational folklore about traditional ways of learning but also explorations of contemporary learning, such as Barad's. Interestingly, Barad conveys her point through narratives, anecdotes about physicists' discoveries. Here, conversational narrative provides one means for identifying and understanding know-how as a pedagogical and methodological practice.

Expanding on Barad's observations, I suggest that we can learn about know-how on several levels. In addition to examples about how people acquire know-how, we can observe how narratives about know-how transmit not only the information

about how to do something but also understandings about the value of particular ways of doing things. Stealth knowledge is one example of such a value, attributing significance to the learner's need to demonstrate his worthiness and his ability to learn through arduous practice. Additionally, in the historical narratives about the artisan community, know-how is narrated nostalgically as a lost art. I describe these different levels of narration in terms of narrative positioning.

In the discussion that follows, I turn to the connection between tellability and the circulation of knowledge as an additional means for studying and understanding the artisans' narratives.

The Role of Interpretation from Research Design to Analysis of Data

Narrative is always interpretive. Interpretations of conversational narrative take account of how narrators interpret the events they recount, how listeners interpret the narrative told, and how researchers interpret the process. In addition, in both conversational narrative and oral history researches, methods for collecting narrative are integrally related questions of interaction and interpretation. Interpretation is not only an end product to be applied to texts after they are collected but rather part of every process of narrative study, including the methods of collection. My interpretive framework for this project considers (1) the larger discursive context that includes an ethnography of communication of the community, (2) intersections between oral history and conversational narratives, and (3) narrative as part of the circulation of knowledge and relationships, with particular attention to dialogic narration. I will demonstrate how this interpretive framework works through an examination of questions of tellability, including what is said, what is not, to whom, and in what contexts (including the context of my research).

The concept of tellability destabilizes the relationship between experience and narrative and addresses incoherencies and fragmentations (rather than idealized coherent subjects). Tellability has often been discussed in terms of the relationships among co-participants in an occasion (Shuman 1986; Ochs and Capps 2001), but for the artisans, the primary considerations for tellability were the larger cultural historical contexts, and the immediate occasion was of secondary relevance.

Tellability and the Ethnography of Communication

The first thing I considered in approaching my study of the artisans was how they talk about their practice. How would my research complement already existing conversations, or discourses, about the artisan world? What were the larger contexts, from *their* perspective about their practice? Narrative itself is an

interpretive practice, so a conversational narrative researcher's interpretive practices are designed to identify the interpretive strategies used by narrators. The decision to focus on narrative as a means of communication has important implications for interpretation. In my interpretation of the data, I pay attention not only to the information given or not given but also to how the information was conveyed. This means that I work not only at the macro level of explanation but also at the micro level of poetics and form, to better understand not just what happened but also how people talk or don't talk about what happened.

In the first few interviews, I began by asking, "How did you become an artisan?" It wasn't until I received the same answer from several artisans that I realized that I was asking the wrong question. Each of the artisans had answered by beginning with their grandfather's great grandfather's or other relative's story. Even the artisan who was the first of his family to become an artisan began by saying, "Well, my grandfather wasn't an artisan." I learned that the artisans understood my question in terms of their larger family history. It wasn't possible to understand an individual's choice outside of the story of generations. This discovery had interpretive consequences: I learned that describing individuals' life histories would contain a fundamental inaccuracy since the artisans do not conceptualize their choices, their motivations, and their cultural practices apart from a larger family or community story.

As part of preparing for my research, I learned as much as I could about the history of the area and the artisans. The artisan history had not been recorded as a subject in itself; instead the history was embedded in accounts of the economy of the region. Instead of regarding the large historical events of the past century (wars, depression, etc.) as *the* significant events, I made history a topic of inquiry and endeavored to learn what the artisans regarded as the most significant moments, or turning points, of their enterprise. Although I brought assumptions into the project about the role of politics, economic events, and technological changes as possible influences on artisan practices, and I asked questions about those influences, I was also interested in understanding different timelines and assessments of how and whether or not things had changed. In other words, throughout my work, I have resisted providing a definitive history that would tell the story of the artisans from my point of view. Instead, borrowing from oral history methodology (Portelli 1991), my goal has been to demonstrate history on the ground, which inevitably leads to an interpretive mode in which multiple, sometimes competing, historical narratives coexist. Oral history interpretation is often focused on the multiple versions told about events; conversational narrative analysis in addition attends to form, for example, my above discussion of the coda (Johnstone 2001).

Tellability and the Circulation of Knowledge

Narrative interpretation also attends to silences, things not said. Margaret Mills (1991) provides an elaborate account of "silential relations, the relations of the said to the unsaid and the unsayable." She describes the

... obvious or consensual unsaid, the things any competent member of the social group is expected to know...the unsaid of privileged or private knowledge...the unsaid which is omitted because it is not central to the speaker's goals in this particular performance... the unsaid which is repressed, unsayable because unthinkable in the sense of inhibition, ... and the unsaid which is culturally irrelevant. (p. 20)³

In Pietrasanta, some elements of history were not frequently disclosed or discussed. In particular the history of Fascism in the region was a fraught topic. Everyone knew who had been a Fascist, but when I arrived, more than 30 years after the war had ended, the public history of the region was its contribution to the partisan opposition. People proudly told me about their or their family's partisan activities; the mountain communities around Pietrasanta were well known for partisan efforts, and the area had paid a high price. On August 12, 1944, as the war was ending, the Nazis rounded up everyone they could find in one of the villages, herded them into a church, and burned it down. Hundreds of people, mostly women, the elderly, and more than 100 children, died, and a memorial, Sant'Anna di Stazzema, stands as a reminder.

The prominent historical events did not have equal bearing on my research, but they were nonetheless important for me to understand, especially so that I could be aware of stories not told. As Gabriella Modan and I argue (2011), sometimes interview methods afford people the possibility of talking about things ordinarily *outside* their discourse. It is a commonly held tenet of ethnographic research to avoid interfering in the discourse, or, to put it in positive terms, to attempt to gather the kind of data that represents what people say and do without the influence of the researcher. However, Modan and I found that the presence of the researcher gave individuals a warrant to talk about topics that were more easily addressed to a presumably unknowledgeable outsider. This was the case in conversations about Fascism. One of the artisans I interviewed took the opportunity to explain to me the consequences of Fascism on the stonemasonry enterprise. Although others were present, they already knew his stories, and, moreover, it was an unpleasant topic that was, for the most part, avoided.

My method for attempting to limit my influence on my interviews was my decision to be accompanied by a young artisan, Massimo Pasquini, who I hired as my assistant. Massimo had enough artisan skills to work in his grandfather's studio, but he was hoping to pursue a career in children's theater rather than as an artisan. During the interviews, I introduced my project and asked the first few questions, but the conversation inevitably turned to a dialogue between Massimo and the artisan we were interviewing both because the artisans recognized Massimo's familiarity with the topic and, perhaps more importantly, because the artisans wanted to impart their knowledge and opinions to Massimo, who they saw as the next generation of artisans. I also relied on Massimo and others for interpretive analysis. As I have mentioned, the artisans are incredibly articulate about their practices and about the

³ See also Neal Norrick's discussion of "interactional remembering" in which co-participants in a narrative occasion make references to forgotten details (2005, p. 1822).

consequences of historical, economic, political, and technological events; insofar as it was possible, I attempted to describe *their* interpretations rather than to impose outside explanations. At the same time, I do bring my interpretations to the work. The researcher's interpretation of the interpretation made by the people studied creates a dialogue governed by ethics and obligations to the people (Borland 1991; Mullen 2000).

This is not to say that artisan knowledge and interpretation is free flowing and available at face value. As I discussed above and as other scholars of artisan practice have noted (Herzfeld 2004, p. 117), artisans are often reluctant to part with knowledge about their craft. Part of the methodology of ethnographic research, whether participant observation or interviewing, is to understand how knowledge is passed down, under what conditions and under what constraints. The reluctance to impart knowledge sometimes requires a fieldworker to prove her worthiness (Shuman 1986).

In my artisan research, I was worried that as a person who does not carve stone, I would be perceived as an outsider unentitled to be collecting the artisans' stories. Pietrasanta is an international community comprised of the local artisans, hundreds of international artists, some of whom live permanently in the area and others who are residents for part of the year, and other residents. I addressed my concern to several of the artisans I interviewed and was surprised when several explained that they saw me as an artisan of another kind: they carved stone and I wrote. I was the only ethnographer of the artisans, though other ethnographers had documented the cultural practices of the quarriers (Leitch 2009), many journalists had documented the quarries, and several local historians had written about the area (Paolicchi 1981).

Interpretation also depends on how an ethnographer defines the parameters of the research. A first step is to compile the other forms of documentation of the area and to understand the networks of documentation and collection, both public and private. In my study of the artisans, I called on the expertise of others to help me to interpret the larger context of the work. The local historian, Paolicchi (1981), explained some of the controversial politics behind the activity and inactivity of the local and national government regarding laws for the export of raw marble. An Italian labor political scientist, Professor Adele Maiello from the University of Genoa, accompanied me on interviews with the local labor union representatives so that I could better understand the lack of protection of the apprenticeship system. The region was self-conscious of its heritage and especially marked significant anniversaries with publications; for example, the local artisan school celebrated its 150th anniversary with a book documenting its history. Individual artisans had their own photographic collections of work they had done, and most artists produced catalogues of their work. In addition, the stonecarving studios had their own form of documentation. Most prominently, most marble sculptures are copies, often enlarged, of plaster models, and the studios had plaster archives, or "gypsoteccas," with hundreds of plasters. Documentation sometimes crosses over into commercial or marketplace endeavors. A local tool-making family, located high in the mountains at the end of a village, next to the waterfall that had served as the power for their workshop, had an elaborate, glossy, catalogue of their wares, produced by the New York City art supply store that was one of the retailers of their handmade

chisels. The contrast between the deeply local knowledge of generations of a family-owned business that continues to play an important role in the context-near lives of the artisans and the glossy marketing brochure is evidence of the complexity of the circulation of knowledge. Of course my work, also, is part of that circulation. Interpretation is not separate from documentation in this regard. I recognize that any interpretations I offer are part of the circulation of knowledge about the community, and this, too, plays a role in my reluctance to offer outside explanations or interpretations (Clifford and Marcus 1986).

The existing forms of documentation did not contain the information I sought, and yet they were an important part of understanding the community and its circulation of knowledge. They did not explain how artisans learned their skills, how the work was organized into specializations, and how they viewed their knowledge and expertise. Yet the existing forms of documentation were useful not only for providing background information but also for understanding how the community understood itself and presented itself to others.

I defined my research project as the study of the artisans (rather than, for example, the quarriers or the artists). Most specifically, my research did not encompass the work of the marble quarries, the phenomenon that, because of its (literal) magnitude, drew the fascination of both locals and outsiders and was the topic of most of the documentation of the area. I was interested in the contrast between the fascination about the quarries and quarriers and the relative lack of fascination about the artisans. Here, working at the level of discourse, I engage in another form of narrative interpretation in my examination of both the discourses of the artisans and the discourses of the journalists, local historians, and others who have documented the artisans.

Interpretation is a necessarily subjective practice; rather than consider the researcher's subjectivity to be an obstacle, we can view the researcher's lens of observation as a tool, like other tools, requiring attention to its limits and usefulness. Physicist Karen Barad points out that scientific research takes into account the role that the observer's tools play in constraining and affording particular kinds of observations. Research is always an interaction, and we need to understand the conditions of the interaction. Ethnographers have always described their methodologies, or what Barad refers to as the "apparatus" of research. New generations of researchers expose different dimensions of the apparatus and understand different conditions for intelligibility and interpretation.

The different agendas of the researcher, the people studied, and the ways the research can be used produce gaps, examples of what Slavoj Žižek (2006) calls a "parallax view, constantly shifting perspectives between two points between which no synthesis or mediation is possible" (p. 4). This gap is part of our research; it's part of the dynamics of the circulation of knowledge and possibly the strongest rationale for doing ethnographic research. Ethnography is designed to attend to the interactive, performative, dynamic dimensions of the circulation of knowledge, including, or especially, the contradictions and inconsistencies that are part of cultural experience.

In my work on the artisan narratives, one of the biggest challenges was to account for the circulations, gaps, and possible contradictions among the many narratives that artisans tell about their practice. Each of these narratives is shaped differently; I have asked how the narrators position themselves and their audience to create these different configurations. For example, narrators who position themselves in relationship to a tradition traced to Michelangelo often shape a nostalgic narrative that frames the present in terms of a lost past. In addition to exploring positioning, I asked how different narrative configurations circulated, in what conditions, and when. Included in those conditions are the ways that, in some cases, my interviews provided the warrant for particular tellings. Some of the narratives I collected have relatively scant circulation in the community; in some cases I was entrusted to circulate them, and in others, I realized that I was receiving information that was not meant to circulate. The task of the narrative scholar/collector is to understand the conditions in which the narratives circulate, including consideration of how the scholar's retellings bring the narratives into different realms of circulation. Questions about circulation are, I would argue, some of the most important questions educators can address about narrative. The stone carvers of Pietrasanta make their sculptures for export and are therefore more aware than some other cultural practitioners of the significance of what circulates and what does not. In this essay, I've explored the relationship between narratives about the circulation of artisan knowledge through pedagogies of stealth learning and larger questions about both how narrators position themselves and the conditions in which their narratives circulate.

1.6 Ethnography of Primary School Teaching in Tanzania

Sharon Tao

The Research Project

In 2004/2005 I had worked as a volunteer teacher in a primary school near to Arusha, Tanzania. This experience gave me some insight into the difficulties faced by Tanzanian teachers and of the efforts they made to overcome them. However, too much research on teaching in the Global South positions teachers as a major cause of poor quality education while failing to consider the circumstances under which they teach. I felt that the meta-narratives framing such research were too simplistic. When I returned to Tanzania to conduct this ethnographic study, it was with the intent of generating other narratives that addressed the lives, experiences, and aspirations of individual teachers and that would allow the reinterpretation of their actions.

In Tanzania, the central role of teachers in the provision of quality education has been explicitly recognized by the Ministry of Education and Vocational training, but commentators within government, the international development community, and academia frequently voice concerns about the teaching force. Different types of teacher practice and behavior that have been criticized include absenteeism (Benavot and Gad 2004; Carr-Hill and Ndalichako 2005), rote-teaching methods (Sumra 2001), inadequate subject knowledge (Mrutu et al. 2005), and withholding content to support private tuition (Kironde 2001). These criticisms can also be found in the literature regarding teacher quality in other low- to middle-income countries, including concerns about rote teaching in Nigeria (Hardman et al. 2008), lack of teacher commitment in Indonesia (Suryadarma et al. 2006), and teacher absenteeism in India (Kremer et al. 2005).

Such concerns have led to what might be referred to as the Third World Teacher Discourse (Tao 2013) with its implicit assumptions of poor quality teachers with “deficient” behaviors typically explained as acts predominantly governed by “culture” or “opportunism.” Alongside this, a discourse of Technical Assistance has developed with many international development agencies and consultants introducing technicist interventions to reduce or alter these “deficient” practices by, for example, providing training in learner-centered pedagogies (Cooper and Alvarado 2006) or using curricular calendars to ensure time on task (Abadzi 2007). However, a number of Tanzanian researchers believe that “technocratic fixes of this kind rarely work since they fail to take into account the very difficult working and living conditions that teachers have to endure” (Bennell and Mukyanuzi 2005, p. 48). Sumra expands on this:

Increased resources and training are not necessarily the sole areas that need to be addressed. Teachers’ social environment, attitudes, and working conditions are inter-related in a complex way that needs to be understood better if efforts to improve education in the country are to succeed. (2005, p. 2)

Yet these meta-narratives of poor quality teaching and deficiency continue to dominate the literature on teachers and teaching in the Global South, and this literature often seeps into educational policies. More recently though, the importance of incorporating teachers’ voices in the research process has been recognized. This Teacher Advocacy Discourse goes some way to addressing the oversimplification of the Third World Teacher Discourse as it begins to look at teacher practice and behavior from the teachers’ perspectives. It has also started to dispel certain assumptions that teachers in different contexts abide by a universal set of educational goals and philosophies. For example, Barrett (2007) and Vavrus (2009) investigate the acute environmental and social conditions that contribute to and often justify the various forms of teacher-centered pedagogies in Tanzania; while others address the material deprivations in Tanzanian teachers’ personal and professional lives, including substandard classrooms and housing, lack of teaching materials, and excessive workloads (Cooksey et al. 1991; Sumra 2005).

It seemed to me that these meta-narratives of deficiency were too simple – they were not entirely untrue but they were incomplete. Much of the Third World Teacher and the Technical Assistance Discourses focuses on poor teaching practice and fails to take into account the many challenges that teachers face inside and outside of school. However, it could also be argued that the Teacher Advocacy Discourse is too simplistic as well in that it fails to acknowledge the significance of wider contextual issues. Although some authors attempt to relate the deprivations they deal with to low levels of teacher motivation (Fry 2002; Bennell and Mukyanuzi 2005; Davidson 2007) Fry is quick to note, this still does not demonstrate “a direct causal link between teacher motivation, performance and quality education” (2002, p. 22).

From my time as a volunteer, I had a feeling that there were a number of complex reasons behind the classroom actions of teachers but that these more complex stories were not being told. Returning to Tanzania as a researcher, my intent was to challenge the Third World Teacher Discourse I had identified in the

literature by providing fuller understandings of and alternatives to the simplistic stereotypes it produced (something, I felt, weakened measures to improve teacher practice). I wanted to locate their teaching in the wider context of the policies and practices, as well as the sociocultural conditions framing the opportunities available to them and the constraints acting upon them. To develop this more complete understanding of why these teachers did what they did, I had to look beyond the stories they told and construct a culturally embedded narrative of their teaching.

I chose an ethnographic approach because the “thick description” (Geertz 1973, 2000) it uses to generate detailed accounts of the cultural settings gives a vivid sense of what life is like for those who are the focus of the research. Instead of simply looking at the poor practices identified in the Third World Teacher Discourse or the absence of support framing the Technical Assistance Discourse, this ethnographic approach allowed me to focus on the experience of teaching and to gain insight into how and why these teachers went about it. In particular, it gave me the chance to investigate the teachers’ personal and professional values and the ways in which contextual factors influenced them. By seeking to understand what it is like being a primary schoolteacher in Tanzania, the research provided insight into the significance of institutional and social practices on the agency of individual teachers. This thickly descriptive narrative allowed a more nuanced understanding of their practices, for example, whether their deficient actions were the result of not caring or of succumbing to too many pressures.

The teachers often referred to their professional development and promotion as “upgrading” and the research revealed a greater desire for this than was suggested in the wider literature. It also revealed gendered narratives in attitudes to and perceptions of this upgrading. The female teachers typically focused on the constraints that limited their opportunities to upgrade, but the male teachers usually looked beyond those limitations. The formal process of upgrading depended on school- and district-level policies and practices, but these were embedded in the day-to-day practice of teaching. However, the female teachers had to negotiate domestic barriers that limited their opportunities to upgrade and also tended to shape the perceptions others, such as the district-level officers responsible for allocating professional development courses. In order to understand the narratives of constraint (told by the female teachers) and of aspiration (told by their male colleagues) generated by the research, it was necessary to locate them in the wider sociocultural context of teaching in Tanzania.

Collecting and Organizing the Data

I was interested in the stories the teachers told about their professional practice and their aspirations, but these were only one strand of the research narrative. Just as I felt the meta-narratives, particularly those of the Third World Teacher and Technical Assistance Discourses were incomplete because they paid insufficient

attention to such individual stories, I felt these individual stories were incomplete because they offered a limited view of the wider contextual narrative. The ethnographic approach of this research enabled me to bring together the individual stories and the wider sociocultural story.

The thick descriptions of educational ethnographies typically draw on a range of sources from observations of classroom behavior to policy documents as well as individual informants. In this sense, the main source of data was the field itself—that is, the context in which the teachers worked and lived—their schools, communities, and wider social contexts. However, the focal point of this ethnographic narrative was the stories these teachers told, and they were therefore my principal sources of information. As I wanted to obtain an understanding of how different environments influenced their practice and the choices they made (or were unable to make), I decided to work with teachers in three settings: urban, periurban, and rural government primary schools. The rationale for constructing case studies around these three different schools was that it would potentially highlight differences and/or similarities in the teachers' narratives during cross-case comparisons (Yin 1981).

Although I viewed teachers as the primary research participants whose narratives could provide the most thorough data, I also conducted interviews with 15 secondary participants who managed and worked with the teachers on a daily basis. Many of these secondary participants were in the position to significantly affect teachers' experiences at the school level and included District Education Officers, inspectors, and headteachers. I also interviewed people at regional and national levels whose research and advocacy work could affect their experiences, such as representatives of the Tanzanian Teachers' Union and Civil Society Organisations as well as academics. Their accounts provided additional information on the teachers' practices as well as insight into the more subtle factors influencing them.

The research was intended to engage with and understand the actions of these teachers. It was recognized from the outset that these actions—which were generally considered to be somehow deficient in the meta-narratives of the Third World Teacher and Technical Assistance Discourses—were grounded in complex sociocultural situations and that the research would therefore need to apprehend that complexity. I used a range of qualitative methods in order to generate the data that constituted the ethnographic narratives. There were three broad strands within these wider narratives: the narratives of the teachers (constructed from focus groups, one-to-one interviews, and observations), the wider contextual narratives (constructed from interviews with other research participants, observations of the sociocultural context of the teachers, and other data including documentary analysis), and my own reflective narrative (constructed from my field notes and research diary) which required me to constantly question the interpretations I was making.

The stories the teachers told of their professional and personal lives were central to the study as they provided a narrative thread linking their experiences to the

opportunities and constraints framing them. However, Hammersley and Atkinson (2007) explain:

it is necessary to recognise that [individual] narratives should be studied within the context of an overall ethnographic strategy. Narratives should not be treated as if they occupied a different, special and privileged analytic space. (p. 171)

The data from the teachers gave considerable insight to their perspectives but could only provide a limited account of the wider contexts in which they lived and worked. To only focus on their stories would have led to the simplification of the more complex story of primary school teaching in Tanzania. So although their individual narratives and the perspectives they offered were important, it was necessary to embed them in contextual data. The main research methods used in ethnography are participant observation and interviewing, but other methods include (but are not limited to) tests, surveys, audiovisual techniques, and network research (Holloway 1997). I used multiple methods to elicit data that would inform the narrative of teaching and so allow an in-depth understanding of the teachers' values, the constraints and opportunities acting upon them, and the relationship between these. The range of methods drew upon theoretical and empirical examples used in the literature on the capability approach (Sen 1992, 1999; Nussbaum 2000), which was the main theoretical framework of this research. It included the following: focus groups, which have proven successful in enabling groups to consider, debate, and scrutinize shared values (Alkire 2002; Biggeri 2007); semi-structured interviews, which have also been used to elicit values, as well as constraints and opportunities, through narrative accounts (Nussbaum 2000; Raynor 2007); and participant observation, which has been used to add to the thick descriptions needed for capability assessments (Takayanagi 2010). Each of the data sets generated by these different methods added to the thickness of the description that allowed the construction of the ethnographic narrative of teaching.

My own participant observations added another layer of data as they allowed me to get some sense of what it felt like to be a primary schoolteacher (although this was always limited by the knowledge that I was a volunteer who would be returning home at the conclusion of the study) and facilitated my understanding and interpretation of the teaching narrative, making me sensitive to nuances I might otherwise have missed. I kept a detailed research diary that included descriptive accounts of and reflections on my own teaching. These reflections had another purpose though – they caused me to reflect on my position as a researcher embedded in the local community. There is a risk that in trying to obtain the feel for the subjects of their study, ethnographers can lose sight of the wider context. This was a particular concern for me as this study had been prompted by my sympathy for the teachers and the ways in which they were represented in the meta-narratives. Constant reflection on my role as a participant observer helped to mitigate this concern and ensure the data I collected would facilitate a better understanding of the conditions in which these teachers taught rather than simply advocating their positions.

My previous experience as a volunteer had made me familiar with some of the problems encountered by Tanzanian teachers such as teaching with a lack of materials and having 80–120 students in a class. I had attempted to immerse myself

in my school's community by establishing relationships with teachers, students, and parents and in the surrounding village community through becoming proficient in Kiswahili and living in an orphanage and a *boma* (a family compound). The time I spent teaching at this school was not related to or intended for research, but it provided insights for my subsequent ethnographic study and made it easier to gain access to the research sites and the participants.

Teaching English to up to 120 students in years 3–6 for four to six periods a day provided insights into the daily conditions, pressures, and politics that these teachers faced. Living as part of the community—which involved, among other activities, attending municipality meetings, weddings, and even a funeral—also helped establish my position as a participant observer. The positioning was helped by my working knowledge of Kiswahili, but, before returning to do the research, I took a course in London to improve my language skills. This made the teaching and the research easier, but it also made it easier for me to be accepted as a participant observer. I had made the practical decision to conduct all discussions in Kiswahili, without the aid of a translator, while planning the data collection. This decision was based on my language abilities, but there was also the practical consideration that my limited resources precluded extensive translator assistance. Although having a translator might have been helpful during formal discussions, my proficiency in Kiswahili enabled me to engage in formal and informal conversations, pre-translate the interview and focus group questions, clarify questions put forward by participants, and follow most responses during discussions. Language fluency was important for my participant observations as activities such as relationship building, informal conversations, and direct/indirect observations could not have been executed as smoothly if it had been necessary to use a translator.

My previous teaching experiences facilitated the specific identification of the particular schools I wanted to involve in the research. Having obtained permission to conduct my research from the relevant District Education Officers, I was able to make use of the contacts I had previously made to get permission from the head teachers. Having gained permission from headteachers, I then proceeded to recruit teachers at each of the three schools. Again, my previous experience and language skills made this easier. As a teacher, I was able to access the teachers and other informants and to observe the conditions under which they worked in these schools. I used in-school and nonschool participant observations to further contextualize and triangulate the stories they told in formal and nonformal research situations.

The more formal research with the teachers began with focus groups which have been used for fostering group reflection and discussion by participants (Kreuger 1994) and as a platform for including traditionally excluded and marginalized individuals to voice their opinions and values (Cambridge and McCarthy 2001). One limitation of focus groups, however, is the omission of information in discussions either because certain topics are not included or because the nature of certain topics is too personal to share with others (Smithson 2000, p. 103). To mitigate these problems, I conducted follow-up semi-structured interviews with participants in order to glean information that might have been missed during the group discussions and to explore individual issues and experiences in greater detail. In addition, I used

questionnaires to triangulate data obtained from the interviews and focus groups and to provide a space for topics that might not have otherwise been discussed:

... either because people forget about [them] in the heat of discussion or because they presume that the facilitator is not interested (as in matters of faith or family), or because they are not used to talking about these issues in a group (such as culture or inner peace). (Alkire 2006, p. 144)

Another limitation of focus groups and interviews is that the power relations between participants and the researcher can also affect participants' responses and narratives. Woods (1985, p. 4) describes how participants can put up false "fronts," such as speaking in voices that are not entirely their own as a result of nerves, poor memory, or power differences. In an attempt to overcome the silences or failings that interfere with the achievement of "full" voice, MacLure (2009, p. 101) suggests putting participants at ease, making the discussion feel like a conversation and triangulating accounts to check for validity. Gubrium and Holstein (2002) note that interviews are contextually based, mutually accomplished stories produced by both the researcher and the respondent, and so they caution that "to tell what happened (the what) is not enough because the what depends greatly on the ways, negotiations, and other interactive elements that take place between the researcher and the respondent" (p. 141). Being part of the community helped the mutual accomplishment of the stories that made up the narrative. For this study, I used a facilitating style and informal spaces (such as empty classrooms) to conduct the group and individual interviews. In addition to this, I carried out activities that Alkire (2002, p. 225) suggests diffuse power dynamics, such as wearing simple clothing, adapting the methodology flexibly to the situation, respecting traditional and religious customs, organizing the meeting at a convenient time and place, having an informal and open attitude, and using the local language.

I collected questionnaires in written form and recorded observations through field notes written in the form of brief thoughts or observations while at school or after a conversation. As well as being a record of the conditions under which the teachers taught, these field notes allowed me to record smaller insights that were not necessarily revealed through the greater formality of the interviews. They also allowed me to note responses to everyday actions, such as what it is like to teach large classes of students on a daily basis. I also wrote longer, journal-like reflections (regarding observations, initial analyses, or tensions I was feeling) while on my own. As a full-time member of staff (which involved team teaching and covering other teachers' classes), I was able to contextualize my interpretations of teachers' experiences and narratives and provided reciprocity for the staff's contribution to this study. Participant observation also helped to minimize the effects of my positioning as a researcher on participants' responses.

Focusing the Narratives

The research generated a data set apprehending the complex narrative of teaching through the thick description that ethnography enables. The main narrative threads running through the study were the stories the teachers told about their professional

and personal lives. These stories were told through interviews, and they typically followed a clear narrative line. However, the construction of their narratives drew on more than what they said. Data from individual teachers was gathered over time and through a range of methods, and this was incorporated into the narratives structured around the interview data. Moreover, the ethnographic approach to the research, which was facilitated by being a participant observer, meant they were embedded in the wider contextual narrative. This incorporated significant detail—such as what it is like teaching large classes with limited resources and how the wider communities view teachers—that might otherwise be missed, but this data often lacked the clear direction of the interviews. This data was important as it meant the conclusions of the Third World Teacher and the Technical Assistance Discourses could be explored more carefully. It was necessary to organize the raw data into a cogent narrative that gave insight into primary school teaching in Tanzania, but, at the same time, it had to avoid replicating what I considered to be the oversimplification of these meta-narratives.

I wanted to illustrate the difficulties these teachers experienced in their day-to-day teaching and in realizing their professional and personal values. The data from the questionnaires and focus groups, supported by the interview data, allowed me to identify key issues, including their values and the opportunities (and the lack of opportunities) to realize them. These key issues provided a means of selecting and organizing the data, particularly that from the interviews, that generated descriptive accounts of how they experienced their teaching and the opportunities available to them for professional development and advancement. I was then able to draw on other data sets to contextualize their aspirations and the opportunities (and lack of opportunities) available to them. It was not possible to incorporate all the data so I focused on that which illustrated the most significant issues to emerge from the analyses, such as the gendered approaches to professional advancement or upgrading.

When addressing the issues identified from earlier stages of research (i.e., the focus groups and questionnaires), the female teachers often articulated their values and aspirations from a deficit perspective, addressing what was absent in their lives as well as what would continue to be absent because of the many obstacles surrounding them. For example, Aisha,¹ one of the teachers from the periurban school, explained:

I would love to upgrade and have a better qualification, to get more education. But I can't because my salary is low and is not enough to pay for my education and to give my children education as well. Also, in each school there are only two spots for teachers to take study leave each year. And these spots do not open again for three years. By then you have children and you are too old to go to school. So we remain [and] for those who are married, that is an obstacle. When you have children, the moment you bring an idea to your husband that you want to go to school, he will ask 'Who will take care of the children?' In the next discussion with your husband, you might agree to find a house girl, but in the midst of looking for a house girl, you are pregnant.

¹ All names have been changed in order to protect research participants' privacy.

In contrast, Elias, a male periurban colleague of hers, answered the same question this way:

I would like to upgrade as others have said. The education that I have is not enough. I don't have enough academics for teaching children. And the things I'd like to fulfil, according to my career, I should be able to do other things, outside of teaching in school. For example, I would like to open a school and employ other teachers so we could work together. Another career is to open a stationary shop or a bookshop from this career, it will support me to do other things.

It is clear from these two interview excerpts that the professional aspirations of the teachers were influenced by more than just school-based issues. Their individual narratives generated an understanding of their professional lives that included the experiences, hopes, and frustrations of dealing with students and bureaucracy as well as significant aspects of their personal day-to-day lives. Such accounts formed the main thread of the individual narratives, but, while they provided insight into the experiences of the teachers, they lacked the richer ethnographic detail. Aisha's account, for example, indicates the weariness caused by the teaching conditions and exacerbated by the lack of opportunities for promotion but does not incorporate the attitudes of the District Education Officers to upgrading female teachers which were steeped in hierarchical and sexist—yet widely accepted—cultural beliefs. This process of embedding the teachers' narratives in thick contextual descriptions allowed me to apprehend the complexity of their practices and experiences and so negotiate the oversimplification of the dominant meta-narratives. That is, it allowed me to construct a more complete narrative not just of the experiences and aspirations of individual teachers but of primary school teaching in Tanzania.

Interpreting and Presenting the Data

While exploring the literature surrounding international development and development theory, I was instinctively drawn to the capability approach as a theoretical framework to understand teachers' well-being.² The capability approach does not view well-being as constitutive of traditional components such as income and resources, but as a product of people's opportunities for realizing the "beings and doings" that they value (Sen 1999, p. 73). It suggests that instead of focusing on the means that might facilitate a good life, such as more income or resources, we should instead consider the actual standard of living that people manage to achieve and, more importantly, the freedom they have to achieve the types of lives they want to lead. This view uses the information base of functionings (which are the "beings and doings" that people have reason to value) and capabilities (which are the opportunities or substantive freedoms they have for realizing these functionings). The

²For an interpretation and application of the capability approach in a non-developing country context, see Watts' chapter in this volume.

capability approach also scrutinizes the enhancement and constraints of these opportunities by acknowledging environmental conversion factors (such as geographical location and logistics), social conversion factors (such as social norms and power relations), and personal conversion factors (such as intelligence, physical ability, and skills) (Robeyns 2005). If the conversion factors that block capability freedom can be reconciled, a person would then be judged to have an expanded capability, and her well-being would be evaluated either based on the opportunities reflected in her capability set or on the functionings that she chose to realize from this set (Sen 1999, p. 76). Given my personal experiences as a teacher in Tanzania, I felt that this type of analysis could be helpful in elucidating which working/living conditions constrained the “beings and doings” that teachers valued. However, I was also aware that further explanatory theory was needed to link this type of restricted well-being to their criticized behaviors.

In this instance, my reading and interpretations of the literature surrounding the philosophy of social science brought me to the work of critical realism, which has its foundations a philosophical critique of positivism’s assertion that knowledge of reality can be “value-free” as well as gained through empirical means (Bhaskar 1978, 1979). Critical realists caution against the epistemological assumption that reality can be reduced to what can be apprehended, but they also caution against the converse assumption that reality is solely a product of our construction of knowledge. As Sayer (2000) posits, if either were the case, then surely we would never be mistaken about how we suppose phenomena to be. Instead, critical realism begins with an ontological positioning that reality is structured, changing, and not readily observable. Within these non-observable dimensions of reality, particular causal mechanisms, structures, and tendencies interact, conflict, and generate empirical events. These empirical events are phenomena that we see in the world every day (such as a teacher being absent from class), and any explanation of what caused a phenomenon to occur would entail an account of these underlying generative mechanisms as opposed to positivism’s identification of highly correlated empirical variables (Sayer 1992). Thus, looking for repeating causal factors (such as personal characteristics associated with teachers who are absent) is helpful only in establishing conditions related to a phenomenon’s existence and activation; but to conflate these with causation by virtue of their repetition overlooks the processes that explain the deeper, causal mechanisms related to the phenomenon.

Drawing on these two frameworks, I aimed to generate narrative and observational data about teachers’ values, experiences, and beliefs; and, by interpreting these data through the lenses of the capability approach and critical realism, I hoped to reframe teachers’ criticized practices as a product of their constrained capabilities which could potentially offer a more nuanced understanding of their practice.

The research had been initiated by a concern that the meta-narratives of teaching in Tanzania ascribed deficient behaviors to the teachers without taking account of the complex issues influencing their practice. Phenomena such as absenteeism and lack of motivation could not be overlooked when interpreting the data, but this was not the point of the study – I wanted to develop a better understanding of why these teachers acted as they did and the ethnographic narrative, which placed the

teachers' narratives in a wider sociocultural context, enabled a more nuanced interpretation of their behaviors that took into account a range of factors overlooked by the meta-narratives.

The integrity of the interpretation rested upon the rigorous analysis of the teachers' narratives. They were thematically analyzed using deductive codes (originating from prior concepts and theorization) and inductive codes (developed from the actual data) (Strauss 1987; Hennink et al. 2011) in order not to fragment the narratives or take snippets of quotes out of context. I ascribed importance to codes based on intensity (Boyatzis 1998) with depth in discussion, assessed through the amount of time and detail given to a topic, providing the greatest indication of salience. I ascribed more importance to depth of discussion, such as Aisha's concerns about upgrading, because I found focusing solely on frequency to be misleading as many teachers in focus groups did not speak as readily as others and instead tacitly agreed through physical gestures and acknowledgements with the topics under discussion. The ethnographic approach, with its concern for thick description, facilitated this process. Although I placed greater significance on the data gleaned from focus groups and interviews, as these data came most directly from teachers themselves, the data collected from the other methods were used to confirm or contradict my understanding of the salience of the issues.

The key issues, from both the literature and the research, were then considered from the perspectives of the teachers. Behaviors that were identified in the wider literature as deficient were acknowledged, but they were approached through detailed descriptions of the conditions that framed them as told by the teachers' narratives. These narratives comprised more than the spoken accounts they had given, but they were not simply taken at face value. They were considered in the wider contexts of their teaching, such as the social factors delimiting opportunities for female teachers to be upgraded and the partisan views of the District Education Officers that further limited them. This enabled me to address issues that were not necessarily obvious from either the snapshots of deficient behaviors informing the meta-narratives or the accounts given by the teachers themselves—issues such as the weariness engendered by teaching large classes that they may have become conditioned to and so not recognized as problematic contributors to their actions. That is, the interpretation located their behavior in the thick descriptions generated by the rich ethnographic data.

The narratives allowed a clearer understanding of the conditions under which teaching in Tanzania takes place. It meant that particular behaviors could be seen not as discrete practices but as taking place in, and as part of, complex socio-cultural situations that all too often were skimmed over in the wider literature. Interpreting their teaching in terms of their capabilities—that is, of what they valued and had reason to value and the substantive opportunities they had to achieve them—was an important part of this process. The Third World Teacher Discourse typically focused on what they did without giving proper consideration to the opportunities they had to do anything else; and this is not something that can be addressed through the interventions proposed in the Technical Assistance Discourse. The use of ethnographic narratives offers a more holistic view and

subverts the oversimplification of the meta-narratives, allowing interpretations that look beyond the poor practice so often ascribed to these teachers.

The general aim of this study was to draw attention to the many conditions that constrain teachers and produce “deficient” practices. I wanted my research results to contribute to policy and practice to improve teachers’ well-being and affect some of these practices as a result. I am also aware that there is a danger in trying to advocate for or represent the needs and voices of a marginalized group, as it involves issues of authority. Why should I have the “right” or ability to represent Tanzanian teachers? This position is very powerful as it also involves choosing what to present (and occluding certain views) as well as affecting what is being said. This privileged position also poses the danger of exoticizing or “othering” Tanzanian teachers (which I was highly critical of within the Third World Teacher research) because representations are filtered through my own world view and values. This is where the use of reflexivity is imperative, which is when researchers make explicit

... their historical and geographical situatedness, their personal investments in the research, various biases they bring to the work, their surprises and ‘undoings’ in the process of the research endeavour, the ways in which their choices of literary tropes lend rhetorical force to the research report, and/or the ways in which they have avoided or suppressed certain points of view. (Gergen and Gergen 2000, p. 1027)

By being transparent about these issues (to their audience as well as themselves), researchers enhance their ability to recognize that their interpretations and representations of the social objects they study are a product of their investments and positionings; and by recognizing their default position for interpretation, a researcher might be able to challenge herself to view a situation beyond such a position. This is not to say that a researcher can purge herself of her biases, or necessarily be able to better understand a situation by “challenging herself”; however, by being conscious of how her subjectivity has shaped her interpretations, the researcher and audience are alerted to the complex relationship between knowledge production, the knowledge producer, and how knowledge is presented; and this helps to shed light on partialities, exclusions, and agendas that were previously opaque.

I am aware that reflexivity alone does not provide a clear-cut solution or way to absolve the problems involved in representing Tanzanian teachers, but, if I can problematize the process of interpretation and representation of an “other,” and be conscious of the act of exoticizing, my hope is to at least reduce some of the power asymmetry and misrepresentation that is inevitable.

Reasons for Choosing This Approach

My reasons for using ethnography in this research were closely linked to what I had seen during my time as a volunteer teacher in Tanzania. In the transition from volunteer to researcher, I aligned myself with what I identified as the Teacher Advocacy literature. However, I felt that it typically positioned teachers as victims

of a flawed system and, in failing to acknowledge the reality of their lives, it undermined their agency. I wanted to investigate the relationship between their conditions of service, their lives beyond the classroom, and the behaviors for which they were criticized. The central focus of my research was therefore to develop a closer understanding of the values, beliefs, and lived experiences of Tanzanian teachers in order to generate nuanced explanations of why they do what they do. People act differently in different situations, and it can be difficult to address the significance of their everyday behavior through other research methodologies. I felt that the context-based subtleties framing such opportunities had been lost in much of the literature on teaching and teacher education in the Global South, but the ethnographic approach offered a way to address this problem. It allowed me to construct a broad social narrative within which I could present the personal narratives that simultaneously represented how individuals make sense of their lives, the resources they use to tell their stories and the auspices under which their stories are told (Gubrium and Holstein 1998).

Actions, as well as the norms and values guiding them, are typically context dependent, and people within the same general setting (such as a school) may act differently in different contexts within it (such as the classroom and the staffroom) (Hammersley and Atkinson 2007). However, more than what happens in the school setting influenced the choices and opportunities that were the focus of this study. The research included the wider contexts because the failure to take them into account may have led to distorted interpretations of the teachers' professional lives. For example, the criticism that teachers may sometimes adapt their teaching in order to generate private tuition needs to be situated in the context of the wider socioeconomic situation to be fully understood.

This leads to a further point: What do people talk about in a research situation? It may be that the everyday issues that shape action are not recognized as significant and may therefore not be addressed through other research methods such as interviews. It is not unreasonable to ask how far such research methods can apprehend the often subtle complexities that make up the day-to-day lives of those we work with in our research. Beyond this, though, is the influence of power structures that may inhibit the sharing of experiences. Ebbutt (1998) paints a vivid picture of the bemused reluctance of subjects from the Global South to criticize the apparent experts from the Global North, and Clark (2009) provides a more insidious interpretation of those experts riding roughly over local knowledge.

The experiences these Tanzanian teachers shared were filtered through social structures, and their effect was clearly demonstrated in the differences between what was shared in the focus groups and in the one-to-one interviews. Such partial data can generate partial understandings that may reinforce interpretations that paint the teachers in a poor light, such as focusing simply on the notion of limited teaching intended to encourage private tuition. It was important to consider the wider context and how the participants related to it. These power structures also have the potential to diminish the agency of teachers struggling to be professional under highly demanding and enervating circumstances.

However, these same social structures extend beyond the immediacy of the research context to the relationship between participants and researcher. It is necessary to move beyond an understanding of what these subjects do to understanding why they do it. That is, it is necessary to develop an understanding of their world view. This concern with how people make sense of the world and act within it is especially important in capability-based studies that consider what individuals value and have reason to value. This cannot always be understood through other methodologies (as was evidenced by the differences between what the teachers said in the focus groups and individual interviews as well as the differences between this interview data and what they were observed doing outside the formal immediacy of such data collection). Taking teachers out of their everyday contexts—even if only through inviting them to participate in focus groups and interviews—may undermine the apprehension of that complexity. We may lose sight of the links between their self-reported behavior and the social milieu that frames it.

Action typically has greater meaning and significance than can be grasped through what is reported. To begin to understand action, it is necessary to consider its manifest significance (which may be reported) and its latent significance (which may remain unreported because of the failure to understand its significance). People lead contextualized lives that give meaning to their actions, but that context is not always expressed through spoken narratives (e.g., through interviews) as assumptions about it often remain unquestioned. Human action is imbued with more than what can be seen or reported to an outside researcher. Ethnography seeks to uncover those meanings through the participant observation that enables understanding of the subjects' values and circumstances rather than those of the outsider, the nonparticipant observer.

I chose to use ethnography for two reasons. First, it involves the use of multiple research methods to generate rich data that allows the collection and construction of narratives for the group under study. Second, it entails extended researcher presence in the field, which not only enables the identification, analysis, and interpretation of complex—and often subtle—issues in context but can also minimize the influence of the researcher on participants. Cohen et al. (2007) elaborate on these points when explaining:

The researcher stays with the participants for a substantial period of time to reduce reactivity effects (the effects of the researcher on the researched, changing the behaviour of the latter), recording what is happening, while taking a role in that situation . . . by staying in a situation over a long period the researcher is also able to see how events evolve over time, catching the dynamics of situations, the people, personalities, contexts, resources, roles, etc. (pp. 404–405)

Becoming a temporary member of staff who taught and socialized in Kiswahili meant that I could be viewed by teachers as a participant who observed; but my positioning as a non-Tanzanian researcher always placed me in the default position as an “outsider” or observer who actively participated. Nonetheless, the participant observation that I engaged in enabled me to develop close relationships with the teachers, and this helped to reduce the effect I had on their everyday behavior, as well as on the narratives they provided through the focus groups and interviews.

Participant observer activities such as these can only be had through engaging in an ethnographic approach (although it should be noted that the use of participant observation is not mandatory in ethnographies), and the extent to which it allowed me to minimize my researcher/outsider effects, as well as triangulate and contextualize the teachers' narratives, was extremely helpful in identifying the teachers' valued functionings and constraints, as well as interpreting the gendered nature of their narratives and the meta-narratives surrounding them.

The capability approach is concerned with the range of opportunities available to people and so requires consideration of aspects of well-being that individuals do not necessarily recognize as important to them. The distinction between what an individual values and has reason to value, and how these are linked to their freedom to choose a preferred way of living, is particularly important in capability studies. As Sen (1992) explains, capability assessments:

... must take note of the real freedoms that people in *fact* (not just 'in principle') enjoy. If social conditioning makes a person lack the courage to choose (perhaps even to 'desire' what is denied but what would be valued *if* chosen), then it would be unfair to undertake the ethical assessment *assuming* that she does have that effective choice. It is a matter of concentrating on the real freedoms actually enjoyed, taking note of *all* the barriers – including those from 'social discipline.' (p. 149, original emphases)

Having worked in Tanzania, I was aware that "social discipline" could be enforced from beyond the country (e.g., through the Third World Teacher Discourse) as well as from within it (e.g., through the structure of gender relationships) and that it could shape the teachers' narratives. I wanted to hear the stories they told, including those told through the focus groups and one-to-one interviews, but I also wanted to contextualize them in order to account for "*all* the barriers – including those from 'social discipline'" that prevented the teachers from achieving their valued goals.

Hopes and aspirations may be limited by circumstances, and so what the teachers said they valued may not have apprehended what they had reason to value. I therefore needed a research methodology that could account for this. Ethnography, with its multiple methods and participant observation generating thick data and enabling iterative triangulation, offered the necessary "informational space" (Sen 1992, 1999) for capability analyses addressing the relationships between expressions of valued ways of living and the circumstances surrounding them. Indeed, Comim (2008) argues that capability assessments should begin with an ethnographic approach. The teachers' narratives were most obviously articulated through the focus groups and interviews, but the ethnographic approach I took meant that they could be embedded in and understood through wider data sets. By choosing ethnography as my research methodology, I was able to develop a clearer understanding of how these teachers made sense of their world (Tedlock 2003; Hammersley and Atkinson 2007) and why they did what they did.

However, it should be noted that there have been some criticisms leveled at the use of ethnography, most notably those that derive from philosophical debates. Broadly speaking, criticisms of ethnographic case studies reside in the epistemological realm whereby ethnography (along with other forms of qualitative research) does not meet the positivist criteria of scientific rigor and validity, as ascertaining

data entails a “subjective” process (Hammersley and Atkinson 2007, pp. 6–7). However, Greenbank (2003) posits:

Even before data is analysed, interpreted and presented the researcher’s method of sampling, experimental design or questionnaires are likely to reflect their (often unconscious) values. . . Whilst researchers may attempt to eliminate the effect of bias, they are unlikely to eradicate it totally and therefore this assumption of value-neutral research is flawed. (p. 792)

During the process of data interpretation, I not only attempted to remain reflexive about my biases and world views and how these would affect my interpretations, but I was also aware of the many layers of interpretation that could be had within the data itself. For example, Hammersley and Atkinson (2007) suggest that participants’ accounts can be scrutinized in the following ways:

First, they can be read for what they tell us about the phenomena to which they refer. Second, we can analyse them in terms of the perspectives they imply, the discursive strategies they employ, and even the psychosocial dynamics they suggest. (p. 97)

The participants’ narratives could be interpreted “at face value” as a source of information about the functionings they valued and the constraints they experienced as well as a source that revealed more subtextual perspectives, structures, and discursive practices. My use of multiple research methods generated a variety of data, which aided the construction and interpretation of these more subtextual perspectives. I primarily used the data gleaned from focus group and interview discussions as the foundation for my interpretations, but the data collected from the other methods within my ethnographic approach were used to deepen and nuance my interpretations of teachers’ narratives.

What Was the Role of Interpretation in This Research Study?

Although I aligned myself with the Teacher Advocacy literature because it challenged the notion that teachers are the causes of poor quality education, unfortunately, it sought to position teachers as victims of a flawed system. To make sense of these polarized views, I set out to better understand the relations between teachers’ conditions of service and the behaviors for which they were criticized. Emphasis was given to collecting the personal narratives of teachers as these simultaneously represent how individuals made sense of their lives, the resources they used to tell their stories, and the auspices under which their stories were told (Gubrium and Holstein 1998). However, it is important to understand how particular kinds of narratives function within specific organizational or cultural contexts. By engaging in close, prolonged ethnographic interaction within these contexts, researchers can understand their subjects’ personal narratives, beliefs, and motivations better than with any other approach (Tedlock 2003).

Ethnography typically “involves fairly lengthy contact, through participant observation in relevant settings, and/or through relatively open-ended interviews designed to understand people’s perspectives” (Hammersley 2006, p. 4). However, while this close engagement has clear methodological advantages, particularly in mitigating the effect of the research on the research situation, it does raise potential interpretative problems. Perhaps one of the biggest problems in ethnographic studies is the possibility of the researcher becoming so immersed in the setting that she “goes native” and her interpretations become distorted through the assumption of the cultural perspective of those with whom she is working.

I was aware that my previous experiences as a volunteer in Tanzania had left me dissatisfied with much of the literature on teaching in the Global South and with a great deal of sympathy for the teachers. I was also aware that I needed to exercise care when interpreting the data generated by this research. Researchers are very much embedded in broader social structures and discourses, and they exercise varying degrees of agency within these bounds, just as the people they study (Archer 2007). Given this understanding, it seems that irrespective of design, research can never be value-free and the positivistic claim of “value-neutral research” is misleading at best (Greenbank 2003). Preliminary interpretations occur between the researcher and the participants, which are generally tacit, unconscious, and immediate in nature and are significantly different from the secondary interpretations in which the researcher “does not construct but (further) interprets and explores ‘data’ in depth” (Alvesson and Skoldberg 2000, p. 261). I had to negotiate three such types of preliminary interpretations during this study—linguistic, interpersonal, and analytic; each influenced and informed the role of interpretation in this study.

With regard to preliminary linguistic interpretations, the weaknesses in my Kiswahili did at times affect my interpretations of some responses, and there were times when I was unable to probe further if a teacher offered a particularly unusual answer. Also, some of my pre-translations of focus group and interview questions caused some teachers to misinterpret my intended meaning. This is a common situation when conducting research in a different language:

The nuances of interpreting mean that it is not simply a matter of directly replacing words of some language with another. . . In any language, translation rather requires conceptual transferences, and a degree of interpretation on the part of the translator, at all steps in the conversation. (McWilliam et al. 2009, p. 71)

Although I had had a critical friend double-check my pre-translations, it was clear that there were still slippages in translating the meaning of certain concepts, expressions, and ideas. However, once these mistakes were identified, I was able to change wordings for subsequent rounds of data collection. For example, when asking teachers what kinds of choices they had at school, the direct translation of “choice” into Kiswahili was *machaguo*, but when listening to teachers’ answers during discussions, I realized that they were interpreting the word “choice” to mean “priority.” In examining this issue with my critical friend, he suggested I use the word *mapendekezo* instead. This means “suggestion” in English, but given the

conceptual intent behind my question, he insisted that teachers would understand it to mean “choice.”

The interviewees and I consciously and unconsciously gauged and interpreted the personal dynamics during data collection (Gubrium and Holstein 2002). On my part, I was constantly attempting to interpret the participants’ levels of comfort and ease in order to facilitate discussion. On the participants’ part, interpersonal interpretations may have had less to do with how I was feeling or reacting and more to do with their interpretations of my identity, intents, and expectations.

Although this is my interpretation, there were isolated instances where I felt that my positioning as a researcher (from a prosperous country such as the UK) interested in teachers’ challenges seemed to affect the construction of their narratives. For example, some teachers positioned themselves as “victims” while discussing their constraints—so much so that two teachers concluded their victim narratives with an appeal for money (it should be noted that the teachers who petitioned me for money had previously received money from Western volunteers who had worked at their schools and that this past experience may have greatly affected their interpretations and assumptions about myself and what I would be willing to do). Fadzillah (2004) argues that it is crucial for an ethnographic researcher to acknowledge that she is often under as much scrutiny from her research subjects as they are from her and that their “. . . perceptions of the ‘other-ness’ of the researcher have always influenced the type of information made available to that person” (p. 43). In such situations, Hey (1997) suggests the following:

What is required is not only more reflexivity (about who ‘we’ are) but also a more finessed sense of how these power relations (including those of research) shift and are contested by their subjects/objects in the everyday. (p. 49)

Given this perspective, the teachers’ requests for money could be interpreted not as a sign of victimization but one of agency in that they recognized and attempted to use social differences to their advantage. It should be noted, though, that appeals for money by teachers were not the norm. However, I was reminded of the victim positionings within the Teacher Advocacy literature and reflected on whether, and to what extent, the many expositions of teachers’ impoverished working and living conditions (Fry 2002; Bennell and Mukyanuzi 2005; Davidson 2007) were also affected by the interpretation of interpersonal dynamics.

At the analytic level, preliminary interpretations occurred during interviews with respondents providing retrospective interpretations in the form of their narratives. My own preliminary interpretations were more practical in nature in that I was gauging whether and to what extent the participants were understanding and answering my questions and, if there was any dissonance, I had to consider whether this content warranted further investigation or was it the result of a conceptual misunderstanding of my questions. Either way, these forms of preliminary interpretation provided the basis for the more explicit, conscious, and traditionally understood secondary interpretations that came with analyzing the data after the fieldwork phase had been completed.

Interpretative practices informed the judgments I made concerning the framing of the research and the collection and organization of data. The analysis of the individual teachers' narratives and the wider narratives within which they were located then constituted a secondary form of interpretative practice. I was aware that this analytic process could be done in many ways (e.g., to generate interpretations that aligned with the Teacher Advocacy or the other approaches), and so transparency and self-scrutiny were particularly important. In approaching the analysis, I drew from Hammersley and Atkinson (2007) who suggest that such accounts can be scrutinized in the following ways:

First, they can be read for what they tell us about the phenomena to which they refer. Second, we can analyse them in terms of the perspectives they imply, the discursive strategies they employ, and even the psychosocial dynamics they suggest. (p. 97)

In attempting to interpret the teachers' narratives during the post-fieldwork analysis, I drew from narrative analysts such as Somers (1994) who discerned broader forms of narrative that both shape and transcend those at the personal level. For example, public narratives are those attached to cultural and institutional formations larger than the individual and "range from the narratives of one's family, to those of the workplace (organisational myths), church, government, and nation" (Somers 1994, p. 62), while meta-narratives transcend the group-based boundaries of family, profession, or discipline and "usually operate at a pre-suppositional level of social science epistemology or beyond our awareness" (p. 65). For example, themes regarding gender relations may be viewed as meta-narratives as their discursive origins are obscured through people's often naturalistic and ahistorical understandings of gender roles (Somers 1994).

To distinguish between the public and meta-narratives in the research, I engaged in the process of comparing and contrasting data and interpreted patterns in the content of the female teachers' narratives, focusing in particular on the functionalities they valued, how they articulated these values, how their capabilities (i.e., their substantive freedoms) were constrained, and how they ultimately contended with and negotiated those constraints. As indicated by the excerpts from the interviews with Aisha and Elias, the female teachers often articulated their values through a deficit perspective, whereas their male colleagues typically used an aspirational articulation. Chase (2008, pp. 64–65) endorses the interpretation of narrative data beyond face value, arguing that narratives can be interpreted as a way in which to understand how participants make sense of their own and others' actions, how they perform particular subject positions, and how their particular settings shape their stories.

Ethnography, with its focus on rich contextual data, facilitates such interpretations. However, the practice of interpretation

... does not take place in a neutral, apolitical, ideology-free space. Nor is an autonomous, value-free researcher responsible for it. Various paradigms, perspectives and concepts, as well as research and other political interests, all bring out certain types of interpretation possibilities, at the same time as they suppress others, often under the guise of what is neutral, rational, right and correct. (Alvesson and Skoldberg 2000, p. 9)

Ethnography has “always meant the attempt to understand another life world using the self – as much of it as possible – as the instrument of knowing” (Ortner 1995, p. 173). If other methodologies distance the researcher from the context, ethnography can bring her too close. That is, there is a fine interpretative line between the imposition of the researcher’s own interests (a concern that initiated this research) and the problem of the researcher “going native.” This problem was mediated through the use of my own narrative fieldwork journal, which was a personal record of the study that included my own feelings and responses to the research process (Hammersley and Atkinson 2007).

McGee discusses how this reflexive process also plays a part in refining the main research tool—the researcher herself—as it “requires a high level of critical self-awareness, as well as a capacity for self-evaluation, i.e., the recognition of one’s own limits and the willingness to embrace error” (Blackburn and Holland quoted in McGee 2002, p. 21). By vigilantly reflecting on the analyses and findings of this research, the limits of my understanding of the object of study and my socially situated constructions and representations of the object, I engaged in the process of continually improving my ability to problematize the issue of interpretation and representation and the risks that were involved.

At a methodological level, another function of reflexivity is to also improve the quality and trustworthiness of the research practice, as researchers have a mandate to continually analyze the procedures and processes during their fieldwork. According to McGee (2002), “this seeks to instil in researchers a self-critical monitoring of their application of methods” (p. 21). This necessitates being transparent and sensitive to biases governing interpretive practice as well as critically monitoring and evaluating this ongoing process. The key to rigorous interpretation in this ethnographic study, then, was defined by my ability to understand and interpret my own position in this research on the values held by and opportunities available to primary schoolteachers in Tanzania.

Conclusion

This research collected, constructed, and interpreted the narratives of Tanzanian teachers within the broader narrative of ethnography. A parallel narrative—that was constructed from my research journal—facilitated the reflexive process that informed the judgments, interactions, and meaning making that constituted my interpretation of their narratives. The multiple research methods I used to construct the ethnographic case studies facilitated the triangulation that shaped my interpretations of the data, and my extended time in the field enhanced my ability to create trusting relationships with teachers in order to mitigate researcher effects on their narratives. The use of ethnographic case studies enabled a more context-based understanding of the deeper issues that affect teachers’ practice and behavior, which allowed me to

(continued)

interpret and construct nuanced explanations for why Tanzanian teachers do what they do in their classrooms.

That said, I was conscious of my ideological and personal locations during my analysis of the data, and these were in the forefront of producing these interpretive explanations. For example, my analytical positioning led to the delineation of two types of narratives: the personal narratives regarding the types of lives that teachers wished to lead and the meta-narratives of the social and institutional structures that conflicted with them. My feminist politics influenced how I interpreted the meta-narrative of unequal gender relations that not only affected how female teachers articulated their personal narratives but also shaped their valued functionings and their constraints. And finally, my personal teaching experiences in Tanzania and theoretical interests in the capability approach and critical realism impacted on my interpretation of how teachers' criticized practices and behaviors (which are constitutive of the Third World Teacher discourse) were actually a product of teachers contending with capability constraint. By reframing teacher practice and behavior in this way, I aimed to provide a more complete and detailed understanding of why teachers do what they do. This may help to stem unproductive "blame or victimize the teacher" mentalities by demonstrating that certain classroom actions are a result of teachers trying to improve their (and their families') well-being. This perspective, of course, is not meant to justify any and all behavior; but what it has done is provide a new, human development-oriented way in which to approach policy and practice aiming to improve teachers' school-based performance.

By offering this interpretation of teachers' behaviors and understanding the underlying generative mechanisms that produce certain empirically apprehended actions, it is possible to see entry points in which measures to improve teachers' professional performance could be seeded. One policy implication is that interventions should acknowledge teachers' causal mechanisms because these are the valued beings and doings that are central to the lives that teachers want to lead; if interventions could aid in the achievement of these functionings, they would also aid in the reduction of some "deficient" behaviors that are associated with their constraint. Secondly, interventions need to account for and address dominant countertendencies (or constraining conversion factors) that teachers face, as this will ground strategies in context, provide pragmatic solutions, and convince teachers that these measures are worth trying. Without acknowledgement of causal mechanisms or countertendencies, it is highly likely that technocratic fixes that attempt to alter certain criticized practices will not be sustained, as teachers will revert to old ways. The reason being, these criticized "old ways" are grounded in the valued functionings and conversion factors that consistently generate much of teachers' behavior.

(continued)

The interpretations offered by this study and its theoretical framework aimed to provide a corrective to the reductive, monolithic identities and assumptions fostered within the Third World Teacher Discourse, by providing explicit connections between broader social structures, teachers' values, their contexts, constrained capabilities, and the process in which these combined to produce certain teacher actions. The benefit of reframing teacher performance in this way was that it provided a theoretically grounded account of teacher behavior that was situated in their values and contexts. Such an account not only fostered rigorous and detailed explanations of teacher performance, but the hope is that this may lay the groundwork for more nuanced and creative policies and strategies aimed at improving it.

1.7 Life History Research and the Interpretation of Working Class Success in Higher Education in the United Kingdom

Michael F. Watts

The Research Project

Life history research explicitly locates the stories people tell of their lives within their wider contexts. The ongoing life history research upon which this chapter is based addresses the enduring issue of access to the Universities of Cambridge and Oxford (commonly elided as Oxbridge) by students from the state maintained sector. It therefore interprets the stories the students told about progressing to Oxbridge through an understanding of their wider educational and sociocultural contexts.

Widening participation—that is, increasing the number of students from historically underrepresented social groups—is a key element of contemporary higher education policy in the UK. However, statistical analyses unremittingly show that access to higher education remains fractured along the lines of social class. Students tend to choose the university they feel most comfortable with because it is populated by people from similar backgrounds (Reay et al. 2005). The significance of this was summed by Lord Dearing who characterized higher education as a catalyst enabling young people to either progress “from privileged pasts to privileged futures or from less privileged pasts to less secure and lower status futures” (Dearing 1997, p. 106). Fifteen years later, successfully extending the franchise of higher education beyond its historic middle class base remains deeply problematic not only in the UK but elsewhere (Tilak 2002; Giroux and Giroux 2004; Yorke and Longden 2004; Côté and Allahar 2007; Rothblatt 2007; van Stolk et al. 2007). This necessarily generates questions concerning the interpretation of student identities and the real options young people have when it comes to making important educational choices. It also raises questions about the use of life history research as a means of enabling these interpretations.

Statistical studies show that young people from working class backgrounds in the UK who achieve the same A level grades are significantly less likely to progress to the more prestigious universities than those from middle class backgrounds (Sutton Trust 2000, 2004). That is, decisions about which university to attend—or, particularly in the case of working class students, decisions about whether or not to attend university—are typically dependent on more than academic achievements. The French sociologist Pierre Bourdieu considered this concern in terms of what he called “cultural capital” (1993, 1996, 2000; Bourdieu and Passeron 1990). Cultural capital is more than the possession of obvious academic resources such as formal qualifications: it includes the accumulated benefits of the individual’s social background (such as the type of school attended), accents, confidence, and the possession and knowledge of cultural objects such as books and the “high culture” of the arts. This cultural capital has a significant influence on the individual’s interpretation of her identity and of her sense of legitimacy in educational institutions. It also informs much of the research on access to higher education in the UK. Typically, that research is concerned with the reasons why students from less privileged backgrounds struggle to progress to university in general and to the more prestigious universities in particular.

The research concluded that these students had greater agency than is usually attributed to them but that their substantive freedoms to progress to Oxbridge were severely restrained and typically made possible only through the serendipitous interventions of others. That is, it articulated with most of the research on higher education but provided a different interpretation of the students’ agency.

The Focus of the Research

The issue of self-deselection is particularly pronounced in the context of Oxbridge which is typically seen as not only being academically elite but also socially exclusive—a finishing school for the sons and daughters of the rich and powerful. Fewer than one in ten students in the UK attend fee-paying schools (a figure which serves here as an index to social elitism), but approximately half of the UK students progressing to Oxbridge attend such schools. Oxbridge is often used by politicians and policymakers as a litmus test for the widening participation agenda, and the sense of exclusivity is exacerbated by the media which regularly offers stories on the bright state school student failing to secure a place. All this contributes to the wide-held belief that it is out of the reach of students from less privileged backgrounds. In turn, this informs the interpretation of academic studies: if you look for the reasons state-educated students do not progress to Oxbridge (which, it should be made clear, is an important and legitimate focus), you are likely to find them.

However, it can be argued that the accumulation of such studies has generated a normative heuristic framework that operates on this understanding: state-educated students do not progress to Oxbridge. Bourdieu’s work provides a reasonable account of the cultural mechanisms that indirectly produce social order and make individuals

complicit in the reproduction of educational inequalities. Yet his work—or, rather, the way in which it is often put to use in interpreting these inequalities—is liable to charges of overdetermination. It fails to account for working class success, and the suggestion that working class students who do progress to elite institutions are “lucky survivors” (Ball et al. 2002; Reay et al. 2005) is of particular concern as it smothers their agency with the inertia of social structures. The research used the capability approach (Sen 1992, 1999; Nussbaum 2000) which focuses on the substantive freedoms individuals have to choose and lead the good life to interrogate the Bourdieusian analyses that deny the agency of these “lucky survivors.”

It focused on state-educated students who do successfully progress to Oxbridge. That is, its concern was with what enables appropriately qualified students to get in rather than with what keeps them out. It was driven by three key research questions: What conditions shape the identities of widening participation students in relation to Oxbridge? What substantive freedoms do they have to recognize and act upon their entitlement to progress there? What resources are needed to enhance these freedoms and what circumstances are required for the students to use these resources? Looking to provide a workable account of what is needed to facilitate successful progression rather than further entrench failure, the research therefore sought to identify what allows state-educated students to focus on what they have rather than what they lack when considering their higher education choices. At the practical level, this would enable the development of interventions that can promote widening participation. At the theoretical level, it would enable the retheorization of the access debate, shifting the focus away from the notion of lucky survivors to agents taking greater control of their own lives. The purpose was not simply to learn *of* the students’ agential experiences but to articulate them with the structures through which they moved in order to learn *from* those experiences. That is, the research sought to inform aspects of the access debate by illuminating salient issues (including those that may not be addressed in the statistics or that exist only in anecdotal form).

Identifying Sources

The central focus of the project was to understand these issues from the perspectives of students who had successfully progressed from the state sector to Oxbridge. The research was concerned with the breadth of the student experience rather than its typicality and required “thick descriptions” that would generate rich data sets. The life history approach that had been chosen for this purpose links agency and structure and necessitated engagement with two broad sources of that data—the one addressing the agency of the students and the other the social structures within which they moved.

The underlying presumption was that the students would be able to provide the clearest insights into what enabled them to successfully negotiate the social structures that typically impede progression from the state sector to Oxbridge, and so from the outset, it was intended to use life histories. These would allow the students to articulate the stories of their lives and how they perceived their progress to

Oxbridge. However, it was necessary to decide which students to work with: those from less and more privileged backgrounds would have different stories to tell, and these stories would offer different interpretations of the access debate. As the research was concerned with the ongoing problems of widening participation, it was decided that the research should focus on state-educated students only. The different educational and sociocultural contexts of state-educated students with the same exam results tend to influence their progression to higher education, and so it was decided that the life histories of students with relatively more and less cultural capital should be compared. It was presumed (and turned out to be the case) that at least some of these students would have levels of cultural capital similar to privately educated students and that this would enable the research to take into account the sense of inheritance that continues to bedevil the issue of access. It was also decided to work only with students who had successfully progressed to Oxbridge. This was partly a practical concern (it was easy to identify and locate them) and partly because this would allow the research to engage with what enabled them to negotiate the barriers they encountered.

Although a vital source of data, the students could only offer partial views—partial in both senses of being incomplete and of being biased—of the social structures generating these barriers. It was therefore necessary to turn to other sources to provide a more comprehensive understanding of these structures. These sources included quantitative and qualitative studies addressing access rates, exam results, and the student experience from various bodies including government departments and agencies, the two universities, and research institutes. Given the high public profile of Oxbridge and the part it plays in the wider public consciousness, data was also sourced from the media and from fictional representations in books and film.

These sources were all explicitly identified. However, behind them all was a tacit source—my own experience of having been a widening participation student at Oxford (albeit at a time before the phrase had gained common currency), which inevitably informed my engagement with and understanding of these other data sources.

The Research Data

The main concern here is the conduct of the life history interviews that were used to generate data illuminating the substantive freedoms of the students to recognize and act upon the value of their progression to Oxbridge. Accessing Oxbridge was conceptualized as a process rather than simply an end result to be looked back upon and the data sets needed to apprehend this. Life history research locates the stories people tell of their lives in their wider contexts (here, their educational and sociocultural contexts). As such, they can be seen as the little stories individuals tell of their lives within the bigger stories going on around them. Each life history therefore requires sufficient and appropriate data to tell and to link both the little and big stories. When integrated through the life history methodology, these two

sets of stories generate data locating the individual life stories within the wider structures that frame them.

The stories told by the research participants in face-to-face interviews generated the data about their lives. That is, it provided the data that would constitute their life stories and that would be transformed into their life histories. These interviews addressed factual issues (e.g., what schools they attended and their exam results), their experiences and interpretations of general and specific events (such as how they had experienced their schooling and how they felt their schools had helped them progress to Oxbridge), and reflections upon decisions (most obviously, the decision to apply). Such interviews assume that individuals have the best understanding of how they experience their own lives and their own stories therefore give a clearer insight into their lives than other accounts such as formal records (e.g., school reports).

A second presumption is that the accounts are truthful, although Bruner (1990) notes the “factual indifference” of narrative research because it retains illuminative power whether the accounts are real or imaginary. However, truth is taken to be contingent, and because its constructions are subjective, it may sometimes be necessary to corroborate interview data. In some instances, this merely required clarification during the interview. For example, students described classroom disruptions that ranged from peers talking back to the teachers to large-scale fights. Both can be seen as disruptive, but there is clearly a significant difference between the disruptions. In other cases, it was sometimes necessary to seek external corroboration. When talking about the overall academic track record of their schools, for example, students sometimes over- or understated these achievements because their interpretations of good and bad exam results had shifted through the subsequent comparison of their own schools with those sending higher proportions of students to Oxbridge.

As Goodson and Sikes note, “without contextual commentary on issues of time and space, life stories remain uncoupled from the conditions of their social construction. This, above all, is the argument for life histories rather than life stories” (2001, p. 17). The individual interviews contributed much of the data pertaining to these social constructions through, for example, the students’ interpretations of their own schooling and of the widening participation agenda. Comparisons between individual life stories provided information on the lack of cultural capital to be incorporated where appropriate. The aggregated data sets generated by the interviews also contributed to the bigger story framing these life stories. Further data was obtained from other research (including both qualitative and quantitative research), policy documents, and other sources such as the media and Ofsted (the Office for Standards in Education) reports on the students’ schools.

Preparing to Obtain the Data

The purpose of the interviews was to generate a rich data set detailing the lives of the students as they progressed towards Oxbridge. Interviews were conducted with selected students who were invited to tell the stories of their lives. More

specifically, they were asked to tell the stories of their lives as they led to Oxbridge. Stories can be told in many ways, and narrative is, therefore, a vague concept (Kvernbekk 2003). However, narrative research requires focus, and there is a need for research participants to establish their authority to speak on the issues at hand (Phoenix 2008). Their narratives should be relevant to those issues (Griffiths and Macleod 2009, p. 128), and this requires the researcher to provide the necessary guidance through the conduct of the interviews. Goodson et al. (2010) may simply invite people to tell the stories of their lives, but this can be disquieting and the narrator may well—as sometimes happened in this research—require prompting to realize their narrative capital (Watts 2008). Moreover, the research required a specific story: that of their progression to Oxbridge.

A further concern is that narrators may be unlikely to talk about what has not happened in their lives. A pertinent example here was the level of support the students had received from their schools and colleges: if that support had been absent, they may have needed prompting to talk about the effects of its absence (although in this particular context it was such a “hot topic” that all participants spoke about it at length). The framework for the interviews was therefore structured around a limited number of open-ended questions intended to elicit detailed responses. However, to settle the students into the interviews, the initial questions addressed factual issues (e.g., schools attended, exam results, parental background). That is, they were questions the students could easily answer. These then led into the stories of their lives, and to facilitate the sense of progression, they were invited to describe them in chronological order. They were then asked to reflect on the widening participation agenda, especially in terms of accessing Oxbridge, and to relate that understanding to their own experiences.

Key analytic issues had been identified from the literature, but the interviews needed to engage with them in a way that the students would understand. That is, these analytic issues needed a demotic or everyday interpretation. After all, the interviews were intended to elicit stories rather than academic accounts. These stories, though, needed to address the different understandings the students had of their progression to Oxbridge. In inviting the students to tell the stories of their lives, the interviews needed to give them room for description and discussion. A central concern with the realization of the widening participation agenda is the relative lack of capital possessed by students from less privileged backgrounds. Articulating the absence of educational resources and opportunities can be difficult, and so the interview framework made room for the students to reflect on what would have made their progression to Oxbridge easier.

The interview schedule was kept deliberately flexible to allow for the expected reflections on the highly personal nature of educational experiences as well as the unexpected stories that were likely to emerge. It was anticipated—or, rather, it was intended—that the interviews would generate more data than would be used. This, though, is the inevitable consequence of the production of the rich data sets that are the hallmark of life history research.

Obtaining the Data

To keep the project manageable, it was necessary to select a smaller number of students from the considerably larger number willing to take part. These students were then interviewed, the interviews were transcribed in full, and the raw data were converted into the life stories that informed the construction of the students' life histories.

Recruitment of participants was in two phases. In the initial phase, it was intended to work through just two colleges (one each at Cambridge and Oxford) and interview 12 students at each to provide the necessary "saturation" (Goodson and Sikes 2001, pp. 22–25) required to incorporate the experiences of a diverse range of state-educated students. It also addressed a number of practical considerations (e.g., working with individual colleges made recruitment more manageable because it meant dealing with several hundred rather than several thousand potential participants). The second phase was based on the assumption that insufficient numbers of students from lower socio-economic and/or ethnic minority backgrounds (i.e., those most underrepresented at Oxbridge) would be recruited in the first phase (an assumption that proved correct). These additional students were to be recruited by "snowballing"—asking existing participants and university-based access schemes to identify other students who were then invited to participate. A further seven participants were recruited in this second phase.

To assist in the initial selection of participants, students were asked to provide brief summaries of key points such as the type of school attended and parental backgrounds. In one sense, the selection criteria was simple: with a focus on breadth rather than typicality of experience, the lists of students willing to take part in the project were whittled down by choosing those representing the greatest diversity of experiences. In practice, this was necessarily more difficult because each student had a tale worth telling. The atypicality of some students (such as being the only applicant from their school) made them immediately obvious choices. From there, further participants were selected to maintain the diversity of experience and the balance of gender and subjects studied. Eventual imbalances resulted from the participation of students from the second phase of recruitment and were reasonably assumed to reflect the underrepresentation at Oxbridge of students from certain social groups.

Selected participants were interviewed individually. The purpose of the project was explained to them, and they were invited to review and agree to the ethical guidelines (Bridges et al. 2007) governing the research. The interviews, which were tape recorded, were semi-structured and all assumed the same format. Participants were first asked to provide basic factual data—family composition, schools attended, GCSE and A level results (the exams typically taken at 16 and 18 in England), and so on—to settle them into the interview situation. They were then asked to describe their sociocultural and educational backgrounds, what led them to consider Oxbridge and their experiences of applying to and being at Oxbridge. Having provided their life stories, they were then invited to begin the

co-construction of their life histories by considering what they had described in relation to the classed nature of education.

The raw data were converted into shorter stories which, together with an outline of the initial analysis, were sent to the participants for their comment and approval.

The Processes Followed

The interviews, some of which lasted for up to 8 h, resulted in a considerable volume of data that filled two A4 box files to overflowing when transcribed. Moreover, in its unrefined form, the data was (as was to be expected) at best punctuated by the repetitions, deviations, and hesitations of ordinary conversation, and “at worst” (where the cautionary apostrophes indicate the time required to organize the enriched data) all over the place as the students recalled, refined, and reflected upon additional aspects of their stories. It therefore needed to be organized into a series of cogent life stories. There were two reasons for this. Firstly, the research protocols required that the students approve the data for use in the research (a standard concern, particularly in qualitative research, but one that is especially important in life history research given that it is highly personal and could lead to the identification of the participants). As the students had already spent a lot of time being interviewed, it would be unreasonable to expect them to plow through the direct transcripts of their interviews. There are practical considerations to this, too: This stage of the research offered students the opportunity to add to their stories if they so wanted. Secondly, it was necessary to make the data manageable prior to the analytic shift from life stories to life histories.

The distinction between the two is important because although the process of translating the interview data into life stories required some analysis—perhaps most obviously in deciding what should be left out—this was a matter of refining rather than fully analyzing the data. For example, some of the students over- or under-emphasized the significance of the cultural capital they possessed. Yet life history research is a collaborative endeavor between the researcher and the research participants, and it was therefore necessary to see the data as the students saw it rather than rushing ahead to its full analysis. Nonetheless, generating the life stories demanded an initial analysis of the individual and aggregated interviews to identify the key points to be incorporated into each story.

Identifying key moments—what Denzin (1989b) and Kearney (2003) term epiphanies—in the lives of these students was an essential part of interpreting the data in such a way that it could be used to facilitate the subsequent life history analyses (see also Lieblich et al. 1998). When and how did they first recognize that they could progress to Oxbridge? However, the interview data was suffused with the everyday small details of the students’ lives, and these needed tracking because they added up to the accumulation and recognition of the capital they possessed. Having ascertained the content of each story, including the idiosyncratic descriptions around these key moments, a common plot was decided upon to provide a framework for organizing each transcript in such a way that universal and individual concerns could be

incorporated. Structuring the stories around a chronological progression through sociocultural and educational contexts apprehended not only the accumulation of experience but its significance. As far as possible, they made use of the participants' various idiolects to offer greater authenticity.

The Frameworks Used

The research made use of two analytic frameworks: Pierre Bourdieu's sociology of education (1993, 1996, 2000; Bourdieu and Passeron 1990) and the capability approach developed by Amartya Sen (1992, 1999) and Martha Nussbaum (2000). Both are concerned with the influence of structure on agency and so anticipate the shift from life story to life history.

Bourdieu's work, which informs much of the literature on widening participation, addresses the cultural mechanisms that indirectly produce social order and restraint and that tend to make individuals complicit in the reproduction of social inequalities produced in and by education. His analytic toolkit—including the concepts of field, capital, and habitus—offers a means of linking macro level structures to micro level processes by interrogating the self-held truths of social phenomena that “[lead] one to exclude oneself from the goods, persons, places and so forth from which one is excluded” (Bourdieu 1984, p. 471). These conceptual tools link the possession of resources, particularly those inherited and acquired by the individual in her youth, to the mental dispositions that generate her understanding of what it is reasonable to expect (Bourdieu and Passeron 1990, p. 226) and so sanction the perpetuation of relative advantage and disadvantage. However, while it provides a reasonable account of those processes, its focus on educational outcomes leaves it susceptible to charges of over determination that can de-emphasize agential choice. In this Oxbridge context, the argument that Bourdieu's sociology fails to account for working class educational successes (Moore 2004) and the suggestion that those working class students who do progress to elite institutions are “lucky survivors” (Ball et al. 2002) are of particular concern.

The capability approach has its origins in development economics and Aristotelian and Marxist philosophies. It is used to address the issue of human well-being which is considered in terms of the substantive freedoms individuals have to choose and lead the lives they value and have reason to value. It does not consider resources to be important in themselves but in what they enable the individual to do in pursuit of what they understand to be the good life. The focus on freedom means that it recognizes opportunity rather than just outcome and therefore makes room for greater agency in educational evaluations. So, for example, it would take into account the freedom state-educated students have to progress to Oxbridge even if they choose not to pursue that option. However, the key to such well-being assessments is that options should be viable and although it de-emphasizes the importance of resources and the capital they signify, the capability approach acknowledges that a certain amount of visible consumption is necessary for the

individual to take part in the life of a given community (here, the community of Oxbridge). It therefore takes account of the problems arising from the social construction of resources (inter alia, Sen 1999, p. 71), but the capability approach typically leaves education under-theorized.

These frameworks were used to complement each other, each engaging with the analytical and conceptual shortcomings of the other. If Bourdieusian analyses of the progression to higher education typically incorporate rigid interpretations of cultural capital, the capability approach has been criticized for failing to pay proper attention to the social structures which influence the relative value of educational commodities and the consequent freedom individuals have to make use of them. Taken together, these two frameworks enabled a focus on both the agency of the students and the social structures surrounding them.

Interpreting the Results

Widening participation in the UK—particularly as it relates to elite universities such as Cambridge and Oxford—is a highly politicized arena. The issues are not merely embedded in the social structures that influence individual agency but are regularly aired by politicians and in the press. The initial analyses were hardly unexpected: these students valued Oxbridge, their relative lack of cultural capital typically disadvantaged them, and the schools, colleges, families, and friends all had a significant impact upon their own perceptions of their opportunities to progress to Oxbridge. However, the “life story is the *current* interpretation of one’s past” (Goodson et al. 2010, p. 7). Some students from very atypical backgrounds, for example, had experienced relatively few problems because of significant support from their schools and colleges which meant the wider structural issues were sometimes downplayed in their narratives. Similarly, students from less disadvantaged backgrounds sometimes overemphasized the influence of those structures upon their progression. These stories were all important at the individual level but needed to be interpreted as life histories—which demanded attention to the wider social structures framing them—to usefully inform the access debate as life histories. Taken together, though, they still offered a counter-discourse to most of the research on widening participation.

The common thread running through all these life histories was the recognition that the academic and cultural capital possessed by the students had legitimacy in the Oxbridge subfield. Typically, this recognition arose from comparisons with students who had already progressed to Oxbridge from similar backgrounds. As most of the students taking part in this research had not moved in circles where this was the norm, such class matching had been enabled by interventions engineered by their schools and colleges or through their own initiatives. However, these interventions did not invest the students with any additional academic or cultural capital, and their apparent capital shortfall remained. Typical Bourdieusian analyses were therefore becoming less helpful. Further analyses, prompted by the capability

approach, focused on the perceptions the students had of their capital and how they saw it in relation to that possessed by contemporary Oxbridge students from nontraditional and traditional backgrounds. What emerged was not tangible—no additional academic capital, no more cultural capital—but the intangible confidence apprehended by Bourdieu's notion of symbolic capital (2000). This was then used to reanalyze the stories of the students and to clarify that they had recognized the legitimacy of their academic and cultural capital.

The next stage was to collate the acquisition of these three forms of capital and, in particular, to determine under what conditions the academic and cultural capital obtained symbolic significance in relation to the Oxbridge subfield. This enabled the identification of the opportunities these students had to attain the formal entry-level requirements that made Oxbridge a viable option and the sociocultural conversion factors—the cultural and symbolic capital—to make use of their academic capital in progressing there. The final stage of the capability analysis was to look beyond the opportunities they had to achieve this educational well-being and consider their substantive freedoms to progress to Oxbridge. The data sets highlighted the difficulties many of these students had in making use of their academic resources, and these problems were located in the wider literature which reiterated the paucity of sustained interventions available to those in most need of them. The final analysis addressed the importance of these interventions in enabling appropriately qualified students from the state sector to focus on the capital they possessed rather than that which they lacked.

Presenting the Results

The research focused on the opportunities of state-educated students to progress to Oxbridge, and although it highlighted the barriers such students must negotiate, it was always likely to be at odds with most research addressing this issue. That is, it was a heterodox interpretation of the widening participation agenda. In a highly politicized context such as this, the practical implications of the research—that not all appropriately qualified state-educated students are able and willing to progress to Oxbridge—are susceptible to polarized interpretation: the opportunities for some call attention to the lack of opportunities for others. It was, therefore, considered necessary to present the research and its results in a way that would enable it to withstand the critical scrutiny not only of the research participants but of academic peers. Even if there is disagreement with the overall interpretation and analyses (something I am usually reminded of when presenting the results at conferences), it remains important that their validity is acknowledged if the research is to inform the policy debate or serve the more self-serving agenda of being recognized through academic publications (and self-serving though this may be, it serves as a reminder that the interpretation of research needs to be defensible).

The research methodology had been specifically chosen to fill in the gaps between the statistical numbers highlighting the enduring problem of progression

from the UK's state schools to Oxbridge. Life histories locate the stories individuals tell within their relevant contexts and so acknowledge the co-related power of both agency and structure. The research was (and occasionally still is) presented in a way that mirrored its methodological justification in order to engage rather than alienate the potential readership.

Having summarized the problems of widening participation in general and in relation to Oxbridge, the main research report therefore presented a selection of the *life stories* illustrating the progression of these students to Oxbridge. These were deliberately arranged from the stories of the most to the least privileged students taking part in the research in order to signal the advantages of the former and the disadvantages of the latter—that is, anticipating the shift to the *life histories* addressed through the contextual discussions. Individually and together, these stories enabled the reader to view it through the eyes of the students. However, although the stories described that progression, they did not fully engage with the social structures framing it. Again, this was perhaps most obvious in the over- or underemphasis of the significance of the academic and cultural capital the students possessed. Nevertheless, as the access debate necessarily turns upon the real experiences of real students, such stories provide the key to understanding the issues these students need to negotiate.

This context was provided by a series of specific case studies addressing the issues of elitism at Oxbridge, perceptions of academic ability and social suitability, and the interventions (or lack of them) made available to these students. Each case drew on the wider research literature to frame the problem and the accounts of the students to illustrate its potential for negotiation. The life histories were then addressed by relating the stories of these six selected students to the cases in terms of that which inhibited and enabled their progress to Oxbridge. This presentational framework therefore not only replicated the life history methodology but enabled the reader to ascertain the validity of my interpretations while giving room for other interpretations informed by the research.

The Reasons for Choosing Life Histories

Thomas and Znaniecki suggest that life histories—what they describe as “life records, as complete as possible”—are the “perfect type of sociological material” for apprehending abstracted laws concerning individuals in society (1918–20, pp. 1831–33). This is a bold claim but one that has some merit. Life histories locate the stories told by individuals in their wider socioeconomic, political, and historical contexts (Goodson and Walker 1991; Hatch and Wisniewski 1995; Antikainen et al. 1996; Dominicé 2000; Cole and Knowles 2001; Goodson and Sikes 2001; Kearney 2003; Dhunpath and Samuel 2009; Goodson and Gill 2011). Life stories allow us to learn *of* individuals whereas life histories allow us to learn *from* them: they provide a means of understanding social structures from the perspective of the agents moving through them and so offer greater insight into the complex

relationships between agency and structure. In the context of this research project, the successes of the students are celebrated through their life stories but understood through their life histories.

The orthodox story told in most research accounts, as well as by certain politicians and some sections of the media, is that state-educated students, especially those from working class backgrounds, are excluded from Oxbridge by social structures that sometimes present as undisguised disdain. The extant research literature typically turns to the backgrounds of these students to explain their nonparticipation. This research set out to generate and theorize a counterstory that would enable a clearer understanding of how such students do succeed in getting to Oxbridge. Although their stories are sometimes told, they are usually decontextualized, perpetuating the notion that they are lucky survivors and reproducing the illusion of cultural destiny. The research was concerned more with opportunity than outcome, and this demanded an appropriate focus on the wider contexts of the stories the students told. The decision to apply to Oxbridge may be triggered by a single event, but the interpretation of such events needs to recognize choice-making processes as evolving from the accumulation of experience and opportunity. Addressing the research questions therefore required a deep understanding of the lives of the students and the social forces shaping their interpretations of their own identities in relation to the Oxbridge subfield. That is, the stories the students told of their lives needed to be located in the wider stories of the social structures framing their individual accounts. Life history research was, therefore, a clear methodological choice.

Narrative research offers a means of filling in the gaps between the statistical numbers, but narrative analyses do not always fit into neat summations, and this makes it “imperative to attend with care to what other people are saying, especially if they use unfamiliar idioms and speak to us from socially subordinate positions” (Rosaldo 1989, p. 148). Concerns and experiences which may seem irrelevant may be anything but if only they could be listened to properly. The agential choices and personal valuations that influence access to higher education do not appear from nowhere when the individual begins to consider her post-18 opportunities but emerge from lifelong evolutionary processes embedded in social structures. Decisions made in the here-and-now are dependent upon decisions made in the past, and current opportunities are delimited by the accumulation of previous opportunities taken or missed. At the most obvious level, higher education choices are limited by entry-level requirements. However, Bourdieu’s work shows that academic capital is typically subsumed by cultural capital and that students are more likely to choose the universities that are most likely to choose them. Orthodox choices are generated by individual and social histories, and heterodox choices, such as those that were the focus of this research, therefore demand a greater understanding of those histories. The research necessitated detailed data concerning their progression to Oxbridge, including their perceptions of the journey, and this demanded some form of narrative research.

Narrative research is concerned with addressing cultural complexities. It does not only give voice to those who may not otherwise be heard, but it does enable

different understandings of data to be elicited and illuminated (Cortazzi 1993; Clandinin and Connelly 2000; Watts 2008). It gives insight into how strangers relocate in new societies (Chamberlayne et al. 2002; Ting and Watts 2009) and so has great potential for understanding how the widening participation agenda is experienced. It presumes that the generalizable objectives of other research paradigms cannot fully apprehend the way in which people experience, interpret, and negotiate the complexities of their lives. In the context of much of the research concerning progression to Oxbridge, such understandings are framed (albeit not necessarily in these Bourdieusian terms) by the position of students in the field of higher education which is determined by the capital they possess. The students taking part in this research may have been relatively impoverished (with the important caveat being that this impoverishment is relative to their Oxbridge peers), but their actions were not fully determined by this. They maintained considerable control over their lives, albeit within the habitual parameters of the field.

Forms of narrative research offer powerful testimony and have the potential to influence policy (Griffiths and Macleod 2009; Perry et al. 2010). Indeed, this particular research was partially prompted by the highly publicized story of Laura Spence, a high-achieving state-educated student who was turned down for a place at Oxford, which had such a considerable impact on the framing of higher education policy and practice under the previous Labour government (Watts 2002, 2009; King 2003; Rothblatt 2007). For some, the focus on the thoughts and feelings of the individual story teller is important (Hollway and Jefferson 2000; Chamberlayne et al. 2002; Andrews et al. 2008; Bathmaker and Harnett 2010), but this risks decontextualizing their stories and so either valorizing their acceptance of the social order or downplaying their engagement with it. Thinking small emphasizes the significance of the idiosyncratic interplay of circumstances, but these are played out in the field of wider social structures. A one-to-one correspondence between the stories people tell and the identities that affect their agency cannot be assumed (Sclater 2003; Craib 2004; Phoenix 2008), and there is therefore a need to avoid the dichotomy of thinking small and thinking big. The decontextualized valorization of individual stories may fail to account for the individual's struggle through the social structures pressing upon her and a failure to understand that struggle predicates a failure to address future challenges to the power of orthodox hierarchies. As Atkinson and Delamont (2006a, b) suggest, narrative needs to be rescued from the excesses of qualitative research.

The case of Laura Spence indicated the potential for biographical stories to generate public response and debate, but it also indicated the potential for anecdotes told in the media to be misused (Watts 2002, 2009). Her individuality was, by turns, pulled across the political arena and then lost: "I can't really comment any further," she told one newspaper at the time, "because it has got so political." In this sense, she was disenfranchised twice: first by rejection and then by the uses to which her story was put. There is no view from nowhere (Nagel 1986), and she was held up as both the victim of privilege and as a poor representative of widening participation students. Her life story—which was so much more than the scraps thrown around by the press and politicians—required context. However, the increasing popularity of

narrative research has blurred the distinctions between life histories and other forms of narrative research and life writing.

The use of little stories to understand bigger issues (Griffiths 2002, 2003; Hulme 2004; Tierney 2010) offers a “means of access to social reality, signifying the worlds through which people have moved” (Freeman 2004, p. 69). It provides insights into their agency and challenges orthodox interpretations of the production and reproduction of social inequalities measured out (in educational fields) by cultural capital. Rather than being “merely ornamental, a dab of local color, protagonists’ narratives about their own conduct merit serious attention of social analysis” (Rosaldo 1989, p. 142). The insights they generate have the potential to allow the analyst to avoid becoming complicit in the reproduction of social inequality. However, understanding the significance of individual life stories—of how students feel, act, respond, and so on—can only ever be partial if the structures that frame them are backgrounded. There is, then, a need to engage with the complexities generated by life stories in their contexts.

The experience of social structures may form the narrative of the life story, but analyses of social structures may not be part of the research participant’s worldview (although the highly public nature of the access debate typically generated such understandings in this research). The influence of these structures upon their stories as they are told may therefore go unacknowledged. Yet the deep social structures that underwrite individual stories mean that even the most idiosyncratic of accounts can never be wholly unique. These structures leave marks on the individual’s story even though that story may tell different ways of dealing with them. Here, for example, the students each had their own stories to tell, but each story had a common plot: the student’s progression to Oxbridge followed in the footsteps of those who had preceded them and their predecessors had marked out the route with the signifiers of their own experiences which all reified the social structures impeding the progress of these students. Significantly, these structures are there even if the individual does not notice them (and I had missed them until I took up my studies at Oxford).

So, although narratives may be important in understanding the individual, they can also be limiting if they are separated out from their various contexts. Life history research can enhance the narrative capital of individual (Watts 2008), but unless those narratives are contextualized, they may become nothing more than celebrations of the individual’s life. Such celebrations have a part to play—but not, I would suggest, in researching progression to higher education. What is it that they celebrate? In the wider literature, the subordination of working class students with high aspirations? In this research, their barefaced luck? If the life story individualizes and personalizes experience, the life history contextualizes and politicizes it.

Ignoring the political aspect of contextualizing life stories invites the “sometimes breathless” postmodern celebration of diversity that “often avoids uncomfortable issues of values in favour of an empty rhetoric of pluralism” (Kearney 2003, p. 48). Context enables the analysis of what, in the language of the capability approach, the individual has reason to value and of her substantive freedoms—that is, her capability—to choose how she lives her life. It offers insight into what is important

to her and what real chance she has of achieving it. These are highly idiosyncratic concerns which life histories can illuminate by seeking to understand the character of the individual in the context of her past as it is shaped by the structural forces acting upon her (Goodson 1995; Järvinen 2004). The interpretative need to avoid the dichotomy of big and small stories means that life histories offer a means of rigorously examining the connections between “the lives and stories of individuals [and] the understanding of larger human and social phenomena” (Hatch and Wisniewski 1995, p. 113). The smaller stories told by individuals are framed by the bigger stories being told around them with each informing and illuminating the other. However, while it may seem that the bigger stories tend towards continuity rather than change (and no more so, perhaps, than in this context of accessing Oxbridge), it should be remembered that they comprise all the smaller stories that are told and that close attention to individual lives offers the potential to reveal dynamic new plots.

The orthodox storyline of widening participation, particularly the Bourdieusian storyline that provides the cultural context within which the stories told by the students are located here, is one that writes of—or perhaps even writes off—working class success as the good fortune of lucky survivors. Yet what emerges from these life histories is a far greater sense of agency that demands reconsideration of the orthodox Bourdieusian analyses that typically plot the nonreflective acquiescence in the reproduction of inequalities found in so much of the widening participation literature. The life stories of the students told of their individual experiences but constructing their life histories allowed a deeper understanding of the structures framing those experiences and so offers a means of challenging the structural inequalities these students had to negotiate.

The Role of Interpretation in This Research

It is, perhaps, appropriate that a chapter on life history research should be contextualized by my own story. In brief, then, I left a reasonably good school at sixteen and worked for 7 years before successfully applying to Oxford to read English. Key chapters in this story include: sufficient interest in my subject to have pursued it A level (the traditional preuniversity exams taken at 17–18) in my own time; considerably less interest in my employment, which meant that I was looking for a change of career at the time I took my A levels; and a social network that included teachers who advised me on my educational options and encouraged me to consider university. Also, although the story only tells this through omission, by leaving school I missed the sixth form (the post-compulsory, pre-university phase of education when students typically study for and take their A level exams) where so many of the classificatory processes that influence university choice take place. Many years later, having returned yet again to education, I was looking for a substantive research area for my PhD studies when Laura Spence’s story made

the national headlines. The rest, as they say, is history—and that history informed my interpretation of the research.

The highly personal nature of life history research, together with the tendency for interviews to last several hours and more, emphasizes many issues of interpretation that are pertinent to other forms of qualitative research. Researching life histories involves working through palimpsests of life as it is perceived by those taking part in the research—including the researcher—and the remarkably rich data sets generated by life history research are therefore suffused with interpretations which will always be partial. Importantly, such partiality references both the incomplete understanding of the social world generated through the research and the biases of the participants and the researcher. The very nature of life history research means that stories must be interpreted through ethical frameworks (Bridges 2003; Ramrathan 2009; Sikes 2010) and these should include a commitment to authenticity and verisimilitude in the generation, selection, and contextualization of data as well as the acknowledgement of its epistemological limitations.

Narrative enquiry is “a collaborative method of telling stories, reflecting on stories, and (re)writing stories” (Leavy 2009, p. 27). Life histories are constructed from subjective perceptions revealed in the ways individuals tell stories about their lives and learning and “in researching life histories there is a temptation to ascribe meanings to previous events to explain present lives” (Harnett 2010, p. 167). Researchers, too, may be tempted, and this requires recognition of the interpretive symbiosis of the research: the researcher begins by interpreting the brief and conveying a particular understanding of it through the explanations and questions put to the participants whose interpretation of the research shapes the stories they tell which are then analyzed and interpreted by the researcher.

The influence of my own story can be seen in the empathy that informed my understanding of the widening participation agenda. However, sympathy (or the countervailing antipathy) can exert a considerable influence on the coherence of the narrative of the research itself: within the meta-contextual questions about the purpose of higher education and the stratification of the sector, for example, there is a subtle but very significant difference between research questions addressing the problem of getting students from working class backgrounds into elite universities and those concerned with the problems of them being kept out.

Narrative research can be seen as reflecting the human need for coherence and the investment of what we do and what we value with meaning (Bruner 1990). These are matters of interpretation, which necessarily inform the construction of the life history. The students were not simply asked for a description of their lives but to evaluate their experiences, and this necessarily involved contextualization: how does anyone attribute value, particularly when addressed in terms of choice and freedom, except through interpretative comparisons? These narrative contexts were bound by their understandings of their circumstances, and there were, for example, significant differences in the evaluations made by middle class students who were the first to apply to Oxbridge from their schools and working class students from schools providing enough effective support to send several students to Oxbridge every year. These assessments were inevitably made in the knowledge of what had

happened since: classed references in particular, often made through comparisons with the reported experiences of their more privileged peers, littered their accounts.

This meant that the events the students described in their stories had already been interpreted through their increasing awareness of the contexts framing them. Salient issues (such as family backgrounds and the support—or lack of it—from their schools and colleges) had been rehearsed through conversations with old and new friends. Moreover, the issue of widening participation, particularly as it relates to accessing Oxbridge, has been highly publicized and politicized, and this informed the stories most of them told. Whatever understandings they may have had of the issue at the time they were considering their university applications, by the time they took part in this research they were conscious of the social structures that had influenced their agential choices. Their accounts of their progression to Oxbridge were therefore suffused with a sociopolitical meaning that was given sharper focus by the research. These meanings tended to be aligned to the endpoint and contextual details (such as home and school environments) were typically overwritten by the plotline leading up to their successful application. That is, they were interpreting the past from their present positions.

Narrative research imposes its own interpretative structure on stories, and this research-bound personalized telos offered insight into the retrospective significance they attributed to events which may have been accorded more or less importance at the time. Events become linked through narrative, and this suffused the recollections of the students with meaning whether their life stories foregrounded coherency or highlighted its absence. Their stories, reaching out to their conclusions, became purposeful. However, the contextual data they provided was limited by the inevitable partiality of their experiences and worldviews. Their progression to Oxbridge was often marked by the lack of appropriate support and the significance of such gaps can only be apprehended through an interpretation of what might have been (and it was only when I began researching this issue of access that I began to properly appreciate how lucky I had been to miss the sixth form in my own progression to Oxford).

These post hoc interpretations of the students needed to be acknowledged and understood in terms of the real opportunities they had to progress to Oxbridge. Some of the middle class students had overestimated the barriers confronting them relative to their social advantage. Most of the working class students, however, had only appreciated the extent of those barriers once they were there; and their interpretations of their circumstances generally aligned with those I added to the research. Participant interpretations are an inevitable aspect of narrative research, but here they usefully signaled the capability and capital of the students (i.e., their substantive freedoms and the value of the sociocultural possessions that facilitate opportunity). Moreover, they articulate with the life history approach of explicitly contextualizing stories. Without such contexts, the serendipitous progression of some working class students lucky enough to attend schools and colleges with well-established support for potential Oxbridge applicants can obscure the wider structural influences that typically make such progression so difficult.

Narrative research in all its forms presumes that life stories are the best means of accessing the personal understandings of what individuals experience even though they can never fully comprehend their lives. Such concerns may be mediated to some extent by use of life history rather than other forms of narrative research, but the confusion between them (Denzin 1989a; Roberts 2002; Bathmaker and Hartnett 2010) demands methodological interpretation and commitment. However, just as the contextual understandings of the participants shade their life stories, so too the reinterpretations of the researcher influence the story told in the research. What contexts should the researcher bring to the life history and how should they be interpreted? Extant literature and analytic frameworks provide some guidance, but they are a historical accumulation of previous interpretations, and the greater objectivity they may bring to the research therefore always incorporates subjective dimensions.

An early interpretation of this research (Watts 2002) sidestepped the structural issues and focusing on the notion of the risk society (Giddens 1991; Beck 1992; Beck et al. 1995), which emphasizes the destabilization of identity and so offered a means of justifying the data. This interpretation prioritized the life stories rather than the life histories of the two students upon whose experiences the paper focused. It bore the hallmarks of my own experience but did not tally with those of the majority of students with whom I had been working. Yet it was validated by the students who were asked to comment on this representation of their lives and by the unknown academic colleagues who had reviewed and approved the paper—which suggests that, in the search for what you are looking for, a cogent argument has the potential to trump interpretative rigor. Put another way, this early argument illustrates how different conceptual frameworks can and do lead to interpretations that may be simultaneously consistent and partial.

It has been suggested that “in terms of interpretation, at the extremes, life stories may be given as (or claimed to be) more or less unmediated by the researcher or adopted as merely illustrative of some theoretical and analytical perspective” (Roberts 2002, p. 47). At one end of the interpretative scale, then, is the phenomenological perspective, which respects the story as it is and takes it at face value. At the other, the story is subjected to a range of theoretical interrogations, and different conceptual frameworks can and do lead to interpretations that may be simultaneously consistent and yet partial. At this end there appears to be something of a competition among some contemporary writers to create longer and longer lists of the interpretative layers—as well as of the options, possibilities, and counterfactuals—that run through narrative accounts, and it is tempting to ask who this serves. Acknowledging the interpretative complexity of such research supports its defensibility but there is also the need to generate accounts with which to work.

It was not possible here to take the naive approach of simply accepting the accounts for what they were because their co-construction even at interview stage disallowed this option. Seeking clarification of their various experiences is one thing, but the contextualization that is a fundamental element of life history research demanded a closer examination of the meanings they had given to their choices and actions. As indicated above, some students from working class backgrounds found their progression to Oxbridge easy because of the levels of support

they received. Yet the research was based on the demonstrable premise that such progression is typically anything but easy for such students. To simply accept such stories of easy progression without engaging with their understandings of why it was easy and without my own meta-contextual analysis would have been to negate the purpose of the research. More than this, I had set out to obtain a clearer understanding of what influences successful progression and to naively accept the stories I was told would have been to abdicate my own responsibility as a researcher.

And this brings me back to my story.

My undergraduate studies, viewed through the interpretive lens of my postgraduate research, allowed me to realize that “there will always be more stories to tell and different ways of telling them to different audiences” (Watts 2007, p. 216, original emphasis). Those studies also introduced me to the work of Václav Havel who wrote that truth “is not simply what you think it is; it is also the circumstances in which it is said, and to whom, why, and how it is said” (1990, p. 67). The words of the playwright-turned-politician are a reminder that the epistemological key to narrative research is its verisimilitude and that, given the inherent problems of representing truths and realities, it must be taken on trust and used in a way (including the acknowledgement of its limitations) that it can be trusted by others. Life stories placed in context to generate life histories are filtered through multiple layers of interpretation and are therefore colored by the understandings of the research participants and the researcher. However, although the layers of interpretation that necessarily suffuse life histories need to be acknowledged, the life historian needs to get on with the research using these extremely rich data sets that enable the world to be seen and therefore interpreted through the eyes of others.

1.8 An Awareness of the Feminist Subject: An Example of Collective Biography Writing in Poststructuralist Discourse Practice

Monne Wihlborg

Learning to *Become* Aware

Collective biography writing (CBW) involves the co-construction of narratives of memory. The narrator tells a story which, at the prompting of the co-participants, is suffused with emotional and sensory details as it is rewritten. CBW is fundamentally concerned with the social construction of the self. It seeks to develop “a process of collective biography as a means of learning to read/write embodied social selves” (Davies and Gannon 2006b, p. 7) that enables the possibility of becoming critically aware of ourselves in order to question that which is taken for granted. It is therefore particularly useful in opening up methodological and philosophical spaces in which to discuss questions of justice, equality, and diversity in the contexts of education and learning. The particular focus of this chapter is the narrative *Steering the Pilot Boat* which illustrates the sort of data generated in CBW and acts as the focus of the interpretations discussed here in this chapter. Although the narrative may be seen as emphasizing the autonomy of the girl who is demonstrating what she has learned—here, how to steer the boat—the CBW process enables a poststructuralist interpretation that calls attention to the context-specific contingency of her learning.

This particular narrative was part of a wider project addressing the constitution of the feminist subject in poststructural discourse (Davies and Gannon 2006a). The focus of the research was therefore about more than learning processes—it was concerned with how we learn to learn about ourselves through acceptance of frameworks that, if left untroubled, define us. CBW can assist us in the process and insight of unlearning certain mechanisms we have internalized. The illustrative moment used in this chapter shows the strengths of social influences that position us

as we construct our understandings of the self and of identifies through particular tropes. CBW involves the shared construction of remembered narratives. Participants typically draw on their memories to tell a story about a significant moment which is closely interrogated to heighten the sens(it)ive nature of the moment. The focus is on how the related events felt. Questions encourage the storyteller to engage with and share the emotional and sensory dimensions of the moment in order to embody it. Participants use their “reading/writing to produce a textual base through which [they explore] various aspects of the processes of meaning-making through which [they] become subjects and go on becoming subjects” (Davies and Gannon 2006b, p. 7).

Steering the Pilot Boat is concerned with informal learning, but the insights obtained through this narrative can usefully illuminate more formal teaching and learning situations (e.g., how teachers and learners are positioned relative to each other in learning activities). Working collectively with narratives can be a powerful tool, and it can help us become aware of how knowledge is constructed as well as contribute to the greater critical scrutiny of various assumptions in the research process. It is a methodology that is therefore highly pertinent to education and educational research.

CBW comprises several steps (Barthes 1977; Haug et al. 1987; Davies and Gannon 2006a). These include selecting a group of participants and selecting the topic as well as structuring the writing workshop(s) and the process over time. The processes are initiated by telling memories in relation to the chosen topic and then interactively writing those memories through questions, brainstorming, exemplifications, and elaborations. It is crucial to summons emotions (e.g., how it felt when this or that happened) and the senses (e.g., smells and sensations) to ensure that embodied memories come to the fore where they are visible and/or understandable to others in the group. Over time, the participants read the stories and rewrote them collectively by sending the stories back and forth between the group participants. This stage of the collective biography practice leads up to the writing of an analytic text where the aim is to unravel “the discursive nets in which [the participants’] individual memories are caught” (Davies and Gannon 2006b, p. 14). The outcomes are then interpreted in terms of the relevant theme—which, here, was the constitution of subjectivity.

The original research project was presented as three memory stories attempting to articulate the ongoing process of being subjected, of subjectivity, and of the relations between the outer and the inner, thereby revealing the constitutive force of discourse (Davies and Gannon 2005). Our vulnerability to those discourses and practices became visible through our analytic readings of our memories. The re-examinations of the poststructuralist subject and its transformative possibilities made visible the extent to which we are always caught up in specific reiterative practices, through which intelligibility is made available to ambivalence. As poststructuralist writers, we were engaged in both private and public experimentation with discourse influences through

seeing, at one and the same time, the usual ways of seeing as ways of seeing, and seeing against the grain of those usual ways. The particular detail of specific subjects are

interesting only insofar as they can be used to make visible the ways in which bodies/emotions/desires/memories become the inscribed (and re-inscribed) public/private, inner/outer depth/surface to be read against the grain of dominant/humanist discourses and practices. (Davies et al. 2006a, p. 100)

The outcomes of the research in the original work were presented through showing the process of “becoming a subject” and how the constitution of subjectivity takes place within a social context. Here in this chapter, this process of the constitution of subjectivity and the constitution of selfing is characterized by the example of the narrative *Steering the Pilot Boat*. It illustrates the process of the CBW approach, and this use of a memory story offers a fairly good idea of what is going on when strong social (collective) forces of influences are at work on personal narratives.

The Influences of Being and Becoming

The problem addressed in this research is that gender is still connected with exclusionary and discriminatory practices at home and in society at large, including in educational settings. The overall issue is that most cultures divide the being of women and the being of men—“the female” and “the male”—which inevitably leads to and involves inequalities (Deutsch 2007). What this means, and the denotation of the interpretation of female/male, then becomes a question of social discourse values that are influenced by power and politics. If we accept the assertion that gender inequality exists and is an ongoing matter (as are other forms of inequality concerning race, class, religion, disability, and sexuality), then it is important to make use of methodologies that explore various ways of experiencing and understanding it. The issue here concerns taking a critical stance when data concerning lived experiences and memory-telling are decontextualized and recontextualized in the research process.

Some research methodologies used within feminism and poststructuralism (Weedon 1987; Peters and Wain 2003; Butler 2005; Davies and Gannon 2006a; Davies 2007; Gannon and Davies 2007), postmodernism (Derrida 1978, 1984; Peters and Wain 2003), and postcolonialism (St. Pierre and Pillow 2000; Weedon 1987) raise questions concerning what can be known and who can know it (c.f. Denzin 2003) as well as how we as researchers can get hold of variations of experiences. Research in education and educational studies involves analyzing, understanding, and interpreting data. Such interpretation turns to various research methods to explore and reveal something different or something which goes beyond what we already know. Referring to Derrida, Biesta stresses that

the road towards the other is not an easy road. Derrida might say it is an impossible road, that is, if we understand the impossibility with Derrida as that which cannot be foreseen as a possibility. It is, therefore, the very ‘experience of the impossible’ (Derrida 1992, p. 15), all in purpose to not make ‘explicit a program of possibilities within the economy of the same’. (Biesta 2009, p. 15)

These issues are considered here in connection with the research methodology practice of CBW. The research addressed in this chapter starts from the rationale that what we experience as “reality” and “truth” are not fixed entities and brings the subject and object of research closer together. The social discourse context is assumed to be powerful and important when understanding possible realities. The subject is not constituted in advance, but within the discourse and cultural practice (Butler 1992; St. Pierre and Pillow 2000), the subject is thus learned and constructed. CBW is one way of understanding how we learn about the learning of socially constructed identities. It fosters the critical scrutiny of the meaning given to various outcomes in relation to social discourses (contexts) and so gives insight into issues of equity, justice, and diversity. As a method, it is concerned with the unlearning and with the reconstruction of identities. This should be of particular social and existential interest in education and educational studies. One of the main assumptions when conducting CBW, therefore, is that subjectivity is liable to change and that it can be changed radically if a new discourse becomes available. Contact with a new discourse will inevitably lead to changes in power relations between rival discourses or by revealing that different subject positions could become available within one and the same discourse.

Becoming Subjects

Feminist research approaches are concerned with granting all humans the same opportunities and consider unequal opportunities in relation to gender. Using Butler (2004, 2005) as a point of departure, this research addressed social change and possibilities. In Butler’s writing, when elaborating on the issue of “undoing gender,” she offers arguments that point to an understanding of how restrictively normative conceptions of sexual and gendered life might be undone. This process of undoing is not value-based per se, not bad or good. Instead, it is a way of making visible the polarized tension between societal-mediated forces that have an impact on influences for becoming acknowledged and accepted versus the agency of the individual “other” (Butler 2004). Butler reminds us that one does not author one’s gender, for its terms are always negotiated within collective social contexts. If we agree on this statement, then it is also meaningful to elaborate on *what* this social impact means when we are in the process of becoming subjects and, furthermore, *how* we can become aware of our understandings and learning of possible ways of becoming subjects.

In this research, we focused on the topic of becoming subjects and on ways to become aware of this process of constituting and of becoming a subject. As part of this endeavor, we turned to poststructuralist discourse when elaborating on the question of constituting the feminist subject. In *Doing Collective Biography* (Davies and Gannon 2006a) we described our approach in the following terms:

We will draw on Barthes’s concept of decomposition and our own concept of mo(ve)ment.
We will unravel – through focused collective work – the rational choosing subjects of our

individual biographies, necessitating a shift from the rational possibilities of deconstruction to the embodied subject decomposing itself. We focus on the specific remembered moments and on the movement that becomes visible in the particular mode of memory-writing. (Davies and Gannon 2006d, p. 172)

The research therefore engaged with equity, justice, and diversity and the possibilities for recognizing and realizing them. Derrida (1978, 1988) has argued that the history of Western philosophy, in constituting the liberal humanist subject, attempts to seek and locate a fixed centre that everything starts from. It thereby also becomes a point from which attitudes or actions can be predicted and controlled (see also Biesta 2009). Our research asked if gendered values and norms create an absence of meaning in some cases or if certain meaning-based opportunities and ways of being are denied to certain subjects while being offered to others. If the latter is the case, it also becomes a question of power as well as of recognition. Butler's (2004) response to the issue of eliminating social inequality is to "undo gender." The intention is to make it more equal to become a subject and to be able to negotiate on equal (social) terms for being recognized. Our focus was to explore these concerns through our own collective biographies.

The Use of Memories as Sources for Becoming Aware

We used our own biographic stories and moments that capture lives and memories as data. The sources for this data were therefore always going to be the participants in this research project. Our own memories, expressed through the telling and writing of a moment, were the foundation for this project. This kind of data is commonly worked with in collective biography practices. Through the use of our own recollection of early memories, supported by poststructuralist theory, we aimed at creatively "folding and unfolding" history, thereby revealing new possible ways in which sense could be made, by disrupting "what is taken for granted as stable/unquestionable truth" (Davies 2004, p. 7).

The project was concerned with telling(s) and writing(s) as well as asking questions in relation to these told and written stories. We triggered memories about ourselves in certain situations, aiming at taking us into our earliest memories of being a subject (Davies et al. 2006). However, we needed to identify and focus on particular moments in our lives, and so we sourced the data around three subtopics within our overall theme: "being someone," "being hailed as someone in a way that felt good," and "being miss-recognised" (Davies et al. 2006). These stories and moments, which were used as the starting point for further analysis, highlighted the importance of identity formation within the lifelong learning agenda and in relation to the issues of equity, justice, and diversity. In our collective biography writing, we focused on the subject and how she/he might be read in the humanist discourse as well as, and also in, poststructuralist discourse. All six participants contributed one

story on all three topics to generate eighteen stories. We then read our stories, one by one, reflecting and making notes in order to ask each other questions. This part of the procedure involved being able to understand and recognize the story through our efforts to make sense of it.

Three stories were then selected for the subsequent process. The decision concerning which of the stories to use was reached through the procedure of asking each other questions and making the stories as collectively understandable as possible. It was not a matter of assessing the “truth of history,” but instead a question of sense making. In theory, all of the stories could have been included in our CBW procedure. However, since it would be very time-consuming if all the stories had been included, three were collectively selected for this purpose (Davies and Gannon 2006). We analyzed, deconstructed, and broke open the writings of the three stories that were selected. Our collective work aimed to show ways in which the feminist subject can be constituted in poststructural discourse, contrasted to how it would be constituted as a liberal humanist subject. Our exploration used memories that can be read in liberal humanist terms and then compared this to a poststructuralist reading of the memories.

Data: Investigating a Memory of Being Someone

The story presented here is one of my memories related to the theme “being someone.” It exemplifies the character of the stories used in our project and is offered as an illustrative example of how memory-telling stories can be written and related to the topic used as the point of departure. This particular story was told and shared during the research, but it was not included in the published collection (Davies and Gannon 2006). However, as with all 18 stories that were told, it was exposed to our collective critical and “investigating questioning approach” in the research. The intention here is not to repeat the stories told in our published work but to develop an understanding of what CBW is about, how it can be done, and how and why this type of research and interpretative practice can and should be used in educational contexts. The stories written and told during the research were based on the participants’ own memories of various moments related to the three subtopics within the overall topic of constituting the feminist subject. They were written in the third person present tense so that they could be shared as collective memories when investigating them further in the CBW process. The remembered story, which I will return to later on in this chapter, addresses the topic of “being someone” and is titled *Steering the Pilot Boat*:

It was one of those days she went with her grandfather on the pilot boat out on the sea to escort some of the very, very big tank ships. She was standing on a little ladder with two steps holding a firm grip of the boat’s steering wheel. The compass needle was moving back and forth until she got it steady. “Steady she goes,” she said, and her grandfather standing behind her said “Aye, aye. Steady as she goes.” She felt the power of being the one that made the strong little boat plough through the waves, the water coming up against the sides

of the boat and splashing against the front window. Her arms vibrated (sort of shaking but not as being afraid, rather because of the movement of the boat). She saw the big boat they headed for coming nearer real fast and, nearly at the edge, bumping into it, the engine was turned down. She turned the wheel 180° and felt a small bump when the side of the little boat touched the huge side of the tank boat it made her feel strong and capable.

Establishing the Continuing Process of/for the CBW Practice

In our project, and before starting the CBW process, all the participants read and critically reflected on poststructuralist theory and the research approach. This was a necessary process that framed the stories we told of the memories we remembered. This was achieved partly by looking at the general approach, clarifying a theoretical framework for the particular “object of research” and then selecting work from some theorists particularly relevant for the CBW procedure. From there, and as a group, we decided on the final rationales and chose the theoretical framework for conducting the research project. This was an important phase, since such interpretations and clarifications, even disagreements, and not taking anything for granted, contributed to supporting the group’s further collaborative and collective working process. The group agreed on and established some theoretical statements which underpinned the interpretative outcome.

The main topic we agreed on was *the constitution of the feminist subject in poststructuralist discourse*. Collective biography writing using this topic as point of departure was then conducted as a poststructuralist writing practice over approximately one and a half years. In our particular CBW practice, after the workshop, we made considerable use of correspondence by e-mail sending drafts between us according to the schedule we had set up, with stated deadlines.

Viewing the Methodological Options

Critiques of traditional research methodological approaches were also included in this stage of the CBW process. We considered the problem that traditional biographic research methods typically either *do not* recognize or *bypass* the issue concerned with the importance of intertwining the subject–object relationship. Davies emphasizes that “The complexity of the movement and intersections amongst knowledge, power and subjectivity *require the researchers to survey life from within itself*” (2004, p. 5, original emphasis). In this respect, the challenge is to find ways to reveal life “itself.” The researchers in CBW assert that the “subjects/. . ./have language, and are constituted within the social in a multitude of ways and in a multitude of contexts, including the contexts of the research” (Davies and Gannon 2006b, p. 3). In general, positivistic research traditions fail to investigate such relationships. In contrast, in the social sciences new methodologies have been developed, such as collective biography,

where “embodiment and sociality are crucial dimensions as lived experience is re-membered” (Davies and Gannon 2006b, p. 3).

In this kind of research, the source of data we elaborate is not data as “evidence” of something we would be asked to prove as “real.” Nor is it a search for that which is homogeneous with something we could say is “real.” Indeed, the research focus is not about the object of sense making (Wihlborg 2013). Instead, attention is directed towards our statements or descriptions, made through our stories, revealing the ways in which sense is being made. This is an important distinction and, as Davies puts it “when poststructuralists talk about ‘the way that sense is made’ they are not attempting to reveal something about the *sense*maker (the subject) her- or himself, about his or her motives or intentions but the possibilities of sensemaking available within the discourses within a particular sensemaking community” (Davies 2004, pp. 4–5, original emphasis; cf. Foucault 1980; Deleuze 1988).

Writing and Making Sense of the Memory Stories to Be Used

The stories—all 18 of them—were told during a 3-day workshop that was the start for our CBW practice that continued for a year and a half. We started the process by telling our own memories, about moments drawn from our own experiences, in relation to the chosen topic concerned with constituting the subject. The stories were then dealt with collectively, through questions, brainstorming, exemplifications, and elaborations. We all elaborated our related emotions (e.g., what it felt like when this or that happened), and the group then asked about the surroundings, our sensory responses, and so on. This helped support the embodied memories, bringing them to the fore and making them visible and understandable for others in the group. We also decided which stories we were going to continue to work with. The next step, outside the workshop setting, included a process of rewriting the “memory stories” over time and collectively sending the stories back and forth between the group participants. This part of the process, which can take several years, thus become the actual collective biography practice. Eventually the writing was finalized through the writing of an analytic text. In our original work, it was about revealing how our subjectivity becomes constituted in social contexts.

Over the 18-month period of the project, we all agreed to and were involved in the process of rewriting the texts to jointly tap a collective soul, looking for the moments in the texts’ movements—rocking the text and emphasizing the resonances and agreements. This can be both provocative and hurtful and yet exciting, since everyone has the opportunity to view the shared collective understanding during the rewriting process. When we had returned to our respective homes, we were far away from each other and lapses in communication between us were prolonged. The mutual work in our workshop had welded us together, and the process of agreeing on three stories out of the initial 18 played a central role in this respect. Not being able to see or hear each other left us to focus on the text, but it also meant we were constantly dealing with the notion that we granted each

other permission to overwrite each others' sentences, words, and paragraphs in the text. In the writing practice, as well as in our souls, this meant that we really had to engage with the struggle to let go of our own egos. . . Writing and reading for hours, trying to understand the text as intended by the previous writer, then reading the references made in the text, reflecting, interpreting, and, finally rewriting the text. . . Maybe not all of it, sometimes just adding some paragraphs, accepting the text in parts, and sometime completely changing the text, by discovering new possible ways of reading it. Throughout this process, we struggled to still keep the "we" approach.

It is not possible to show the process in full here, but I will show how the interpretation "ended" (the outcome) by using the illustrative example *Steering the Pilot Boat* and by highlighting a possible interpretation and understanding of the story in relation to the search for and of constituting the subject. The learning focus thus is about becoming aware through the process of unraveling and searching for the hidden and developing/accomplishing a critical stance, which, in turn, is a fundamental competence in learning in education and educational research.

Using a Dual Strategy to Grasp the Mo(ve)ment

The memory stories, describing moments based on our own experiences, were exposed to our collective critical and investigating questioning approach. In this part of the process, the aim was to reveal and peel off and make sense of the "moment" we collectively discussed. This procedure is named decomposition. Decomposition does not mean that everything is rejected or "destroyed." Rather, it is a process that involves recognition and reworking of discernible and possible possibilities:

In order to destroy, in short, we must be able to *overleap*. But overleap where? Into what language? Into which site of good conscience and bad faith? Whereas by decomposing, I agree to accompany such decomposition, to decompose myself as well the process: I scrape, catch and drag. (Barthes 1977, p. 63, original emphasis)

This required us to approach the stories by a dual strategy, using our memories (stories about the topics) as data to be analyzed and then "to produce insights into the process of subjectification" (Davies and Gannon 2006d, p. 172). We told our stories to each other and (inter)related to and with them by asking questions, brainstorming, and asking for exemplifications and further elaborations. The aim was to trace the embodied memories so that they could become understandable for others in the group. All members in the group read the stories and rewrote them mostly using email (when the actual workshop had ended) until the group agreed on moving to the next stage. This involved writing an analytic text that included processes of interpretation of meaning by revealing how the memories had been and were caught up in the ruling discourse.

Central to the whole process was an interpretation that showed the outcome in terms of “the revealed.” In our research project, we practiced this dual strategy of retrieving memories and using memories as data that could be analyzed to produce insights into the processes of subjectification. This involved us using “*mo(ve)ment* to signify the simultaneity of specific embodied *moments* and the movement toward the subject as process that can come about through the mode of telling” (Davies et al. 2006, p. 92, original emphases). The dual process, shifting and using a poststructural lens, reveals the “processes through which we become specific individuals” (Davies et al. 2006, p. 92) showing “that the humanist individual is not what it thought it was. It is caught in fictions of itself as unitary, rational and centered, in control of its own subjectivity” (Davies et al. 2006, p. 89).

By revealing the process, we became aware of “the naïve liberal humanist subject – the essentialized, unique, universal and unhistorical subject who believes itself to be creating itself and is blind to the constitutive effects of discourses and systems of thought” (Davies et al. 2006, p. 89); c.f. Butler 1993a).

The Poststructuralist Discourse and Deconstruction

The narratives generated during this CBW project were framed by a poststructuralist discourse practice. The feminist poststructuralist theory used in our project followed liberal feminism and radical feminism (Kristeva 1981). It was not intended to replace previous feminist theories but to enable a poststructural analysis of the discourse and discursive and regulatory practices (Weedon 1987; Butler 1992, 2005; Davies and Gannon 2005). In this respect, our use of feminist poststructuralist theory was in line with other projects concerned with critically reflecting on discursive constructed phenomena. Our theoretical focus was on the process of gendered subjectification as the historically specific processes whereby one is subjected to discursive regimes and regulatory frameworks and through which gendered individuals and their social context are constructed (Butler 1992; St Pierre and Pillow 2000; Davies and Gannon 2006a).

Poststructuralism aims to “conceptualize the relationship between language, social institutions and individual consciousness” (Weedon 1987, p. 19). Language is viewed as a human constitutive product (i.e., human, rather than given by nature), and it is held that meaning is constituted through language. Furthermore, consideration of the relationships between language, social institutions, individual consciousness, and subject position is a central and necessary condition for our understanding of subjectivity. Weedon stresses that:

the meaning of the existing structure of social institutions, as much as the structures themselves and the subject positions which they offer their subjects, is a site of political struggle waged mainly, though not exclusively, in *language*. (1987, p. 38, original emphasis)

Subjectivity is therefore open to be understood by exploring the variation of different subject positions available within the operating discourse.

The search for the discursively constituted subject, according to poststructural theory, is experienced as a subject-in-process, subjects who can become aware and

see the constitutive process; read the text of their 'selving'; recognize the constitutive power of discourses to produce historically located ideas of what it might even mean to be a self, engage in 'selving'; look at the contradictions between discourses (and reject them solely on those grounds; and play endlessly with the discursive possibilities that have been made observable through poststructural analysis. (Davies 2000, p. 137)

At the same time, through a related process, there is a challenge to and exploration of the unaware

naïve liberal humanist subject – the essentialized, unique, universal and unhistorical subject who believes itself to be creating itself and is blind to the constitutive effects of discourses and systems of thought[s]. (Davies et al. 2006, p. 89)

Deconstructing identity, theoretically, helps us to become aware of our gender blindness. The task consists of “imagining a world without gender” (Butler 1991, p. 150) and declining various kinds of fixed identities, including those fixed by and within educational discourses. Working with CBW, and within a framework of feminist poststructuralism, we were able to practice how this could be experienced and so obtain different insights into the constitution of the feminist subject and its implications for equity, justice, and diversity.

Revealing the Relational Nature of Being a Subject and Becoming Subjected

Although *Steering the Pilot Boat* is my narrative memory—or, rather, my shared and co-constructed narrative memory—its interpretation is dealt with in the third person because that is how the memory was presented. The narrative drew on and evoked memories of “being someone,” and, constructed through the CBW process, it is richly sensory. The girl’s heightened recollection of her grandfather saying “Aye, aye. Steady as she goes” highlights the sensory nature of narratives co-constructed through CBW and is therefore central to the following interpretation (which exemplifies the interpretations of the wider project).

Analytic readings in CBW are performed collectively, but they must all begin somewhere. Rereading this memory in liberal humanist terms, it presents a story about an autonomous, confident, and responsible girl, a rational individual subject who is highly capable in what she is doing. She has learned the skills and competences needed to manage the pilot boat on the rough sea and she is demonstrating that learning.

A poststructuralist reading of the memory, though, differs from this reading in that it reveals the relational nature of being a subject accomplished through a specific discourse that considers specific times, places, and space(s) (i.e., context).

The embodied specifics in this memory (which also “talk” to us in silence) tell us that the girl is positioned as being capable to act autonomously not only by her grandfather but also by other sailors on board the pilot boat and by sailors on the larger tank boat as well. She is confident with this subject position, feeling the others believing in her competence and holding the steering wheel as steadily as required and getting acknowledgements from her grandfather. She feels the power as a physical sense, enhanced by the waves and water splashing up against the sides of the boat. The emerging subject position she is taking up is embedded within the discourses of individual competency and of autonomy. She implicitly proves herself “into” a discourse of relationality and reliability. The memory tells us that the “other” characters appearing in this story interrelate (her grandfather saying “Aye, aye. Steady as she goes”) in such a way that they are present and not objecting. She is made possible by this—her subject is made possible.

She could have imagined her grandfather’s words within her, confirming what she knew—that she was sailing the pilot boat steadily. This is easy to imagine since it is evident that the girl is in charge of the situation, standing and holding the steering wheel, steering out towards the big tanker. She has done this before, and she knows how to do it, how it feels when the boat goes steady. The instructions for getting it right could have been incorporated into her understanding about steering the boat, including the feeling of “rightness” in keeping it steady when plow through the waves. That it is her grandfather who instructed her is not hard to imagine either, and thus being positioned as a subject, she is constituting herself as well in this memory as being in position and inhabiting the position of the autonomous and responsible, capable subject. She has been held capable by her grandfather, and his words (whether or not he spoke them on this occasion) frame the recognition of the other sailors who do not challenge the position her grandfather has given her. She is recognized and treated as a person who is legitimately capable of being in control and she recognizes this legitimized position.

This is not a recognition that has come about by chance. It is not an easy environment within which she can be recognized. In the social environment constituted by professional sailors, and within such specific contexts, recognition is strongly relational in character, and she can therefore only gain social recognition in very specific and significant interaction with (the) others. The interactive character of the movement between whole memory and the details constituting the memory show the subject’s dependence on the discourse. This is precisely what poststructuralist researchers are involved in. It reveals to us the girl’s deeply embedded dependency on discourse recognition. This dependency stands in contradiction to the competent, solitary, and independent/autonomous individual first perceived steering the pilot boat. Thus, the dependence on recognition of others in relation to her subjection is revealed. In our original study, we saw that

The memory might thus be said to ‘reveal’ the individual subject as she is constituted and constitutes herself through dominant discourses. The memory is vivid precisely because the fiction of herself as the autonomous subject is so skillfully achieved. The detail of the telling makes visible the constitutive work that is going on, and that has gone on, to make that (illusion of the) autonomous subject possible. (Davies et al. 2006, p. 96)

Davies et al. (2002, 2006), Davies (2004), and Davies and Gannon (2005, 2006a) discuss the subject's dependency on the discourse and context, underlining how the subject becomes vulnerable, for instance, to not being recognized, or having recognition withheld, or sudden breaks in certainty of belonging. The girl has learned to steer the pilot boat and is demonstrating that learning. Here, though, the poststructuralist interpretation of the rich sensory data arising from the CBW process shifts from a demonstration of competence to the validation of that demonstration—from competence to competence in context. The aurally heightened data generated here by CBW enables a (re)interpretation of the narrative that shows the issues of justice, equity, and diversity in a subtly but significantly different light. This interpretation makes us aware of

the naturalized individual who can be described and explained as always having been this person, or this person in the making [but] the story opens another possibility: I see the way in which this kind of subjecthood is granted, and I therefore also see how, on other occasions, it might not be granted – to me, to anyone. I see my attachment to it, I see my dependence on it and thus my vulnerability to it. (Davies et al. 2006, p. 96)

The Reasons for Choosing CBW

Deconstruction and Reconstruction and the Purpose of Becoming Aware

The question of whether the girl's grandfather spoke the words "Aye, aye. Steady as she goes" points to the "imaginability" that is central to CBW. The writing process is not intended as an authoritative or authenticated record of an event. It is an act of careful and focused creativity that allows others to broaden their experience of being in the world by experiencing it from another's perspective. The story should be vividly evocative, making it highly imaginable to others. This is why CBW emphasizes the sensory—the sights, smells, and sounds and the taste and touch of remembered experiences—to generate an "imaginability [that] comes not out of the repetition of predictable or familiar storylines but out of the detailed attention to embodied detail that brings a new and unexpected view of what happened to light" (Davies and Gannon 2006, p. 98).

All too often, the repetition of familiar storylines in education, whether they concern formal or (as here) informal learning, reifies inequalities, injustice, and the denial of diversity. They leave no room to explore the subject. Disrupting the familiar requires an appropriate methodology. CBW, through the collective process of moving beyond the telling of a story, generates narratives that apprehend (but never fully comprehend) the creation of differences that enable poststructural interpretations of justice, equity, and diversity in education. The embodied and emotional nature of the stories, heightened by their being read aloud, provides a sens(it)ive database that allows and encourages the poststructuralist researcher to ask questions that explore taken-for-granted knowledge.

It is asserted that the poststructural subject is open to culture and that the subject is fluid—in process—with open boundaries (Henriques et al. 1998; Davies 2000; Davies et al. 2006; Davies and Gannon 2006a). New interpretative possibilities emerge from the search for and the play with the contradictions and differences of the constituted subject (Barthes 1977; Derrida 1978, 1984, 1997; Deleuze 1994). For Derrida, in writing(s) and in the text, the way differences are created is important. He distinguishes between an open structure of differences and a sealed, closed structure, using the term “structure” in a transparent manner. Based on his concern with the philosophy of language, Derrida develops a way of interpreting texts that has come to be known as “deconstruction,” an activity that is both destructive (revealing) and constructive (building). He reads in a manner which aims at finding representatives of the fragmentary text. Each text is based on a fundamental difference, which is a crucial part of the rationales in CBW. Johnson (1981) clarifies that deconstruction should not be mistaken for “destruction” but that it (the method) lies in line with a deep analysis approach revealing differences in a critical way, the text’s critical differences from itself. It is about understanding(s) and misunderstanding(s) that reveals other(s), different possibilities of a constructed self.

Deconstruction of our life stories can be described in two main steps, which we call “the opposites” and “displacement.” Both of these steps are based on the fundamental distinction that is constantly repeated in the language, in the text. In every story, there are a number of oppositions in which two concepts in one way or another relate to each other. In an initial step, it is important to catch sight of these opposites: Which are they? How can we portray the opposed pairs of a (our) narrative? Although somewhat simplified, one could say that these opposites produce different places in the story.

If the text, by the use of oppositions/differences, is put into change, into movement, then it will be possible to observe shifts in the text. These shifts have the effect that the text/signs are no longer recognizable in the system of conflicts that previously constituted and defined them. It is common in this step of reading to see how the text creates movement and games with language and meaning differences. So the poststructuralist seeks what we are now and—making visible the break with a dominant discourse—the changing of the subject (Foucault 1980, 2000; Henriques et al. 1998; Butler 1993a, b, 2005). The devil is in the detail and the detail helps to create a movement in the language and thus helps to maintain (reinforce) the game with differences and contradictions. This in turn means that the subject can maintain her/his inflexible/fixed position in life, even in situations of great diversity and flexibility. A kind of paradox occurs in this sense, an illusion of “no disruptions” where there in fact are many.

The Question of Trustworthiness

The “imaginability” of CBW and the acknowledgement of fictionalized selves—that is, the epistemological conditions and justifications of CBW—necessarily call into question the concept of “trustworthiness” of this kind of research (cf. Lincoln and

Guba 1985; Wolcott 1990). This means that we consider to what extent the ways we work meet the criteria of credibility and believability of our research (Harrison et al. 2001, p. 324). St. Pierre and Pillow problematize the question, by asking

when does research begin and end if one gives up a linear concept of time? Does it make sense to continue to describe and prescribe a step-by-step, linear research process? If time shifts in poststructural research, then place and space must shift as well. (2000, p. 10)

Harrison et al. (2001) point to the aspect of reciprocity as an important component in qualitative research. This means that the social interactions among the researchers–participants are crucial, particularly (as is the case here) when deep dialogue interactive questioning of each other’s memories is used. In our case, we made use of this interaction and the reciprocity, the give and take of social interactions [which] may be used to gain access to particular settings (Harrison et al. 2001). The narratives with which we worked in the project could be experienced as a means to empower the researched (cf. Lather 1991). Still, the question remains whether the outcome of collecting and analyzing our data met the criterion of “trustworthiness.” Conducting CBW and our choice of topics raise important questions about becoming positioned and marginalized. In line with Harrison et al. (2001), we particularly wanted to “challenge preconceived notions of what is already known and is established scientific fact” (2001, p. 325). In our sessions, we “practiced” a form of *transactional validity* by sharing our stories, our mutual inquiring and asking questions, and elaborating on misunderstandings and on “the not understandings” (cf. Wolcott 1990). In our research approach, we also practiced a form of *transformational validity*. Turning to Lather (1993) and Richardson (1997), our approach can also be said to be close to a *transgressive* approach since we sought to explore underlying forces and to make the social, cultural, and political meanings and influences explicit (cf. St. Pierre 1997). In our deconstruction and reconstruction of the constituting of the feminist subject in poststructural discourse, we also practiced a high-degree of *self-reflexivity* and examined the meanings that are taken for granted. We paid

attention to each moment of storytelling and listening in such a way that we are each fully present to the other, and at the same time vulnerable to the other, and vulnerable to our own incomplete knowledge of ourselves. This form of attention enables a recognition of the other, not as a fictionalized and completed subject who in her completeness is necessarily foreign, but a recognition that responds to our mutual vulnerability to normative discourses and to each other. (Davies and Gannon 2006a, p. 183)

This involved a supportive understanding quality of attention, which nevertheless aimed to critically scrutinize underlying assumptions.

The Possibility for Revealing the Hidden

The life-memory stories generated through CBW do not stand as transparent evidence for that which is “real.” The way that sense is made of gender in terms of descriptions or performances is not the focus of interest here. It might reveal

something about the essence of the individual sensemaker or perhaps about her or his motives or intentions, but again, this is not the primary focus. Rather, the interest lies in exploring the process of subjectification and the kinds of gendered subjectivities that are available within a particular (social) discourse. The memory stories are used by telling and by writing and provide data for this exploration. In education, as well as in educational studies and research dealing with issues of exclusionary and discriminatory practices, the use of CBW enables and supports a critical interpretation in relation to social discourses. Such discourses condition how we learn to become someone, through the learning of identities. Using CBW also allows us to initiate a process of unlearning identities, and this opens up other possibilities. The language as it is presented in texts, produced as data, is deconstructed and broken open to show the ways in which “the real” is constructed. The aim of this analysis is not to expose the hidden “truth” of sex/gender, but to disrupt that which is taken for granted and destabilize assumptions which are taken for a stable and unquestionable truth. The interest lies in the folding and unfolding of history, in the movement (process) from one configuration of gender to another. Feminist poststructuralist research asks questions, through storied lives and memories, about how these narratives reiterate and reconstitute the male/female binary. In turn, this opens up the narratives for questions, debates, and changes concerning equality, power, and equal-other social accessibilities in relation to social discourses.

It has been argued for some time that we need to critically reflect on what is taken for granted: the discourses that underlie our reflection (Wihlborg 2013). Within the present discourse of humanism, it has made sense to say things in a certain way. Therefore, to be able to challenge this “certain way,” poststructural feminists declare an interest in opening up for “different ways” of saying things. Poststructural feminists assert that in different discourses, other statements as well as other material and political conditions might be possible: “poststructural feminists work toward the not-yet-thought, what Derrida calls the ‘as-yet unnameable which begins to proclaim itself’” (St. Pierre and Pillow 2000, p. 4 [with reference to Derrida 1978/1966, p. 293]). The point here is to be able to open up what is taken for granted, what is not reflected on, and what could be and ultimately challenge the notion that discourses are thus not closed systems. Shifts in historical thought and material conditions are both possible and “available.” It is not a question of the right or the wrong way of saying things—changing one apparent truth for another—but rather to acknowledge that it is possible to see different and various ways of construction so that an emancipatory outcome is possible. This process ultimately permits challenges to the liberal humanist subject as constituted in the liberal humanist discourse. It destabilizes the notion of a predetermined, rational, stable, and “unified, knowing individual and fixed self whose morality allows atrocities beyond imagining but still claims inalienable ‘rights’ that protect it from responsibility to the Other it destroys” (St. Pierre and Pillow 2000, p. 6). The subject of poststructuralism is “generally described as one constituted, not in advance of, but within the discourse and cultural practice” (p. 6), a subject-in-process. This is not a dualistic issue, good or bad, true or false. Nor does it imply that poststructuralism asserts that humanism is “evil” or needs to be replaced because it supposes a fixed

coherent self. The argument does not attempt to prove that poststructuralism is an emancipatory and “good” force. Instead, St. Pierre and Pillow argue that “it offers critiques and methods for examining the functions and effects of any structure or grid of regularity that we put into place, including those poststructuralism itself might create” (p. 6).

However, telling the same old stories in the same old way limits, and perhaps even inhibits, the deconstructive possibilities and therefore the emancipatory project. Such narratives can become structures or grids of regularity that we put into place to keep hidden that which is already hidden:

The fiction of the self is created when detailed embodied memories are only made relevant to the extent that they fit an essentialized unified (fictional) version of self that fits within and makes sense within hegemonic forms of meaning-making about individuals in the social world. (Davies and Gannon 2006, p. 98)

CBW does not seek to overwrite this fictional subject with a “real” subject. It seeks to bring to light the discourses that frame the subject so that they can be understood for what they are—frameworks for understanding the self that draw their authority from being taken for granted. Within these frameworks, understandings of (in)justice, (in)equality, and (the denial of) diversity are perpetuated because they are told and retold through the same storylines. The poststructuralist reading of the girl who had learned how to steer the pilot boat through the discourse of liberal humanism thus reveals a literary trope, a fictionalized cliché embedded (but not embodied) in a make-believe autonomy. The embodiment of the narrative through CBW—capturing the echoes of her grandfather calling out “Aye, aye. Steady as she goes” down the years—allows such rereadings of this early learning experience and so facilitates different perspectives on the justice, equity, and diversity of that educational moment.

The Role of Interpretation in This Research Study

Becoming Aware of What Is Going on: Experiencing Involvement in CBW

The narrative used to illustrate this chapter—*Steering the Pilot Boat*—was not, along with most of the stories we shared, subjected to the full CBW-based analysis of the three narratives chosen for inclusion in *Doing Collective Biography* (Davies and Gannon 2006a). Such analyses are conducted over an extended period of time. However, although the analysis is incomplete, it does illustrate the role of interpretation in CBW.

Interpretation and a close scrutiny of interpretative processes were inevitably central to this research as our purpose was to understand the constitution of the feminist subject in poststructural discourse. As researchers we make theoretical and methodological decisions all the time and thus have to be able to argue for chosen

standpoints and point of departure concerning our research projects. The general view is that various methodologies can be used when we try to seek some deeper understanding concerning *what is going on* and *how we can learn to learn about what is going on*. Here, in the context of justice, equity, and diversity in education, the interpretative process is not simply concerned with how the girl learned to steer the pilot boat (or, indeed, about how she would go on to learn anything else) but how we as researchers learn to learn about that learning process and its context. This required the participants in the project to agree on what could be considered as an ontologically coherent standpoint for the validity of the narratives generated during the research.

What, then, is the standpoint in research concerned with collective biography writing(s) and in poststructural research practice more generally? Choosing this research practice means choosing to reject dichotomous paradigmatic ontological and epistemological arguments that alienate the subject–object relationship. This rejection is an important stance which guided us as CBW practitioners during the whole process of the project. Following this and whatever methodology or theoretical framework is used, it is acknowledged that social discourse plays an important role when people shape and construct their realities and understanding(s) of those realities. Consequently, the challenge as a researcher in the CBW tradition is to become more aware of the extent to which we actually become “discourse blinded” and so miss out on possible ways of understanding what is going on. Put more provocatively, we try to become aware of *what is really really going on in our lives* and of *what other realities can we find*.

In line with Weedon (1987), the poststructuralist understanding of subjectivity refers to that aspect of an individual’s psyche by means of which she/he identifies herself/himself and her/his place in the world. This idea can be linked to the concept of “subject position” and is particularly useful and important when interpreting narratives about education and those that address issues of equity, justice and diversity. The researchers have to be engaged and to give “of themselves” through making use of personal narratives. They therefore become integrated in the research process as a part in a collective whole. This includes taking a position incorporating both a conceptual repertoire and the recognition of rights for those using the repertoire. Having taken up a particular position as one’s own, a person (the researcher) inevitably sees the world from the vantage point of that position and in terms of the particular images, metaphors, storylines, and concepts which are made relevant within the particular discursive practice in which they are positioned. At least a possibility of notional choice is inevitably involved because there are many and contradictory discursive practices that each person could engage in (Davies and Harré 1990, p. 46).

These positions underpin the role of interpretation in CBW, some aspects of which have already been outlined. Against the outlined methodological and theoretical background, the interpretation of these remembered narratives was not random by any means. On the contrary, it was carefully and critically worked through over time.

As researchers with a poststructuralist point of view, we wanted to find out more about the possibilities of sensemaking available within social discourses and to examine the processes of subjection and forces of subjectification. When we are

engaged in this kind of research, it is held that the subject is always inscribed in language and that the discourse is constituted. Researchers in the CBW process aim at creatively working with the constitutive process—the “selving”—to look at the contradictions and play with the discursive possibilities (Davies 2000), and this includes becoming aware of our own discourse blindness. We are not aiming to destroy/dissolve the subject, but rather to look for possible ways of becoming a subject, making use of our own selvings. We, as researchers, made use of our earliest memories

of being a subject. . . in order to examine more closely questions about being caught up in humanist forms of subjection and about the transformative mo(ve)ments entailed in reconstructing ourselves post-structurally. (Davies and Gannon 2006d, p. 172)

We made use of our memories as data and also conducted collective reading (s) of our memories, using a dual approach in our analysis and interpretation. The dual strategy, reading and so interpreting the subject through both humanist and poststructural discourses, made it possible to unravel “the rational choosing subjects of our individual biographies, necessitating a shift from the rational possibilities of deconstruction to the embodied subject decomposing itself” (Davies et al. 2006, p. 92). Through our writing of remembered stories, moments, and movements became visible:

The process of transformation, then, is not so much the result of a rational choice to be someone or something else in particular, but a movement, a ‘decomposition’, an engagement in a messy process in which one ‘scrapes and catches and drags’ in a complex process of re-inscription, of rubbing out the unthinkable; a decomposition, and a fractured, messy recomposition, of thought and of body. (Davies et al. 2006, p. 90)

Working the Ground: Peeling Off and Decomposing

What we achieved through the dual strategy of decomposition was to decompose or peel off the layers of innocence so that we could then observe the self as an object and shift the self to become recomposed in thought and body. The kind of “alienation” of the body and mind, looking at the self through various lenses, gives the feeling of being a spectator while still being very present. This process can go on for months and even years, a practice where we conduct the “messy” and “slippery” collective biography work, peeling away the constituent layers of the liberal humanist subject that “desires to be taken up (by others and ourselves) as unique and individual” (Davies et al. 2006, p. 92). Finally, we continued our collective biography sessions by recovering the embodied details—“details that might be lost in the rendition of oneself as a unique and rational subject who remains essentially the same over time and varying contexts” (Davies et al. 2006, pp. 92–93).

CBW begins with the participants listening to each other, asking questions, and pushing the storyteller to explain and express how it felt to experience the particular situation. This can be read, for example, in the physical sensations recalled by the

girl in the pilot boat. The storyteller is encouraged to relive her memory, and this leads to all kinds of emotions and experiences—sadness and happiness, becoming upset or confused—which the participants must interpret as they intensely question her about what happened. Although it can be unsettling, this is an important point of departure, and without the collective biography approach, it would not be possible to reach the same initial quality of awareness. The process is therefore layered with interpretations—interpretations of how the story is initially remembered and then told, of the collective response to it (as individuals within the group share their interpretations with the group), and of the storyteller’s retelling. The sens(it)ive nature of CBW demands sensory interpretations of this collective enterprise as the narrative becomes embodied. We found that CBW supported the difficult task of deconstruction through our collective

interrogation of the selves that we habitually tell ourselves (and others) that we are (as in our memory stories). . . and decomposing the subject movement through which we unmoor our embodied selves from those discourses we have worked on deconstructively to make them unthinkable. (Davies et al. 2006, p. 99)

In relation to learning and education (whether in formal or informal settings), but also in a more general sense, it is important to develop the critical ability to recognize and identify differences. The collective search for possible scenarios, moments, illustrations or scenes is a central part of the process. It opens up the possibility of becoming aware of such differences and of becoming aware of differences as phenomena. We had to keep an eye out for the unexpected as we became engaged in dealing with resonance and agreements, exclusions, and rewritings. The process involved challenging ourselves in being open and yet argumentative in reading and writing our collective text, agreeing to overwrite each other in order to collectivize our search and let go of our individual egos. In some sense, each participant lost *herself*, but, at the same time, each one of us became more—in becoming we—through writing the text together. This sense of togetherness is the impetus which sets the writing in progress and constitutes the very force behind the struggle to reveal and make visible.

The place of interpretation as individuals and as a group is important in CBW because its concern with the embodiment of experience requires responses to sensory cues. However, after the workshop, we all returned home. During the workshop itself, all authors were present and worked in real-time sessions. We were able to look at each other, to ask follow-up questions, and to elaborate further on those issues needing attention. After leaving the workshop, the collective writing processes had to negotiate time differences and online work. E-mails and online multimedia tools (such as Skype and Adobe Connect) are extremely helpful, but they are very different to being physically present in the same time and place (while wary of imposing new discourses to be identified, interpreted, and negotiated, online meetings could be used to help elaborate understandings—although this is not something we chose to do for this project). In our postworkshop sessions, we primarily used e-mails. Changes of time and place shifted the interpretative process as we sought to read and respond to each other. Yet this should not be seen as

wholly disadvantageous. After all, writing rather than speaking gives more time for reflection. As the CBW process unfolds over a long period of time, it is almost inevitable that these different means of interaction must be negotiated and their interpretative consequences incorporated into the process.

Letting go of your ego, whether in the workshop or in the following writing processes, can be fun as you ride the roller coaster of deconstruction and feel a turbulent and tingling sensation. This description maybe does not sound very “academic”—but this is hardly surprising since deconstruction challenges a number of fundamental presuppositions in academia. It is profoundly creative and yet analytic and deep. Engaging in this form of collective analytic process really pays off since the outcome becomes so much more. Through the support of all the participants’ readings and writings, the whole becomes far richer, elaborated, and produced by the variations of differences that are processed throughout the process.

It Hurts So Good: Becoming Aware and Letting Go!

CBW suffuses narratives with emotional and sensory details to generate a sens(it)ive account, and so it seems appropriate to offer a more personal response to my engagement with this methodology as I address some aspects that have impressed me particularly and reflect on my own experiences as a member in a CBW group, participating in the process of practising this method (see also Davies et al. 2006, pp. 114–144).

The first experience I would like to focus on is *letting go of your/my ego*. How did this feel bearing in mind the personal investment of doing and being involved in a CBW activity that progresses over a considerable period of time, which might range from a couple of months to several years? Personally, I can say that it made me feel and reflect in various ways in the course of this period. It is rather a complex process to be involved in, but overall it was very challenging in a good way. The undoing of what you know is to surrender to what we cannot yet see or make sense of. It’s scary and thrilling at the same time—it sharpen ones senses—an explorative adventure, where your own interpretation merges with others, shaping new compositions. In the course of this process, I also perceived that my prejudices floated up to the surface and become visible. Dealing with these was painful—taking a good look at myself through the collective lens, so to speak. For me, this meant seeing myself as a capable and autonomous person—and at the same time seeing how (contextually) exposed this self actually is. Being utterly vulnerable and exposed to being subjected by others (as in the memory story about the pilot boat) and realizing that this is something that is happening all the time have made me much more humble—*nothing is for sure*.

Other aspects or the process that impressed me are above all the experience of developing *critical awareness* and *the insight of the deconstruction of the self* (with particular emphasis on the dimension of insight). What did I learn and how has this made a difference, beyond the work that we shared in this period? This can be

discussed in terms of developing and strengthening the ability to achieve critical awareness as a scholar, which is of course eminently useful in my continuing research approach. It all boils down to the understanding and insight that differences are always available. Grasping this intellectually may be a cliché, but the implications become far more tangible when you are personally involved in an analysis using a dualistic strategy: the differences become very present and are highlighted in a striking manner. *In between*, I felt lost, with no belonging to either—the opposites and displacements, at the same time trying to deconstruct and reconstruct *the other*. Derrida has shown how differences are created, but reading his texts is not enough to really grasp what it entails. In my own experience, I felt that the process for doing so demanded both passion and deep engagement, since creativity—in a most fundamental way—is an attribute that absolutely needs to be present, *there is no way around it*. In my research approach today, this has made me open for dealing with a bit of chaos, and I am no longer afraid of getting “variations” as an outcome in my scientific results—a kind of outcome space (cf. the phenomenographic methodology), that *gestalts* a richer whole—*revealing contradictions and differences*.

Finally, believing, as I did, that the support from all the participants’ readings and writings would lead to achieving a far richer whole, I did my best to hold on to this conviction, as a motor from the very beginning, at the same time, quoting myself, “doing my best to hang on to the swing” (Davies and Gannon 2006c, p. 126), trying not to fall off. Initially, it was not easy to expose myself, my thoughts and feelings, to five unknown and highly competent scholars, telling about real life memories, problematizing theoretical and methodological assumptions. It was difficult to merge the private and academic sides of my person. My – *I and she* – started out strong, but during the process became dissolved, when everyone joined in and became a part of my own memory stories. The collective experience turned it into a shared experience, decomposing and peeling, elaborating on and recomposing, and highlighting the variations of differences that appear and transform throughout the process. The ride in the pilot boat became quite a journey.

Genre 2 Analysis of Language and Significations

Introduction

Jane Mulderrig and Vally Lytra

In this section chapters highlight the role of semiosis in constructing and interpreting the practices through which roles and relationships are negotiated across a range of educational settings. For the authors interpretation in educational research is not something performed exclusively by the researchers at the end of the study, but is relevant to every stage of the process and all its participants (both researchers and researched). It therefore follows that language and other forms of semiosis should be a key analytical focus in exploring the importance of these sense-making practices in education.

Dunn's chapter addressing the UK government's school exclusion policy puts a critical spotlight on the dilemmas posed by those on the margins of state schooling: children with challenging behavior. Dunn's chapter sheds light on the role of powerful actors whose voices shape the terms of the debate as well as opportunities for relatively powerless actors to engage in it, by reframing school exclusion in a discourse of criminal justice.

Djonov, Knox, and Zhao present a social-semiotic multimodal approach to the exploration of websites and the challenges they present in terms of fostering critical educational engagement with digital knowledge resources. Drawing on three case studies, they demonstrate that interpretation is integral to the highly complex, multimodal, and dynamic construction of meaning in hypermedia texts.

Montesano Montessori and Schuman use participatory action research in Dutch primary schools to explore the implications for social justice of including students with additional support needs in mainstream classrooms. Focusing in particular on

interactions between teachers and pupils as well as among pupils themselves, the researchers strove to integrate fully the perspectives of the research participants.

Perhaps no field of educational research is more obviously defined by the interpretive process than intercultural communication. As Zotzmann argues in her chapter, competing theories of intercultural communication do not simply provide academic interpretations of the phenomenon but also in doing so provide the discursive and cognitive resources that in turn shape the communicative practices they analyze. Drawing on evidence from three prominent theoretical frameworks for investigating intercultural communication, she shows how interpretation impacts on the entire process from theory to practice.

Pahl's chapter explores children's writing practices in out of school settings, namely, in the home and in a local library. Drawing on collaborative ethnography and the process of doing reciprocal analysis, the author shows the children's creative use and combination of different representational resources, as they produced visual, material, and written texts.

Rowsell explores video game design and production through the perspectives of two video game designers. The author uses multimodality and modal learning to discuss the different modes and strategies the game designers employed to create successful video games and the insights their design and production practices can provide to learning and understanding texts in general and literacy education in particular.

Mulderrig's chapter examines the negotiation of power roles and relations between citizen and state in UK educational policy discourse under the New Labour government (1997–2005). The author combines critical discourse analysis (CDA) with corpus linguistics to illustrate how the systematic use of personal pronouns in educational policy documents, alongside a more distanced form of grammatical agency, helped to transform the model of governance into a more personalized, inclusive, and managerial one.

Snell and Lefstein investigate a feedback session where the teacher uses popular culture, more specifically the televised talent show *X-factor*, as a means for the class to evaluate student writing. The linguistic ethnographic analysis of a segment of a video-recorded literacy lesson is deployed to show the social, interactional, and discursive resources pupils drew upon as the discourse genre of conventional classroom feedback shifted in line with the demands of *X-factor*.

2.1 Using Critical Discourse Analysis to Interpret Educational Policy on School Exclusion in England and Wales

Yo Dunn

Introduction to the Research

Critical discourse analysis (CDA), and, in particular, Fairclough's (2009) dialectical–relational CDA, is a problem-focused methodology. The CDA research on which this chapter is based examined the social problem of exclusion from school (as a disciplinary measure) in the UK during the period from 1997 to 2006. Rather than focusing on identifying correlates of school exclusion by means of statistical analysis, or interpreting the experiences of excluded children by investigating their individual perspectives, this research focused on political discourses and their role in and interaction with this area of educational policy.

Until the early 1990s, exclusion from school was a rarely used sanction in the state education system in England and Wales. Its use increased dramatically between 1990 and 1997. The election of the New Labour government in 1997 brought with it a new policy: an explicit aim to reduce exclusion from school as part of a wider policy focus on social exclusion. The 3 years after 1997 saw a notable fall in permanent exclusions from their peak of 12,700 per year to a low of 8,320 in 1999/2000 (DfES 2001). From 2000 to 2006, however, permanent exclusions rose slightly and stabilized in a range from 8,500 to 10,000 per year (DfES 2007). The overall level of exclusions remains substantially higher than was the case prior to 1990. The dramatic change from 1990 to 1997 had already been the subject of considerable research interest (e.g., Hayden 1997; Wright et al. 2000). This research focused on changes in school exclusion policy after 1997 and investigated why the initial falls had not been sustained.

This issue was well suited to investigation by means of an approach with a discursive focus. Under New Labour, political discourse had become a highly significant part of how government policies are not only transmitted but also enacted (Chilton 2004; Graham 2001). The 1997 policy of reducing exclusion from school had been the subject of vocal opposition in the media and, by the time of the research, had ceased to be a stated educational policy goal. So the trend in exclusions between 1997 and 2006 raised questions about the interaction between political discourses around exclusion from school, educational policy, and exclusion itself.

The research identified two trends in New Labour's discourses around school exclusion between 1997 and 2006. The first was a substantial shift away from discourses of social exclusion focused on targets to reduce exclusion from school towards strongly negative, individualized discourses of behavior and responsibility focused on punitive responses to children and parents. An inextricable part of this change was the increasing elimination from the discourse of the agency of powerful social actors including the government itself. The second closely related trend was an apparent decrease in dialogical engagement of government with the citizenry and in particular with potentially critical discourses. These findings enhance explanations of the social problem of exclusion from school by extending the multilevel analyses already available beyond the individual, their family, and the immediate school environment, to include the role of educational policy and political discourse.

The Focus of the Research

The treatment of children at the margins of the education system is of perpetual interest to researchers concerned with social justice (Slee 2001). While the numbers formally excluded from school (especially those permanently excluded) remain a tiny minority of the total school population, their difficulties can be seen as an acute representation of much larger issues within the educational policy. There are substantial social inequities involved in exclusion from school. Although the causal connections are complex, children who experience exclusion from school are more likely to be involved in crime, to experience poverty, to experience unemployment in later life, and to go into local authority care (Berridge et al. 2001; Hayden 1997; Munn and Lloyd 2005). The risk of exclusion from school falls disproportionately on particular groups, notably boys, black children, and pupils with special educational needs (SEN) (DfE 2011). Formal exclusion is at the thin end of a wedge which includes truancy and self-exclusion, school (in)discipline, disaffection, and, at its broadest, concepts of social exclusion extending out beyond the school to issues of poverty, class, disadvantage, and inequity. Exclusion from school can be viewed as the most acute point of conflict between the education system

and the child as pupil. Thus, research into exclusion from school is relevant to understanding broader issues in social relations between state and child through the structures of the education system.

Previous research on exclusion from school has tended to focus heavily on the agency of individual excluded children, with some discussion of broader social factors as identifying characteristics of the excluded population. Methodologically, the existing literature is dominated by statistical analyses (usually investigating either the causes or the consequences of exclusion) (such as Daniels et al. 2003) and studies focused on understanding the individual experiences of excluded children and their families (what is mainly thought of as “interpretative” research) (such as Kane 2012).

The CDA approach taken in this research is a form of explanatory critique, focused on explanation rather than simple relations of causation. This approach allows access to structural factors of potential interest in explaining exclusion from school, but which are not amenable to statistical analyses, such as political discourse and the role of central government. Similarly CDA provides a means of focusing on social and discursive forces which social actors in the event of exclusion from school may be unaware of and which are, therefore, unavailable to research focused on understanding the experiences of excluded children and their families from their own perspectives.

The central question posed in the research was how have New Labour’s discourses relating to exclusion from school, related educational policies and the social practices in which they were embedded, evolved between 1997 and 2006? The research process evolved in an iterative way, moving back and forth between theory and data, and between levels of abstraction, in a process which sought to continually refine understandings on all of these levels. This type of process is both common and necessary in interdisciplinary research of this kind and is theoretically consistent with CDA (Fleming and Moloney 1996, pp. 120–121; Wodak 2009, p. 95).

Subsidiary research questions were thus gradually refined during the course of the research, informed both by theoretical insights and guided by emerging findings. These subsidiary questions both helped to focus the investigation and structure findings. They were:

1. How does the way the social problem is defined in political discourse evolve?
2. How are social events represented and how does this change?
3. How are social actors represented and how does this change?
4. What shifts are there in the power, authority, and agency of the social actors involved?
5. Are there changes in the dialogicality¹ of government discourse and what are the implications of this for (a) discourses and policies in the area of exclusion from school and (b) governance?

¹ See “The Process of Analysis” below.

The findings generated by these questions were then interpreted with reference to a set of sociological questions which were derived from the literature on New Labour's discourses of social exclusion. These were:

- (A) Do New Labour's discourses around school exclusion narrow the concept of equality?
- (B) Do New Labour's discourses around school exclusion represent the world in a way which demonstrates a commitment to neoliberal values which overrides social democratic concerns?
- (C) Do New Labour's discourses around school exclusion focus on individuals rather than structures?
- (D) Do New Labour's discourses around school exclusion obfuscate issues of power and agency?
- (E) Are New Labour's discourses around school exclusion constructed in a way which tends to deflect criticism and avoid conflict?

The two sets of subsidiary questions are clearly related but do not precisely map on to each other. The following section on the dialectical–relational approach explicates how the levels of analysis represented by these two sets of questions coexisted in the research process.

A Dialectical–Relational Approach (DRA) to CDA

The research broadly followed Fairclough's (2009, p. 167) four-stage framework for dialectical–relational CDA:

1. **Focus upon a social wrong, in its semiotic aspect.** In this case, the social wrong was school exclusion with all its inequalities and adverse social consequences. It is important to note that this step involves the researcher adopting an explicitly normative position. While uncommon in social research generally, it can be argued that this is a necessary step in achieving truly adequate explanatory critique. In order to develop more rounded explanations and propose specific emancipatory changes, research which aims to be "critical" has to engage in explicit moral debate about preferred forms of social organization (Sayer 2000). In identifying the act of school exclusion as a "social wrong," this research took the moral position (based on the extensive evidence outlined above of power imbalances in the use of school exclusion and correlation between its use and other social harms) that school exclusion is a source of avoidable suffering (Sayer 2009) and that its use should be eliminated or, at least, minimized.

While other semiotic aspects to this social problem undoubtedly exist, this study focused on political and particularly government (at the time New Labour) discourses around school exclusion. There were two reasons for this. Firstly, CDA's inherent focus on power relations (Fairclough et al. 2011) and extensive prior use to analyse political discourse suggested that a CDA methodology could

be usefully applied to such material. Secondly, the heavy emphasis in the existing literature on researching the excluded themselves and their families (the relatively powerless) suggested the need for an approach which would allow a research focus on the powerful in relation to school exclusion.

2. **Identify obstacles to addressing the social wrong.** The research aimed to identify discursive and extradiscursive elements which might contribute to perpetuating school exclusion or act to make inclusion more difficult. Four main obstacles were identified by the research. The first of these was a cycle in which texts produced by the teaching unions, media, and government interacted in ways which continually increased punitive and decreased welfarist discourses. Another obstacle identified was the importation of criminal justice discourses into this area of educational policy discourse from 2000 onwards. Related to both of these was a persistent, increasing focus on the agency of individual children and parents rather than that of other social actors and relevant structural factors. The final obstacle identified by the research was the curtailment of opportunities for critique, including the exclusion of those most adversely affected by this policy from public debates/dialogue on the subject.
3. **Consider whether the social order “needs” the social wrong.** The research considered not only whether school exclusion could be reduced by making changes within the current social order but also whether power relations needed to change. Two key interests were identified as being served by the perpetuation of school exclusion during the period studied. The political interests of the New Labour government were protected by avoiding potential threats to neoliberal policies that would have arisen from recognizing and addressing the structural factors relevant to school exclusion (particularly poverty). In the face of limited resources to provide for the needs of children with challenging behavior in schools, the interests of teachers and headteachers (as represented by the teaching unions) were being served by removing children in need of such resources from their working environment.
4. **Identify possible ways past the obstacles.** DRA encourages the researcher to go beyond stating findings to identifying strategies with the potential to change relations of domination (Fairclough 2009). The research identified some specific discursive strategies that might allow the dominant discourse to be opposed. These included:
 - Challenging the underlying assumptions in the framing of government consultations as a potential avenue to overcoming the curtailment of opportunities for critique identified by the research
 - Challenging the *non sequitur* that an explanation cannot be valid if it is not a justification, in order to open up public debate around school exclusion to discussion of the relevant structural factors, rather than allowing these to be dismissed
 - Counteracting the persistent discursive focus on individuals identified in the research through the deliberate use of inclusive pronouns (e.g., “our children”)

- Countering the dehumanization of excluded children by telling “human-scale” (Fauconnier and Turner 2002, p. 312) stories highlighting the damage caused by exclusion and positive stories about inclusion in order to encourage empathy
- Reframing the problem in terms of the right to education and, generally, reintroducing morality to political discourse (Harvey 2005, p. 204)

Identifying Sources

The project’s focus on discourse was underpinned by a dialectical view of discourse and the social, which sees discourse as both shaping the social world and shaped by the social world (Chouliaraki and Fairclough 1999; Sayer 2000). This entails a particular focus on issues of power, since discursive practices can play an important role in producing and reproducing power relations through representations of social events and positioning of social actors (Fairclough et al. 2011). New Labour’s discourses around school exclusion were seen, therefore, as both a reflection of power relations in the education system (as realized through conflict over behavior) and as a mechanism through which power relations were potentially being reproduced. It was, therefore, appropriate for the project to focus on examples of New Labour’s texts already in the public domain, since these were the texts with the potential to act as such a mechanism for the transmission of power relations.

The formal means by which UK governments state their policies is through White Papers. However, White Papers are not the only “genres of governance” (Fairclough 2003, p. 32), that is, texts that are concerned with governing the way things are done as opposed to actually doing them. “Policy” involves not only what government does or intends to do but also reasons, justifications, legitimations, and the communication of these (Parsons 1995). So policy is also formulated and implemented through wider political discourse (Colebatch 2002, pp. 130–131; Fairclough 1989, pp. 70, 90–91). Political discourse was, therefore, conceptualized as a “technology of government” (Rose and Miller 1992, developing Foucault 1981). Consequently, the data selected for analysis includes speeches and press releases alongside White Papers, in order to access a more rounded picture of New Labour’s political discourses around the issue of school exclusion.

Having made this choice of genres, the next step was to build a small, specialized corpus of texts focusing on school exclusion and related issues for the period 1997–2006. This corpus totaled a little over 300,000 words and included texts from all three genres. Some of the analysis made use of this entire corpus of texts. The majority of the research, however, focused on close textual analysis of nine of these texts (or sections of them)—three from each of the genres—and relating these nine texts to their sociopolitical context.

In CDA generally, as is the case in this study, data collection can be seen as part of the ongoing iterative process of research rather than as a distinct phase (Wodak and Meyer 2009a, p. 27), and in this respect CDA is similar to grounded theory

(Glaser and Strauss 1967). In this study, investigation of the sociopolitical context suggested that the 12–18 months after each of the general elections of 1997, 2001 and 2005 were “critical periods”² during which discourses around school exclusion were particularly prominent in New Labour’s political discourse generally and during which important policy announcements in this area had been made. Consequently, as far as possible, the core texts were selected from those published within these periods.

Within CDA, methods of sampling vary widely, with most CDA approaches not recommending particular sampling procedures (Wodak and Meyer 2009a, p. 27). Since this project aimed to investigate diachronic change, it was important to select texts that would be as comparable as possible, at least within each genre, over time. However, the iterative approach at times conflicted with the need for comparability, and as a result, the core texts, while comparable within each genre, were not necessarily directly related to those from similar time periods.

In summary, the nine core texts selected for qualitative analysis comprised extracts pertaining to school discipline from three White Papers; the complete text of three of Tony Blair’s speeches in which school discipline was a significant theme; and three Department for Education and Skills (DfES) press releases relating to school discipline. One text from each genre dated from the 12 to 18 months following each of the general elections which took place in 1997, 2001 and 2005.³

The Process of Analysis

Corpus Analysis

The corpus analysis was carried out by dividing the large corpus of texts into three smaller cross-genre subcorpora, each covering one of New Labour’s three terms in government.⁴ These subcorpora were then compared using the lexical analysis software WordSmith (Scott 1999). Keyword analysis was used to compare the vocabulary used in each subcorpus, determining which words appeared more often in one corpus than another and measuring the extent and significance of the change (a score known as “keyness”). Originally designed to detect stylistic changes in different versions of the same text, this tool has been used successfully both in CDA generally (e.g., Baker 2006) and for the specific purpose of tracking

² Drawing on aspects of Fairclough’s notion of “moments of crisis” (Fairclough 1992, p. 230) and Wodak’s criterion of “specific periods of time relating to important discursive events which are connected with the issue in question” (Wodak 2009, p. 98).

³ With the exception of the third press release which was issued in 2004, this anomaly is due to the inclusion of this text in a pilot project predating the 2005 election.

⁴ The third period ends in 2006 because of the timing of the research.

shifts in language use over time (Mulderigg 2006, 2008). Measuring “keyness” provides an indication of the strength of any shift in vocabulary and indicates not just frequency but salience (Baker 2006, p. 125).

In this research, keyness was used to examine changes over time in the vocabulary used to describe and circumscribe the social problem: terms such as “exclusion” and “behavior” and their ideological associations. One finding from this aspect of the research was a substantial shift away from the use of words such as “exclusion,” “exclusions,” and “inclusion” between New Labour’s first term in office and subsequently. This contributed, along with indications from elsewhere in the research, to identifying the prominence of discourses of social exclusion prior to 2001 and their relative absence after that point.

Collocation (the occurrence of words in proximity to each other) is a means of understanding meanings and relationships between words which may not be apparent from qualitative analysis of individual texts (Baker 2006, p. 96). Words which occur frequently together are indicative of powerful discourses as the strength of collocation (the degree to which such words occur together and only together) suggests that these concepts have been linked in the minds of people and used again and again (Baker 2006, p. 114). In this study collocation was used to aid in the identification of such powerful discourses and track shifts in those discourses over time.

Analyzing collocations in each of the subcorpora allowed the identification of sets of labels associated with key social actors, such as “children” and “parents.” These were interpreted through CDA’s conception of the dialectical relationship between discourse and society via the assumption that frequently occurring associations were likely to reflect the presence of socially important discourses (Mulderigg 2008).

Metaphor Analysis

Cognitive perspectives can be extremely useful in understanding the mechanisms through which power relations can be obscured in political discourse (Chilton 2004, p. 51). Analyzing metaphors in particular can illuminate values and assumptions in texts that are deeply embedded and obscured from casual awareness because we are so accustomed to the use of certain metaphors that we take them for granted. Cognitive blending theory (CBT)⁵ (Fauconnier and Turner 2002) describes metaphor usage as a blending in which concepts are associated by means of existing associations between them and then blended, which creates emergent concepts as a result of the blending process. The project focused, therefore, not on novel one-off metaphors but on those conceptual metaphors that underpinned a range of lexical

⁵ See “An eclectic approach” below for discussion of the choice of CBT over alternative theorizations of metaphor and its compatibility with CDA.

patterns in the texts and that, by virtue of having become established and conventional (Goatly 2007, p. 30), were most likely to be effective at conveying hidden ideology (Chilton 2004, p. 52).

One example was the common metaphor “misbehaving child as runaway train.” The presence of this blend was indicated by the use of phrases such as “out of control” and “off the rails” to describe children in the core texts. The concepts of a misbehaving child and a runaway train are initially associated because both share the characteristic of a failure to conform to commands. The emergent concepts are of children as objects in need of control and who pose a catastrophic danger if they are not controlled. Identifying these emergent concepts illustrated the hidden ideological content of this blend. Associating children with inanimate objects tends to deny their rights as members of society. The blend also evokes emotions of danger entirely disproportionate to the literal threat posed by children.

My CDA Toolbox

A huge range of CDA techniques were used in the project, and there is only space here to describe a selection of the most useful:

1. **Policy analysis/analysis of social context** (Fairclough 2003, p. 191). This comprised a mixture of the sociological tradition of policy analysis (Parsons 1995, p. 85) and the type of analysis of social context advocated in DRA (Fairclough 2003, p. 191). It involved examining the political and media context in which policy statements about school discipline were made and the other voices and texts with which the core texts interacted. This allowed the research to address the external relations (Fairclough 2003, p. 39) of the core texts, that is, those texts and social events that were outside of the core texts but which, in some way, were brought into them. These were identified through a range of indications such as one text being directly referred to in another or chronological correlations (e.g., a newspaper article being published the day after a press release on the same topic). These were then mapped through the creation of timelines and diagrams showing relationships between different texts (including texts outside those in the study) and between the core texts and non-textual social events (such as general elections). The diagrams then facilitated the identification of further connections.
This process served the research in two important ways. Firstly, it provided essential contextualizing knowledge that informed the rest of the analysis. Secondly, it also provided important analytical insights, for example, by initially identifying a chronological association between government texts, media texts and those produced by teaching unions, which led to further investigation of these interactions in the project.
2. **Representation of social events** (Fairclough 2003, p. 193). This involved textual analysis at the whole text level, looking at the ways in which social

events were represented in the core texts. For example, by looking at which elements of the social event were included and which excluded. This provided an overview of diachronic change. For instance, in an analysis of sections from the White Papers, a distinct difference was evident between texts from 1997 and from 2005. In the 1997 text, the social problem was represented as the act of school exclusion. Institutions (schools, LEAs, and the government) were included in the text but individual persons largely excluded. On the other hand, in the 2005 text, the social problem was represented as the behavior of individual children and parents. Institutions were largely excluded, while individual persons were prominently included (parents, individual pupils, headteachers). This fed into the overall conclusion that over time the discourses had shifted away from a representation of the social problem which recognized structural factors towards an emphasis on individual agency.

3. **Discourses** (Fairclough 2003, p. 193). Also working at a whole text level, this involved examining specific discourses which were drawn upon in the texts. Levitas' (1998, 2005) existing typology of New Labour's discourses of social exclusion was used to classify discourses of social exclusion in the core texts. For example, the 1998 press release describes the purpose of the target set by the government to reduce exclusions as "to give thousands of children a better chance in life" (DfES 1998). This assumes that giving children a better chance in life is an appropriate social goal and that social mobility is best achieved by providing access to better education leading to better paid employment. This suggests that the social exclusion discourses that are prominent in this text are those described by Levitas (1998, 2005) as redistributive (focused on equality) and social integrationist (social mobility through access to paid employment). In contrast the 2004 press release describes the purpose of government policy in phrases such as "tackling poor behaviour and enforcing discipline" (DfES 2004). School exclusion is mentioned only to emphasize that headteachers "have every right to exercise permanent exclusion" (DfES 2004). There is no sign in that text of any concern for the disproportionate impact of exclusion on disadvantaged social groups (redistributive discourse). Nor are there any indicators of concern for equality of opportunity within the education system (social integrationist discourse). In this text a blaming discourse of behavior, which constructs socially disadvantaged young people as solely responsible for their exclusion from education (moral underclass discourse), is completely dominant.

Analyzing the presence of discourses of social exclusion in the texts in this way provided insights into changes over time in the weight given to competing discourses. Recognition of the growing dominance of moral underclass discourse contributed to the identification of the importation of criminal justice discourses into educational policy discourse.

4. **Representation of social actors** (Fairclough 2003, pp. 145–150; Van Leeuwen 1996). Another key tool in analyzing the core texts was Van Leeuwen's (1996) systematic categorization of the representations of social actors. The categories of textual analysis used in the research included whether actors were included or excluded from a text, activated or passivated, personalized or impersonalized

and whether actors were assimilated or individualized in the text. These tools were applied primarily to examining representations of children and parents in the core texts, while drawing on the corpus analysis for broader contextualization. This provided insight into changes over time in the agency ascribed to these groups.

These tools were particularly useful in identifying and analyzing overwhelmingly negative and “othering”⁶ portrayals of some children and parents in later texts. For example, in analyzing a representation such as “how do we protect the majority from the dangerous and irresponsible minority?” (Blair 2005), Van Leeuwen’s categorization was used to identify the key linguistic mechanisms by which this was achieved. In this example, agency in relation to the social problem has shifted onto children (relative to earlier texts) who are differentiated from “us”, homogenized and impersonalized. Through detailed analysis of such examples, the research was able to describe the mechanisms through which New Labour’s characterizations of children changed between 1997 and 2006, representing them first as bad, then as violent, and finally associating them with the use of weapons (particularly knives). Analyzing representations of social actors in the texts also identified a changing relationship between children and schools in which the emphasis shifted from schools meeting the needs of children to children conforming to the needs of schools; discursive strategies that effectively reduced reader empathy with the “othered” children represented in the texts; and how, particularly in texts from 2005/2006, these children were further impersonalized as less than human.

5. **Dialogicality** (Bakhtin 1981; Fairclough 2003, p. 42). Indications from multiple strands of the study suggested the possibility of changes in the nature and/or quality of communication between government and citizen. The ability to identify and then investigate unanticipated issues is a strength of the iterative nature of this methodology. Fairclough’s concept of dialogicality (Fairclough 2003, p. 42) was employed to investigate this issue. Drawing on an aspect of Bakhtin’s “dialogical” theory of language, Fairclough suggests that texts differ in their orientation to difference, the degree to which they engage with the views and utterances of others. This is particularly important in political discourse because:

One of the central problems of contemporary politics is the squeezing out of the ‘public sphere’, of spaces where people can openly dialogue over matters of common concern free from the constraints of both the state and the market, and in a way which can influence government. . . . The argument over what constitutes ‘real’ dialogue is a central part of the political struggle over the public sphere. (Fairclough 2000, p. 127)

⁶“Othering” is used to describe the representation of a group of social actors in a way which emphasizes differences and minimizes similarities between that group and the author and/or intended audience of the text. Such representations tend to reduce identification with, and thus empathy towards, members of the social group.

Very little in the way of previous attempts to operationalize the concept existed. Consequently, the project took a novel approach, seeing dialogicality in terms of the ability of social actors to access and effectively use:

1. The means of communication
2. The language of communication
3. Discourses

Each of these was investigated: (1) by considering changes in public consultation; (2) by investigating the intelligibility of the texts through a range of potentially relevant factors including sentence length, lexical density, grammatical complexity, and specificity; and (3) by considering to what degree the texts were open to the presence of competing discourses and alternative perspectives. Overall the research found low and decreasing dialogicality between 1997 and 2006.

An Eclectic Approach

DRA's problem-focused approach permits the researcher to draw on whatever tools may be useful in investigating the problem studied. Such an eclectic approach is appropriate to the study of public policy, that is, the study of "what governments do, why they do it, what difference it makes" (Dye 1976). It can be argued that studying policy requires the researcher to cross disciplinary boundaries in order to bring to bear whatever approaches, models, theories, and methods are necessary in order to understand a specific social problem (Parsons 1995, pp. xv–xvi).

This research was particularly eclectic and, within the broad umbrella of DRA, made use of tools, not only from within CDA (which itself equips the researcher with a range of tools with which to investigate a problem) but also corpus analytical techniques and CBT. In the study as a whole, these tools were deployed strategically. At any given point during the study, research issues were investigated using the most appropriate tools for those issues (Fairclough 2009, p. 167) and those which were most relevant to the texts under analysis. Consequently, not all tools were applied to all texts.

The eclecticism of the approach taken in this research had several advantages. The use of a diverse range of methods allowed the problem of school exclusion to be examined from many angles. For example, when changes in vocabulary over time were initially investigated using corpus analysis, words sharing a common root, for example, "violent," "violence," etc. (or "disruption," "disrupt," "disruptive," etc.), did not appear to have undergone any significant changes in usage. However, subsequent closer analysis of the representation of social events and social actors suggested that in fact usage of these words had undergone some change. Returning to the corpus for a more detailed examination of these items demonstrated that both words abruptly entered government discourse from 2000 onwards. This finding aligned with other insights from the research, such as

changes in metaphorical representations of the relationship between schools and children. Thus, each of these separate stages of the research helped build an overall picture of substantial discursive change occurring in 2000/2001.

Another advantage of this flexible methodology was that the wide range of tools allowed for contrasting (though complementary) units of analysis that ranged from individual words to discursive patterns across groups of texts and non-textual elements. This methodological breadth and diversity was particularly useful in allowing connections to be made between insights from disparate areas of the study. For example, one pattern that emerged from the corpus analysis was a substantial increase in the number of references to children and parents in later texts. This linked to a finding from CBT analysis of texts from this same period wherein parents and children were metaphorically positioned as “the enemy”, both findings demonstrating that specific instances of “negative other” (van Dijk 2003, p. 263) representations of these actors (identified in the close text analysis) were not isolated cases but formed part of a wider pattern.

The eclecticism of the research also improved validity through methodological triangulation as advocated in more recent overviews of CDA (Wodak and Meyer 2009a). The use of corpus analysis to ground close text analysis within a quantitative methodology (Mautner 2009) was particularly important for a researcher taking an explicit ideological stance. Close text readings, which are particularly vulnerable to researcher bias, were thus guided and supported by statistically significant changes in word usage across a large corpus of texts. The use of a range of text analytical tools meant that findings were based on repeated indications of change across different linguistic categories, thereby offering robust support of findings through a multi-method approach.

Nevertheless, such extreme eclecticism also had some disadvantages. Breadth was achieved at the expense of more intensive analysis of individual textual features. There is also a significant risk of theoretical incompatibilities when bringing together methods from such different traditions. This was particularly a risk in using CBT in conjunction with CDA.

Of the two leading theorizations of metaphor—conceptual metaphor theory (Lakoff and Johnson 1980) and conceptual blending theory (Fauconnier and Turner 2002)—the latter is considered more theoretically compatible with CDA (Hart 2008; Koller 2005). This is largely because CBT’s dialectical view of the cognitive processes involved in metaphor is compatible with CDA’s dialectical view of the relationship between discourse and the social (Hart 2008, p. 98). However, theoretical work remains to be done to build a bridge between the individual cognitive focus of blending theory and the socio-cognitive perspective of CDA. Nevertheless, CBT can contribute to problem-focused CDA research, provided a certain degree of pragmatism is used in considering conceptual tools on the basis of their usefulness for addressing the particular problem investigated rather than their internal consistency within a seamless conceptual framework.

The Frameworks Used

Throughout the research sociological and linguistic frameworks were used to complement each other. This is a result of the interdisciplinary nature of the research and the dialectical view of discourse and the social, which inherently brings social and linguistic theories into dialogue with each other (Chouliaraki and Fairclough 1999, pp. 16–17). The CDA toolkit contains its own conceptual frameworks as described above. The research made extensive use of these. These were complemented by the use of two main frameworks from broader social theory: the concept of social exclusion and Bourdieu’s “constrained communication.”

Social Exclusion

Social exclusion is a heavily contested concept, and this struggle over meaning was evident in the discourses investigated in the research. Definitions of social exclusion can be loosely grouped into “strong” and “weak.” Strong versions emphasize the role of those who are doing the excluding, see exclusion as the result of processes that derive from a fundamentally unequal social structure, and posit solutions that redress power imbalances (Byrne 2008). This is contrasted with “weak” versions of social exclusion (such as those derived from Giddens 1991). Weak versions see exclusion as a consequence of the negative attributes of excluded individuals and groups and posit solutions that focus on altering the handicapping characteristics of excluded people and promoting their integration into the dominant society (Byrne 2008, pp. 2, 8; Viet-Wilson 1998, p. 45).

Rather than attempting a superficially “objective” analysis, the normative position taken in this research led me to explicitly adopt a strong definition of social exclusion. The weak versions of social exclusion dominating the political arena that were the focus of this research were then critiqued from this explicit perspective using the typology provided by Levitas (1998, 2005) as described above, in which redistributive discourse can be seen as roughly equating to a strong version of social exclusion, while social integrationist discourse (emphasizing integration into the dominant social order) and moral underclass discourse (emphasizing the negative characteristics of excluded people) can both be seen as weak versions.

Concepts of social exclusion were useful in the research in differentiating between competing conceptions of the social problem of school exclusion. The explicit presence of some versions of the concept of social exclusion in the discourses under study (primarily in earlier texts) meant that this framework was particularly relevant to understanding these representations and a strong version of social exclusion was useful in providing a critical perspective on the failure of the state to uphold a universal right to education. However, in isolation, concepts of social exclusion were unable to account sufficiently for the role of public sphere discourse in processes of exclusion.

Constrained Communication

For some time now, social theorists have been raising concerns about the hegemony of neoliberalism and its implications for democracy (Bauman 1999; Bourdieu and Wacquant 2001; Fairclough 2000; Harvey 2005; Mouffe 1999; Sayer 2005). Bauman (1999, p. 4) argues that “Liberalism today boils down to the simple ‘no alternative’ credo.” Bourdieu and Wacquant (2001) describe the neoliberal discourse of political parties such as New Labour as “cultural imperialism,” which they see as “a form of symbolic violence that relies on a relationship of constrained communication to extort submission” (Bourdieu and Wacquant 2001, p. 1 emphasis original).

The key critique is that neoliberal discourses have performative power (Bourdieu and Wacquant 2001, p. 4), that is, that they are used as an instrument to both construct and evaluate social policy and that they discourage questioning by incorporating an “implacable and irreversible logic of social reality,” which disallows any alternative possibilities (Bauman 1999, p. 127).

The research described in this chapter did not set out to investigate these issues. However, issues which began to emerge from the analysis were interpreted in terms of the sociological concept of “constrained communication” (Bourdieu and Wacquant 2001). This was operationalized through the linguistic concept of “dialogicality” (Fairclough 2003) in order to investigate specific linguistic mechanisms that were identified as acting as constraints on communication. Fairclough (2000, p. 125) proposes five criteria for assessing the substantiveness of dialogue, of which three were relevant to this study:

- Access is open to whichever sections of society want to join in—there is “equality of opportunity” to join in and to contribute.
- People are free to disagree, and their differences are recognized.
- It is talk which makes a difference—it leads to action (e.g., policy change).

Interpreting the Results

The findings were interpreted using the set of five sociological questions set out above:

(A) Do New Labour’s discourses around school exclusion narrow the concept of equality?

The findings suggest that New Labour’s discourses around school exclusion between 1997 and 2006 shifted from a fairly narrow view of equality (deriving largely from social integrationist discourse) to largely eliminating concerns about equality from the discourse altogether (in the course of an overwhelming focus on moral underclass discourse). This shift can be illustrated in the changing representations of parents during the period. The research identified

assumptions in the texts throughout the period that parenting is a teachable skill and that parents can (and should) control their children's behavior. Both assumptions are rooted in a narrow view of equality which focuses on personal responsibility to the exclusion of any recognition of the role of wider social inequities (Bevir 2005; Davies 2005). Over time, the prominence of parents as social actors in the texts increased markedly, and there was a shift towards coercion rather than support. By using "responsibility" as a rhetorical device rather than a coherent concept that would allow consideration of the degree to which parents really are responsible for their children's behavior when broader social inequities are considered (Koffman 2008, p. 119), this shift virtually eliminated concern for equality from the discourse altogether.

(B) Do New Labour's discourses around school exclusion represent the world in a way which demonstrates a commitment to neoliberal values which overrides social democratic concerns?

The finding of a substantial discursive shift away from welfarist discourses (epitomized in the 1998 target to reduce exclusions) and towards punitive discourses was interpreted as a consequence of inherent conflicts in New Labour's fundamental model of society, particularly those between social democracy and neoliberalism (Levitas 2005, p. 177). The early welfarist discourses appeared, at least to some extent, to be rooted in social democratic concerns. However, textual analysis indicated that these were founded on a weak version of social exclusion that did not really engage with structural inequalities. Nevertheless, even a weak attempt to promote social inclusion inherently conflicted with what is arguably a key neoliberal reality: that the socially excluded are a functional requirement of capitalist labour markets (Byrne 2005; Harvey 2005; Smith 2007). Alongside external pressures from powerful groups within education (primarily teaching unions) and the media, this inherent conflict is a plausible explanation for the transformation of concerns about the inclusion of all children in education into punitive discourses that tended to blame the socially excluded for their own plight (Byrne 2005, p. 173; Harvey 2005, p. 185).

(C) Do New Labour's discourses around school exclusion focus on individuals rather than structures?

Social theorists have postulated discursive shifts towards individualization (Bauman 2000; Beck 2001; Byrne 2005). The findings illustrated a strong shift in that direction in New Labour's discourses around school exclusion: elements of collectivity and focus on structures, which were evident between 1997 and 2000, were supplanted from 2001 onwards by a dominant focus on the personal responsibility of individual parents and children. This individualization of the social problem became, by 2005, so pervasive as to eliminate discursive space for consideration of the role of institutional and systemic factors.

(D) Do New Labour's discourses around school exclusion background issues of power and agency?

Many of the findings were interpreted in terms of issues of power and agency. Across the period, linguistic mechanisms (such as nominalization (Fairclough 2000, pp. 54–56)) were identified that served to background the agency of

those doing the excluding (both specifically from school and in broader social exclusion terms). The role of government, schools, and teachers was backgrounded and that of capital was entirely absent. In later texts, power and agency were ascribed to those who actually have very little (e.g., through the use of warfare metaphors representing excluded children as powerful adversaries against whom the “majority” needed to be defended). These children and their parents were also ascribed total individual responsibility for their situations (with the consequent implication that they possessed the agency to effect change).

(E) Are New Labour’s discourses around school exclusion constructed in a way which tends to deflect criticism and avoid conflict?

There were indications throughout the study of a broad tendency in New Labour’s discourses around school exclusion towards deflecting criticism and avoiding conflict. The findings confirmed the presence in these texts of tendencies identified in other studies of New Labour’s discourse towards less substantive processes of consultation (Fairclough 2000, pp. 124–127): aligning the government with “the people” to deflect popular criticism (Mulderig 2006, p. 179; van Leeuwen 1996, p. 49), reduced accountability (Brown 2006; Funnell 2000), decreased dialogic engagement with other voices (Fairclough 2000, pp. 124–127), and deeply embedded assumptions that tended to exclude alternate world views (Fairclough 2003, p. 173; Ozga 2000, p. 7). Additionally, the results suggested a link between intelligibility and the avoidance of genuine dialogue with potentially critical citizenry. These findings were interpreted in terms of the assertions of Bourdieu (Bourdieu and Wacquant 2001), Bauman (1999, p. 74), and Harvey (2005, pp. 39–41) about the weakness of public sphere debate under the neoliberal government. The research concluded that the lack of dialogicality in New Labour’s discourses around school exclusion did not merely act to deflect negative criticism of policies in this area but did extend to an avoidance of engagement with critique more broadly.

The Reasons for Choosing CDA

CDA in General (and DRA in Particular) in Educational Policy Sociology

The project described in this chapter took an explicitly interdisciplinary⁷ approach. Research that seeks to analyze “real-world” social problems must engage with the full range of influences on those issues using whatever tools that provide the most

⁷ Across CDA various terms are used to describe research which goes beyond traditional disciplinary boundaries: trans (Fairclough 2005)-, inter (Van Leeuwen 2005)-, multi (van Dijk 2001)-, or even post (Jessop and Sum 2001)- disciplinary. However, recently “interdisciplinarity” seems to have become the most widely used term to describe this core aspect of CDA (Weiss and Wodak 2003; Wodak and Chilton 2005).

robust explanations, rather than being artificially constrained by disciplinary boundaries. The dialectical–relational approach to CDA is well suited to this type of research because its focus is explanation of the social problem. In addition to the extensive range of linguistic tools already available within DRA, it allows the researcher to bring additional tools under its umbrella in the practical investigation of social issues without, necessarily, requiring smooth theoretical compatibility. DRA is situated at the intersection of linguistic and social theory (Fairclough 2003) and is, therefore, particularly effective in bringing linguistic tools into the operationalization of sociological concepts.

Educational policy sociology has been widely criticized in recent years. CDA methodologies (such as the type of DRA described here) are capable of effectively addressing current concerns. The empirical investigation of sociological theory in the educational policy field has been identified as a weakness (Hallinan 2011). Even where nominally “CDA” methodologies have been used in the field, they have frequently lacked detailed linguistic analysis and the secure theoretical foundations necessary to relate linguistic features directly to sociological conclusions (Rogers et al. 2005). The CDA methodology described in this chapter makes use of empirical tools that are well suited to investigating sociological questions in areas of policy and capable of providing a rigorous analysis. While empirical investigation of this type does require the nonlinguistic researcher (such as myself) to grapple with new analytical skills, most of the CDA tools used in this study are sufficiently accessible to be effectively deployed in textual analysis at a relatively early stage of familiarity. What is essential is for the researcher to risk going beyond a sociological reading of the texts and engage in detailed textual analysis.

Policy sociology has also been criticized for its implicit redemptive agenda and lack of effective impact on policy making (Lauder et al. 2010). This research illustrates that, rather than denying redemptive goals, one approach to addressing this criticism is to make the normative element explicit (Balarin et al. 2011; Sayer 2009, 2011). This project also recognizes the limited likelihood of direct impact on policy makers since the research findings themselves suggest that policy makers are unlikely to be open to such dialogue. Instead, following the structure provided by DRA (Fairclough 2009 pp. 171–174), the project sought to empower those seeking to challenge those dominant discourses with specific strategies for doing so.

CDA was particularly suitable for this project because of its flexibility. It is not one single methodology, but allows a variety of positions on philosophical grounding, theory, and methods (see Wodak and Meyer 2009b for an overview of the main approaches). Using CDA allowed the project to draw on tools best suited to particular sociological issues and/or types of textual analysis, while remaining under the broad umbrella of CDA, and to draw together the analyses using Fairclough’s dialectical–relational approach as a unifying framework (1989, 1992, 2001, 2003, 2009). As a result the project was able to bring together insights from approaches as diverse as Van Leeuwen’s (1996) work on the representation of social actors; Van Dijk (1998, 2006, 2008) on ideology; Wodak (Reisigl and Wodak 2001) on argumentation; Baker (2006), (Baker et al. 2008), Mulderrig (2006, 2008, 2009), and Mautner (2009) on the application of corpus analysis to

CDA; Fauconnier and Turner (2002) on blending theory; and Hart (2006, 2007, 2008) on the application of blending theory to CDA.

The use of CDA also addresses the difficulty policy sociology in educational research has had in trying to keep up with the growing importance of rhetorical practice in not merely communicating but also creating and enacting policy (Walford 1994). It has been argued that:

educational researchers need to develop sophisticated methodologies for investigating these power discourses. Without such methodologies, our understanding of the process of policy formation will be underdeveloped, naive and sometimes inaccurate. (Walford 1994, p. 9)

The CDA approach used in this project is just such a sophisticated methodology.

The Strengths of CDA for This Topic

The research benefited from CDA's ability to recognize what is not present in a text as well as what is. CDA has this capability because, unlike approaches such as thematic analysis and content analysis that depend on topics and content derived from the texts themselves, CDA relies on linguistic categories for its core operationalizations (Wodak and Meyer 2009a, p. 28). This project was thus able to recognize that the target to reduce exclusions and the whole concept of social exclusion were entirely absent from later texts. Without this recognition, the research would have been trapped within the definitions of the social problem contained in the texts. Since the texts themselves do not acknowledge (and in some cases actively deny) any change in policy, this would have meant uncritically accepting the shift from seeing school exclusion as the problem to seeing badly behaving children as the problem. Instead, using CDA allowed the research access to a perspective from which to recognize and investigate this key discursive change.

The research also benefited from CDA's ability to show how discourse is shaped by relations of power and ideologies (Fairclough 1992, p. 12), rather than simply describing how participants in the discourse represent themselves (as in narrative analysis). For example, in analyzing a statement such as "Our actions on exclusion reflect our values and those of the British people" (Blair 1997a, emphasis added), the use of relations of parataxis⁸ to co-opt a homogenized citizenry as sharing equivalent values to those of the government was identified. Identifying the power relations and ideological content of the texts contributed to the developing explanation of how opportunities for critique were being curtailed.

⁸ Grammatical distinctions between the ways in which clauses are related to each other can be made in terms of parataxis, hypotaxis, and embedded clauses. Parataxis describes clauses which are in a relation of equivalence, often joined by a conjunction such as "and" or included as elements in a list.

Weaknesses of CDA for This Topic and How These Were Addressed

CDA is always open to criticism from different epistemological perspectives that it cannot do what it claims (Jones 2007). This was addressed in this research by making epistemological assumptions explicit. Jones' position is that CDA is incapable of producing meaningful analysis because the use of analytical techniques based on systemic functional linguistics (Halliday 1994) forces the analyst to separate out semiotic aspects of social interaction from their context. This is based on a misunderstanding of CDA's epistemological assumptions and was addressed by making the dialectical view of the relationship between discourse and society explicit and ensuring that linguistic and sociological analyses were strongly integrated throughout the research.

Both CDA (Widdowson 2004) and policy sociology (Lauder et al. 2010) have been criticized for unacknowledged ideological bias in analysis. These concerns were addressed in this project by making the researcher's ideological position explicit from the outset, using robust and valid data selection, transparent analytical techniques grounded in corpus analysis, and methodological triangulation. As a researcher I came to this study with a preexisting interest in social relations of domination, a belief in the internationally recognized human rights of people and in social equality as a normative goal. CDA research requires the researcher to make ideological positions explicit not only in order to reflect on and minimize potential bias but also in order to engage in moral debate about avoidable suffering (Sayer 2009). CDA research is most effective in engaging in such debate where it is demonstrably robust. The influence of my ideological position can be seen in the normative interpretation that goes beyond the finding that the dominant discourse contributes to perpetuating school exclusion to conclude that the dominant discourse is contributing to avoidable suffering and **should** be resisted. But this interpretation is built on an analysis which uses explicit and defensible data selection, findings from a larger corpus to support findings from close text analysis of a small number of texts, and findings supported from multiple strands of the research using different textual analysis tools.

Nevertheless, applying CDA to research on school exclusion was not without its difficulties. A particular challenge was the degree to which conclusions about discursive change could be related to the level of exclusions. Discursive representations and legitimations cannot automatically be translated into effects. The research was, therefore, unable to make direct causal claims.

One approach to addressing this issue would have been to carry out a reception study focusing on how the dominant discourses were being received and interpreted by social actors directly involved in school exclusion decisions, such as headteachers. Unfortunately, as yet, DRA lacks a theoretical account of discourse reception, although other CDA approaches (such as the discourse–historical approach) have made some headway in this area (Koller 2008). In addition there were a number of other factors which would have made researching discourse

reception in this project highly problematic. Interviewing those who read/receive texts is unlikely to account adequately for (a) the influence of wider exposure to dominant discourses through sources that the interviewee does not remember or is not consciously aware of or (b) effects of exposure to the dominant discourse of which the interviewee is not themselves consciously aware. And it is these two effects (i.e., those of which discourse participants are not consciously aware) which CDA is most interested in and which this project sought to investigate.

Instead, then, this weakness was partially compensated for through the use of CBT which contributes something of the cognitive perspective that DRA lacks (Fairclough 2009, p. 183). For example, analyzing the conceptual blending of very unbalanced realities with the concept of balance complemented findings from the qualitative analysis in furthering understandings of how dialogicality was being reduced through the exclusion from the discourse of potential avenues of critique. The project also considered intertextual connections that provided some insights into how some of the texts in this study were recontextualized in other texts. Nevertheless, it is important to recognize that this study did not directly analyze how these policy texts were received by those who read or heard them.

Overall it is fair to say that definitive causality is extremely difficult to establish in relation to discourse. This is generally true of structural factors in school exclusion and contributes to the tendency in existing research towards an overemphasis on the role of individual agency (because that is what is readily measurable). The CDA approach taken in this project allowed it to contribute to redressing that balance when taken as a contribution to the overall explanation of the social problem, extending the multilevel analyses of school exclusion already available to include the role of political discourse.

Impact on the Topic of Using This Approach

The CDA-based research described here brings to explanatory accounts of school exclusion a discursive perspective and a focus on powerful social actors that had previously been absent. The use of CDA has drawn attention to the important role of powerful discourses, government, media, and union, in both shaping and implementing the educational policy in this area. The existing literature has frequently bemoaned the direction of school discipline policy (Parsons 2005), but has not been able to provide an account of how and why that direction seems fixed. A CDA approach to the problem contributes an understanding of discursive cycles that perpetuate the dominant punitive discourses and, through the concept of dialogicality, an account of the decreasing openness of those discourses to critique.

The DRA framework employed in this research led to the identification of specific strategies with the potential to oppose the dominant discourse. This is a particularly important element of the approach. Research that takes a moral position on social issues is of limited use if avoidable social harm is identified, but strategies for its amelioration are not. By making explicit some of the hidden assumptions and

ideology of New Labour's discourses around school exclusion, CDA is capable of contributing to countering discursive strategies that seek to disguise changes that impose punitive policies on already marginalized children and parents and to dodge critique that seeks to challenge the hegemony of a neoliberal world view.

The Role of Interpretation in This Research

Interpretation was key throughout this research. The interpretive process began (as always in research) with the framing of the research problem. The usual framings of the issue of school exclusion in terms of either identifying the "risk factors" which make children more likely to be excluded from school or interpreting the accounts of those involved in and affected by exclusion tend to overemphasize the agency of children themselves. The lens provided by DRA reframed the issue in a discourse-orientated way that shifted the focus towards structure. This produced questions and answers that, rather than being about what is wrong with children or how families experience exclusion, were about how social events and social actors were represented in New Labour's discourses and about power relations in the education system.

Throughout the research overarching concepts that draw on both linguistic and social theories were used to interpret the findings from disparate analyses and develop a coherent explanation of the social problem. Each of these contributed to interpreting the texts in particular ways.

Representations of Social Events and Social Actors

Analyzing the texts in terms of the representations of social events and social actors that they contained (and that they did not contain) assumes that such representations are crucial in the dissemination and reproduction of dominant ideologies (Fairclough 1989, p. 3; van Dijk 1998, p. 191). The most influential ideologies are often those that are the most deeply embedded and least explicit (Wodak and Meyer 2009a, p. 8). It is through these ideologies that discourses manufacture consent or at least acquiescence (Fairclough 1989, pp. 3–4). Ideological discourses play a particularly crucial role in policy texts (Fairclough et al. 2011; Muntigl et al. 2000). Consequently throughout this study, a central focus of the analysis was the identification of ideological values and assumptions that underlie—but are not explicitly expressed in—government texts. Weiss and Wodak (2003, p. 14) contend that CDA aims to "'demystify' discourses by deciphering ideologies." In this research identifying and making explicit such latent values and assumptions was a core component of investigating the discursive processes through which consent to government policies around school exclusion is produced.

Legitimation

In the research, many findings were interpreted in terms of legitimation strategies:

In liberal democratic systems, political elites have to give rational reasons for what they propose or what they have done (Parsons 1995, p. 16)

so legitimation is a primary purpose of political discourse (Fairclough 1989, p. 90). For example, the finding of strongly negative representations of excluded children and their parents in later texts was interpreted as “negative other presentation.” This has repeatedly been identified as a key legitimation strategy in political discourse, particularly discourses that seek to maintain an ideological situation of dominance between social groups (Reisigl and Wodak 2001, p. 44; Riggins 1997, p. 6; van Dijk 1998, pp. 257–258).

Unequal power relations are embedded in the education system. According to Bernstein, “Pedagogic communication is a relay for patterns of dominance external to itself” (1990, pp. 168–169). Despite New Labour’s claims about creating “equality of opportunity” (Blunkett 1997) which imply that the education system is a level playing field in which all children have an equal chance, there is consistent evidence that the UK education system does largely reproduce the social relations of wider society (Trades Union Congress 2008) and that it does so to a greater extent than the education systems of many other countries (OECD 2008). Indeed the legitimization of preexisting social inequality has been argued to have become a primary function of the education system (Parsons 1999, p. 17). Children who behave, or are labeled as behaving, unacceptably in school can be conceptualized as resisting (Sayer 2005, pp. 30–35, 159) the existing power relations of the education system. Educational researchers have repeatedly argued that such resistance is frequently construed in ways that reinforce these power relations (Munn and Lloyd 2005; Parsons 1999, 2005).

The intertextual connections and discursive shifts identified in the research were interpreted in terms of a reactive process that powerfully influences the direction of political discourses and policy on school exclusion (in their dialectical relationship) towards such reinforcing construals. The early New Labour government policy to reduce school exclusion was unpopular with powerful social actors within the education system (particularly the teaching unions) and media. The government’s response to that criticism can be seen as a continual process of appeasement and attempts to placate through policy responses that achieve immediate and readily understandable “action.”

Increasingly negative representations of some children and parents were thus interpreted as legitimation strategies for increasingly punitive policies. Both were seen as being driven by the government’s need to assuage electoral anxiety by responding to the demands of socially powerful groups (Lister 2001; Pitts 2000). Negative representations led to an increased perception of threat from this group of children and parents. In turn that led to demands for action to address the perceived threat from powerful social actors. Punitive policies were thus needed in order to placate these demands for action. The legitimation of those policies then required

even more negative and “othering” representations of children and parents. Accusations of unfairness in the extent of negative representations were countered with discourses of individual responsibility; such characterizations were justified as a naturalistic or inevitable response to their behavior (Cook 2006).

Dialogicality

The concept of dialogicality (Fairclough 2003, p. 42) was used throughout the research to interpret findings in terms of their implications for governance rather than for educational policy. The research found that New Labour’s discourses in this policy area were never particularly dialogical, being very much more promotional than genuinely consultative. This is consistent with the findings of other linguistic (Fairclough 2000, pp. 132–141) and political (Bevir 2005, p. 148–153) analyses of New Labour’s style of governance. The findings also indicated that, at least in this area of social policy, the limited degree of dialogicality present in early texts reduced still further in later texts. Moreover the degree to which the lack of substantive dialogue was camouflaged by texts with superficially dialogical traits appeared to have increased over time, shifting from avoiding engaging with dissenting voices towards an increasing denial of the possibility of dissent at all.

If government texts are not open to different and dissenting views, then policies are less open to being challenged or contested. This is what Brown (2006, p. 695) describes as neoliberalism’s “business approach to governing,” in which the promotion of a political “product” has become more important than any conception of the social good. The project thus saw the resulting reduction in substantive public debate about policies in this area as allowing the development of policies on the basis of that which is politically expedient rather than morally justifiable.

Decreasing dialogicality in New Labour’s discourse implied a reduction in government accountability through the minimization or elimination of opportunities for critique of government actions. The period studied was one in which the real power of other social actors in the education system (heads, LEAs, etc.) was being eroded and the centralization of powers in the hands of the government had increased (Bache 2003, p. 312). Thus, the government had become less accountable for policy in this area at the same time as its power had actually increased. This was interpreted in terms of hegemony, which was defined as an attempt to close down practices and networks of practices, which can be undermined by new opportunities for resistance generated by the diversity and unpredictability of social practices, but constrained by variations in the ability of different social groups to access semiotic possibilities (Chouliaraki and Fairclough 1999, p. 25). The hegemony of neoliberalism is thus reinforced by the decreasing dialogicality of New Labour’s discourse, making attempts to resist social injustice increasingly difficult by minimizing or even eliminating spaces in which counter-hegemonic discourses might be constructed. The finding that the absence of dialogicality in New Labour’s

discourse was being disguised in later texts was thus interpreted as compounding the hegemony of neoliberal discourse by making it more difficult for citizens not only to engage in substantive dialogue with the government but even to contest the lack of dialogue itself.

As Fairclough describes it following an analysis of New Labour's discourses around welfare reform:

Language has been used to promote the outcomes that the Government is seeking. The precise management of that process has inevitably had the effect of discouraging dialogue and making it more difficult – it is very difficult to engage in real dialogue with someone whose every word is strategically calculated. Discouraging dialogue means discouraging democracy. . . . (Fairclough 2000, p. 132)

Dissent and critique have a vital role to play in the process of democratic governance. Public debate promotes the development of better answers to social problems, in which the needs and rights of competing social groups are balanced through the give and take of dialogue. As Bauman argues:

No society which forgets the art of asking questions or allows this art to fall into disuse can count on finding answers to the problems that beset it – certainly not before it is too late and the answers, however correct, have become irrelevant. (Bauman 1999, p. 7)

Without the process of dialogue, social problems will not be resolved. The powerful will simply continue to assert their power unchecked.

Bauman argues for the role of intellectuals in reopening the public sphere to real debate:

where not just the selection from the choices on offer is made, but the range of choices is examined, questioned and renegotiated. (Bauman 1999, p. 107)

This research attempted to examine, question and renegotiate the range of choices offered in New Labour's discourses for dealing with the social problem of school exclusion.

The Role of the Researcher

Research using DRA does not require the researcher to step outside the society they are researching, but rather to engage with it (Sayer 2009). In 1997 I listened to Tony Blair's very first speech as Prime Minister. Having known nothing but Conservative government to that point in my life, I hoped for progress towards a fairer, more equal society. In that speech he focused on social exclusion, saying:

For 18 years, the poorest people in our country have been forgotten by government. They have been left out of growing prosperity, told that they were not needed, ignored by the Government except for the purpose of blaming them. I want that to change. There will be no forgotten people in the Britain I want to build. (Blair 1997b)

By 2005, however, my expectations had dampened. Listening once again to Tony Blair, I was struck by the contrast with the way he had talked 8 years earlier.

He was still talking about people on the margins of society, but his focus seemed very different:

I think the first question should be: how do we protect the majority from the dangerous and irresponsible minority? (Blair 2005)

I wondered when Tony Blair had begun to talk so differently about such issues and to what extent my emotional reactions reflected actual change in that talk. These were, after all, isolated speeches and my reactions at this point were personal rather than the product of systematic analysis. Using a CDA methodology allowed me to go from that emotional reaction to the research described in this chapter through a process of reflexivity, the deployment of systematic strategies for data collection and analysis and defensible frameworks for interpretation. But, it also allowed the interpretation of the findings in terms of a moral argument favoring the avoidance of suffering.

2.2 Interpreting Websites in Educational Contexts: A Social-Semiotic, Multimodal Approach

Emilia Djonov, John S. Knox, and Sumin Zhao

The World Wide Web is the world's largest hypermedia environment. The ability to use it effectively to locate or present information in ways that foster knowledge construction and critical engagement is essential for success in many educational and professional contexts. This chapter presents three research projects, each of which addresses a different challenge that websites present for discourse analysis and educational research. The projects all take a social-semiotic, multimodal approach to analysing the design and/or use of online hypermedia, yet also incorporate insights from diverse academic and professional fields, in order to develop solutions to these challenges.

This chapter is organized into four sections. Section “[Introduction](#)” orients readers to the distinguishing features of websites as online hypermedia texts and the challenges they present. Section “[A Social-Semiotic, Multimodal Approach to Hypermedia](#)” introduces the common approach adopted by the three studies, each of which is described in section “[Three Social-Semiotic Projects on Hypermedia](#)”, and section “[The Role of Interpretation](#)” discusses the role of interpretation across these studies.

Introduction

What Is Hypermedia?

The term ‘hypermedia’ is nowadays used interchangeably with ‘hypertext’ as it describes any hypertext featuring both typographic and non-typographic elements and is no longer restricted to hypertext with sound and/or video. Hypertext has two fundamental components: nodes and hyperlinks. *Nodes* present information through a variety of communicative modes, that is, multimodally—using verbal and visual and increasingly also aural and kinetic semiotic resources.

Nodes typically include anchors. An *anchor* is a clickable area from which hypertext users can activate a hyperlink and visit another node. So, the anchor is what the reader clicks; the *hyperlink* is the connection (the *link*) between one node and another. Anchors then allow nodes to function as an interface for navigating through hypertext.

While hypermedia include CD-ROMs and ‘closed’ spaces such as intranets, the world’s largest and most complex hypermedia environment is undoubtedly the World Wide Web. On the Web, nodes are *webpages* (HTML documents opened with a Web browser such as Google Chrome or Mozilla Firefox) and a group of webpages that displays cohesion, and coherence (i.e., functions as a text) is called a *website*.

Three Perspectives on Hypermedia

The roles of hypermedia in professional, educational, and recreational contexts have been explored in various disciplines, including computer and information science; literary, cultural, and media studies; education; and linguistics. Adopting the three complementary perspectives recognized by Lemke (2002b), these studies can be classified according to their tendency to view hypermedia as (i) digital technology for realizing hypertext, (ii) a platform for integrating multiple media/channels of communication (e.g., aural, visual, haptic, i.e., touch based), and/or (iii) content/text, that is, in terms of its meaning-making potential.

The first of these complementary perspectives dominates research on the similarities and differences between hypermedia and other technologies such as print or TV. It also characterizes efforts to support the development of computer and information literacy skills, including familiarity with specific software and hardware, information retrieval skills, and the ability to evaluate the authorship, validity, currency, and appropriateness of information on the Web (e.g., Large and Beheshti 2000; Rader 2003; Stern 2003).

The second is typical of empirical research that argues that instructional design can support learning better when information is simultaneously presented through

mixed channels, rather than a single one, and interactively, so that the learner has control over the pace and sequence in which it is presented (e.g., Mayer 2009).

The third perspective motivates most studies of hypermedia in applied linguistics and multiliteracies education, which is the main perspective adopted in the three projects presented in this chapter. This perspective focuses on the meaning-making potential of hypermedia, while acknowledging that it is influenced by the technology and media that materialize it. It is also reflected in the idea that literacy in hypermedia environments, or hypermedia literacy, extends beyond computer and information literacy skills and includes the ability to interpret the meanings of hypermedia texts such as websites critically, in relation to the sociocultural contexts in which they operate (see Bigum 2002; Burbules 2002; Lankshear and Knobel 2008).

Websites as Hypermedia Texts and the Challenges They Present for Discourse Analysis and Education

Meaning in hypermedia texts is construed through the interaction of hyperlinks with various semiotic resources such as language, typography, layout, color, sound, and movement. Hyperlinks may connect nodes that belong to the same or different texts, activate an application other than the user's Web browser, or link existing to newly designed nodes. *Hypertextuality* is the presence of hyperlinks. It allows designers to establish potential sequences of nodes, and allows users to forge actual paths through hypertext by selecting which nodes from one or more texts to visit and in what order. Users usually explore hypermedia environments by focusing on one node at a time and switching between three dominant *modes of hypertext use*: *searching/information retrieval*, *browsing* (navigation aimed at fulfilling a specific task, such as looking for a cooking recipe), and *free navigation* (exploring hypermedia with a more general interest such as browsing through news of the day). They may also redesign and contribute hypermedia content, particularly in Web 2.0 spaces such as personal blogs, Facebook, and Twitter. Hypertextuality thus renders hypermedia texts multi-sequential, fragmentary, and—especially on the Web—open-ended and transient and defies the notion of text as a unit bound in space and/or time.

Although hyperlinks reveal the presence of meaningful relations within and between hypermedia texts (Burbules 2002), the meaning of these relations (e.g., similarity, temporal sequence, exemplification) can only be revealed by their *multimodality*, the interplay of semiotic resources within and across nodes. In fact, meaningful relations may be constructed within nodes as well as between nodes or groups of nodes not hyperlinked with each other or visited in a user's navigation path (Djonov 2005). The meaning of hypermedia texts is thus contingent on the potential of language and other semiotic modes to make meaning, independently and in collaboration with each other. To analyze hypermedia texts and support hypermedia

literacy, then, researchers and educators require a metalanguage for describing and interpreting multimodal interaction (cf. New London Group 1996).

A further challenge that many websites present for discourse analysis and educational research is generic complexity. Websites for children, for instance, are frequently labeled “edutainment” or “infotainment,” as they address a dual audience and have a hybrid purpose: to educate/inform and entertain children, while seeking the approval of educators and caregivers (Djonov 2008). The flexibility of hypermedia design conventions and the ease with which different modes and media can be digitally combined and manipulated have also contributed to the emergence of new genres alongside genres adopted from traditional media (Baldry and Thibault 2006), for instance, the emergent visual genre of online news galleries in news websites (Caple and Knox 2012) and multimodal history genres such as the visual autobiographic recount found in online learning materials (Zhao 2011).

The hypertextuality, multimodality, and generic complexity of websites present considerable challenges for discourse analysis as well as major practical issues for educational research. Practitioners and researchers ultimately aim to understand how to design and use such texts so as to support (i) user orientation, (ii) knowledge construction and learning, and (iii) critical engagement with website content.

A Social-Semiotic, Multimodal Approach to Hypermedia

Social semiotics is the study of meaning-making resources and their use in social contexts and originates in Halliday’s (1978) theory of language as a social semiotic—systemic functional linguistics (SFL). Social-semiotic theory provides a highly suitable basis for developing tools for analyzing the design and use of websites and for addressing the challenges hypermedia texts present for discourse analysis and education. It also allows analysts to incorporate insights from diverse professional and academic fields.

Central to the theory is the definition of *text* as “a social exchange of meanings” (Halliday 1985, p. 11). The definition implies neither linearity nor finiteness, so that a text can be any act of communication perceived as meaningful in the social context in which it is produced or received or having “socially ascribed unity” (Hodge and Kress 1988, p. 6). This has motivated researchers to develop social-semiotic tools for analysing both generically complex texts (e.g., Lemke 2002a; Martin 2002b) and hypermedia texts (e.g., Baldry and Thibault 2006; Djonov 2005; Knox 2009a; Kok 2004; Lemke 2002b; Unsworth 2004; Van Leeuwen 2005a; Zhao 2011).

The theory’s primary focus on meaning has also made its central principles adaptable to the study of multimodality. Social-semiotic research on multimodal discourse typically focuses on developing frameworks for studying the meaning-making potential of both modes other than language such as visual design (Kress and Van Leeuwen 2006 [1996]) and sound (Van Leeuwen 1999) and of their interaction with each other and with language. Indeed, social-semiotic theory views all meaning-making as multimodal, for any act of communication that

involves making choices from different semiotic resources (e.g., sound, gesture, typography, etc.) and combining these selections following the logic of space (e.g., on a visual unit such as a page) and/or time (e.g., in a dynamic composition such as a dance) (Kress 2010).

Multimodality, while the norm in communication, is relatively new as a defined area of study, and agreement is yet to be reached on fundamental notions such as “mode” and “semiotic resource” (Bateman 2011; Kress 2009). A shared understanding, however, is that the meanings created through multimodal or intersemiotic interaction are “multiplicative” in nature or greater than the sum of the meanings that each semiotic resource could realize alone (Lemke 1998).

The focus on meaning is evident in one of social-semiotic theory’s central tenets, its model of the mutually defining and dynamic relationship between text and context. For instance, texts can be classified in terms of the social purpose they serve (e.g., to entertain, to explain, to invite, etc.) within a given context of culture. The systematic relationship between social purpose and identifiable patterns of meaning observable across texts is captured in the social-semiotic definition of *genres* as:

staged, goal-oriented social processes. Staged because it usually takes more than one step to reach our goals; goal-oriented because we feel frustrated if we don’t accomplish the final steps . . . social because writers shape their texts for readers of particular kinds. (Martin and Rose 2008, p. 6)

While this definition focuses primarily on short, linearly unfolding verbal texts typically with a single, clear purpose, it has been adapted to multimodal texts by recognizing that multimodal genres may rely on the logic of space and time to present genre-specific patterns of meaningful choices and that such patterns may be realized nonverbally and/or through different modes (Bateman 2008; Van Leeuwen 2005b).

Social-semiotic theory also explores changes in the relationship between text and context over time, through the scale of semogenesis. *Semogenesis* concerns changes in the meaning potential of different semiotic modes and genres and comprises three main time frames: *logogenesis* (the unfolding of a text), *ontogenesis* (the development of the individual), and *phylogenesis* (the evolution of systems comprising the meaning potential of a culture). Each time frame provides a lens for focusing on a different type of semiotic change.

Analyzing hypermedia from a social-semiotic perspective, then, involves understanding the meaning-making potential of the interaction between multimodality and hypertextuality and the relationship between the meanings of hypermedia texts and the social context in which they operate. This is encapsulated in Lemke’s notion of “hypermodality”:

Hypermodality is one way to name the new interactions of word-, image-, and sound-based meanings in hypermedia [. . .]. It is not simply that we juxtapose image, text, and sound; we design multiple interconnections among them, both potential and explicit.

Hypermodality is the conflation of multimodality and hypertextuality. Not only do we have linkages among text units of various scales, but we have linkages among text units, visual elements, and sound units. And these go beyond the default conventions of traditional multimodal genres. (Lemke 2002b, pp. 300–301, original emphasis)

Three Social-Semiotic Projects on Hypermedia

This section offers an overview of the three research projects on hypermedia texts presented in this paper, each of which addresses a different challenge presented by the use of hypermedia in educational contexts. These projects focus on:

- User orientation within websites for children (Djonov 2005, 2007, 2008)
- Knowledge construction in online educational multimedia interactives for children (Zhao 2008, 2010, 2011)
- Visual design in online newspapers (Knox 2007, 2009a, b, c) and its relation to cultural and institutional contexts and the potential and challenges of using online newspapers in TESOL and applied linguistics teaching (Knox 2008, 2010)

This section describes each project in terms of its data, methodology, use of insights from professional and theoretical fields beyond social semiotics, and main findings of relevance to understanding hypermedia in educational contexts.

User Orientation in Websites for Children

This project aimed to develop a framework for analysing (i) how information is organized in websites and (ii) how visual, verbal, aural, and kinetic resources can interact with hyperlinks to signal this organization and thereby support user orientation. This aim was motivated by studies in computer and information science as well as hypermedia design and use according to which user orientation relies on understanding how information is organized in hypermedia environments (e.g., Edwards and Hardman 1989; Krug 2006 [2000]) and by educational research that viewed successful orientation as contingent on two factors: users' skills in using visual, verbal, and other cues to conceptualize the structure of a hypermedia text (Downes and Fatouros 1995, p. 104; Moore 1996, p. 322) and their "understanding of the relations among ideas" presented in the text (Luke 2000, p. 73).

Websites for upper primary school children were selected as a fertile ground for developing this framework for two main reasons. First, these websites epitomize the challenges of multimodality and generic hybridity which hypermedia presents for discourse analysis and literacy education. At the beginning of the project, children's websites were considerably more likely than other websites to use not only visual and verbal resources but also sound and animation (e.g., rollovers—anchors that change their appearance, move or make sounds when the cursor is placed over them) to signal the ways in which information was organized in them. Most children's websites are also generically hybrid as they aim to both entertain and educate/inform children (their overt addressees), perhaps due to the fact that, like other products for children, children's websites seek to gain the endorsement of a covert audience of adult censors such as teachers and parents. Second, children's websites were more likely to be used and designed for browsing and free navigation

(rather than information retrieval), the two modes of hypertext use where the ability to draw on multimodal relations in order to conceptualize the organization of information within a website is crucial for user orientation.

Specifically, five websites designed by adults for primary school children were selected for developing the framework:

- *ABC's The Playground* (Australian Broadcasting Corporation, 1998–2004)
- *Sanford—A Lifetime of Color* (Sanford Ink Corporation, 1998–2005)
- *CBBC Newsround* (British Broadcasting Corporation, 2001–2004)
- *National Geographic Kids* (National Geographic Society, 1996–2005)
- *TryScience* (New York Hall of Science, 1999–2005).

Each was owned by a well-established company or organization and had existed for at least 3 years, offered rich content organized into many different sections and subsections, and included sections addressing parents and educators and was listed in the two then most popular Web directories for children—*Yahooligans* (Yahoo! Inc. 1996–2005) and *KidsClick!* (Ramapo Catskill Library 1995–2005), both maintained by adults (Web developers, educators, and librarians) and served the hybrid purpose of providing “edutainment” or “infotainment.” These selection criteria were adopted to ensure that the five websites were representative of children’s websites in general, yet offered enough variety to build a framework that was rich enough to adopt for and/or adapt to the analysis of other websites.

A sixth website, *Tracking Trains* (State Rail Authority of New South Wales, 2000–2002), was also analyzed together with the navigation paths of 14 upper primary school students through it, which were recorded as individual log files showing the order in which webpages/URLs were visited and the duration of each webpage visit in each student’s navigation through the website. These log files were used to illustrate how the framework could be employed to analyze and evaluate website use and its interaction with website design. This website was selected to suit both the theme of local transport that the participants were exploring in the science and technology class in which their paths were recorded and the project’s focus on edutainment and infotainment websites for children. Interviews with the children, their teacher, and the designers of *ABC's The Playground*, *National Geographic Kids*, and *Tracking Trains* were also conducted.

While systemic functional linguistics (Halliday and Hasan 1976; Halliday and Matthiessen 2004; Martin 1992; Martin and Rose 2007) provided tools for studying the role of verbal resources in signaling how information is organized within a website, social-semiotic frameworks for analyzing visual and multimodal discourse (e.g., Kress and Van Leeuwen 2001, 2006 [1996]; Martin 2002a; Thibault 2001; Van Leeuwen 2005a) were employed for identifying the contribution of resources such as color, layout, and movement and of their interaction with language and with each other.

The main methodological challenge consisted in adapting tools originally developed for analyzing verbal texts to hypermedia. Specifically, the notion of hierarchy of Themes (Martin 1992) provided a basis for reconceptualizing website hierarchy as an aspect of the textual organization of meaning in websites. This

reconceptualization was then used to build a system for describing the potential of hypertextual relations (those whose presence is signaled by hyperlinks) to reveal, transcend, or obscure a website's hierarchical structure and thereby support or hinder user orientation.

Parameters for describing conjunctive relations in language (e.g., similarity, contrast, cause) were also adapted to hypermedia in building a system for analyzing the relations that can obtain between elements presented in different (combinations of) modes within and between (groups of) webpages, which may or may not be hyperlinked with each other.

Finally, the two systems were employed to explore the interaction between the design of *Tracking Trains* and students' navigation paths through the website. This exploration was limited to hypertextual relations only as these lend themselves to both quantitative and qualitative analyses. The analysis of the website's design was further restricted to relations originating from (i.e., anchors found on) webpages representing the top three levels of website structure—the homepage, the main pages of website sections, and the main pages of website subsections.

The framework for analyzing how information is organized in websites and the results of the analysis of *Tracking Trains*' design and use were interpreted in the light of insights derived from the professional literature on hypermedia design and use, from research in information and computer science, ICT in education, and literary, cultural, and discourse studies of hypertext, as well as from the researcher's observations of the students' navigation through the website and interviews with the students, their teacher, and an educational consultant who was involved in redesigning *Tracking Trains*. For instance, the homepage was suggested as the topmost level in a website's hierarchical organization in both website usability studies (where it was seen as the main point of entry to a website, with the levels of other webpages determined by how many clicks away they are from the homepage) and in information architecture for the Web (where the homepage is seen as representing the organization of content in the website as a whole).

This project produced analytical tools and findings that extended existing understanding of website design and use in education, while remaining adaptable to hypermedia in general.

Website hierarchy had been widely acknowledged as the key principle for organizing information in the professional Web design and usability literature (e.g., Garrett 2003; Krug 2006 [2000]; Nielsen and Tahir 2002), yet existing definitions of the term tended to consider the role of navigation, webpage design, or website content in isolation. These perspectives were reconciled by adopting the SFL notion of Theme as a resource for creating cohesion by packaging information into unified wholes such as chapters, paragraphs, and clauses and reconceptualizing website structure as comprising hierarchies of Themes.

Within this structure, a website's homepage typically serves as the website's highest-level Theme (macro-Themeⁿ) as it orients users to the website as a whole. Through the use of language and images, it provides information about the website's subject matter/content. It can also present, say, a children's infotainment website such as *CBBC Newsround* as an up-to-date and reliable source of

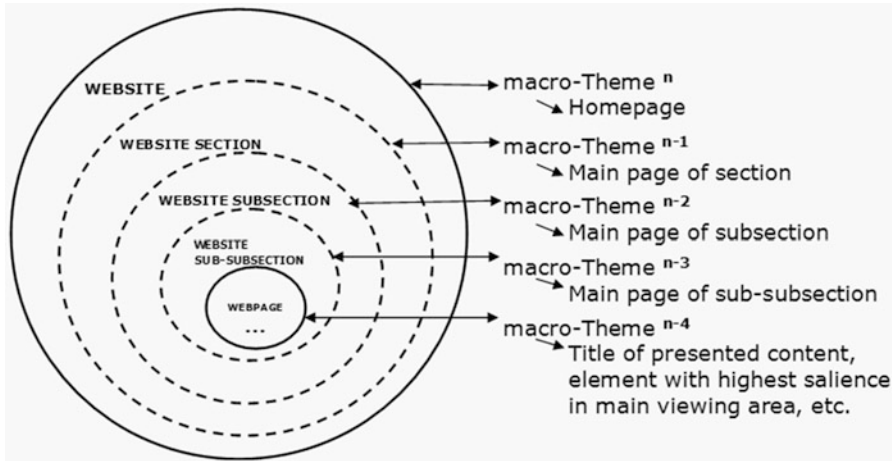

Fig. 1 A hierarchy of Themes in website structure

information that complies with social norms related to products for children. Further, by displaying anchors to the website's main sections (in the form of section icons, titles, or icon-and-title combinations) and any new features/stories/games, the homepage points cataphorically (i.e., forwards in the text) to them and by presenting these anchors as similar or different from each other (e.g., through visual design principles) can construct different types of relations between website sections on one hand and between website sections and the website as a whole on the other. Similarly, the main page of a website section can be considered as the highest-level Theme of that section (i.e., as a Theme below the level of the homepage, macro-Themeⁿ⁻¹) and the main page of a subsection as the highest-level Theme for that subsection (macro-Themeⁿ⁻²).

Thus—in analogy to the relationship between the title of a chapter in a book, the first clause/s in a paragraph within that chapter, and the Theme of a clause within that paragraph—the relationship between the homepage, the main page of a website's section, the main page of a subsection of that section, and so on, can be modeled as a hierarchy of Themes, as represented in Fig. 1. Reflecting the multilinearity and potential for expandability and change of websites as hypermedia texts, the addition of a new website section, subsection, subsubsection, and so on is modeled as giving rise to a separate hierarchy of Themes (see further Djonov 2007).

While webpage design is the key means for signaling how website content is organized into sections and subsections, hyperlinks have the potential to transcend (e.g., by taking users outside the website), reveal, or obscure a website's hierarchical structure. To describe this potential, this project used the reconceptualization of website hierarchy as the basis for designing a system of hypertextual distance relations (presented in Djonov 2005, 2008). The system reveals that hyperlinks can obscure a website's structure if they allow users to skip pages that function as higher-level Themes (which Web usability studies had shown to be essential for

Table 1 Parameters for describing logico-semantic relations in hypermedia

Explicitness	The extent to which the presence and the meaning of the relationship are explicitly signaled
Scope	The size of the related units (e.g., elements within a webpage, webpages, groups of webpages, website as a whole)
Interdependency and directionality	Whether a related unit depends on first interpreting and/or accessing the other unit/s in the relationship and how this affects the direction in which the relationship is actualized in a user's navigation path and/or interpreted (e.g., from website as a whole (represented by the homepage and the website logo)/general to its sections/particular or vice versa)
Recursion	Whether a relationship is presented as self-contained or as part of a chain of relationships
Orientation	Internal (revealing aspects of the organization of the text itself) vs. external (construing entities as related in the text-external world)
Type	The meaning of the relationship (e.g., exemplification, similarity, contrast, cause, purpose, projection, etc.)

successful orientation) in their navigation through a website, for example, to visit a news story page directly from the homepage (without having to first visit the main page of the section to which that story belongs), to return to the homepage directly from that story page, or to jump from one website section to another website section (without having to go through the homepage).

Although potentially increasing disorientation, these hyperlinks enable freedom of navigation and are therefore indispensable for a website's attractiveness. For this reason, website designers need to combine such hyperlinks with webpage design that clearly signals the organization of information within a website, and literacy educators need to equip learners with knowledge of website design conventions and the visual and multimodal design principles that support Web orientation.

Drawing on the systemic functional work on conjunctive relations in verbal discourse, i.e., logico-semantic relations such as cause, contrast, and addition, which may be signaled by conjunctions such as "because," "equally," "but," and "and" (Halliday and Hasan 1976; Halliday and Matthiessen 2004; Martin 1992), the project also developed six parameters for describing the logico-semantic relations (LSRs) that can relate units presented on the same or different webpages within a website. These are presented in Table 1.

Each parameter was considered specifically in terms of its relevance for user orientation and learning in children's edutainment and infotainment websites. To illustrate, when units occupying different webpages are interdependent, their presentation almost always entails linearity since a dependent webpage or group of webpages cannot be accessed before visiting the webpage or group of webpages on which it depends. In educational hypermedia, such relations have long been employed to ensure that learners attend to information in a particular sequence, for example, from simpler to more complex ideas (e.g., Whalley 1990). Linearity, however, does not preclude LSRs being (re)interpreted both prospectively and retrospectively (e.g., Tosca 2000), as they are in written texts (Martin and Rose 2007).

Turning to the type, or meaning, of LSRs, in children's websites, *projection* relations are often employed to construct fictional characters such as children or personified animals as the projectors of content presented in the form of speech, thoughts, drawings, or songs, thus contributing to constructing these characters as pseudo-teachers that guide the child-user in learning games and compensate for the apparent absence of teachers and parents. Relations construing a *temporal sequence* may be used to impose a sequence of steps in educational activities, while *purpose* relations may be employed at the beginning of such activities to motivate users to undertake them. *Reason* relations may link to an explanation about why the strategy adopted by a user was, or was not, successful at the end (see Stenglin and Djonov 2010).

Finally, the *Tracking Trains* case study illustrated that the tools developed in this project offer a useful means for evaluating the interaction between website design and use (e.g., the freedom of navigation a website offers its users and the ways and extent to which they use that freedom). The quantitative analysis revealed that there were discrepancies between the proportions and kinds of both hypertextual distance relations and hypertextual LSRs available in a website on one hand and those actualized in its use on the other. Further, it suggested that such discrepancies can indicate problems in the website's design, users' hypermedia literacy, or both.

To understand the source and nature of these problems, however, researchers need to investigate the multimodal relations constructed within and between (groups of) webpages as well as closely analyze individual navigation patterns. The results of such investigations can also be productively interpreted in relation to the opinions of website designers, website users, and educators, as well as in relation to relevant findings from other studies of hypermedia design and use (see further Djonov 2005, 2008).

Knowledge Construction in Online Educational Interactives for Children

This project explored online curriculum materials, referred to as multimedia interactives (MIs), designed for lower primary social science subjects in Australia. It had two aims:

- To account for the relations between verbal text and other modes in MIs and formulate a metalanguage for describing these relations that is readily adaptable to educational contexts
- To provide an understanding of the ways in which primary social science knowledge is recontextualized in MIs as a type of emerging electronic multimodal discourse

The data, multimedia interactives, were selected from online curriculum materials, designed by the Le@rning Federation (<http://www.thelearningfederation.edu.au>), an Australian government initiative established in 2001 to develop online materials

for supporting learning in six priority curriculum areas in Australia and New Zealand (cf. Freebody 2005). Five MIs—*Mystery object: Torres Strait Islands*, *Emergency at Lonely Creek*, *New homes*, *The first golden age of cricket*, and *Gold Rush!*—were selected for the project. These five MIs were selected as each covered a different topic from the Australian primary social science syllabus, each was designed for children aged between 7 and 12, and each differed from the other four MIs in its interactive structure and learning task.

A typical MI involves a variety of media, audio, animation, and graphs and requires a learner to accomplish a certain learning task through a series of hypertext navigation and interactive activities. *Gold Rush!* (Plate 1), for example, is a mission-oriented MI where the learner is to use limited financial resources to select and buy food, shelter, and other requirements related to gold mining in order to complete a successful dig in 1865 in outback Australia.

The game starts at a fictitious street in the Australian town of Ballarat in 1865 (see Plate 1a) with instructions regarding the game's tasks, which are (1) buying a permit, (2) choosing the type of mine to dig from the map, (3) purchasing suitable tools, (4) obtaining sufficient amount of food and utilities, and (5) digging in the goldfields. Once the learner decides on the sequence in which these tasks will be accomplished, he/she selects an anchor (e.g., the shop with the sign "Tools"), which takes the learner to a micro-site (e.g., the tool shop in Plate 1b) where each task (e.g., purchasing mining tools) is performed by following a number of steps (e.g., reading descriptions of various mining tools and deciding which to purchase). Upon successful completion of the digging task, the learner is awarded with "gold" (Plate 1c).

The project explored the MIs from three different theoretical perspectives: from above (contextual level), as a type of social process and "pedagogic discourse" (Bernstein 2001); from around (the textual level), as texts involving various types of (inter)semiotic relations (Zhao 2010); and from below (medium), as hypermedia technology (Bolter and Grusin 1999). More specifically, the first, the Bernsteinian, perspective recognizes that MIs are a type of pedagogic discourse with two embedded registers—*instructional*, which concerns the construal of educational knowledge/content, and *regulative*, which concerns the overall pedagogic directions taken, their goals, pacing, and sequencing (Christie 2000, 2002). In *Gold Rush!* (see Plate 1C), for instance, the text in the text box titled *Dig Over!* can be seen as belonging to the regulative register, as it indicates the completion of a learning task and evaluates the learning result (e.g., *That is a great result for your effort*). In contrast, the text in Plate 2, which can be activated by clicking on the anchor of the Windlass in Plate 1b, belongs to the instructional register as it offers a description of the mechanism of a windlass and its role in gold mining.

The second perspective focuses on exploring the inter(semiotic) relations in MIs, that is, the ways in which language and image co-construe meaning in the multimodal textual environment. In particular, this project highlights the importance of exploring the ways in which meaning accumulates while semiotic patterns form and cluster—referred to as a logogenetic model of multimodal analysis—throughout the unfolding of a hypermedia text. In essence, it allows us to look at the ways in

Plate 1 Gold Rush! (a) A fictitious street in Ballarat. (b) In the tool shop. (c) In the Goldfields! Dig Over!

Plate 2 Example of instructional register: Windlass

which fields of knowledge build up and expand in an educational hypermedia text. In *Gold Rush!*, for example, depending on their navigation paths, learners may encounter in sequence a range of multimodal texts such as the one in Plate 2 and others, typically much more complex in nature, with more images and more complex genres. They need first to understand the semantic relations formed between the images and text. In the example in Plate 2, the relationship is categorized as classifying–exemplifying as the visually represented object is classified as a windlass, while the visually represented object exemplifies the typical features of a windlass. If a learner then reads another multimodal text about a tool (e.g., a cradle) which like the windlass can be used in gold digging, the image of the windlass and that of the cradle form a second semantic relation—co-hyponymy. A comparable semantic relation is also formed between the texts that describe the two mining tools. In this way, a complex semantic cluster is formed, allowing learners to build not only local knowledge about a tool such as the windlass or the cradle but also an extended visual–verbal taxonomy of mining tools and their historical roles in gold mining. In the course of the interactive activity, similarly, various fields of knowledge are built up through inter(semiotic) semantic clustering such as those about tools, people, and places in gold mining.

Finally, the perspective from below explores the nature of the medium in which the MIs are embedded, using Bolter and Grusin’s (1999) notion of remediation, the idea that every medium “appropriates the techniques, forms, and social significance of other media” (p. 65) to various degrees. It shows that the design of MIs appropriates a space-based medium like that of the museum, manifested in the space-based and nonlinear logic of the organization and placement of learning contents. Simply put, the navigation through an MI such as *Gold Rush!* is comparable to navigating through a museum exhibition rather than reading a book page by page.

Ultimately, the synthesis of the three perspectives produced a sophisticated treatment of hypertext that does not treat hypertext merely as hyperlinked pages or semantically complex print-like texts. Rather hypertext is conceptualized as an emerging type of “text” in its own right. The incorporation of three perspectives, at three different levels of analysis (contextual, textual, and medium), also facilitates multiple analyses in a single study, as will be demonstrated next. Subsequently, several tools have been developed for analyzing educational hypermedia materials such as MIs.

The first analytical tool is a model for categorizing hypertext anchors in MIs (e.g., in Plate 1 all the shops are anchors, and clicking upon each leads to a different micro-site). The model distinguishes the affordance (technological function) of anchors from their semiotic representation (i.e., the language and/or other semiotic resources used to specify their function). In MIs, the technological affordance of anchors is to enable learners to perform various hypermedia tasks, including navigating through the virtual space and activating multimedia artifacts. Anchors also allow the learner to perform certain exchanges of meaning (i.e., seek or provide information and goods and services) within hypertext (e.g., “Play Again” in Plate 1c).

Anchors are often represented by one or more semiotic resources such as language, image, or visual icons. When these resources have meaning beyond identifying an anchor’s technological affordance, the anchor enters as a semantic unit in the logogenetic unfolding of a given MI. This allows the anchor to perform a second, non-technological function and facilitate learning (of primary social science) and “playing” (of the interactive game). For instance, the shop anchors in *Gold Rush!* belong both to the field of interactive activities (i.e., buy equipment needed to complete the task) and to the field of primary social science (i.e., a type of shop during the Gold Rush). Anchors thus provide a means of controlling the pacing and sequencing (i.e., “framing” in Bernstein 2001) of learning and playing in MIs, by, for example, giving learners different degrees of control and having their non-technological functions clearly indicated (or not).

In addition to categorizing hypertext anchors, the research dealt with three textual patterns in MIs: genres, couplings, and clusters. The first pattern was verbal elementary genres. The categorization of the verbal elementary genres suggested that successful engagement with MIs (i.e., learning *while* playing) requires the ability to handle a range of genres, including procedure, report, and explanation generally and history genres such as biographical recount, historical account, and historical recount in particular (see Martin and Rose 2008). For example, while procedures specify the interactive activities and realize the regulative register of MIs as pedagogic discourse, other genres construe the field of primary social science and realize the instructional register.

The second pattern was verbiage–image couplings. This part of the analysis revealed five main types of coupling relations—naming, identifying, representing, classifying–exemplifying, and circumstantiating—with naming, identifying, and classifying–exemplifying predominant in MIs. These five types organize our experience based on three basic principles: abstraction, generalization, and specification.

The third pattern was local clustering. This part of the analysis revealed a relatively consistent link (or clustering) between types of verbiage–image coupling and types of elementary verbal genres, while naming and identifying tend to occur in history genres, classifying–exemplifying couplings are often found in factual genres such as report or explanation, and representing and circumstantiating do not appear to be associated with a particular genre.

Finally, the research provided a contextual interpretation of MIs through the lens of Bernstein’s sociological theory of pedagogy (see Bernstein 1971, 1974, 1975, 1990, 2000 [1996], 2001). The interpretation focused on how primary social science knowledge is construed and recontextualized in MIs. This analysis showed that the key area of knowledge in primary social science as construed in MIs deals with building hybrid notions of community through the multimodal construal of people (the community members) and places (the social spaces to which the members belong). The construal of people is concerned with both the celebration of individuality and the reinforcement of communal values and shared emotions. The construal of places focuses on the encoding of various social values onto politically, culturally, and economically significant sites and locations. In this way, the physical spaces in which the community dwells are transferred into social spaces to which the community belongs.

The interpretation of how primary social science knowledge is recontextualized in MIs drew on Bernstein’s notions of classification (the translation of power relations, which create, legitimize, and reproduce boundaries between social categories) and framing (control relations, which establish legitimate forms of communication appropriate to the different categories). The analysis of classification has two implications:

- Primary social science is a subject of low-level speciality; even though there are signs of transition taking place from commonsense knowledge to specialized school discourse, a distinctive boundary between various fields of social science (e.g., history, geography) is yet to emerge.
- In MIs there is no clear boundary between the activities of acquiring subject knowledge and navigating through hypermedia; in other words, in MIs fields of social science and activities are both weakly classified, so that learning is often hidden behind “playing.”

The open nature of hypertext structure gives the learner a strong sense of control over the learning process (i.e., different learners can create different types of traversals). Yet, control by educators, designers, or other pedagogic agencies and agents is not absent; rather, it is often concealed in a labyrinth of hyperlinks and can easily be made visible through simple manipulation of technology and semiotic resources. In this sense, hypertexts such as MIs constitute potential sites in which a struggle for power and symbolic control takes place in the age of digital learning.

This project made a twofold contribution to the field of educational linguistics, in particular multiliteracies and digital learning. First, it provided a semiotic account of primary social science as a less well-documented subject area, adding to the ontogenetic profile of social science literacies in schools within the

Australian context (cf. Coffin 2000, 2006; Humphrey 1996). By extending existing understanding of the evolving multiliteracies demands of the subject during the years of schooling, the research has the potential to help better apprentice students and support their transition from primary to secondary school into this particular area of learning.

Second, although the descriptive framework developed in the research is complex in nature, involving various theoretical categories and principles, the analytical results are rather straightforward and can be easily translated into the teaching of multiliteracies. In essence, the two types of patterns described in the research—coupling and clustering—separate the issue of multiliteracies into two interrelated dimensions.

Coupling deals with the ways in which image and language co-construe experience. It allows the teacher and the student to understand that language and other semiotic resources can organize various aspects of experience through some fundamental principles, such as abstraction, generalization, and specification. These principles are not unique to one developmental stage but are relevant throughout ontogenesis (see Painter 2001 on learning classification in first language development). During a given developmental stage, however, the emphasis of multiliteracies education can be placed on a particular principle or a semantic relation within it. For instance, in early primary school it can be on building abstraction and teaching students to name, identify, and then classify various visually represented objects. The understanding of coupling also has the potential to promote critical literacy. For example, the distinction made between identifying and classifying—exemplifying coupling may help reveal how stereotypes about a particular group of people (e.g., gender, ethnicity) can be created. When a certain social group is represented visually, each member of the group only *exemplifies* rather than *identifies* the characteristics of this particular group. This semiotic pattern then highlights the risk of making generalizations about a group of people from a few images.

The description of clustering, on the other hand, potentially extends the practice of genre-based literacy programs into the realm of multimodal texts. It will help teacher and students to understand how different types of images can be used in different types of genre and how the meanings of a written text can change when the images accompanying it are changed (e.g., images in biographical recount). From the perspective of critical literacies, understanding how various clusters are formed can help, for example, unpack how a particular cultural myth is built (e.g., who are the heroes and how the community aligns itself around values ascribed to a place or an individual) and thus help students develop a resistant reading of various ideologies.

Ultimately, the research project challenged the prevailing rhetoric around digital learning that the students of today are “digital natives” (Prensky 2001a, b) because they are born into the world of digital technology. However, just like native speakers of English or any other language, while they may have (arguably) similar access to digital technologies, their access to a particular “semantic code” (Bernstein 1971; Hasan 2009) is not necessarily equal. If the pedagogic discourse is both weakly

classified and weakly framed (as in *Gold Rush!*), what type of students will then be able to recognize the boundaries between learning and playing and between genres that realize a particular field of knowledge? In other words, not all students who can play the MIs analyzed in this project will benefit and learn primary social science knowledge as intended.

Exploring News Design in Online Newspapers

The purpose of this project was to identify similarities and differences in the multimodal design of three online newspapers written in different cultural and institutional contexts, for different primary audiences. At the time the study was begun, there had been no studies of this kind on online newspapers and very few on websites. The literature on the visual design of online newspapers typically took a more quantitative approach to news design, employing surveys (e.g., Utt and Pasternack 2003) or content analysis (e.g., Greer and Mensing 2004; Li 2002; Lin and Jeffres 2001). The work of Kress and Van Leeuwen on the design of print media texts (e.g., 1998, 2006 [1996]) was a primary inspiration for the approach taken in this study.

The study looked at three online English-language newspapers published in three countries:

- *The Bangkok Post*, written in English and published in Thailand
- *The People's Daily*, written in Chinese, translated into several languages (including English), and published in China
- *The Sydney Morning Herald*, written in English and published in Australia

Much of the literature that examines newspapers has a focus on newspapers published in the USA and the UK. The choice to focus on English-language newspapers in Asia and Australasia was a deliberate decision to contribute to re-balancing the weight of research away from the two traditional geographical sites of newspaper research.

The initial data collection was conducted from February to April 2002. The “constructed week” data collection method was used: across a number of weeks, an edition of a newspaper from a different day of the week is collected to give, eventually, 1 week’s worth of newspapers. The rationale for a constructed week is to capture all parts of the “typical” weekly news cycle, while at the same time avoiding a potential “skewing” of the data from significant news events which may dominate the newspaper discourse in a given week. This approach gives a representative sample of news discourse much broader than the weeks over which it is collected (e.g., Bell 1991; Riffe et al. 1993). In this study, a five-day constructed week was used (Monday–Friday) and weekend editions were not collected.

Homepages of each newspaper were saved, as were the “section pages” of the “National” section of each newspaper (or its equivalent). Several stories from each

homepage and each National section page were also followed, and these “story pages” were also downloaded.

By late 2005, all three newspapers had changed the design of their homepage, and another round of data collection using the same methodology was conducted from September to November 2005. At the end of 2005, both the *Bangkok Post* and the *Sydney Morning Herald* again changed the design of their homepages. Design change suggested itself as a research focus, and another round of data collection using the same methodology on all three newspapers was conducted from January to April 2006.

In all, 45 homepages (15 from each newspaper) and 45 “National” section pages (15 from each newspaper) were collected. In addition, 513 story pages (over 100 from each newspaper, over 200 from the *Sydney Morning Herald*) were also collected.

Employing Kress and Van Leeuwen’s (2006[1996]) “visual grammar,” each page was approached as a multi-semiotic, visual sign. In the early stages of the study, detailed linguistic analysis was conducted, but the findings of this analysis were not novel. Much of the language of online newspapers is “shovelware”—text “shoveled” from the corresponding print version of the newspaper, and the analysis of the visual design of the pages was more productive and more interesting, so this part of the study was pursued.

The study proceeded on a number of levels. The design of pages was analyzed using Kress and Van Leeuwen’s (2006[1996]) “grammar of visual design.” A number of aspects of this framework worked well with the data, but due to the nature of the Web pages under examination, other aspects did not and had to be developed and adapted for application to webpages.

The structure of websites was explored using the theoretical tool of a rank scale from systemic functional linguistics, where the combination of the semiotic elements at one “rank” constitutes an element at a higher rank (e.g., texts on pages combine to make a “zone,” “zones” combine to make a “page,” “pages” combine to make a “section,” “sections” combine to make a “website”).

Newsbites—the short headline-plus-lead-plus-hyperlink stories that dominate online newspaper home pages—were also analyzed in terms of their multimodal structure and identified as a news genre. Over time, considerable structural variation in newsbites was identified, and paradigms of design choices were identified and mapped in order to explore the relations between design and social context.

The prevalence of thumbnail images in the data also led to an exploration of the function of these images—typically an extreme close-up of a human face. The function of these images, as part of short texts and also collectively across the entire page, was explored employing Kress and Van Leeuwen’s (2006 [1996]) visual grammar, Caple’s (2013) framework for analyzing composition in photographs, and a historical perspective on press photography, punctuation, and typography (see Knox 2009a, b).

In a later part of the study, interviews were conducted with senior editors from *The Bangkok Post* and *The Sydney Morning Herald*; attempts to contact *The People’s Daily* were unsuccessful. These interviews allowed the researcher

to “get a feel” for the geography of each newsroom and also to learn about institutional attitudes towards the online edition in each newspaper. In these ways, the insights gained were very helpful in explaining some aspects of design, and combined with insights from literature on news design (e.g., de Vries 2008; Machin and Niblock 2006) and newsroom ethnography (e.g., Boczkowski 2004; Paterson and Domingo 2008), it was possible to discover relations between social and institutional practices and the visual design of each newspaper and to provide informed speculation when “discovery” was not possible.

This study generated several findings of particular importance to understanding how to support the development of critical hypermedia literacy in educational contexts, with a specific focus on TESOL and applied linguistics education.

First, the newsbite—a new genre which has emerged with online newspapers—was identified and described. The functions of newsbites are to highlight stories valued by the news institution as important, to contribute to an “overview” of current news on the homepage (and on section pages), and to provide multiple “entry points” to the content of the newspaper by encouraging readers to “follow” these stories through hyperlinks to other pages. Newsbites differ from the stories to which they are hyperlinked. While they often use exactly the same wording as in the longer story, sometimes they do not, and they always appear in a different visual and rhetorical environment from the longer story. Sometimes newsbites are hyperlinked to audio or video stories and sometimes to entire section pages (and, therefore, not to a single story at all).

Newsbites emerged as a result of a number of social and historical factors. The first is the tendency in English-language newspaper reporting to move the “peak” of information to the front of the story in headlines and leads, allowing the remainder of the story to be moved or even deleted if needed (Feez et al. 2008). Similarly, the existing practice in print newspapers of “splitting” stories, with headline and early paragraphs on the front page and the rest of the story inside, meant that when editors and readers came to online newspapers, they were already familiar with stories beginning on one page and continuing on another. Third, the historical tendency towards “soundbite news” (e.g., Hallin 1997) and the emergence of the “attention economy” (Gauntlett 2000) reflect a greater interest in attracting the attention of media readers than maintaining it, and the brevity of newsbites is consistent with this. Fourth, writing and designing for the screen require different practices to writing and designing for print.

The emergence of the newsbite is of interest because, if news institutions are partisan and powerful institutions (e.g., Herman and Chomsky 1988; Iyengar and Reeves 1997) and ideology is an important factor in news reporting (e.g., Fairclough 1995; Fowler 1991; Hall 1982), these small texts must perform functions consistent with the ideology of news organizations, or they would not have become so prevalent so rapidly. The finding of this part of the research was that the brevity and ubiquity of newsbites in online newspapers are part of a trend whereby the content and ideological import of any single news story is downplayed and backgrounded against the ongoing discourse between the news institution and its readership, which unfolds on a much longer timescale. Further, subtle

features in the visual design of newsbites and homepages create a paradigm within which news events are positioned. The verbal content of news stories and the details of what happened are stripped to a bare minimum; the visual design and positioning of these news stories give them value in relation to other stories on the same page and other stories which appear on the same page in other editions of the newspaper over time (Knox 2007).

Homepage design, then, becomes an important feature in the communication of news and of the social value of events and actors. Homepages vary in the degree to which they classify news on their home pages. Some provide explicit categories, using headings and framing, and some use implicit categorization where the classification of content and the distinctions between categories are unclear.

For teachers and learners of second and foreign languages, these findings are significant for a number of reasons. First, in foreign language education (where the language being learned is *not* typically spoken in the social environment), online newspapers provide an accessible source of authentic, target-language material. Similarly, in second language education (where the language being learned *is* typically spoken in the social environment), online newspapers are also a useful source of public discourse. In both cases, newspapers deal with public events and issues and give learners access to public discourses and values. Because they are short texts, and often deal with concrete actors and material events, newsbites are often suitable for use with learners of different levels.

Newsbites and homepages provide valuable material for language teachers and learners to work with in and outside the classroom. Basic comprehension of these short stories can be developed through vocabulary-building exercises and grammatical analysis. Predictive reading (guessing content through headlines), familiarity with idioms and puns (common in headlines), and identification of authorial position through evaluative terms in headlines (and their typical absence in “hard-news” leads) can be the subject of classroom activities.

More critical pedagogical approaches can also be taken. How is the page designed? What visual and verbal framing devices are used to categorize content? Or put another way, which stories are grouped together and how is this achieved visually? Are borders, frames, white space, and/or headings used? Is there consistency in the size/color scheme/layout of newsbites? How do these devices work to create explicit or implicit categorization of the news? What kind of content is covered in certain categories? In which stories does explicit evaluation of actors and events occur and in which is such evaluation absent? How would the students rewrite a story (within the design constraints of the new category) if it were moved from one category to another?

This kind of analytical approach to these pervasive and powerful multimodal texts can also be applied by learners to online news texts in their first language, and comparisons can be made of how stories and actors are represented across cultures and languages. At a more abstract level, the kinds of categorization and social valuation made by news institutions in the learners’ first and second languages, first and second cultures, can also be explored in a systematic, explicit way that can be taught and learned and that goes beyond comprehension and beyond individual readings of and responses to individual texts.

Such an approach is not limited to foreign and second language education. All language learners (and that means all of us, all our lives) can benefit from explicit understanding of the multimodal practices of online news reporting, which are evolving rapidly.

The Role of Interpretation

This section concludes the chapter by exploring the role of interpretation across the three projects presented in section “[Three Social-Semiotic Projects on Hypermedia](#),” highlighting their similarities (including their shared theoretical and methodological foundation in social-semiotic, multimodal discourse analysis) and their differences in relation to the position taken in each project on the nature of hypermedia texts, the relationship between social-semiotic theory and different types of hypermedia texts as new data, contributions from diverse professional and research perspectives, and the relevance of findings to educational contexts.

Interpreting the Semiotic Nature of Hypermedia Texts

Drawing on Lemke (2002b), all three projects can be described as viewing hypermedia predominantly as content/text but also differentiated from each other in terms of (i) the extent to which hypermedia is also considered as technology for realizing hypertext and as platform for integrating different channels of communication and (ii) the aspects of meaning explored in the hypermedia texts analyzed in each study.

The studies by Djonov and Knox consider the webpage an important technological unit in hypertext with significant implications for the meanings and social functions of hypermedia texts. Both examine relations between various webpage elements on the homepage before considering broader questions such as how these relations reveal the overall organization of information in children’s websites (including how they signal relations between whole website sections) or how the visual design of online newspaper homepages relates to social and institutional practices.

Additionally, due to its focus on user orientation as a challenge directly related to the fragmented and open-ended nature of hypermedia texts, Djonov (2005) distinguishes hypertextual from non-hypertextual relations and specifies which semantic relations are most likely to obtain within and which between (groups of) webpages. On this basis, she argues that semantic relations within (groups of) webpages are essential for enabling users to predict where hyperlinks may take them, and relations between webpages are essential for confirming and/or reevaluating such predictions and enabling users to identify their current position in a website’s structure.

Further, while Knox focuses exclusively on homepages as multi-semiotic, visual units, Djonov's (2005) analysis accounts for any medium (co)deployed to signal the organization of information within a website. For instance, sound and movement were considered when they signaled LSRs between website components (e.g., sounds and animation played when website section anchors are rolled over to suggest a relation of similarity or contrast between different website sections).

The studies by Djonov and Zhao both consider website navigation, by exploring, respectively, the (actual) navigation paths forged by students through a children's website and the (potential) critical navigation path that would allow learners to achieve the goal/s of an MI most efficiently.

One way in which all three studies interpreted hypermedia as content/text was through the social-semiotic approach to (macro)genre. A broad understanding of social purpose was adopted in Djonov's (2005, 2007, 2008) study, and the studies by Zhao and Knox employed genre in more depth. Zhao (2011) explored the contribution of various verbal elementary genres (e.g., procedure, historical recount, explanation) and their multimodal recontextualization (through hyperlink anchors and intersemiotic relations) to fulfilling the learning goals of MIs (cf. Stenglin and Djonov 2010). Knox (2009a) established systematic correlations between social purpose and the multimodal composition of hypermedia texts (e.g., visual-verbal relations and/or use of specific linguistic and visual patterns) in order to identify the newsbite as a genre that emerged with online newspapers.

Interpreting the Relation Between Theory and Data

All three projects adopted and further developed social-semiotic, multimodal discourse analysis to explore hypermedia as a new type of data. Each dealt with a different type of hypermedia texts and addressed a different challenge that they present for discourse analysis and education. The projects also varied in their interpretations of the relation between theory and data and in the ways each adapted and built on the theory.

Djonov (2005) aimed to account for the role multimodal interaction plays in signaling the organization of information within websites (particularly those designed and used for free exploration) and thereby supporting user orientation. Accordingly, the data included whole websites, and both their multimodality and hypertextual structure were considered. Yet, as the open-ended nature of websites makes analyzing entire websites neither possible nor productive for understanding user orientation, the study adapted the SFL notion of hierarchy of Themes in a reconceptualization of website hierarchy as an overarching principle for organizing information in websites and then employed the data to identify as diverse a range of LSRs as possible (both within and beyond the webpage). The exploration of the data involved both adapting and questioning social-semiotic analytical distinctions. An example is the parameter of explicitness for describing LSRs. In SFL a verbal LSR is described as either explicit (when a conjunction is used) or implicit

(when it is not). Yet, while the conjunction “because” may reveal both the presence and the meaning of the relation between two stretches of discourse, conjunctions like “and” make explicit the presence but not always the meaning of such relations. The latter thus function comparably to hyperlinks, which cannot signal the meaning of LSRs, leaving this function to be fulfilled by the interaction of various semiotic resources. Such observations then suggest that the parameter of explicitness should be modeled not as a binary opposition but as a scale for LSRs in hypermedia and verbal texts alike. Additionally, differences among the fourteen navigation paths through *Tracking Trains*, interpreted in light of the opinions of the website’s users and designers, suggest that the explicitness of LSRs depends on users’ familiarity with website design conventions as well as their world knowledge.

Zhao’s (2011) research addressed the challenge of understanding how knowledge is constructed in hypermedia through the analysis of multimedia interactive curriculum materials for primary social science in the Australian context. The nature of these data, which present learners with tasks that they need to accomplish, and the aim of understanding how knowledge is constructed in hypermedia (through the use of anchors, intersemiotic patterns, and multimodal genres) prompted Zhao (2010, 2011), while drawing on existing SFL accounts of verbal genres and text–context relations, to expand social-semiotic theory in two main directions. One consisted in identifying intersemiotic relations in MIs (naming, identifying, representing, classifying–exemplifying, and circumstantiating) and linking them to basic principles for organizing experience and constructing knowledge (abstraction, generalization, and specification). The other resulted in a model for studying how meanings are configured and reconfigured over time in the unfolding of MIs and other multimodal texts. Because of this (re)configuration, semantic relations and fields can be expanded through the clustering of verbal genres with images and verbiage–image relations. Central to this model, and reflecting both the nature of the data and the purpose of Zhao’s project, is the notion of the critical path as a new, semiotically motivated, unit of description.

Knox (2007, 2009a) explored the multimodal design of online newspaper webpages as visual units and its relationship to the newspapers’ sociocultural contexts of production and reception. Adapting Kress and Van Leeuwen’s (2006 [1996]) framework to the analysis of webpages highlighted key differences between the design of images/print layout and that of webpages in general and online newspaper homepages in particular. For example, considering the information value of different positions on the page, Knox (2007) argued that Kress and Van Leeuwen’s distinction between ideal and real, which operates between information presented in the top part vs. information presented in the bottom part of a printed page/image where the two parts are compositionally distinguished from each other, does not operate in webpage design. Rather, in webpage design there is a continual (rather than oppositional) difference in the value and salience of what appears first in a webpage (i.e., prior to scrolling down) vs. what appears below it. The study also showed that online newspaper homepages rely on grid-based design (rather than on polarization between top and bottom, left and right, or center and margin) in order to classify news and other content in ways that reflect the social

value assigned to different types of content by a given institution. Considering this type of data allowed this project to build on existing SFL accounts of news genres and media discourse by identifying newsbites as an emergent multimodal genre and exploring changes in its realization over time. This exploration also suggests that additional distinctions may need to be drawn in social-semiotic theory's model of the dynamic relationship between text and context in order to capture the timescales at which the ongoing discourse between the news institution and its readership operates.

Interpreting Contributions from Other Professional and Theoretical Perspectives

In addition to assumptions based on social-semiotic theory, the purpose and data of each project led the researchers to draw on insights from different professional and theoretical perspectives.

The study of children's websites identified insights from the professional field of hypermedia design as most relevant to understanding user orientation. Its different subfields, however, tend to focus on different aspects of website design and/or use in isolation from each other—interface design on webpages, information architecture on the organization of website content, and Web usability on the role individual resources (e.g., hyperlinks, labels, color) play in supporting the accessibility and efficient use of websites. Reinterpreting these insights through the lens of social-semiotic theory, by contrast, was seen as a means of understanding how the interaction between webpage design, content, and website structure can support user orientation by establishing meaningful relationships within a website as a coherent and cohesive text (see further Djonov 2007).

Zhao (2011) employed Bolter and Grusin's (1999) theory of remediation for examining MIs as hypermedia. This provided evidence that MIs draw on media such as film and museum exhibitions, rather than print, which justified proposing space rather than the page as a suitable metaphor and the critical path as a unit for describing meaning making in MIs. In social-semiotic research, Bernstein's sociology of education had already established itself as a suitable means for explicating the role language plays in recontextualizing knowledge in pedagogic discourse (e.g., Christie 2000, 2002; Hasan 2009). Engaging in the continuing dialogue on language, knowledge, and pedagogy between social-semiotic theory (SFL and SFL-MDA) of the Hallidayan tradition and Bernstein's (2001) sociological theory of pedagogy enabled Zhao (2011) to interpret MIs as pedagogic discourse and consider the role that anchors, verbal genres, and intersemiotic patterns play in the realization of regulative and instructional registers in these texts.

The aim of relating the multimodal design of online newspaper homepages to social and institutional values led Knox to draw on interviews with newspaper editors and on literature on journalism and press photography. In this way, the

project represents a well-established tradition of employing and developing systemic functional linguistic and multimodal analysis for the purpose of revealing the ways that power relations as well as social and cultural changes are enacted, maintained, and negotiated in communication. Part of this tradition, also followed by Knox (2009a), is to use ethnographic data such as interviews and observations to support the interpretation of the results yielded by such analysis. Insights from media studies, on the other hand, were of particular value for understanding changes in the use of various technologies in the production of news media.

Interpreting Research Findings for Educational Purposes

All three projects offer social-semiotic tools for the analysis of multimodal and hypermedia discourse that can support advanced students in applied linguistics and (critical) discourse analysis to further explore hypermedia texts, and each presents findings with implications for hypermedia in educational contexts. These tools and findings, however, differ in the nature of the educational research and/or practices to which they can be most readily adapted.

The tools offered by Djonov (2005) are most suitable for analyzing and evaluating the interaction between website design and use, with a focus on user orientation. They can be used to evaluate the extent to which a website's design grants freedom of navigation while supporting successful orientation as well as to identify gaps in users' hypermedia literacy skills (e.g., familiarity with website design conventions). Such evaluations can provide a starting point for research aimed at developing guidelines for the design of websites for children, evaluating websites and their suitability for upper primary students, and developing teaching strategies that foster the development of hypermedia literacy.

Zhao's (2011) project was explicitly designed to develop a metalanguage for describing verbiage–image relations that is readily adaptable to pedagogic practices and to understand how primary social science knowledge is constructed multimodally in online learning materials such as MIs. The different types of verbiage–image couplings and the description of clustering hold considerable value for multiliteracies education. And while this project focused on a specific subject area—social science—at primary level, the principles for organizing experience and constructing knowledge proposed in it are applicable to other subject areas and levels as well. Findings of this research also have significant implications for critical literacy pedagogy as they draw attention to the role that verbiage–image couplings and clustering play in construing stereotypes and cultural myths. As well, they reveal the risk that MIs with weak boundaries between learning and playing may limit some learners' access to the knowledge constructed in them.

The findings of Knox's research on online newspapers are readily adaptable to pedagogic practices oriented towards helping second and foreign language learners to develop not only target language skills but also familiarity with and understanding of public values and discourses in the target culture. They can also

support the development of pedagogic approaches oriented towards enhancing multimodal and (critical) media literacy in secondary and adult education contexts (for both first and second/foreign language learners) and fields such as language and communication studies, applied linguistics, and media and cultural studies.

2.3 CDA and Participatory Action Research: A New Approach to Shared Processes of Interpretation in Educational Research

Nicolina Montesano Montessori and Hans Schuman

Introduction

This chapter is based on a research project exploring social justice in the classroom (2008–2010), which took place in the context of the research group “Behaviour and Communication in Educational Praxis” which then formed part of the knowledge center of the Utrecht University of Applied Sciences (UUAS). The research was done in the context of the official policy in the Netherlands to include more students with disabilities and/or special needs in mainstream school classes (Schuman 2010). This brings about a responsibility on behalf of the teacher to respond to the diversity of students in such a manner that they feel that “all students get a fair deal” (Gerschel 2003, p. 106). Since this problem is embedded in the heart of the classroom where educational practice and the interaction between teachers and students take place, it was decided to include teachers, student teachers, and pupils in a form of Participatory Action Research (PAR). It was furthermore decided to combine PAR with Critical Discourse Analysis (CDA). The main aim was to give a central voice to school teachers and student teachers throughout the research process. This has led to the deployment of an emergent research design and a focus on narrative inquiry in the earlier stages of the research and the use of focus groups throughout the process. In general it was attempted to create a horizontal (nonhierarchical) research group which included researchers from the UUAS, some with and some without a PhD degree, eight teachers, eight student teachers,

and pupils from the four classrooms. There was a strong emphasis on dialogical validity. The effect was that interpretation was not something performed exclusively by the researchers at the very end of the fieldwork/data collection, but was an ongoing and integral process which was inherent to every stage of the research process. Interpretation became a matter of shared meaning making, systematically integrating insiders' and outsiders' perspectives. The goal of the research was a genuine transformation of everyday practice in the various participating schools and classrooms. This approach allowed for contextually sensitive results, achieved in each particular school, which were connected to the findings of teachers from other schools during focus groups. Hence, there was a continuous movement going back and forth from the parts to the whole and vice versa.

Social Problem Addressed in This Research

New legislation in the Netherlands is aiming at decreasing the numbers of students referred to special schools, in particular students with behavioral difficulties. The Dutch Ministry of Education is trying to control the budget for specialized provision, and teachers and support staff in mainstream schools face the challenge of including more students with disabilities and/or special needs in their classes (Schuman 2010). Some mainstream schools in the Netherlands are already quite experienced with having students with disabilities and/or a diagnosis of, for example, ADHD or autistic spectrum disorders, in their classes. However, the staff working in these classes often finds it hard to respond to the diversity of students in such a manner that they feel that “all students have the opportunity to realise their potential and develop their talents” (Oliver 1996). In Dutch primary schools the deployment of learning support assistants is not everyday practice. Thus teachers are pretty much left on their own when facing the challenges of coping with diversity in their classes and rethinking issues of segregation, inclusion, and social justice. The UUAS researchers distinguished the following problems with this policy:

- A dominant, often implicit, focus on a “deficit” perspective, despite a rhetoric of social inclusion
- A view on inclusion which remained restricted to the provision of financial means for SEN pupils
- Avoidance of the issue as to how a more inclusive educational context could or should be created to include pupils with various different needs in the mainstream educational system

Furthermore the commission charged with the evaluation of the official policy of inclusion stated that the discussion is performed by policy makers and managers, who fail to include teachers. Officials tend to talk *about* but not *with* practitioners. If they mention them at all, they tend to see them as part of the problem. On the other hand, the commission recognized that teachers have a key position when it comes to realizing sustained change in education (Evaluatie- en adviescommissie Passend

Onderwijs 2009, p. 17; Schuman 2010). In order to address these issues, it was decided to involve practitioners in the research by setting up a research community to perform PAR.

The Research on Social Justice in the Classroom¹

The particular focus was on inclusive and exclusive relationships and the impact of a social justice approach on the interaction between the teachers and their pupils and among pupils and the dilemmas that it provokes. Participatory Action Research (PAR) (Carr and Kemmis 1986; O’Hanlon 2003) was selected as the research strategy to explore the relations between classroom interaction, education, and social justice and to engage in a shared process of constructing knowledge, stimulating professional development and improving everyday practice in the classroom. A central tenet of this approach is the explicit involvement of the practitioners in the research process, rather than simply treating them as passive providers of data. It was decided to use Critical Discourse Analysis (CDA) as a methodology, as will be further explained below. The research in four different primary schools was supervised by university researchers from the UUAS in cooperation with three university lecturers who are involved in initial teacher training, eight primary school teachers, six student teachers, pupils, and the Special Educational Needs coordinators (SENCOs) of the four schools. All of the preceding stakeholders acted at some stage of the research as participant researchers. The entire process was run and coordinated by the first author of this chapter.

Research Questions

Some of us had already been involved in in-service training with SENCOs and teachers of the schools. Current government policy regarding the development of more inclusive practices in mainstream schools and the implications it may have for the work of teachers were recurring topics in our meetings. To learn more about these implications, we decided to set up a small research group. Collaboratively we decided to address the following research questions:

- How do teachers and pupils communicate and behave when managing difference in a socially just way?
- What limiting and what supportive factors do they encounter at the micro (class), meso (school), and macro (society) levels when engaging with social justice?
- What dilemmas do the teachers face when engaging with social justice?

¹Publications about this project include Montesano Montessori et al. (2011); Montesano Montessori and Ponte (2012).

At the end of the general exploration stage, teachers further operationalized these research questions so that all teachers were empowered to study the situation in their classes on their terms. At school A, the teachers reinterpreted the original research question to: How do we communicate in specific situations with the pupils? How does this form of communication relate to social justice? At school B: How can I, as a teacher, influence the interaction between myself and the pupils in the light of social justice? At schools C and D: How can I enhance the self-regulative and self-corrective capacity of the pupils? With these operational research questions, the teachers would initiate the specific explorative research stage, as will be described below.

Process and Content Goals

The research aimed at reaching both process goals which had to do with the dynamics and development within the research group and the classroom and content goals aimed at generating knowledge in the field of inclusion from the perspective of social justice. The process goals aimed at empowering teachers to do systematic research in their classrooms and establishing a horizontal dialogue with colleagues, university researchers, and teacher students. The content goals aimed at generating knowledge in relation to the conditions and implications of dealing with diversity in the light of social justice and developing innovative ways of communication and behavior in classroom settings. The ambition was, furthermore, to do research from an insiders' as well as an outsiders' perspective (Cochran Smith and Susan 1993). In order to facilitate and strengthen these research dynamics, we applied the layered approach to data analysis found in the abductive methodology of CDA and analyzed and evaluated the impact of this approach on the interpretative cycle throughout the research.

Our Concerns Towards the Topics of Social Justice, Special Education and *Passend Onderwijs*

As stated in the beginning, one of our aims was to critically address the current practices in Dutch compulsory education with its emphasis on the shortcomings and problems of pupils (the medical-deficit discourse) in order to create a climate for an alternative discourse which values differences and activates and supports the development of the strengths and unique talents of each pupil (the social model of disability discourse) (Oliver 1996). We intended to broaden our focus from pupils with Special Educational Needs (SEN) to all pupils, who, for a variety of reasons, need additional support during a shorter or longer period. Therefore we also challenged the concept of SEN, being reminiscent of the medical and deficit discourse of the 1980s. Hence, we suggested the adoption of the social model of

disability and a focus on the barriers which may prevent pupils from learning and participation (Booth and Ainscow 2002). These barriers may be present in the person concerned, but, in our perspective, it is equally important to consider whether certain barriers may be the result of, for example, the attitudes of the teacher, the social relationships in the classrooms, or an unwelcoming teaching and learning environment that does not meet the needs of the pupils. For instance, previous research indicated that the existing curriculum in a special school for adolescents with a visual impairment was not appropriate for the target group (Schuman 2009).

We were aware that, as has been observed elsewhere, people in different situations make use of identical words, but do not refer to identical situations or imply identical meanings (Palshaugen 2001, p. 261). We assumed that this situation might occur within our research community. Given the open meaning of “social justice,” we believed that a collaborative process of meaning making would be necessary. This interest in language further supported our decision to triangulate PAR with CDA. CDA states that discourse and social practice are mutually constitutive. Discourse helps create the realities it describes, but is also constrained by social structures. Thus, a medical perspective on SEN will call for other measures (a budget to hire special educators) than a social perspective which will focus on developing an inclusive practice ready to acknowledge and to deal with difference. It will also bring into practice different discourses, as stated above. We therefore wanted to take into account the language people use in everyday life about, for example, pupils with challenging behavior, and the way it shapes their actions, thus integrating PAR with a critical discursive analysis of their language in use.

Again, this perspective was supported by previous research: in the case study of the teenagers with a visual impairment at the Bartimaeus Institute in Zeist, it became clear that involving these teenagers in the research required creating a new frame and new terminology to develop a shared and empowering language which was more in agreement with the reality of these teenagers than the dominant disability discourse in society was, which had produced most of the texts and the frames in which to discuss the reality of persons with a visual impairment (Schuman 2009).

The Theoretical Framework

The theoretical framework was based on the work of Iris Young (1990) who considers social justice a matter not only of the just distribution of material means but also emphasizes the need for a just distribution of (institutional) power. While we agreed with this perspective, we noticed that Young does not provide tools as to how to analyze these processes of distribution. For the reasons mentioned above, we were therefore looking for ways to connect her rather abstract approach to social justice to other social theories which would help us to critically address the official Dutch policy towards *passend onderwijs* (the Dutch equivalent for inclusive education). We therefore reinterpreted Young’s advocacy for a more equitable participation of minority groups in society as removing barriers to learning and participation for pupils in mainstream school classes considered to

having SEN (Booth and Ainscow 2002). Thus we were connecting her theory to the social model of disability (Oliver 1996). As discussed in a previous section, the social model of disability challenges the more traditional medical-deficit view which suggests that the difficulties and challenges people with disabilities face, i.e., pupils with SEN, are the outcomes of personal characteristics (Ibid.). For pupils with SEN the medical model led to their exclusion from mainstream schools because they could not cope with the standard curriculum and were not able to assimilate (Thomas et al. 1998).

In order to address these concerns, we designed a research model to facilitate teachers to contextualize general theories on social justice to their own practice. After the initial round of gathering data through narrative inquiry with the participant researchers, we selected Harvey's ideas about social processes (Harvey 1996) to be used as a model to further explore Young's notions of social justice. Harvey analyzes social processes in terms of six simultaneously operating moments: language/discourse, power, material practices, institutional practices, beliefs and values, and social relations (Ibid). The analysis of the narratives called for the introduction of one more moment: social identities. The following table provides the model of Harvey with the added moment and the way in which it was related to our research purposes and results. Thus, the moments are mentioned in the first column, the way these were defined in the context of this research appears in the middle column, while the relation to the data is included in the third column (see Montesano Montessori and Ponte 2012 for further details).

Our Research Position

The two authors of this article met in this research project and have cooperated in several others, since. Both received their PhD's in the UK: Schuman performed Participatory Action Research with teachers, support staff, and teenage students with a visual impairment in a special school in the Netherlands and graduated at Roehampton University in 2007 (Schuman 2010). Montesano Montessori completed a discursive analysis on hegemony and political discourse in Mexico. This research was performed in a CDA tradition. She graduated at Lancaster University in 2008 (Montesano Montessori 2009). Schuman's research resulted in designing and implementing a curriculum which was more appropriate for adolescents with a visual impairment and which better prepared them for adult life and getting into paid work. A central concern for Schuman is that pupils with special needs should not be looked at through a medical-deficit perspective, which sees them as being subjects in need who require special medical and technical (monetary, special educators) help. Rather, he defends the view (Schuman 2009, 2010) that children with special needs and, in fact all children, have the right to receive whatever support they need to realize their strengths and talents and to develop their personality in harmony with others. In other words, he prioritizes a citizenship model over a medical model.

Montesano Montessori was well introduced in the critical theory in which CDA is rooted and she sees research as an instrument for social change in the direction of a more just and more sustainable world. Critical theory aims to “produce and convey critical knowledge that enables human beings to emancipate themselves from forms of domination through self-reflection” (Wodak and Meyer 2009, p. 7). She therefore, but also out of personal involvement with minorities, shared the emancipatory view which is implicit in Schuman’s perspective. Both authors agreed on the importance of performing research *with* the practitioners who operated in the context to be researched, in this case: the four classrooms. Schuman selected three primary schools from a cluster of about twenty-eight collaborating schools. From these three schools six teachers participated in the research. The fourth school participated as a single entity. Both authors consider research as a form of social practice. Following authors such as Fullan (2001) and Pring (2000), we were convinced that it is essential to include practitioners in the research community, in order to come to a process of shared meaning making, to develop a shared view on the research questions and the social challenges these address, and to come to a full understanding of a professional activity.

Epistemological, Ontological, and Methodological Assumptions

At a more abstract level, both authors agreed on a series of epistemological and ontological assumptions, which we will briefly present here. Our epistemological position is based on the perspective that there is no such thing as an “objective” world out there which can be objectively grasped by an uninvolved, objective researcher. We believe that both university and participant researchers are situated in their own context, their personal history and beliefs, and the knowledge system(s) that they were formed by. We believe that this position is strongly influenced by personal values and beliefs. In fact, we believe that, in order to allow true participative research to happen and to allow processes of social change as a result of this research, it is necessary to question and discuss and be prepared to change these values and beliefs (Schuman 2009, 2010; De Lange et al. 2010).

We believe that PAR constructs a form of contextualized knowledge which is situated in the context in which it takes place. We do not believe that there is a bias of theory over practice or that research should start with theory. In fact, we believe that empirical research focusing on involvement and change requires a dialogue between theory, data, and context. In that sense we have been using the abductive approach proper to disciplines situated in critical theory, such as CDA. We will explain this further below. We believe that the social world, and therefore social research, is different from the natural world and that it is undesirable to blindly adopt research methods from the objective-empirical paradigm to processes of PAR. In our view, PAR is originating from Critical Theory because of its focus

on participation, emancipation, experience, plural ways of knowing, and social justice (Reason and Bradbury 2001). In our various common research projects, we opt for the critical emancipatory paradigm, in that we intend to facilitate processes of social change which enforce the position of the practitioners and the participants in the practice that is under research. The choice for performing research in the critical theory tradition further sharpens our epistemological position. We believe, following Habermas (1984), that knowledge claims are valid when they are meaningful to the research community; when they are true in the sense of being based on valid arguments; when they are sincere, which, in our view, means a coincidence between “saying” and “doing”; and when the speaker is justified to say what he or she is saying. An important condition for this kind of truth to be generated is discussion or dialogue (Habermas 1984; Scott and Usher 1996). We also share the idea that the creation of knowledge is the result of both cognitive and social processes and therefore never absolute, but always open to discussion and revision. We share the critical realist ontology of CDA, which accepts that there are causal powers in the world and that reality is stratified. A research object exists at various levels. For instance, in educational research, one can investigate at micro level the day-to-day practice in a classroom, at the meso level school ethos or professional relationships, and at macro level the impact of society and major structures, such as the Ministry of Education, on education more generally, for example, on the PISA results of Dutch students. We believe that PAR normally takes place at the micro level, but that the researcher should take into account the ways in which the micro level is embedded in larger social meso and macro structures.

Our Perspective on Interpretation

Having described our research position, we will now address our perspective on interpretation in educational research. We see interpretation as a double hermeneutic process. Seeing research as a social practice, it is performed by social actors who are previously constituted by their education and training, their readings, the social groups they belong to or have access to, and their current knowledge and experience. Social subjects understand texts and social practice, in part, through their previously constituted knowledge, earlier interpretations and through their personal understanding of that reality which, together, form the member’s resources which determine a persons understanding of a situation (Fairclough 1989). We work in agreement with the hermeneutic/interpretative epistemology (Usher 1996, pp. 18–21). Following Laragy (2004), we intended to produce emancipatory knowledge which would support self-determination, through a collaborative process of interpretation and meaning making of the professionals and students involved.

This implies that we consider that all human action is meaningful and hence has to be interpreted and understood within the context of social practices. This by itself

implies a double hermeneutic. Social actors give meaning to their actions by interpretative schemes. But researchers also make sense of their research topics through interpretative schemes. This implies distancing ourselves in two ways from research traditions found in the natural sciences, which still remain dominant in the social sciences and even in practice-oriented research. First, we do not believe in a strict separation between subject (researcher) and object (the researched), since both share the characteristic of being interpreters and sense-seekers. Second, we do not believe that research can be done by restricting ourselves to the observable only, as we explained above. It requires investigating and discussing underlying values and beliefs. Therefore, in our view, dialogue is of eminent importance in this kind of research. We furthermore believe that knowledge formation is circular, iterative, and spiral, because it is a matter of increasingly combining the interpretation of the parts with the interpretation of the whole (Usher 1996, p. 19). In CDA this is reflected in its concern to always combine the micro and the macro, in this case the micro reality of the four classrooms and the macro level of Dutch policy in relation to *passend onderwijs*.

Implications of Our Research Position for the Initial Stages of the Research

Triangulation of Research Strategies

Our research concerns have gradually led to a new framework which was implicit in this research on social justice, which has been elaborated further in other projects and which implies a subtle integration between CDA and PAR (De Lange et al. 2010; Montesano Montessori, Schuman and De Lange (2012), and recent research on democratic citizenship in the classroom. While we use the social justice research as a case study to illustrate this, we emphasize that our work in this direction has developed beyond this particular project. The most obvious research strategy chosen for social justice was that of PAR, since it was also the main strategy employed in the formal research group in which the research was initiated (Montesano Montessori et al. 2011; Montesano Montessori and Ponte 2012). Reason and Bradbury (2001, p. 1) give a working definition of PAR which matches our ideas about research in schools and classrooms: “Action research is a participatory, democratic process concerned with developing practical knowing in the pursuit of worthwhile human purposes, grounded in a participatory world-view.” Action research takes place in several stages, which include orientation, exploration, reconstruction, and evaluation (Ponte 2002, 2006). We agree that for action research to become effective, that is, having a positive and sustained impact on the learning and teaching that takes place in classrooms, it is best treated as “an emergent, evolutionary and educational process of engaging with self, persons and communities which needs to be sustained for a significant period of time” (Reason

and Bradbury 2001, p. 1). In this sense the knowledge we developed did not equate with certainty, but it was “always embedded in analytical processes and open to review and reinterpretation” (Nixon et al. 2003, p. 91).

CDA is the analysis of the dialectical relationships between discourse and other elements of social practices, such as power, values and beliefs, and institutional and material practices. It focuses on the relation between discourse and power relations in society. It looks at how discourse contributes to maintain asymmetric power relations or to resist or modify these. It is a framework which allows researchers to develop a model in agreement with their research purposes and orientation which requires transparency on behalf of the researchers’ position. In our view, CDA presents a sophisticated methodology with a layered approach to the collection and analysis of data. The abductive approach includes a cyclical research process, in that the researcher, at each stage of data analysis, sets up a dialogue between theory, data, and social context (Fairclough and Wodak 1997; Reisigl and Wodak 2001). The first author of this chapter, for instance, developed a research model to analyze hegemonic procedures in political texts (Montesano Montessori 2009). In the case of social justice, as stated above, a framework was developed based on Young (1990) and an adapted version of Harvey (1996). The layered approach of CDA connects well to PAR because it also advocates a cyclical approach of the research process: plan → act → observe → reflect → and act again (Carr and Kemmis 1986). We will demonstrate, in this chapter, how the combination of PAR and CDA enabled a hermeneutic and cyclical—rather than linear—approach to interpretation. In fact, we believe that the combination of CDA and PAR helps to overcome a classical problem in educational research, namely, the gap between positivist research and practice. CDA provides a sophisticated research approach which integrates the macro and the micro levels, theory, and empirical data. PAR introduces the social agent in the research and helps to make sense of the research findings at each level of analysis.

An Abductive Approach to Research

Abduction involves constructing theories based on social actors’ language, meanings, and accounts. Research starts by describing these activities and then deriving from them concepts and categories that contribute to understanding the problem that is being researched (Blaikie 2010, p. 90). Although abduction as a strategy has been criticized as a misinterpretation of its original source in the philosophy of Peirce (Deutscher 2002), this study adopts the prevailing view in CDA, which considers abduction as a constant movement between theory and empirical data (Reisigl and Wodak 2009). This choice was indicated by locating the research in a post-structural framework, which requires this dialogue between theory, methodology, and data, in order to make sense of the social and linguistic processes it seeks to understand. Therefore, the accumulation and analysis of data was performed in three stages. We started with a general exploration stage, which included narrative

inquiry in which the participant researchers expressed their insights and experiences in relation to social justice and inclusion. This was followed by a specific exploration stage in which the teachers defined their own research focus and described, analyzed, and reflected on specific situations in the classroom. The third research stage focused on specific situations or on specific children and led to the reconstruction stage in which teachers and pupils experimented with innovative ways of addressing difficult issues in their classes which were then evaluated and described in the final reports of the participant researchers. Every stage was completed with a focus group meeting with all participants, which facilitated processes of interpretation of the results achieved in that particular stage and common decisions as to how to proceed into the next stage.

The Creation of a Horizontal Research Group

As stated at the beginning of this chapter, one of our main aims was to provide a central voice to the practitioners, since we considered that they have the experience and the knowledge but also the duty to take care of all of their pupils. This central role of teachers in developing an educational practice suggests a research approach which is supportive of the idea of teacher participation and stakeholder involvement (Senge et al. 2000). In doing so, we also aimed at overcoming the problem mentioned above and perceived by the Evaluation and Advisory Committee of *passend onderwijs* that researchers do not involve practitioners. The choice to incorporate the voice of the practitioners was also inspired by our personal stance of combining social research with processes of social change. In order to achieve this horizontal community, we took distance from traditional hierarchical research relations. We made no formal distinction between university researchers (with or without a PhD) and participant researchers. As university researchers we saw it as our task to facilitate the research process, to focus the attention of the research group in line with progressing insights, to design appropriate research instruments, and to provide support when needed.

The Creation of an Emergent Research Design

We decided to the deployment of an emergent research design (Reason and Bradbury 2001; O'Hanlon 2003) and a focus on narrative inquiry at the earlier stages of the research and the use of focus groups throughout the research process (Trahar 2006; Abell and Myers 2008). An emergent design was prepared that was strong enough to support the entire research process in all its stages. It therefore included an agenda for the various stages distinguished in PAR (see Table 2). It was simultaneously flexible enough to allow for changes in

agreement with the research process in terms of generation of new ideas or common decisions taken during the process, yet flexible enough to sustain the entire research process.

The Use of Dialogical Research Instruments: Narrative Inquiry and Focus Groups

In order to facilitate this, we started with a process of narrative inquiry in which teachers were invited to present a narrative interview, based on a series of topics concerning communication in relation to difference in the light of social justice and inclusion. The indication of the required topics to deal with, though providing some coherence, still differed from a structured interview, since the teachers were free to decide on the order in which they would deal with these topics. The teachers were invited to prepare their ideas on a mind map and to freely transmit their experience and their ideas to the interviewer who operated as a moderator (Abell and Myers 2008). The strength of narrative inquiry is that it provides informants with freedom to articulate their personal story and to describe the causal relations as they see them. It also gives them time to prepare the interview, which helps them to increase their own responsibility and to further limit their dependency on the interviewer. In this sense a narrative inquiry is a more open and less structured method than an open interview (Trahar 2006). We furthermore worked on the principle that every participant who entered the research process (for instance, the teachers started in January 2009, while the student teachers started in September 2009) would formulate their personal research questions within the larger framework. This was done in order to distribute ownership and it would help to remedy as much as possible the issue of parity of influence. At the end of every research stage, a focus group was organized (three plenary and one round of focus groups held at all different schools), which helped to turn interpretation into a process which played a role in every stage of the research and in which all stakeholders had a say. It thus facilitated the cyclical character of interpretation according to the hermeneutic/interpretative epistemology described above.

Taking into Account Ethics

In our view, setting up a research community requires a climate of security, mutual interest, and respect. If we were to invite participant researchers, we expected of ourselves to have respect for their current positions and points of views as well as for their further process of investigating their own practice. From the beginning we took this into account and we paid careful attention to the facilitation and accommodation of the participant researchers. We made sure that every participant would get considerable research time allocated within their normal duties.

This counted for teachers as well as for student teachers, who compensated part of their curriculum with their participation in the research. It was also arranged that they would receive an official acknowledgement of participation at the end. Contracts were made and signed between the participants and the school directors. Accommodation involved the support and the preparation for participant researchers to take up their roles as researchers. Narrative inquiry played a significant role in this attempt. We were aware of the fact that participants made themselves vulnerable by questioning their own practice and sharing the outcomes with direct colleagues and student teachers.

We therefore gave high priority to the creation of a safe research climate that tested practices and beliefs, without becoming judgmental about them or about those who raised them.

Description of the Research Process

We will now proceed to describe the research process. Table 2 describes the various stages of the research. The five stages mentioned in the left column correspond to stages distinguished in PAR, to which we added a division of a general and specific stage within exploration. We added in bold and italics the steps of data collection and analysis inspired by the CDA methodology. Below follows a detailed description of each stage.

The First Level of Data Collection, Analysis, and Interpretation: Narrative Inquiry

With the CDA methodology in mind, the focus was also on a layered organization of the collection and analysis of data. It was decided to perform narrative inquiry during the general orientation stage with content analysis of the results then being done using principles of narrative analysis in the tradition of CDA and aided by software tools (Atlas.Ti). At this particular stage, the participative researchers expressed the following dilemmas: How many pupils with SEN can we admit within the present budget? Will inclusive education disturb the learning process of the other children?

The Second Level of Data Collection, Analysis, and Interpretation: Bumpy Moments

In order to make a second step in data collection and analysis, it was decided for the specific exploration stage to start registering the so-called bumpy moments, which are

moments that could, in hindsight, convey several legitimate and competing courses of action with regard to classroom interactions with pupils (Romano 2004). Bumpy moments were introduced as dichotomous situations: “The term bumpy moment did not refer to a situation in which teachers did not know what to do (incapacity to act) but to a situation that could, with hindsight, convey several legitimate and competing courses of action with regard to classroom interactions. We assumed that these mini dilemmas have an inherent moral significance” (Van Kan et al. 2010). In other words, a bumpy moment is a moment where the teacher could have exercised agency—in the sense that agency is the ability to act otherwise than one did.

At this stage of specific orientation, various significant developments took place:

- The teachers collectively reformulated the question of how to improve social justice in the classroom, deciding instead that the issue to address was “how to enhance the self-regulative capacity of the pupil.” This completed the specific exploration stage in the sense that this now became the group’s definition of social justice. This was a significant moment in a process of shared meaning making. Harvey (1996) was selected as an interface to analyze bumpy moments.
- These two decisions led to the design of the proforma which the group then developed further in order to gather data on these bumpy moments. The structure of this proforma included a description of the bumpy moment, the situation which caused the teacher to act in a way which caused a conflict with her personal values and beliefs. This was followed by the dilemma as experienced by the teacher. The third step was a reflection on the bumpy moment and on thinking of possible alternatives. Alternatives had to be checked in terms of consequences for the pupil, the teacher, and the group. Then feedback should be asked from the pupil to find out how he/she had experienced the situation, what he/she thought of the behavior of the teacher, and whether he/she thought that the teacher had acted in a just way. Then the teacher had to write down the lessons learned. The final category included the formulation of innovative ideas for alternative ways of acting and communicating (see Montesano Montessori and Ponte 2012, for a full account and a copy of the proforma).

The findings of the bumpy moments were then analyzed in terms of the seven moments of Harvey (Table 1). The dilemmas formulated at this stage included: “Shall I intervene now or later?”

The Third Level of Collecting and Analyzing Data: The Reconstruction Stage (February 2009–June 2010)

Teacher and student researchers now started to experiment on the basis of their reconstruction plan. In one school the teacher invited a pupil who suffered a light form of autism to list alternative ways of acting, which he/she could consult during future incidents in order to learn to regulate his/her own behavior. One student

Table 1 Model of social processes developed by Harvey (1996) in relation to this research

Moment	Definition of the moment in the context of this research	Results from the narrative inquiry
Values and beliefs	Values and beliefs carried out implicitly or explicitly by stakeholders	Values and beliefs. Conditions. Considerations. Vision on inclusion
Discourse/ language	(a) Communication and information	Communication and information at micro (classroom), meso (school), and macro (society) levels
	(b) Communicative relations	
Social identities	All stakeholders. The description of and attributions to these identities	Pupils, teachers, coordinators, assistants, parents; characteristics attributed to them; social role
Institutional practices	(a) Organized institutional procedures at the micro, meso, and macro level	Policy at the micro and meso level; classroom management, differentiation, specific working methods, inclusion or segregation of groups or individuals
	(b) Ceremonies	
	(c) Institutional cooperation	
Material practices	The presence or absence of material means and facilities	Facilities or the lack of them at the levels of the classroom, the school, and the Ministry of Education
Power	The capability to: Have someone do something or to forbid someone from doing something. Influence the distribution of material or nonmaterial goods	Communication. Distribution of facilities. Considerations and decisions. Choice of teaching methods. Policy of admittance
Social relations	Social interactions, social relations, forms of cooperation at the levels of the classroom and the school	Educational climate. Relations between stakeholders. Forms of cooperation. Interactive educational methods

teacher invited three girls to each write a short story on the conflict that they had had so that the different points of disagreement would become clear. They would then write an alternative story with alternative solutions. Another teacher assigned a section on the wall where children could describe a problem with other children on a piece of red paper (after having discussed it with the child concerned). Other children could give advice as to how to resolve the conflict on green sheets of paper. This particular teacher engaged in frequent group or circle discussions with the pupils to discuss norms and values and how to resolve problems or conflicts which emerged in the group. At another school, a teacher decided to focus on a girl from Morocco who remained isolated in the class. It was assumed that the girl experienced a gap between the situation at home and at school. This led to the formulation of an innovation plan in which the child would be invited to do activities outside the classroom and to sometimes join the school coordinator in order to have a cup of tea and a chat. Other children would be invited to join her so that she would get a chance to get to know more children and to make friends. The coordinator and the teacher both hoped to get a better understanding of the child.

Table 2 The stages of the Social Justice Project in relation to CDA methodology

Stage	Research methodology	Outcome in terms of contents	Outcome in terms of processes
Orientation (Sept. 2008–January 2009)	Preparation of a vigorous, but flexible research design in close collaboration with university researchers	The joint formulation both of the research questions and of the planning of the research design	Establishment of external network with the participating schools
General exploration stage February 2009–June 2009 <i>First step of data analysis in terms of CDA</i>	Narrative inquiry through open interviews with the teacher researchers. Content analysis	Selection and adjustment of Harvey's model (one extra moment was added: social identities)	(<i>Dynamics</i> : teachers changed roles from informants to researchers and decided on the research focus in their classrooms)
Specific exploration stage September 2009–January 2010 <i>Second step of data gathering and analysis</i>	Description of “bumpy moments” connection of bumpy moments to Harvey's model	Reinterpretation of the concept of social justice as “to enhance the self-regulative capacity of the pupil(s)”	Development of the research instrument for <i>bumpy moments</i> . Integration of insider and outsider perspectives
Reconstruction February–June 2010 <i>The third step of data analysis</i>	Action research by teacher researchers using video-observations, reflective dialogues	Identifying indications which are needed to improve the pupils' “self-regulative potential”	Continuous focus on specific children of procedures. Shift in power position of teachers
Overall analysis June 2010	Overall analysis in terms of lessons learned	Focus groups in each of the schools and a final plenary focus group	Teachers reported to have a multiple lens to look at their practice. Order became more organic

Analysis of Results (June 2010)

In terms of process, the reconstruction cycle seemed to have a remarkable result in the classroom: bumpy moments became less frequent in all classrooms. Relations became more harmonious and order seemed to become more organic and less regulated by the teacher. Most participant researchers reported that the pedagogical climate in their classrooms had changed. The outcome of this stage in terms of content implied a more subtle view on power and on the position of the teacher. Children developed their own strategies to regulate their behavior and communication. New teaching methods had been developed. Teachers gained insight into the motives of children which influenced their behavior. In making motives more explicit, new ways of dealing with them emerged. The teacher of that group reached the insight that social justice required equality. She has to hold to the same rules as the children. So when she does something wrong, she apologizes. She sometimes discusses norms and values with the group and involves them in the process of

decisions taken as to how problems should be managed in the class. Participant researchers now formulated the following dilemmas: “Should my norms and values be the rule or should I discuss this (sometimes) with the pupils?” “If I let go of my power, then what is my position and my responsibility?” “Should I always do what the children want or should I engage in a dialogue with them?” “Should I protect the child or should I prepare it for its new environment at secondary school?” “How do I make sure that social justice becomes a shared process between me and the children and not an idea that I impose?”

Specific Features of This Research Model *During* the Research Process

We would now like to present some specific features which emerged and developed throughout the process of this participative research.

Research Activities and Instruments Were Designed to Simultaneously Serve Various Functions

The *narrative inquiry* served a series of purposes. It gave a central voice to teachers, and further decisions on theory and methodology were taken on the basis of the outcome of these narratives. It helped to establish a transparent and horizontal research relation between university and school researchers. It empowered teachers and helped them prepare for the role of researchers. It laid the basis for processes of shared meaning making and the exchange of insiders and outsiders’ perspectives. It led to the selection of Harvey’s dialectical view of social processes in terms of six dialectically related social moments, namely, discourse/language, power, social relations, material practices, institutions and rituals, and beliefs/values/desires, and the addition of one more moment: social identities. This represented a moment where theory informed practice, while practice informed theory.

The proforma of the *bumpy moments* was a multifunctional template which served simultaneously for the collection of data by the teachers, reflection, dialogue, and formulation of innovative action (preparation for the reconstruction stage).

Participant researchers systematically related their bumpy moments to Harvey’s model, which helped them reach an understanding about their practice in relation to the seven moments and seemed to draw their attention to their own power position. Finally, it was through the proforma and the procedure of providing feedback that the integration of the insiders and outsiders’ perspective reached its moment of greatest intensity. Teachers sent the proforma to the university researchers, who provided feedback through comments in the margins of the proforma.

The *feedback* provided by university researchers turned out to be twofold. On the one hand, university researchers helped participant researchers to focus

on their reflections on the now chosen definition of social justice as “the enhancement of the self-regulatory capacity of pupils.” On the other hand, it also turned out to be a process of joint reflection, for instance, when there was doubt as to how to relate aspects of the description of the bumpy moments to the model of Harvey.

Shift of Roles The first focus group, held in June 2009, implied a serious challenge. The focus group was meant to discuss the results of the analysis of the narrative inquiry. But it was also during this session that participant researchers were invited to formulate their own specific research questions to investigate in their classrooms starting in September. In other words, participant researchers would let go of their role of providing data as they had done during the general orientation session, in order to adopt the role of co-researchers. University researchers shifted their role in the direction of facilitators of this micro-research in the classroom, the organization of plenary meetings, and providing feedback as well as any other kind of support when needed, to the participant researchers.

Especially the project leader had to find a subtle balance between controlling and facilitating the entire research process in all its stages while providing freedom and support to the participants. It required taking on multiple roles varying from being the researcher who had the overview, and who took the initiative, to being a critical friend and co-researcher, to being a partner when discussing educational problems in the classroom. While performing these various roles, she always remained conscious of her role as a researcher.

Stratified Dilemmas While the participant researchers clearly showed a shift from technical and material dilemmas in the first stage, to more procedural dilemmas in the second stage and significant personal dilemmas in the third stage, it was certainly true that the university researchers had to face a series of dilemmas as well. During the first focus group, when the shift of roles had to take place, university researchers made themselves dependent on the very procedure they had designed. What if the teachers were unwilling to take up the role of researchers? It might have meant the end of the research, at least in the way it had been designed during the orientation stage. University teachers faced a second dilemma when the school researchers were supposed to submit bumpy moments. Initially hardly any material was received. One option was to remind them to do it. But this could easily lead to a counterproductive dependent relationship. University researchers were sensitive to the fact that teacher researchers should consider the bumpy moments procedure as part of their research and not as homework to be done for the university researchers. This problem was resolved through an internal meeting at the university among colleagues, through an additional informative letter sent to the teachers, and through the help of the SENCOs at the schools who discussed the issue with the teachers. Then the procedure started to flow. Prompt feedback by university researchers helped teachers to keep an interest in the process. An interesting finding was that participant researchers started to experience similar dilemmas. One teacher was hesitant to say too much about social justice to the children, because she wanted it to be their (and not her) social justice.

A final specific feature was the *interpretation* as a collective process at the end of every research stage. Since this represents the main topic of this handbook, we will address this in a separate paragraph.

Interpretation in the Research on Social Justice

As indicated before, each research stage was completed with a plenary session that allowed for a process of collaborative sense making and interpretation of the results achieved in that particular research stage. One could say that the orientation stage was embedded in the authors' orientation about research as a social practice. This led to the interpretation of research as a social, contextualized, cyclical process, which required participation, a layered form of research and, as such, an emergent research design which was developed at that stage. It also led to the decision to select narrative inquiry as an instrument for the first round of data collection.

The general exploration stage in which the narrative inquiry took place and the selection of Harvey's model can be considered an initial reinterpretation of Young's approach to social justice in terms of the simultaneous occurrence in social processes of power, language/discourse, social relations, material and institutional practices, and values and beliefs. Based on the narratives, it was then decided to add a seventh moment, social identities, which represents a reinterpretation of the model, when recontextualizing it explicitly to the topic of social justice. The first focus group furthermore revealed that the research group considered that social justice was a matter of acknowledging that diversity is a given and that this requires an inclusive approach by everyone involved in the social practice in the classroom. It also became increasingly clear that inclusion was a matter of both behavior and communication.

The specific exploration stage led to the definition of social justice in this research as a means to "enhance the self-regulative capacity of pupils." This moment occurred when one participant researchers made this as her research question. It was then collectively recognized as a meaningful definition of social justice for this research community in this context. This paved the way for focusing on the bumpy moments, the reflection on these moments in terms of what can the teacher or the pupil do to enhance the capacity of self-regulation of the pupil, which in all cases led to the formulation of innovative actions which were tried out in the reconstruction stage. It definitely provided university teachers with a lens to look at the description of these bumpy moments as a basis for providing feedback. Much of the feedback was directed at questioning participant researchers on their habit of rewarding and punishment. University teachers were now inclined to ask the teacher whether he or she saw an opportunity for starting a conversation with a child about its behavior, rather than rewarding or punishing. The result was seen in later descriptions of bumpy moments and the results were significant. Children very often had very clear motives for their behavior, and when asked about it, the road was open to them to remove certain causes or to change behavior patterns.

During this stage, the participant researchers decided on redefining bumpy moments as critical moments in which the established norms and values (of the teacher) in the relationship between a teacher and a student were called into question. Even though this same relation between bumpy moments and values and beliefs is also described in theory (Romano 2004; Van Kan et al. 2010), this was definitely a moment of increased understanding within the research community. It helped to make the distinction between general hectic situations and actual bumpy moments. In a certain way, this confirms the importance of contextualized PAR: people do not learn as readily from theory as they do from experience and collaborative reflective practice.

During the specific orientation stage, a salient and increased understanding of Harvey's model in relation to social justice was developed as a result of a teacher who could not communicate spontaneously with the pupils due to the excessive power of the parents in that school. It brought the group to identify the need of the seven moments of Harvey to be *in balance* for social justice to occur. If one moment manifests itself too strongly, social justice is rendered impossible. In a certain way, this reconfirms Young's assumption that just the material distribution of goods does not lead to social justice.

During the reconstruction stage, participant researchers reinterpreted their role as teachers. They let go of their expected and routinized role of conductors of group processes. They started to pay individual attention to children and facilitated them to create their own solutions to their challenging behavior or conflicts in the group. The intriguing result was that the number of bumpy moments seemed to decrease. All teachers reported a more organic order which seemed to emerge spontaneously.

Last but not least, and we may call this a salient CDA research result, the research allowed for a reinterpretation of the Dutch policy towards pupils with SEN at school and classroom level.

The final and official interpretation was drawn by university researchers after the research cycle was completed. In fact the results—and in many ways the features of the research procedures—became manifest in the process of publication of the results (Montesano Montessori et al. 2011; Montesano Montessori and Ponte 2012). Unfortunately, it was not possible to involve the participant researchers in this process. Especially the latter publication formulates the results of this research in four particular fields: a critical revision of the official policy from a medical to an inclusive perspective, the theoretical development of the theory of Young, the selection and further elaboration of the theory of Harvey, and an innovative process in the classroom.

Reflections on Interpretation in Educational Research

In this chapter we described ways in which interpretation was a process which took place in each of the three research stages. However, though it is certainly true that interpretation occurred in a layered way, perhaps not even too surprising in a

research that was set up in order to go through different layers, a series of problems emerged. How exactly do we define interpretation? While describing the process for the purposes of this chapter, it became clear that interpretation in this research has meant several mental and social activities, such as *seeing* or *considering* or *further understanding*, *a collective process of making sense of*. It has also meant a *reinterpretation* of the theory of Harvey which, in any case, was recontextualized, since he never connected this model to social justice. It also implied the *reinterpretation* by the teachers of their own role and position. In a hermeneutic process such as this, what is the difference between an interpretation and a reinterpretation? Some future research may be necessary to flesh this out. Does one thing lead to the other? In other words: did the “further understanding” lead to rethinking social role and position in the classroom and acting on that? How does this process of interpretation relate to more linear research strategies?

To further complicate matters, in fact each and every publication on this topic has been an example of a reinterpretation of the research process. Surprisingly, this was the case with the two official publications of the research itself (Montesano Montessori et al. 2011; Montesano Montessori and Ponte 2012). In the first article, for instance, it was only when writing it up and after requests of the reviewers to specify certain aspects of the research that it became clear to us that we had to distinguish a general and a specific orientation stage, whereas we had considered it a uniform orientation stage during the process itself. When writing the second article, it turned out to be necessary to clarify the issue of the shift of roles and the stratified dilemmas in order to convincingly describe the research results in four different fields. As a side product of this research and as a result of the aspect of the integration of critical theory, CDA and PAR, this research has been recontextualized to the field of management (Edward and Montesano Montessori 2011).

The preparation of this particular chapter set interpretation center stage. In order to fully explain the stratified character of the research inspired by critical theory—as well as being inspired by increased research experience after this particular project—it seemed necessary to explicitly describe our research position.

Last but not least, it was only in this particular rewriting of the project for this chapter that we recognized, for the first time, that we had achieved a very clear CDA result per se. So far we believed that we had used CDA mainly as a methodological approach which led to a layered research design and an abductive research strategy. Since the orientation of this chapter forced us to rethink the research in terms of interpretation, we became aware that we obtained a CDA result proper in terms of revealing the implicit medical-deficit approach of the official policy and suggesting a new perspective in the direction of the empowerment of the pupils. We definitely demonstrated that the belief that teachers are part of the problem and should not be taken into account in the research is unfounded. When given a chance, teachers and student teachers are extremely capable of investigating their social practice, the context in which it is embedded, and, above all, their own position and responsibility within that practice. Furthermore they showed the world that they are willing to critically address this position and change it when this is meaningful to them.

2.4 Discourses of Intercultural Communication and Education

Karin Zotzmann

Introduction

Research on intercultural communication is characterized by great theoretical and methodological heterogeneity which is not surprising given the “broadness” or “fuzziness” (Blommaert 1998) of the topic. Despite these differences, a common denominator seems to be that “phenomena of cultural differences [are] ‘somehow’ meaningful for the communication process” (Otten and Geppert 2009). It is assumed that communication is intrinsically bound up with cultural presuppositions, values, and identities and that these can potentially lead to misunderstandings, stereotypes, and prejudices. Overcoming the ills of ethnocentrism in particular—the idea that one’s norms, values, and forms of being, acting, and relating are universally valid and superior to those of others—is one of the principal goals of intercultural education. One of the main methods to achieve this is to increase knowledge about other perspectives and to generate awareness about similarities and differences between people who do not, or only partly, share a common sociocultural and linguistic background. Openness, flexibility, tolerance, and empathy are essential objectives, and so are self-reflection and ultimately relativization of taken-for-granted assumptions.

This is however as far as commonality reaches. A closer look at individual approaches brings to light the diversity of, and the tensions between, theoretical stances towards the nature of intercultural communication and concomitant recommendations for intercultural education. The present chapter starts from the assumption that academic discourses about intercultural education do not merely discover, describe, and analyze intercultural communicative practices that already exist in an

objective manner, but actively co-construct them (Risager 2010). Academic authors as well as teachers, consultants, and trainers significantly shape ideas and practices of intercultural interaction by providing cognitive and discursive resources for thinking about, relating to, and communicating with others. Taking this discursive mediation of social scientific knowledge as a point of departure, the discourses of intercultural education are understood to be interpretive and evaluative moments that require a heightened reflexivity towards the role of language in the constitution of reality and the construction of knowledge:

... we should not only worry about intercultural communication per se, but also about the way in which it is perceived, interpreted, construed, and structured by all kinds of people, including ourselves. In short, we should be committed to investigating the ideologies surrounding intercultural communication. (Blommaert 1995, p. 5, see also Tochon and Cendel 2009; Holliday 2011)

The chapter will present a meta-analysis of approaches to intercultural communication and education. That is, it will provide an “interpretation of interpretation” (Alvesson and Skoldberg 2000). It will discuss three different frameworks developed in the field: a modernist and essentialist view, a first postmodern and also distinctly postcolonial perspective, and a second postmodern account, this time focusing on intercultural communication through English as a lingua franca. By comparing research on intercultural communication from these different standpoints, I will show how interpretation impacts upon the entire process, from theoretical choices over the identification of social domains and contexts as relevant for the extrapolation of data to the selection of methodological instruments, the analysis of the data, and the promotion of particular pedagogic interventions on the basis of the results obtained. Therefore, the overall objective of this chapter is not to provide an overview of major strands of current research in the field—this would be impossible in the face of the diversity of research that exists and disciplines that are drawn upon—but to demonstrate that differences between views on intercultural communication can be traced back to decisions on five distinct but interrelated levels: *the theoretical–conceptual*, *the methodological*, *the political–normative*, and *the epistemological–ontological*. Connected but secondary to choices on these planes are *generalizations and pedagogical recommendations* drawn from empirical findings. Such a matrix, it is argued, allows a systematic comparison which is a precondition for identifying compatibilities and incompatibilities and fostering dialogue across frameworks. Additionally, it can guide researchers, educators and students to a systematic reflexivity and scrutiny of assumptions underlying academic and educational practices, which in turn is demanded by the very subject of intercultural education itself.

Previous overviews of the variety of research on intercultural communication and education have so far concentrated either on common themes (Landis et al. 2006), contributing disciplines (Kotthoff and Spencer-Oatey 2007), or on theoretical–conceptual components, in particular the notion of *culture* (Risager 2007; Holliday 2011; Spencer-Oatey and Franklin 2009) and *identity* (Kim 1988). Both concepts are not only essential to the field as they underlie and shape the view on the nature of intercultural communication, but they are also rather

vague and can be employed in different, often even contradictory ways (Bauman 1999). Hence, this is a good starting point for a comparative analysis. Blommaert (1998), quoted above, expands this discussion by emphasizing the political–ideological implications of different concepts of culture. Otten and Geppert (2009) provide a “heuristic frame to manoeuvre through a rapidly expanding ‘galaxy’ of research on intercultural communication.” In contrast to Blommaert, their point of departure is less political and more focused on core components of academic research. Similar to the normal process of quality control through peer review, they discuss and evaluate the coherence of empirical studies according to three dimensions: the theoretical assumptions that underlie the concept of culture; the basic research design, modes of analysis, and reflexivity; and the generalizations drawn from the empirical findings.

The matrix proposed in this context not only shares an acknowledgement of the importance of each of these dimensions with previous meta-analyses but also combines, systematizes, and extends them. While theoretical and methodological choices undoubtedly shape research on intercultural communication and pedagogic recommendations, the latter two, the political–normative and the epistemological–ontological level, need further justification. The political–normative level is relevant as research on intercultural communication and intercultural education is almost always justified by references to social change, often subsumed under the buzzword of “globalization.” Most authors seem to agree that educational institutions have to respond in one way or another to the interweaving of cultural, economic, technological, and other processes on an international plane, in order to prepare students for the exigencies of a rapidly changing and interconnected world (Risager 2010). Intercultural competencies, however defined, have therefore become essential to many educational programs, either as an integrated part of existing modules, stand-alone units, or entire degree programs. But while diagnoses of socioeconomic change are decisive for recommendations of particular pedagogical interventions, the actual nature, causality, and effects of “globalization” are highly contested and hotly debated. In addition to this, specific diagnoses of contemporary social change are generally linked to a prognosis; that is, an image of a potential future society and its desirability. In this sense, the application of discourses of globalization is normative presupposing “a discernible difference between what ought to be and what is” (Sayer 2004, p. 5). In the case of pedagogy, references to and narratives of internationalization processes are employed to justify specific content areas, methods, and curricula which do not only shape education itself but also feed back into wider perceptions and dynamics of the social transformation in question (Pennycook 1994, p. 225). It is in this engagement with the project of social change that the field of intercultural education is, according to Young (1996, p. 20), “a political-ethical act which is not independent of history but occurs in the full blood of history’s law, bound by its urgency, and specifically, by the urgency of our current, global problems.” In order to capture differences between approaches, the discourse of globalization or internationalization that authors draw upon—and the particular goals and objectives intercultural competencies are related to and designed for—needs to be analyzed.

Inexorably linked to the political–normative views on social change are the interests behind particular forms of research and the concomitant pedagogical recommendations. In order to capture this epistemological–ontological component, I will draw upon Habermas (1971, 1987), who departs from the assumption that there is no such thing as pure knowledge; instead the creation of knowledge is always motivated. Habermas differentiates between three kinds of generic interests that can drive and influence the creation of knowledge: *technical*, *practical*, and *emancipatory*. The *technical* interest stems from the need to manipulate and control the environment and is often accompanied by empirical investigations founded on objectivist and positivist assumptions. Whereas this form of instrumental rationality dominates the natural sciences, knowledge creation in the social sciences and humanities usually does not aim for efficient control, given that human behavior is complex and necessarily mediated by language and the self-understanding of individuals. Knowledge about human interaction and communication is therefore interpretative and oriented towards *practical* understanding. *Emancipatory* interest, in contrast, engages critically with ideologies, taken-for-granted assumptions, and power relations and ultimately aims for liberation, social transformation and alternative ways of living that enhance human flourishing. Self-reflection and reflection upon the sociocultural factors that influence one’s own ways of thinking, being, and acting are essential to this kind of knowledge (Table 1).

To capture the choices at each of the five levels described above, the three different frameworks on intercultural communication and education will be subjected to the following five questions:

Theoretical–conceptual level:

- **How is the key concept of *culture* theorized?**

Methodological level:

- **How is the research designed and conducted?**

Political–normative level:

- **How is “globalization” (or any other internationalization process) represented?**

Epistemological–ontological level:

- **Which research interests drive the respective study?**

Table 1 Habermas’ three types of knowledge

Type of human interest/knowledge	Research methods
Technical: control and manipulation (causal explanation)	Positivist sciences, empirical–analytical methods
Practical: interpretation and understanding	Interpretive and hermeneutic methods
Emancipatory: reflection, critique, and liberation	Critical social sciences

Generalizations and recommendations:

- **What generalizations and pedagogical recommendations are drawn from empirical findings?**

The five analytical meta-criteria are distinct but closely interrelated. A specific epistemological–ontological stance, for example, tends to influence conceptual choices and pedagogic recommendations. A study that aims for critical reflection will thus in all probability choose a more complex notion of culture than one that aims for a practical and efficient “handling” of intercultural encounters, and both will come to different conclusions as to what intercultural education should look like. Similarly, particular views on the political–normative level will impact upon the design of the study: A researcher who is convinced that globalization generates increased information flow and communication between people who come from geographically distant places and sociocultural backgrounds will probably select a social domain for investigation where communication is intensified and not restricted. As a result, decisions on all five levels work together to generate a specific discourse of interculturality, although the weighting and impact of these nodal points might differ across studies.

In order to categorize adequately the respective view on culture and globalization adopted by each author, a range of available options will be outlined in section “[Levels of Interpretation](#).” The aim here is not and cannot be to cover the whole spectrum of theoretical standpoints on either one of these concepts, as they are endorsed by different disciplines and debated among an infinite number of authors in an equally uncountable number of publications. The discussion will therefore be confined to some of the most crucial arguments in current debates. In the first instance however, a brief overview of the emergence of the field of intercultural communication will clarify the historical context of this kind of knowledge production as well as its core terminology.

Historical Overview of the Emergence and Diversity of the Academic Field of Intercultural Communication and Education

The institutional establishment of academic fields or disciplines is a complex and uneven process. With this in mind, I will attempt to give a meaningful but unavoidably partial account of the historical and political factors that have helped to bring about and shape the institutionalization of intercultural communication and education as a field of research and subject area at university level.

It is generally agreed that the field first emerged in the USA (Dahl 1995; Leeds-Hurwitz 1990; Schweitzer 1994; Kenji 1985; Kohls and Brussow 1995). In this prototypical context of extensive immigration and ethnic diversity issues arising from the coexistence of different cultural groups gained, albeit to a modest degree, academic attention as early as the 1930s. Yet the decisive historical and political constellation that brought intercultural issues to the attention of politicians,

and a wider range of academics and funding bodies, took place in the international order of the post-World War II era (Dahl 1995; Hart 1999; Brislin and Yoshida 1994). As the US emerged as one of the two superpowers of the Cold War and began to exert an unprecedented political and economic influence throughout the world, a new set of competencies for politicians, army personnel, and business people was required, in particular a knowledge of foreign languages and cultures. Intercultural communication, education, and training turned into a topic of national interest and therefore benefitted from funding and institutional support.

In the 1960s, cross-cultural or intercultural communication had become a recognized subject at universities, a development that was accompanied in the 1970s by the foundation of societies and academic journals, the publication of textbooks, and the organization of specialized conferences. By the 1980s two hundred US universities offered undergraduate courses in intercultural communication, 50 offered master's degrees, and an estimated 20 more offered programs at the doctoral level (Wasilewski 1999). This institutional growth mirrored growing concerns over the "financial costs of employee turnover in overseas assignments" (Dahl 1995, p. 30; Kramsch 1991; Schweitzer 1998) and even more importantly over the stagnation of the US and Western European economy after the oil crisis in the late 1970s. Research into Asian cultures, organization structure, and management styles abounded in the face of the success of East Asian economies, and foreign languages, cultural knowledge, and intercultural competencies were again "viewed as a solution to the nation's problems" (Kramsch 1991, p. 220). In the 1980s and 1990s the USA and the world witnessed the phenomenon of the globalization of the economy. Businesses were "going international" to an unprecedented degree in order to expand their market reach and enhance their competitiveness and profitability (Paige and Martin 1996, p. 42).

Although both directions of intercultural research, education and training—that is, the international/external and the intranational/internal—are conceptually linked and influence each other, they are also institutionally and practically separated and display different, sometimes contesting, pedagogical approaches. This equally applies to the institutional establishment in Western Europe, where the topic of intercultural communication and education initially arose in response to the growing cultural plurality *inside* the nation state through labor immigration from Southern to Northern European countries in the 1960s. Accommodating and integrating people from diverse backgrounds into the labor, educational and social system became an urgent task and is still a highly contested battlefield between conservatives who insist on an alleged cultural homogeneity of nation states and those who point to the evident multicultural reality of Europe. From the second half of the 1980s onwards, intercultural issues began to be discussed in relation to international (business) scenarios and processes, a debate that was strongly influenced by the already institutionalized US-American academic field. Here again, both areas—the *intranational* and the *international*—have partly developed alongside each other, but are institutionally separated with little dialogue or academic exchange.

Parallel to the diversity of theoretical stances towards the nature of intercultural communication, the terms which are used to designate the field or discipline also

differ. Two main strands, the *cross-cultural* and the *intercultural* approach, can be identified. The first is commonly based on large-scale and often comparative empirical studies about intra-cultural patterns, values, and attitudes. On the basis of their findings, researchers attempt to predict the possible difficulties and potential misunderstandings that can occur when people from different cultural backgrounds meet. Authors writing from an *intercultural* perspective hold onto the idea that individuals often enter interactions with unconscious and taken-for-granted assumptions, expectations, and values. In contrast to cross-cultural studies, though, individuals and their interaction in concrete situations are regarded as unique and outcomes as ultimately unpredictable. As Scollon and Scollon (1995, p. 125) succinctly describe it: “Cultures do not talk to each other, individuals do.” Some authors (see, e.g., Kumaravadivelu 2002) might even reject the term intercultural, as the prefix “inter” appears to imply and demarcate some kind of space between two entities—“us” and “them”—each with their own fixed boundaries and essential qualities.

The choices of terminology not only depend upon different theoretical perspectives but also reflect the institutional context the term is used in. “Intercultural education,” for instance, tends to be employed by schools and universities, whereas the notion of “intercultural communication” and “intercultural training” is mostly related to research about and preparation of professionals who already work in international contexts or students who aim to do so. “Intercultural language education” draws attention to the fact that language is one of the most important cultural resources, and that learning another language has to go along with intercultural learning. For the purpose of the present chapter, I will use the term “intercultural communication” whenever I refer to the investigation of intercultural encounters, however defined, and “intercultural education” when intercultural learning becomes an intentional educational goal.

Levels of Interpretation

The Theoretical–Conceptual Level: Different Perspectives on Culture

Culture, in the most general sense, sets humans apart from other beings in the natural world. It designates the capacity for meaning-making processes through the use of semiotic systems such as language (Ray and Sayer 1999, p. 5). On an equally general level, the term addresses the relationship between the individual and larger social entities. Whereas many authors would agree on the definition of culture in the singular, the plural *cultures* is a platform for heated debate as it brings into focus culture, society, and the nation state (Swingewood 1998). The use of the plural has traditionally been associated with the work of the German romantic philosopher Johann Gottfried Herder (1744–1803) who regarded culture as the shared

worldview, values, and way of life of the members of one nation, a perspective that has been accused of overemphasizing homogeneity and consensus. Indeed, Herder's ideas are inexorably linked with the historical phase of nation building and the concomitant political imperative for its citizens to identify with "the nation." Cultures and national languages were thought to overlap. They were conceptualized as containers including national citizens and excluding foreigners, which almost automatically entailed a positive evaluation of one's "in-group," and by implication a view of "others" as not only being different but also deficient. Thus the symbolic, political, and linguistic homogenization and unification of the modern state was accompanied by a variety of practices and policies to suppress differences, marginalize, exclude, and even persecute and kill others (Bauman 1999).

This notion of culture has obviously been challenged on a variety of grounds. Many authors would agree that such a view homogenizes otherwise diverse people and essentializes alleged qualities of "imagined communities" (Anderson 1991). Instead, culture and identity should be understood as always multiple, hybrid, and co-constructed. Street (1993, p. 23), for instance, argues that culture should be defined not in terms of what it supposedly *is*, but by what it *does*: namely, actively constructing meaning. "The job of studying culture is not of finding and then accepting its definitions but of discovering how and what definitions are made, under what circumstances and for what reasons." This idea—that every account of culture has to be seen as a resource in itself in the ongoing signifying process—is basic to many postmodern and poststructuralist accounts which try to break down binaries of the "self" versus the "other" and the "home culture" versus the "foreign culture." Culture and identity are seen here as in a constant state of flux and remaking. The argument is often justified with reference to contemporary changes that brought about an increase in the transcultural flow of people, ideas and ideology, information, technology, and finance, and a concomitant hybridization and mixing of cultures and languages. Globalization supposedly diminishes the force of the nation state through increasing international economic and political interdependence, mobility and transport, constantly developing communication and information technologies, the global reach of the Internet and cultural industries, and so on. Today many people cross borders and are—either voluntarily or by force—familiar with living in two or more nation states. They also identify with different communities and will in turn be influenced by these memberships (Dupré 2001, p. 108). Modern states therefore need to go beyond nation-based identifications and politics and embrace hybridity, heterogeneity, and difference (Parekh 2000).

While I fully agree with the main thrust of these perspectives, I nevertheless want to draw attention to the fact that such an understanding of culture as fluid and procedural leaves one of the most pressing questions open, namely, what kind of meanings become prevalent in a particular interaction and for what kind of reasons. A fruitful perspective is offered by Sealey and Carter (2004, p. 139) who argue from critical realist perspective and distinguish between the "ideational elements of knowledge, belief and norms" accessible to a group of people (society)—the cultural system, the roles and relationships or social structures instantiated by

social practices—and the people with the power actually to do things in the world (human agents). Culture in this perspective is different from but strongly related to social practices which it orders and shapes (and vice versa). Both are mediated by self-reflexive individual agents who are nevertheless enabled or constrained by particular contexts. According to Parekh (2000, p. 145), “[b]eliefs are necessarily general, even vague and amenable to different interpretations, whereas practices which are meant to regulate human conduct and social relations are fairly determinate and concrete.” Furthermore, “while beliefs are not easy to discover and enforce, conformity to practices is easily ascertainable and enforceable.” Social practices are thus cultural but at the same time different from beliefs and subject to their own logic, characteristics, and patterns of change. Institutions and their concomitant practices can, for instance, be changed for political and other reasons without people believing in their merit which in turn might make these structural changes unsuccessful. In contrast to strong poststructuralist and postmodern perspectives which emphasize the relative free interplay of cultural resources, this view allows us to relate cultural elements to structure, institutions, and relations of power and hence to put

... semiotic processes into context. This means locating them within their necessary dialectical relations with persons (hence minds, intentions, desires, bodies), social relations, and the material world—locating them within the practical engagement of embodied and socially organised persons with the material world. (Fairclough et al. 2001, p. 7)

The Political–Normative Level: The Discourse of Globalization

Globalization has become a key concept for politics as well as academia since the end of the Cold War and the beginning of the expansion of the capitalist market system into the so-called transition economies of Middle and Eastern Europe and Asia (Held and McGrew 2002, p. 2). *Globalization* has since become a meta-narrative for contemporary socioeconomic changes, mostly referring to the alleged integration of the world into a single market and the withering away of nation states and their influence. In its broadest sense it includes all economic, political, cultural, or environmental processes that take place beyond the confines of the nation state. As stated earlier however, the actual causes, nature, consequences, and even existence of the phenomenon are highly contested. In order to structure this extreme heterogeneous field of discourses, I will draw on Held and McGrew’s (2002) categorization of three main views: *globalists*, *skeptics*, and *transformationists/moderates*, and briefly describe their view in relation to the actual domain the changes are supposed to take place in, that is, the *economy*, the *state*, and *culture*. I follow Marcussen (2000, see also Shaw 1997; Block 1994) who argues that the relationship between the state and the economy is inseparable. I therefore combine them into the *political–economic* domain. The classification groups together authors and perspectives according to the assessment of the causes and

dynamics of globalization, not according to the normative evaluation of these processes. Overall, the categories represent ideal or pure types and cannot account for overlaps or mixtures.

Globalists argue for a qualitatively new phase in either the history of capitalism or Western civilization, driven and supported by, for example, substantive developments in communication technologies (Castells 2000). The assumed changes can be evaluated positively as well as negatively. For instance, neoliberals celebrate economic globalization, claiming that eventually all participants in this process will gain through the spread of the market forces. Ohmae (1990), as one of the most famous proponents of this view, sees nation states as becoming increasingly irrelevant due to changes in patterns of trade, finance, and governance. A majority of those in line with the antiglobalization movement would agree with the main tenets of this diagnosis and view globalization as a quasi self-realizing process that is occurring while nation states are eroding. However, they evaluate this process rather negatively. For them, the effects of an unfettered capitalist system on a global scale are adverse to equality, democracy, and ecology.

Cultural globalists hold that on the basis of profound economic and political changes, we will sooner or later inhabit a homogenized, uniform world as not only products and services but also particular cultural practices and values are distributed worldwide. This end state, often metaphorically referred to as a *global village* (after McLuhan 1962), seems to be welcomed only by few authors. Others fear a flattening out of cultural differences that will lead to the complete loss of diversity (Bourdieu 1998; Barber 1995) or give rise to the reaffirmation of traditional values and ethnic, national, or religious identities (Nida-Rümelin 2002; Castells 2000). This in turn can lead to hostility towards external influences, reactionary politics, and fundamentalism, which then again feed into social conflict.

Skeptics doubt that a qualitative change in the international economic and political order, as the term *globalization* seems to imply, has or is taking place. Hirst and Thompson (1996), for example, draw on an avalanche of longitudinal data in order to support their claim that international trade is no more intense than at the beginning of the twentieth century. Some authors might acknowledge that some changes are underway, but refute attempts at mono-causal explanation as suggested by the term “globalization.” *Skeptics* in the cultural domain would hold that there is either no change which could be attributed to something like globalization (and there is therefore no effect on culture) or that shifts in the economic, political, and social spheres do not entail alteration in the cultural domain.

Transformationists/moderates, like many *skeptics*, allow for the contingency of current socioeconomic processes and argue that although there are profound changes underway the outcomes are still highly contested and uncertain (Fairclough and Thomas 2004; Jessop 1999). The idea that globalization is an agentless, self-realizing process is refuted and political agency and responsibility emphasized. Authors in this category differ as to how these changes are accounted for. Harvey (1996), for instance, speaks of a *time space* compression in global capitalism, by which he means not only the speeding up of the production and distribution of goods and services but also an intensified interaction between global cities and the

further marginalization of rural areas. In terms of culture, this perspective strongly opposes views of globalization as the imposition of cultural goods, values, and practices. Tomlinson (1991), for instance, argues that the global is always locally appropriated, transformed, or even resisted. Giddens (1991) argues along similar lines and emphasizes the positive and liberating aspects of the global–local interaction, in particular the shift towards a post-traditional, reflexive, cosmopolitan identity and culture. To him, traditional national views of culture and identity have often generated discrimination, suffering, and violence.

The table below shows the range of possible stances (globalist, skeptic, and transformationist/moderate) available to authors who legitimate intercultural education through reference to globalization, or more generally through current political, socioeconomic, and cultural changes at the global–local nexus. This taxonomy allows us not only to systematically identify the particular perspective adopted by a given author, but can likewise indicate silences about potentially relevant issues (Table 2).

Each of the three approaches to intercultural communication and education that will be discussed in the following sections represents *one* example of a particular discourse of interculturality: a modernist and essentialist view, a first postmodern and also distinctly postcolonial perspective, and a second postmodern account, this time focusing on intercultural communication through English as a lingua franca. Inside these broad philosophical outlooks, there is obviously an infinite number of variations and combinations, as well as debate and contestation. As a matter of fact, the examples were randomly chosen, and although the work of individual authors will be discussed, the purpose—in the limited space available in this chapter—is not to give a comprehensive account of individual research programs or conceptual development over time, nor is it an evaluation of the robustness of

Table 2 Taxonomy of perspectives on “globalization” (After Held and McGrew 2002)

	Economy–state	Culture
Globalists	Globalization is strong and new. There are different driving forces, e.g., transnational companies (TNCs), innovation in communication technology, international financial markets, etc.	Cultures are becoming more homogeneous
	(+) This development is positive and desirable, state sovereignty is lost	(+) National backwardness will be overcome
	(–) This development is negative and undesirable, state sovereignty is hollowed out by supranational organizations, international financial markets, and TNCs	(–) Multicultural diversity is being flattened out
Skeptics	Nothing fundamental has changed, only tendencies might have intensified	The cultural domain is not affected or only insignificantly
Moderates	Some changes might have taken place. In general, however, these processes are complex and outcomes still uncertain and contested	Global influences are locally appropriated and changed in the process (“glocalization”)

particular research designs or the feasibility of specific methods of data collection and analysis. Instead, the approaches will exemplify the diversity of views that exist in the field, the differences between them, and the need for a matrix that allows us to compare them systematically and reflect upon the choices that were made on different levels.

Three Approaches to Intercultural Communication and Education

Case 1: A Modernist and Essentialist Perspective

Writing about intercultural education is impossible without reference to the work of Geert Hofstede who is one of the most widely read and influential authors in the field. His empirical study of cultural differences has greatly contributed to the popularization of the concept of inter- or cross-cultural education and training, although it has been criticized from a wide variety of theoretical and methodological perspectives. In the present context Hofstede's work is significant not only for the impact it has had but also for its quantitative nature. The author aimed to prove with empirical "hard" data the causal influence of culture on individuals. The objective of this analysis is hence to show that "interpretive" does not equal "qualitative" but that "[a]ll research is interpretive. It is guided by a set of beliefs and feelings about the world and how it should be understood and studied" (Denzin and Lincoln 2003, p. 33).

In order to describe cultural differences and their impact upon communicative behavior, Hofstede (1991) draws upon the anthropological work of Kluckholm and Strodtbeck (1961) who compared cultures along the so-called value orientations. Cultures are assumed to solve a limited number of universal problems for societies, for example, how to define human nature, how to conceptualize time, how to regulate interpersonal relations, and so on. According to Hofstede, different national cultures provide different understandings of and responses to these questions and generate specific norms and values that orient members of society to behave in an acceptable way in relation to these challenges. The author claims that there are five of these specific solutions or "cultural dimensions," each consisting of a cluster of correlating phenomena:

- *Masculinity/Femininity*: This dimension refers to the "social" versus the "ego orientation" of members of a society (Hofstede 1994, p. 3) and is based on generalized gender roles: More socially oriented behaviors are associated with the traditional role of women and competitiveness and assertiveness with men.
- *Power Distance*: According to the author, cultures endorse and accept inequality and dependence in social relations to different degrees.

- *Uncertainty Avoidance* designates the degree to which members of a society are comfortable with, or afraid of, ambivalent and unstructured situations and to what extent they control and express their emotions.
- *Individualism/Collectivism* identifies degrees of integration of individuals into groups. A strong integration allegedly entails the prevalence of group interests over the interest of individuals (collectivism), a weak integration has the opposite effect.
- *Long-Term/Short-Term Orientation* is associated with thrift and perseverance (long term) as opposed to more immediate concerns with social obligations and face protection (short term).

Methodology

On the basis of this theoretical framework, Hofstede designed a large-scale empirical study about intra-cultural patterns, values, and attitude. He administered 116,000 questionnaires each with over 100 standardized questions about values related to work situations to 72 IBM subsidiaries in 53 different countries from 1967 to 1973. The specific sample allegedly offered the methodological advantage, that all variables apart from culture were held constant. The author claimed that since the participants were employed by the same international company, they therefore shared the same corporate values and professional identity, adhered to the same code of practices, used the same technology, and had similar educational backgrounds, professions, gender (almost exclusively male), and age. Hofstede reasoned that any substantial attitudinal difference to be found could therefore only be attributed to “culture.”

According to McSweeney (2002, pp. 7–8) this argument is tautological: Hofstede assumes first that national cultures influence every aspect of an individual’s behavior and then exempts organizational culture from its influence. He thereby maintains

.... the convenient, but fantastic, assumption that throughout the world members of the same occupation regardless of diverse entry requirements, regulations, social status, structure and number of trade associations or professional bodies each share an identical world-wide occupational culture. (ibid)

It is equally illogical to take a tendency among some employees of a particular company to be representative for the national average since its employees constitute a very specific group with a particular social status and educational background. As a matter of fact, it is the a priori assumption that cultural dimensions exist in the way Hofstede describes them that shaped the analytical tool (the questionnaire) which in turn determined the results (measurable differences between national cultures):

The circularity of Hofstede’s reasoning is evident from the effect of not presupposing national uniformity. Without that supposition there are no valid grounds for treating the miniscule local as representative of the national. Instead there is a huge unbridged

conceptual chasm between the micro-level [...] and the national. To assume national uniformity, as Hofstede does, is not appropriate for a study which purports to have found it. (McSweeney 2002, p. 8)

The fallacious assumptions that went into the design of this quantitative study are accompanied by flaws on the conceptual level.

The Concept of Culture

A number of compelling objections have been raised against Hofstede's notion of culture as "the collective programming of the mind which distinguishes the members of one group or category of people from another" (1991, p. 5). Supposedly, human beings are socialized into and have internalized this "mental software" specific to their cultural group through different institutions starting from the family through the school to the community and the workplace. By interpreting cultures a priori as overlapping with nation states, the author overemphasizes cultural homogeneity and consensus. Wider political and economic structures, power, contestation, and struggle are excised from the framework and no difference is made between what culture *is* and what it *is not*. As a consequence the term becomes all-embracing and explains everything and nothing at the same time. By portraying people as being determined by national culture, the framework is hence in danger of contributing to the formation and consolidation of stereotypes and prejudices instead of reducing them (Jack and Lorbiecki 1999; Holliday 2011, p. 7).

The fallacious assumptions that went into the design of this empirical study are probably easy to critique and deconstruct. What remains puzzling however is the decision to use a large-scale quantitative instrument in order to study something as unquantifiable as culture. To explain what McSweeney (2002, p. 27) calls the "too great a desire to prove his a priori convictions rather than evaluate the adequacy of his 'findings'" we need to turn to the political–normative assumptions and interests behind this kind of research and the context the framework was designed for.

The Discourse of Globalization

In Hofstede's work globalization is represented as a quasi-autonomous agent in the international economic order. It unfolds naturally, is inevitable and irreversible, and forces economic actors, including states, cultures, companies, and individuals, to adapt or perish. From this market-fundamentalist perspective, local cultures tend to be seen as potential problems and instantiations of backwardness that have to be overcome in order to enhance business success:

Although culture is a 'soft' characteristic, changing it calls for 'hard' measures. *Structural changes* may mean closing departments, opening other departments, merging or splitting activities, or moving people and/or groups geographically. The general rule is that when people are moved as individuals, they will adapt to the culture of their new environment; when people are moved as groups, they will bring their group cultural along. People in

groups have developed, as part of their culture, ways of interacting which are quite stable and difficult to change. Changing them means that all interpersonal relationships have to be renegotiated. However, if new tasks or a new environment force such a renegotiation there is a good chance that *undesirable aspects of the old culture will be cleaned up*. [my emphasis] (Hofstede 1994, p. 201)

The law of the market, i.e., the accumulation of profit, is erected in this *globalist* discourse as the defining standard for all practices (Bourdieu 1998, p. 1). While it is claimed that values and norms are culturally relative, the approach promotes strategic and instrumental rationality as neutral and given, a position that “has a priori secured the correctness of its own position and only gets involved with foreign cultures with the *strategic attitude* of bringing them to reason step by step and in line with the situation” (Steinmann and Scherer 1998, p. 35). The idea that life could be understood in different ways and that intercultural dialogue could be beneficial to the common good is not entertained. Such a stance is obviously highly problematic for any approach to intercultural communication and education because of its lack of empathy, reflexivity, and underlying social-Darwinian assumptions. It puts, as Halsall (2002, p. 76) describes it, “intercultural communication in the position of denying its own *raison d’être*: the respect for every culture as equally valid.”

Research Interest

According to Said (1983) the cultural production of the “other” has to be understood in its specific historical and political contexts and the power relations therein. For the case of cross-cultural studies à la Hofstede, the construction of the “other” constitutes a specific form of “objectifying the other” and thus rendering them controllable: “the impetus for many international and cross-cultural studies is the desire to make accurate outcome predictions based on a given theory in various countries or cultural settings” (Earley and Singh 2000, p. 8). Underlying Hofstede’s framework is a *technical* interest and a concomitant empiricist assumption that culture is a systematically determining cause of behavior that manifests itself in observable, measurable, and quantifiable data. The aim is to decode this (unconscious) set of cultural rules in order to make them manageable and the highly complex context of international business more predictable and profitable. In addition to this, the adoption of an empiricist stance and a quantitative methodology establishes credibility in the respective target readership, managers and other clients, who hold similar beliefs about the nature and purpose of science.

Case 2: A Postmodern, Postcolonial Approach

From a strongly antiessentialist postmodern perspective, Holliday (2010, 2011) emphasizes how individuals co-construct their identities in instances of communication by drawing upon specific discourses. He is particularly interested in the

postcolonial relation between “the West” and “the periphery” and the allegedly neutral, but implicitly biased, categories of “self” and “other,” “us” and “them” it produces.

Methodology

The study under investigation is an exploratory, qualitative study of the relationship between constructions of cultural identity and perceptions of nation (Holliday 2010, p. 165). Twenty-eight interviewees from diverse national backgrounds (European, Asian, Latin American, Arabic, and African) were invited to speak about the complexity of the cultural realities in which they lived. The participants were selected according to two criteria: They had to represent a variety of nationalities and should have engaged consciously with issues of culture because of experiences with crossing cultural boundaries of one type or another. The group was a convenience sample as the researcher knew all participants personally which explains why 18 interviewees were academics, of whom 14 were applied linguists. It is thus very unlikely that this selection is representative of the wider population, as the author admits himself: “A probable weakness of the study is that the data may have been skewed by the interviewees being all middle class, often academics, expert users of English and personally known to me” (ibid, p. 166). Participants were invited to respond via e-mail to two questions: (1) What are the major features of your cultural identity? (2) What role does nation play in this? Holliday tried to be as careful and noninterventionist as possible by bracketing off his own assumptions, being attentive to the themes that emerge from the data itself and to cross-check his interpretation with the respondents. On the basis of his analysis, Holliday concludes that in the first instance, his interviewees did not appear to use the concepts “Western” and “non-Western.” Secondly, “nation” as a concept was important to the participants but more as an external force than a source of identification. Instead, participants displayed changing identities and alignments with a variety of communities that crossed national but also ethnic, class, professional, and gender boundaries and displayed fluid and organic cultural trajectories.

The Concept of Culture

Holliday views culture as implicated in power relations and imbued with ideology. In this context he aims to deconstruct biased representations of “self” and “other” that the colonial “center” produces and that, according to the author, serve particular interests by the dominant West. The question, however, is whether tying systems of thought and interest to social groups like “the West” does not constitute another form of neo-essentialist polarization of in-group versus out-group. Holliday could thus be subjected to the same criticism as Said who introduced the concept of “Orientalism” in the first place, namely, of homogenizing and objectifying the rather diffuse

“Occident” by presenting “it” as an entity with a single voice, a monolithic discourse, and a homogeneous interest to subjugate “the other” (Mills 1997, p. 119).

On a more general level, postmodernist accounts of intercultural communication are less interested in the cultural aspect and more in the “inter” understood here as the discursively mediated interaction between people (Piller 2011). With reference to Bauman’s (2000) concept of “liquid modernity” Dervin even calls this the “liquid” approach to interculturality as opposed to “solid” essentialist views that overemphasize the durability of cultural characteristics and dispositions. “Liquifying” the nexus between language, identity, discourse, and culture has however the disadvantage that there is little conceptual clarity about how linguistic, cultural, and symbolic resources are distributed. This is important as privileged groups not only enjoy access to higher valued goods and services, they also have a greater say in “which characteristics to use to categorize and rank people” (Goodman 2011, p. 5). Evaluations and (mis)representations of others hence reflect not only cultural but also socioeconomic and sometimes even legal differences and inequalities, as Blommaert (1998) points out in his discussion of the role of context in intercultural communication:

It makes a world of difference whether someone talks to the police or to a co-worker, in a formal and administrative setting or in a loose, informal chat. It also makes a world of difference whether the ‘ethnically marked’ interlocutor (e.g. a Pakistani man in London) is the dominant party in an interaction, or the dominated party. For instance, whether the Pakistani man is the one who needs something from someone else, or vice versa. And also, what makes a world of difference is the larger context of interethnic relations in an area, a city, a community, at a particular historical point in time. It is this larger context that accounts for aspects in intercultural communication such as racism, stereotypes, cultural schemata and so on. It is immensely relevant to realize that most of what we call intercultural communication occurs in an urban context, between people who are multilingual, and with socio-historical dimensions of immigration, labor relations involving immigrant workers in particular roles, ethnic antagonism and stereotyping and so on. If ‘cultures meet’, they usually do so under rather grim socioeconomic circumstances.

Even though Holliday expresses his concern about the generalizability of his findings given that his participants came from a highly privileged group, he does not provide an explanation of how context and structural preconditions enable or constrain identification and interaction at the micro level.

The Discourse of Globalization

From Holliday’s postmodern and postcolonial perspective, globalization is presented as a continuation of colonialization and imperialism. He (2010, p. 165) aligns himself with cosmopolitan sociologists who claim that

... a methodological nationalism, borne from nineteenth century European nationalism, has imposed false boundaries on a cultural complexity which has become apparent in recent trends in globalisation (e.g. Beck & Sznaider, 2006; Schudson, 1994). At the more critical end of this thinking, cosmopolitanism and globalisation themselves are accused of constructing images of culture which serve centre-western commercial interest within an unequal world. (Bhabha 1994; Hall 1991)

Dirlik (1994, p. 344) argues that in spite of their “insistence on historicity and difference,” postcolonial authors present colonialist thinking as ahistorical and universal. While colonial relations are regarded as still persisting alongside neocolonial reconfigurations, the transformations that take place internationally on socioeconomic and political levels have, as the same author argues, re-organized earlier global relations.

The Research Interest

Holliday’s research interest is, above all, *critical*, as he engages in depth with unjust representations of others. The author speaks of a “moral imperative” to ensure fair treatment as well as “fair labeling” and to “refrain from Othering” (Holliday 2009, pp. xii–xiii). In order to do justice to the complexity and fluidity of identities, the author calls for critical cultural awareness, critical cosmopolitanism, and the ability to deconstruct (neo)essentialist and hence unjust discourses and representations of “self” and the “other.”

Case 3: Intercultural Communication Through English as a Lingua Franca

The majority of people who use English today are non-native speakers who communicate with other non-native and native speakers in an infinite variety of contexts (Graddol 1997, p. 10). The motivation for research into the particularities of communication through English as a lingua franca (ELF) is thus clearly linked to and motivated by demographic developments and internationalization processes. Although studies on intercultural phenomena through ELF again differ according to the philosophical perspectives adopted, there seems to be an agreement that in the context of the ELF communication, “the nation state view of language varieties and speech communities no longer suffices” (Jenkins et al. 2011, p. 297). In such interactions, it is argued, there is no need to speak an alleged “standard” variety of English, comply with a native speaker “norm,” or dispose of a particular sociocultural knowledge as long as individuals are intelligible. What is important instead is the communicative ability to negotiate meaning with other speakers who belong to different linguacultural communities. This does not mean that ELF communication is regarded as culturally neutral, but rather that its speakers appropriate it and articulate their identities through it in different ways (Baker 2011). Communication through ELF is interpreted as hybrid and fluid, “continually renewed,” and “co-operatively modified” (Jenkins et al. 2011, p. 303). Intercultural competence from this perspective means that learners move beyond cultural stereotypes, develop a sense of belonging to the international community, become

aware of the hybridity and fluidity inherent to all communication, and acquire “the pragmatic skills required to adapt one’s English use to the demands of the current communicative situation” (ibid, p. 301).

Methodology

Approaches to intercultural communication informed by an ELF perspective usually include an investigation into the empirical realities of native and nonnative speaker communication (see, e.g., Cogo 2012; Cogo and Dewey 2006). The study (Baker 2011) under consideration however presents a model of intercultural awareness and employs the data only to illustrate its usefulness for understanding intercultural communication through English. The data originated in an ethnographic study conducted in a higher education institute in Thailand, a country where English is the de facto second language used to communicate with others in a variety of, for instance, commercial or academic contexts (ibid, p. 200). Similarly to the study by Holliday, the site and participants were selected on the basis of the privileged access the researcher enjoyed. Baker describes himself as “a participant observer” (ibid, p. 206) as he worked as a visiting lecturer at the institution during the fieldwork. The participants were seven fourth-year undergraduates majoring in English with different proficiency levels in English and experiences abroad. While appreciating the advantages of such an “emic” or insider perspective, the author introduces “a degree of objectivity and reflexivity” (ibid) through a number of techniques such as an extended period of fieldwork, triangulation of data sources, peer and member checks, contradictory cases, thick description, a research journal, and an audit trail. The actual data presented are semi-structured interviews with each of the participants and examples of intercultural communication (a mixture of focus group-style discussions and more naturalistic informal conversations between Thai English speakers and other “nonnative speakers” and “native speakers” of English). The extracts exemplify each level of intercultural awareness of the proposed model: In the first conversation, participants explain their own culturally based perspectives, in the second they compare this perspective with those of other cultures, in the third participants move towards a more “complex” understanding of cultures as fluid and relative, and the fourth extract shows how participants discuss mediation, adaptation, and negotiation in intercultural communication. On the basis of the findings about the way these speakers perceive, experience, and enact the relationship between culture and language, recommendations for intercultural education, i.e., the types of skills, knowledge, and attitudes that need to be developed to engage in ELF communication, are put forth.

The Concept of Culture

Research in Global Englishes generally rejects static models of language and culture and emphasizes the performative character of meaning-making processes. The account of culture is in this, as in many other ELF studies (for a selection, see,

for instance, Archibald et al. 2012), based on empirical performance of actual speakers who come from a variety of backgrounds. Baker (ibid, p. 201) explicitly adopts Street's (1993.) view that culture should be defined not in terms of what it supposedly *is* but by what it *does*, namely, actively constructing meaning. From a clearly postmodernist perspective, the author refutes structuralism and the essentialist idea of an "unbreakable bond" between a specific language and a national conception of culture (ibid, p. 199) and attempts to show empirically that culture and language are emergent, dynamic, fluid, and hybrid. "Diversity in performance" is hence not only a key factor in accounts of ELF, as Baird (2012, p. 5) clarifies: ELF interactions are assumed to be intercultural, multilingual, and dynamic before "data is even sought."

Again here it could be argued that even though it is of great importance to attend to the discourses employed by and the identities and self-understanding of individuals, the circumstances they find themselves in and the resources they can draw upon need also to be addressed. Individuals or groups who have less control over the conditions of their lives might lack knowledge or resources recognized as valuable by society and therefore cannot to the same degree choose how to express and realize their identities. Such a perspective, however, requires attention to rather durable power relations and social structures which enable and constrain human beings. Structures are enduring; they persist over time and hence preexist individuals who enter into them and whose activity reproduces or transforms them. The way individuals and structures interact, however, does not have to display regularity; contexts differ and interrelate differently with the particular realization of agency in each specific case.

The Discourse of Globalization

In order to understand the differentiated use of ELF in a global context, researchers commonly draw upon and modify a model developed by Kachru (1985, 1992). It consists of three concentric circles representing "the types of spread, the patterns of acquisition and the functional domains in which English is used across cultures and languages" (Kachru 1985, p. 12). The author calls the countries where English is the primary language of communication (e.g., the UK, the USA, or Canada) the *Inner Circle*. The *Outer* or *Extended Circle* includes countries formerly colonized by England such as India or Singapore where English has become an important second language and is used largely in administration. The third *Expanding Circle* includes those nations, e.g., China, Chile, and Japan, which acknowledge the importance of English as an internationally useful language and therefore include the teaching of English as a foreign language in their curricula.

While the use of ELF has traditionally been associated with the Expanding Circle, it is now regarded to be geographically unbounded and culturally decentered and used by native and nonnative speakers alike in a diverse range of international contexts. In other words, English has turned into a multilingual language (Kachru and Nelson 2006). At the same time research on ELF is conceptually tied closely to

globalization: The widespread use of English is regarded as an effect of and at the same time as contributing to it. Jenkins et al. (2011, p. 303) summarize in their *state of the art in ELF* that “globalization is the process by which the world has become/ is becoming more interconnected, where relations across local, regional, and global contexts become more enmeshed, where flows of language, culture, and people are intensified and accelerated.” In the study under investigation the author states:

Key notions include viewing language and cultural practices as part of a ‘global flow’ which is influenced by and in turn influences more localised linguistic practices (Canagarajah 2005; Pennycook 2007; Risager 2006). Pennycook underscores the tensions in these flows between the centrifugal forces of ‘fluidity’ and the centripetal forces of ‘fixity’ (2007, p. 8). The commensurable idea of liminality (Rampton 1995) also aids in an understanding of the way in which cultural and linguistic practices can take on new forms and meanings in intercultural communication that are not attributable to any one culture; although, with the caveat that ELF users are not seen as borrowing the resources of a particular community or in-between ‘target’ languages and cultures.

This and other similar pronouncements indicate that globalization is viewed from a strong *cultural globalist* perspective emphasizing and celebrating the interconnection, intermeshing and mixing of cultural resources. At the same time, little attention is paid to processes in the political or economic domain. Authors with a more critical perspective on globalization might argue that although transcultural interaction and communication have increased, the hybridization and mixing of cultural elements seems to follow rather *structural* paths (Gorski 2008). The widening gap between rich and poor (OECD 2011) has made some differences more accentuated, while others have diminished; this is most particularly the case for those practices with greater “market value.” National financial “elites,” for instance, are becoming internationally more similar in their forms of consumption, their mobility, access to technologies, and ways of communicating. At the same time, they are increasingly disconnected from other classes of the same nationality who are excluded from such practices and goods (de Rivera 1998, p. 113).

The Research Interest

ELF theorists regard themselves as politically engaged and *critical* as they attempt to offer learners and speakers of English choices they might not have been aware of. They argue that non-native speakers of ELF should be acknowledged in their own right and not subjected to any kind of native speaker “correctness.” On a more general level the normative aims of this approach could be described as the appreciation of diversity and, ultimately, the emancipation from alleged “norms” and “standards.” To this end, data collected for research purposes often serves to illustrate the richness of ELF communication, the equality that seems to predominate the interaction, the choices its speakers exert, the communication strategies they employ, the free flow of ideas and information, the creativity and playfulness that characterizes the collaborative construction of meaning, the apparent unwillingness to categorize others, and the positive attitudes towards nonnativeness

(Cogo 2012; Cogo and Dewey 2006; Baird 2012; Archibald et al. 2012). With its strong focus on empirical data from actual ELF communication and the bottom-up generation of theoretical concepts, ELF research also displays a distinct *practical* interest.

Conclusion

Interpretation generally enters into every stage of the research process, from the theoretical assumptions and philosophical stance adopted to the design of the research, the selection of the particular site for the extrapolation of data, the understanding of what counts as evidence, through to the analysis and presentation of the data. In intercultural research, interpretation is, however, a sensitive issue as misrepresentation of and bias towards others is always a danger. A heightened reflexivity towards underlying and often taken-for-granted assumptions is therefore demanded by the very subject itself. An acknowledgement of the researcher's own position, theoretical assumptions, and interests can enable a more critical reading of the respective construction of knowledge and interculturality. The aim of the preceding meta-analysis of three different approaches to intercultural communication and education was to demonstrate, firstly, that the object of research, the "intercultural encounter," is highly amorphous and lends itself to diverse interpretations, conceptualizations, and research designs. It was argued secondly that these interpretations can be traced back to decisions on five distinct but interrelated levels: the theoretical–conceptual, the methodological, the political–normative, and the epistemological–ontological. Connected, but secondary to choices on these planes are generalizations and pedagogical recommendations drawn from empirical findings.

The three research examples were randomly chosen and exemplify the diversity of views that exist in the field more than individual research paradigms or "schools of thought." The modernist and essentialist research by Hofstede probably presents the most pressing conceptual and ethical concerns as so many unquestioned assumptions went into the design and analysis of his quantitative study due to the *technical* interest driving the investigation. Globalization was presented here from a rather uncritical *globalist* perspective as a natural force with its own dynamic and apparently unavoidable consequences. Culture was predominantly seen as overlapping with national borders and as a burden for successful international business that needed to be brought under control. The empiricist and positivist assumptions underlying this quantitative study were both aligned with its overriding instrumental research interest and attuned to expectations of what counts as evidence for potential consulting and training clients. The research site (the large transnational company IBM) and the participants (IBM employees) were chosen to be representative of the same clientele. Paradoxically, it

(continued)

was assumed that organizational culture was at the same time exempt from and indicative of the influence of national culture.

In the postmodern postcolonial example, the author explicitly stated his research interest to be *critical* as he deconstructed the discourses about “self” and “other” understood to be inherited from a colonial past and thus ideologically biased. The data originated from interviews with individuals from a variety of national backgrounds and was meant to exemplify the discursive use and construction of the “nation” for particular identities. While the sampling was convenient (the interviewees were friends of the researcher who had engaged with the topic explicitly before the investigation took place), the researcher checked the validity of his interpretation against the participants’ perspectives and subsequently modified it on the basis of their input. Globalization was represented here from a strictly postcolonialist perspective which made it difficult to capture contemporary complex and diverse international processes that take place at a cultural, economic, and political level.

The second postmodern account of interculturality came from research on English as a lingua franca. The study under consideration shared many of the assumptions and conceptual choices of Holliday’s investigation but was less oriented towards the deconstruction of ideological representations of “self” and “other” and more *practically* interested in the resourcefulness of real world speakers of ELF. Here again, data was employed to exemplify the particular theoretical perspective and the particular model of intercultural awareness the researcher wanted to promote. Globalization was represented in a fairly uncritical way as an agentive force that brings about increased international interconnections and contact and thus enhances fluidity, mixing, and hybridity of cultural elements.

As the analysis showed, the selection of the focus of enquiry, the chosen method, the site of the research, and the forms of data depended in all four cases on specific interpretations of social change, theoretical–methodological commitments, as well as the interests (e.g., instrumental or emancipatory) motivating each particular kind of academic research. Such a meta-theoretical matrix, I argued at the beginning of this chapter, would allow us to identify essential components of any approach to interculturality. It would make reflexivity, the sine qua non of intercultural research, more systematic and enable thorough comparison between different perspectives.

A caveat has to be made: By showing how much interpretation there is in intercultural research I do not want to imply that research in this field is biased, or that my own meta-level interpretation is not equally partial or fallible. Clearly, researchers need to bring their theoretical knowledge and practical research experiences and their values, expectations, and purposes to the research process, both in quantitative and qualitative studies. But while it

(continued)

is important to acknowledge the decisions that go into the construction of a specific kind of knowledge and, more generally, its discursive mediation, there is also a danger of reducing knowledge to subjective interpretation, to discourse, or to mere social construction. If this was the case and all interpretations of the social world were equally valid, then researchers in general and those investigating intercultural encounters in particular would be free to bestow any interpretation on the social reality they claim to describe or explain. The basic assumption underlying my own interpretation of research in this specific field is that there is a world “out there” independent of our understanding of and discourses about it that guarantees that there can always be a debate about the truth status of our validity claims: “How things seem to us, in other words, depends *both* on the world *and* our descriptions of it” (Sealey and Carter 2004, p. 125). In other words, although research always involves some form of interpretation, some accounts of the world are more accurate than others. In order to come to an intersubjective agreement about the truth status of specific knowledge informed discussions and debate are essential. The precise claims made about the social world and the desirability of specific pedagogic interventions need to be brought to light, subjected to scrutiny, and contrasted with alternative views. The suggested meta-theoretical matrix might serve this purpose.

2.5 Literacy in the Community: The Interpretation of “Local” Literacy Practices Through Ethnography

Kate Pahl

The Research Project

In this chapter I look at the interpretative practices that are involved when an ethnographer investigates local literacies in home and community settings (Barton and Hamilton 1998). Ethnography is concerned with everyday life and ethnographers tend to focus on the cultural practices people engage with (Heath and Street 2008). The process of “doing ethnography” as a process of data collection, analysis, and interpretation is here discussed in relation to the field participants’ own interpretative processes and practices (Wolcott 1994). I draw on the tradition, from Eric Lassiter, of collaborative ethnography and the process of doing “reciprocal analysis” (Lassiter 2005; Campbell and Lassiter 2010). I use this mode of analysis to make sense of grounded interpretations which then enabled me to construct a shared epistemological space in which to make sense of these interpretations (Pahl and Pool 2011).

Literacy has been understood, drawing on research from the New Literacy Studies, to be a social practice realised in different domains, such as home, school, and community (Barton and Hamilton 1998; Street 1984, 1993, 2000). I focus here on literacy in home and community contexts. I draw on an ethnographic study of writing practices in a home and a library. In each case, children and young people as well as family members were involved in the construction of the interpretative framework that I used to make sense of the data. They also participated in the process of dissemination. Ethnographic research brings to the fore issues connected to reflexivity, positionality, and the relationship between participants (“emic” perspectives) and researcher (“etic” perspectives). It is therefore a methodological approach that problematizes the process of interpretation from the beginning.

K. Pahl (✉)

School of Education, University of Sheffield, 388 Glossop Road, Sheffield S10 2JA, UK
e-mail: k.pahl@sheffield.ac.uk

The setting for the study was a Northern town in the UK with a minority population composed of British Asian families. The research study was conducted in areas of high deprivation according to the UK Indices of Multiple Deprivation (these measured particular indices such as education, access to good quality housing, the economic status of the households, and so on). This study built on my previous work on literacy practices in the home (Pahl 2002, 2004). In previous studies I was interested in the ways in which the “habitus” of the home could be found sedimented in children’s multimodal texts (Rowse and Pahl 2007). I was also interested in the different frameworks that young people and families brought to literacy in home and community settings. For example, I found in my previous work studying home literacy practices (Pahl 2002, 2004) that literacy in school contexts is associated with certain kinds of practices such as writing reports and doing exams; at home the uses of literacy and the practices associated with it are less commonly recognized and understood.

Here, I describe an ethnographic investigation of a family’s home literacy practices (the “home” study) together with a study of literacy practices based in a library (the “library” study). They are here described as different strands but part of a longer study of home and community writing practices. The research was funded from the AHRC’s Connected Communities program (as “Writing in the Home and in the Street”) as well as Yorkshire Forward, a regional agency, and ran from 2009 to 2011. The research described here includes a closely observed study of one British Asian home. The family included three children, all girls, aged 3, 9, and 12. I describe the process that led me to construct an interpretative framework in order to understand the children’s home writing practices. This involved a process of interpretation and analysis that was co-constructed, in which analysis was conducted within the field and interpretation was an ongoing process of construction.

I also describe a parallel study, conducted in a library, of writing practices in a community context, funded through a local authority. This study was part of a larger survey of literacy events and practices present within one particular community in the town. I conducted an audit of literacy in the community, drawing on the ecological approach suggested by Neuman and Celano (2001). Through funding from the AHRC “Writing in the Home and in the Street” project, I was able to bring an arts dimension to the project in the second year of the study. The research upon which this chapter is based considers the way in which home and community writing is conceptualized and the cultural shaping of home and community writing practices. While the research took place in different sites (a home and a library), it was part of a wider series of research engagements which addressed the issue of how literacy is framed and understood in out-of-school settings. In both home and library projects, the process of interpretation was contested and complex.

Studies of literacy in the community using an ethnographic perspective understand literacy to be a social practice (Street 2000). An ethnographer might study the things people do with literacy and the different domains of practice where literacy takes place (Barton and Hamilton 1998). By understanding literacy to be a social practice, links could be made between everyday social practices such as shopping

and cooking and cultural practices such as popular cultural activities, and literacy. It would then be possible to understand how literacy was embedded within particular events and practices. For example, shopping often might involve the writing of a list or cooking the reading of a recipe.

Research studies of writing in the home have focused on children and their families, in an attempt to make sense of what children bring to schooling from “everyday” settings. Studies of young children’s early writing in naturalistic settings began by looking at environmental print and then studying the making of meaning from the child’s perspective (Bissex 1980; Ferreiro and Teberosky 1982; Kress 1997; Lancaster 2003; Pahl 2002). Studies of home writing practices have considered the way in which children come to writing in the home as a process of engagement with multimodal forms, including drawing and oral storytelling (Kress 1997). Writing in the home is characterized by ephemeral productions, often seen as “mess” by adults (Pahl 2002). Researchers have looked at the way in which writing in multilingual households is conceptualized and framed (Gregory et al. 2004; Kenner 2004). This has enabled them to understand these practices as strengths and from the perspective of a “wealth” model of home literacy practices (Gonzalez et al. 2005).

Studies of writing in the community have considered place and space and the location of literacy practices within particular places and spaces (Neuman and Celano 2001, 2006; Comber 2010; Morrell 2008; Kinloch 2010). Many of these studies look closely at power relations to consider why certain communities have more access to literacy than others (Neuman and Celano 2006; Nichols et al. 2009). The way in which spatial literacies are configured and play out in local contexts have been studied by Comber and colleagues in looking at the shaping of literacies through place-making (Comber 2010). More recently, a focus on timescales and family life has informed the way time intersects with family life and shapes literacy practices in the home (Compton Lilly 2010).

From an interpretative perspective the study of home writing practices requires an understanding of how “schooled” literacy practices are framed (Street and Street 1991). Research from a more cognitive or psychological perspective has sometimes assumed that the “acquisition model” of literacy is more salient, with a particular focus on the processes and practices of writing as a technical, “autonomous” skill, decontextualized and without a focus on social practice (Street 1993). Street (1993) calls this model the “autonomous” model and contrasts it with an “ideological” model of literacy that understands literacy to be subject to relations of power and ideologies within discourses. This insight brings the role of interpretation in constructing and understanding literacy practices to the fore. When constructing interpretations of home literacy practices, it is important to foreground an “emic” perspective to bring participants’ perspectives to bear on texts and practices, which is why the concept, from Campbell and Lassiter, of “reciprocal analysis” of texts (2010) is so important. In this chapter, I address the way in which interpretation both co-constructs and shapes the way writing is understood and framed in out of school settings such as a home and a community library.

The Focus of the Research

Both of these projects focused on home and community literacy practices in naturalistic settings. Literacy in the home and in the community is often disregarded in institutional settings. For example, a child might create a bird from tissue paper and produce such an ephemeral object in a home setting (Pahl 2002). This object, however, carries within it intergenerational meanings and sedimented experiences of grandparents and “home” stories (Rowse and Pahl 2007). Recognizing these practices as being related to stories and written texts is the job of the ethnographer (Pahl 2004). The focus of the home study was to explore the uses of “literacy” in relation to the interpretative frameworks of the participants. What did they consider to be reading and writing? How was literacy linked with other multimodal practices such as drawing and model making? What kinds of literacies could be found, in which languages and modalities? Were there “hidden” or “vernacular” literacies that could usefully be explored in more detail to make sense of language and literacy practices outside school?

In this research, both in the library and in the home, the process involved repeated visits, on a regular basis, together with the development of an interpretative schema that was collaboratively created with research participants. This collaborative ethnographic methodology enabled interpretations and understandings to be checked with participants on an ongoing basis (Lassiter 2005). Campbell and Lassiter (2010) describe the processes and practices that make up a collaborative ethnography:

An ethnography that makes collaboration an explicit and deliberate part of both fieldwork and the broader processes of research, interpretation, and writing is not just about producing more dialogically centered and multivocal texts . . . Because it also seeks to encourage more ethically responsible practices, verifications of findings, and reciprocal analysis . . . (p. 377)

Here, I explore the process of doing “reciprocal analysis” with children and young people in home and community contexts. I explore the strengths and weaknesses of this approach and consider what the role of reciprocal analysis is in developing a collaborative interpretative framework.

In the case of the “home” project I analyzed writing by Lucy (pseudonym) aged 12. Lucy produced fairy tales as well as factual reports in writing as well as more textile-based objects such as sewing with writing inscribed within it. I began to understand Lucy’s texts in relation to their everyday aesthetic properties. For example, I was able to recognize, working in collaboration with Lucy, how a moral and aesthetic schema was drawn upon to inform the way the texts were written. I then related these texts to other texts that could inform their meaning, and also discussed my interpretations with the young people in the study. This was particularly useful when the texts found in the home were from different genres, e.g., from fairy tales, or from a factual “essay” model but carried the same sets of meanings and ideas.

The “library” project was an ecological study of literacy in a library within a community. By ecological study, I mean that I took an area-based approach to data

collection. By seeing literacy as a resource that could be found in communities, the focus of the study was in conducting an audit of the literacies available to families in the area. A group of children and young people met regularly in order to find out what kinds of literacy resources were available to young people within the library and in the community. Children conducted community walk arounds to log the kinds of literacy practices found in the community. These different images and films were viewed and discussed in a group. Selections from the young people’s videos and images were then turned into a short film. This was then shown to the local community and library officials. As a shared form of data collection, the young people decided to use scrapbooks to document their home literacy practices. These could then be discussed with me in a collaborative interpretative mode of analysis.

Both studies (home and library) involved creating a shared interpretative framework. This meant that participants were involved in the collection of the data and then the selection of key episodes for further discussion. Research data collection methods were chosen by children. In the case of the home, the children in the families used Flip cameras and disposable cameras to record key writing episodes. I then collected these and asked about the films that the children had made with the Flip cameras, and these films and discussions then dictated the focus of the study. In the case of the library, the children who visited the library took photographs and made films about the library. One film was put together from these resources and shown at the end of the project. It was important that the methods used for the studies were congruent with the practices of the young people. In this, I followed Law’s insight (2004) that methods, and even more, methods’ practices, dictate the reality that they are supposed to represent. While some of the young people chose to use films made by Flip cameras for their data collection methods, others used more traditional print literacy methods. For example, two girls, Bonni and Dionne, who initially attended the film making research sessions in the library, chose to represent their findings about their home literacy practices in the form of scrapbooks that they co-curated together in the first year of the study.

After working with Bonni and Dionne in the library for a year, we continued the project, drawing on funding from the AHRC “Writing in the Home and in the Street” project, but this time we also worked with visual and art materials to describe their writing practices and to record the literacy resources available in the library and the community. This part of the project was also in collaboration with an art gallery, who agreed to display their texts and artifacts with the theme of “Writing in the Street.” They used a chest of drawers from Bonni’s home to document their home literacy practices. We met within the gallery for one day in May 2011 and, after some discussion, filled the drawers with documents and images to represent home literacies. This project was enabled with the help of a visual artist and co-curated with the two girls. In both cases, visual modes were the preferred mode used to present the findings of the research, for example, the chest of drawers and the film.

Studies of home and community literacies have tended to be placed in a sometimes oppositional relationship to schooled literacies (Hull and Schultz 2002). However, data from these studies showed that the links between home and

school were permeable and fluid, with children and the young people carrying literacies across the spaces they inhabited (Dyson 2003). This quality of permeability means that interpretation of texts is less about the “domains” in which the texts were produced and more about the traveling of texts, the “lines” they follow across territories and spaces (Ingold 2007). By not reifying home and community literacies, these situated yet fluid practices become alive with movement and can be recognized as emerging within a number of different, connected spaces. For example, within the “Writing in the Home” project, literacy practices were found associated with textiles, craft activities, nail art, gardening, tiling, and other everyday home practices. Some of these spaces had links with other spaces such as craft groups in community settings and gardening practices in Pakistan. In this research, the connections across the spaces were revealed through the ethnographic fieldwork.

The Research Data

Because the data sources were co-curated by informants, data was presented selectively in the home by informants to me. The data set for the “Writing in the Home” project included field narratives, which were extended pieces of writing composed of observations drawn from field notes, audio files recorded on site, and pieces of writing by informants (Gregory and Ruby 2011). While some of the data was collected by me, as a researcher, most of the data was collected by informants. They then collaboratively made sense of the data with me, and I then worked with informants to select the most apt “mode” (Kress 1997) in which to disseminate results. In many cases, writing did not seem the most appropriate mode in which to present findings. The findings of the study were presented in various forms, including film, material objects placed in a chest of drawers, scrapbooks, and collage (see Fig. 1). Art galleries and exhibitions were then used to display these findings (see Fig. 2). While I have presented collaborative research with young people in the form of an academic peer-reviewed article (Pahl and Pool 2011), this was not the preferred presentational mode for the young people, not surprisingly. Data, then, if collaboratively collected, interpreted, and presented, can look different, in that it can have qualities that are embodied, tactile, and apprehended through sensory and visual formats (Pink 2001, 2009). Below I present the data sources for the home study and the library study in table formats (Table 1).

Data sources also included Flip camera videos recorded when the researcher was not present, which often took the form of an explanatory “voice” showing an example of a home writing practice. Photographs taken on site by informants in the library and also in the home were also useful for shared interpretations.

In the case of the library project, a weekly meeting with a group of young people, who called their group “Research Rebels,” enabled the identification of research questions, the process of collecting data, and the processing of writing up and presenting data to be worked through in a 9-month period. In that way, children

Fig. 1 Scrapbooks of home literacy practices as a form of research interpretation

and young people were involved in a participatory research framework. This framework reflected their “becoming” status as adults in the making (Franks 2011; Uprichard 2008). The data sources therefore included the process of writing up, and the different formats used by the young people to present their findings included a film, scrapbooks, a chest of drawers, and a library book which was de-accessed from the library and presented in a new setting (Table 2).

However, the process of presenting the data in this way concealed the issue of the ethics of data collection. Some of the writing by young people remained inaccessible. Because the data was shaped and presented by informants, there were a number of sources that remain hidden. Some of the writing young people

Table 1 Data sources for the home study (2-year ethnographic study of writing in the home)

Type of data	Quantity and nature of data set	Quantity and nature of data set
	Year 1 2009–2010	Year 2 2010–2011
Flip camera videos taken by children	60 Flip videos, taken when researcher was not present	7 Flip videos taken when the researcher was not present
Photographs by children	120 photographs taken by the girls (aged 8 and 12) with a disposable camera	60 photographs taken by the researcher, 10 by the children
Field narratives drawing on participant observation	7 field narratives based on repeated visits lasting up to one hour long, every other week	6 field narratives based on regular visits, every other week
Field visit audio tape	4 audio files to support field visit data	36 audio files recording language in the home
Writing by children	1 scrapbook each, about 10 pages filled with writing	1 scrapbook each plus 40 A4 pages of writing and a further 12 pages of notes

did at home was regarded as “private” and not shown. Where young people did show me their stories, and in the case of the library, the scrapbooks became a source of knowledge exchange, passed between researcher and young people. Some data sources were more “open” than others to collaborative analysis. For example, scrapbooks could be photocopied and shared for analysis. Construction of meanings on site could be enabled through multimodal methods such as working collaboratively to fill a chest of drawers with “Writing Materials” (exhibition, May 2011) as described in Fig. 2.

Table 2 Data sources for the Library/Art Gallery project (2-year ethnographic study of writing in the community)

Type of data	Quantity and nature of data set from the library February 2010–December 2011
Flip camera videos taken by children	60 Flip videos, over the period of the Research Rebels study (Feb 4, March 22, March 29, April 19)
Photographs by children	120 photographs taken by the children (aged between 6 and 13) over the period of the study plus 6 disposable cameras taken home
Field narratives drawing on participant observation	5 sets of fieldnotes (March 9, March 29, April 19, April 26, May 10) on library study
Interviews by children, audio recorded	7 interviews of library users by the children, audio recorded (March 22, May 10)
Writing by children	6 scrapbooks by the children. This became the scrapbook club from July to December 2010
Art objects and films and other materials produced by children	Two of the participants produced a chest of drawers (May 2011), two canvases, and a library book, customized, in response to the Writing in the Home and in the Street project displayed in an art gallery in September 2011. All of the participants produced a film, shown to library staff in July 2010

The Processes of Collecting Data

When beginning an ethnographic study, the researcher often starts by “casing the joint” (Dyson and Genishi 2005) which involves conducting a series of walks around the neighborhood. I had previous links with families from the British Asian community in the town through an exhibition and website, co-curated by a visual artist, Zahir Rafiq, called “Every Object Tells a Story” (Pahl and Rowsell 2010).¹ My contacts within the town were further supported by a research project, funded locally, in which I evaluated a literacy initiative called “Inspire Rotherham.” Through these networks, I met families and was able to select families and sites for the ethnographic study in the home as well as in the library. Drawing on Neuman and Celano (2001) who conducted an ecological study of four neighborhoods in Philadelphia and the access to literacy of each of these neighborhoods, with a particular focus on public libraries, we (myself and a co-researcher Chloe Allan; for a detailed account of this study, see Pahl and Allan 2011) looked both at the fabric of a neighborhood, its affordances in terms of literacy, and the literacy “sponsors” within the neighborhood (Neuman and Celano 2006; Brandt 2001). Key informants who worked in the library were interviewed by the young people, to gain a sense of the “literacy hubs” in the neighborhood (Neuman and Celano 2001, 2006). Mapping was conducted through repeated visits, which were necessary to log the literacy activity and resources within hubs and then establish a picture of

¹ See www.everyobjecttellsastory.org.uk.

literacies circulating within these hubs (Nichols et al. 2009; Nichols 2011). In the case of home ethnography, a slow process of “making the familiar strange” involved repeated visits to the home, to establish routines and practices and to agree with research informants’ ethical protocols and the focus for the study (Agar 1996). Much depended at this point on trust between field informants and the researcher.

The process of collecting data in the library started with weekly visits to the library and a series of craft exercises to find out what literacy meant to the young people. This developed into a project called “Research Rebels” led by the young people in which films were made by them about literacy in the community. For this part of the project, young people selected episodes they wanted to include in a final film, which was shown to the head of libraries. Ethical protocols meant that this film was made for the community by the community. While the home project involved checking consent as the project unfolded, the library project involved a discussion with the young people about the outputs and where they should be shown. The young people who attended the library wanted to change the opportunities for young people in their area, which was why they continued the project and made the film. Bonni and Dionne, who continued the project using scrapbooks and the chest of drawers, were interested in the affordances of visual art for representing home literacies. They used their own names in the project, and in the exhibition at the art gallery, and continue to meet with me to negotiate how they are represented within the research. When I reflect on this process, what is clear that in both settings, the library and the home, what is important is an ongoing relationship with the young people to negotiate consent for all stages of research and to continue to meet with young people long after data has been collected. These relationships are real and valued.

Examples from Data I Used in the Study

Below, I describe some specific examples of data. The first example is from the “home” study and was part of a longer analysis of the role of textiles and the ways in which writing was embedded within a range of craft-based practices in the home. The second is from the “library” study. In both cases, these examples helped me think differently about literacy in home and community settings, and I could then use this thinking to inform educators in informal and formal learning settings.

Writing in the Home: Textiles, Craft, and Writing

The data I collected from the home consisted of a number of short videos, which were constructed by the children when I was not there. In the process of coding the videos, I was struck by how many of the Flip videos recorded by the children of

their home literacy practices included textiles, such as sewing, craft activities, and stitching. One of the first pieces of data I collected was an image of some home embroidery with a name written on it. This was collected in the form of a Flip video of the embroidery by Lucy (pseudonym chosen by the child), then aged 11 in August 2010. I asked Lucy’s aunt, who I was then in contact with, about this. She emailed back:

The textile side of our heritage comes from the women in the family. We have older relatives that do appliqué, crochet, embroidery, sewing and knitting (from the girl’s mother’s side their grandmothers sister and cousin and from their father side his two cousins who live close by). My younger sister loves craft type of activities and buys the girls a lot of resources to do sewing and fabric work especially on birthdays, Christmas and Eid. (Written text from the girls’ aunt, e-mail, August 2010)

Another aspect of the home writing practices was a focus on craft and the materiality of writing materials. I collected many examples of pieces of paper decorated with glitter, illustrating the name of the child and using colors to create a bright image (see Fig. 3). I discussed these objects with Tanya (pseudonym chosen by child) then aged 8:

Researcher: *Can you tell me a bit about this please?*

Tanya: *I did it in my big sister’s bedroom called Lucy. I used watercolors and I wrote it in my name and I have done lots of stories. And I used some glitter and I wrote some crystals (audio transcript recorded in field notes October 4, 2010)*

Fig. 3 Glitter writing

Here, writing could be linked to an interest in sparkle and gold using watercolors and glitter. The aesthetics of glitter could be partially linked to an interest in glittery forms as demonstrated by this website, which was recorded in field notes as being regularly used by the family at the time of the data being collected (Craft 4Kids: <http://www.crafts4kids.co.uk/sequin-and-mosaic-art/c12>) but also could be linked to the category “gold” which I found was often strongly linked to home values in British Asian homes. This collage of representations draws on a complex set of meanings that can be found sedimented within everyday texts (Pahl and Pollard 2008). Alongside this visual and material text, the author, Tanya, had also written stories. These stories were often kept secret from the researcher. Writing involved an assembly of a number of different representational resources for writing, including stickers that could denote privacy, as Lucy, Tanya’s older sister, outlined in a home video she produced and then showed me. I transcribed the video as an audio recording:

Lucy: *Here, I have made a purse
 And I can put my money and cards in it
 And I have put lots of stickers
 And three D stickers as well on
 And I have put all my favorite things on this side
 And I have put some things I hate and some things I like on this side
 I have got little gems and stars
 And little animals and food on
 And little signs that say keep out top secret* (audio from film August 4, 2010)

Writing using stickers is an example of vernacular literacies in the home that might be invisible to the researcher (Ives 2011). Stickers are not cursive written text, but like the text that is produced through the “copy and paste” mechanism on computers, they are arrangements of text that produce “writing.” They constitute a multimodal form of writing as a design process (Kress 1997). They are linked to writing through association both with the script on the stickers and through the meanings generated in the stickers. Literacy can be understood as a series of lines and traces (Ingold 2007) which a researcher can follow and can then see as materialized in stickers, sewing, and craft, as well as writing and drawing. Much of the girls’ texts were stitched as embroidery, or stuck, as in Lucy’s stickers on her purse, or took the form of craft activities such as nail art, which included decorative written text, as well as writing embedded within craft objects such as bookmarks, pencil cases, and masks. These small pieces of writing could have been rendered invisible; however, their meanings were important. When I discussed the meanings with Lucy, she highlighted the message on the nail art, which was “say no to racism,” and also highlighted the role of her aunt in supporting her in the craft activities. This then led to a longer discussion about the importance of writing for Lucy as a site of resistance and resilience using the concept of “reciprocal analysis” (Campbell and Lassiter 2010).

Writing in the Community: Making Meaning from Scrapbooks

In the case of the library, meetings with the group of young people who attended the library were held and a research group was set up, called “Research Rebels.” With the support of the library assistant, the researchers (Kate Pahl and Chloe Allan) conducted the meetings to work with the young people collaboratively on the research. The young people took images of library use, made films, and collected audio data about how the library was used (Pahl and Allan 2011). These audio and video data were then played back and analyzed on site by the young people. The process of data analysis led to the production of a film about the use of the library which was shown in the library setting.

As part of a study of literacy practices in a library, I worked with Bonni and Dionne, both aged 12, who made a scrapbook using books provided by the project and then drawing on material cut out and stored at home (see Fig. 1). Here, Bonni and Dionne talk about cutting out:

Dionne: In the library we started sticking our pictures in and we got bored at school so Bonni messed about with the Tippex in Spanish and started writing and then she started sticking pictures in.

Kate: How did you choose the pictures?

Dionne: Well Bonni and me had a camera we used some of the film at my house and some at her house and we had like six left and we used some of them when we went to Much Wenlock on holiday. (discussion July 2010)

Dionne, here however, sees this practice retrospectively; it was what she and Bonni used to do “when we bored at school” in their Spanish lesson. The two young people jointly re-constructed their past selves in the scrapbooks. For example, Bonni included a picture of herself as a young child to signal this “self” that used to be. Writing contained past “selves” and the young people talked to me about how these different selves were realized in writing. Bonni and Dionne also described the layers of “stuff” that they drew on to make their scrapbooks:

Kate: Where did you get the ideas to put the different things in like color?

Dionne: Bonni had this blue folder and it were full of cut up stuff and we just went through it put them in piles like for hours like things we what she has collected over the years.

Bonni and Dionne used their scrapbooks to recall their past writing identities. They were fascinated by their childhood writing selves:

Kate: This is a good page as well

Dionne: That’s one of Bonni

Kate: Is that one of your drawings when you were little?

Girls: Yeah

Dionne: She did a little note saying to mum: “this is just a little note to too you how much I love you” (that’s embarrassing by the way).

Kate: I love it

Dionne: She used to write backwards! (from recorded conversation July 2010)

Time, as well as writing, is something that can be assembled retrospectively and presented in these formats. By listening to the girls’ interpretative schemas on their writing practice, I could see how writing was linked to their process of “becoming” (Uprichard 2008) and could be a point of remembering past selves as well as an inscription of future identities.

The “Writing in the Home and in the Street” project, which funded a continuation of the library project also involved a local art gallery in the process of dissemination. Bonnie and Dionne co-curated their thoughts and ideas and produced an exhibition in the art gallery (see Fig. 2). The production of images and artistic outputs such the chest of drawers enabled a different interpretative schema to be placed on the young people’s writing, taken from arts practice (Kester 2004). This schema understood their productions to be relational and produced in an interpretative framework that was inherently collaborative and co-constructed. The framework was constructed in relation to the modal choices the young people decided upon for dissemination processes (Kress 1997).

Using arts practice as mode of dissemination was congruent with the interpretative frameworks the children and young people in the study brought to the analysis as this enabled a wider and more visual form of knowledge to be available. An arts practice approach combined with ethnographically informed methodologies opened up an engaged practice that understood interpretations to be relational and reliant on collective conversations (Pahl et al. 2010). This approach to data collection, when combined with ethnography, enabled the production of multimodal communicative artifacts such as a co-curated chest of drawers and a jointly produced library book, de-accessed and then reinterpreted in an arts space. This book was filled with such phenomena such as “lift the flap” but, instead of messages for young children, included much more complex messages constructed by the two young people who curated this (Fig. 4).

The Frameworks Used

The process of doing ethnographic research in home and community settings involved a process of gradual embodied knowing (Ingold 2011; Pink 2009). This approach relied on perceptual schemata from sensory ethnography (Pink 2009). Sensory ethnography can be understood as being an engaged anthropology that is about a commitment to site and space. In the case of these studies, I committed to regular fortnightly visits and regular exchanges with the people I worked with. They came to the University and also were invited as guests to my home and were part of my daily life as well as on weekend and holiday visits. My commitment lay

Fig. 4 Library book in the art gallery

outside the recognized spaces of “research” but was informed more closely by the concept of “engaged practice” from socially engaged arts practice as described by Kester (2004). This approach was a crafting of practice as experiential, intuitive, ethnographically informed and engaged in ways that were not just about linguistic modes of knowing. Arts practice was important in recognizing the way in which collective conversations about objects and meanings could be co-constructed with informants, and these conversations were both the subject and the object of research, an approach that comes from relational aesthetics (Ranciere 2006). I took from the anthropology of Finnegan (2002, 2007) the recognition of cultural spaces in embodied and multimodal forms. These frameworks then meant that the data collected was wider than the concept of “writing” as presented in “schooled” contexts (Street and Street 1991). When I looked at the content of the writing, both with the girls in the library project and the girls in the home project, we could trace back together where the ideas came from. For example, Bonni and Dionne had pasted in a page of bus tickets (see Fig. 5), and we talked about the importance of their routes out of their neighborhood and why traveling was important to them. With the home study, Lucy described her experience of racism and Tanya’s aunt described their home gardening practices to frame and make sense of their texts.

Fig. 5 Scrapbook with Manga drawing and bus tickets

The data presented to me included information about gardening, animals, moving house, racism, tiling and house building practices, school and nursery information, as well as cultural practices and values. By linking these, and connecting up the “fragments and fields” (Comaroff and Comaroff 1992), that is, the texts taken together with an understanding of the contexts they came from, the links could be made to make sense of home writing practices. I relied on informants to make those links visible, and the constructing of the links was the “work” undertaken within the ethnography, together with regular visits, generating field notes, the collecting and recording of ethnographic data.

Reasons for Choosing an Approach

In this section, I reflect on the process of taking this approach to the interpretation and analysis of home and community literacy practices. My concern when doing this analysis was to remain attentive to what the young people were trying to tell me. In the case of the home, some of the data set involved exploring the racism the family had explored. This process meant attending to the meanings the children and young people created in the home in imaginative ways. As they produced stories and recounted the experience of racism, I had to remain vigilant as to the weighting of these meanings. I used Hull and Nelson’s concept of “imaginative vigilance” (2009) to help in this analysis. In that sense, I began to move outside the schema of “New Literacy Studies,” which understood literacy to be a social practice, and

began to use schemas from everyday aesthetics (Saito 2007) to analyze my data. By thinking about the data from an aesthetic perspective, whether I was thinking about glitter, or about the moral purpose associated with writing about racism, I could identify the decisions made about the piece of writing that were not just about its medium but about the mode used and the materiality of the piece of writing. It mattered whether it was in glitter, inscribed on the body or presented in the form of a work of art.

I have discussed above the intersections between methods such as collaborative ethnography (Lassiter 2005) and relational arts practice (Kester 2004). I have become convinced of the necessity to recognize forms of knowledge outside the “academic” domain, such as the aesthetic choices made by an informant about a text, and equally, collaborative ethnography enables me to construct meanings dialogically within the field. Important publications in this field (arts practice and ethnography) include Willis’ *The Ethnographic Imagination* (2000) which argued for recognition of the symbolic power of everyday creativity, rooted in everyday life and practices. In the field of arts practice, Kester’s *Conversation Pieces* (2004) is also helpful in understanding the relational nature of situated encounters in the field. Harnessing these encounters to create new kinds of discourses and practices is a complex and active process, which has been described by Campbell and Lassiter (2010) in their return to the “Middletown” research and their discussion of the difficulties of writing up ethnographic research with community members.

Reflecting on this approach now, I can see that I have constructed my epistemological position in relation to a particular strand of theorizing, originally stemming from the work of Raymond Williams (1961), which could be said to render aesthetic and therefore special, hidden, or vernacular literacies (Barton and Hamilton 1998). In this, I could be guilty of a certain kind of valorization. I have not, for example, discussed the genres I encountered in home settings that drew on school literacy practices such as the report, the formal letter, and the story. I have focused less on what the young people gained from formal education and more on how they constructed writing relationally within family and home settings. In this sense, I focus on ethnographic interpretation as relational social practice.

What I would hope is that this way of working could impact on educational policy. Following the work of Heath (1983), Street (1993), Barton and Hamilton (1998), Gregory (2008), and Gonzalez et al. (2005), I am seeking to redress the power imbalance that privileges “school literacy” over less visible forms of writing in home and community contexts. This power imbalance has serious implications for many children and young people who fail to thrive when their literacy practices remain unrecognized. Teachers can often be surprised by the range and complexity of children and young people’s literacy practices. The disadvantage of this method is that it comes from a post-modern interpretative paradigm that acknowledges the situated and contested nature of knowledge produced in such a way. Clashes can be found within the data set, including a discussion with my co-researchers about the purpose and meaning of the chest of drawers. The power of the “ethnographic present” can hold sway over analytic imperatives.

More broadly, the field of everyday aesthetics (Saito 2007) recognizes the importance of the mundane and the everyday in holding key meanings and ideas that are sometimes “lost” in educational contexts. The choices children and young people make in home settings about how they construct their worlds can look different in out-of-school contexts. For example, here is a written description of a page of Dionne’s scrapbook:

Dionne showed me a new page of her book. She had been documenting her home writing practices in different ways. She had pasted in bus tickets to represent her home/school journeys. She also had been representing her online and off line literacy practices. She did this by cutting and pasting an image of ‘Google’ search engines, with the open box in the middle of the page. Then she pasted what she had been looking for on the search engines, which in this case was an example of a Manga drawing. She hand drew her own Manga drawing, in order to signal what she meant by Manga. Dionne has therefore represented the search engine (Google) by cutting and pasting from a screen shot of Google together with a hand drawing of her Manga person, and had also pasted in her bus tickets. Dionne’s meaning making was entirely multimodal, being composed of cut-out screen shots, bus tickets collected and pasted in, and hand drawing. In this way, she could make meaning from an ensemble of semiotic resources and re-assemble them to create a new text signaling her home writing practices. (Pahl and Rowsell 2012, pp. 25–26)

In this example, literacy practices include bus tickets, the “Google” search engine box, and Manga drawings, which are in themselves semiotic, with writing inscribed within them. While in an educational context the “Google” search engine box will be a tool for a certain sort of literacy practice, possibly referencing or looking up a concept, here it is used as a window to create an aesthetic response to Manga. The framing of this practice is therefore entirely different from a school framing.

What Was the Role of Interpretation in This Research Study?

For me, the role of interpretation was intertwined with the situated practice that was informed by my own epistemologies and practice. My first degree was in English Literature and I focused on writing in social context, particularly fragmented or unheard writing, such as women prophets of the English Revolution. I became an outreach worker in a London inner city borough, I had worked with parents in community settings to support home literacies (Bird and Pahl 1994). I then worked in a voluntary sector organization, the National Literacy Trust, and explored community-focused approaches to literacy (Hannon et al. 2003). My MA was a study of meaning making in a nursery (Pahl 1999) and my doctoral work used an ethnographic approach to explore the meaning making of boys aged five within three London homes (Pahl 2002). Accordingly, I had combined an English literature approach on texts with a commitment to outreach as a methodology and as a practice. The interpretative schemas I brought to this research came from this history described above.

Ethnography is a very situated approach to home and community literacies. It involves the whole person (Coffey 1999), and, increasingly, ethnographers value a sensory and embodied relationship to the data they encounter (Pink 2009; Ingold 2011). Working in an ethnographic way involves commitment to the field. In any one week, I can sit in a home and listen to a story, visit a youth center in a public park, or hang out with informants in a local museum on a Saturday. These events blur into my own personal life, as informants come to be part of the “fabric” of my life, due to the longitudinal nature of the commitment and the way in which this is perceived, by both me and my informants, as a personal as well as professional commitment. My interpretative framework then does involve this commitment. I do not assume that my interpretative schemas are correct; rather I remain skeptical of them, preferring to develop a shared interpretative framework through a long period of engagement and encounter that is site specific and boundaries were created by research participants.

Interpretation is a process that is constructed by both time and space. In terms of time, I have drawn on time theory, particularly Ricoeur (1980) and Lemke (2000), in understanding the different ways time operates. Ricoeur (1980) talks about how time is more of a spiraling process and is framed by memory rather than a modernist “marching” on process. Lemke argues that time shapes artifactual encounters in different ways, and different timescales impact differently upon understandings of events and practices (2000). In my interpretative framework, I took time into consideration. For example, while the concept “glitter” had a relatively short time frame, connected to a website that had been consulted a few weeks before I collected the data, gold and its associated values in British Asian households often stretched back over generations (Pahl and Pollard 2008). Likewise, the phenomena of textiles was linked, in my data set, to craft clubs and sewing clubs that the informants attended on a weekly basis; however, as the girls’ aunt wrote to me, the family had a long heritage involving textiles.

I also drew on visual as well as spatial interpretative frameworks when analyzing the data (Massey 2005; Soja 2010). I understood that space was constructed and its arrangement was not given. For example, when constructing an interpretative framework for understanding the data I collected in the community library, when I did a visual analysis of the photographs the children took of the library, I noticed how many photographs were blurred and had an “underwater” quality. This was not because the children were not able to take sharp photographs. More, the images reminded the children of their previous experience of the site that was now a library. Before the library was built, it had been a swimming pool. Therefore, I could draw on an interpretative framework of the different states of “being” the children associated with the library (Uprichard 2008). The construction of an interpretative framework was enabled through an encounter with the literature on the way in which space was something that enabled more or less powerful those who inhabited it. The children were able to reflect on the different ways they moved within the site that was now the library and was their swimming pool. For the first year they often moved around the library on roller skates. More recently the library contained less movement in it, and the spatial affordances shifted again. An interpretative framework informed by visual ethnography (Pink 2001) helped this process.

Ethnography is a process of coming to know that involves historically and spatially informed information that contextualizes data (Duranti and Goodwin 1992). In the case of home and community literacies, this might involve drawing on interpretative frameworks that are historically and geographically located. Collaborations with community members across the University/community divide were also an important part of the interpretative process. In this, the focus for the construction of the interpretative framework is an awareness of the crafting of the practice that was involved in its construction. Present within this included the following:

1. An embodied and sensory understanding of the field that included the visual. I used visual ethnography (Pink 2009) to inform my understanding and interpretation of home literacy practices and was thus able to see them as much more materially situated.
2. An aesthetic awareness of the potential of writing in the home and in the community that encompassed ephemera as well as more recognized aesthetic categories such as “glitter” and “Manga” characters (Saito 2007).
3. A focus on embodied and careful listening (Back 2007) that led to a construction of methods that were congruent with informants—recognizing with Law (2004) that methods and even more methods’ practices constructed the realities they purported to represent.
4. Interpretations led by the epistemological frameworks of the people within home and community contexts. To build these up I spend time interviewing and being with informants in community contexts, such as Children’s Centres and nurseries, voluntary groups, libraries, craft groups, and youth groups, as well as visiting arts and related heritage events. I learned from policy documents in the Council domain as well as drawing on networks and contacts I had built up since previous work in 2006 (see the website www.everyobjecttellsastory.org for an account of this project)

Taken together, a focus on embodied, intuitive understanding that constructed an interpretative framework from arts practice and ethnography was the basis of my interpretative framework (Pahl et al. 2010). This framework could be described as a crafting of practice that is situated, contingent, and rests on epistemologies and knowledge construction that, in many cases, lie outside the University domains of knowledge but is also constructed relationally and in conversation with the interpretative schemas I have described in this chapter.

2.6 Touch Points and Tacit Practices: How Videogame Designers Help Literacy Studies

Jennifer Rowsell

*Videogames are bad for you? . . . That is what they said about
rock and roll.*

Shigeru Miyamoto, 1952

The world of videogames continue to capture interest and their popularity only increases with time. With this popularity, there is an acknowledgement of their merit as learning, problem-solving tools. Videogames demand that players strategize, communicate, interpret context, solve problems, analyze characters, possess hand/eye coordination, have patience, understand semiotic tools, and use their spatial sense, and the list goes on. Many scholars (Abrams 2009, 2010; Gee 2003; Squire 2008; Steinkuehler 2007; Williams 2008) have argued that these same skills can be transferred to literacy. In this chapter, I explore what videogame designers can offer literacy studies. Interpreting game designer perspectives offers this collection a different approach to new media and digital technologies; it gives readers a more critical understanding of what these texts assume and the implications of these assumptions on learning.

Rather than exploring actual game play, I offer insider perspectives of game producers who share their stories and expertise in game design as alternative ways of thinking about the way that we make meaning. Designers and producers of videogames have a veiled knowledge and expertise on learning in gaming environments that is valuable for understanding how we communicate and make meaning with texts. Contemporary learning theories are increasingly arguing for understanding virtual environments as a way forward for literacy pedagogy and policy (Gee 2003; Knobel and Lankshear 2010; Williams 2008), and videogames and gamification specifically have been targeted as models for future pedagogy (Abrams 2009, 2010; Gee 2003; Steinkuehler 2007).

What is clear is that videogames are not easy and their tacit practices call on skills and competencies that can be used within more formalized settings such as

schooling. To play videogames requires spatial sense; the use and understanding of semiotic tools in the form of language, objects, and visual cues; and they call on higher-order thinking processes. There have been significant accounts of game play and practices, gaming epistemologies, and connections to school learning, but there has been much less attention on how videogames are designed and produced, from a videogame producer perspective. I cannot claim to be a gamer, but what I have researched significantly is how much we can learn from media and technologies producers (Sheridan and Rowsell 2010; Rowsell 2013), and this chapter extends such work by focusing on videogame producers. The chapter takes account of two videogame designers' experiences designing and producing videogames and what this insider knowledge and folk wisdom can contribute to literacy studies.

Researching Producers

What I have researched for some time now is how the design and production of print and digital texts can inform contemporary understandings of literacy learning (Rowsell 2006, 2012; Sheridan and Rowsell 2010). Such research is built on a contention that to be critical, active text consumers, we need to fully comprehend the logic, processes, and practices of production. For example, with videogame design and production in mind, what ideologies are games based on? Who is the target user? What assumptions are made during the design process? What skills and competencies are called upon? From such a line of questioning, I speculate on the kind of learning and thinking that happens during game play. If we accept the pervasive nature of videogame play, which indeed we should, and if we go one step further and attempt to stretch such pervasive, tacit practices into formalized structures like schooling, then we open up learning and teaching to new skills and competencies that remain outside of the purview of "school learning." Through this line of questioning and this heuristic, I examine production to inform more conventional notions of learning and teaching.

Drawing on a 2-year study of professionals in a variety of fields from architecture to dance to interface design (Rowsell 2013), this chapter focuses on interviews with videogame designers and producers and the practices and epistemologies that they invoke to create games. When I interviewed professionals¹ about how they work with modes, I had specific research questions to explore their perspectives on making meaning through modes:

1. How did producer backgrounds play a role in what they produced?
2. In what ways did this background play a role in their approaches to design and production?
3. How does their chosen mode (visual, language, interactive, game-based) afford more meanings than other modes?

¹To conduct the *Working with Multimodality* research study, I interviewed 30 professionals across a variety of fields.

4. What is the design and production process?
5. Who enters and exits the design and production process?
6. What forms of knowledge and concepts about learning come into play during the design and production process?
7. Describe the production of a specific text.

This line of questioning accessed the thinking and the practices used to design games. The methods used to probe professional expertise was informal interviews with producers in their workplace or by phone or Skype and some shadowing of interviewees to incorporate an ethnographic perspective into the research. What I wanted to capture and had some success in capturing during the research process is Geertz's notion of "thick description" of the design and production process. For data collection, I wanted to take an ethnographic perspective (Green and Bloome 1997) to have an iterative engagement with data inscribed in field notes and interview recordings (Lederman 1990). For data analysis and interpretation, I aimed to make sense out of records of observed behaviors and verbal accounts of subjective experience. What this approach to data collection and analyses illuminated was cultural meanings and conceptual structures that direct and are constructed from particular individual experiences (Geertz 1973). It is this multilayered and cultural nature of ethnographic interpretation that is referenced in Geertz's (1973) oft-cited term, thick description; it is the desired outcome that ethnographers refer to as a richly textured interpretation. I was limited by my lack of access to production sites and to a more intensive investigation of professional practices in situ. Given that I interviewed most participants, I can hardly say that I had an ethnographic perspective on their work; however, through questioning and personal reflections, I was able to document recurring practices and thinking processes across participant accounts. In the future, I would like a far more situated account of practice.

Although there are many educational settings that may include technology, the educational community needs to understand *why* virtual experiences can support learning and *how* this learning can actually happen. Understanding how games are designed and systems of knowledge embedded within them will fill out a picture of new forms of learning and ways of instantiating these forms in student learning.

Multimodality and Modal Learning

The chapter is built on a theory of multimodality (Jewitt 2008; Kress 1997, 2003; Kress and Van Leeuwen 2001) and modal learning. A theory of multimodality allows for ideas to be represented through different modes, which includes but does not privilege writing. Such a perspective sees representation as crossing different ways of representing, that is, visual, oral, written, moving images, etc. Therefore, an idea can be drawn, embedded in interface, enacted, modeled, and spoken. These different possibilities that offer ways of representing can be called *modes*. A mode is one particular form in which it is possible to represent an idea. Sometimes it is easier to put an idea into a drawing rather than a piece of writing. This idea of

possibility in meaning making can be described as an *affordance*. An affordance describes the specific possibilities resident within a mode, whether these are determined by the material possibilities of the mode or the cultural possibilities (Kress and Van Leeuwen 2001). Because there are options in terms of sound, image, language, and texture, there are more possibilities for meaning making. The shaping of meanings into modes is always culturally shaped, and it is materially and socially situated. This theory comes from the work of Kress (1997) and in his joint book with van Leeuwen *Reading Images* (Kress and Van Leeuwen 1996). These books explored how it is possible to make meanings that are situated in social contexts but are spread across modes, that is, they are *multimodal*.

By putting together literacy with the multimodal, it is possible to see how a text has material qualities. Scholars have taken up the challenge of multimodal literacy (Flewitt 2008; Kress 1997; Jewitt and Kress 2003; Lancaster 2003; Stein 2003) and have illustrated in their research how meaning makers learn quite naturally through a variety of modes, sometimes in isolation and sometimes combined. When looking at meaning makers' intentions, a multimodal text also needs to acknowledge what lies behind the meaning, that is, what meaning makers bring to texts. This brings us back to the cultural qualities of texts. They are infused with meanings. By thinking about literacy as multimodal, it becomes a wider experience of not just words on the page but the feel of the page, the sound of a voice talking, and the curve in a drawing. Literacy, as a multimodal practice, is material.

If we accept that literacy can be seen as multimodal and as material, then it is possible to extrapolate material qualities in texts so that we know how to emulate these practices in our own meaning making. That is, how we can use a mode that best suits a composition when we produce texts. For a long time now, I have been interested in how producers choose modes to design and produce texts. Printed and digital texts alike rely on the affordances of modes to express meanings an author wants to express. Case in point, to access and extrapolate the perspectives of new media and digital technologies producers, Mary Sheridan and I interviewed producers to explore their logic and language for producing "texts" (toys, videogames, movies, TV shows) for the marketplace. Our research identified a framework comprised of four stages: spinning an idea into a design, designing the spin, remixing and converging the idea into branded items, and using social networking to promote the text and give it life. As a formula for text production, producers viewed these four stages as exhibiting what they call "fearless creativity." Learning in the twenty-first century implies these skills and a disposition for trial and error until you find the right design and fitting modes to express the spin. Design and its nuances and its logic are central to a twenty-first-century literacy mind-set.

Design and Production

Design has been a focus for much research in multimodality and multiliteracies. Love (2004) argues that design has both conceptual and expressive features. Albers and Harste (2007) believe design is "one of the most important parts of multimodal

expression because it encourages imagination, vision, and problem solving, when learners become designers” (p. 13). Design involves deliberate decisions regarding modes of expression. The New London Group views design as “the concept of design emphasizes the relationships between received modes of meaning (available designs), the transformation of these modes of meaning in their hybrid and intertextual use (Designing), and their subsequent to-be-received status (The Redesigned)” (pp. 304–305). The New London Group (2000) delineates six areas of design: linguistic, visual, audio, gestural, spatial, and multimodal. Each area constitutes a mode (form) in the process of meaning making. Visual design includes images, layouts, or screen formats (Love 2004; Merchant 2007). Audio involves music and sound effect contributions to meaning making. Body language and behavior are involved in gestural design. Spatial design incorporates elements of the environmental spaces. Multimodal design incorporates all in the meaning-making process. From design comes the concept of enacting design through production.

Production refers to the creation and the organization of representation—in other words both the product (text) and the technical skill used during the design process (Albers and Harste 2007). Changes in communication have resulted in new relationships between the production of texts and dissemination of texts across an array of media and technologies, which has resulted in reconfiguring the circumstances, operations, and functions of authorship and audience (Jewitt 2008). For the New London Group (2000), production involves the following decisions: delivery, modality, transitivity (choice of words), vocabulary and metaphor, nominalization process (how actions, qualities, assessments, and logical connections are turned into an ontological state), information structures of presentation, and logical and global coherence.

Videogaming, Design, and Pedagogy

Reflecting on design and design-based thinking, videogames encourage the expression of user’s cultural backgrounds and traditions for “information and resource exchange” (Pinkett 2000, p. 4) across broad contexts that engage a reciprocal and developmental relationship between individuals and communities, and literacy research supports this relationship. For example, in *What Video Games Have to Teach Us About Learning and Literacy*, Gee (2003) offers an in-depth look at what goes on when children use videogames and the ways that videogames teach our children how to conceive and use language. Gee’s detailed analysis of what goes on cognitively and linguistically when children use videogames is a powerful rethinking of the uses of console games. Considering how videogames are designed and how they are played, Gee argues that there are 36 important learning principles built into videogames including how we form identities, how we connect sign systems, how we solve problems, and how we learn nonverbal cues.

Aarseth (2000) argues that game players learn both technological and programming skills through game play, both through the user interface design and the development of three-dimensional programming techniques. Galloway (2006) adds to the discussion arguing that gaming comes into being at the hand of the players who must control, strategize, and execute game play. There are also theorists who argue that contemporary studies on literacy education neglect to acknowledge sophisticated and nuanced practices involved in game play (Gander 2000; Dawes and Dumbleton 2001; Egenfeldt-Nielsen 2005; Egenfeldt-Nielsen et al. 2008; Walsh 2010). After all, digital games are systems (Juul 2003; Salen and Zimmermann 2004) with rules (Järvinen 2003) that players engage in and follow. Yet in addition to interaction with the game itself, players engage with information about the game, the game industry, and other players to generate strategic moves, thereby promoting (Consalvo 2007) reflection in action (Schon 1983; Salen 2007; Walsh 2010).

Gaming also promotes procedural literacy (Bogust 2007), a term which encompasses gamers' understandings of the rules of game systems and the significance of these rules. For example, Salen (2007) talks about "game-play literacy" as literacies that compel gamers to strategize, navigate, and redesign structures during their participation. Consalvo (2007) argues that gamers acquire a sophisticated gaming capital together with an accumulation of cultural, social, economic, and symbolic capitals (Bourdieu 1984). Consalvo (2007) used the concept of *paratexts* as a means to study digital game culture: they are systems of media products that work to frame digital utilization. From a critical perspective, these paratexts "provide a focus for critical discussion, talk and textual production, thereby acting as a pivotal point in the social and cultural lives of many players" (Newman 2005, p. 50). Thus, they provide an effective segue into a critical discourse of gaming, corporate culture, and media manipulation.

Researching, playing, and designing digital games place students into new literacy domains that are positioned outside traditional reading, writing, and multimodal design practices, because games are enacted through game play and actions in virtual and non-virtual worlds. Playing digital games and engaging in game design involve understanding that taking actions has consequences. Game play and design require players to, on their own and/or collaboratively, explore and negotiate risk, possibility, identity, and subjectivity in new and emerging virtual worlds.

With all of this research attention on videogames and what videogames can teach us about learning (Gee 2003), there has been relatively little attention on what it takes to produce a successful videogame. Because an understanding of the hidden folk wisdom and know-how of game producers can help educators replicate the same composition and design practices in their own lessons. The following two case studies of videogame designers examine the choices producers must make to engage users and the modes they find most appropriate to accomplish their goals.

Building Gaming Worlds: David Elton

David Elton has worked in the videogame industry for two decades, entering the industry before there were even degrees in videogame design.² Originally trained in theater, Elton had every intention to act professionally, but, through serendipity, he ended up in the videogame industry. Following a Fordist work model, Dave started his career from the ground up. For his first job in gaming, Dave worked at a videogame store in British Columbia called Games Exchange, which allowed shoppers to play videogames before purchasing them. Because he needed to familiarize himself with various genres of videogames such as fighter games, first-person shooter games, and action–adventure games to help customers, Elton accumulated hours upon hours of game-play time before and after work, developing in the process a holistic sense of game design logic. After moving back to Ontario to manage a Games Exchange store in Markham, Elton ultimately decided to tackle all domains videogame work.

Elton worked inside the videogame and software industry for some time in the United States and Canada designing and producing videogames, acquiring knowledge and expertise in purchasing, selling, designing, producing, scheduling, and project management. Elton has worked for grassroots videogame designers all the way up to software juggernauts like Microsoft. He has worked for large game designers like Silicon Knights to working freelance for local and international game designers. He avows to having “had the gamut of experience in Canada and the United States.” In this time, Elton developed a comprehensive view of the evolution of gaming from a fringe hobby to a part of everyday life.

There are always moments in interviews that stand out, and one moment during the Elton interview that, in retrospect, seems emblematic of his philosophy of production occurred when he discussed an art class he had during his theater training. Elton shared the anecdote from an art professor that captures a notion at the heart of game design, *touchpoints*:

So one of the best examples I was given, I guess, was an example an art professor gave me, he went to his class, and he said, alright, class, next week I want you to come back with a fantastic painting, and the students came back the next week, he found a lot of them really, really struggled with what it is they were going to create because they had options, it was completely wide open. And he said, ok, class, this week what I'm going to do is, I'm asking you to paint a bowl of apples, I want you to paint this bowl of apples any way you want to, but it has to be focused on this bowl of apples, and the following week they came back with some of the most creative paintings that he'd ever seen from his students because they'd been given one sort of touchpoint, and it all had this one little focus, so some went realistic, some people went completely abstract but they all had that one framework. March 2011

Only by explicitly framing an idea—focus on the bowl of apples—could art students find their style and interpretation for the assignment. Touchpoints bracket off modal representation. Rather than having a wide field of interpretation, the

²I use the actual names of interview participants in the Working with Multimodality project.

art professor narrowed the task and in many ways the modes that could be used. Elton kept returning to the notion of touchpoints in the interview—as a process of narrowing the modes that could be used to paint the bowl of apples.

Elton's description of touchpoints can be seen in his discussion of the videogame industry. A veteran in the business, Elton gave me a panoptic view of where the gaming industry was and where it is going. Where Elton used to focus on how to structure an idea, feature, or license in a gaming world, he now helps and often manages junior game designers working through issues and troubleshooting their designs. From this patchwork of experience, Elton described how gamers build gaming worlds by communicating an idea.

According to Elton, a concept within videogame design is “world building” for a player:

When it comes to an idea for a story or concept or for *building a world* [my emphasis] with a player, designers construct worlds around stories. One of the things that's in the toolbox for every designer is being able to communicate, and it is the same for a producer or people working in teams. You need to be able to communicate your ideas in ways that different people will be able to understand. March 2011

Recognizing the importance of crafting worlds in videogames, Elton stresses the value of communication for game designers. When he talks about communication, Elton is referring to how designers *communicate* a world to gamers. During our interview, Elton talked about how immersive and augmented worlds can be communicated visually, orally, or through prototypes, but he emphasized, “a core idea needs to be communicated.” Throughout our interview, he peppered in concrete examples of communicating an idea. Ideas are materialized through modes in game interfaces.

During our interview, Elton talked about how designers focus on touchpoints when designing a game. The first touchpoint Elton touched on is spatial modes. He did not refer to a specific game that he has worked on, but we spoke in generalities about games and he offered some examples. With spatial games, designers construct interface for games based on how a gamer might navigate through a space and how to create more and more challenges with space and shapes as a player moves up levels. For example, the *World of Goo* is a game of strategy where players figure out a trajectory for globs of goo to travel through cylinders and rods before they enter a vat. At first, the game is fairly easy, but it gets steadily more complex as you move up levels. Think back to the days of Tetris, and anticipating, within seconds, where a square can fit with other squares, this game works on a similar principle. The starting point of spatially dominant games is to communicate the story of moving around a confined space through an object and a system. The dominant mode at work is spatial and geometric, and designers play up this mode when they design spatially ruled games. With the *World of Goo* example (Dave Elton did not work on the game itself), a gamer starts from the idea of figuring out how to launch balls across a space and conceptualize space and cylinders to find the best, fastest, most efficient path to launch the goo. The premise of the game is to figure out the most expeditious way to shoot goo into a cylinder and the nature of space and obstacles become increasingly more complex as you move up levels.

Whatever touchpoint or mode dominates in a game, there needs to be a story communicated. Throughout our conversation, Elton kept going back to the notion of “bounded story worlds.” Essentially, there needs to be boundaries within the structure and story of a videogame that emerge from the actual practices used and understood to problem solve through a game. Boundaries might include characters having a certain, quite specific palette and illustration style to match the overall aesthetic of the game. Elton gave the example of the licensed *Xmen* story and how characters such as Cyclops look and act a certain way within the story. Bounded worlds have lines around the content and structure that create consistency and coherence throughout the game. Licensed videogames such as the *Xmen* game are helpful examples because only certain sorts of actions can take place and certain kinds of characters can inhabit these worlds.

A mode that dominates licensed stories like *Xmen* is illustration style. Elton talked about illustration as a mode when he discussed his work on the *Xmen* videogame. Elton discussed how modes can create story boundaries. With the *Xmen* example, the distinct illustration style of *Xmen*, and Marvel Comics characters more broadly, make the characters singular and tied to the storylines. Through the printed comics, television show, and movies, *Xmen* characters have come to look and sound a certain way, and relying on this aesthetic helps game designers frame the gaming world. A technical term in the media industry for migrating a product or license to another media channel is *transmedia*.

Elton talked about the notion of *transmedia* where stories move from one media to another media. Kress (1997) talks about “transduction,” and Siegel (2006) talks about transmediation—both referring to a process when one mode switches into another mode. That is, moving a character like Cyclops from an *Xmen* Marvel comic into a videogame interface not only changes what the character can do through three dimensions and moving images but also slightly changes the aesthetic. When modes shift from one medium (printed cartoons or moving image) to another medium (e.g., videogame), the properties and affordances of modes shift. During our interview, Elton talked about working on the *Xmen* videogame and how they were allowed more design license and expansion of modes by introducing new characters:

... for Xmen, we have the universe. We're fortunate enough in that we're able to create some original characters for it, which are actual playable characters in addition to the Marvel characters, but these characters still need to fit inside the universe. March 2011

Elton here directly refers to how modes need to “fit inside the universe” of the *Xmen* aesthetic and illustration style, yet there is some latitude to distinguish characters by introducing new characters into the gaming universe. Although there is an in-place aesthetic, idea, type of character, and storyline in *Xmen* that cannot be tinkered with, the fact that these characters need to be transferred into a new, interactive paratext or digital world offers an artistic design license that game designers can use to create new characters who fit “inside the universe.” In Elton’s case, this meant adhering to the integrity of the original, preexistent story style, aesthetic, and dispositions of Marvel characters within the *Xmen* world even as new characters emerged.

Embedded within the *Xmen* example, there are practices used with modes—customizing characters and elements/modes (e.g., distinctive features, superpowers, aesthetics, etc.) about characters. For example, when Elton met the *Xmen* producers, he and his team asked about introducing new characters into the *Xmen* videogame version to give players a chance to construct and customize their own character to their liking. As Elton elaborated “they’re not necessarily playing as Cyclops, although they can. But he already exists [within the larger media text in the movie, etc.]. There’s not a lot of customization to that, whereas if we have an original character as long as we’re inside the overall guidelines of what makes a Marvel superhero.” As a result, according to Elton, customization is key to gaming experience because it is a way of imbuing subjectivity into the experience. “Customizing” refers to the act of choosing specific modes (e.g., illustration, color, movements, vectors, etc.) to give across or materialize a particular kind of message. Drawing on the customization practices, Elton argued that players find it more relaxing to work within existing characters; having said that, a winning videogame usually gives players an option to either work with predetermined, storied worlds or create their own characters.

Another transmedia example is *Transformers* that was converted into a videogame in 2009. Noting that *Transformers* characters are robots in disguise, Elton explained how the core idea of the story needed to underpin the design of the videogame. In other words, a designer must work “within the boundaries of that universe” and allow for characters to transform into some kind of robot. A designer can, for example, develop a character who is an object such as a car or lamppost that turns into a robot. As with the *Xmen* example, the characters in the *Transformers* story have a variety of practices that accompany their modal representation—heavy weaponry or light weaponry that robots use in battles. Gamers have the option of unlocking color schemes when they get to certain levels. Where the *World of Goo* is about spatial dimensions and the *Xmen* game is about action and adventure and taking on characters that fight enemies, the *Transformers* videogame is far more about strategizing and using the right tools in the right moment.

What the transmedial movement from *Transformers* the movie, toy, and books to the videogame signaled is a shift from an elaborate storyline to more about applying an understanding of characterization to a gaming strategizing through levels.

The movement of modes and affordances of modes was a recurring topic in the Elton interview. Framed as remix, Elton and I talked about how game designers build on modes in other texts and embed and often couple them with other modes. Modal remix and convergence works on these principles whereby game designers combine vestiges of characters or texts or actions that have a distinct color palette, texture, expression, and recognizable backdrop and they add these modes to game interface. For example, a lead character in a videogame could have Scarlett Johansson’s body type with an Angelina Jolie head, and the character could appear in a desert setting with traces of a Pixar film background. Through bricolage, designers construct characters and backdrops that are remixed and converged

versions of other texts. Elton talked about how gamers combine modes from other media texts to create immersive environments:

It happens actually in a variety of ways, so, part of it is, the main reason why that is successful is because what you're trying to do is communicate your idea in a way that people can understand or grasp, and one of the easiest ways to do that is to come up with examples everyone is familiar with. So if you say, so for example, if you say, I want this to taste like chicken, pretty much everyone knows what chicken tastes like so, by using examples from film or a very popular film or very popular painting or a very popular movie, people have a level of understanding of what that idea is about, be it tone, be it what the audience is, what it is they want the player to be feeling or experiencing during that time, so by taking all these examples from different media and applying them together. I know a lot of studios use film as a reference, so, say, I want this to be as epic as Star Wars, you know, and have this, or I ordered this as more of a period piece, and bring examples, so here's in the '40s, and just so here's an example from Ice Age, so that sort of idea. There are other cases, so when you're doing concept art, for example, you're trying to define what that visual look is on your board or object or character, you know, being able to take ideals from different places, so I'm looking for a character. I'm looking for, you know, Angelina Jolie's mouth, you know, the hairstyle off of Scarlet Johanssen, or the overall body build of Julianna Moore. March 2011

Aspects of videogames such as a character's hairstyle looking like Scarlett Johansson are a way of taking a mode and transplanting it into another place giving it new meaning but reminding the player and/or viewer of the original character.

One of the best examples of designing a game around a mode is an award-winning videogame that Elton worked on, *Need for Speed*. The dominant mode in *Need for Speed* is sound. Designed with sound and audio as the focal mode, much of the success of the game relies on the mode of sound signaling the experience of driving a car. *Need for Speed* relies on sound—accelerating, stopping, and honking to communicate the world of the road to players. Elton elaborates:

... the way that they (designers) went about it, the way they realized that part of the sense of driving a car is the audio, so when you step on the gas, feeling of power, slamming on the brakes going around the corner, the sound of the wheels against the concrete, a lot of feedback for the player but also it helped give a sense of speed and power, it's realistic but it's also emphasized. March 2011

Whereas the *Xmen* videogame might rely on images or actions, *Need for Speed* relies heavily on audio, so Elton and his fellow designers said they charted in detail the kinds of driving practices that gamers would use and the sounds that accord with these movements:

That was very much a deliberate thing [R: ok]. So they actually took cars, put a ton of mics on them, took them to a track, and thought about what the sound is like in real life [R: right], through a wide variety of situations, so light load, heavy load, squealing the tires, doing donuts, heavy acceleration, light acceleration, so they had a wide gamut of what those sounds are for a car. Then the audio engineers and the sound designers would then take those sound effects and emphasize them where [muffled] you get a real solid feel for driving a car, only slightly exaggerated [R: ok]. We had basic interactive sound in that we had musical sound tracks that were divided up into layers, so, a lot of video games, they have a licensed piece of music, they just play the whole piece of music. What we did we actually got the original files for the music so we had all the original tracks so we could pull out the guitar, we could pull out the drums, we could pull out the vocals. So what we were able to

do was change the music dynamically with what was happening inside the game. So if you were going full board and you knew that the player was going really fast, but when they hit a jump we pulled back almost all of the audio so it was just a little sense of the music that's playing, and pump up the sound effects for all the wind and everything, and the end result is, you get a sense of, it just really supported the idea of 'ohmygod' I am flying, I am 100 feet, 200 feet above the ground", and the thing that's really, at that point we're changing the camera. March 2011

By explaining how he and his design team mixed audio with visuals, Elton shows how producers carefully craft a bounded story through dominant (sound) and subordinate modes (visuals).

There is much that we can learn from Elton's case study and seasoned experience as a videogame producer. Brought together, Elton unravels a process that happened working within an immersive world. First of all, once there is an idea for a game such as building on an existing, perhaps licensed story or fulfilling actions or a repertoire of practices, then there need to be touchpoints that materialize this world. Does the world have a darker, more abstract aesthetic, or does the immersive world use bold, fun colors to represent levity and light-hearted play? From touchpoints, the story develops and there needs to be a structure and boundaries to the story. If the settings and characters are good and evil illustrated in darker, more somber colors, then it would not make sense to introduce comic, pastel characters. Is sth missing from this sentence? Modes need to match and adhere to story boundaries. What is more, modes exude the internal meanings and thinking systems. Take the example of *Need for Speed*, which uses sound to signal, the dominant practice to play and be competent, maybe even skillful at the game. Sound and particularly the sound of speed turning corners or making jumps across canyons provide gamers with feedback on game play. In this way, modes in videogames materialize immaterial, ephemeral experiences such as driving or battling a Cyclops through movement, colors, interactivity, etc. In the next case study, the research participant offers a videogame genre or medium and how its materiality shapes the boundaries and storyline.

Mobile Gaming: Kevin Kee

Kevin Kee is an academic who developed a successful augmented reality game called the *Niagara 1812 Heritage Tour*. Similar to Elton, Kee entered the gaming industry by the backdoor through a job that eventually led him to technology in general and gaming in particular. Kee completed a PhD in History in 1998, and when he graduated there were very few academic jobs, so Kee worked at the National Film Board (NFB) in Montreal for several years, where his main job entailed building a history website. Although Kee used the Internet during his graduate studies, it wasn't until he joined NFB that Kee began to use and understand virtual environments. At that time, all the NFB knew about was film and printed text, so Kee being "conversant and somewhat capable just elevated" his status to

Web authority within the organization. And it was in this capacity that Kee pushed NFB into augmented experiences and immersive worlds.

Responsible for building the history website, Kee was ushered, “theoretically and technically,” into the Web world. Reading scholars like Marshall McLuhan, Kee gravitated from conventional ways of doing history to a digital humanities approach to history. Noting that he was “underwhelmed” by the strategy games he found, he began to think about strategy games that might help learners think about history as process, one that “supported a system analysis of history writ large”:

... what I felt was there was very little history going on in these strategy games, so that what one was doing actually was learning how to play a strategy game, was learning how to, for instance, weigh resource allocation – that’s basically what strategy games do – and how your present decisions will affect your future within the game environment, and other people are now making this case, that what you’re learning is to play a strategy game, you’re not really learning much history [R: ok]. It’s incidental, which doesn’t mean it can’t happen but it’s incidental. So, why spend all that time on it if it’s incidental? Anyway, what that got me back to think was I kind of liked reality, and I thought the real world was a really compelling place. February, 2011

Working within a history mind-set, Kee recognized that there was great potential for thinking and learning in terms of history within augmented reality games, which triggered an epiphany that augmented reality has potential for teaching and learning, but not gaming as it is typically conceived. Built on the affordances of digital, immersive, embodied experiences, Kee envisioned a mobile gaming environment where players could learn and use historic information to strategically move a character through screens.

After some years at the National Film Board and taking a university faculty position, Kee became a research chair in digital humanities at another university and that move jettisoned him into the world of research and scholarship in virtual, immersive environment. It is at this point in his career that he set out to pursue his interest in teaching history through augmented reality. After attending a session at a conference by a team of researchers at MIT who designed an immersive, teaching environment, Kee decided to design and produce his own videogame. He gathered a team across different disciplines, both nonindustry and industry people, to develop the game. Kee’s team consisted of an artist, a journalist, a programmer, and himself, as the historian. Together the team began *Niagara 1812 Heritage Tour*, which ultimately led to the Apple App that thousands of players use.

What dawned on Kee during the process of developing the game is that history is best experienced in situ, in the place of origin where the events took place, and that can only happen if a device is mobile and you go to the historical sites. Contemporaneously with developing the game, there was a proliferation of smartphones, so what naturally happened is that the development team produced a mobile gaming platform that is action–adventure and at the same time a learning tool. You get on the game and move to different locations where a player can simulate historic events and battles, reliving the moment on your smartphone. The videogame morphed into an easily accessible, mobile platform to present and teach history. The result was an augmented reality game called the *Niagara 1812 Heritage Tour*, a

game that allows users/players to move around different parts of Niagara with their smartphones to play games that teach historical information about the area.

Kee explained the inspiration behind the game's infrastructure was a desire to help players experience history in an unpredictable way: "what happens in these kinds of situations, is that people interact on the street with one another in ways that we cannot predict, and so there's an element of unpredictability that if you recognize it and incorporate it, can really transform the experience." And his early adoption of apps versus console-led gaming allowed Kee to exploit a design model built on the affordances of a format—a mobile device whose form dictates function and tacit practice and produces a mobile version that requires players to move around and engage with real settings.

Recognizing the success of such a game relied on a portable device with visual impact, I interviewed the artist, Anthony Perri, who developed the aesthetic for the game's visuals. He described the bumpy development behind the visual evolution of the lead avatar in the game, Isaac, who modeled after Isaac Brock, a British Army officer and administrator who was assigned to Canada in 1802:

Yeah, so at first the avatar was sort of realistic looking. It looked like an old drawing. It looked like... maybe it had Isaac if he was on a dollar bill or something and as we kept going it just felt like it wasn't working with what Isaac had turned into because the development changed drastically half way through when this became less about story and characters and more about the city. Isaac was more of an A.I. and I always thought that realistic thing was not iconic enough, so getting them to agree with me on turning him into a 'cartoony' icon required me to write up a two page document with examples and what-not and the original concept for the new look was much different. It was a lot more simple I guess. It was sort of like a Lego head. (Fig. 1)

Fig. 1 Lego character's head (March 2011)

Fig. 2 Screenshot on iPhone of the Niagara 1812 Tour

In Fig. 2, there is a screenshot of the *Niagara 1812 Tour* with Isaac as a cartoony Lego head providing clues as players work their way through the game as they move through real settings associated with different parts of the game.

Once Perri worked out the game's avatar, he turned his attention to the interface, which needed to be simple, functional, and professional enough to appear alongside other iPhone apps. The key to the design was to make it small and haptic (i.e., as in designed with touch-tap screen logic). The dominant mode of the videogame is visual coupled almost equally with strong audio. The game needed to be fun and cool and not like a textbook or remotely didactic, pedagogical. The smaller surface meant that every design needed to account for form. Consequently, design teams had to try out different illustrations, particularly of Isaac, before they established the final avatar.

When Kee and his team designed the interface for the game, he wanted to keep it simple with a neutral background: browns, grays, monochromatic tones, and sepia tones that signal history and historic events and sites. A user can either roam using GPS to pinpoint your location and identify nearby heritage sites, or a user can solve a mystery in quest mode where you can access maps and pictures and decode puzzles carved into buildings. It is a functional interface, the antithesis of the *Xmen* and *Transformers* videogames because the interface does not use illustration styles and details for effects; instead it uses interface to get you somewhere and to use the outside world as the focus for game play.

In this way, the *Niagara 1812 Heritage Tour* adopts a particular historical epistemology, one that uses immersive worlds to find tangible, concrete, material historic sites. The videogame embeds simulations, role play, and strategy to compel the gamer to go out into the world to find history. The dominant mode for the videogame is mobility as opposed to a large, immersive world. The game can be

viewed on a small screen that you can transport, and this mobility is part of the tacit experience of playing the game.

What the case study illustrates is how a videogame producer adopts a philosophy of game design: keep it simple, make it portable. Unlike the panoramic view that Elton provided, Kee intellectualized the process of creating an immersive environment to make an epistemic point: “a videogame that is built for a small window” so that it can be used in everyday life and as a part of tacit practice. Kee developed the app during the nascent stages of the iPhone and iPad, before these technologies jettisoned as daily artifacts. Kee and his team developed the videogame when other game designers and producers were building consoles and even “massive structures that you enter into, like big caves.” What the Kee case study tells us about learning is that you can take a mobile device like an iPad and iPhone and use it with street sociability and as a part of social practice. Taking the immaterial nature of digital worlds and coupling them with material worlds such as a building or historic sites opens up gaming and technology to leverage real, lived worlds with virtual worlds.

Conclusion

Theory and research suggest that videogames can function as academic and social resources. For example, in addition to helping players assume roles that may be unavailable to them in conventional forums, videogames can give players an opportunity to experiment and learn without consequences that often affect academics, involve play, expand traditional constructs for learning, encourage speech genre and new syntactic structures that accompany emergent literacy, and promote interactivity. What gets less attention, however, are the strategies for creating the games and other interactive forums that can engage students in productive, enjoyable, thoughtful ways.

The two case studies in the chapter reveal ways of framing modes and modal composition that can be funneled back into the classroom. Notions such as bounded story worlds, privileging touchpoints, and even making technologies a part of the social fabric of classrooms can inform literacy teaching and learning.

No matter how much we speculate on the impact of digital texts and the practices that they invite, there is a need to figure out digital logic and epistemologies through methods of design and production. Figuring out design and production logic may not lead to a pedagogic revolution in literacy education, but it will offer new templates and models for composing and viewing texts. Listening to design and production stories introduces learning models that start to break down traditional conceptions of learning and understanding texts.

There are questions and issues that this research raises. For instance, is it really possible to apply some of these practices and thinking processes within

(continued)

more conventional notions of making meaning such as reading and writing activities in-school? Or do we know enough about design and about haptic play to harness them to theories of learning and cognition? Or, in terms of research methods, is it legitimate to claim that I captured an insider perspective by interviewing professionals and basing my analyses on their reflections? Further research can probe these issues and questions, but the chapter goes some way in presenting an alternative way of thinking about how interactive spaces shape knowledge systems.

2.7 “Enabling” Participatory Governance in Education: A Corpus-Based Critical Analysis of Policy in the United Kingdom

Jane Mulderrig

Introduction

The idea of the “enabling state” has emerged in recent decades as a way of theoretically conceptualizing and politically enacting advanced liberal governance. At its heart lies the assumption that the primary goal of the state is international competitiveness and that this is best achieved through economic liberalism and labor market activation. The result is a growing emphasis on “productive social policy” in which the enabling state provides “workfare”¹ incentives and structural opportunities for the active citizen to work. Framed in the rhetoric of reciprocity, of “rights and responsibilities” (Giddens 1998), this brings about a new *contractual relation* between citizen and state. In an era when the state is no longer perceived to be capable of offering economic guarantees and social protections, the weight of responsibility shifts to the individual. In 1990 the OECD proposed the “Active Society” as the future for social policy, in which the primary goal of governments is no longer guaranteeing full employment but facilitating full employability. The main policy instruments to achieve this are education and training alongside (limited and contingent) income support, whereby the state “foster[s] economic opportunity and activity for everyone in order to combat poverty, dependency and social exclusion” (OECD 1990, p. 8). In terms of the *social relations of governance*,

¹Briefly, “workfare” is an alternative to traditional social welfare in which the state provides monetary protection against unemployment. Designed to stimulate some form of social contribution from recipients, workfare schemes have been operationalized in different ways. They also vary in the nature of the activities required (e.g., demonstrable efforts to seek work, interviews to determine “fitness to work” among those with disabilities, mandatory training or education, or compulsory unpaid work) and the levels of coerciveness entailed. Because the workfare principle is inherently vulnerable to exploitation, it is a controversial mechanism for social protection.

J. Mulderrig (✉)

School of English, University of Sheffield, 1 Upper Hanover Street, Sheffield S3 7RA, UK
e-mail: j.mulderrig@sheffield.ac.uk

this entails new forms of “active, participatory” citizenship coupled with a more devolved, “enabling” model of political leadership. In other words, advanced capitalist societies have, it is claimed, undergone a fundamental reconfiguration of the distribution of *social power, roles, and relations* in the state. This chapter uses critical discourse analysis to explore the extent to which this was historically brought about in the UK through education policy discourse.

Alongside these postulated changes in the relations of governance, there has been an increasing emphasis in advanced capitalist economies on educational investment *as* economic investment. This is particularly explicit in the ambitions set out in the Lisbon Agenda (2000) for the European Union to become “the most dynamic, competitive, knowledge-based economy in the world, with sustainable growth, more and better jobs and greater social cohesion.” At the heart of this competitive economy is a new commodity: knowledge. With a postindustrial shift in primacy from physical to intellectual labor, growth is now seen to depend increasingly on the production and application of knowledge (Bell 1973; Castells 1998). It follows that in a knowledge economy individual success for the “active citizen” (and protection from social and economic exclusion) lies in the ability to acquire and market this commodity better than one’s competitors. In effect, investment in learning is now seen as a key political mechanism for achieving economic growth and social cohesion. This has inevitable consequences for the perceived value, function, and content of schooling, fundamentally challenging the educational status quo and generating structural and ideological pressures to align education more closely with economic policy goals. Here again this process relies on reshaping the roles and relations of education so as to foster the lifelong learning citizen, whose responsibility is to safeguard her future “employability” through the accumulation of skills (Brine 2006). The case study outlined therefore focuses on the historic negotiation of the roles and relations of governance in UK education policy discourse during the late twentieth and early twenty-first centuries. In particular the analysis examines how their historic reconfiguration helped shape a new policy hegemony in which an apparent consensus on, and thus legitimacy for, policy goals is construed through an inclusive governmental identity. At the same time an “enabling” and distinctly managerial model of governance progressively reconfigures the balance of power in education towards a more devolved, managerial model. A computer-aided approach to critical discourse analysis (CDA) is used to highlight the systematic grammatical forms through which these transformations are historically enacted and naturalized in policy discourse.

The remainder of the chapter is organized as follows. I begin by discussing CDA as a distinctive approach to interpretive analysis and its potential contribution to critical social research. A key characteristic of CDA is that it explicitly acknowledges the (normative) position of the researcher and the interpretive process in the research. In other words, CDA has an explicitly emancipatory agenda in which critical *interpretation* of empirical objects is seen as a mechanism both for explaining social phenomena and for changing them. This explicitly interventionist stance sets CDA apart from some other approaches to social science, while it is nevertheless committed to the same levels of scientific rigor. In this chapter, I therefore argue that rather than a discrete stage in the research process,

interpretation is integral to the multilayered, iterative methodology that typifies CDA. In essence this approach involves a continual movement between, and critical reflection upon, the different stages and levels of the research (formulation of the research object or “problem,” selection of appropriate data, identification of relevant conceptual and procedural tools with which to analyze them, assessment of the significance and normative implications of the findings).

CDA is inherently interdisciplinary, combing a theory of discourse and a range of (always variable) text analytical methods with social and political theories relevant to the object of inquiry in order to contextualize and interpret its findings. Thus the social context of the data under investigation is always crucial to the interpretive process. In the next section, I therefore present a more detailed account of the historical context of this case study, framed in a political economic theorization of specific transformations in the British welfare state (Jessop 2002; Hay 1996, 1999). This account of the political economic context of the case study is itself a theoretically informed *interpretation* of the social practices (of educational governance) under investigation. Moreover, this theoretical account was used as the lens through which the research questions were refined, the foci of textual analysis identified, and the significance of the findings *interpreted*. Thus at every stage of the research process, the object of inquiry was shaped through processes of theoretical and methodological *interpretation*. Reflecting this integration, I do not treat it here as a separate element of the research, but rather point to its relevance *throughout* the research process.

Following a more general account of the historical context of this study, I briefly discuss the rationale for focusing on, and questions formulated in order to do so, the changing roles and relations of neoliberal governance as constructed in education policy discourse. I begin with a description of the combined corpus-based methodology developed for this particular study, outlining the procedures this involved. I then present the findings from the research, drawing on the political economic context of the data in order to interpret their potential significance. I conclude with a brief reflection on the insights afforded by the interpretive analytical process of CDA into the reality of so-called enabling, participatory forms of educational governance and the salient role played by discourse in their enactment. In particular, I suggest that as advanced liberal democracy moves towards greater emphasis on “reflexive, participatory” governance and “active, responsible” citizenship, critical language awareness is vital for the defense of democratic freedoms and the promotion of alternative visions for education.

Critical Discourse Analysis as Interpretive Method in Educational Research

CDA is an approach to social scientific research that brings a detailed account of the role of language (and other forms of semiosis) in social life. In particular it offers a dialectical theory of discourse that recognizes its socially constitutive potential

without reducing social practices (and their analysis) to “mere signification.” Combining detailed textual analysis with theoretically informed accounts of the phenomena under investigation, CDA identifies the processes by which particular ways of using language (re)produce social practices and help privilege certain ways of doing, thinking, and being over others. The approach has its origins in Linguistics, although unlike some branches of the discipline, it is not a discrete discipline with a relatively fixed set of methods. Instead it is best seen as a problem-oriented interdisciplinary research movement that includes a variety of approaches, theoretical models, and research agendas (for recent overviews, see Fairclough et al. 2011; in education Rogers et al. 2005). What unites them is, broadly, a shared interest in the semiotic dimensions of power, injustice, abuse, and social change. The way I engage with CDA is mainly influenced by Fairclough’s discourse–dialectical, critical realist approach (2003, 2005; Fairclough et al. 2002) and shares with it a research interest in investigating the impact of broad processes of social and political change (here characterized in relation to advanced liberalism). Other approaches to CDA have developed in different theoretical and methodological directions depending on the foci of research. The variability in theory and method in fact stems from some important theoretical principles and ontological assumptions underpinning CDA. I begin by outlining these, as well as the analytical concepts this gives rise to, and discuss the interpretive and methodological implications for educational and other areas of social scientific research.

The Dialectics of Discourse

A key theoretical starting point for CDA is the dynamic and mutually constitutive relationship between discourse and other nondiscursive elements that comprises any object of social research. It is this dialectical approach which leads CDA to engage explicitly with social scientific theory, since it seeks to correlate its close textual analyses with a view of social practice as something which people actively produce on the basis of shared norms of behavior that are partly constituted in language. Further, it seeks to interpret these practices in relation to the formation and transformation of social structures, thus making one of its research objectives the investigation of social change. In short, CDA seeks to explore the “ways in which discourse ‘(re)constructs’ social life in processes of social change” (Fairclough 2005, p. 76). A useful way to conceptualize the relationship between the discursive and nondiscursive is Harvey’s (1996) framework in which he posits six “moments” of social processes. An ontological distinction between different elements of the social world, the term “moment” is deliberately chosen to reflect their transient and contingent nature. Briefly, these moments are (1) beliefs/values/desires (our epistemology, ontology, and sense of self), (2) institutions (ways of formally organizing political and social relations on a more or less durable basis; e.g., education, religion, politics, the military, etc.), (3) material practices (the physical and built environment), (4) social relations, (5) power (internalizing

all other moments since it is a function of them), and (6) discourse.² Each of these moments has distinct properties; therefore researching them gives rise to distinctive academic disciplines. One thing that marks out CDA from other research traditions in Linguistics is its commitment to dialogue with other disciplines³ in order to understand the *relationship between* discourse and these other dimensions of social life.

Discourse is a crosscutting dimension in so far as it internalizes all other moments including values, beliefs, desires, and institutionalized ways of doing and being. The discourse moment is at its most potent as a mechanism of sociocultural reproduction when it is the most invisible and naturalized. Critically analyzing (here, policy) discourse therefore means highlighting the inconsistencies, assumptions, vested interests, values, and beliefs that sustain the relations of power it internalizes. CDA offers the analytical apparatus to do this, illuminating how different (representations and enactments of) moments of the social are textured into discourse. This “porous,” hybridizing quality of discourse (in CDA terms its “interdiscursivity”) is the conduit that allows the slippage of values, norms, practices, and power relations between different domains of social practice (e.g., from business management to education).

Key Concepts in CDA

In the previous section, we observed how the discourse moment internalizes all other moments, hence the ideological and material significance of language and why we should analyze it. Equally, because of its socially constitutive and constituted nature, it is possible and necessary to identify different levels of analytical abstraction. The analytical categories developed in CDA⁴ remind us that texts do not exist in a social vacuum but instead form part of a process through which discourse structures and enables social life. The concept of *social practices* will be familiar to many social scientists. It refers to the more or less stable, durable, *conventionalized* forms of social activity that help (re)produce our institutions and organizations.

²Here I am extrapolating from Harvey and for the sake of simplicity conflating his two-part label for this moment: “language/discourse.” The “language” aspect refers to the language system as an internally organized resource, whereas “discourse” is given a very wide definition that resembles the notion of semiosis: “the vast panoply of coded ways available to us for talking about, writing about, and representing the world.” I am using “discourse” to cover both concepts of the linguistic system and semiosis in all its forms (since the latter subsumes the former).

³Following Fairclough, this entails working in a “transdisciplinary” way incorporating where relevant the theories and methodologies of other disciplines (Fairclough 2005).

⁴The concepts I outline here are primarily associated with Fairclough’s approach to CDA (Chouliaraki and Fairclough 1999; Fairclough 2003, 2005), although other approaches are similarly committed to working at different levels of abstraction and to focussing on the socially constituted and constitutive nature of discourse in its historical context.

In Fairclough's terms (2003), they mediate the possible (social structures) and the actual (social events). For example, the field of school education comprises a range of different practices like classroom teaching, assessment, professional training, financial management, policy making, curriculum and material design, and so on. Each has a discursive dimension and is partly characterized by its distinctive set of *discourse practices*. Taken together, these form the *order of discourse* of that social field or institution. These discourse practices essentially provide the conventionalized (but mutable and contestable) resources for doing, thinking, and being in a manner appropriate to participation in a particular institution or organisation. For this reason, socialization and explicit training in a particular social practice (e.g., teaching) involve learning particular ways of using language. Discourse practices can therefore be analyzed along three main dimensions: *genres* (ways of acting and interacting), *discourses*⁵ (ways of talking and thinking about the world from a particular perspective), and *styles* (ways of being or self-identifying). Different orders of discourse are characterized by their distinctive configuration of genres, discourses, and styles. Given that these are never entirely fixed, understanding change over time is about understanding changes in this configuration. More concretely discourse practices (made up of genres, discourses, and styles) are instantiated in particular *texts* (spoken or written language or other forms of semiosis).

A given text may be simultaneously analyzed in terms of genres, discourses, and styles. For example, a primary school lesson may exhibit a broadly "child-centered" educational philosophy through (1) a lesson structure that begins by presenting pupils with a problem to solve and provides the interactional space for them to do this (e.g., through group work) (*genre*), (2) explicitly representing the lesson as a discovery process in which the pupils will be "in the driving seat" (*discourse*), and (3) a less didactic, more informal style of teaching (*style*).⁶ This kind of analysis highlights the distinctive mix of genres, discourses, and styles in a given text, or its *interdiscursivity*. This important analytical concept allows us to capture the "porous" nature of discourse through which it incorporates diverse elements of its wider social context and therefore to investigate the role of discursive change in driving social change (Fairclough 2003, 2005). For example, a widely documented feature of recent change in the UK education system has been the increasing influence of market-oriented managerial practices and values. This phenomenon can be investigated through the lens of discourse by examining the interdiscursive links between these two fields and asking to what extent managerialism is enacted through new genres (appraisal, audit, league tables), articulated through particular discourses (leadership, excellence, accountability), and inculcated through

⁵Thus a distinction is made here between "discourse" as an ontological category in the general sense of language in use (and other forms of semiosis like visual images, symbols, gesture, etc.) and "discourse(s)" as an analytical category to identify the way in which language is used to talk about particular topics from a particular point of view. For example, we might distinguish between Republican and Democrat discourses on health-care provision in terms of how this policy problem is differently constructed depending on competing ideological perspectives.

⁶For an illustrative analysis of a political document using these three categories, see Farrelly (2010).

particular styles (manifest in the adjectives teachers feel obliged to use about themselves when completing their annual professional development review). We can equally examine the interdiscursive mix within a single text, exploring its hybrid mix of other genres, discourses, and styles. Interdiscursivity is an inherent feature of all discourse; in Bakhtin’s (1981) terms, texts are always “dialogical” containing traces of other texts. For this very reason, the discursive “import” of (competing) values, ideologies, and beliefs from other social fields may be readily accomplished, be routinized, and ultimately come to be accepted as common sense. Interdiscursive analysis allows us to render explicit these textual processes of “normalization” and to trace the sociocultural trajectories of the ideas and values contained in discourse practices. Our reasons for doing this may be explanatory (in order to explain social change or the persistence of certain practices) or normative (in order to question the (ethical) acceptability of the practices examined). In this sense, CDA can contribute a focus on discourse to normative or explanatory critical social science (see Fairclough and Fairclough 2012a).

Interpretive Methodology

CDA typically begins by looking at the social world in order to identify a particular topic or problem to investigate—we might call this “*stage 1*” (e.g., gendered patterns of participation in the primary classroom; the dominance of market competition in the organization of state education; the role of social class in educational attainment; the construction of cultural diversity in teaching materials; the increasing salience of “entrepreneurialism” in teachers’ professional identities; etc.). Next (“*stage 2*”) it draws on dialogue with other disciplines and theories that address the issue under investigation, incorporating their theories and methods as appropriate in order to (a) theoretically construct the object of research (Bourdieu and Wacquant 1992) and (b) develop a model for analyzing it. The methodology, and the particular forms of detailed textual analysis, will vary from one research project to another depending on the object(s) of research. For example, analysis of political discourse in general will logically (though not exclusively) entail a particular emphasis on argumentation (Fairclough and Fairclough 2012a). Thus having selected an object of research, the methodological procedure then involves identifying further discourse analytical concepts (like argumentation, transitivity, modality, metaphor, etc.) likely to support a critical exploration of the research object(s). In keeping with the dialectical–relational ontology underpinning CDA, its methodology is reflexive and abductive, continually moving back and forth between theory, method, and data in order to achieve “explanatory adequacy” in the research process. In this way the findings from the empirical analysis of text are set in dialogue with and interpreted in relation to (a theoretically informed understanding of) their social context. Part of this process involves making practical decisions about the validity and viability of the research design, as in the case study discussed below.

Case Study: Towards Neoliberalism in UK Education Policy

The following case study illustrates one way of working with the interpretive approach associated with CDA. The findings selected for discussion here focus on the New Labour government (1997–2005) but stem from a larger study exploring historical change in the representation and legitimation of the social relations of UK educational governance (Mulderrig 2009). The overall project used a corpus-based critical discourse approach to analyze education policy texts dating from the Heath government of 1972 to that of Blair in 2005, theoretically contextualizing the data with the aid of a neo-Marxist state theoretical account of the coevolution of the UK state and its regime of economic growth during this period (Hay 1996, 1999; Jessop 1999, 2002) and educational sociology to position the findings within this specific area of social policy (Dale 1989; Tomlinson 2001; Trowler 2003).

The Position of the Researcher

The motivation for this project (and the identification of the research problem) stemmed from quite personal judgments about the changing face (and language) of UK politics shaped by my own past experiences. Having spent several years abroad, I returned to Britain in 1998 to find Tony Blair at the head of the government and seemingly omnipresent in the media. I was struck by his charismatic style, which seemed to me so polished it actually drew attention to the rhetorical manipulation involved in political rule. When I later came to embark on a PhD, my aim was to try to place the “Blair phenomenon” in its wider political context by exploring the escalating use of promotional techniques used by the New Labour government in “selling” politics and policy. Returning to a long-held interest in education, my particular concern lay with the political discourse of education. I initially approached this problem, following Fairclough (1992a), through the concept of “marketization,” whereby the practices and content of education (or any other extra-economic social practice) are progressively reshaped according to (or colonized by) the practices and principles of the market and its institutions. The goal of my research would be to try to explain, through the lens of language, how this had come about. Thus having identified the social problem (“*stage 1*”), I attempted to construct a theoretical framework with which to explore this question. In the course of doing this, my research question became more defined around the concept of governance. In order to explain why marketization happens at all, one must first have an understanding of the significant role of the economy in shaping the social world. I thus arrived at a political economic understanding of the social phenomenon I wished to investigate, which took shape as the interdisciplinary framework for this case study. In turn, this shaped my understanding of the discourse practice I wished to investigate and the historical conditions of its development. Moreover, this critical inquiry into the wider context of political

discourse and its conditions, causes, and consequences refocused my line of inquiry into matters of power and legitimacy in the art of governing and the negotiation of change over time. As Rose (1999) observes, a crucial element in this is the discursive enactment of governmental identity. Thus, through social theoretical inquiry, I returned full circle to the question of self-presentation in political discourse. This time, however, my exploration of the discourse was shaped by an understanding of the historical conditions of its production. A study of historical change in government self-presentational style could now be understood in its sociopolitical context as an investigation of changes in the practice of governing. This logically suggested the textual analysis of policy discourse, which is a historically constant mechanism of educational governance through which educational leadership at a national level is enacted and legitimated. Thus my own *interpretation* informed the research at every stage: from initial perceptions about the political landscape, selection of the object of research, and its theoretical construction and refinement to the selection of data and methods and the use of political economic theory in order to historically contextualize and interpret the significance of the findings. I outline this (theoretically informed) understanding of the historical context in the next section.

The Political Economic Context

The historical context of the data examined in this study was a turbulent period of political and economic change as Britain, like other liberal western economies, instituted a range of state-restructuring strategies that enabled the progressive dominance of neoliberal, market-valORIZING principles in the exercise of state power. Key symptoms of this were progressive privatization and marketization of public services alongside labor market flexibilization and welfare retrenchment. In education, this entailed a reconfiguration in the balance and loci of power, progressively removing it from the middle tier (LEAs)⁷ and increasing it at the top (nationally imposed curricular and assessment regimes; government audits of individual and institutional performance) and at the bottom (creating a differentiated market among quasi-autonomous state schools).⁸ These interventions in the social practices of education necessarily ran alongside discursive change. As Dale (1989) has it, this period saw a change in the “vocabularies of motives”—the discourses that articulate the goals and values of education—redefining the nature and purposes of education.⁹ Thus the restructuring of UK state education was

⁷Local education authorities (the branch of local government traditionally responsible for overseeing the content and structure of state schooling).

⁸See West and Pennell (2002).

⁹See Mulderrig (2008) for an empirical study of this change in the “vocabularies of motives” in state education during the Thatcher, Major, and Blair governments (1979–2005).

in part enacted through a change in the orders of discourse of education. New genres emerged like Ofsted¹⁰ reports, league tables, and performance reviews; new discourses of accountability, competitiveness, and targets; and new entrepreneurial and competitive styles of participating in education for teachers, pupils, and parents alike (see Mulderrig 2003). This discursive restructuring was in part instituted and legitimated through policy discourse, a discursive barometer of the changing goals and values of educational governance. Thus, reflecting a progressive alignment between education and economic policy goals, from the early 1990s an insistent call to competitiveness became one of the key drivers underpinning education policy in the race to create a globally successful “knowledge economy” (Mulderrig 2008).

The focus of the proceeding discussion is the New Labour government, under which it is argued the neoliberal trajectory in education policy gained particular momentum. As observed at the outset of this chapter, at the heart of this is the assumption that education can and should be a key vehicle for productive social policy, linking economic competitiveness with an entrepreneurial and lifelong learning model of active citizenship. This core premise is reflected in the following extract: “the wealth of nations and success of individuals depend upon the imagination, creativity, skills and talents of all our people” (Department for Education and Skills 2005, p. 2). It assigns each citizen responsibility not just for her own but for the nation’s prosperity. By linking together in equal grammatical weighting national economic goals with individual well-being, it draws a relation of equivalence between the two. It also illustrates the centripetal movement of power in contemporary governance towards an “enabling” model in which the individual assumes greater levels of responsibility for their own welfare and economic prosperity, while the government assumes a more managerial and devolved form of power. I have elsewhere argued (Mulderrig 2011b) that this model of governance can be linked to the general idea of “soft power” in which political power becomes much less about coercion and much more about providing *incentives* and structural *opportunities* for others to act (Courpasson 2000; Nye 2004). This is a hegemonic form of power, attempting to secure consent for decisions rather than enforcing them. Drawing evidence from a corpus of New Labour policy discourse, I argue that such political “powers of attraction” rest heavily on a highly distinctive set of discursive strategies. Moreover I suggest that by emphasizing the importance of individual participation, this form of power also dilutes responsibility for government decisions, shielding it from criticism. Any renegotiation of power entails new roles, relations, and responsibilities for the actors involved (both individual and institutional). In the analytical terms outlined above, the power shift suggested by an “enabling” model of governance means new discursive ways of being (styles), doing/relating (genres), and thinking (discourses). The primary focus of the analysis is therefore on the way in which the government represents its own acts of governing, the institutional identity this entails, and the (power) relations this constructs.

¹⁰“Ofsted” is the abbreviation for the Office for Standards in Education. It is the government body responsible for carrying out regular inspections of schools in the UK.

Questions, Data, Methods, and Dilemmas

As explained above, the object of research in this study was progressively defined through dialogue with political economic theory. In general terms, this was a historical investigation of the (re)negotiation (through policy discourse) of power relations between state and citizen entailed by the emergence of a broadly neoliberal model of educational governance in the UK (alongside other advanced liberal economies; Peck 2001; Thrift 1997). An explanatory critique seeks to describe and understand both the significance and success of these postulated changes in their discursive dimension. Thus having identified and theoretically positioned the object (s) of research, it is necessary to formulate a set of linguistic questions through which to guide the analysis. Here again there are *methodological and practical dilemmas* posed for the researcher: What kind of and how much data will be appropriate? How do you decide which aspects of it to explore? What linguistic analytical tools will be appropriate? How do you know that your chosen focus for textual analysis isn’t biased? Some of these issues can be addressed through careful methodological decisions relating to the handling of the data (e.g., triangulation), while others call for a reflexive acknowledgement of the researcher’s interpretive role. In this study, the principal question about power and identity in educational governance was formulated in terms of the following linguistic questions:

1. Who are the prominent actors in education policy?
2. How and to what extent do grammatical patterns construct for these actors distinctive roles, relations, and differing degrees of agency?
3. Do these patterns change over time?

In this study, the decision was made to use a sociologically grounded model of textual analysis, “systemic functional grammar”¹¹ (Halliday 1994) to examine patterns of reference (construing actors and actions), agency (control over actions), and modality (commitment to propositions). The study also used Van Leeuwen’s sociosemantic model for analyzing social action (1995). In order to trace historical change, a large body of data was required. Thus all education policy documents¹²

¹¹The use of systemic functional grammar has been strongly associated with Fairclough’s work in the field (especially his earlier work, e.g., 1992b, 2003). However, as he himself points out (2005), there are no necessary ties between SFL and CDA—the decision to use it in this study was because it is particularly useful for the analysis of transitivity and agency, which were the primary focus of interest here. Other approaches draw variously on text linguistics, schema theory, pragma-dialectics, and argumentation theory (Reisigl and Wodak 2009; van Dijk 2008; Fairclough and Fairclough 2012a).

¹²Those dealing with the content and organization of schooling in England and Wales; Scotland was not included as it has a separate education system. Some policy documents not fitting the content selection criteria were also omitted (e.g., those dealing with special educational needs in nonmainstream schools or those proposing a program of repairs for school buildings). While the entire corpus contains 17 policy documents, the New Labour section contains five documents: “Excellence in Schools” (1997), “Opportunity for All in a World of Change” (2001), “Schools Achieving Success” (2001), “Twenty-First Century Skills: Realising Our Potential” (2003) and “14–19 Education and Skills” (2005). In addition to these documents the following were also consulted in a follow-up study: “Higher Standards, Better Schools for All: More choice for parents and pupils” (2005) and “Further Education: Raising Skills, Improving Life Chances” (2006).

issued during the relevant time period (1972–2005) were collected in a digital corpus of around 0.5 million words. The decision to analyze every document in this historically constant genre had the advantage of representativeness but generated yet further *methodological dilemmas*: how to handle such a large data set? The decision was made to incorporate these textual analytical methods with corpus linguistics, a computer-based method for analyzing large bodies of textual data.¹³ Its incorporation in CDA has been a relatively recent development.¹⁴ One advantage this combined approach brings is a relatively systematic and readily replicable approach to CDA. There is also a heuristic value to this combined approach in directing the analyst's gaze in unexpected and often fruitful directions. Combining this essentially quantitative approach with the qualitative methods typically associated with CDA also, however, throws up further practical and theoretical problems.

Corpus linguistics involves using “concordancing” software (here “WordSmith” by Scott 1997) designed to perform a range of searches for various textual patterns. This software was used to search the entire corpus and its subsections and to compare against a reference corpus.¹⁵ Most corpus software tools offer the same basic functions: “keywords” (list of the most unusually frequent words in your corpus—ranked by “keyness”—compared with a reference corpus), concordances (every instance of a particular search word with its co-text), and collocate information (those words frequently co-occurring with that search word, including the statistical significance of the pairings). These search functions can serve as a useful entry point into the data, providing a principled and automated means of narrowing the analytical focus and reducing the corpus to a more manageable size. In short, they provide an “automated gaze” on the data (though not a neutral one), highlighting particular sections of it for more detailed analysis. However, there are important limitations to this procedure. Narrowing the focus of analysis in this way inevitably means that other potentially significant elements of the texts may be entirely overlooked. It is also important to remember that corpus tools present the data to the analyst in the form of short extracts removed from their context, thereby

¹³For a very accessible guide to using corpus linguistics in research and teaching, see Hunston (2002).

¹⁴For example, Mautner 2005; applied to educational research, Mulderrig 2003; 2008, 2009, 2011a, b, 2012.

¹⁵The LOB and FLOB corpora, respectively, comprise a cross section of British English texts from the 1960s and the 1990s. Each contains one million words and comprises a range of texts from informative and imaginative fiction (press, general prose, learned writing, and fiction). There exists a range of free-to-access specialist and general corpora in a range of language varieties. A general distinction is made between “stand-alone” and “in-built” corpora. The latter come with their own concordancing facilities (e.g., Mark Davies' online facility providing access to and facilities for searching and cross-comparing the BNC, COCA (Corpus of Contemporary American English), and a corpus of *Time* magazine; available to registered users at <http://corpus.byu>). Stand-alone corpora, by comparison, must be accessed using a separate concordancer like WordSmith or the slightly simpler but free-to-access “AntConc” <http://antconc.com>. These are useful when comparing your own corpus with a reference corpus (since the same concordancer can be used to cross-compare the two data sets).

inevitably making retrieval of all relevant discursal and contextual information virtually impossible. Any analysis of these findings must therefore be seen as a partially informed interpretation of the data.

The Corpus-Based Procedure

In the first stages of the analysis, I ran concordance searches for the most prominent (in terms of “keyness”) forms of actor representation used in the corpus (*school(s)*, *we*, and *government*).¹⁶ I then used functional grammar (Halliday 1994) to code each instance according to the type of action it performs.¹⁷ This first stage of the analysis displayed a marked trend in the New Labour section of the corpus: the government itself becomes by far the most prominent actor in the corpus and undergoes a marked shift in the way it is represented towards an increasingly personalized identity. It is this trend which I discuss in the next section.

Proximization¹⁸

As an institutional entity, the government can refer to itself with either the third person (*the government*) or the first (*we*). The former makes a clear separation of the government from the governed; the latter does not. As Wilson (1990, p. 62) puts it, “indicating self-reference by means other than *I* or *we* is said to represent a distancing strategy on the part of the speaker, because the choice of pronoun indicates how close-distant the speaker is to the topic under discussion, or the participants involved in the discussion.” We might thus characterize the use of first-person reference in policy discourse as a “proximization” strategy, drawing the public closer to and apparently involving them in the policy-making process.

¹⁶These are the only actors that regularly rank within the top 5 keywords (in the case of *schools*, this is consistent throughout the whole corpus; in the case of *government/we*, the distribution across the corpus is significantly skewed). For an analysis of how other actors (*pupils*, *teachers*, *young people*) are represented, see Mulderrig (2003).

¹⁷Using Halliday’s functional grammar, we can classify the elements of a clause according to its participants, processes, and circumstances. Generally realized as verbs, processes are subdivided into subtypes, which map onto the three main realms of human activity: doing, being, and sensing. Thus, they can be categorized as material, existential, relational, verbal, mental, or behavioral. The representation of the government’s actions in the data is in fact frequently very complex, abstract, and metaphorical. The analysis process itself therefore fed back into the development of descriptive tools, with additional models of description overlaid onto the analysis as it progressed. Functional grammar by no means offered an unproblematic means of classifying the data; in fact failing to find an adequate grammatical model for parts of the data, I devised a new sociosemantic category I call “managing actions” (see Mulderrig 2011b).

¹⁸For a more detailed account of this trend, see Mulderrig (2012).

Fig. 1 Textual prominence of the government

One of the most striking findings in the whole corpus was a shift from third- to first-person reference under New Labour, where the pronoun *we* eventually displaces the term *government* almost entirely.¹⁹ This is illustrated in the following graph depicting the use of these two terms over the entire corpus (New Labour begins at point 13 on the graph) (Fig. 1).

The graph clearly indicates a dramatic surge in the overall textual prominence of the government (taking both forms of reference together), almost doubling the figure for the preceding period, with an average figure of 1.34 % compared with 0.74 % under Major. As shown in the graph, the use of the pronoun *we* in New Labour is not entirely without precedent, although its use is negligible until Thatcher where it is used in a limited and fairly inconsistent way. This is in fact quite surprising, given that *we* is acknowledged to be an important rhetorical resource in politics and its strategic use by Thatcher herself in speeches and interviews is well documented (Fairclough 1989; Wilson 1990). It has been shown that the increasing use of the pronoun *we*, alongside other discursive strategies, is part of a general trend in recent decades towards the “personalization” of public discourse,²⁰ removing explicit textual markers of power asymmetries in favor of a more inclusive and collective style. Sometimes referred to as “corporate we” the phenomenon is usually thought to have originated in the world of commerce, where the success of businesses may rest on their ability to project the right corporate identity to the public.

Despite its increasing salience in public discourse more generally, the findings clearly indicate that this pronoun plays a key role in constructing a distinctively different mode of self-identification (style) for the New Labour government (and its successors)²¹ from that of preceding governments. In the realm of politics, it has

¹⁹Under New Labour, the pronoun moves to a higher ranking (2) among the keywords than even *the government* had occupied in the preceding data. It should be noted that it is very unusual for a common grammatical item like a pronoun to attain a high keyness rating in a non-spoken corpus. Under New Labour, it is second only to the word *skills*.

²⁰Fairclough 1992b; Pearce 2005; Petersoo 2007.

²¹Preliminary findings from a search of four education policy documents issued subsequently under Brown (Labour government to 2010; three policy documents) and then Cameron (current Coalition government; one document) suggest that this trend, introduced under Blair, continues in this genre.

particular significance; by collapsing the distinction between the government and the people, this mode of representation draws citizens into the very processes of governing, thus implicating them in policy decisions. When adverts or commercial organizations adopt this “personalized” collective identity, the effect is not the same. It may generate greater affinity and identification with the brand or company in question (as it is doubtless intended to), but it does not draw us into the governance processes of that organization. In New Labour discourse, the pronoun *we* may have been favored over *the government*, with its inherent marking of authority, in order to create a discourse style more consonant with its claims to participatory democracy. Moreover, this pronoun plays a strategic role in the legitimization of New Labour policy decisions. It does so by systematically exploiting the semantic complexity of this pronoun (explained below). Therefore interpreting the rhetorical and sociological significance of *we* in this study involved reference to both its distinctive linguistic properties and the wider political and cultural context in which it is used and with which it is likely to resonate.

Deixis and the Meanings of We

The pronoun *we* belongs to a closed class of deictic expressions like *I, you, here, yesterday* whose meaning is not encoded intrinsically but instead depends on the context of utterance in order to “anchor” the meaning. The meanings of deictic items are anchored in terms of their relative proximity to or distance from the “deictic center.” The default or “unmarked” center is that of the speaker or writer (I) and the time (now) and place (here) of utterance. Deictic choices always entail a particular demarcation of participatory boundaries in the “discourse world” created in texts and of speakers’ and hearers’ relative positions to the events described and their involvement with them. In political discourse, roles and responsibilities are negotiated in part through the deictic system (Chilton 2004). Central to this process is the pronoun *we* which can both *include* and *exclude* participants from the deictic center. Most analyses capture this duality by drawing a distinction between “inclusive” forms whose reference includes the addressees (“we the nation”) and “exclusive” forms where it does not (“we the government”). Where inclusive forms are used in policy documents, “*we the public*” thus acquire a presence in the discourse world of policy making and its arena of accountability. Deciding which form is intended is frequently a tricky matter of context-dependent interpretation. Significantly, policy texts are widely recontextualized (Fairclough and Wodak 2008) and “repackaged” for diverse audiences, making the retrieval of such context-dependent meaning quite problematic. However, this can also be a strategic rhetorical resource. Grundy (2008, p. 28) cites this example from Salman Rushdie’s written apology for the distress caused by his “Satanic Verses,” issued after an Iranian fatwa on him had been pronounced: “living as *we* do in a world of so many faiths,

this experience has served to remind *us* that *we* must all be conscious of the sensibilities of others.” If we interpret *we* “exclusively” this statement appears more apologetic; it is more accusatory if *we* is taken to be “inclusive” and more neutral if its reference is left ambiguous. This kind of deictic vagueness is in fact exploited quite systematically in New Labour policy discourse. For this reason, I identify a third category of “ambivalent” *we* in order to assign full weight to the rhetorical significance of this “strategic vagueness.”

In the corpus *we* can variously refer to “the government,” “the nation,” “citizens of the world,” “England and Wales,” “businesses,” “the partners of government” or “those people concerned about education.” I therefore coded each instance of *we* as inclusive (I), exclusive (E), or ambivalent (?)²² and then analyzed their clausal environments throughout the data.

Functional Distribution of We

The New Labour government makes strategic use of the referential ambivalence of this pronoun to merge its identity with that of the people, thereby blurring responsibility for more contentious claims and implicating us all in the legitimization of policy by assuming, rather than building, consensus. It does this by systematically texturing the different forms of *we* with distinctive speech acts (in square brackets) and forms of propositional content and modality (underlined), as illustrated in the concordance extract below (Fig. 2).

This extract illustrates a widespread pattern in the corpus whereby there is a systematic correlation between exclusive *we* and boasts about the government’s

[Promise] Challenge and How [E] We Will Meet It. Skills for Employers, [Assertion] skilled, qualified people[?] We will not achieve a fairer, [Assertion] re inclusive society if [?] we fail to narrow the gap between the [Exhortation] term. To achieve that [?] we need to act in five key areas [Evaluation] where it is vital that [?] we identify best practice and share [Evaluation] our experiences. [I] We all know that skills [Evaluation] that skills matter. But [I] we also know that as a nation we do [Evaluation] know that as a nation [I] we do not invest as much in skills as [Evaluation] as much in skills as [I] we should. Compared with other [Comparison] with other countries [I] we perform strongly in some areas [Assertion] er education. But [I] we have major shortfalls in [Assertion] consumer demands [E] We are under no illusion about [Assertion] their contribution [?] we can make much faster progress [Exhortation] shared objective. [?] We must put employers’ needs [Exhortation] to those needs [?] We must raise ambition in the demand

²²See Mulderrig (2012) for a detailed account of how each instance of *we* was categorized.

achievements or its future intentions. Secondly, inclusive *we* is regularly textured with evaluative statements comparing the relative achievements of different actors or nations. Finally claims about the imperatives arising from economic globalization (usually realized through modalized forms) regularly collocate with cases of ambivalent *we*, so as to obscure responsibility for the claims made.

Exclusive We: Towards Managerial Governance

Instances of exclusive *we* were by far the most numerous (totaling 83 % of the 2,421 instances of *we* in the New Labour data).²³ The verbal collocates of exclusive *we* are variously past tense actions and present descriptions typically functioning as boasts (*we have already made it easy to become an academy; we have put in place major reform programs; we are on track with our reform of schools*) and irrealis,²⁴ often hedged (underlined), statements functioning as promises about future policy action (*we want to create a spectrum along which schools have the freedom to develop further*). Wilson (1990) observes that it is much safer in politics to use explicitly exclusive pronouns with future claims because such irrealis forms don't yet exist and are thus less vulnerable to attack. As we have seen under New Labour, there is a marked shift towards this more personalized and inclusive governmental self-representational *style*. Analysis of the verbal collocates of exclusive *we* also reveals a change at the level of *genre* in the actions and roles (and power relations) it constructs for itself and others. Mental and verbal processes like *consider, believe, evaluate* and *consult, discuss, ask* are a characteristic feature of the genre of policy documents because of their inherent function of presenting and weighing up arguments about policy decisions. These kinds of actions were the most frequent in the preceding governments. Under New Labour, however, there is a marked increase in the number of material processes of “doing” (*make, create*) which for the first time become the most numerous kind of action represented for the government. In fact many of these “material” processes represent quite abstract and somewhat vague managerial activities like providing leadership and delegating responsibilities. Stylistically this helps create a more dynamic image for the government and resembles strategies found in other public, promotional genres like advertising or the external communications of large corporations (Koller and Wodak 2008). There are two main kinds of material process through which the government constructs its management role. One type draws on building,

²³Of the remainder, 13 % were ambivalent and just 3 % inclusive.

²⁴Irrealis statements are those whose tense indicates that they have not yet happened. Hedged statements are those which are modified in such a way as to limit the speaker's commitment to it (e.g., through modality, “I would like to go” (suggests I might not), or premodifiers, “I'm not sure you'll like the movie”).

transportation, and sporting metaphors like *deliver, establish, build, pilot, carry forward, benchmark, target, drive*. A large number of examples draw on a managerial discourse in representing actions which are very vague and difficult to classify: *set challenging targets; tackle regeneration; bring the criteria for approval in line with one another; benchmark our progress*. The steadily increasing use of managerial discourse in policy is a key factor in explaining this apparent “materialization” of representational patterns under New Labour. Despite the often unrealistic nature of contingency planning and strategic calculation involved in the highest levels of management, its actions tend to be represented, typically through metaphors, as concrete, decisive, and dynamic-sounding actions, located in the here and now. This suggests that an inherent feature of the character of the manager is a self-promotional identity. In the rigors of the competitive neoliberal marketplace, survival demands a dynamic, “take no prisoners” social identity.²⁵ The second main kind of material process represents the government orchestrating in some way the actions of others. Often this is relatively direct through a particular category of verbs like *ensure, help, provide support, enable* which I call “managing actions” and which I discuss in more detail below. Overall then, exclusive *we* helps construct a dynamic identity and managerial role for the government.

Inclusive We and Shared (Neoliberal) Values

We are at an historic turning point: we now have an education system that is largely good, after eight years of investment. . . we are poised to become world class.

This extract²⁶ typifies the use of inclusive *we* in the data. It mainly occurs with (relational) processes that draw comparisons either between Britain and its international competitors or the Britain of today and that of the past. Many of these constitute an implicit or explicit evaluation (underlined) of some aspect of the education system. Examples include: *we now have an education system that is largely good; we are poised to become world class; we have the best ever generation of school leaders; we have a highly flexible labour market; we now have some first class schools; we have particular skills gaps; we perform strongly in some areas; we face new challenges at home and from international competitors*. These evaluations of Britain and its education system are frequently textured with ambivalent cases of *we* articulating concomitant policy imperatives. This rhetorical patterning thus helps construe the rationale for future policy initiatives in terms of

²⁵Note how the analytical concepts of *genre* (in this case the actions performed by the government) and **style** (the identity constructed through stylistic choices in discourse) intersect to create a dynamic picture of the role played by discourse in shaping this particular social practice; its forms of participation, identification, and interrelation.

²⁶From “Higher Standards, Better Schools for All” (2005).

the globally competitive landscape in which education now takes place. In this sense inclusive *we* helps internationalize the context of education: success is doing better than our international competitors. Viewed from the perspective of argumentation, these are the *circumstances* (premises) in which policy *goals* are being formulated. As Fairclough and Fairclough (2012b) observe, “the context of action restricts the range of actions that can be thought of and the choices that can be made.” Thus contextualizing education policy within the logic of global (economic) competitiveness makes it much easier to create a functional equivalence between economic and educational goals.

Inclusive *we* is also used in more explicit evaluative claims that help texture a set of shared values, which again serve as the rationale for the government’s policy decisions. For example: [education provides] *the skills and attitudes we need to make a success of our lives; we all know that skills matter; we all have a vested interest in their [pupils] success; as we, quite rightly, become a society that seeks an ever higher level of achievement.* Such examples construct a popular consensus on a broad set of social and economic needs. The nation, as the collective referent of inclusive *we*, is represented, through mental and relational processes (underlined), as having particular knowledge, desires, and needs in relation to education and society. Inclusive *we* thus allows the government to make privileged claims about shared attitudes and beliefs. These shared values appear to be relatively uncontroversial (who wouldn’t want success?). Indeed the rather generic and inherently unobjectionable nature of these claims is the source of their rhetorical power; virtually any policy initiative could be introduced in their name. Create consensus over the values underpinning policy, and consent over the policy may follow. Here again, in argumentation terms,²⁷ diverse *practical arguments* about what should be done (policy actions) are consistently presented as being in accordance with a set of *values* informing policy *goals*.

Ambivalent We and Policy Imperatives

Ambivalent *we* is most frequently used to represent exhortations with varying degrees of explicitness. Thus under New Labour, there is an increased tendency

²⁷See Fairclough and Fairclough 2012a, b for a detailed analytical model for investigating argumentation in discourse. Relevant concepts here are *practical arguments* (arguments about what should be done, as opposed to *theoretical arguments* about what should be the case), which end in some kind of recommended *action*. Such arguments are structured around a form of practical reasoning wherein action A is seen as the best way of allowing the agent to reach her *goals*, given the current *circumstances* and in accordance with her *values* (or those ascribed to her). In the current analysis, I see the different forms of *we* and the propositions they are textured with as contributing to the practical arguments that underpin the recommended policy *actions* proposed in policy documents. This operates in a rhetorically differentiated way, whereby “exclusive” *we* typically recommends the *actions* and “inclusive” *we* provides the *values* with which the recommended actions are aligned and/or the *circumstances* of the action.

to obfuscate social responsibility, in respect of the obligations and desires that constitute the rationale for policy proposals. In practical argumentation, the context for action is frequently seen as a problem that somehow threatens the agent's (shared) values. The proposed action is then seen as the solution to the problem (Fairclough and Fairclough 2012b). In fact a problem–solution logic is at the heart of the policy genre; its core function is to define the parameters of what is thinkable and doable in education in relation to a historically specific set of political economic circumstances and values. Further, it articulates a set of policy problems (or “challenges”) to which policy proposals are presented as the solution. We can therefore expect to find in policy discourse a problem–solution textual pattern. In the case of the New Labour data, the causal relation between policy problem and policy solution is represented as social necessity. Policies are thereby construed as meeting some form of shared need, where the (grammatical) subject of that need is the ambivalent *we*.

The necessity is of two main types: a duty to act in some way (*we must do X*) or a particular felt need (*we need X*). In both cases the government effectively acts as a spokesperson, making statements on behalf of an unspecified collective. In a similar pattern found with exclusive *we*, the former typically involve rather vague managerial actions steering others' agency: *we must ensure that all pupils have the skills and capabilities; people learn how to be creative; all schools deliver high standards*. The latter type of exhortation by contrast construes social necessity in evaluative statements like: *To carry out the agenda for raising standards in education we shall need a new form of government involvement*, or *we need an active industrial policy*. In a similar way to the examples of inclusive *we* discussed above, which assume shared values and needs, these examples also provide a causal impetus for policy decisions, presenting them as a *necessary* response to a set of imperatives:

In February the European Commission published its Action Plan on Skills [. . .]. This details particular areas where we need an additional emphasis at the European level to ensure we develop a labour force which has the necessary skills as well as the capacity to adapt and acquire new knowledge throughout their working lives.

This extract contains a clear intertextual link to a *discourse* of lifelong learning, a prominent feature of Third Way politics, in which the continuing acquisition of skills is construed as the solution to labor market insecurity. The reference of *we* here is unclear in both cases. The co-text suggests a European scale of inclusion, but whether this extends beyond governmental organizations depends on who are likely to be the agents responsible for developing the labor force. Presumably this also involves employers (particularly when we consider that the remit of this particular policy document extends beyond schooling to cover workplace training).

Textual Sequencing: Evaluation + Exhortation + Promise

The success of the strategy of “proximization” in legitimating policy rests on semantic slippage across the different types of *we*. Often this slippage works simply by juxtaposing various statements containing the different forms of *we*. This extract illustrates how the strategy can be used to legitimate a neoliberal model of citizenship through the assumption of a shared consensus:

Beyond these subjects, we[?] need to be confident that everyone leaving education is equipped to be an informed, responsible, active citizen. In an ever more complex, interdependent world, where an engaged population is crucial to the health of our society, we[E] continue to put citizenship at its heart too. And we[?] need real confidence that our schools and colleges really do give young people the skills they need for employability. (DFES 2005, 14–19 *Education and Skills*)

In the extract ambivalent *we* textures an hortatory evaluation about the role of education in socialization. The second sentence paints a picture of the global economic context for education policy in which individual responsibility is paramount. The next sentence juxtaposes this citizenship argument with an economic responsiveness discourse of education, where the emphasis is on the acquisition of skills to enhance individual employability. While not explicitly conflating them, this textual arrangement construes a close association between employability and citizenship. Significantly, where such workfarist discourse (more or less explicitly advocating “workfare” rather than “welfare” principles)²⁸ is evoked, the agency of the evaluation is absorbed in an ambivalent *we*. Throughout the Blair data, the semantic slipperiness of *we* helps construct an apparent consensus on the nature of the world we live in and the inescapable responsibilities this creates. In turn, this supposedly inexorable context of global economic competitiveness is used to preface and legitimate policy proposals made by the government. Through this rhetorical device, government policy decisions effectively become harder to criticize since their legitimacy rests on global economic forces apparently beyond the government’s control. The legitimation is implicit, triggered only by juxtaposing: “we (I) live in a changing world,” “we (?) must respond with X activity,” and “we (E) will provide the following policy solution.” Moreover, given the way this device exploits the semantics of the pronoun *we*, the political effect is that we are now all implicated in the rationalization and legitimation of policy. In this way, political consensus is assumed, not jointly produced.

²⁸Chief among the principles underlying “workfare” schemes is the desire to combat the fecklessness and structural dependency that state welfare benefits putatively create. Therefore a workfarist discourse will logically highlight the importance of (individual) *responsibility* and *active social/labor market participation*.

Managerialization²⁹

The preceding discussion illustrates how the traditional authority and control of the government has progressively given way to a more managerial form of institutional identity. This also extends to the activities represented for the government, which are increasingly concerned with controlling and monitoring the activities of an ever wider range of actors. Linguistically this is realized through a distinctive grammatical construction that allows the government to steer others' activities at a distance. I call this verbal construction "managing actions." As argued at the beginning of this chapter, the historical context of the New Labour government is one in which the postwar bureaucratic regime and its centrally regulated industrial economy had eventually given way to an emergent neoliberal model of "enabling, participatory" governance. A key figure in this new style of governing is the active citizen–consumer, empowered and responsabilized to make choices that further their own interests or those of the "community." Importantly, this requires a shift in power relations: citizens must have greater agency over their own actions; the government less direct control. We might posit that such an "autonomizing" model of democracy would be capable of absorbing potential conflict by instead offering choice, opportunity, possibility, and so forth. With greater reliance on individual volition, this form of "soft power" would seem to be less coercive and more intrinsically democratic. However, I will argue that the discursive forms this takes do not so much remove coercion as mask it in more subtle forms.

Managing Actions

As the name suggests, the term "managing actions" refers to a set of lexicogrammatical resources for getting people to do things. Typical examples are *ensure*, *require*, *expect*, *support*, and *help*. Their identification arose from an initial classification of the verbal collocates of *welthe government* using systemic grammar. However when it came to the New Labour data, an increasing number of them proved impossible to classify using SFL because they do not represent a simple relationship between agent, process, and object. Rather than the direct agent of processes, in these cases the government is the instigator or controller of others' actions. Thus there are two participants: the manager (X—here, the government) and the managed actor (Y). Some cases involve causative-type verbs like *enable* or *allow* followed by a managing action realized in various forms. However, not all examples involve causative structures or even verbs at all. For example, in some cases the managing action may be nominalized. In fact managing actions overlap with a variety of surface forms. Moreover, systemic functional grammar fails to

²⁹For a fuller account of this trend and a theoretical discussion of its relationship to the "soft power" of contemporary governance, see Mulderrig (2011b).

capture their sociological significance. Thus following Van Leeuwen’s approach (1999), I formulated a sociosemantic typology³⁰ for these actions, grouping them into three categories based on the type of managerial role they construct for the government and the kind of power relation implied between the manager and the managed. I then analyzed their distribution and function throughout the data. Thus, my typology attempts to move beyond the purely textual level in order to capture the important role of social power in the discursive representation and enactment of management. In the example *We will take powers to allow schools greater freedom to innovate*, power relations are semantically encoded in the lexical forms *allow* and *freedom*. In other cases, they are assumed, as in examples representing the government’s expectations of others, where the successful instigation of others’ actions is vested in its institutional authority. Thus, forms of managing vary in coerciveness and intersect with the power relations between the participants. It follows that these relations may in part be reproduced or transformed through the forms of management represented. For example, there is a tendency for more explicitly coercive forms of management, as encoded in the semantics of the verb (*expect*, *require*) to be textured with institutional actors whose power and influence we know to be in decline, namely, LEAs (Dale 1989; Trowler 2003). Conversely, actions which semantically encode greater freedom and/or less coercion (*enable*, *allow*, *encourage*) tend to be textured with schools, which accords with the principle of school autonomy in the creation of an educational market of “independent state schools” (Blair 2005).

The full typology is reproduced in the appendix and summarized in the table below. Examples of each type are included in brackets, along with the implied power relation involved in each case. To the extent that managerialism is becoming an increasingly significant aspect of the art of governing, these categories help provide a more detailed picture of the type of managerialism the government employs, in what domains and with what people.

Managing role	Implied power relation
Overseer (<i>ensure</i> , <i>make sure</i>)	“Without X, Y wouldn’t do it”
Leader (<i>require</i> , <i>expect</i>)	“Without X, Y wouldn’t do it”
Facilitator (<i>enable</i> , <i>help</i>)	“Without X, Y couldn’t ^a do it”

^aFor want of either opportunity or ability

In effect, these managing actions can be variously positioned along a cline of coercion. The Overseer is the most coercive role, where the manager is in control of the managed actor’s behavior, seeing it through to completion. In other words, they

³⁰It is important to note that this typology has been derived in order to characterize the findings in the data examined; it is not intended as a universally applicable context-free grammar. Thus, for instance, the specific power relations underlying the social practice examined here were factored into the analysis. It would, however, be interesting to “test” its interpretive capacity in other social contexts. Note also the typology only contains verbal collocates of *we* and *the government*. Thus other possible surface forms like nominalizations have been omitted.

encode the meaning “without X, Y wouldn’t do it.” Completion of the activity is assumed semantically. The Leader role assumes the manager’s authority to instigate others’ actions, but the future orientation encoded semantically means there is no assumption of their completion. Finally the least coercive is the Facilitator role. Here the manager’s authority over the managed actor is assumed, but completion of the action is not necessarily assumed. They encode the meaning “without X, Y couldn’t do it,” for want of either ability or permission/opportunity. Here, the coercion works by assuming the managed actor is willing to act and as such, although on the surface the least coercive, is nevertheless a particularly hegemonic formulation.

I argue that managing actions play an important role in constructing the type of “soft power” associated with an “enabling” model of governance. This works on two linguistic levels. Firstly these actions are semantically pre-evaluated; they subtly encode positive meanings like necessity and desirability (this being the most common). Such meanings carry their own persuasive power, conveying their own soft “power of attraction” and thus hortatory impetus. Secondly managing actions encode assumptions about the capacity and willingness of managed actors to carry out the represented activities. Compare the following:

- (A) *We will ensure that LEAs devolve more power to schools.*
 (B) *We will enable successful schools to expand further to become centers of excellence.*

The first example implies that the stated outcome would not happen without government intervention and has an equivalent speech act function of a command. By contrast the second example implies that schools want to do this and the government’s role is merely to facilitate. Here the equivalent speech act function is an offer. The second example assumes more willingness and so encodes less coerciveness than the first. Thus through “managing actions,” governmental power operates in a subtly hegemonic way, making assumptions about the desirability of the proposed policy actions and about the willingness of diverse educational actors to be managed.

General Findings

I used this typology to examine the use of these managing actions throughout the data. As illustrated in the table below, there is a huge surge in their use from just 9 instances under Thatcher, to 43 under Major, to 358 under Blair. By 2005 they account for 20 % of all verbal collocates³¹ of the government (Fig. 3).

³¹“Collocates” are words that co-occur. Thus the verb co-occurring with *we* or *the government* is a managing action in a fifth of all cases under New Labour.

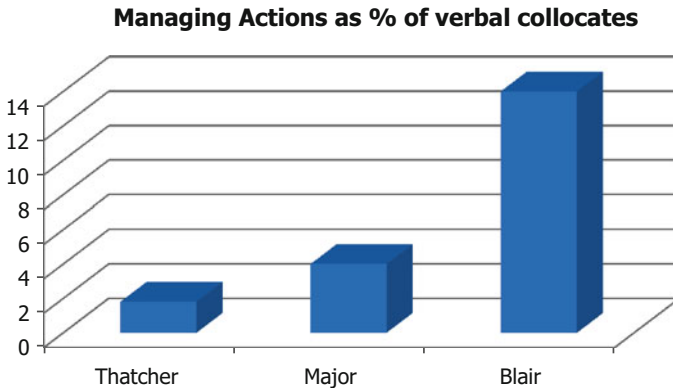

Fig. 3 The use of managing actions in policy discourse 1979–2005

Despite the New Labour government’s claims to “*offer an active, enabling government,*” it is interesting to note that this is its least prominent role in the data. Instead its most textually prominent role, and by some margin, is actually that of the traditional manager. It uses its Leader role to oversee, benchmark, and monitor others—types of activities that involve fewer freedoms for educational actors than the government makes claims to.

Blair the Overseer

The single most frequently used managing verb is *ensure*, which constructs a steering role over both economic and educational practices. It does so by guaranteeing an abstract vision of excellence and success in both spheres. In an expansive, positively affective discourse, the government offers ever-widening opportunities for improvement, access, information, and participation. The most frequently managed actors are young people who are steered into lifelong learning practices. These are construed as the keys to full participation in both work and society, underlining the central role of education (specifically skills) in New Labour’s Third Way alignment of social justice with economic participation. It is illustrated in the following extract:

We will ensure:

- *young people develop **knowledge and skills** to [take their place in society];*
- *people can obtain **the learning and skills** they need to [take on new challenges at work];*
- *learn how to be creative and enterprising to generate ideas, products and innovations*

The alignment of social justice with economic participation entails a blurring of boundaries between education and employment policy. It achieves this by merging social roles, relations, and actions from different social practices. In other words, it brings together competing ways of doing and being in such a way as to make them

appear compatible. Textually this is achieved at three levels by construing a series of relations of equivalence between different social roles, ways of doing, and ways of being. (1) Social roles: the extract construes an equivalence between (in square brackets) participation in society (their role as citizens) and participation in the labor market (their role as workers). Moreover, this relation of equivalence is emphasized through parallel textual patterning, both verbal (*take*) and nominal (*young people*) as objects of education policy and (*people*) as objects of employment policy. (2) Instrumental ways of doing: the extract brings diverse forms of activity in education and society under a single commodifying logic; the items in bold illustrate how education is reified into a product to be acquired and owned by individuals (through the verbs of possession underlined) in order to sell those educational outputs in a competitive labor market. A competing vision of education might instead see it as a process of mutual growth and empowerment. (3) Instrumental ways of being: the extract also brings the range of possible ways of being in education under a single instrumental logic oriented to particular material outcomes (in the third bullet point). The dispositions construed here typify the entrepreneurial, economically oriented discourse through which education is increasingly represented as the most direct key to economic growth. While innovation is commendable, there is a danger that the logic of entrepreneurialism will pervade education policy entirely, encouraging young people to divorce themselves from the intrinsic value of their own learning, narrowing the perceived value of education to the economic dividends it yields, and thus reinforcing a commercial “exchange-value” view of education among all those involved. This type of logic forces students to see their education as an increasingly expensive purchase and educators to see themselves as purveyors of quality-assured products. Such an arrangement discourages both from taking the kind of intellectual risks from which genuine learning and intellectual innovation can arise.

Blair the Leader: Delegating and Coordinating

In its leader role, the government is represented as institutionalizing and orchestrating joined up governance. It thus manages actors who are represented in terms of their organizational properties or functional remit. These include middle-tier governmental and nongovernmental organizations, partnerships, and other more or less abstract networks of actors (*Education Action Zones, Regional Development Agencies, Learning and Skills Council, Sector Skills Development Agency, Local Forums, Local Strategic Partnerships, and the Skills for Business Network, LEAs*). Such institutional actors are *expected, asked, and invited* to engage in predominantly semiotic middle-management activities. Under Major prominent attention was given to macro level economic goals (competitiveness), while the locus of educational power was moved towards a hollowed out model, removing powers from the middle tier (LEAs), a key pillar in the former bureaucratic governance of state education. The Blair government builds on this, elaborating a specifically

skills-based growth strategy, developing new roles, relations, and institutions of a networked or “joined up” model of governance. This extends also to LEAs who are to a degree brought back into the configuration of power and assigned new “middle manager” roles. To the extent that we can call the flows of power under Major a “hollowing out” of the state, we might therefore characterize those under Blair as “filling in.”

Blair the Facilitator: Enabling Neoliberal Change

The facilitated actors are institutions (*schools, universities, colleges*), occupationally represented actors (*learners, heads, teachers, workers, employers, parents, trainers*), or the sectorally defined *business*. The most frequent form of facilitating is *support*. While a variety of actions are managed by it, a recurrent theme is that of skills. Businesses are helped to succeed by focussing on the skills of their workforce, while learners and young people are supported in developing them, as are heads and middle managers. Thus, in what is in fact the most textually and politically prominent theme of the Blair data, the government *supports* a variety of actors to *upgrade, acquire, develop, renew* (*key, core, basic, advanced, professional, work-related*) *skills*. Meanwhile schools are helped to take on an increased range of responsibilities for securing both excellence and social inclusion. The government’s facilitation of schools is textured with both a discourse of competitive marketization and a more pastoral discourse of needs and social problems, construing a central role for schools in securing social inclusion. Thus on the one hand they will be helped to *raise the quality of teaching and learning; deliver greater flexibility; meet the needs of talented and gifted children; develop further to become centers of excellence*. While on the other hand, they will be helped to *become healthy schools* (this refers to *pressing public health problems* including smoking and drug and alcohol abuse) and *meet the needs of children with special educational needs*. Finally, *we will [P] help schools [M] deliver this [M] focused [P] support* (for *young people* who are struggling to reach, by age 14, the required standard set for them in government targets). The represented actions in this example help texture a pastoral discourse [P] with the managerial [M], so that support and social inclusion become a matter of meeting external targets, even while still at school.

Summary and Discussion

The concept of “enabling, participatory” governance, increasingly associated with advanced liberal states, logically implies greater levels of public involvement and autonomy in the relevant domain of public (and private) life. It suggests a reconfiguration of power away from the center and towards the periphery. This case

study illustrates the salient role of language in bringing about this model of governance. In particular the use of personal pronouns helps construct a more personalized, inclusive governmental identity. The devolution of power implied in the concept of “enabling” involves a dispersal of agency in the implementation of policy actions. Under New Labour this was partly enacted through grammatical innovations, implying a reconfiguration of power in educational governance towards a more devolved, managerial model. In particular *ensure* appears to be a prominent textual mechanism for coordinating increasingly complex networks of activity across larger political and social spaces. While this permits greater governing at a distance, it does not necessarily imply a weakening of power, simply a change in how it is applied, for example, by monitoring performance and emphasizing desired outcomes. Moves towards a more “participatory” democratic model (as exemplified in concepts like “the Big Society”) also require a new consensus that social life is increasingly a matter of shared responsibility between the state and its citizens. Deictic expressions like *we* potentially provide a vehicle for achieving this. Through a process of textual “proximization” we are all apparently invited into the deliberative processes of educational policy making. However, this does not necessarily entail genuine political agency. Closer scrutiny of how this pronoun is used in the data shows that its inherent semantic ambiguity is systematically exploited so as to *assume* rather than *win* consent over policy proposals, thereby legitimating de facto policy decisions and obfuscating lines of political accountability. Taken together, these two trends in New Labour discourse (“proximization” and “managerialization”) help construct a subtly hegemonic and managerial mode of governance that has all the appearances of “enabling government” and “participatory democracy” while masking the reality of limited, contingent, and unevenly distributed agency. The “soft power” of contemporary “enabling” governance relies increasingly on discourse through which we are invited to participate, deliberate, and acquire self-steering capabilities. This necessarily implies a key role for critical discourse analysis in interrogating the language through which these new relations between citizen and state are introduced, reproduced, and naturalized in society and the extent to which they afford genuine freedoms and forms of political agency.

Appendix

Typology of Managing Actions

1. Overseer

Ensure (that) – does, Make sure (that) – does

2. Leader

Require – to, Expect – to, Look to – to, Want – to, Envisage that – should, Urge – to, Encourage – to, Ask – to, Invite – to, Promote [+nominalisation meaning “the doing of X by MA”]

3. Facilitator

- (a) **Ability**
Support – (to/in doing), Help – to, Facilitate – to, Let – do, Allow – to, Enable – to, (Transform/Enhance) the capacity of – to, Make it easier (for –) to,
- (b) **Opportunity**
Free – to, Give – (greater/more) freedom(s) to, Provide/Increase/widen the opportunities for – to, Provide for – to

2.8 Moving from “Interesting Data” to a Publishable Research Article: Some Interpretive and Representational Dilemmas in a Linguistic Ethnographic Analysis of an English Literacy Lesson

Julia Snell and Adam Lefstein

I have fundamental concerns with the match of the data episode being presented with the theoretical constructs being explored, with the presentation of data collection and analysis methods, and with the contribution being offered in this draft of the article, and so I'm recommending rejection of the manuscript. However, because I value the theoretical concepts being explored in this article and because I was intrigued by the episode, I do feel some regret about rejecting.

This quotation comes from one of the four reviews received on the first draft of an article submitted to (and later published in) *Reading Research Quarterly*.¹ The article was based on linguistic ethnographic analysis of a video-recorded literacy lesson in which an English primary school teacher invoked the televised talent show *X Factor*² as a way of organizing the class to provide feedback on pupil writing. Like the reviewer, this lesson intrigued us. In particular, we were drawn to a 7-min segment in which patterns of classroom talk shifted in line with the (sometimes conflicting) demands of *X Factor* versus the traditional classroom genre

¹Lefstein and Snell (2011a). The other three reviews were much more positive.

²*X Factor* is a highly popular British television music talent show in which would-be pop stars audition in front of a panel of celebrity judges in order to demonstrate that they have what it takes to be a successful recording artist (i.e., the allusive “X Factor”). The show was originally aired in 2004 and has been exported throughout the world, including to the USA (*American Idol*), Canada (*Canadian Idol*), France (*Nouvelle Star*), Brazil (*Ídolos*), and the Arab States Emirates (*Super Star*).

of feedback on student writing. We spent a considerable amount of time analyzing this episode and also played it back and discussed it with teachers in the school. As indicated in the reviewer's comment, however, the move from "intriguing episode" to published article was by no means straightforward. In this chapter we discuss (1) the key concepts and principles we drew upon in our analysis of the episode and (2) the interpretive and representational dilemmas that we confronted as we moved from data analysis to academic argument, including:

- How to hook the focal case on some theoretical problem that would be of interest to readers without reducing the complexity of the episode to that one issue or making claims that overstep the data?
- How to justify—retrospectively—our case selection in a way that is both honest and acceptable?
- How to treat "context": How to cut up the data (i.e., when does the episode start and end)? What details guided our interpretation, and what information should we include in the published framing of the case?
- What should be the relationship between the different sources of data in the analysis—especially, ethnographic "lurking and soaking" vs. the video record?
- How to "protect" the dignity of the teachers and pupils involved, without compromising the integrity of the analysis?

Ultimately, investigation of these and related questions leads to reflection on the relationships between data and theory in linguistic ethnography, and on how academic institutions and genres impinge upon practices of interpretation and representation.

We begin by providing a brief overview of linguistic ethnography. Next we outline the research project that frames this particular case study (including research aims, fieldwork site, data collection, and analytic frameworks). We then provide further information about the focal episode and why it piqued our interest. Finally we share excerpts from our analysis of this episode, exemplifying some of the key principles of Linguistic Ethnography outlined in the next section, and then reflect on key interpretative and representational issues in the move from data analysis to the "theoretical contributions" reported in the final article.

Linguistic Ethnography

Linguistic ethnography refers to a body of research by scholars who share an orientation towards using linguistic and ethnographic approaches to address questions in a range of academic fields and professional contexts (education, psychology, anthropology, linguistics, health, and management, among others)³

³These researchers have joined the Linguistic Ethnography Forum (www.lingethnog.org/), and attended regular annual conferences, seminars, and colloquia. Set up in 2001, UKLEF now has over 400 members, around half of whom are UK based.

(Maybin and Tusting 2011, p. 515). Linguistic ethnographers combine powerful, precise linguistic procedures for describing patterns of communication with ethnographic commitments to particularity, participation, and holistic accounts of social practices (Rampton and U.K. Linguistic Ethnography Forum [UKLEF] 2004; special issue of the *Journal of Sociolinguistics*, Volume 11, Issue 5, 2007). In a sense, this synthesis constitutes a move to tie down ethnography, “pushing ethnography towards the analysis of clearly delimitable processes, increasing the amount of reported data that is open to falsification, looking to impregnate local description with analytical frameworks drawn from outside,” while simultaneously opening linguistics up, “inviting reflexive sensitivity to the processes involved in the production of linguistic claims and to the potential importance of what gets left out” (Rampton and U.K. Linguistic Ethnography Forum 2004, p. 4).

Linguistic ethnographers share a particular analytic disposition—not “method” in the sense of a set of techniques that need to be followed, but rather a more general approach to data. We summarize our own take on this approach as follows:

- *Data driven*: Viewing data as situated interaction prior to investigating it as an instance of a theoretical construct. Language and communication data are taken as the “principal point of analytic entry” (Rampton and U.K. Linguistic Ethnography Forum 2004, p. 11) into the issues researchers would like to address. For us this involves extensive immersion in classroom data, investigating interaction from multiple perspectives (e.g., teacher, different pupils) before homing in on any particular educational issue (e.g., interactional change, writing pedagogy, dialogue).
- *Rigorous eclecticism*: Drawing upon and combining analytic techniques from a variety of approaches to the study of language, communication, and society, including the ethnography of communication (Hymes 1972), Goffman’s theories of social interaction (Goffman 1974, 1983), interactional sociolinguistics (Gumperz 1982), linguistic anthropology, micro-ethnography, conversation analysis, and multimodality. In the section on “[Linguistic Ethnographic Interpretation](#)” we demonstrate how we selected a range of tools/techniques for the analysis of classroom data.
- *Openness and systematicity*: Embracing openness and adventurousness in interpretation, yet also accountability to evidence, to procedural rigor, to conceptual frames, and to competing interpretations. For us, this involves beginning with relatively free, creative (and time-consuming) interpretive brainstorming before subjecting our ideas to more disciplined, systematic investigation.⁴ This process produces much more description and data than the analyst would ever eventually want to use; and in doing so it makes room for the unpredictable, ensuring that as little as possible gets left out.
- *Attention to detail*: Aware that careful investigation of small-scale phenomena is invaluable for understanding what’s going on, linguistic ethnographers work through data slowly, attending to every detail as potentially significant (the “aesthetic of smallness and slowness”—cf. Silverman (1999)).

⁴See Lehrer (2012) for an introduction to and critique of brainstorming and Berkun (2012) for a response to Lehrer.

- *Interplay of micro, multimodal, and transcontextual analyses*: Engaging in a layered and iterative analytic process that, for us, involves (a) microanalysis—attending to the way participants build up an interactional event moment-by-moment, such that each utterance (or gesture) responds to what came before, while simultaneously setting up expectations for what can follow (i.e., the notion of sequentiality within conversation analysis, see, e.g., Heritage 1997); (b) multimodal analysis—replaying and reanalyzing the video recording without audio, in order to focus on nonverbal communicative resources such as seating arrangements, body postures, dress, gesture, gaze, and writing and, in such a way, to bring into view those pupils whose participation in the lesson was less vocal (and were thus relatively absent from the verbal transcript); and (c) transcontextual analysis, examination of textual trajectories into and out of the event, attending, for example, to texts recruited by participants (e.g., student worksheets, preceding lessons, curricular frames), and to the entextualization of the interaction in the episode as it is distilled into teacher reports, our transcripts, and so forth.

We demonstrate the key principles of a linguistic ethnographic approach in sections “Linguistic Ethnographic Interpretation” and “Constructing an Argument: Issues in Interpretation and Representation” below, but first some background information on the wider study.

The Research Project: “Towards Dialogue”

The episode investigated in this chapter is drawn from a corpus of audio- and video-recorded literacy lessons collected as part of the ESRC-funded, “Towards Dialogue: A Linguistic Ethnographic Study of Classroom Interaction and Change” project (RES-061-25-0363). The background to this study is the finding that despite multiple attempts by educational researchers (see, e.g., Burbules 1993; Nystrand et al. 1997; Wells 1999; Alexander 2005), and more recently, the UK Government (DfES 2003; QCA 2005), to promote dialogic pedagogy,⁵ classroom talk has remained relatively unchanged (Lefstein 2008; Smith et al. 2004). Teachers dominate classroom interaction, talking most of the time, controlling topics, and allocation of turns; pupils talk much less than the teacher, for shorter durations and in most cases only in response to teacher prompts. The *Towards Dialogue* project aim was to advance understanding of why this pattern of classroom interaction is so resistant to reform, and how dialogic pedagogy can be fostered and sustained.

The project employed an extended case study design (cf. Burawoy 1998) that included a professional development program intended to facilitate dialogic teaching

⁵Defined broadly as “a pedagogy that exploits the power of talk to engage and shape children’s thinking and learning, and to secure and enhance their understanding” (Alexander 2008, p. 92). For further discussion, see Lefstein (2010) and Lefstein and Snell (2011c, 2014).

of literacy in one primary school, and linguistic ethnographic study of processes of continuity and change in the wake of that intervention. The fieldsite, Abbeyford Primary,⁶ is a relatively large community primary school in East London, England. We chose to work in this area because the local authority has a long-standing interest in dialogic pedagogy and a history of developing and implementing pedagogical innovations. A senior local authority advisor recommended Abbeyford Primary on account of its highly regarded, stable, and experienced teaching staff and leadership team. Furthermore, the staff had positive experiences in a previous intervention and were keen to experiment with their practice.

Data Collection

The professional development program ran from late November 2008 until mid-July 2009 and involved biweekly workshops with seven participating teachers. Roughly half of these meetings included collaborative lesson planning, while in the remaining sessions we facilitated participating teachers’ group reflection upon video-recorded excerpts of their own classroom practice.⁷ These sessions were audio-recorded and documented in field notes. Concurrent with the professional development sessions, we visited the school two to three times a week to observe and video- and/or audio-record participating teachers’ literacy lessons and also to spend time informally observing school life. For each lesson observed we wrote detailed field notes, which, together with the video/audio data, formed the basis for discussion at weekly research team meetings. During these meetings we selected extracts for use in the reflection workshops.

We augmented our participant observation with interviews with the teachers (participating teachers were interviewed at the beginning and end of the process and some also took part in one-to-one feedback sessions), pupil learning environment surveys, and collection of artifacts (such as lesson plans, pupil writing, photos of wall displays). In summary, the data collected for this project included: 73 audio- and/or video-recorded literacy lessons, audio recording of 19 professional development workshops and 15 teacher interviews, pre- and post-surveys of 150 pupils, detailed field notes based on participant observation, and related artifacts.

Data Analysis

In order to investigate continuity and change in classroom interactional patterns, we subjected a subset of lessons to computer-assisted systematic observation.

⁶A pseudonym, as are all names of teachers and pupils used in this chapter.

⁷For more details on the professional development component of the project, see Lefstein and Snell (2011b).

We sampled ten lessons each from three participating teachers, and for each whole-class segment of these lessons, we coded discourse moves for actor, function, and pedagogic activity using the systematic observation software, *The Observer XT* (Noldus 2008). We then calculated relative durations and rates of select discourse features for each of the lessons and contrasted the distributions of these features between teachers, over time, and between pedagogic activities (for in-depth discussion of this analysis, see Snell and Lefstein 2011). A subset of 19 episodes were selected on the basis of relatively high rates of features often associated with dialogic pedagogy (such as teacher open questions and probes and pupil challenges). The video recordings and field notes for these episodes were then analyzed with regard to what aspects of classroom activity did and did not change, and conditions that facilitated the emergence of dialogic patterns. To date, eight of these episodes have been transcribed in detail and subjected to linguistic ethnographic microanalysis. These episodes were selected on the basis that they: (1) included a dense clustering of dialogic features or an interesting/anomalous discourse pattern, as identified in the systematic observation and subsequent analysis, and/or (2) highlighted particularly salient phenomena that emerged in the course of the fieldwork (e.g., importing discourse genres from outside of the school context, direct challenges to pupil and teacher positions, and radical shifts in teachers' footing in whole class discussions), and which were of interest for the professional development program. The *X Factor* episode, which forms the focus of this chapter, was one of the segments selected for detailed linguistic ethnographic analysis (the reasons for this selection are discussed in the next section).

The Focal Episode: Playing *X Factor* in a Literacy Lesson

Ms. Leigh, the teacher appearing in the focal episode, had been teaching for 11 years and also served as assistant head teacher and literacy coordinator. Over a 9-month period, we visited Ms. Leigh's classroom 13 times. Her lessons were always interesting and enjoyable and often innovative in their integration of music, visual aids, noncurricular texts, and dramatic performance with the official curriculum. Class feedback on individual pupil's written work was a relatively common activity at Abbeyford Primary, part of the routine lesson sequence used to develop pupils' writing skills. In Ms. Leigh's literacy classes, feedback was usually given in the final few minutes of the lesson, in which several pupils read out their written work and received comments. Ms. Leigh typically provided detailed individual feedback and also often gave other pupils the opportunity to evaluate the work of their peers. In most cases, this peer feedback was directed by Ms. Leigh (e.g., "Spot the interesting technique that Carl has used," "Is there anything you would change about Rachel's word choices or the style she's writing in?"). Pupils were keen to provide feedback in these situations and often offered additional advice to the pupil-writer (e.g., "Can I make a suggestion for William? Because I know in his story he goes back in time, so maybe erm once he's done the

first bit – when he goes back in time he can do that little star thing [asterisk]”). In the focal episode, however, these practices and norms were momentarily disrupted following a brief reference to popular culture.

Summary Description

This event took place in a January literacy lesson, in the middle of a unit on writing short stories about a storm. Prior to this lesson the pupils wrote first drafts of “timed stories” (written under conditions of limited time to simulate the national tests), which Ms. Leigh assessed, providing pupils with their assessment levels and targets for improvement. The pupils then redrafted their stories. In the focal lesson, they shared their targets, after which one pupil, Harry, read out loud his first draft. Ms. Leigh then announced:

We’re going to be your judges now. So we’re going to have *X Factor*. We’re going to decide marks out of ten for how much Harry has improved in the second version of his story.

Harry then read his second story out loud. Ms. Leigh projected this text on the board and instructed the pupils to discuss in pairs what they thought of the second story and the extent to which it had improved upon Harry’s first draft. These consultations last about 30 s, after which the pupils all turned to face Harry and raised their hands to display their scores (see Fig. 1 below). At this

Fig. 1 Harry surveys his marks

point, almost all eyes were on Harry, and more than half the class had their backs to Ms. Leigh who was located at the front of the room (offscreen, beyond the right edge of the picture). Harry (circled in the picture) rose out of his chair and surveys his scores, commenting enthusiastically about the nines and tens.

This was the first time Ms. Leigh had introduced *X Factor* into her classroom, and we were intrigued by pupils' immediate and positive responses to the mere mention of the televised talent show. For example, one pupil, William, raised his arms above his head in the trademark "X" sign and hummed the show's theme tune. Harry removed his jumper, readying himself for the contest. Later, when Ms. Leigh asked students to decide "How many marks out of ten do you think we should give Harry for the improvement to his story?" Harry held up both hands and projected a perfect score of 10 around the room in the manner of an *X Factor* contestant pleading with the audience for telephone votes; William responded by showing Harry a nil sign. Readers are recommended to view the video clip online at <http://vimeo.com/17810542>. A full transcript of this event can be found in Lefstein and Snell (2011a). Here we provide a brief summary of the segment that followed delivery of the pupils' scores.

Harry received feedback on his second story from six pupils, three of whom were nominated by Harry, while the others were nominated by Ms. Leigh, who also offered her own evaluative comments. Most of this discussion revolved around the question of whether the description, and in particular the quantity of descriptive words, in the first story was better than that of the second, allegedly improved story. This line of reasoning began with William, who was chosen by Harry to be the first pupil judge, even though his score of five was relatively low. William and Harry were friends, but they were also keen competitors in classroom tasks, and because they were confident, outgoing students, they were at the center of most of the classroom discussions we observed (Excerpt 1).

Excerpt 1 William's assessment and explanation

132 Harry: excuse me
 133 explain why you've only give me a five
 134 William: Because
 135 Pupils: ((laughter))
 136 ((most pupils put down their hands))
 137 William: becau:se in the first story y-
 138 you had more descriptive (.) words
 139 and you didn't ex-
 140 in the second story you didn't [explai:n the:
 141 Julie: ((to neighbouring pupil) [(xxxxxxxxxxxxx)]
 142 William: man who was changing the weather
 143 and
 144 the characters (.)
 145 a:nd
 146 in the other one-
 147 because in the first one you had (.)
 148 better descriptive words
 149 in that one you had more

Excerpt 2 Level four or five vocabulary

244 Harry: why did you give me a ten out of ten Gina
 245 Gina: well because the description was really good
 246 and (.) erm
 247 instead of using like just
 248 hot a:nd sunny
 249 you actually use- used like
 250 scalding heat blazed and
 251 it was really good description
 252 and it was very very like
 253 like it was like level four or five in vocabulary
 254 because it was really really good
 255 and erm
 256 the way you described Scarlett was really really good
 257 Ms Leigh: why
 258 what did it do for you as a reader
 259 Gina: because
 260 it makes you think (.) that she like
 261 she’s really nice and pretty
 262 and erm you-
 263 you want to: know more about her
 264 because erm like you’ve described her so well

Julie (who was caught whispering during William’s turn) was selected by Ms. Leigh to give feedback following William. She quoted William (almost) directly: “yeah like because h- the better- the first one was better because he had like more descriptive words but in that one he didn’t like describe the person who was changing the weather much” (compare with lines 137–138 and 140–142). Ms. Leigh challenged this line of criticism, first by calling on a pupil, Tamara, to comment on the *quality* of the words chosen (lines 163–202), then by highlighting some words that she felt were particularly advanced (173–185). The next pupil judge, Gina, continued this more favorable assessment of Harry’s second story (Excerpt 2).

Harry was then invited by Ms. Leigh to choose a final judge. With some resignation, he selected Callum, who was enthusiastically projecting a score of 4 in Harry’s direction (Excerpt 3).

Harry acquiesced to Callum’s criticism and demonstrated orally how he might have added more description of one of the characters (lines 315–324), but Ms. Leigh challenged the idea that more description is necessarily better, demonstrating how minimal descriptive details can provide excellent characterization without slowing down plot development (Excerpt 4).

At the end of the segment Ms. Leigh summarized the discussion by asking, “Do we all generally agree [Harry’s] story improved from yesterday?” (lines 404–405). The pupils assent, and William initiated a round of applause for Harry, who asked, “Should I bow?” (line 411).

Excerpt 3 Some “honest” feedback

283 Ms Leigh: right Harry we've had
 284 a girl and a boy
 285 so now somebody else who's given you
 286 not a ten out of ten
 287 not a five out of ten
 288 [*>come< o::n who's going to give Harry some honest feedback*
 289 [*((Callum changes from six fingers to four))*
 290 Callum: me *((moves hand in Harry's direction))*
 291 Harry: er *((looks around the room))*
 292 William: four *((points to Callum's hand))*
 293 (2)
 294 Harry: Callum go on
 295 why did you give me a four
 296 Callum: er well like
 297 you never really explained as much
 298 [as like the first one
 299 [*((Rachel and William raise their hands))*
 300 Harry: I didn't get up to there [peo:ple
 301 Callum: [yeah but you c-
 302 (2)
 303 okay
 304 you could have like done the characters
 305 like you and the Ms Leigh or whatever you were
 306 [or was you even in it
 307 Harry: [*((looks back at first version of story on his desk))*
 308 oh you mean describe the Ms Leigh [and stuff
 309 Callum: [yeah
 310 Harry: aw right yeah

Excerpt 4 Minimal detail but maximum description

326 Ms Leigh okay
 327 using that simple phrase here
 328 Scarlett her simply put up hair
 329 gives me lots of details about Scarlett
 330 because now I can see Scarlett inside my head
 331 her hair's put up
 332 so maybe she's one of these people
 333 that likes to be able to
 334 run around
 335 without having to spend lots time touching her hair and
 336 checking she looks right in the reflection
 337 you know
 338 it tells me that she's a person that's
 339 maybe clean tidy organised efficient
 340 it's simply put up but she looks quite attractive
 341 so she cares about her appearance
 342 but not enough to be vain
 343 so a simple phrase like that
 344 actually helps to give you lots of character details
 345 if you'd have said erm
 346 the teacher's placid voice
 347 it tells you straight away
 348 using the word placid
 349 that actually the teacher's nice and calm
 350 just like me hey Callum

Why Did This Episode Stand Out?

Throughout the fieldwork we selected episodes that highlighted issues related to dialogic pedagogy and/or interactional change for use in stimulating individual and group feedback discussions with the participating teachers. The lesson described above was among those selected, in the first instance as basis for a one-to-one feedback conversation with Ms. Leigh in mid-March 2009; 10 weeks later, the *X Factor* episode was discussed in a session with all seven participating teachers. We were drawn to this episode for a number of reasons. First, it represents relatively positive practice—e.g., pupils are actively engaged, authority is decentered (without loss of control), and multiple perspectives on story writing are drawn out in the discussion—yet also poses pedagogical problems from which the teachers can learn (e.g., how to shift from specific focus and feedback on one pupil’s work to general principles and insights relevant to the entire class). Second, the extract captures well a set of issues related to evaluations of pupil writing, which had repeatedly emerged in our field notes and which we wished to investigate with the teachers. Third, the episode displays significant shifts in interactional patterns, including high incidences of extended pupil utterances and pupil–pupil exchanges (i.e., those not directly mediated by the teacher). Finally, we were interested in exploring the hypothesis that importing discourse genres from outside of school (including popular cultural discourse genres) can be an effective way of changing classroom interactional norms.

Our intuition (based on participant observation) was that this episode was conspicuous as the most sustained use of popular culture in the corpus of Ms. Leigh’s lessons. Systematic review of field notes confirmed this intuition. Though it was not unusual for Ms. Leigh to refer to television shows, music, and novels (and her own personal experiences of these) in her explanations, these references were mostly fleeting. The *X Factor* episode is the only case in the corpus in which this kind of reference was built into an extended activity. As such, this episode poses a critical case for exploring issues related to interactional change in the classroom: an instance “where the concatenation of events is so idiosyncratic as to throw into sharp relief the principles underlying them” (Mitchell 1983/2006, p. 37). Linguistic ethnographers often focus on such examples, instances that highlight “creative practice” that breaks away from the status quo (Rampton and U.K. Linguistic Ethnography Forum 2004, p. 7). In the next section, we illustrate the way we used linguistic ethnographic analyses in order to uncover the processes underlying this change.⁸

⁸For a comprehensive analysis of this episode, readers are recommended to consult the original article (Lefstein and Snell 2011a).

Linguistic Ethnographic Interpretation

Our inquiry was largely inductive, grounded in data and observations, but that does not mean that we approached the data atheoretically. The overall study and research problem (concerning processes of interactional change) were framed by the concept of discourse genre. Our use of the term is inspired primarily by Bakhtin et al. (1981), (1986) and the way his concept of speech genre has been taken up in linguistic anthropology (e.g., Briggs and Bauman 1992; Hanks 1987, 1996) and linguistic ethnography (e.g., Maybin 2006; Rampton 2006). At the heart of this approach to genre is the idea that in different spheres of social activity recurring situations give rise to relatively stable ways of using language and interacting. These relatively stable ways of communicating, or “discourse genres,” serve both as resources for fashioning utterances and as constraints upon the way those utterances are understood and judged by others.⁹

Building upon research and theory in linguistic anthropology (e.g., Hanks 1996; Wortham and Rymes 2002) and an ethnographic study conducted by one of us on the enactment of the National Literacy Strategy (Lefstein 2005), we hypothesized that classroom activity is resistant to change in part because of the inherent durability of discourse genres (such as the canonical initiation–response–feedback pattern of classroom talk), which elude direct teacher control (Lefstein 2008; Rampton 2006), and further speculated that importing and adapting generic models from extracurricular contexts might be a promising strategy for instigating change. The *X Factor* episode stood out (at least in part) because it offered an opportunity to explore this idea. It’s important to note, however, that discourse genre was for us a “sensitizing concept,” “suggest[ing] directions along which to look” rather than a “definitive” concept “provid[ing] prescriptions of what to see” (Blumer 1954, p. 7; see also Rampton and U.K. Linguistic Ethnography Forum 2004). This distinction is significant because simply noticing the introduction of *X Factor* into the classroom did not constitute the end of our analysis; rather it was a springboard for further study. So, having noticed what appeared to be the “importation” and enthusiastic embrace of an extra-curricular discourse genre, we then began to think systematically about the various dimensions of this and the more conventional discourse genres employed in the classroom, and how they might be expressed in the episode. The results of this exercise are produced in Table 1, which contrasts the discourse genre of conventional classroom feedback with *X Factor* in relation to a range of social, interactional, and discursive dimensions.

The juxtaposition of the two genres demonstrates a basic structural overlap—i.e., both involve the evaluation of a performance and provision of feedback for improvement—alongside important divergences: contradictions at the level of underlying purposes, differential distribution of roles and authority, differences in the way language is used, etc. The next step in our analysis was to ask: How are the tensions between the two genres managed by participants in the interaction? How, if at all, does *X Factor* shape conventional classroom feedback, and vice versa?

Different participants were oriented to different aspects of these two genres at different times. On occasions, some participants appeared to orient simultaneously to

⁹See Lefstein and Snell (2011a) for a more detailed exposition.

Table 1 Contrasting discourse genres

	Feedback in a literacy lesson	<i>X Factor</i>
Social field	Education/schooling	Entertainment/television/music
Central task	To evaluate and improve a pupil’s written work	To evaluate and improve a contestant’s stage performance
Participants and roles	Teacher and pupils	Celebrity judges/mentors, contestants, coaches, and audience
Purposes	<i>Teacher</i> : to improve an individual piece of pupil writing, to teach the rest of the class about qualities of good writing, to produce an institutionally adequate lesson, and to categorize pupils according to national standards of achievement <i>Pupils</i> : to perform well, be accepted by peers, get through the lesson	<i>Producers/judges</i> : to produce an entertaining show (as indicated in viewer ratings, which lead to advertising revenue), to organize contestants according to their relative talent, and to promote the best performers to the next level <i>Contestants</i> : to win the show and/or launch a career in the entertainment industry
Sequential structure/stages	Will typically include the following (though not necessarily in this order): <ul style="list-style-type: none"> • discussion of targets / criteria • sharing of pupil work • judgment and/or interpretation of the work • suggestions for improvement • conclusion 	Will typically include the following (usually in this order): <ul style="list-style-type: none"> • review of contestant’s participation in competition so far (through edited clips) • contestant’s stage performance • critique of performance by judges (with some suggestions for improvement) • interview with contestant (who then has the “right-to-reply” to the judges’ comments)
Topics/themes	Issues arising from pupil written work that are salient to the official curriculum	Contestant’s performance (but this focal point often overridden by discussion of judges’ own careers, arguments between judges, etc.)
Interactional norms	Speaking dominated by the teacher, who also allocates the floor; primarily IRE/F	Speaking dominated by judges; host allocates the floor to individual judges, but judges also assume the power to self-select; lots of interruptions and overlap
Social relationships	“Emotionally flat” (Goodlad 1984). Pupils are emotionally invested in peer relations, but these are downplayed in the public spaces of lessons	Emotionally charged. There is a competitive relationship between judges, but to their own acts, judges provide support and guidance in their role as “mentor”
Language use	Polite or at least disciplined; use of standard grammatical forms	“Brutally honest” assessments of a contestants’ potential; highly emotive responses
Evaluative criteria	National curriculum attainment levels and related learning objectives, divided into word, sentence, and text levels	Does the contestant have the “X Factor”? This encompasses musical talent, personality (e.g., genuineness, likeability), and moral character (e.g., humility, niceness)

both. William (the first pupil judge) had given Harry a score of 5 out of 10 and evaluated Harry's first story as being better than the second because he claimed it had "more descriptive words" (line 138), "better descriptive words" (line 148), and overall greater explanation of character (lines 140–144). This assessment draws upon the resources of the school feedback genre: William's comments refer to specific elements of Harry's stories (e.g., line 142) and tap into shared frameworks for assessment (which highlight the importance of descriptive vocabulary). William's rather critical assessment of Harry's second story may also draw upon his experience of *X Factor*. *X Factor* contestants who appear overly confident or arrogant (an accusation that might be levied at Harry) are usually "put back in their place" by the judges' sobering comments. By adopting the critical stance of an *X Factor* judge, while also drawing upon his knowledge of the school-based genre, William is able to orient both to the classroom task of peer assessment and to his social relationship with Harry. Note also that rather than grading Harry on the improvement he made to his story through the redrafting process (as Ms. Leigh had requested), William is actually evaluating which version of the story is better. This focus on categorical judgment rather than on the process of improvement is more in keeping with *X Factor* evaluative criteria than school assessments, and it sets the tone for the following discussion. This shift in focus threatens to undermine the school ideology of continuous improvement, according to which feedback and editing necessarily lead to better writing (and better writers)—we return to this point later.

Another consequence of *X Factor* is that it carves out a space for Harry to take on some unconventional roles and assume non-pupil interactional privileges (standing up, nominating pupils, interrupting). And Harry seems to rise to the occasion, performing for the class and winning their appreciative laughter. This is tolerated by the teacher, to a point. She shifts in and out of the *X Factor* frame according to competing pedagogical goals. For example, part way through the discussion of Harry's stories (lines 239–241), Ms. Leigh is about to select the next speaker in accordance with traditional classroom discourse norms and participant roles ("Okay Callum what did you give-"), but stops herself ("oh sorry, I shouldn't do that should I") and transfers authority to the pupil-contestant Harry ("Harry, you had two more choices for people who gave you marks"), in keeping with the "*X Factor*" rules she established (it is interesting to note that the teacher does not have a legitimate participant role in *X Factor*: she is neither contestant nor judge). At the point at which she needs to discipline a pupil who is not paying attention, she shifts into conventional teacher recitation mode: "Julie, what were you going to say, because you- I could see you ((*makes whispering noise*)) on the back there." When she can see that student interest is waning (evident through pupil gaze and body positioning), she shifts back to *X Factor* and takes it up a gear: "Come on, who's going to give Harry some *honest* feedback?" These changes mark a shift in footing (Goffman 1981), that is, "a change in the alignment we take up to ourselves and the others present as expressed in the way we manage the production and reception of an utterance" (1981, p. 128).¹⁰

¹⁰Students were also able to instigate a change in footing, though in practice only certain students (i.e., those who were often at the center of classroom discussion) took advantage of this opportunity).

In addition to using the linguistic anthropological concept of discourse genre, we also drew upon conversation analysis, multimodality, and the notion of indexicality (i.e., the social meanings that language can evoke) in our analyses. All three can be seen at work in an interpretation of Excerpt 3.¹¹

Beginning with conversation analysis, and its focus on the sequential unfolding of interaction, we note that Ms. Leigh’s utterance on line 288 clearly sets up the expectation that pupils should bid for a turn to be Harry’s final judge. More specifically, the way her utterance is phrased appears to invite a certain kind of response. Within *X Factor*, “honest” often means Simon Cowell-like harsh criticism, and there’s some evidence that this is what Ms. Leigh is trying to invoke in the stress she places on “honest” and in the elongated vowel sound of “o:n,” which makes Ms. Leigh’s “come on” sound like something of a rallying call. So the preferred response here is not simply that pupils should bid to give their evaluation but also that the resulting evaluation should be “brutally honest.” From a multimodal perspective, we see Callum (who is sitting directly opposite Harry) respond to this. He reduces his score from an original six fingers to four during Ms. Leigh’s utterance and appears eager to speak—his right hand, which displays the score, is outstretched towards Harry, and he pleads, “me” (line 290). William, who is sitting next to Callum, points to the latter’s score and exclaims, “four.” Harry surveys the room, studiously avoiding Callum’s gaze (even though Callum is sitting directly between Harry and Ms. Leigh). Having not found a socially acceptable alternative, Harry rather begrudgingly selects Callum.

Callum responds to Harry’s question on line 295 by bringing the discussion back to the issue of character description, echoing the idea originally expounded by William that more is better (lines 297–298). Callum’s utterance is marked as a “dispreferred response” (Hutchby and Wooffitt 1998; Levinson 1983; Schegloff 2007): Callum hesitates, uses the discourse marker “well,” and stalls with the filler “like.” Further evidence for this interpretation can be found in Harry’s next turn. He responds defensively and with more than a hint of exasperation, appealing not just to Callum but to the whole class to cut him some slack: “I didn’t get up to there, people” (line 300). As he speaks, Harry’s body tenses and he holds out his hands, palms up, in a beseeching gesture. The utterance is also marked by a “stylized” local accent (e.g., l-vocalization in “people,” a recognizable feature of London speech in which the <l> at the end of a syllable is pronounced using a sound closer to a vowel), perhaps as a way of indexing a sense of camaraderie with his peers (i.e., his *X Factor* audience) (cf. Snell 2010). These two boys are friends, but Callum has been asked to take on a role usually reserved for teachers and has also arguably been encouraged to take a more negative evaluative stance by Ms. Leigh; that this feels slightly awkward and out of the ordinary is shown here through preference organization and indexicality.

¹¹We do not aim to provide an exhaustive analysis of the episode here but rather demonstrate how our interpretation takes advantage of linguistic ethnographic key concepts and principles.

Finally, we move away from the here and now of the focal episode and begin to think “transcontextually,” about how this episode might link up with broader social structures, institutions, and ideologies. One way to do this is to focus on the movement of texts (both written and oral) into, through, and beyond the episode. In this episode, relevant texts include: the first draft of Harry’s story; the teacher’s oral and written assessments of this draft; Harry’s second, revised draft; National Literacy Strategy documents; and available assessment criteria.

Close analysis of the extract reveals that of the six pupils who offer an assessment of Harry’s stories, four follow William’s line, almost word for word. This repetition is not immediately apparent. For example, take Julie’s evaluation: “yeah, like because h- the better- the first one was better because he had like more descriptive words but in that one he didn’t like describe the person who was changing the weather much.” She does not cast her comment as building upon or agreeing with William; in fact, her relative lack of fluency, the hesitation, and use of the filler “like” give the impression of real-time processing of thought. But noticing this repetition is significant because the majority of the pupil contributions in this segment can be traced back to William’s initial utterance—going back to Goffman (1981) these other pupils act as “animators” of ideas originally authored by William (though they pretend to be the author¹²)—and this becomes important when considering to what extent these pupils are engaging in a meaningful discussion of story writing.

Based on these pupil assessments we might expect the first story to have more and better descriptive words. However, systematic comparison of the descriptive words used in the two stories (see Lefstein and Snell 2011a, Table 4) suggests that actually there were *more* adjectives in the second version. And in terms of quality, many of the word choices in the second version appear to fulfill implicit National Literacy Strategy criteria for “high-level” descriptive words—the teacher herself highlights these word choices as being “very advanced” (lines 74–86). So, if the pupils were not orienting to differences between the two stories, what were they talking about? One possibility is that pupils were attending primarily to available assessment criteria.

The pupils’ evaluations—both negative and positive—appear to be based upon an implicit set of criteria for assessment of story value, according to which (1) more character description = better story, (2) more descriptive words = better character description, and (3) more advanced words = better description/better story. This way of thinking about writing quality appears to be widespread in English primary schools and is inadvertently promoted, alongside competing approaches, in policy documents and supporting materials.

One way in which these ideas have entered the classroom is through the VCOP scheme of assessment. Within this scheme, four key aspects of “good” writing are identified—vocabulary, connectives, openers, punctuation—and in each area

¹²An additional complication that Goffman’s production format does not account for; perhaps an additional role of “plagiarizer” would be appropriate.

the items are hierarchically ordered into attainment levels (which are displayed visually in a pyramid structure). According to this scheme, for example, “exciting” and “so” are level 1 words, while “formidable” and “outstandingly” are level 5. VCOP pyramids are displayed prominently in the classroom and are often referred to by the teacher (and also by pupils themselves). Prior to the focal extract, the teacher spent 10 min discussing the written feedback she gave the pupils on their timed stories in terms of VCOP targets (e.g., asking for a show of hands to indicate who “had a V-type target... a C target”). The pupils were thus primed to judge Harry’s writing using this frame. VCOP is implicit, for example, in William’s judgment that the first story had “better descriptive words” and explicit in Gina’s later (and opposing) statement that the description in the second version “was like level four or five in vocabulary” (line 153). Ms. Leigh also orients to this framework in lines 85 and 109–115 when she refers to “advanced” word choices. Although it may have been difficult for many pupils to see or remember Harry’s stories, VCOP texts—and associated evaluative framework—were on the tips of everyone’s tongues.

Going back to William’s initial evaluation, then, it would seem that he drew from a number of resources on hand, fusing together (a) topic—character description, which was highlighted by Ms. Leigh in her initial feedback to Harry and in her instructions to the pupil—judges: “[Harry] has to make sure he was adding enough detailed description to give us some ideas about what was going on”; (b) assessment criteria—based upon VCOP, which is posted on the wall and was also flagged up by Ms. Leigh at the beginning of the lesson; and (c) a combative critical stance, based upon the *X Factor* judges, especially Simon Cowell.

In this section we’ve demonstrated some of the key concepts and methods we drew upon in our analysis of the episode, including discourse genre, footing, indexicality, and micro, multimodal, and transcontextual analyses. These concepts assisted us in interpreting what was going on in the episode. In the next section we turn to issues arising in the move from a detailed interpretation of an episode to the construction of an argument, and ultimately an academic article, and how this move in turn impinges on the interpretation and representation of the case.

Constructing an Argument: Issues in Interpretation and Representation

Pinning the Case on a Theoretical Problem

The primary criterion for the success of scholarly work—and its publication—is to make a significant contribution to knowledge in the relevant domain, usually by advancing theory. Empirical findings are significant inasmuch as they modify or otherwise inform our theoretical perspectives. Note that the priority of theory to data is also implicit in the structure conventional to academic articles: theoretical background and problems precede research method and findings. This is not at all straightforward, however, in research such as that discussed here, wherein the

construction of knowledge takes an “empirically driven trajectory” (Rampton 2011), that is, when ideas emerge inductively, grounded in the data. This “bottom-up” approach is typical of linguistic ethnography:

instead of asking, ‘top-down’, “what can linguistic analysis contribute to issues already identified by other social researchers?”, the driving question tends to be a ‘bottom-up’: “what more general issues can the description & analysis of my experience help to clarify?” (Rampton and U.K. Linguistic Ethnography Forum 2004, p. 15)

But how did we move from interesting data and observations to the reporting of theoretically and practically relevant findings?

As already noted, part of the reason for our initial interest in the *X Factor* episode were the significant shifts in interactional patterns, which appeared to be associated with the importing of a popular culture discourse genre. This was not, in and of itself, particularly newsworthy, but it prompted us to dig deeper into the research literature on popular culture in the classroom. There we found a broad consensus in favor of importing popular culture into classrooms, in order to attain a range of advantages, including: bringing the passion and energy that pupils have for popular culture into the classroom; bridging the funds of knowledge (cf. Moll et al. 1992) students bring with them from home and the relatively specialized discourse genres and knowledge they encounter in school, thus empowering disenfranchised students; and making use of everyday experiences to make sense of and build academic knowledge (Kwek *in press*; Luke et al. 2006) and moreover to see the potential relevance of school knowledge to their everyday lives (Teo 2008). For these reasons the research literature is generally very positive about the educational and emancipatory potential of discourse genre “hybridity” or “third space” (see, e.g., Barton and Tan 2009; Gutierrez 2008; Moje et al. 2004; Pahl and Kelly 2005; but cf. Moss 2000; Duff 2003)—whereby school-based discourse genres *intermix* with everyday and popular culture genres. While the *X Factor* episode exhibited some of these processes, and to a certain extent presented some cause for celebration, we saw the episode as far more complicated and problematic than existing research literature would suggest. The disparity between the enthusiasm for popular culture reported in the research literature and what we actually saw happening in the classroom can be described as the “contrastive insight” (Hymes 1996, p. 5; see also Rampton 2006, p. 32) that framed our subsequent analysis. We noted, for example, the following apparent contradictions between the *X Factor* episode and the research literature:

- The introduction of *X Factor* led to fundamental shifts in interactional patterns and new student roles, *but* appeared to lead to a narrowing rather than an expansion of learning opportunities, with *X Factor*-ish critical stance and confrontations at times distracting the class from meaningful discussion;
- The mixing of popular culture and school discourse genres led to shifts in classroom power relations, *but* these shifts did not involve empowerment of traditionally marginalized students;
- The class shifted back and forth between *X Factor*-influenced performances and more traditional forms of classroom participation, *but* on a number of occasions different participants appeared to be simultaneously participating in different generic events.

These contradictions became the theoretical “hook” upon which to hang the empirical case. We used the episode to explore the complexities of discourse genre hybridity and to highlight some of the shortcomings of current models and metaphors for describing the mixing of school and popular culture discourse genres. For example, the insight that different participants can participate in different genres at the same time has implications for how one theorises the mixing of school-based and popular culture discourse genres. Neither complete separation (script and counter script) nor integrative third space hybridity is an appropriate description for Ms. Leigh’s lesson, which seems rather to embody a contested hybridity.¹³

Justifying Our Case Selection

A challenge in building an argument on the basis of one brief episode is to demonstrate to the readers (and yourself) that this one case is worthy of attention, that it is in some way a strategically selected, “telling case” (Mitchell 1983). This episode intuitively stood out to us as participant observers in the school, but subsequent systematic discourse analysis¹⁴ confirmed the critical nature of this episode, highlighting how the *X Factor* episode stands out against other episodes in the corpus in relation to key structural indicators of dialogic interaction.¹⁵ Relative to the rest of the corpus of Ms. Leigh’s lessons, the episode exhibits a high proportion of student questions (a rate of 30 per hour, compared to an average of 5); over twice as many open questions (i.e., questions for which there is no single correct response) and many fewer closed questions, less frequent evaluation of pupil responses, and the feedback Ms. Leigh does give is “laborated” (i.e., involves an extended response); and a high rate of pupils responding directly to one another (113 per hour compared to an average of 11).

We presented this quantitative evidence in the article, but we were troubled by the retrospective nature of our “case selection,” which didn’t feel entirely honest. After all, selection of the case arose organically from the exigencies of fieldwork: specifically, the need to choose (in the middle of the data collection process) an appropriate case for conducting a feedback conversation with Ms. Leigh and subsequently a reflection workshop with all the teachers. On the other hand, the episode wasn’t selected *arbitrarily*, it intuitively stood out in our ethnographic experience. We could rely on such a claim, but where possible, why not test intuitions, moving from vague terms like “feedback in Ms. Leigh’s lesson was

¹³See Lefstein and Snell (2011a) for a full account of the phenomena that seem to us particularly noteworthy for future study of discourse genres and their interaction in classrooms.

¹⁴See Lefstein and Snell (2011a) for detailed analysis.

¹⁵We distinguish between structural, epistemic, interpersonal, substantive, and political dimensions of dialogic pedagogy (Lefstein 2010; Lefstein and Snell 2011c).

usually/generally/often. . .” to rather precise quantification. Linguistic ethnography is open to quantitative data and analyses; indeed, we might see such analyses as part of LE’s move to “tie ethnography down.”

Cutting Up the Data

One key interpretive dilemma in any case study is deciding how to demarcate the boundaries of the case. In this study, we started with the 8-min discussion of Harry’s story as a focal episode for discussion with the teachers in the school. Then, as we homed in on *X Factor* as a key reference point, we expanded the boundaries of the case: Ms. Leigh introduces *X Factor* a few minutes before the discussion, prior to Harry reading the second draft of his story out loud. Such a segmentation of the data produces a relatively coherent episode with a beginning (Ms. Leigh: “We’re going to have *X Factor*”), middle (the judges’ assessments), and end (Harry: “Should I bow?”). It especially makes sense in light of the focus on importing popular culture and *X Factor*: the beginning marks the first mention of *X Factor*, the middle the substantive content of the game, and the end evokes the closing event in a public performance.

However, given a different theoretical focus, we could have just as easily cut up the data differently, and such different segmentation would have made just as much sense. For example, if our focus had been on the ways in which assessment categories penetrate classroom discourse, our “episode” would have begun much earlier, with pupils reading out their targets for improvement. Or, alternatively, if we had studied the development of pupil writing, we would have ended the episode much later, e.g., after the final set of Harry’s revisions to his story. The important point for our current purposes is to note that the theoretical questions and analytic frame guide the segmentation of the data and help to grant the resulting episode a sense of coherence. That said, it is nevertheless useful to check to see how participants are orienting to the transitions between interactional segments, in other words, whether our segmentation of the data reflects the way they’re making sense of the activity. And, indeed, Ms. Leigh signals to the class the transitions into and out of the *X Factor* activity (see lines 1–3 and 417–8).

The significance of demarcating the case is that we devote our most systematic and thorough analysis to the resulting episode, including detailed transcription and micro-analytic brainstorming. This segment is also that which we played back to and discussed with the participating teachers. Nevertheless, over the course of the analysis, we found ourselves searching for references, clues, and contextualizing information in the rest of the lesson and indeed in the entire corpus, as discussed in the next section.

Sources of Data: Balancing the Video Record and Ethnographic Background

Having segmented the data and created an episode, we spent a lot of time with our heads in the video and audio record. Our viewing and listening is of course informed by our knowledge of the school, class, and other lessons we’ve participated in, but this latter ethnographic knowledge is often implicit and as such does not as readily find its way into the written account of our argument. Rhetorically, it’s easier to make claims on the basis of the video—pointing to transcript line numbers and specific linguistic and paralinguistic features—than on the basis of more amorphous ethnographic impressions. This tendency led to our writing an initial manuscript so narrowly focused on the episode that one reviewer questioned our ethnographic credentials:

Why do the authors seem to know so little about the classroom intertext, about the relationships among the students and the positions they typically occupy? ... I don't think that the word ethnographic should really be used to describe such a study.

We quote this review point because it highlights an important issue, namely, the relationship between different sources of data in linguistic ethnography—especially, ethnographic “lurking and soaking” vs. microanalysis of the video record. Our analysis of the video-recorded extract was informed by our understanding of what constituted a standard lesson in Ms. Leigh’s classroom and how this compared to the rest of the school, and by our knowledge of pupils’ classroom performances and social relationships. The challenge was to make this kind of *implicit* knowledge, grounded in ethnographic experience, *explicit* for the readers, thus “highlighting the primacy of direct field experience in establishing interpretative validity” Maybin and Tusting 2011, p. 517).

In later versions of the article, we drew much more explicitly on a number of different sources of data and presented these sources as evidence. For example, one of our key claims was that the introduction of *X Factor* gave more power to those pupils (such as William and Harry) who were already at the center of classroom activity rather than to those pupils who were on the periphery of classroom interaction. This was based on our observation of this classroom over the period of a school year, but could be substantiated by drawing upon evidence from field notes, which mention these two boys by name for 12 of the 13 lessons we observed in Ms. Leigh’s classroom and which document Ms. Leigh’s own concerns (raised during informal conversation and in one of the reflection meetings) about the dominance of these boys. Similarly, we bolstered our claims about pupils’ enthusiasm for *X Factor* and for Simon Cowell with evidence from outside of the event. First, the school held its own *X Factor* competition at Christmas, in which Ms. Leigh’s class participated. Second, one of the teachers commented on the pupils’ interest in and interpretations of *X Factor* (and related shows) during the reflection meeting on the episode:

I was talking about *Britain's Got Talent* in my class today, and they all could tell you that, well, Amanda's not very good, because she just says they're all quite good, and Piers¹⁶ is, sort of, like, in-between, but Simon really tells the truth, he's really mean to them. But they like Simon because he is mean and he helps them get better. So, as well, they know, sort of, the different ways of giving feedback, as well. They all want to be a Simon Cowell, because he actually does tell the truth. (Comment in workshop, June 1, 2009)

This comment is significant in that it confirms our sense that Simon Cowell, with his trademark harsh but fair criticism, was a salient figure for pupils in this school.

Protecting the Dignity of Research Subjects

We've shared project video recordings with researchers and practitioners in numerous forums and have frequently been disturbed by the speed with which observers rush to judge—often harshly—the teachers appearing in the recordings. This phenomenon is probably due in part to the fact that we have slowed down the recordings, dissecting them move by move and thereby exposing any shortcomings for all to see. It's easy to forget that there's a wide gap separating the slow analysis of a lesson from its experience in real time. In light of this experience we've been keen in our written account to protect the teachers' and pupils' dignity, especially since they and we won't be there to contest unfair reader judgments. However, we're also wary that this desire to protect the research participants not compromise the integrity of the analysis. For instance, recall that Ms. Leigh summarizes the discussion of Harry's stories by asking, "Do we all generally agree [Harry's] story improved from yesterday?" (lines 404–405). The pupils assent, and William initiates a round of applause for Harry, reintroducing *X Factor* as a salient frame. This is a curious account of the discussion, since actually the question of which story was better had been contested throughout, and if anything, most pupils had voiced the opinion that the first draft of the story was, in fact, better than the second. Since the initial response of the children was to prefer the *first* story, this could have led to a more in-depth discussion of how the different language elements contribute to the narrative effects, instead of maneuvering the children round to accepting the teacher's view that the story was improved after editing. Should we have acknowledged this point? Is this episode an example of bad teaching? Was the lesson as a whole failure? And is it the role of the researcher to make such evaluations?¹⁷

A commitment to research ethics and professional practice means that researchers should always respect the sensitivities of their participants and avoid causing any disruption or undue stress or embarrassment to their lives (see, e.g., Rampton et al. 1994). In addition to being bound by professional codes of conduct, many researchers, especially those undertaking ethnographic fieldwork,

¹⁶Amanda Holden and Piers Morgan were judges on Simon Cowell's show *Britain's Got Talent*.

¹⁷Further consideration of the relationship between linguistic ethnographic and professional cultures can be found in Lefstein and Snell (2011b).

also feel a personal commitment to research participants: teachers who make us welcome in their classrooms and open up their practice to observation deserve our respect. But professional integrity also demands that the researcher stay true to the data. So, how can the researcher protect their participants’ face without compromising the integrity of the analysis? For us, the answer in this case was to situate the lesson within the wider context.

In discussing this lesson with us and the other teachers, Ms. Leigh mentioned multiple goals, including: to encourage pupils to engage in a process of continuous editing and redrafting to improve their work, and to build enthusiasm for story writing and encourage whole-class participation. Ms. Leigh’s summary of the discussion makes sense in the context of these goals. It also makes sense within the context of the ideology embedded within the classroom feedback genre in UK schools more generally: pupils should be rewarded with praise for presenting their work, and feedback and redrafting necessarily leads to improvement. It would not have been easy for Ms. Leigh to relinquish control and explore the children’s suggestion that the first story was better than the second because the challenge to the pedagogical aims might have been too costly (i.e., the aim of demonstrating that editing improves a piece of writing).¹⁸ Ms. Leigh was also subject to institutional constraints. She was aware, for example, that the designated hour for literacy was coming to an end and that there were other tasks to complete before their time was up.

Overall, then, it’s crucial to acknowledge that most of the issues we raise with respect to the *X Factor* episode are rooted in the broader policy environment in which Ms. Leigh works and against the boundaries of which she is pushing, and moreover, Ms. Leigh was herself critical of many of these practices in discussions about the episode with us and with the other teachers. We also acknowledge in the article that Ms. Leigh was recognized by the local authority as a leading teacher for the purposes of filming exemplary lessons and that we also hold her in very high regard.

Conclusion

In this chapter we’ve explicated the linguistic ethnographic approach we adopted in investigating the mixing of school-based and popular culture discourse genres. We’ve outlined key principles of linguistic ethnographic interpretation and demonstrated how we applied them to classroom data. Finally, we have examined tensions between these principles and other academic practices and genres, and some of the interpretive and representational dilemmas that arise from these tensions. For example, the linguistic

(continued)

¹⁸Ms. Leigh may also have been as confused about these evaluations as we were—recall that most pupils followed William’s lead in orienting to available frameworks for assessment rather than to the actual stories in voicing their assessments.

ethnographic commitment to an inductive, data-driven approach is in tension with the genre of the academic journal article, which prioritizes theory over data and expects that case selection precede analysis. We have shown, however, that while inductive, our approach was by no means atheoretical: our analyses were guided by the “sensitizing concept” of discourse genre. We have further demonstrated how careful mediation between theory and data gave rise to a “contrastive insight” that framed the analysis. Our focal case emerged from our ethnographic experience: it stood out as a classroom discourse event that diverged from the status quo. We were able to demonstrate the critical nature of this episode, however, using quantitative analyses.

Throughout the process we have highlighted central dilemmas in the process of interpreting and representing the case, for instance, the consequences of the decisions we made in cutting up the data (e.g., how might this have changed given a different theoretical focus?) and in the final presentation of our analysis (e.g., how to balance microanalysis of the video data with less tangible ethnographic experience). For each dilemma we have presented the problem and described—and attempted to justify—the way in which we responded to it. Nevertheless, in closing, we should emphasize that doubts still linger and that we don’t see linguistic ethnography as necessarily providing a solution to the problems we have discussed, but rather as a methodological prism that brings them into view, and forces us as researchers to confront them. We hope that this chapter has served to underscore the importance of such reflexivity as a critical component of research and other interpretive processes.

**Genre 3 Ethnography *of* Education:
Sociological and Anthropological
Approaches**

Introduction

Francesca Gobbo and Kathryn Anderson-Levitt

Ethnographic research is interpretive research in a double sense. One role of ethnographers is to understand the *participants*' perspectives: How do *they* interpret the world? At the same time, ethnographers themselves do interpretive work. These essays address both issues.

How Participants Interpret Their Educational Worlds

Democratic nation states have traditionally assigned to public education the double task of transmitting knowledge and forming the future citizens through the values and cultural orientations that are seen as constitutive of a given society. In doing so, policy makers and educators alike have often overlooked or ignored that many future citizens—the pupils and students of today—may only partially share the values and cultural orientations that weave together the institutional discourse and practice of education. The diversity of ethnic, linguistic, and occupational minorities has more often been the object of bureaucratic classification or redefinition than of cultural recognition, so as to translate education into assimilation and integration. It must be acknowledged that ethnography and ethnography of education in particular have long since pointed out how the meanings and practices of education can neither be taken for granted nor be considered outside the dialectics of power differentials.

Such interpretation of educational indifference and injustice is once again brought to the foreground by several of the essays in this section.

For example, in her chapter *Francesca Gobbo* revisits the ethnographic research she conducted between 1999 and 2001 among a number of Veneto traveling attractionist families whose children's right to education was seriously impaired by the schools' inability to respond to their nomadic way of life. The researcher's first challenge consisted in interpreting the meaning and practice of occupational nomadism, the learning and teaching taking place within families, and "on the square," the families' and youths' epistemologies elaborated through the experience of nomadism and what it entails with regard to their relations with sedentary co-citizens and local administrations. Participant observation during fairs and informal and formal conversations with adults and youth were relevant for questioning a stereotypical interpretation of the nomadic life and identity and for valorizing the interpretations of work, learning, and social positioning that those families had developed themselves.

Similarly, in her chapter *Diana Milstein* demonstrates the value of attending to the interpretations offered by actors rarely listened to, schoolchildren in poor neighborhoods of a great city. Reporting on fieldwork conducted in Buenos Aires in collaboration with several children, Milstein reflects on how the child ethnographers interpreted their environment by drawing expressive maps, taking photographs, discussing and debating with each other, laughing, and gesturing. Sometimes their interpretation aligned with adult meanings and sometimes it did not.

In a discussion of her study of Disaster Education, *Mara Benadusi* points to interpretation—the making of meaning—in its most active sense as the social construction of new realities. Her research analyzes the international aid response to the 2004 tsunami that was accompanied by the launch of ad hoc educational programs in which she was both a participant and an observer. She points out how such programs aimed at establishing preparedness and resilience as overall values and outcomes of the processes of training in prevention and limitation of "natural" disasters. Disaster Education and its variants are aimed at promoting skills and knowledge in people so that they can survive catastrophes but they also offer analytical and interpretive categories whereby not only a specific culture is built but also a new, double identity: the local populations struck by the tsunami were (even some years after the catastrophe) at the same time victims and survivors. Seldom, however, were they recognized as people who could contribute to the educational programs through their own local knowledge, a point that is also underlined by educational comparativists.

Benadusi carried out her research in the tsunami struck areas at three different times and in three different locations: thus not only her involvement went from documentary research to observation and participation into some programs, but she also made use of different theoretical approaches. Of particular interest is her third field experience, during which she lived in what had become a so-called success village, where she could notice how disaster "teaches," that is, can be the consequence of a way of life that strayed away from local values, on the one hand, and on

the other, “educates” people to look for the reasons and to invest in anticipation, preparation, and resilience. With regard to this latter aspect, Benadusi highlights the need, among the village people, to balance their disaster-resilient identity accurately so as to continue to access donations and to show the positive effects of learning.

How Ethnographers Work to Interpret the Participants’ Interpretations

But if ethnographers seek to undercover the interpretive work of people in ordinary (and sometimes disastrously extraordinary) circumstances, how do they accomplish that work? What can we say about the processes through which ethnographers themselves make sense?

Observing as Outsiders Even When “at Home”

A classic response is to point out that ethnographers interpret “what is going on here” by taking the double perspective of participant observation. On the one hand, rather than pretending that research can take place without social interaction, ethnographers seek to learn by participating in ordinary conversation and everyday activities with the people whose lives they seek to understand. On the other hand, ethnographers always observe in some sense from the outside, noticing because of their distanced or comparative perspective what insiders take for granted, or are too immersed in, to see.

One way to take the distanced perspective is to come from elsewhere to conduct the research, as Benadusi does when she arrives in Sri Lanka to study disaster management, or when, as we will see below, Payet leaves France to understand educational processes in South Africa. However, even when researchers are working “at home,” they are likely to bring certain outside perspectives because of their social class and professional situation vis-à-vis the position of local people, or because they are defined as outsiders by the local people owing to their (usually more privileged) social class or professional position or ethnicity or urban location, or because they bring a comparative perspective from prior research abroad. Thus, although most of the authors in this section conducted research “at home,” many of them were not completely at home in the settings they studied.

Yuko Okubo brings the insider–outsider tension to the fore in a chapter on how her role as a “native” anthropologist doing research “at home” enhanced her understanding in some ways and inhibited it in others. In the process, she clarifies the many shades of “insider” and “outsider” status, showing how they depend on particular relationships in particular situations. (Compare Dietz and Álvarez

on ethnographers' identities.) During her fieldwork in a school and community in Japan, Dr. Okubo's status as an outsider to the local community resulted in several surprises and confusions of the kind experienced by many ethnographers. (Compare Payet.) To begin, she selected her site because it was a school serving immigrants only to discover later that it was also and importantly a school serving Buraku students, a formerly stigmatized minority. Meanwhile, again because of her unfamiliarity with the setting, she did not realize at first that she had overstayed her welcome with the local teachers, resulting in lost opportunities to grasp their point of view—although helping her to maintain her distanced researcher stance. However, Dr. Okubo's insider status as a native speaker of Japanese also inhibited her understanding in some ways by making it virtually impossible for her to ask questions asking for clarification of meaning.

In the central case of her essay, Dr. Okubo shows how her positionality led to a specific kind of "partiality" in her interpretation of school and community. Having distanced herself a bit from the school on her advisors' counsel, and having been further distanced by the teachers after staying "too long," but meanwhile finding a common bond with local activists in spite of differences in ethnicity, gender, and class, she wrote an analysis of how the school treated immigrant students that was considered much too critical by the local teachers. Perhaps the most important lesson to learn from Dr. Okubo's experience is that she did publish her research in Japanese, so the participants could read it, and did listen to their reactions and reflect seriously on what had led to her interpretation and on how it might have differed had her roles played out differently in the field.

David Doubek and Marketa Levinska were likewise working "at home" to study the "Roma." In their chapter they analyze and discuss Czech policies concerning the schooling provision for Czech Roma as well as the strategies and choices enacted by Roma families to counter the ethnic labeling and their children's negative educational experience in mainstream classrooms. An ethnographic approach combining some years of fieldwork with the comparative perspective resulting from the diversity of the research team highlights not only the tense complexity of the research endeavor but also that of the Czech Roma–non Roma relations. Their interpretive tasks were first, that the ethnographers had to clarify to themselves "who" they were going to focus on (a task not unexpected in ethnographic research) and then to clarify how the relations established with the Czech Roma in turn redefined the researchers' self-definition as professionals and as Czech.

The Meandering Road to Understanding Insiders' Perspectives

How to grasp insider perspectives? Golden uses the metaphor of wandering, while Payet refers to the openness of ethnographic research.

In her elegant, brief essay, *Deborah Golden* meditates on ethnographic research as a process of wandering or meandering. She uses as examples her work on the

socialization of newcomers to Israel and her later work on the parallel socialization of children in preschools. As she argues, “I shall suggest that the work of ethnography unfolds, quite often without preplanning and, even if preplanned, there are often unintended consequences. Hence, making sense of what has unfolded most often takes place after the fact.”

It is interesting to read Golden’s essay alongside Diana Milstein’s chapter, which describes literal wandering around the city with child ethnographers. Milstein describes several occasions when she did not ask for an explanation right away from the children, but instead came to understand through later visits to the streets, or later interaction with the children, just what they had been talking about. This is the unfolding of understanding as time passes and experiences in the field accumulate that Golden is describing.

Jean-Paul Payet reflects on his years of ethnographic research on the children of immigrants in French schools and his more recent work in South Africa to draw the lesson that “the decisive moments that moved the research forward, in terms of understanding the actions and social relations being observed, have been the moments when the act of interpreting ran into difficulty.” He illustrates by describing a difficult moment of tension with research participants in South Africa. (Okubo’s chapter likewise illustrates the difficult moments and unfolding of insights late in the game.) “Ethnography places us within such moments,” he says, “when conventional thinking is toppled.” Ethnography makes these moments of insight possible, he argues, because of its attitude of openness, a concept allied with the “wandering” and “meandering,” that Golden describes.

From Interpretation to Action

Other researchers sometimes ask ethnographers, “But when you are participating, don’t you influence what is going on?” Noting that all research engages the researcher in social action with the research participants, ethnographers answer, “Yes, to a degree, inevitably, as do you.”

In fact, the local participants may demand such engagement. The research by *Gunther Dietz* and *Aurora Álvarez Veinguer* described in their chapter analyzes and discusses the intercultural investment in a higher education project originally centered on indigenous cultural identity and its valorization. Unlike the Czech case, here the demand for innovation comes from the local communities, grassroots organizations, local activists, and intellectuals. In presenting and discussing the aims of the project, which underwent significant modifications along the process of its implementation, the two ethnographers support the native people’s and activists’ right to make themselves not only heard but also recognized as full participants and cooperators in the construction of university courses and intercultural dialogue, and point out that such fundamental political recognition affected both the theory and methodology of their research. Dietz and Aurora Álvarez Veinguer underline that in

interpreting the natives' demands and in collaborating to achieve the realization of the project, they became part of the very enterprise under study. Furthermore, in creating a course of study meaningful to students and to the social environment, they also collaborated to introduce and sustain changes that in turn promoted unexpected social, cultural, and political changes (for instance, the outing of homosexual and lesbian students). For Dietz and Aurora Álvarez Veinguer ethnography means interpreting the epistemologies of all those involved in the project, but they also stress how to collectively make sense of an ongoing enterprise such as their university requires reflecting on the processes of decision and implementation making and on the impact that power relations have on them.

Likewise, Okubo and Benadusi and many of the ethnographers here acknowledge their occasional roles as activists. The educational indifference and injustice that educational ethnographers witness as participants and observers demand, sometimes, an immediate response.

In Summary

In short, the authors in this section analyze several continua: insider–outsider, interpretation by the local participants and interpretation by the ethnographer, simply interpreting or taking action, along which ethnographers vacillate as they seek to make meaning of participants' everyday lives.

3.1 People “of Passage”: An Intercultural Educator’s Interpretation of Diversity and Cultural Identity in Italy

Francesca Gobbo

The invitation to contribute a chapter to the section on ethnography represents a good opportunity to reflect on my teaching and researching in the field of intercultural education that has always been characterized by considerable attention to Italian “everyday diversity.” On the one hand it has given me the chance to retrace my evolving interpretations of what I learned during fieldwork I conducted, between 1999 and 2001, among a number of families of Veneto *attrazionisti viaggianti*¹ (the Italian official denomination of those who are elsewhere known as *forains*, fairground; circus or show people; travellers or occupational travellers). On the other hand it demonstrates how those interpretations not only evolved but also affected what I did, how I did it, and the conclusions I drew.

The notion of interculture—and its variants, interculturalism and interculturality—originated in the 1980s from the concern of European institutions such as the Council of Europe about the climate of prejudice and even racism that a growing number of immigrants and refugees experienced after settling in various European nation states. In particular, the European legislation of the 1970s, which had acknowledged the right of migrant pupils and students to learn the language and culture of origin, was in the following decade complemented by further Council of

¹The English translation (traveling attractionist) will from now on be used throughout this chapter. Since the first presentation of fieldwork findings (Gobbo 2001a), I am aware—thanks to Michael Herzfeld’s notice—that “attractionist” is my own linguistic invention, but I intend to maintain it in order to underline the constitutive, and special, connection that this mobile occupational minority has with attractions, the “tools” of their work. This aspect is also recognized by Italian legislation (Law 337/1968) that defines the members of this occupational minority as proprietor of traveling attraction (*esercente di attrazione viaggiante*).

Europe's recommendations that migrants be recognized as *cultural subjects* and not only as labor force, and that diversity—whether cultural, linguistic, or religious—be the focus of educational attention and the lever of a new school approach.² By inviting and supporting a reflective approach to different cultural and/or religious ways and beliefs, intercultural discourse and practice aim to contest and deconstruct stereotypes, prejudices, and racism as well as to understand and explain processes of identity construction and transformation by taking notice of the critical learning that diversity can engender, and of the cultural changes in the second generations born and growing up within the majority context.

As Italy became an immigrant-receiving nation, intercultural entered Italian educational discourse and policies from the early 1990s, characterizing both educational research at the university level and also the collaboration between the latter and teachers; it was perceived that the country and its schools were progressively changing and ready to be redefined as multicultural, while the unforeseen diversities of the new pupils and students were interpreted by educational researchers and the Ministry of Education³ as an asset and an educational resource for the education of *all* learners.⁴ Intercultural education was seen as capable of promoting processes of mutual recognition and positive interaction among culturally diverse individuals, instead of intolerance, exclusion, or racism, as well as of problematizing the meanings of diversity in the light of the Italian and European histories.

As an intercultural educator, I thought it worthwhile and relevant to connect intercultural, and its goals, to an anthropological perspective honed by the minorities' protest movements of the 1960s in the USA that I had observed as a student at the University of California, Berkeley. There, the demand for recognition of cultural and ethnic diversity and identity arose and grew among minority *citizens* and aimed to redefine the symbolic meaning and political import of cultural diversity and identity, as well as their essential connection with social and educational justice. Since then, the term "multiculturalism" (initially perceived as critical of American political and social history; see Schlesinger 1992) has become part of our everyday vocabulary. The debate on *culture* as what is taught and learned through the process of enculturation (namely, learning before, during, and even against schooling), and on *identity* (as the radical interrogation of genealogy, biology, history, and society) that in the late 1960s went on at Berkeley in and off the university campus, eventually led me first to Oakland to study a local movement for "community control" (see Gobbo 1977a) and then to the Anthropology Department where I was a student of the late John U. Ogbu and where I was encouraged to pursue my interests in Italian internal or everyday diversities (as I would later call them), by studying them through the anthropological "lens" and ethnographic fieldwork. In the USA, the protest movements of the end of the 1960s had

strengthened a line of theoretical and ethnographic research—the sector of anthropology of education—that cultural anthropologists and anthropologically oriented educators had inaugurated since the mid-1950s,⁵ overturning, among other things, the prevailing interpretation of minorities’ inequality of opportunities and lack of educational success as due either to their social and/or cultural “disadvantage” or cultural “deprivation.”

The theory of *cultural discontinuity* was anthropologists’ early important contribution for interpreting the minorities’ failure and dis-investment in schooling, and for further acknowledging the latter as a form of resistance, in the name of a group’s cultural identity and diversity as it was noticed how, in contemporary societies, the processes of enculturation often compete or conflict with the cultural orientation of national education systems. In Italy, for instance,

The richly differentiated fabric of languages and cultural ways characterizing [the country] had been consistently ignored by educational authorities since the political unification of the country in 1861. (...) For almost a century, the pursuit of national unification and the construction of a national culture required that the regional and dialect differences be overcome. (Gobbo 2012b, p. 152)

The realization that an emphasis on cultural discontinuity could, on the one hand, represent the different cultures as more homogeneous and distinct than they usually are and, on the other, legitimize the belief that all minorities respond to schooling in the same way and that every minority culture breeds educational failure is at the origin of the theory elaborated by John U. Ogbu. His theory seemed to me especially suited for intercultural educators as it invites them to look at cultural differences as enmeshed in the web of social and political forces and historical relations, and minority groups’ members as “autonomous human beings who actively interpret and respond to their situation” (Ogbu and Simons 1998, p. 158). Cultural identity—be it minority’s or majority’s—is then conceptualized as the result of the (rarely balanced) intertwining of multiple cultural orientations. In my research, this theory was crucial for making me also notice the *intracultural* diversity of each minority group I studied, as well as the impact that majority’s representations and classifications of minority cultures and its members had for the latter’s school careers, and for the elaboration of groups’ emic theories on schooling and successful life prospects.

In this perspective, the pursuit and realization of intercultural dialogue (see Council of Europe 2008) could not but require that a policy approach be complemented by in-depth qualitative research on the many facets of diversity. More specifically, ethnographic research can represent an indispensable “source of, and a resource for, intercultural dialogue, especially when teachers themselves become ethnographers” (Gobbo 2012c, p. 232; see also Gobbo 2000a, 2004b) and suspend taking for granted the “culture(s) of the school(s)” and notions of identity that have in the meantime become convenient stereotypes. Appropriately dubbed as an intentional “experiment of experience” (Piasere 1997), ethnographic

⁵See Spindler 1955, 1963, 1974; Wolcott 1967; Ogbu 1978, 1982, 1990, 1991, 1994, 1996, 2003; Ogbu and Simons 1998; Gibson 1976; Gobbo 1996; and Anderson-Levitt 2012, among others.

research challenges our (and others') cultural "provincialism," the taken-for-grantedness of habitual ways, and makes the ethnographer—as well as the teacher-turned-ethnographer (see Gobbo 2004c)—recognize that they had a point of view all along from which they may now gain a critical distance.

Owing to the prevailing and understandable attention paid by intercultural education to immigrant pupils' and students' cultural, linguistic, and religious diversity, I thus promoted an ethnographic approach among a number of young researchers.⁶ Their findings are innovative and often unforeseen and thus of great interest for those who work in the area of intercultural, anthropology of education, and ethnography. Yet, when diversity, the right to its recognition and its contribution in problematizing a society' identity, is almost exclusively interrogated in relation to the structural effects of immigration, ethnographers—young and old—risk making their research on social and cultural complexity less comprehensive and/or relevant, since the questioning of *our* own internal, or everyday, diversity is dimmed, or overtaken, by what is perceived as the new social and educational urgency. Furthermore, it must be recognized that the shareable concern for cultural "integration" or "inclusion," with its ad hoc educational interventions, often tends to drive the issue of diversity into the background and to shy away from questioning a social order historically and politically responsible for muffling, if not silencing, minorities' voices. For these reasons, and because of my early interest in multiculturalism, I chose to focus my ethnographic and educational research on a number of Italian minorities in order to understand the meaning that the processes of enculturation and schooling had among them.

Identifying the "Field" and Approaching It

The decision to specifically study the occupational minority of travelling attractionists, whose children's educational difficulties have often been examined together with those of other nomadic groups' children such as the Roma, the bargees, and the agricultural workers (see Schools Council Research Studies 1975; Liégeois 1992; ECOTEC 2008, among others), arose after I invited anthropologists Leonardo Piasere and Ana Maria Gomes to present their research among the Italian Roma and Sinti to students at the University of Padua, where I taught until 2001. In different ways, they interpreted the fieldwork experience not only as an instructive encounter with another worldview but also with a *new* view of *their* own worlds that they had learned from the research subjects. Ana Maria Gomes had aimed to understand the meanings that schooling had for the Sinti children and their parents, and, by making those "epistemologies" (Ogbu 2003) known to teachers, to awaken the latter's attention to the rules, expectations, social abilities, and tacit assumptions that symbolically and practically order a school's everyday organization

⁶See Gobbo and Simonicca 2014; Santoro 2014; Setti 2014; Giorgis 2013; Costa 2013, 2008, 2007; Peano 2013, 2007; Gobbo 2012b; Sansoé 2012, 2007; Pescarmona 2012, 2010a, b; Galloni 2009, 2008a, b, 2007a, b, c; Rapanà 2007; and Naclerio 2007.

and activity. By “decentering” their view (as intercultural solicits, but not always successfully realizes), teachers would become aware of alternative meaningful versions of schooling and education (Gomes 1997; see also Gomes 1998). Upon reflecting on his fieldwork “immersions” among the Roma, Leonardo Piasere had come to the conclusion that the ethnographer’s distinction between a *there* (learning in the “field”) and a *here* (writing about what has been learned) did not hold: to understand the Roma and their ways, the ethnographer “must learn to categorize anew *his* own world, because that is the world that Roma inhabit” (Piasere 1997, p. 74). As he further noticed, living with the Roma, “progressively taught me that there are multiple worlds in *my* world . . . and we are not aware of them” (*ibid.*, p. 75).

The two anthropologists’ reflective accounts and radical conclusions—both from a theoretical and methodological point of view—revived my memories of the world of traveling attractions I had been “passionate” about as a toddler, according to my parents. In my role of educator, I then wondered about the children’s schooling experience and the educational provision taken to ensure that they could participate in the classroom learning *and* learn⁷ since children attend a different school almost every week, usually for less than a week (except in winter, when families stop and park their caravans in a town for about a month and children attend the same classroom for the whole period). As an ethnographer, I was intrigued by the prospect of getting to know the cultural ways and values their mobile lives entailed (see Gobbo 2003b, 2006, 2007a, b, 2009a). What was initially a concern for educational justice developed into a set of interconnected research goals: I intended to understand the meaning and experience of schooling and education by observing what traveling attractionists did and how they did it, and listen to their narratives so as to hopefully make known their educational values, skills, and knowledge.

Notwithstanding the awareness gained from Gomes and Piasere, when I started to plan the new ethnographic research among the traveling attractionists, I seemed to expect that their world was out *there*, and such expectation was enhanced by the difficulties I encountered when I tried to figure out how to get in contact with some attractionist families. Unlike my previous research among the Arberesh and the Waldensians,⁸ teaching duties now did not allow me to go to the “field” and live there; I was instead prepared to drive to the fairs and visit the families when it would be time to interview them, but I had almost reached the point of throwing in the towel, when I eventually met Mr. Pulliero, a knowledgeable and helpful “mediator” and mentor.

Mr. Pulliero had for years worked for a small union (*Sindacato Nazionale Attrazionisti Viaggianti*/Traveling Attractionists National Union, member of the

⁷The ECOTEC study (2008) reports a very limited number of educational initiatives, but no research among Italian fairground and circus people had been carried out until 1999.

⁸Before doing fieldwork among the Veneto traveling attractionists, I was in Calabria, to study the Arberesh, an ethno-linguistic minority arrived in Italy in the fifteenth century from Albania fleeing from the Turks (Gobbo 1977b), then in Piedmont, for research among the Waldensians, a religious minority that joined Calvinism in 1531 and was granted civic rights only in 1848 (Gobbo 1999, 2000b, c, 2001b, 2003a).

powerful leftist union CGIL) that represented a number of Veneto traveling attractionists. In reminiscing his beginnings, he stressed how

taking care of their problems was an absolute novelty for me. I was a salaried worker all my life, and I knew nothing about this occupational sector. Unlike us salaried workers, these people are their own bosses, they have a different way of seeing things, of handling the problems.⁹

He did not always agree with those ways; nevertheless, he maintained that attractionists deserved to be supported. In years of dealing with them, he had come to see them as people

who must hustle and bustle because of the tight competition for the *piazze* [squares, i.e. the towns' areas assigned for attractions], because their job is not guaranteed.¹⁰ (...) We like attractions and the circus, but we seldom realize the cost they levy on these people's life and time.

Though it had not been easy to metabolize such "educational" experience, he concluded that the attractionists and their culture were part of our (i.e., the settled people's) everyday culture and had to be reckoned with.

Perhaps without knowing it, Mr. Pulliero was interpreting such experience in an intercultural vein: in fact, when I first met him to explain my research project, he had agreed to help and clear up many of the stereotypes and prejudices surrounding the traveling attractionists. Not surprisingly, the issue of stereotypes and prejudice—as will be seen—is something that deeply concerns attractionists and on which many construct the presentation of themselves, even by drawing clear-cut distinctions within their occupational group. However, Mr. Pulliero preferred to underline other characteristics ("qualities," as he defined them) of this occupational minority: the attachment, even the "love" or "veneration" for the attraction, of which good care is taken during the winter stop, the generational *continuity* in the sector of attractions, the men's acknowledgement of the work contribution of women and young people, the respect for the customers, and the feeling of ownership towards "their" fairs, "their" circuit (that, after all, are their source of income and work pride). He conveyed a picture of a world that is usually portrayed as festive and anti-routine (see Pretini 1984a, b; Vita and Rossati 1997; Zaghini 2001), but that is also framed by specific legislation (law n. 337/1968)¹¹ and a host of local and national regulations concerning taxes, criteria for

⁹All quotations that are not referenced are from my ethnographic field notes.

¹⁰Unfortunately, today this applies to many young people in more stable jobs as well.

¹¹With regard to this law, it is worth recalling some of its qualifying points: it officially defines this occupational minority as *esercenti di attrazioni viaggianti* (proprietors of traveling attractions), recognizes the "social function" of circuses and traveling shows, and indicates the consolidation and development of the sector as social and political goals. A national committee with consulting tasks was then set up to support the foreseen improvements, and a list of all the attractions – distinguished according to size – was prepared that is periodically updated. In fact, the registered size and technical characteristics of attractions provide the official basis on which the Minister of Tourism and the local administrations decide on taxes and space allocation. Local administrators, in particular, are responsible for locating and approving areas suitable as fairgrounds and for annually renewing or withdrawing approval according to suitability evaluations based on the fairs' economic returns and the residents' appreciation. The law also requires annual safety checks (see footnote 12) that have to be passed satisfactorily for approval to be granted.

attractions’ space assignment, safety rules,¹² and compliance with compulsory education rules, all of which attractionists have to follow and implement.

Furthermore, while it is true that attractionists’ everyday life and work are tightly intertwined, and that their home (a caravan or a trailer) moves with them from one “square” to another along a well-established “circuit” (*giro*), the latter might change when a local town administration agrees to support its citizens’ demand that the space allotted to the fair be instead maintained for the weekly market or as a parking area. The cancelation of a fair means not only a loss of income for the attractionists, but it also upset the parallel “school circuit” that children travel, regularly attending the same schools for a short and predictable number of days and meeting the same classmates and teachers, year after year, until they complete compulsory education. Such arrangement is intended to formally realize the right to education of the attractionists’ children,¹³ however it raises relevant questions regarding how and what the latter can learn, and how and what teachers can teach. Participant observation in the diverse classrooms attended by the attractionists’ children seemed a rather difficult enterprise. So I decided to focus on the teaching/learning process taking place in the family and in relation to the family’s work, on the one hand, and, on the other, to later contact teachers from the “school circuit” and learn how they responded to that regular sequence of arrivals and departures that tested both their professional competence and creativity as well as the children’s and the families’ educational expectations.

Background Research Literature

The introductory words of Mr. Pulliero had concisely illustrated the complexity of the attractionists’ life and work in Veneto, helping me to sketch a tentative road map that would be further problematized by observations and narratives gathered during fieldwork, as well as by the international research literature on the topic. As the latter uses the criterion of nomadism to explore and interpret the educational experience and provisions for the children of mobile minorities in Europe and in other continents, Gypsies, Travellers, bargees, pastoralists, fairground, and circus people are often grouped together in many studies. Yet, if the way of life of all these nomadic minorities continues to impact on children’s regular school attendance (see Danaher et al. 2009), the view of, and the relation to, schooling place

¹²Since the school year 2003–2004, a project titled *Seguendo fiere e sagre* (Following fairs and countryside festivals), devised by Elisa Marini and supported by the intercultural network *Rete senza confini* (Network No Borders), has been disseminated among various schools of the Padua province. It included a course on work safety rules that was highly appreciated by attractionist families and youth. See “Storia di un progetto” in www.seguendofieresagre.it.

¹³Attendance is always duly recorded in an official notebook (the *quadernino*) that every pupil has with him or her, in which to let teachers and principals know that he or she had complied with the rules.

fairground and circus families and children as different from the rest. Fairground and circus families—at least when interviewed or involved in special projects—seem to consider schooling positively, even though the mismatch between school and work calendars remains a problem and a source of frustration, as parents realize that their children can only learn very little and in a disorderly manner.

Within the literature, such persisting difficulties were interpreted through the theory of cultural discontinuity in turn tempered by the recognition of the fairground and circus people's contribution to European culture. Thus, on the one hand, Jean-Pierre Liégeois could remark that

It is difficult, when one is entrenched in a given pattern of thought and a given educational system, to see one's foundations as relative. (...) Thus, in regard to Gypsies and Traveller communities, with the weight of history so heavily disfavoring them, how is a dominant majority to question its own attitudes and actions towards such a dispersed minority? Until the present, no urgent need to do so was felt on the part of the majority. (1992, p. 8)

On the other hand, the 1994 European Commission Report underlined how:

While the reasons which make them [fairground and circus people] opt for a nomadic style of life are different, they also hold on to a lifestyle which is no less part of the European heritage. Whilst they tend to live on the fringes of society, the traveling professions represent an important element in the socio-cultural fabric of Europe, as is demonstrated by their contribution to the functioning of the economies and the cultural role they play during the festive days of the people of Europe. (1994, p. 16)

However, cultural discontinuity was again stressed some years later, when Kiddle noticed that

For some groups of Traveller children it must seem as if school and home are two totally separate and different cultures and the fact of traveling itself only exacerbates the sense of distance. (...) The lives led by children from the fairground community illustrate clearly the conflicting demands made by home and school (...) making school attendance problematic. (Kiddle 1999, p. 96)

This is so since parents need to transmit their skills “to their children, to educate them for life in the fairground business” so that they can take on “increasing responsibility” as they are considered ready for it (*ibid.*, pp. 102–103).¹⁴ Kiddle argued that discontinuity does not only refer to the Travellers' different lifeways and specific work calendars but also to the problematic relation with sedentary cultures, because

we – the sedentary society – have never quite coped with having a nomadic element in our society ... we have never accepted or accommodated ... mobility. (*ibid.*, p. 154)

The great difficulties families encounter in ensuring *educational continuity* for their children were poignantly interpreted as one of “interrupted learning” and of “interrupted learners,” as collateral effects of the European school systems, whose lack of recognition for fairground and circus families' cultural diversity nourished

¹⁴A 1975 study pointed out that schooling “complements the training [Travellers' children] receive in fairground operation with the family” (Schools Council Research Studies 1975, p. 13).

stereotyping and prejudice among teachers and sedentary co-citizens (Jordan 1997, 2000, 2001a, b). The internal heterogeneity of fairground and circus people—owing to difference in financial and cultural capital, and in the members’ agency to find solutions for their children’s future (Danaher 2000; Danaher and Danaher 2000)—was underlined in the Australian case. Furthermore, authors disclaimed that itinerancy per se (just like minority condition per se) was the unifying factor behind various nomadic groups, though they had to acknowledge that settled Australians perceived nomadic groups as “deviating” from the “norm” of fixed residence, even if a sizable portion of Australian population is relatively mobile.

As a consequence,

travellers are stereotypically assumed not to have the financial and emotional investment in a single community . . . [while] the general incapacity of schooling institutions to ‘cope’ with itinerant students . . . renders the travellers marginalized from conventional sources of power, status and wealth. (Danaher 1999, p. 26)

By failing “to fit” the conventional categories of students familiar to educational providers, “educational systems tend to ignore itinerant people as being ‘too difficult’ to accommodate” (*ibid.*, p. 28) to the schooling process (see also Danaher et al. 1999, 2000). More recent research cannot but point out how ensuring *educational continuity* for the children of fairground and circus families remains a considerable problem for them (see ECOTEC 2008; Padfield and Cameron 2009; Kiddle 2009; Moriarty 2009). The ECOTEC study confirms the fairground and circus families’ and children’s positive attitude towards schooling as well as their *agency*, when it is necessary to find alternative (but not always successful) solutions. Interestingly, in this study the cultural discontinuity interpretation is proposed as moderated by the families’ and children’s strategy of *accommodation* to sedentary life that shades their visibility—for instance, in classrooms—and allows teachers to overlook the cultural and work reasons at the root of the children’s fragmentary attendance. It follows that ECOTEC educational indications are towards

Customization and experimentation, as well as flexibility in provision. A move towards individual, tailored learning pathways, with a focus on ‘learning outcomes’ rather than attendance at school, seems to present the most suitable approach towards developing provision for occupational traveller children. (2008, p. vii)

This is especially the case since institutional policies such as “Traveller education” might engender differential integration and educational marginalization (Kiddle 2009; Danaher and Danaher 2009).

Before going into the “field,” I had also hypothesized a certain degree of cultural discontinuity—between learning from the family members and from other attractionists, and learning in school—that could explain the schooling difficulties of attractionists’ children. In education, ethnography has a major role to play, not so much in terms of applied anthropology but rather as a way to problematize the meanings of diversity and identity within minorities and majorities; in the “field” it allows or compels the researcher to critically reflect on his or her initial assumptions and research questions and to learn a different, perhaps unforeseen, perspective. However, as I wrote, the fieldwork experience:

Indicated that the process of enculturation could explain only partly the relatively gratifying schooling experience among children of attractionist families. A nuanced interpretation was needed that would take into account the traveling families' sophisticated knowledge of the sedentary population's habits and values, and the schools' inability to acknowledge the attractionist cultural experience in any fashion. (Gobbo 2009a, p. 14)

Attractionists' way of life and work might not fit the social order, so that they are *marginalized* rather than marginal to sedentary society (see Gobbo 2006), but as *marginalized pedagogues* they do teach their children and do so through educational manners that emphasize self-reliance, responsibility, independence, ingenuity, and family cooperation. The "separate participation in ongoing sedentary life" (Gobbo 2009a)—be it in a school or in a town—is well represented by their *cyclical presence* that comes strongly to the attention of their co-citizens for some of the reasons that will be illustrated in the next paragraph, but also because it provides them with the occasion for imagining other ways of living and working.

In the "Field"

Initially, fieldwork¹⁵ consisted in going to the fairs almost always accompanied and introduced by Mr. Pulliero, presenting the reasons why I was there, asking for permission to watch the task of pulling up (*tirar su*) an attraction and starting informal conversations with those who had the time to do so. Even before interviewing began towards the end of fieldwork, the narratives I listened to were alternatively focused on the changes affecting the world of attractionists and the decrease of group's solidarity, the pride and satisfaction deriving from their occupation, and the care for the attractions, the relations with the local people and attractionists' children's upsetting experience of being "mistaken" as Gypsies. The relevance of exploring the school issue against the background of the families' work patterns and concerns was provisionally confirmed.

According to Mr. Pulliero, traveling attractionists "sell a moment of fleeting enjoyment, just a ride on the merry-go-round"¹⁶ or the roller coaster. If they are a familiar, eagerly awaited, presence in urban and countryside environments, their mobile lives cannot but make them (and their children) only a recurrent, or seasonal presence. Thus they are aware of both the appreciation they raise and of the caution and sense of cultural distance with which their sedentary co-citizens, and customers, receive, and interact with, them. It is a deeply felt and somewhat contradictory life experience that is well illustrated by two different narratives collected during fieldwork: on the one hand, there was the surprise of a woman

¹⁵Fieldwork was carried out between fall of 1999 and the end of 2001 among a group of 25 families whose annual fairs' circuits call at many towns and villages in the Veneto provinces of Padua, Venice, Treviso, and Vicenza.

¹⁶Immediately after this remark, Mr Pulliero hastened to remind me the economic and technological importance of the attraction industry sector. About it, and specifically about the town of Bergantino and its post-World War II manufacturing "tradition," see Silvestrini 2000.

attractionist—Ms. Forani¹⁷—when she drove through a town that at first looked foreign, even inhospitable. Almost immediately, however, she realized that the unfamiliar looking town was one of her circuit’s regular stops, where she had “pulled up” the attraction two weeks earlier. She had not recognized the quiet, somber, and empty urban center because, during the fair, the place was filled with lights, music, noise, the children’s delighted cries, and the young people’s excited shouts, and she had concluded that “we bring life to towns, we make them change, and when we leave, everything disappears” (Gobbo 2007a, b, p. 481).

It was a proud awareness that I had heard from her brother too, when he recollected the magic of the summer fairs, created by the music he always chose with great attention. In the 1970s, and even in the 1980s, fairs were a big social event: he would invariably play the same records for the young women whom he had seen enjoying his attraction, and its music, the year before. It was a *present* to them because, in those years, “as a *giostraio*¹⁸ you were someone . . . you felt [great], and every night was a big night, no dead nights back then.”

Young man Tassi revealed that while his mother pressed him to find a salaried, i.e., secure, work position, his father thought that “without the attractions one cannot live well.” Agreeing with him, he stressed that

At the fair there is music, people, it is not like factory work! I did not go on with school, I love this work. With my younger sister, we always talk of music, trucks, fairs, attractions. Instead, those of our age talk of school, computers, cell phones. We are really different. . .

However, there also was the disenchanting picture of traveling attractionism drawn by Mr. Casati: for whom it was crucial to draw (and to make *me* understand) the symbolic boundary that keeps the “law-abiding” attractionists apart from the “others,” the “criminals,” whose bad actions strengthen the sedentary hosts’ prejudicial wariness towards the whole occupational minority.¹⁹ He seemed to share such an attitude, since he described those “others” in negative stereotypical terms, pointing out how “those people don’t care for honest work,” and disclaimed any relationship between them and the “law-abiding” attractionists such as himself. The distinction between the two “groups” thus results from the interpretation of how the respective members *relate* to their co-citizens and define themselves: the “law-abiding” ones claim that, unlike the “others,” they respect their hosts and the rules that concern them all as responsible citizens,²⁰ namely, that they are not, nor intend to be, outside civil society.

¹⁷This name, as all the others, is a pseudonym to protect the privacy of my interlocutors. The exception is the name of the leftist union secretary, Mr Pulliero, who gave me permission to mention his real name.

¹⁸*Giostraio* (sing. m., *giostraia*, sing. f.) is the word with which attractionists nominate themselves, especially when there is familiarity with the interlocutor. It denotes the relationship between a person and the attraction, that is, the *giostra*. However *giostraio* (pl. *giostrai*) often has a negative connotation, and when newspapers report crimes attributed to, or done by attractionists, the word used is usually *giostraio/giostrai*. In Medieval times, *giostra* was the joust or tournament of knights.

¹⁹For further elaboration of this point by attractionists, see Gobbo 2007b.

²⁰It is quite possible that this point was emphasized in relation to me and to maintain a dignified image of attractionists.

Other attractionists shared Mr. Casati's black-and-white perspective and the complaints about the multifaceted (and questionable) character of attractionists' lifestyles. For instance, Mr. Torrasi—a keen observer of his own world and somewhat disenchanted about it like Mr. Casati—argued that the work and generational continuity was nourished by the belief (that I repeatedly heard during fieldwork) that owning and managing an attraction meant to be “an independent, autonomous person,” “who is *sul suo*,”²¹ and to escape working *sotto padrone* (under the boss), as a salaried worker who “has to punch the clock” every day. Thus, being the proprietor of a traveling attraction²² entails some hard work, yet, after “pulling up” the attraction, “he can sit at the cashier desk and lean back more or less in peace.” Nevertheless Mr. Torrasi was critical of any interpretation of fairs and attractionists that underestimated the decrease in earnings brought about by the growing number of attractions, the tight competition for the “squares,” and customers with less money to spend or attracted by “too many other places of entertainment, besides fairs.” Unfortunately—he complained—the prevailing, contemporary trend among attractionists was “to live from one day to the next,” disregarding, even belittling, any effort to take a collective political stance against some of the rules unfair to these people's working interests. These bitter remarks should not be overlooked, as they highlight some of the social changes that had already taken place: Mr. Forani had switched to a well-lighted videogame installation remarking how, thanks to the sexual “revolution” (*sic*) of the 1970s, young lovers no longer needed the relative darkness of a circus tent or the confusion of a fair to display their affection. To stay successfully in business, circuses might have to host popular TV personalities during the show or cancel “animal shows” because of animal rights activists' opposition (see Gobbo 2006). Additional, and negative, changes were related to local administrations' decisions regarding space allocation or entitlement, as already mentioned.

For my interlocutors, being or becoming an attractionist meant not only (relative) economic and work independence,²³ but especially being able to use all their transmitted and acquired skills at work. Thus, parents taught their children that this mobile occupation required everyone to have (and to have learned) as many competences as possible:

To be flexible and double up as truck drivers when it's time to move from one place to the other, as labourers when the attraction must be put up and taken down, as secretaries when forms are to be filled in and paperwork taken care of and as ‘public relations experts’ . . . when they must bid for a *piazza* and deal with local administrators. (Gobbo 2006, p. 795)

²¹The expression is difficult to translate, but it is exemplary of a certain cultural attitude that some define typical of the Veneto region: *essere* [to be] *sul suo* alludes to property rights, but also to the value of “being one's own master” and “being able to keep one's own ground.”

²²It must be noticed that many *fermi e ferme* (“still,” i.e., settled men and women) have become part of traveling attractionist families, often (but not exclusively) through marriage.

²³Because traveling attractionists must arrive to the fairground within a certain time and leave it within a given time to avoid a ticket, it could be said that they also have “to punch the clock,” at least twice, at the beginning and at the end of a fair.

An interesting example is provided by Mr. Gappi, a “still” man by birth who had turned attractionist in his youth (see Gobbo 2009a). He was the son of a farm tenant who gave hospitality to an attractionist family in his backyard during the winter stop. After his father’s death during World War II, he chose “to move his life” instead of staying in the small village and grow vegetables and fruits to be sold on the market. His wife shared his “still” origin. He underlined how, as a young attraction laborer, he had learned that the important values in this occupation were thrift, hard work, and self-control, and had passed them on to younger laborers when he eventually bought his own attraction. When his older son told him that he would drop out of higher secondary school in view of joining the family enterprise, Mr. Gappi was very happy to teach him all there was to know about the family business and took him along when he went to local administrators’ offices, because “practical training would teach his son how to handle negotiations to secure a *piazza* for his own attraction” (Gobbo 2009a, p. 19). His two granddaughters had also learned many of the attractionists’ skills, even though, in order to attend school until the high school diploma, they had to go and live with their father’s parents in Bergantino, the “capital of the attractions,” as the sign at the entrance of that small town claims proudly. The two girls would join their parents during weekends, and by watching and listening to them, they learned how important it was to sharpen their communicative skills, to speak nicely to customers and engage people passing by the attraction by having them, or their child, talk into a microphone. They emphasized that no other attractionist had ever used a microphone to attract and entertain customers, adding that it was a bonus for the family enterprise. Mrs. Capari, the girls’ mother (and daughter of Mr. Gappi), paid special attention to the linguistic proficiency of her customers²⁴ and would switch from Italian to dialect if she felt that they would be more comfortable with the latter. It was a kind gesture that certainly gained her the customers’ affection (and make them return to her attraction), while it indicates how social knowledge is indispensable for running a successfully mobile enterprise.

Success, among traveling attractionists, is not exclusively measured by income but also by what they can “save” when the attraction or the trucks need to be repaired. It was pointed out that this could be achieved through learning by watching and listening. The older Bertini son explained to me that whenever he had to seek the help of an electrician or a mechanic, he would also respectfully ask how he went about solving it, because “if you do it kindly and without hassling the man, he’ll tell you what you need to know.” For him, and other attractionists, the goal was being able to tackle a future problem by himself, thanks to what he could learn from an expert well-disposed to give a hand: “to know what works,” to get

²⁴In Veneto, the local dialect (that I speak fluently) is widely used in social interaction. From the early contacts on, I always interpreted my interlocutors’ use of dialect as a specific choice meant to establish a climate of intimacy during the interviews, on the one hand, but on the other as a way to signal that I was expected to adapt to the language “rules” of the exchange, as was clear the time I greeted a family in dialect only to be answered in a neat Italian that was then used by my hosts for the whole interview, obviously obliging me to do the same.

“into the ‘mechanics’ of a problem,” and to solve it independently were the young man’s goals and a good example of agency, self-reliance, and disposition to learn that were repeatedly presented as values and indicators of attractionists.

Attractionists as Teachers and Learners

My emphasis on attractionists’ *disposition to learn* ensues certainly from an anthropological formation that oriented me towards interpreting education as not limited to schooling but as inclusive of the teaching and learning processes taking place in the family, the cultural group, the peers, and, today, in the “electronic” youth community (see Setti 2014). Along the process of enculturation, cultural beliefs, habits, and values are consciously or unconsciously transmitted that are considered of crucial relevance for the continuity of a way of life, on the one hand, and on the other, different or new ones may be actively sought and learned by children and young people who thus set in motion a process of cultural transformation and/or change that, particularly, but not exclusively, in this research, concerns those who became attractionists from a farming or a factory background.

The decision to learn a new way of life, or “to move my life” as Mr. Gappi did (Gobbo 2009a, p. 18), was often explained by the older men as related to the difficult work and economic conditions of postwar Italy and of the Veneto region in particular. A few tenant farmers realized that, while they had to wait a whole year before being paid, they could instead raise some money—albeit little—on the spot, if they had an attraction. The best known attractionists from Bergantino—among the “founders” of the local occupational and industrial enterprise—left the fields or a bicycle workshop to realize their creative innovations (often constructed with parts of planes that had been shot down during the war and laid scattered around in the countryside) and take them to the fairs (see Silvestrini 2000). One of the Gioietti brothers recalled how, during the war, his father (another man of “still” origin) had built a small horse-drawn trailer by using parts of trucks left behind after the war, and only after a while he had been able to buy a motor truck, also left behind by the Allied troops, but evidently still running. Several of the stories I collected bear witness to the difficult conditions, if not poverty, of many in Veneto who originally were craftsmen, factory workers, or tenant farmers, but also to the possibility of eking a more decent life by choosing the road and providing other countryside people and workers with some affordable entertainment.

Those men had to learn how to be, and work as, an attractionist: then, they undertook teaching the indispensable “love” and “veneration,” if not even “passion” (according to Mr. Forani), for the “craft” (*mestiere*, as the attraction is colloquially called) to their children, just like the families who had been mobile for generations. Furthermore, they taught that “this is a kind of work—Mr. Forani pointed out—that one learns *by living it*, by being on the ‘square,’” or “by intently watching,” according to Mr. Gappi. It thus was understandable that the former claimed how “the most important thing in my life is learning”: learning coincided

with his life on the road and on the “square.” I may add how, from the educator’s point of view, the confident expectation that children will learn (as in fact they do) by watching and listening is a meaningful lesson, since it tells us that attractionists’ children were seen, and dealt with as reliable, trustworthy persons, whose responsible, and affective, investment in the enterprise could be counted on.

The attractionists’ life and work not only demand physical exertion when “pulling up” (*tirar su*) and “pulling down” (*tirar giù*) the craft, as well as financial risk when a very expensive one is bought, but also an intense, emotional investment in the enterprise. Mr. Forani reminisced how

Our parents taught us to care for the attraction . . . We chose fashionable colors and painted it with great accuracy . . . [After all] an attraction is not just a working tool, it is rather an image [of one’s care for it].

On its part, the younger generation recognized that their fathers were knowledgeable and had passed their knowledge on to the children who learned to have “ambition” for, to be proud of the family attraction, as Mrs. Capari’s daughters testified. The importance of keeping attractions and fairgrounds clean and in order so as to please and reassure the customers was infallibly mentioned, while some stressed that attractionists (or, perhaps, the “good” attractionists) had “a different way to make and keep order.”

The knowledge taught and learn centered on *how* things are done—be they the attraction, the customers’ interaction, the sedentary co-citizens’ relations, and the respect of regulations. The educational relevance of “knowing how” over “knowing that” was not only interesting for the intercultural educator but also visible to the ethnographer during observations at fairgrounds. There, I was repeatedly impressed by the quiet, competent professionalism with which attractionists performed tasks: when, in one case, the adults were busy placing the attraction floor level with the pavement, the young ones collaborated firstly gauging the results by sight and then with a bubble level in order to give appropriate indications. Since trucks have to be precisely parked within the space allotted by the administration, it was possible to see a boy at its wheel who steered it according to the directions his father gave him from the street, while his mother and the little sister held a measuring tape to make sure that no mistakes were made. Or, when it was time to “pull down” an attraction, a little, dignified girl followed her mother closely holding a little beach bucket where the nuts and bolts the former was releasing were collected. One of the Gioietti teenagers, who was in charge of “pulling up” the family’s roller coaster together with a laborer’s help, went swiftly up the steel structure, keeping his balance and deftly moving from one beam to the next—under the admiring eyes of the local children. Later on, when the fair was fully under way, he beckoned me to stand by him, at the cashier desk, to appreciate how through jokes, loud music, even a raffle he enticed potential customers to come and test their driving (and bumping) ability.

Through the fieldwork and narratives’ collection, my early research questions came out somewhat modified: now, I would rather ask—with respect to the manners of teaching and learning I had observed and listened to, and to the attractionists’ awareness that it was the most effective way to pursue cultural and occupational

continuity—how relevant was the overall schooling experience for these children and their families, how meaningful was their classroom participation, and if their cultural and educational ways had ever been taken into consideration.

The older daughter of Mr. Casati was the first with whom I had a conversation²⁵ about her school experience: she had mixed feelings about it, because she remembered how in primary school some of her classmates did not associate with her, believing she was a “Gypsy,” while relations were so much more satisfactory in lower secondary school that, at the time of our conversation, she still exchanged visits and phone calls with some of those classmates. She recalled how the first grade had been the most difficult school year, because, owing to the family’s fair circuit, she met new children every week. During the years, classmates could “adore” her or keep cautiously to themselves, and she soon realized that she either had already learned what the class was being taught or, on the contrary, she didn’t have a clue about what the teacher was saying (a point made by almost every other attractionist). Thus, in one school she could have “top grades” and even be able to help her classmates in a difficult math exercise, while in the next one she could find herself “down to zero” and aware that there were things she would “never have a chance to learn.” Nevertheless, she was a good student and her arts teacher suggested that she could enroll in the university. However, as other young people narrated, she never enrolled in higher secondary school: it would have meant moving in with her grandparents, and her father could not imagine her leaving the family.²⁶ Meanwhile, her younger brother had stayed in school longer because he had been enrolled in a boarding school (that had been closed at the time of my research), a decision that had been difficult to make for his family. The younger daughter of Mr. Casati remembered how she would hit those classmates who treated her with hostility and, just like her sister, how she would either be “ahead of her class” since she had learned a specific curricular topic in another school, or “behind,” actually “discombobulated” by the disconnected learning path she and her sister had to trudge.

The narratives of the Casati sisters well illustrate the schooling experience attractionists’ children usually underwent and the “ahead/behind” curricular alternation they had encountered. The parents’ available alternatives were to leave the children with grandparents or relatives and reunite with them during weekends and vacations²⁷; to have children attend fewer schools which entailed long driving trips between the fairground and the school, four times a day, every day, until a next fair’s location made this impracticable; to enroll them in a boarding school—an option no longer possible in 1999; and to settle down and have the family man

²⁵It took place on December 26, 1999.

²⁶Her mother instead remembered that “the family needed [her] help.”

²⁷The mixed marriages between “still” young women or young men and traveling attractionists bring some practical advantages (a “still” relative caring for the children’s school education, fewer intragroup conflicts, and less revengeful competition, just to remember the positive consequences most often mentioned by the interviewees).

either bear total responsibility for taking the attraction along the “fairs’ circuit” (as Mr. Torrasi did) or for managing one at the town park, like Mr. Gappi (see Gobbo 2009a). His daughter had attended schools in the provincial town where the Gappi family had taken residence and had a very positive memory of those years; however, eager to follow on his father’s steps, she had her two daughters stay with her husband’s parents so she could work as a *traveling* attractionist while they studied to achieve the high school diploma.

Parents in their 40s were aware that the occupational sector no longer gave those economic and relational gratifications they, and their parents before them, had been used to; so they all expressed concern for the difficulties their children encountered, demonstrating their awareness that education was going to be more than necessary with the new century. As the younger Gioietti brother said:

This is the year 2000, it’s high time that the traveling attractionist be educated, so that he will know what to say to a person he must talk to.

He regretted that he had not completed compulsory education, and regardless of his success, he worried that lack of education could make an attractionists dependent on his interlocutor and less able to get along with his sedentary co-citizens.

As for the children who were still in school, they were open and proud of the little help they could give the family, because of their age, while they shied away from talking about their classmates, teachers, and school tasks, as if those were painful or embarrassing topics for discussion, and made me imagine that they had met prejudices or indifference their teachers had not been able to fend off.

Interpreting Diversity: The Teachers’ View

As mentioned earlier, at the end of fieldwork I contacted two primary schools and a lower secondary one²⁸ that had attractionists’ children among their pupils and students: my aim was to understand how teachers perceived their educational engagement with the attractionists’ children²⁹ and how familiar they were with their culture. In previous articles (Gobbo 2007a, b), I pointed out how in both schools³⁰ the teachers’ narratives developed through some relevant categories of the school culture that had characteristically shaped their perception of the “parceled school attendance” of attractionists’ children. The latter were firstly narrated as *pupils*, whose positive social attitude and good school behavior teachers praised, underlining how much more self-confident they were in comparison to their

²⁸On this occasion, only the focus groups organized in the primary schools will be taken into account.

²⁹My questions were as unstructured as possible so as to let teachers guide the conversation and put forward the themes, or the difficulties, that they saw as most relevant to their work.

³⁰The two primary schools were in two different Veneto provinces and the teachers did not know each other.

classmates (“they turn the page of the reading book without asking me first!” sighed one of the teachers), who usually welcomed them warmly when they arrived, “unlike [what happens with] Sinti or Roma children.” Possibly, what made the attractionists’ children appreciated as *pupils* and classmates was that they were in fact eager to be treated as such and participate in the class work: the teachers noticed that most of them showed an interest in what was being taught, even though they could not always follow the lessons or complete the assignments. In fact, the teachers’ narratives about the strategies enacted in class by those pupils made me hypothesize that

These children’s eagerness for school tasks is not only evidence of their goodwill, but also of knowing that if they cannot do as the other pupils do, without any problem, at least they can *try to show that they also share such an expectation*. (Gobbo 2007b, p. 495)

Still, those good pupils were “interrupted *learners*,” notwithstanding their socio-educational know-how. The teachers stated that the attractionists’ children could certainly learn but that they had considerable learning “gaps” (*buchi*), which impaired both their working with the rest of the class and their ability to follow what the teacher was doing—as the young attractionists had already admitted to me. The teachers’ narratives, and educational expectations, made clear that involvement with and success in learning required *continuity* in school attendance in order for all *learners* to proceed together, at more or less the same pace, through the curriculum. Teachers felt frustrated by their own inability to make such well-disposed pupils (*bravi alunni*, as they were unanimously represented) into *learners*, but they complained that their stay was too brief to give teachers enough time to prepare ad hoc assignments or pay a greater attention to what the “interrupted *learners*” already knew or needed to know. Then, when those pupils, and interrupted learners, went home for the day, they returned to be the attractionists’ *children* in the perception of teachers. The latter recognized that they knew very little of those families’ life and work, but they imagined the *children* confronted by “hardships everyday” since a life on the road could not provide the same comforts of a sedentary one. In the narratives, the school threshold those *children* crossed everyday became the metaphorical *limen* between a culture of freedom and daring actions and that of school life and sedentary society. Attractionists’ *children* were thus depicted by emphasizing the latter’s cultural diversity and interpreting it as resulting from a nomadic life and an occupation that set traveling families and children sharply apart from their “still” co-citizens. On the contrary, fieldwork findings encouraged an interpretation of traveling attractionists, and their children, as people who have developed a complex cultural framework able to accommodate the features and meanings of mobile as well as of sedentary lives.

Conclusions and a Proposal

On this occasion, after looking back at the fieldwork experience, and reading anew my published and unpublished material on the cultural and educational aspects of this occupational mobile minority, I chose to qualify the title of the chapter with a

metaphor that, some years ago, closed a text of mine devoted to the teachers’ narratives (Gobbo 2007a). In listening to them describing how they had to grapple with those pupils’ arrivals, departures, and returns taking place every year until completion of compulsory education, and firmly regulated by the fairs’ calendar, I was reminded of birds’ cyclical migration. Could the metaphor³¹ of people and children “of passage” suggest not only a problematizing interpretation of the minority’s occupation and social participation but also a different, more positive, educational attitude?

The metaphor did not intend to minimize the hardships the traveling attractionists go through which were too often compounded by the stereotypical and prejudicial perceptions and interactions on the part of their sedentary co-citizens. However, another facet of the metaphor stresses the expectation of a cyclical renewal that in nature is, for instance, announced by the spring return of the swallows, and highlights the positive meaning our culture assigns to an awaited *discontinuity*. The teachers testified that the arrival of the attractionists’ children does in fact announce an intermission in the daily and weekly routines of a town, to which both their classroom peers and the adults look forward to.

Obviously, the metaphor can neither quell teachers’ feelings of uneasiness, nor make the attractionists’ children learn more or better: however, it points to the complexity of cultural diversity and gives us all (and not just the teachers) the opportunity to place *our* own cultural identity and continuity—in everyday life and in school—into a critical perspective that valorizes creativity. Consider, for instance, the invention of innovative attractions by some of the Bergantino inhabitants at the end of World War II or the decision of other countrymen and women to move their lives and take the road (see Silvestrini 2000). In either case, cultural discontinuity was chosen as a positive step, so that building attractions from remnants of the war can be imagined as a way to signal the awaited overcoming of fear, famine, and death and announce peace. Italian writer Luigi Meneghello (and a member of the Resistance) is aware of this in remembering (1988) that when peace was at last attained, the “crafts” had not by chance returned to the main Padua square. Back then, the discontinuity of attractionists’ life at the same time warranted continuity in everyday life and hope for its renewal.

Looking at attractionists’ ways and work from this perspective suggests that their diverse identity has continually intertwined and enriched another diverse identity—the “still” one we call ours. Again consider, for instance, how the lives and performances of the “people of passage” (and especially those of the circus—the acrobats and the clowns) fire the imagination of artists and allow them to play with identity and representation by either highlighting those people’s discontinuity with everyday reality or ironically presenting themselves as critical both of bourgeois honorability and of the artistic call, while claiming their own freedom in the celebration of levity and challenge of gravity (Starobinski 1984; di Genova 2008). Thus, if with the circus “the noble steeds become riding horses” (Starobinski 1984,

³¹For the relevance of metaphors in education, see Gobbo 2009b.

p. 43) that mock the military parades, the same arena, by being circular, “offers multiple points of view [to the audience]” (di Genova 2008, p. 19) and to Alexander Calder the joy of playing with different roles and identifications (Painlevé 1955). Travelling attractions, circuses, and circus characters have appealed to an array of culturally and temporally diverse writers and artists.³² Their works indicate—as I propose—that cultural discontinuity is (t)here to be interpreted and make us see the world from other vantage points, rather than subscribed as a self-sufficient, “scripted,” and neatly bounded reality. To this end, the exercise of interpretation through social imagination (Greene 1978, 1995; Hanson 1988; Appiah 1996; Nussbaum 1997; Griffiths et al. 2007) is as indispensable as ethnographic findings and interpretations for promoting a reflective and critical view of cultural differences among teachers and intercultural educators.

3.2 Constructing Collaborative Interpretations: Children as Co-researchers in an Ethnographic Study in Argentina

Diana Milstein

Introduction

The fieldwork characteristic of ethnographic research includes a wide range of tasks that put the researcher in contact with and in relation to places, subjects, and objects, and originate what, towards the end of the research process, can be called the course of an experience. Ethnographic research, and the *experience of fieldwork* that it entails, always implies a researcher challenging social and cultural prejudices and making efforts to put one's own culture in perspective. It is about overcoming limitations and distortions that impose categories, classifications, and understandings, visions that are always partial and restricted. One strives to appreciate that those who live in those places in which one is conducting fieldwork have agency, interpret the world, and act in it according to their own categories, classifications, and understandings. Among those who live in these worlds are *children*, though they are not often incorporated in ethnographic research as interlocutors with *agency*. For those of us who study the educational processes in which children participate, not including them restricts our possibilities of understanding phenomena.

The importance of incorporating the perspectives of children in ethnographies was realized early on by ethnographers who included children as guides in the "exotic" worlds where they carried out their research. This did not, however, lead them to incorporate their perspectives and points of view because they were not considered "key informants" for the understanding of societies and cultures.

A preliminary version of this work was published in Spanish in the volume compiled by Milstein, Clemente, Dantas-Whitney, Guerrero and Higgins (2011) *Encuentros etnográficos con niños y adolescentes. Entre tiempos y espacios compartidos*

Considering them “informants” was a process whose beginnings date back to the decade of the 1920s. The most cited example, though not the only, is that of Margaret Mead and her study of adolescence among the inhabitants of Samoa.¹ Recently, in the 1980s and as part of a worldwide movement of the affirmation of the rights of children, sociologists, anthropologists, and other social researchers began to discuss the problem in social and cultural research of not recognizing children as social actors. Underestimating them was a problem because it implied ignoring that in any context, in one way or another, children were part of the productive and reproductive activities as well as the educational, religious, health, labor, etc., practices. Ignoring them implied silencing practices and locating in secondary or marginal places social groups who were critical for understanding these practices and minimizing analytical categories such as age and generation. Strategies for opposing ways of silencing children multiplied in social research from diverse disciplinary traditions and paradigms, but that generally coincided and some aspects: children are not incomplete human beings but rather active in the *socialization* processes. It is interesting to engage in dialogue with them and, above all, listen to them as they can teach “things” to adults. Furthermore, there is a certain consensus around the idea that ethnography, as a research focus, is particularly appropriate in terms of incorporating children when giving them a voice and an active participation—in the same way as other interlocutors or “informants”—in the processes of the production of knowledge. In this work, I am interested in going deeper into the question of the active participation of children in the processes of knowledge production inherent in ethnographic research. I also reflect on the possibilities that *ethnography with children* offers in order to enrich the processes of interpretation in educational research.

More concretely, I’ll discuss these questions through a report of experiences of co-research with children, done as part of a research project that I carried out in Argentina in 2004 and 2006. I was doing fieldwork for my doctoral thesis in an elementary school in Villa La Florida, located 25 km. from the city of Buenos Aires, capital of Argentina. I wondered about school practices in their political dimension in the context of the disorganization and destructuralization produced by the economic, political, and social crises of the 1990s in Argentina. Since the research centered on examining school practices from a political standpoint, this meant considering the school as a social environment within which to analyze political processes without restricting analysis to pedagogical, administrative, and/or legislative issues. It also meant placing these practices within general processes developing both inside and outside of the school. “My aim was to avoid limiting the political dimension to State policies or to the political use of education by governments and parties, thus allowing me to research the political tensions and social dynamics that evolve in schools and affect every day school life.

¹ “Anthropological pioneers like Malinowski, Mead, and Sapir identified ways in which childhood was worthy of ethnographic attention, and the literature grew at an increasing pace from the 1920s to the present” (Levine 2007, p. 155).

Indeed, the research focused on the politics of daily school life and showed the diversity of social roles that come together and play a part in this routine, as well as profiling a variety of political aspects, tensions, and disputes” (Milstein 2010a, p. 1). With the children, I did an important part of my field work outside the **school** that was linked, primarily, to the urban life in this community. I developed these experiences with a group of students of a local elementary school. In 2004, the participants were Fabian, a 13-year-old who was in the eighth grade; Yanina, Daniela, and Rodrigo who were 11 and were in the sixth grade; and Ezequiel who was 12 and Micaela and Marisol who were 11 were all in the sixth grade. The following year Yanina, Daniela, and Rodrigo were there again, and Patricia and Leonor, their classmates, joined us, as well as Camila who was in the fifth grade and was the sister of Leonor. All of them lived close to the school, between 2 and 9 blocks away. The houses they lived in, the composition of the families with whom they lived, the jobs of those who maintained the homes, the time of residency there, and their performance in school all varied, as I will describe further on. Each of these children had a prominent role as interlocutor in my work process. Likewise, as members of the collaborative group, they participated in activities that involved moments of fieldwork—collection of data and analysis—and in the writing, as coauthors of the texts. In both texts that we wrote and organized as a group, their own testimonies and those of the others were organized through the transcription of interviews, fragments of commentaries, plans designed by them, as well as photographed images. In this way, I was able to get to know and register versions and interpretations of life in the local and in the school from the perception that they had of the social world dominated by the feeling, saying, and acting of the adults, as well as to rethink aspects linked to questions such as *reflexivity*, the ways of constructing experiences, authorship, and writing.² The analysis that I am proposing requires two fundamental and unavoidable theoretical frameworks. The first is relative to children as categories that are socially and culturally marked and the other to the consideration of every space in terms of its social dimension. The former, as can be seen by the incorporation of the plural and the gender difference, I consider as settled—in the sense that in this work I do not discuss it—a still open process and fully developing debate on the *denaturalization* of the notion of infancy as biological, natural, relatively homogeneous, and historic. Children, in this work, refer to social subjects with positions in the social structure according to the intersecting variables of class, ethnicity, race, gender, nationality, age, and generation. A fundamental aspect of their identities as children is constituted in their relationship with adults. There is a recognition, just as in all the other social actors, of the capacity of agency and relative autonomy, which includes the capacity for reflection and interpretation and to change and have influence in the events and situations in the life in which they participate.

When I refer to the *space* in terms of its social dimensions, I am not thinking of social phenomena exactly as they flow about the space but rather of the social phenomena and the space, both constituted from a base of social relations. In this

² Some of these topics are developed in Milstein (2006, 2008, and 2010a).

sense, the spatial organization of the society is integral to the production of what is social and not simply a result of it. This is implied in terms of geography, history, and politics (Massey 2007, p. 2). Henri Lefebvre posed space as a conceptual triad that includes spatial practice, production and reproduction of places and spatial groupings characteristic of each social formation; the representation of space, the order imposed by spatial relations and the knowledge of the order and of the relations; and the spaces of representation, containers of the most complex symbolisms (1991, p. 33). These three dimensions shed light on the ways in which the spatial organized the narrative of children. It is also relevant for the analysis that I am suggesting here, the distinction between space and place in as much as we consider that “space is a practiced place” (de Certeau 2007, p. 129):

A place (lieu) is the order (of whatever kind) in accord with which the elements are distributed in relationships of coexistence. (...) A space exists when one takes into consideration vectors of direction, velocities, and time variables. Thus space is composed of intersections of mobile elements. (De Certeau 2007, p. 129/1984, p. 117)

In this way, De Certeau—inspired by the differentiation made by *Merleau Ponty* between “geometric space” and “anthropological space”—argues that spatiality is constituted by the collection of practices of those who live, move in, and experience urban life. And these practices are those which give movement to the places and create the space as to link it to actions that give it the present and past existence. In this sense, de Certeau adds that stories also produce transformations of places into spaces and spaces into places. They animate and reanimate and can even invent them. In a way, what I experienced in my work with the children was, in part, this process of the “fabrication of spaces.”

The Place and the Children Co-researchers

Villa La Florida has 30,000 residents. It is located around 25 km. from the city of Buenos Aires, 2½ h in public transportation and more than an hour by car. It is part of Partido de Quilmes, one of the most populated and extended areas in the south of the Buenos Aires metropolitan area. Its urbanization had its origin in real estate between the 1940s and 1950s, a period of industrial development and intense internal migration that also meant changes in the life of the population and that included the installation of businesses, schools, health centers, churches, etc. The first industries—brick, ceramics, glass, and iron—were fundamentally linked to the process of rapid urbanization. Along with population growth, housing increased, and in the central zone drainage, sewage lines, electricity, and gas were installed and some streets were paved. If up until the 1950s this zone was considered rural, in the 1970s it was, as the residents called it, “*a prosperous laborer neighborhood*.” In the 1990s, there were very abrupt and unexpected changes in this area that had become accustomed to work-based growth and development. The biggest factories that employed a large population of men and women who lived there closed. Small

businesses and shops reduced their activities and, in some cases, closed. For the first time, the region experienced massive unemployment about which, to this day, there are no precise records; the estimates correspond in that unemployment and reduced employment at the end of the 1990s affected 40 % of the economically active sector of the population.³ Many of the residents lived through this situation as an end to a progressive growth of opportunities and possibilities and the beginning of a social descent with an uncertain and discouraging future. At several points in time, sectors of the local society protested in the streets against the closing of factories and demanded work. On the other hand, some women were incorporated into an assistance program that was organized by the government of the province of Buenos Aires as the distributors of the so-called Life Plan,⁴ which not only guaranteed food for their children but also gave them other benefits. As time passed, some of them became involved in neighborhood political work. There was also, in this work, the presence of distinct local leaders who divided and disputed the zones over whom they were trying to exercise their influence through the delivering of subsidiaries and social plans. This division of zones included the health center and the schools.

The school attended by the kids I worked with was school N° 40 and was called *Islas Malvinas*. I did bulk of my fieldwork research there. It was the first school in La Florida in 1947 and was opened through the initiative of a group of residents. Throughout the 1950s and 1960s, the enrollment experienced constant growth in keeping with the increase in the population that lived in the zone and which resulted, furthermore, in the creation of more elementary schools. The majority of the students who went to this school were from the closest neighborhood and were generally children of local factory workers and merchants from the area. A significant percentage of graduates—compared to other similar schools—enrolled in junior high schools; some of them completed it and everyone knew the names of those who had gone to the university.

This stage lasted through the middle of the 1980s. The situation of this school, just as is the case of the majority of the public elementary schools of the Buenos Aires metropolitan area, changed radically in the decade of the 1990s. The school was impacted by the economic and social changes suffered in the area and by the negative changes in the school system itself.⁵ Public funding for the repair and

³ In order to have an idea of the dimensions of this percentage, one must consider that during the same period, the national average of unemployment and underemployment oscillated between 25 % and 30 %.

⁴ The *Plan Vida* (the Life Plan) was organized and subsidized by the Provincial Council of the Family and Human Development of the province of Buenos Aires designed to distribute milk and cereals to pregnant women and children younger than 5 years old.

⁵ In 1996, this elementary school was transformed into a general basic school by a law passed 2 years before, a law meeting resistance by the majority of teachers' unions. This implied the incorporation of teaching and non-teaching personnel and of students who up to this point attended junior high schools that worked in other buildings. In order to accommodate these students, there was a precarious and hurried expansion of the building that did not meet the basic necessities for the institution.

maintenance of school buildings was reduced, teachers' salaries were disregarded, the number of students of unemployed parents and who came from the poorest parts of the region grew, and the number of students whose families had work diminished. This situation blurred the almost homelike atmosphere that the school had had among the neighbors' locals, especially those who lived near the building, and the perception outside the school was that the links between the school and the neighborhood had eroded. This experience of the fracturing of links was, in part, what led me to bring together a group of students to work with me on my research. Briefly narrating how I arrived at this decision is no minor detail. Originally I had planned that my tour of the area, visits to the other scholastic and non-scholastic institutions, and the interviews of the residents would be made with the orientation and accompaniment of teachers, auxiliary workers, and relatives of the students from the school.

During the third month of my fieldwork while I reread my notes, I noticed the importance of certain conversations that, on various occasions and casually, I had had with different children. In my research project I had defined the adults—teachers, helpers, technicians, relatives, authorities, and neighbors—as the privileged interlocutors because I had assumed that they were the ones involved and interested in the political framework of daily life. But while reading attentively my exchanges with the children, I noticed that they allowed me to establish connections with topics that were of great interest to my study. In addition to this discovery of the children in my notes was added my difficulty connecting with residents and the enthusiasm of the principal and some teachers when I presented them with the idea of organizing a group of children as a team to work with me on my research. The first team took about 3 weeks to form with its seven permanent members. The teachers and I called the first meeting, and eight girls, two boys, four mothers, and two fathers attended. On that first occasion, we had conversations primarily among adults. After this first encounter, some of the children came back and others did not. The fathers did not visit us again and some mothers came for their children at the end. Finally, the day that we organized for our first outing, the group had three girls and a boy. On the next occasion, four more members joined us. Yanina, Daniela, Rodrigo, and Ezequiel were accompanied by a relative and came on a regular basis, while Fabián, Marisol, and Micaela participated sporadically. The following year, when I convoked them in order to organize the second group, Yanina, Daniela, and Rodrigo attended. Ezequiel and Marisol were no longer in the school and had moved. Micaela was busy a few afternoons in the church so that she could come only sporadically. Fabián preferred not to join because the previous year his father and brothers had made fun of him for his participation: they considered it to be “an activity for women.” Yanina and Daniela decided to call two classmates and thus Patricia and Leonor joined us. Camila—the younger sister of Leonor—came to me during a recess when activities had already begun and asked to join the group. Fabián lived with his father, mother, brothers, and an uncle in an old, slightly deteriorated house that had belonged to his grandfather, an Italian immigrant who had passed away. His house was across the street from a bar frequented by men where his father, who worked sporadically,

went daily. His mother worked as a domestic worker and his brothers participated in activities linked to “*choreo*”.⁶ Both his father and his brothers made their disapproval clear in different ways over what Fabián did with the group. Yanina lived with her mother and father, natives of Corrientes—a province situated along the coast of the country and with two old sisters and one younger. Her father worked as a graphics laborer in a press and her sisters worked in a beauty salon. Her mother attended to the domestic chores and her brother was in the fifth grade, also in the School No. 40. Both the mother and the father expressed, in different moments, their enthusiasm for the activities that Yanina was involved in with me and, on several occasions, we used their house as a meeting and work space. Daniela lived in the same house as Rodrigo. She was the sister of Rodrigo’s father, his aunt. Both of them liked to introduce themselves that way. Under the same roof lived the father and mother of Daniela—Rodrigo’s grandparents—and Rodrigo’s parents. Daniela’s mother kept busy raising both of them and her other children; we met up with her in different moments and she was always attentive to what we were doing. Daniela’s father fixed refrigeration apparatuses; Rodrigo’s was a volunteer fireman and worked doing odd jobs or “*changas*”.⁷ Ezequiel lived in a rented house with his mother, father, and three older siblings. They had all been born in Santiago del Estero, a province situated in the center of the country, and his mother was very happy living in this area because she thought that it provided more and better opportunities for her children. Marisol was born nearby, and when she was 2 years old, she moved to a house that was loaned to them by a relative in La Florida. She lived with her mother, father, and one older brother and one older sister. Those who maintained the home were her mother, who “worked in a beauty salon”; her father, who “worked in a mechanic’s shop”; and her brother, who helped her father. The oldest sister took care of the house and of Marisol. Micaela had arrived with her family to La Florida 2 years before. There were five children and they lived with their father, mother, and an uncle who “worked in politics.”⁸ Patricia lived with her father and mother in a small rented house. Her family’s nationality was Paraguayan which was for her a source of pride. She was always sorry that she only saw her mother on the weekends because she worked as a domestic employee and slept in the house where she worked. Her father worked in a “junk store” that was very close to the house and he took care of her. It was always difficult for her to get her father to let her participate in the activities of the group. I went personally several times to guarantee that I would take care of his daughter. Leonor and Camila lived in a room of a house with their mother and a younger brother. The mother sometimes was employed in domestic work and had a partner who always visited

⁶ In the colloquial language of the River Plate area, the term “*choreo*” is a lower kind of theft, done in a stealthily, without violence and on a low scale.

⁷ The word “*changa*” means temporary manual work that was sporadic and informal, done by a worker in exchange for a modest sum, with no permanent connection to the contractor.

⁸ This expression originated in the 1990s in Argentina among poor and unemployed sectors in order to describe the work that some people did for governing politicians on the national, provincial, and municipal levels.

her and who worked as a “*cartonero*”.⁹ On some weekends, Leonor and Camila collaborated with their mother on the work of classifying the refuse. On other weekends, they went to the house of her father, who lived with his spouse and more of her siblings in an area closer to the city of Buenos Aires.

Fieldwork with Groups of Children

The fieldwork that I did with groups of children included a number of activities that we did both in and outside of the school building. The school backed up what we did and some teachers and assistants collaborated, but the majority of the activities occurred outside school hours. We got together once or twice a week, sometimes for 2 h; other times, the activities lasted up to 4 and 5 h. We used a day of the weekend and afternoon hours, after school had been dismissed.

“During the first encounters with both groups, I proposed activities aimed at achieving an exchange of ideas with the group of children, in order to decide what we would do together, who would participate and how we would organize our activities. The topic that integrated the collective preoccupations with both groups was getting to know the place in which they lived through what people from Villa La Florida could tell them. I told them the topic of my research; however, it wasn’t that story which enthused them but rather the concrete activities- visiting places that they had chosen, interviewing and recording, photographing- which they assimilated with those television journalists who do reports in the street. They liked to be in the school outside of normal school hours: “*we have the school to ourselves,*” they would say. We did practically all of our activities outside of school hours using spaces that were not used typically for school activities. During this first period, we were establishing the roles of each one of us. This was fundamental for me because I had to find concrete ways of preventing my position from becoming what “naturally” was produced in interactions: teacher, caregiver” (Milstein 2010b, p. 72).

Both groups carried out activities of observation, participant observation, recorded interviewing, photographic registry, the design of plans of the area, readings and analysis of the recorded registers and of the photographs, text selection tasks, and writing for the creation and edition of their texts.

The group of activities of the first group was oriented towards finding out what the adult neighbors thought about the place they lived in and of the School No. 40, as it was before and as it was now. The second group centered its work on finding out what children like them who attended their school and those who had stopped attending thought of the neighborhood, the schools, their parents, and families and their work. The development of the project, for both groups, was designed in three stages. The first stage was dedicated to the training of the group

⁹The term “*cartonero*” alludes to the job of collecting cardboard, paper, and other urban residuals for recycling, done by one’s own initiative at the margins of the work of collectors of refuse and in which were involved families, including children.

for fieldwork; the next, information collection; and; the third, processing the information and written production. I use the term training in the sense of preparation and rehearsal: preparing for the development of a task in a group, becoming integrated as a team, bringing interests together, and finding appropriate means of communication. The rehearsal of activities was aimed at learning to look and to take pictures, ask questions, respond, tell, and listen. Collecting information involved a series of activities which included visiting places, drawing, photographing, interviewing and recording the interviews, and getting together to talk about it and give an account. In order to process the information, the activities that I proposed consisted in listening to recordings and commenting on them, reading the transcripts of the recordings and pointing out what most interested them, looking at photographs, exchanging anecdotes, and proposing a selection of images.¹⁰ The first meetings, both with the first and the second groups, were held in the school building. We used them to talk about the places we would visit, the people we would interview, and the tasks that each of us would carry out. Also as a group, the children drew a map of the neighborhood. Both groups took up the drawing of the map again at various moments and they finished it during our last meetings. These drawn maps, along with everything the children had talked about and told while they drew, enriched our communication and my possibilities for capturing what they perceived and interpreted in terms of the lived space.

I understood that every space referred to was important in that it was recognized as a “place,” that is, as a space that the people of the area and these children had charged with meaning because, in one way or another, they were linking the people and producing a senses of belonging (Cresswell in Den Besten 2010, p. 182).

- Camila: What I like the most is interviewing people
 Diana (researcher): And you?
 Patricia: I don't know. . .
 Leonor: I like visiting a lot of places and being with people. Because I'm not allowed to go out much.
 Camila: The furthest that we've been is the house of my uncle Miguel
 Yanina: Which is really close
 Patricia: I almost never go out of my house because now that my mom is working and it's just my dad there, he doesn't let me and he's afraid of the streets
 Daniela: Me, I go out along the streets alone
 Yanina: And sometimes to the house of a friend or Daniela's.
 Diana: You two don't visit each other much?
 Yanina: No, not much.
 Patricia: It's because our parents won't let us.
 Yanina: My mom and dad don't like it much because of the things that happen in the house.

¹⁰ A more detailed account of these experiences is published in Milstein 2008 and 2009a.

Camila: My mom doesn't like it much either.
 Yanina: They let me come here because we came out with you
 (Transcript of fieldnotes on a work meeting with the group
 of children. 10/30/2005)

Thus, I tried to understand their ways of being in the world in the complementarity of what they did, said, and drew. At the same time—following the reflections of *Johannes Fabian* (1983, 2007) on the “denial of co-temporality (*coevalness*)” as a critique of ethnographic work—I asked myself: How to avoid that these drawn maps become sealed off as objects of representation? How to understand these drawings without reducing them to “infantile” performances? How to access to what their authors, subjects of my research, were teaching me? How to incorporate what I learned from them? I understood that a path towards responding to this questioning consisted of treating them as documents that, far from being “independent” or enjoying certain “autonomy” as such, ought to be understood within the social relationship in which they had been produced, that is, as part of our *ethnographic encounters*. The trips we had taken around the area included planned visits to some places—the health center, the site of the volunteer fire fighters, shopping centers, the plaza, and among others—and walks along the streets and green areas. During these trips, with both groups, I experienced the point at which the *dialogic interaction* with the children went beyond the verbal and even the gestural:

United to the temporal variable, space introduces a movement variable. The distance that separates object bodies or areas is overcome by means of movement. This refers us to the cultural and social modalities that every act of displacement in space implies: trips, trajectories, itineraries and the networks that enervate space convert it into an element of great plasticity but also into instruments of measurement among groups, individuals and differentially situated topos. (Provansal 2000, p. 6 my translation)

I understood the relevance of following them in their ways of getting around places, both in their manners of moving and the direction and sense that they gave to their trajectories because it was this moving through space that revealed ways of living the space, as de Certeau (2007) said. And these ways later were articulated in the task of selecting photographs that they had taken.

As I indicated above, the last stage of work with the children consisted in processing the information. Concretely, both groups produced texts that they elaborated with fragments of the interviews they had conducted and the photographs they had taken. The process of selecting photographs was also important for understanding the place that spatiality had as an organizer of experience which they related in the texts.

Places, Spaces, and Stories

As I mentioned previously, both groups drew a map, which was done throughout various encounters with the discontinuous participation of the members. In both cases, the idea of making drawings was mine and carried out by the groups happily

and with dedication. The materials that they used were very few and quite limited. The medium they used was rag paper (unprocessed paper that is used for wrapping, donated by the paper factory close to the school) and drawing materials; thick felt-tipped pens in green, black, blue, and red; fine felt-tipped pens in a variety of other colors; black pencils; and colored pencils. In both cases, the children took the paper from the roll and extended it over several tables placed together. Each of the maps, in its natural size, measures around 2 m long by 1.5 m wide. The first group began this activity during our third meeting. The idea came up when they suggested that we begin fieldwork in the plaza. By their gestures, way of speaking and explaining, I felt that this beginning had an unquestionable logic: the plaza was the heart of Villa La Florida. Later, I discovered that it was a perspective common to many of the residents, in spite of the information to the contrary that I had previously gathered from the adults of the school. And so, I suggested that they draw a plan of the zone in which the plaza was located so that I could orient myself on the walks that we would take together. They drew for two afternoons, for about 2½ h each time. The locations of the constructions, the directions, and the orientations of buildings all corresponded with reality. It was a useful plan for getting around in the zone they had drawn. Nevertheless, not all the streets and blocks were detailed in the same way, and the sizes of the various drawings were not proportional in relation to the actual sizes. I recorded the conversations we had while they drew and I also took notes, which helped me not lose perspective on the context in which it all was done. Several times in the recording, there were various comments registered by the girls who were worried about my disorientation in this place, asking me to look at how they were drawing the places furthest away, for example, the location of the middle school No. 11 and the candy factory. It could also note that the plan drawn by the first group did not include drawings of people. This decision was made while they drew when one girl saw another drawing a little boy playing in the plaza and told her not to because if she did, there wouldn't be room to see *what the plaza is like*. The girl erased what she had been drawing and there were no other representations of people. I understood that the implicit agreement that they had made was that they would only draw that which was permanent that which does not move. This was very interesting to me because without resorting to drawings of people, activities and relationships could, nonetheless, "be seen" in this drawing. Without modifying the broadly shared idea that a plan of an urban zone has streets, green areas, and important buildings, these children were able to animate the space. This occurred, for example, with labels on the houses that were drawn, particularly those that had proper names, the names of the children drawing—Nicolás, Aldana, etc. In the conversations that we held while they drew, they explained to me that the map extended towards the four sides of the plaza in accordance with the place in which each of them lived. It was the zone known by them animated by the presence of other houses, businesses, factories, schools, clubs, and society of promotion. In the plan, the size of the space that each of these places occupied, the ways in which the children highlighted them in colors and what surrounded each one, constituted a story of the place, a "fabrication" of it.

Photo 1 A view of two downtown blocks (drawing done by the first group)

As one can appreciate in Photo 1, on both sides of the street 836, the houses of several of the children are drawn and a rectangular figure that indicates the land that the candy factory occupies, as the only building on the block, with trees on one side. Some of these children, as they placed their names on their respective houses, discovered that some of the others lived very close by. They did not all know they were neighbors. But all of them had played at some time on the candy factory's land that, though it was private property, sometimes functioned as a plaza. Behind the candy factory, they drew the street 835, one of the most important streets in the neighborhood because of the circulation of public transportation. This is why the *bus stop* figures in as the place where the residents waited for the bus. During our walks along these places, we never went down the street 835 because “*there is nothing to see,*” “*they could rob you there,*” “*we don't know anyone, they're not from this neighborhood,*” and “*my mom doesn't let me.*” These commentaries converged with indications that some teachers had given me on my first days doing fieldwork. One of the members of the psycho-pedagogical department of the school had told me categorically:

I know because I am the principal of an in-home special education school and my teachers always go and I know the problems that they have. You have to be careful with even what street you take. If you take 835 even the taxi drivers warn you that, no matter what, they do not stop. You always have to think of how to go, along which route. Going in your car is a problem, you are exposing yourself to robbery. We don't drive alone in certain areas, the teachers know well that it's better to have a good relationship with the leaders, and then you can go peacefully through certain areas and know that you are protected.

This general criterion had already been assimilated by the children; for that reason, that is where the zone possible for visiting ended. However, on the other side of 835 street, they also drew two buildings—the middle school that many of the graduates of School No. 40 attended and the promotion society, an old neighborhood association—and a house with the name of one of the children. The drawing of this house was very suggestive for me in terms of thinking about how the knowledge of order and relationships imposed upon ways of representing space. But, at the same time, on the journeys that I took with the children, I learned the importance of differentiating positions since this block was the limit of our walks, but not the border of what was known by the children.

The parts of the plans illustrated by Photos 2 and 3 show houses of the children and also some businesses: stands, an ice-cream shop, a lumberyard, the “Bar poker,” a beauty salon, and a bar “La mendocina.”

“Bar poker” grabbed my attention because there was no visible sign with that name. It was the place where some men got together to play poker, among them, relatives of some of the children. Many stories around this bar and the lives of some relatives came up later. It was not the only bar that was open in the area, but it formed part of the daily social life of some men and of the families of these

Photo 2 View of the intersection of the street of the school with the route that connects with Buenos Aires (drawing done by the first group)

Photo 3 View of an intersection and the location of businesses and bars (drawing done by the first group)

children. And for them it was a reference point for finding their family members, and, at the same time, as children, they did not yet belong. This place clearly differentiated the adult masculine world. Thus, we can also underscore another bar: “La mendocina.” This place was different; it was prohibited. The one who put its name there was a girl and several of the children laughed. I registered the laughter but did not understand it. I also did not ask them why they laughed. But I had already seen it because it was just across the street from where I would get out of the bus, two and a half blocks from the school, and it had always been closed. After awhile, I found out that it was a bar that opened at night and was much frequented by prostitutes. That this reference had been included caught my attention. A few days later, when we went on our first outing and walked around the plaza, they indicated a place to me that I should not go near, and this indication was the key to understanding the reference on the map. One girl told me: “*We aren’t going there where those kids are smoking because that is the red-light district.*” “La mendocina” undoubtedly operated as a space of representation of we think of the triad proposed by Lefebvre (1991): spatial practice, representations of space, and lived spaces. I have tried to show how the “indicators of *outings* and indicators of *maps*” have been relating to one another (De Certeau 2007, p. 131) during these ethnographic encounters with the children. The doing and saying became coordinated through spatial organizational axes that marked the limits and borders. The marks of the inside and of the zones that should not be mixed, both in the area in general and in the plaza specifically, were those that the children, just as the adolescents, young people, and we adults use as rules that differentiate what is dirty from what is clean, pure from impure, order from disorder. Here we recall the attentive and detailed treatment that Mary Douglas (2003 [1966]) gave to these differentiations in order to understand the relevance of the reflexive contribution with my interlocutors. This had a critical influence on the analytical and argumentative development of the monograph that I wrote as a result of all the research.

The Children as Coauthors

The books that I invited the children to produce were printed on half an $8\frac{1}{2} \times 11$ page on common paper and in color. The first, “Looking for something more. Reading the story of our neighborhood and our school,” has 48 pages. The second, “How we see la Florida”, has 40. The cover of the first has the design of the plaza taken from the plan drawn by the group of children, above it, the title of the book, and below it, the names of each of the authors, including myself as coordinator. In the case of the second book, the design covers the front and back covers and includes explicatory notes. On the first page, there is a photo of the entire group and the names of each one of them. The next page in both books is the table of contents. The first book is divided into seven brief chapters: Introduction, Acknowledgments, We know the plaza, Anecdotes from the firemen, Fernando: our “patriarch,” Our school, and How does the neighborhood feel? The other book has eight sections: Introduction, The Schools, The Plazas, The Families, The Parents’ work, Politics, Legends of Fear, and Closing.

The short chapters are organized with fragments of transcribed conversations, parts of the drawn plan which is presented at the beginning and some photos. These images, in addition to illustrating the written part, added an aspect of what was lived and imagined by the group. Keep in mind the dialogue that I transcribed above in which Rodrigo said that they were looking for *something more that they did not know*. This phrase is very significant for me in terms of the collaboration in the authorship of the books because it makes the shared position explicit in that social world that we went out to explore and about which, above all, we decided to tell.

The most descriptive/narrative of this *something more* appears especially in the written part; the lived part showed up particularly in the photos and the imagined, above all, in the drawn design. The final chapter of the first book—How does the neighborhood feel?—is composed of seven fragments of narrations of interviewees, three photos, and four images of parts of the drawn plan. The fragments narrate brief stories in first person related to the arrival to the area, the process of urbanization, the health center, the river “when its water was crystal clear,” and the neighborhood community of those adults who were interviewed. In the four images, the zone in which several of them live is represented, with their houses drawn, the stands where they often buy things and the small candy factory, and the adjoining space that the adults call a “vacant lot” (see Photo 1). This space, as can be appreciated in the image, is represented by two trees and a flower. We went through there twice with the children and on both occasions; they ran and jumped there in the same way that they did in the plaza and then they told me it was a place to play.

Photo 4 Micaela, a girl researcher, at the front door of Medical Center of Villa La Florida

The photograph that they chose of the health center abounds in life (Photo 4). We recall that during this visit the most important activity was to play doctor and patient, and in the image is Micaela—the doctor—saying goodbye to Yanina, her patient. Although this game is not mentioned in the book, the image of this girl in the door of the sanitary unit is revealing in that it is an eruption of play and a redefinition of the habitual image of a sanitary space.

The meaning that the children give to the situations, spaces, and people is sometimes similar to that of the adults. In these cases, their perspectives tend to be relatively conventional. But on occasions, as in the case of the “vacant lot,” it is presented as a spontaneous contraposition to the naturalized sense of adults.

Vacant lot means empty space, and in the common sense of the word, it is a land where there is nothing meaningful, of value, useful. It is a place that is not even good for recreation, and, in urban areas, it is hoped that it becomes productive. It is precisely this space, thus defined, that the children experience as a meaningful, productive, and pleasurable place. This is why this drawing (see Photo 1) provokes a perception of enjoyment that being in that place produced. When we perceive, we understand or enjoy a representation. It is as if we were perceiving, comprehending, or enjoying the represented object (Sperber 1992, p. 26). This confirms that this way of representing the space contiguous to the factory was appropriate in the way that it

was felt and meant. At the same time, it denotes a frank opposition of meanings between the perspective of the adults and that of these children who, far from being derived from some infantile distortion, emanated the way in which the space is perceived and lived. Something similar probably had a bearing on the fact that the children discarded all references to the river as a place that was polluted, dirty, and ruined and chose the only adult voice that talked about it from a childhood memory, as a place of pleasure and play:

An anecdote from when I was Little, but that was many years ago: I was six or seven years old and I had a friend next door who was nine or ten and another who was eleven. One day we went for a walk with her parents. We got to the river with all the grass cut which was beautiful, a park, gorgeous. And we began to walk along the banks. The parents walked on one side and we walked on the other. And the river got wider and wider and deeper and we couldn't find each other. And along there we saw a horse in the river and we looked and the river was clean, clean as drinking water, and so you could see all the rocks and fish and a horse. And so when we saw that a horse was there it occurred to us that we could cross. And we crossed the river.

Former student and assistant of the School No. 40 (Milstein coord. 2004, p. 46)

The selection of the written fragments, images, and titles was done, as I mentioned in the previous section, without me intervening for explanations of the reasons for the selections or rejections. But, as can be seen by this example, it was neither random nor whimsical. As the children selected fragments and images, I noticed a coincidence, a sort of implicit logic that they did not express with arguments. How was this coincidence, this coherence, these memories, possible? These questions are not easy to answer. It is helpful to refer to ways of organizing experience, emotion, and affection intimately anchored in the body. Merleau Ponty (1984) very clearly explained the conclusive relationship between our bodies, daily experiences, and our perception processes which include the apprehension of what he called the lived space. Bryan Turner (2001, p. 13), building on this idea, suggested that the perception of external reality includes corporal experiences of the physical world and the capacity to manipulate the daily world through motor activities. Furthermore, he considered language as necessarily embodied in these material forms of the potentiality of the body. Based on that, thinking, doing, and feeling should be considered practical activities that require our bodily presence. The case of this physical space that the adults represent as vacant lot and the children with a drawing of two trees and a flower evidence opposite experiences, criteria, and perceptions. The adults have embodied a predisposition to see urban spaces with utilitarian and instrumental criteria. The children, in this case, anchored their perception and their language in their capacities to manipulate and apprehend the daily world from and with their bodies. As Peter McLaren would point out, their bodies incorporated and generated ideas (1994, p. 91). We could even accept that, in a major part of these books, it is a representation of an *embodied* reality or, in other words, the embodied apprehension of aspects of reality. This reveals the potential of the reflexive nature of exchange with children when we accept the challenge that is implied in thinking, orienting ourselves and questioning ourselves, with their frames of reference, in a process of interaction, differentiation, and reciprocity between our reflexivity and theirs (Guber 2001, p. 53). The processes of interaction stimulated and fostered the ways of intersubjective relating,

fundamental for producing anthropological knowledge. And in both texts, this communicative experience of fieldwork is inscribed, interwoven with the narrations. Thus, that which is perceived, lived, thought, and represented in the books through their distinct moments and actions confirms the children's agency in their capacity for symbolic production and in the organized constitution of their representations and beliefs. And at the same time, the idea that this elaboration of meanings is part of a symbolic system shared with adults is strengthened.

Reflexivity, Children, and Researcher

Children tend to be social actors whose reflexive capacity is subject to diverse polemics that are not often made explicit. Simply speaking, in the same way that other subjects belonging to subordinated social groups, their interpretations are not valued or are less valued for the simple fact that they belong to the community of children.

This belief is closely linked to a way of conceiving socialization as a stage that lasts from birth up to adulthood, in the best of cases. From this perspective, children are considered subjects in the process of, or on the way to, or simply incomplete beings. It is clear that this conception contains, without completely stating it, an imaginary of a finished process and a point of arrival and completeness, which is the adult. Not just any adult, but we won't go into that here. What I am interested in pointing out is that one of the most prominent aspects of what children lack, from this perspective, is the abilities associated with intellectual activity. This belief is at the base of every discussion about what and how children think—including their capacity for abstraction, the use of languages, the limits of their interpretations, etc.

Conflicting with the idea that children, and only children, are still being completed by socialization, I began to conceive of socialization as a process that covers the entire life span of individuals. This does not mean that we are permanently in the process of socialization—children aren't either—but rather that we sustain, during diverse periods of our lives, actively, distinct socialization processes. This process is very close to us, as ethnographers, who, as part of our work as researchers, intentionally submit ourselves to socialization processes during our fieldwork in order to study and understand diverse social worlds. And during these processes of socialization, we are intentionally very attentive to the possible distortions that can affect our comprehension—distortions derived from *ethnocentricities*, epistemo-centricities, gender-centricities, adult-centricities, etc. Of course, this is not our attitude when in daily life we pass through socialization processes in which we are reflexive and, at the same time, we embody distortions that we are appropriating.

In the same way, children, human beings who are very interested in participating actively in socialization processes, develop reflexive thought. Just as in the case of the adults, it has perceptive distortions that do not take away the value of their interpretations. On the contrary, just as I tried to show through my work with them,

their reflexive thought can shed light on the notions, ideas, feelings, and perceptions common to the social world to which they belong. We can also approach categories that give visibility to phenomena that are unexpected by others, including researchers themselves. And finally, these categories can help us understand how we organize narratives and make sense of our experiences. In the analysis that I am developing in this chapter, what became evident is the role that spatiality plays as an organizer of experiences and how the distinct ways of appropriating places and representing places, while “telling” us about social relations, also model them. It also became clear how children participate quite actively in the laborious social task of “fabricating” places. Undoubtedly, this cannot be understood as an infantile way of organizing experiences. This is a social mode that crosses age and generation barriers and can open up a panorama for us to think about reflexivity in our ethnographic encounters and also with children.

In this sense, I am reconsidering the way that the group used the categories inside and outside to show the relevance that it had in the ethnography I wrote. We recall that the group rebaptized the residential area *Villa La Florida*: instead of using the name “park,” they called it “those from the inside.” They took the fact that the children who lived in this neighborhood had never seen another neighborhood as the principal fact that the term “inside” was used as an indicating social marker that should not be confused with *those from the inside*, and as an indicator of those “others” who differentiate themselves from “us.” They considered this to be the case because in contrast to their own case, these children were not allowed to leave their homes by themselves and walk or hang out along the streets. Interestingly, when applying this classificatory rule, the children placed themselves outside and it was the “others” who remained in an inside marked by enclosure. This was very different from how they used the outside when they represented *what they call the villa*. In this case, the outside remained fixed by the inexistence of human and social marker: they did not draw human figures, houses, businesses, schools, streets, and automobiles. And with respect to this outside, they remained inside conforming to an “us,” those from Villa La Florida, also made up of *those from the inside*. The writing of my ethnography included continuous reflections that sent me again and again to the moments and ways in which the inside/outside dichotomy emerged in these shared experiences of shared processes of the production of knowledge with these groups of children. It also appeared, of course, in my readings of academic works that supported the ideas that I was sketching and in my dialogues with myself, trying to control my so-called expert common sense about these ways of classifying socially. The categories outside and inside were very useful for me to describe, to analyze, and even to speculate with. Thinking about these categories enabled me to show that the school cannot be defined as an inside opposite of the world outside—street, family, government, etc.; I described through various scenes different ways of interpenetration between inside and outside the school, and I organized part of my argument around the presence and incidence of distinct political fronts in daily school life. Being there alongside my collaborators and going back with my imagination, I could achieve every time “the passage from the reflexivity of the researcher-member of another society, to the reflexivity of the inhabitants” (Guber 2001, p. 53), vital for producing anthropological knowledge.

The ethnography that I developed with children should be understood as a collective and cooperative knowledge practice. The anthropological work of co-research with children demands as a first condition acceptance that children are generators and bearers of valuable knowledges for anthropological knowledge and as a second condition that they make full and creative use of the reflexive quality characteristic of language. This implies recognizing and potentiating their **agency**, once again confirmed in the experiences of our work. Adults participate, intervene, lead, share, obligate, allow, etc., but they are definitely not the agents of the learning processes of the children. With this final affirmation, I distance myself categorically from the concept of “educative agents” commonly used in academic, political, and media discourses. In its place, I would emphasize the fact that children act as agents of their own learning processes, including when these processes occur in interactions with adults. The processes generated during distinct moments of fieldwork, reading, and writing with the children can be understood as situations of mutual learning. Here we transform the indispensable cooperation between researchers and interlocutors into an effort to create situations in which we all learn together and we make explicitly conscious—though it be partial—our learning. In this way, in our experience, when children have an influence in their own learning process, they see themselves as authorized in the sphere of knowledge, in their dialogue with adults. We are reminded that it would be highly improbable that these same children as students in their schools would have been able to experience a similar position in a learning process within the conventional and traditional parameters and conditions of the educational institution. And in this sense, *ethnography with children* creates the conditions for an anthropological reconsideration of scholastic education in general.

To conclude, I would like to consider reflection and interpretive work. The surprise and dislocation that were provoked in me by the affirmations, questions, comments, explanations, drawings, photographs, gestures, and the children’s ways of being and interacting have been recuperated in this article in order to show the contrast of the reflexivity that was connected throughout my ethnographic fieldwork. I call these encounters contrasts between my reflexivity and those of the children in order to underscore the logic of what happened with us in the field and from which, therefore, we could learn (Guber et al. 2012). When analyzing my reflexivity, I discovered which paths I might explore and how I might carry out this exploration without knowing exactly where it might lead me. My certainty consisted in that while discovering these inquiry paths, I was discovering the field, discovering myself within its context, and thus opening productive routes for interpretive processes.

Acknowledgments I would like to thank Kathryn Anderson-Levitt for her comments and suggestions that improved both plot development and writing, in all cases. Writer/translator Adam Sederlin translated this text into English.

3.3 Learning to Survive in Sri Lanka: Education and Training in Times of Catastrophe

Mara Benadusi

The Role of Disaster Risk Reduction Education

There is a story in Sri Lanka taken from Theravada Buddhist literature (specifically the *Samudda-Vaniya Jataka*) that tells of a natural disaster in the form of series of tidal waves striking down on a beautiful island. According to the story, only half of the population drowns during the first tsunami. Taking no notice of the warnings issued by the other half of the residents, the island's new arrivals begin to drink alcohol, fill the land with refuse, and defecate all over without cleaning up after themselves. The Gods are offended by this rampant pollution and decay, and together they conspire to have the ocean wash everything away. One deity, more compassionate than his fellows, warns the residents, while a rival God tells the humans to ignore the warning. The islanders thus divide into two groups: some follow an improvident leader who wants to ignore the advice, whereas others cast their lot with a more judicious guide, who decides to build a boat and equip it with provisions in case the first God's warning turns out to be true. At this point a second tidal wave strikes the island. The improvident chief initially believes that his followers can save themselves because the waves only reach as high as their knees. Little by little, however, the tsunami gains strength until every person who did not seek refuge on the boat is entirely submerged (Crosby 2008).

This story highlights the chain of causality linking the explanations most frequently used to interpret the disaster: responsibility for the events is attributed to the deities, nature, and mankind. Tidal waves are natural occurrences (*utu-niyama*), yet the damage they cause varies depending on the behavior that humans adopt. The destruction they produce thus depends on *kamma-niyama*, that is, the individual

Viale XX Settembre 45, 95128 Catania, Italy
e-mail: mara.benadusi@unict.it

and/or collective actions of the people struck by the catastrophe. If humans enrage the Gods, they might unleash the forces of nature; at the same time, however, people are alerted by messages of forewarning (which in the story come from both other men and the deities) and given the opportunity to take preventive measures. They have the ability, for instance, to put their trust in capable and diligent guides. In practice, the two groups' good or bad *kamma* affects their eventual fates as does the behavior of the leaders, one sensible and the other foolish.

I was immediately struck by the educational aspects of the story when I heard it from a Buddhist monk in Sri Lanka. An event as exceptional as a series of tidal waves bringing death and destruction in their wake produces a critical situation (commonly designated "emergency"), the magnitude of which depends on the local capacity for prevention, mitigation, and effective response. In cases of disaster, knowing ahead of time the probability that something will occur, predicting its effects, and circulating this information through alarm systems turn out to be vital factors. This implies that one might prevent the destructive force from striking down (by not triggering the rage of the Gods with one's behavior, for instance). However, preparation also plays a fundamental role, representing the last hope for salvation from a threat that can at least be mitigated through awareness, sensibility, and proactive measures even if it can no longer be avoided. Disaster is therefore selective, discriminating against those who do not develop their own skills and taking the protection of the stars away from them (from the Latin *dis-astrum*).

The educative value of the story allows me to introduce the topic of this chapter: disaster education (DE). This expression is generally used inclusively to refer to instances of teaching/learning aimed at spreading a culture of preparedness and resilience in responding to fresh outbreaks of the so-called natural disaster. Education is seen as a tool for promoting skills and forms of knowledge that help people survive in cases of catastrophe. A case in point is the third priority of the 2005–2015 Hyogo Framework for Action¹: "*Use knowledge, innovation and education to build a culture of safety and resilience at all levels: disasters can be substantially reduced if people are well informed and motivated to adopt a culture of disaster prevention and resilience, which in turn requires the collection, compilation and dissemination of relevant knowledge and information on hazards, vulnerabilities and capacities*" (UNISDR 2005: p. 9).

This explains the success and widespread dissemination of educational projects/programs aimed at developing public awareness and disaster risk reduction skills, as well as strengthening existing capacities for coping with calamities and environmental threats. There is no lack of examples. We might note the proliferation

¹The *Framework for Action 2005–2015: Building the Resilience of Nations and Communities to Disasters* was adopted during the World Conference on Disaster Reduction held from January 18 to 22, 2005, in Kobe, Hyogo, Japan. The document was subsequently adopted, discussed, and presented in detail during various international encounters. For instance, the Asia Pacific Regional Workshop on School Education and Disaster Risk Reduction held in Bangkok, Thailand, in 2007 focused on priority 3 of the Hyogo Framework for Action and further developed the theme of disaster education. See UNISDR 2007.

of natural hazard education initiatives in schools or the extensive use of drills, simulations, and the so-called scenario exercises as a form of practical training for preparedness, not to mention the success of participatory learning techniques used to stimulate resilient behaviors among disaster survivors. It is no stretch to argue that education represents a sort of universal passkey or panacean solution within current strategies of disaster risk reduction (DRR) and disaster management (DM): from formal to non-formal and informal learning settings, from local contexts to national and international arenas; at both the grassroots and policy levels, and in community-based projects as well as capacity building for NGO practitioners, schoolteachers, or government officials.² Furthermore, education plays a strategic role not only in the emergency phase (which generally consists of relief, reconstruction, and rehabilitation) but also in the activities of preparation and risk mitigation preceding the disaster. Indeed, at least at the programmatic level, it is precisely these latter activities that are taking on a more central role in international DRR policies. The International Decade of Education for Sustainable Development (2005–2014), led by UNESCO, provided a long-term focus for moving this agenda forward.

Catastrophe Through the Lens of Educational Ethnography

When a significantly large tsunami struck the coasts of numerous countries facing the Bay of Bengal and beyond (Indonesia, Sri Lanka, Thailand, Republic of Maldives, the Nicobar Islands, and as far as Somalia)³ on December 26, 2004, the international community's response was remarkable. Media images of the catastrophe and the fundraising campaign enabled by the “disaster-media-relief” nexus (Benthall 2010) played a fundamental role in activating civil society's “distant suffering” (Boltanski 1999) and the outpouring of humanitarian generosity

²It is only in the last decade that DE has taken on this strategic importance. As a matter of fact, DM policies and practices from the 1980s to 1990s addressed their training activities almost exclusively to relief and government personnel and hazard managers and scientists. Topics such as capacity building for civil society at large and teaching resilience at the community level had not yet attracted such emphatic attention. National governments and first aid organizations still held the lion's share of responsibility for disaster response. Even when the supportive role carried out by local communities was acknowledged, the focus was still on garnering the involvement of individual volunteers and community representatives with specific expertise in this area. In addition, training was characterized by a technical-type orientation and was provided by experts in a top-down manner. There was not yet significant discussion about experiential learning, practical training, real-life teaching, or community-based participatory techniques. See the special 1983 issue of the periodical *Disasters*, vol 7. n. 1, in particular Carter, Taylor, and Thompson's articles.

³The tidal wave that the media unanimously described as one of the most “exceptional” events of modern times—an “unimaginable catastrophe” with “unforeseen” consequences (Tozzi 2005)—was caused by a level 9 earthquake originating north of the island of Sumatra.

that followed.⁴ Their role was so decisive as to transform some countries, such as Indonesia and Sri Lanka in particular, into staging grounds for an incredible number of aid and reconstruction operations (Benadusi 2011; de Alwis and Hedman 2009; Uyangoda 2009; Korf 2007; Stirrat 2006).⁵

In those winter months, the mediatic reverberation of the event, the economic resources, professional expertise, and social engineering techniques targeting the tsunami-affected areas were not the only elements that attracted my attention to the disaster as a potential research site. I was also struck by the impact that the Indian Ocean tsunami was having on international DM actors and DRR policies on a global scale. In fact, less than a month after the tidal wave, the World Conference on Disaster Reduction held in Kobe (Hyogo, Japan) significantly contributed to modifying the agenda and methods of intervention to be adopted in cases of catastrophe (Revet 2011). There was a gradual shift from technology-based solutions for disaster prevention, usually entrusted to governments and legitimized by the expertise of globally recognized research institutes, to solutions revolving around local communities' endogenous mitigation and response capacities; likewise, traditional DM strategies based on ex post reparatory intervention were joined and sometimes even substituted by adaptive strategies founded on the construction of a widespread culture of preparation and resilience at a grassroots level. "Making people more aware of the threat of natural hazards and of the need and possibility to become better prepared before disasters strike" (BRI and GRIPS 2007) was becoming an unavoidable imperative in DRR policies and practices internationally.

Given these circumstances, the newly significant role of education in the increasingly developed sector of DM attracted my attention. Previously I had been investigating educational processes from an anthropological perspective and through ethnographic methods (Benadusi 2003, 2004, 2008, 2009). Although the field known as the "anthropology of catastrophe" had been gradually expanding at the international level since the beginning of the 1980s (Torry 1979; Signorelli 1992; Hoffman and Oliver-Smith 1999, 2002; Revet 2007; Langumier 2008), I had neither studied disaster nor personally approached that particular branch of the discipline. My new research project therefore represented a challenge, difficult yet promising at the same time. It had clear potential thanks to the applied anthropological implications it might have had as well as its transversal character, balanced between two contemporary spheres of inquiry, the anthropology of education, and the anthropology of disaster. Furthermore, the particular perspective I had adopted

⁴It is sufficient to note that, while an average of 7,000 US dollar total was distributed for each person in the countries struck by the Indian Ocean tsunami, only 3 dollars a head was spent after the floods in Bangladesh and Mozambique (according to an online report by the Tsunami Evaluation Commission).

⁵North of Sumatra, in contrast, the restrictions imposed by the government on the number and kind of NGOs allowed to operate in the disaster sites made the intervention context less rich and multi-vocal. Additionally, given my nationality, I also chose to work in Sri Lanka because the situation of Sri Lankan survivors had such heavy repercussions on Italian civil society, due to the large number of Sinhalese immigrants working in Italy.

that of the experience of catastrophe through the lens of educational ethnography was at that moment and still remains rare in this field of research.

I therefore chose to maneuver through the extended time of catastrophe in which educational interventions unfold. This particular form of temporality develops around two distinct periods, “before” and “after” the event: the time of the emergency and of the subsequent reconstruction and rehabilitation and the preceding time characterized by preventing and mitigating a possible future disaster. This processual and wide-ranging temporal dimension lent itself so well to the intensive and long-term methods of anthropological inquiry. In addition, the simultaneously local and global arena of catastrophe appeared to represent a good setting for observing how knowledge and belief systems, as well as divergent teaching and training techniques, come together on the scene of disaster.

Through what educational experiences do individuals and social groups exposed to the risk of “natural” threats learn to protect themselves and respond in cases of disaster? What are the primary forms and systems of knowledge that interact and/or come into conflict on the site of catastrophe? How does education contribute to shaping, strengthening, and modifying the way people interpret the traumatic event they have undergone? What symbolic and poetic devices are thereby activated? And how do these devices, incited by teaching/learning processes, affect the survivors’ responses?

I approached the fieldwork experience in post-tsunami Sri Lanka with this set of questions, which presupposed my positioning in diversified settings: the formal and non-formal systems that more conventionally host DE were joined by the ethnographically dense and diffused field of the so-called informal or accidental learning that occurs in the course of daily life. I was required to render the multiplicity of forms through which disaster is processed and domesticated from an educational standpoint in both organized learning contexts and the more commonplace sites where learning becomes spontaneously and unintentionally incorporated.

This involved engaging with highly varied interlocutors, from the “experts,” both local and international, entrusted with a training and tutoring role in DE projects to the figures selected to convey the so-called indigenous or local knowledge. I might find myself face-to-face with a technical personnel from the in situ emergency or civil protection offices or NGO operators engaged in DM activities, all of them trained to respond to states of alert and emergency and who went on to share this training with others. At the same time, I might be dealing with both groups of survivors involved in community-based disaster education (CBDE) and with charismatic local leaders: monks, clergy, teachers, and public administrators who contributed to the diffusion of the practical and spiritual knowledge required to survive and make sense of the disaster.

In order to choose a site for my ethnographic inquiry, it should be noted that in the fall of 2005, I went to both Banda Aceh and Sri Lanka (the site of Italy’s most significant humanitarian investment), where I stayed for 2 months to conduct some exploratory investigations. Based on logistical and scientific assessments, I opted for the second location. As a matter of fact, humanitarian interventions in Sri Lanka had attracted governments and multilateral and bilateral agencies as well as

numerous international nongovernmental organizations (INGOs), which for the most part acted in partnership with local NGOs. This convergence rendered the context of observation highly articulated, increasing the number and typology of actors involved in educational initiatives.

The diversity of methods, approaches, and pedagogical tools used to conduct DE in the various learning settings was also significant, from actual training programs (ranging from school teaching to on-the-job training) to awareness and public information campaigns (frequently supplemented by exhibitions, newsletters, publications, posters, etc.). The contexts of post-catastrophe daily life were pervaded in countless ways by education, in the form of workshops, seminars, real-life experiences, drills, simulations, participatory learning exercises, and capacity building initiatives. As much as I sought to maintain a holistic approach, I found myself compelled to delimit the field of research.

Eclectic Empiricism: On Sources, Data, and Collection Techniques

According to J-P. Olivier De Sardan (1995), a scholar who is particularly attentive to methodological issues, “fieldwork takes advantage of every available means. Its empiricism is resolutely eclectic and based on all possible modes of data collection.” It should come as no surprise that the ethnographer is prepared to use disparate resources to grant interpretive density to the experience of fieldwork. Let us also recall that methodological eclecticism, especially when combined with the indeterminacy that often characterizes data production in the field, has contributed to making anthropology one of the social sciences’ most fascinating yet contested disciplines. This is why “indeterminacy must be dissipated as much as possible” (Olivier De Sardan 1995).

Following the tidal wave, my eclectic tendencies were justified thanks in part to the multi-scale (simultaneously local, national, and global) and congested character of the humanitarian intervention in Sri Lanka. Furthermore, the interference between diverse educational opportunities required me to make use of highly differentiated sources, data collection techniques, and research strategies. In the following table I have tried to outline the various levels of analysis that have characterized my ethnographic project since 2005. In the table there are multiple intersecting educational systems, from the formal to non-formal and informal settings. Although the separation may be artificial given the frequent overlap among different systems, I chose to offer this tripartite classification here because it remains useful for purposes of illustration.⁶

⁶The categorization of learning systems into formal, non-formal, and informal education mainly owes its popularity to the UNESCO shift towards lifelong learning, which culminated in *Learning to Be* (Faure et al. 1972). See also Mocker and Spear 1982.

Educational systems	Learning contexts	Data sources	Data collection techniques	Types of data
Formal	DE at the institutional level (DE initiatives targeting schools in the form of teaching units and/or training laboratories)	Policy statements, educational guidelines, and technical reports as well as didactic materials related to teaching/learning activities (training exercises, illustrated manuals, educational videos, interactive games, ⁷ etc.)	Documentary research methods (relevant documents are obtained and analyzed)	Documentary data collected from the Internet: webpages, online library resources ⁸ (from the websites of both governmental and nongovernmental organizations: USAID, Red Cross, Care, Save the Children, etc.)
Non-formal	Community-based education (training courses, workshops, and participatory learning exercises at national and community levels)	Policy statements, educational guidelines, and technical reports as well as didactic materials related to teaching/learning activities (training exercises, illustrated manuals, educational videos, interactive games, etc.)	Documentary research methods (relevant documents are obtained and analyzed)	Documentary data collected from the Internet: webpages, online library resources (from the websites of both governmental and nongovernmental organizations: USAID, Red Cross, Care, Save the Children, etc.)
		In-depth/unstructured interviews, semi-structured interviews, informal colloquia, group discussions, observational and reflective field notes, photographs	Overt participant observation	Dialogical data collected in the course of on-site ethnographic encounters
Informal	Accidental learning in everyday life: daily practice based (conversation and informal communication in family, temple, work, and social life spheres)	In-depth/unstructured interviews, informal colloquia, group discussions, observational and reflective field notes, photographs	Overt participant observation	Dialogical data collected in the course of on-site ethnographic encounters

⁷Virtual games are widely used in disaster education. See *Children in disasters: Games and Guidelines to Engage Youth in Risk Reduction* for a relatively comprehensive list (IFRC 2010). This report includes information on DRR-related board games, online activities, printable educational kits, and work sheets, as well as supporting material for teachers, instructors, and youth leaders.

⁸The thematic platform “Knowledge and Education” created by UNISDR with UNESCO support is the most information-rich digital environment on this topic; it hosts the DREAM Collection (Global online Disaster Reduction Education Materials Library Collection), a comprehensive catalogue and digital library specifically dedicated to this issue.

Whereas the first grouping refers to educational experiences carried out in formal contexts such as schools or universities, the second grouping indicates teaching/learning activities conducted outside recognized institutions. Although they are still organized activities, the experience of non-formal education can be recognized as being more flexible and, at times, having a democratic and participatory character (involving less prescriptive content and a comprehensive, community level approach). Non-formal educational activities can range from awareness and information campaigns targeting the public at large (civil society, decision makers, public servants, etc.) to highly structured activities such as workshops or experiential learning exercises for target groups. What is conventionally excluded are the range of informal and accidental experiences that occur in everyday life without necessarily involving a conscious educational agenda and lacking in organized structure. This set of activities has always attracted the attention of the anthropologist, who is more inclined than other social researchers to grasp the situated and embodied character of human learning: in family settings, at the workplace, during ritual and ceremonial practices, or as part of public life and leisure time.

The table also displays the main educational contexts where I conducted research along with the multiplicity of sources, data, and collection techniques I used in each one. It is clear that priority was granted to informal and non-formal educational systems. Indeed, I addressed the setting of so-called formal education only obliquely, using documentary research⁹ rather than including these learning contexts in my own direct observation. This choice was mainly dictated by the characteristics of the research object itself. With the exception of a few rare cases,¹⁰ there is not yet a real correspondence between the numerous programmatic documents at the international level highlighting the importance of DE in schools¹¹

⁹For more information about the use of documentary analysis in the social sciences, see Prior (2003), Scott (2006), and McCulloch (2004).

¹⁰Australia may represent the most illustrative example. As a matter of fact, numerous initiatives of disaster education are carried out in schools through both curricular and extracurricular activities, in the form of Internet programs, teaching/learning units, fun initiatives (cartoon books, puzzles, games, etc.), simulations, and much more (Dufty 2009). Furthermore, considerable space is dedicated to training packages aimed at diffusing forms of knowledge that would be useful in the case of a future tsunami (AusAID 2005).

¹¹The most exemplary text is called *Let the Children Teach Us: A Review of the Role of Education and Knowledge in DRR* and was written in 2006 by the UNISDR secretariat (together with other partners) to address priority 3 of the Hyogo Framework for Action (Wisner 2006). After the Kobe conference, the importance of integrating DRR education into school curricula was also reaffirmed in multiple other planning meetings: for instance, during the second and third editions of the *Asian Ministerial Conference on Disaster Risk Reduction*, held, respectively, in India and Malaysia, and during the *Asia-Pacific Regional Workshop on School Education and DRR*. Moreover, the *Regional Analysis on DRR Education in the Asia Pacific Region* published in 2009 presents an assessment (though non-comprehensive) of the region's efforts carried out in this area (Tran Phuong 2009). The Building Research Institute and the National Graduate Institute for Policy Studies also produced another central document about DE in 2007 (BRI and GRIPS 2007). See also UNICEF 2011. At any rate, in all of these cases, the topic of DRR education in schools is approached as part of a larger focus on DE in the various contexts where it is applied. For sources that instead deal exclusively with formal education, see Sinha et al. (2007).

and an effective incorporation of curricular training courses in specific national contexts. Sri Lanka is no exception: the DRR education initiatives conducted in schools were no more than occasional and fragmentary rather than coherently structured and systematic.¹²

What did exist in Sri Lanka, especially in the post-disaster phase, were a myriad of educational activities in non-formal settings. These initiatives primarily targeted the populations struck by the tidal wave but also addressed the personnel of NGOs and other organizations involved in the emergency, local administrators, institutional staff tasked with managing the reconstruction, and civil society at large. The most frequent examples of such activities were those directed at CBDE.¹³ These were autonomously planned as independent projects or incorporated into larger programs (aimed at reconstructing villages, homes, and infrastructure or reestablishing the economic and social life disrupted by the tsunami) and shared several key factors: at least in their formal guise, they employed an approach defined as participatory or, in other words, based on trainees' direct involvement from the bottom up; they were conceptualized as simultaneously collaboratively constructed and directed at the "community," despite the lack of a common, shared definition for this term (Benadusi 2012b; Heijmans 2009); and finally, they were aimed at constructing or reinforcing a culture of *resilience* among participants, which was understood as the capacity of affected communities to adopt the positive adaptive behaviors that would allow them to recover and absorb shocks after being struck by a disaster (Benadusi 2013).

¹²More consolidated educational opportunities can instead be found in the graduate and postgraduate sector. Natural disaster management courses were introduced in many universities throughout the country after the 2004 tsunami, especially in the form of specializations within geography, natural sciences, engineering, and geology degree programs (Nianthi 2008).

¹³A special division for "training, education, and public awareness" was created within the disaster management center that was established in Sri Lanka at the ministerial level. This unit's aims include the diffusion of CBDE initiatives in the country "to help people to protect themselves from disasters" through capacity building and pre-disaster planning actions and the promotion of relief, recovery, and rehabilitation capabilities (Sri Lanka Disaster Management Act n. 13, 2005). With technical support from UNDP, the department has published various DRR instructional materials on its website, mainly targeting a young audience. Additionally, in partnership with the Asian Disaster Preparedness Center (ADPC) and the national Red Cross (SLRCS), the department has organized a series of simulations in the island's coastal areas aimed at strengthening institutional and local responses to possible future disasters. Beginning in 2006, the US Forest Service initiated a campaign of simulative exercises in Sri Lanka as part of a US program called the *Indian Ocean Tsunami Warning System*. These simulations were based on catastrophic scenarios and were conducted even in schools thanks to a decision by the Ministry of Education and the National Institute of Education (NIE). The Asian Disaster Reaction Center also published a tsunami awareness booklet titled *Inamura-no-hi* ("fire of rice sheaves") that was circulated in eight countries; the booklet stresses the importance of narration and popular anecdote as educational tools for DRR (see <http://www.adrc.asia/publications/inamura/top.html>). The book was translated and promoted locally in Sri Lanka by the Sarvodaya Shramadana Movement.

It was easier at this second level of analysis to compare the content planned and promoted in policies, programs, and guidelines to what was actually implemented on the ground, that is to say, to triangulate documentary data with results produced dialogically through the ethnographic encounter. As a matter of fact, documentary research preceded, accompanied, and followed field-based investigation. During my longest stay in the country, an 8-month period between 2006 and 2007, I was able to participate regularly in several educational initiatives that Italian Cooperation (IC) and Italian NGOs promoted in Sri Lanka together with local agencies and organizations. I concentrated primarily on those projects that most consistently employed participatory approaches aimed at developing the resilience of disaster victims. I also took part as an overt researcher in training activities directed at the IC office's technical personnel and the operators of local NGOs. These took the form of on-the-job training, workshops, and seminars and were aimed at providing instruction in the participatory learning techniques that should be used at the community level. In the same role, I also took part in monthly encounters organized by the GTZ (German Technical Cooperation) in Sri Lanka to exchange and share community-based disaster management best practices; these targeted the various donors, humanitarian agencies, and institutional actors involved in post-catastrophe reconstruction.

I spent three different periods in the country, the initial scouting mission in 2005, a long research phase (2006–2007), and a subsequent 3-month period in 2010. During this time, I did not limit myself to participant observation in non-formal educational settings such as those listed above. Rather, I lived in contact with the affected populations, seeking to capture as much as possible the dynamics of daily life that gradually began to get back on track following the tidal wave. I was particularly invested in understanding how the disaster was progressively processed in both poetic and symbolic senses through informal educational activities scattered throughout daily life. My first and third fieldwork periods were characterized by this more intimate, demanding, and pervasive research topic, whereas it was more difficult to gain access to this dimension of learning during the middle phase of fieldwork. As a matter of fact, the reconstruction phase in Sri Lanka was characterized by a sort of “hypertrophic gifting”: the survivors were so caught up in the exchange networks linked to the humanitarian network and so dazed by the crowd of organizations that had arrived on the disaster sites that they quite commonly mistook me for one of the many volunteers or operators who had come to offer help. In a setting so crowded with experts, journalists, cameramen, volunteers, and political activists, not to mention the nascent phenomenon of disaster tourism, traveling across the country's coasts as a foreigner required a constant effort to protect myself from being identified as part of the extravagant range of aid relationships.

In the intermediate fieldwork phase, I thus opted to concentrate on the circumscribed and regulated activities of non-formal education, giving more attention to the informal sphere in the other two periods. During my first research phase,

in fact, the experience of the disaster was still fresh and initial aid operations were taking place. This might explain why people were more inclined to openly express their emotions. In my perception, they appeared less conditioned by the humanitarian assistance machine. The same was true of the last period as well. In 2010, nearly 6 years after the tidal wave, the disaster sites were less heavily congested by international actors, and the passage of time had allowed life to regain its course without requiring that people be so wholly invested in tsunami aid. Nonetheless, the detonation effect that the humanitarian apparatus had produced continued to affect, if to a lesser extent, the politics of identity in the field (Benadusi 2012a).

As the table indicates, this last level of investigation did not involve any specific documentary research. The material concerning DE that is produced at both international and national levels (that is to say, related to Sri Lanka) does not explicitly reference the informal setting. Only the first two systems are addressed. At the most, a few documents specify that the indirect effects of actions carried out in the formal and non-formal systems will in the long term work to influence individual communities' behaviors and attitudes towards resilience and preparation, thus becoming a kind of "embodied culture": a culture capable of almost spontaneously predisposing individuals and social groups to protect and strengthen themselves in case of disaster, a "new culture" (defined as a culture "of resilience" or "of security" depending on the case) that will make use of endogenous characteristics to respond more effectively to catastrophe. The so-called indigenous or traditional forms of knowledge are thus brought into play, although—as we will see—in a somewhat controversial way. If updated, properly revitalized, and (above all) linked to "expert knowledge" gained through DE, these forms of knowledge are considered useful in reducing disaster risk, but it is never well specified either where or how they ought to be used.

The Uses and Effects of Triangulation: Comparison and Validation

Triangulation (among different sources, data collection techniques, researchers, and phases of investigation) is widely considered to be a fundamental element of ethnographic research (Hammersley and Hatkinson 1983; Denzin 1989). Although there are periodic debates surrounding its use (Flick 2009: pp. 443–453, 2007: pp. 37–121), ethnographers and especially those working in the field of educational anthropology (Allwright and Bailey 1991: p. 73; Bailey 2006: pp. 131–132; Greenman 2005: pp. 263–306) use triangulation quite frequently in order to convey the density of reality to their readers, to render the process of understanding more multifaceted and, above all, as a means of validation. In the

words of Olivier De Sardan (1995), “be it criminal or ethnographic,” a good investigation must employ triangulation. Indeed, it is necessary to “countercheck” the collected data.

To cite the most common examples, triangulation procedures are used “to test the quality of information [. . .], to understand more completely the part an actor plays in the social drama, to put the whole situation into perspective” (Fetterman 2010: p. 94). Scholars have also attempted to distinguish among different forms of triangulation, producing the following categories: *theoretical triangulation*, when the ethnographer “approach[es] data with multiple perspectives and hypotheses in mind” (Denzin 1989: pp. 237–241); *methodological triangulation*, when diverse quali-/quantitative methodologies are used; and *data collection triangulation*, when the sources and types of data significantly vary over the course of the research.

Triangulation has lost much of its relevance as a technique of validation in anthropology due to deconstructionism and postmodern ethnography; nonetheless, analyzing data from multiple sources, collected through diverse methods and supported by a range of theories, does not simply serve to provide the reader with an artificial sense of reliability. It also allows the ethnographer to imbue his or her research and subsequent writing with the dialogical, multivocal, and open style that most anthropologists currently consider a mark of quality. Indeed, this is what I sought to achieve by using it in my research project. In the long term, moreover, triangulation proved to be a precious tool in other senses as well: to provide interpretive depth to the hypotheses that gradually emerged in the field, to compare different (and, in many cases, opposing) perspectives on disaster in subsequent phases of fieldwork, and to retrospectively evaluate my ethnographic positioning, considering that I was progressively forced to adapt to changes in the situation and research participants involved. Due to space constraints, I will provide only a few brief examples here.

The circulation of knowledge is never separable from the contexts it moves through and its “chains of translation” (Czarniawska and Sevón 2005). Many of the issues addressed in my study revolve around this process of transferring forms of knowledge, educational approaches, and teaching/learning experiences from one context to another: from the local arena to national and international ones and vice versa or from formal educational settings to non-formal and informal ones and vice versa. For instance, I sought to understand what concrete actions were used to enact visions and practices of CBDE that had been borrowed from international discourses in the specific context of post-tsunami Sri Lanka. Triangulation and an eclectic approach turned out to be the most effective strategy for retracing these trajectories and the dynamics they gave rise to. Cross-checking among multiple sources was the only mechanism that allowed me to understand how “expert knowledge” (medical, logistical, technical, geological, climatological, etc.) about disasters ran the risk of obscuring the experiences, interpretations, and solutions to disaster response that did not receive as much legitimization, either because they were improperly relegated to the status of “local, indigenous, or traditional knowledge” or because they were considered irrational, emotional, and

nonscientific. Triangulation was an important tool to explain, interpret, and restore substance to the numerous pedagogical and epistemological viewpoints that permeated the disaster scene.

Likewise, it was the triangulation of data collected in different research phases that allowed me to ethnographically identify a fundamental aspect of current DM policies and practices: their anticipatory nature. According to DE documents, human skills aimed at “present-ifying” the catastrophe are necessary to make societies as prepared and responsive as possible before the next disaster strikes (Lakoff 2006, 2008). Contemporary DE is increasingly based on the assumption that resilience is a fundamental strategy not only in the post-disaster phase but also in the period before the catastrophe that has yet to come but is imagined as unavoidable and unpredictable. The emergency is thus no longer perceived as an anomalous event that momentarily upsets life under normal conditions. From an extraordinary experience, emergency is transformed into a “state of things” that is part of the very nature of the social (Agamben 2005).

The triangulation of different research phases also allowed me to understand the fundamental causes of the catastrophe, deeply rooted in national political history, and its long-term consequences. When I returned to Sri Lanka 6 years after the tidal wave, I had the opportunity to observe how the tsunami functioned as a learning laboratory of “social drama.” Used as the foundation of a new post-disaster temporality, the tsunami entered into a regime of sacrifices, prohibitions, and taboos that transformed it into something sacred and removed from historical traceability. However, in exchange for its gifts, it forced victims to remain bound to the propitiatory cults of the humanitarian industry, requiring that they continuously stage the catastrophe and perform the rituals of a resilient, disaster-surviving community. As I clarified when presenting my research results (Benadusi 2012a, 2013), the most effective tools that empowered and educated survivors had at their disposal to compete in the arena of international aid, 6 years after the tidal wave, were their strategies of claiming a common descent from the tsunami and continuing to perform their own “capacity for resilience.”

Recursiveness and Ethnographic Positioning

The “recursiveness” of the research process, or in other words the effort of recurrently subjecting the same grounds of analysis to multiple instances of investigation, gradually reshaped my positioning in the field, that is, the way I interacted with the various informants I encountered throughout the fieldwork. During my first brief visit to the country, shortly after the tidal wave, my positioning was cautious and relatively noninvasive: instead of asking questions myself, I opted for looking around and allowing others to approach me, if they wished, and recount their stories. In such a painful and yet frenetic period, I was concerned that a hasty

step, an uncomfortable question, or an excessive demand for attention might have upset the people engaged in relief activities. My most formal interviews were conducted with the personnel in charge of humanitarian operations at the headquarters of the main international agencies in the country. For all the rest, I mainly listened and assumed a position of receptiveness.

In this phase, as I traveled along the coasts struck by the tsunami and visited refugee camps or the first sites under construction, I tried not to limit myself to a preestablished itinerary. Rather than initiating a structured project of observation, I let my gaze roam in order to catch suggestions and randomly intercept conversation and interactions, noting everything down in my notebook. This positioning was also necessitated by my unfamiliarity with both the context and the language, although the prevalent use of English to communicate among international and local operators in these humanitarian contexts rendered the latter issue less significant. Whenever there were foreign colleagues present, many local experts used translation even to communicate with the population. The monks, who I was in contact with because of their involvement in aid operations, also spoke fluent English. I was thus able to follow most conversations without difficulty, and whenever I could not resort to English, I sought to “go beyond words” in the sense suggested by Unni Wikan’s description of her ethnographic experience in a poor neighborhood in Cairo: “they opened their hearts to me as if I could understand every word they were saying [. . .], taking for granted that I was able to understand even though I had not mastered the *language*” (Wikan 1992: pp. 460–482). Facing the urgency common among my interlocutors to express desperation or hope, to find an outlet for their rage and frustration, I allowed some form of “resonance” to accomplish what words alone were not able to do.

In contrast, I gradually took on a more proactive position in the intermediate phase of my fieldwork. I returned to Sri Lanka with the project to participate, as a researcher, in a series of activities associated with the humanitarian initiatives IC was promoting in the country. The majority were participatory learning exercises directed at groups of beneficiaries of varying sizes (from workshops of 6–7 participants to meetings of 30–40 people) supported by technical personnel from local or Italian NGOs or the experts of international agencies such as UN-HABITAT and FAO. The objectives of these activities were “practical tasks” such as the creation of a risk map and the drafting of a village evacuation plan or more classical participatory rural appraisal¹⁴; alternately, they were simulated exercises in which

¹⁴Originating in the 1980s, the *participatory rural appraisal* methodology has been used mainly by NGOs and, currently, by development agencies as well because it is faster to carry out than traditional fieldwork. This approach aims to incorporate the rural population’s knowledge and opinions into the planning and management of developmental projects and programs. See Chambers (1994).

participants were required to take on a specific role in responding to a given scenario (such as the arrival of a tidal wave or unexpected flood). It was not unusual, however, for more conventional instructional initiatives to be organized in which an expert explained to a group how to develop community leadership skills, how to effectively coordinate collective reconstruction activities, and how to outfit the village or individual houses in order to make them more secure in cases of disaster or the geophysical causes of the tsunami.

My background in the field of educational anthropology in Italy turned out to be useful in these situations. I was already accustomed to experiencing and observing mine and others' co-participation in group learning activities or what Tedlock (1991: p. 69) calls the "observation of participation." I also felt myself on familiar ground because I had already carried out research in learning sites focused on the sharing of practices and the development of a strong sense of belonging among participants (Benadusi 2010a, b). The majority of these initiatives likewise sought to use a common undertaking (that of trying to survive and come out of the disaster stronger than before) to strengthen a "sense of community" that would stimulate behaviors of collaboration, mutual learning, and resourcefulness (Benadusi 2012b).

When I returned to Sri Lanka nearly 4 years later in 2010, my aim was to broaden the focus of analysis beyond the exceptional post-disaster experience in order to gain a perspective on the traces of catastrophe that remained in the long term, the forms of knowledge, memorialization, and cultural learning that were still present on the disaster scene and/or had reemerged with the passage of time. I thus sought to spend the research period in a village on the country's southern coast that had been reconstructed thanks to IC tsunami funds. In the eyes of many, this site represented an example of success both in terms of its quality infrastructural standards and the "sense of resilient community" that had been so effectively instilled there during the reconstruction phase (Benadusi 2012a, 2013).

Under these circumstances, I was obliged to rapidly adapt my positioning to two new phenomena that in the meantime had affected the country. The last stage of the long and bloody war between governmental forces and the Tamil Tigers (LTTE) had recently concluded, and the ruling family had consolidated its political power, adopting a harsh policy in relation to Western international observers while opening Sri Lanka to cooperative relations with the Asian countries (India, China, Japan). In this context, unlike the other two research periods, I found myself one of very few White people in the area. My presence thus provoked a great deal of curiosity among the population. In addition, as I was located on the edge of a forested zone that had been the stage of armed incursions and conflicts, the region was still guarded by military forces. Although on one hand the absence of humanitarian operators made it easier for me to perceive endogenous educational dynamics, on the other hand the security measures I was forced to adopt served to complicate identity politics on the ground. Whereas I had previously moved around the country with relative ease, feeling free to choose where and when to conduct my research, in

2010 I had to undergo a laborious process of negotiation with local actors to carve out an autonomous space for myself.

Disaster as Interpretive Catalyst

Following the interpretive turn in anthropology, it is nearly unanimously recognized that the ethnographer's epistemological enterprise consists of reading cultural meanings rather than a simple collection of empirical data. In the famous Weberian expression so dear to Clifford Geertz (1973: p. 5), "man is an animal suspended in webs of significance he himself has spun"; cultural analysis is therefore "not an experimental science in search of law but an interpretive one in search of meaning" (*ibidem*).

In my case, the character of the research object itself rendered the task of interpretation even more significant. As a matter of fact, over the course of my fieldwork, the disaster unfolded as an event/process capable of causing a variety of meanings (technical–scientific, political, spiritual, identitarian, etc.) to develop and emerge, thus functioning as a kind of "interpretive catalyst." This particularity revealed the important educational significance of catastrophe. Thanks to its capacity for activating a kaleidoscope of hermeneutic refraction, catastrophe *uncovers*, *reveals*, and *displays* something significant about the life of humans in society. It *educates* in the broadest sense of the word. It mobilizes our "concepts of social and cosmic justice" (Oliver-Smith 2002) and can significantly transform them; it raises questions about "human supernatural relations"; it brings out locally prevalent "perceptions of uncertainty, safety, fortune and fate" (*ibidem*) and, as Mary Douglas has taught us, can trigger risky blaming processes (Douglas 1992; Douglas and Wildavsky 1982). Furthermore, while on one hand catastrophe offers a precious lens for reading the social, on the other hand it provides insights about the juncture of man/environment/technology, thus revealing the embodied nature of human symbolic orientation and how connected it is to our actions in the world (Ligi 2011).

This face of catastrophe, which allows it to function as an interpretive catalyst with enormous paideutic potential, is what makes disaster so attractive to anthropologists and other social analysts. As Oliver-Smith reminds us in *Catastrophe and Culture*, "disasters force researchers to confront the many and shifting faces of socially imagined realities" (Oliver-Smith 2002: pp. 25–26). "Disasters are good to think with" (Kroll-Smith and Gunter 1998) and as such they invite anyone called on to explain them to employ a variety of theoretical, philosophical, humanistic, and political perspectives (Hoffman 2002).

The interpretive framework that I used to approach the Indian Ocean tsunami was shaped by the particular perspective that anthropology brings to bear on disaster. As a matter of fact, anthropological research has productively focused on the historical, social, and economic dynamics that affect catastrophe's reoccurrence and, indeed, constitute its most fundamental causes (O'Keefe et al. 1976; Cuny 1983; Hoffman and Oliver-Smith 1999, 2002). Following

Kenneth Hewitt's *Interpretations of Calamity* (1983), this approach rejects a vision of the disaster as simply a collapse of social order brought on by accidental geophysical factors. Even a catastrophe as "natural" as a tsunami is no more than the result of a long chain of events produced by the unfolding of social life. Disaster can therefore only be fully interpreted through long-term analysis that takes into account political-economic choices and the more broadly "cultural" features of the affected contexts.

This perspective was also driven by my background in educational anthropology. I have in mind the role that John Ogbu (1978) attributes to "ecological factors" such as political, economic, and social forces in producing segregated schooling, for instance, or the importance of "cultural models" in shaping the educational choices of US ethnic minorities (Ogbu 1987; Gobbo 1996). The theoretical reference points I brought to the field prompted me to adopt an approach that was simultaneously situational and diachronic in order to draw out the various symbolic and operational schemes that shaped local DE experiences.

Using this perspective, I sought over the course of my ethnography to longitudinally identify the interpretative "scenarios"—to borrow a term from Sandrine Revet (2007)—that guided actors in responding to the tsunami: what long-term experiences contributed to shaping these scenarios? What political and historical factors affected their production and development? How had more recent DE policies modified these interpretations? As space constraints prevent me from detailing research results in depth, I will offer some brief highlights.

The majority of popular material about the Indian Ocean tsunami (available mainly online) employs a "naturalistic" scenario to interpret the tidal wave as a geophysical occurrence produced solely by the forces of nature. DRR education, on the other hand, is guided by programmatic and technical documents that integrate the naturalistic scenario with a so-called risk scenario (*ibidem*): educational tools are used to improve people's understanding of the natural causes of disaster, but these are accompanied by exercises designed to promote the specific behaviors that are considered suitable for effective prevention and mitigation. In this way catastrophe is conceptualized as the effect of a potentially destructive force in a context deemed "vulnerable" as a result of bad human management, which exacerbates risk factors. In the majority of cases, this material is produced and circulated by international agencies and organizations (the most well-known include International Federation of Red Cross and Red Crescent Societies, World Vision Care, Save the Children, and UNICEF¹⁵) and thus tends to emphasize the

¹⁵DRR educational initiatives have also been promoted by training and research agencies such as UNITAR (the United Nations Institute for Training and Research) or by governmental institutions such as FIMA (the Federal Insurance and Mitigation Administration of the US Department of Homeland Security), which provides technical assistance in mitigating tsunami risk in the USA. The Asian Disaster Preparedness Center and DIPECHO (Disaster Preparedness ECHO—European Commission Humanitarian Office) also assumed an equally important role.

life-saving role of aid workers and to promote fundraising for the survivors.¹⁶ These latter are depicted as either “vulnerable victims” (especially when they are women or children) in need of help and protection or as “resilient survivors” who rally to provide support to the humanitarian agencies. Whenever there is a focus on local “knowledge” (including culture, heritage, and local traditions) in formulating an effective response to disaster, the result is a juxtaposition (if only implicit) between tradition and modernity, science and superstition, and technical and nontechnical expertise.¹⁷

A clear example of this last point is the Tsunami Education Project (TEP), one of the largest DE initiatives promoted in Sri Lanka.¹⁸ According to Sandra Laskowski, the second geographer of the TEP team, the project was aimed at dissipating “superstitious fear about the ocean” and “rumors about new tsunamis in the near future” through the diffusion of geographical expertise. In a context such as Sri Lanka, which external experts saw as dominated by irrational beliefs, priority was given to explaining telluric movements, distributing maps showing the frequency and potency of sea and earthquakes, and providing additional scientific information about disasters.¹⁹

The presentation of different interpretive scenarios as mutually independent and even oppositional, however, fails to account for the complexity of reality. In their efforts to interpret, render narratable, and thereby “domesticate” the disaster, the people experiencing a catastrophe find themselves facing multiple interpretations that can be creatively and contextually used at need. Humans move through highly stratified interpretive universes where it is easier to combine and hybridize than to make unequivocal and definitive choices, whether they are facing technical or

¹⁶Many educational exercises ask students to put themselves in the shoes of aid workers or journalists to describe the aid operations that humanitarian agencies are involved in or to draw the logos of the different organizations that provide aid to the victims, identifying each one’s contribution in reducing the risk of disaster (see Discovery Education 2005; World Vision International 2005; AusAID 2005).

¹⁷The integration of professional and local knowledge in DE policies and practices is discussed in the guides and manuals targeting teachers, local governmental officers, NGO personnel, volunteers, etc. See, for example, Shaw and Takeuchi (2009) and Shaw et al. (2009a, b). In relation to the regional setting, I recommend Shaw et al. (2008). For a retrospective and critical treatment of the divide between indigenous and scientific knowledge, see Agrawal 1995; Sillitoe 1998; Dekens 2007; Mercer et al. 2010.

¹⁸By 2007 TEP had completed 84 geographical workshops reaching a total of 2,300 people in Sri Lanka. Of these, 611 were teachers of O- and A-level schools in the country (Tsunami Education Project (TEP)—Newsletter). TEP extended a similar project initiated by the Global Education Network (GLEN) in 2005 to all the districts of Ampara, on the eastern coast of Sri Lanka.

¹⁹Almost all the DE instructional units designed to be integrated with scholastic programs have a clear tendency to privilege geographical expertise above other forms of knowledge. This is illustrated by the fact that, in the majority of cases, the educational packets in question are included in geography or natural science curricula. Sociocultural materials are rarely included, and when they are, they tend to emphasize folkloristic or otherwise stereotypical aspects of the affected countries’ “cultures” and “religions.” See, for instance, the exercise included in the AusAID guide (2005), where students are asked to compare “the” culture of Indonesia to that of Australia, identifying differences and similarities in terms of religious buildings, clothing, food, physical appearance, and tools/equipment.

nonexpert knowledge, strategies of response produced from above or below, or information conveyed through institutional or informal contexts.

People struck by the tidal wave in Sri Lanka made use of different interpretations of the calamity depending on the circumstances, demonstrating how different scenarios, including the “religious” one, were able to mutually coexist. As other studies on the topic also show (Crosby 2008), the doctrinal explanations prevailing among the Buddhist clergy interacted with less canonical religious explanations, expressed by monks or magic–witchcraft practitioners, that referenced the vast array of local demons and deities. Early on, these kinds of interpretations circulated in public discourse. They were later pushed to positions of marginal visibility by more technical explanations in the media or by local and international DM experts, though without affecting their social influence. Additionally, the locals with whom I had the most significant contact appeared to share the implicit lesson represented by the story I told at the beginning: the natural, supernatural, and human all contribute to the production of catastrophic events. To them, rigidly choosing one alternative over the others in responding to the disaster did not seem to be an effective solution.

The suffering produced by the tsunami might be explained through reference to diverse responsibilities in different moments or circumstances within the same community. Explanatory factors included having good or bad *kamma* (collective responsibility), having participated in a religious function or not, belonging to one ethnic group versus another, working as a fisherman or farmer, or supporting a specific political leader rather than his rival. And yet this did not prevent technical knowledge about the disaster from circulating and even representing a form of prestige in the public sphere, either to demonstrate skills gained through training or to teach young people to respond quickly when facing a second tsunami. This technical knowledge was also displayed in claiming a role of leadership over other group members or other affected communities. The catastrophe thus became a cognitive artifact that activated multiple interpretations, generating contradictory versions of the event itself as well as its causes and dramatic consequences.

Disaster Resilience in the Local Arena of Humanitarian Intervention

Even 6 years after the tsunami, it was not unusual for the local monk in the village where I carried out my third fieldwork to remind the faithful that the tidal wave was not an “impartial” act of nature. The 2004 tsunami was interpreted as a sign of national moral decay caused by the peoples’ straying from Buddhist principles, a trend that was exacerbated by the massive distribution of international aid in the country.

The monk provided the community with instruction that underlined the importance of collective responsibility (*kamma*) in order to foster more religious behavior in the future. He did not seek to instill a sense of guilt or shame, but rather a positive attitude that would help these families make use of their own social agency in

developing mutual collaboration and a supportive stance regarding the less fortunate. Although they were not directly struck by the tidal wave, village members did in fact benefit significantly from humanitarian aid, using it to elevate themselves both socially and economically further than other nearby communities (see Benadusi 2013 for further details).

Given the sheer volume of training the village was subjected to, it is no exaggeration to say that education was the most concrete way that these families experienced the catastrophe. In the effort of promoting a resilient attitude at the community level, however, the beneficiaries of training activities ended up creating a “social drama” with ambiguous and controversial implications. Paradoxically, the most important lesson they received during the emergency phase was how to retain their position as a “good product of the tsunami,” despite lacking a direct connection with the tidal wave. In order to remain suitable for gifting, they were instructed to live in the continuous present of a model disaster-resilient village and perform this identity for any donor who might visit. In this way resilience changed its shape and purpose once introduced to the local arena. Humanitarian propaganda described it as the outcome of a difficult empowerment process aimed at improving local capacities for disaster adaptation. In reality, resilience had become an instrument for providing access to international resources, an instrument, however, that was not easy to use. Indeed, to attract additional aid packages, the villagers had to carefully weigh the level of resilience they had reached through training; they had to appear “just resilient enough” to be eligible for gifting but not so resilient as to tarnish the image of vulnerability still required to intercept aid. As other ethnographic investigations of resilience have shown, “local communities must appear both resourceful and in need of resources in order to receive assistance [. . .]; and they must balance the two in such a way that they live up to donor imaginations to benefit from resilience building projects within DRR” (Olwig 2010).

Furthermore, ethnographic investigation reveals that the meaning attributed to the concept of resilience varied considerably according to the actors involved and the circumstances of social life. The name the villagers chose for their representative organ (literally meaning “enriched by its own *pin*”) clearly illustrates this. *Pin* in Therevada Buddhism refers to the “merit” accrued through one’s actions in this or past life. It was therefore relatively close to the idea of resilience that humanitarian actors are expected to find blooming among the villagers because the community itself was assigned responsibility for “responding productively to significant change” and “implementing positive adaptive behaviors.” Nonetheless, in the village there were at least two different ways of construing this idea. The federation leaders and the UN-Habitat technical personnel supervising DM operations explained this name through reference to the positive qualities that beneficiaries had learned in the course of DE: their ability to cooperate in a spirit of voluntarism, the resourcefulness they gained through hard work, and the commitment they displayed in carrying out empowerment and other training activities. The secret of such a promising village emphasized the participatory learning approach

and community-based techniques adopted by UN-Habitat over almost 40 years of work in Sri Lanka (following prevailing trends in the humanitarian emergency sector).

However, there was also a second level of interpretation that justified choosing this name. Instead of referring to the current life, the causality of the group's collective *kamma* could refer to the Buddhist reincarnation cycle that all living beings pass through. Only a truly incredible merit, apparently accrued in a forgotten past, could explain such a surprising and apparently unearned tsunami gift. Rather than referencing human agency in the post-disaster period, this second interpretation associated the concept of resilience with the ability to accrue a reservoir of *pin* for the future through meritorious behavior in former lives. As I have shown elsewhere (Benadusi 2013), although these explanations were embodied by two contrasting factions, they ended up producing the same result: by explaining villagers' agency as the basis of casual relations, they effectively concealed the political dimensions of a clientelistic gift that was inextricably bound up with the central role this village plays in current nationalistic propaganda. In fact, the resilience that villagers were called on to display in order to maintain the support of local and national actors presupposed a very different type of adaptation: rather than managing the states of uncertainty produced by an untamable nature, they had to adapt to the fluctuating outcomes of national political struggle. To do so, they needed to be unscrupulous enough to maintain the village's connection with central political power, not the capacity of self-governance promoted in humanitarian rhetoric. This third meaning of resilience, which bound the villagers' "capacity for survival" to the clientelistic relations characterizing national history, was intended for "internal" use only, that is, outside the more canonical circuits of humanitarian activity.

This case shows the importance of an ethnographic approach in understanding how the learning experiences that take place on the disaster scene are translated into practice. As a matter of fact, manuals written for DE practitioners have come to use the term resilience in a nearly excessive way.²⁰ As we have seen, resilience is considered the most appropriate survival strategy to use in responding and preparing in cases of catastrophe. This apparent consensus of definition, however, conceals divergent interpretations and applications that further multiply when we consider how the concept is "operationalized" at a local level.

In a 2006 article in the periodical *Disasters*, Bernard Manyena lists some of the best known definitions of resilience, from Wildavsky's 1991 definition to the 2005 one produced by UNISDR. The list includes definitions from Holling et al. (1995), Horne and Orr (1998), Comfort (1999), Paton et al. (2000), and Cardona (2003) and, naturally, also mentions the Resilience Alliance's definition (2005). Whether it refers to ecosystems or individuals and social groups, resilience is interpreted as an *intrinsic* capacity, in the sense of being essential, internal, endogenous, naturally emergent, and context oriented. At the same time, however, it is recognized as a

²⁰The most well-known examples include Roman and Johnston (2005), Paton and Johnson (2006), Gow and Paton (2008), and Comfort et al. (2010).

potential resource that predisposes people towards behaviors and attitudes that are considered positive but require suitable refinement. Three definitions out of twelve, in fact, explicitly reference learning: “*learning* to bounce back,” “*learning* resourcefulness,” and “*learning* from past disasters for better future protection.” The “resilience paradigm” (Manyena 2006: p. 435) thus implies an educational effort of valorization and cultivation (“building resilience”) that is considered the forerunner of learning.²¹ This entails an effort of care and assistance that, however participatory and community based it may be, requires the external intervention of competent outsiders to activate such a socially strategic quality.

Furthermore, if the process of defining the concept of resilience already provokes disagreement and ambiguity, as soon as it becomes part of the local context, resilience gives rise to a refraction of interpretations, thus demonstrating its ambiguous and problematic character. This tendency should encourage its promoters to reflect more carefully on the use of this paradigm. And yet only a limited group of scholars have begun to treat resilience as an operational strategy of DM with caution and some criticism. I believe the most illustrative case to be the 2011 article by Jeremy Walker and Melinda Cooper, in which the authors trace the trajectory of resilience from systemic ecology to current economic policies of crisis adaptation and caution of its becoming a new and insidious “methodology of power.”²²

Anthropological research on catastrophe must take certain unavoidable steps: ethnographically following DE initiatives and studying the various shapes resilience takes at the local level as well as the interpretations that are associated with it by the resilient actors themselves. In fact, the academic literature in this sector uses a primarily pedagogical and psychosocial approach, which leads to a disproportionate ratio of studies conducted in formal and non-formal educational settings. This overrepresentation is heightened by the scarcity of research in informal learning contexts. Furthermore, the available publications²³ provide only normative instructions, acritically outlining the intervention methodologies that should be used to promote disaster resilience and indicators for measuring it (Maguire and

²¹There has also been an attempt to organize this learning in terms of phases: “learn how to maintain preparation; learn what to do before, during, and after disaster; learn how to change and build community competencies to minimize the impact of natural hazards, and learn how to improve after” (Dufty 2008).

²²The most insidious aspect of resilience as a DRR strategy might be the way it is used to compensate for shortfalls in institutional response. As a matter of fact, resilience is presented as an endogenous capacity that allows individual communities to “bounce back with little or no external assistance following a disaster” (Manyena 2006). It thereby capitalizes on the ability of individuals and social groups “to use their internal resources and competencies [. . .], as well as their learned resourcefulness” (McBean and Rodgers 2010: p. 878) to respond to an event understood as unavoidable and difficult to manage. By thus removing responsibility from governments, civil society is subjected to an atmosphere of insecurity that requires an ongoing effort of adaptation and preparation. In this way resilience runs the risk of becoming a new paternalistic device aimed at preserving the status quo (Benadusi 2014).

²³See note n. 20.

Hagan 2007). There is thus a risk that the anthropological and political considerations connected to DE will remain obscured. Ethnography can aid in bringing them to the surface, reconstructing the social life that these approaches lead in their contexts of use. This can help, as it did in my case, to uncover the undemocratic and non-inclusive experiences that are concealed behind the communitarian and participatory façade of DE projects (Benadusi 2012b). The emphasis on community in the interventions aimed at developing disaster resilience presents these learning situations as if they were self-governing, not preset, and chosen by the participants. However, field research can reveal the extent to which CBDE must adapt to politicized and elite-centered contexts. In addition, the supposed consultation that is taken to guarantee its participatory character is in reality limited to adopting standardized training content and methodologies, which are widely used by aid organizations at the international level and appropriated by the survivors themselves to carve out a space of visibility in both the local political arena and circuits of humanitarian action.

Conclusions

Because of its great impact on so extensive a geographical area and the global scale of media coverage surrounding the event, the December 2004 Indian Ocean tsunami has significantly contributed to transforming disaster management policies and prevention practices at the international level. There is an increasing belief that, faced with events of this magnitude that are both unpredictable and difficult to control, it is essential to invest in local communities and spread a “culture of preparedness” and an attitude of “resilience” as instruments of protection and response. As this article shows, in seeking to reduce the impact of disasters through educational projects, both local and global actors are involved in a common (though not peaceful) effort to interpret, shape, and represent “the” disaster. A single disaster is thus fragmented into different and conflicting sets of interpretations according to the experiences and identities of those affected and those who intervene. The ethnographer, with her aptitude for reflexivity and immersion in the research context, is no exception. By repositioning the disaster into its progressive and diachronic dimensions, retracing the play of refractions between different sources of knowledge about the catastrophe, and participating actively in the learning laboratories that shape the emergency arena, the ethnographer contributes to making the disaster “real.” The experience of the 2004 tsunami in Sri Lanka shows how, in the current DRR scenario, a heterogeneous arena of actors (local and global, national and transnational, nonexperts and experts) compete on the scene of disaster, often working to congest operations instead of facilitating a real exchange of knowledge and good practices. The tensions and misunderstandings that emerge between these actors are at the root of many of DE’s failures.

3.4 Negotiating the Boundaries Within: An Anthropologist at Home in a Multiethnic Neighborhood in Urban Japan

Yuko Okubo

In this chapter, I revisit my field experience of living in a multiethnic neighborhood in urban Japan, where people of different historical, sociocultural, and political backgrounds reside, taking an *autoethnographic* approach. I take this perspective to re-examine my research findings to add another layer of analysis to understand the role of interpretation throughout my ethnographic study, which was constructed by an anthropologist studying one's own culture.

Autoethnography is defined by Deborah Reed-Danahay (1997) as “a form of self-narrative that places the self within a social context” (p. 9). It reflects a changing conception of the self and society in the postmodern condition of the late twentieth century by addressing the following questions: the question of identity and selfhood—such as the auto-/ethnographer as a boundary crosser and as a dual identity, foregrounding the multiple nature of selfhood; the question of voice and authenticity—who represents whose life, and whether *autoethnography* is more “authentic” than other ethnographies, calling into question the insider–outsider dichotomy, and lastly, the question of cultural displacement or situation of exile, the fact that a *native anthropologist* cannot completely be “at home” due to the breakdown of the dualisms of identity (self and society) and of insider–outsider status caused by rapid sociocultural change, globalization, etc. (pp. 3–4). In this chapter, I take an *autoethnographic* approach to my study to shed light on the experience of a *native anthropologist* or an *anthropologist “at home.”*

Although anthropology has traditionally studied cultural “others” in distant places, anthropological notions and theories developed in the past few decades, such as the epistemological questions regarding anthropological self and objectivity/subjectivity, have redressed this tradition (Marcus and Fischer 1986; Clifford

Y. Okubo (✉)

Center for Japanese Studies, University of California, Berkeley,
1995 University Ave., Suite 510N, Berkeley, CA 94720, USA
e-mail: yukoo@sbcglobal.net

and Marcus 1986). Anthropologists' inherent hybridity also adds another layer of complexity to this discussion (Narayan 1993). Narayan (1993) argues that an anthropologist merely studying the culture that they are from does not necessarily make him/her a *native anthropologist*. Anthropologists' ascriptive backgrounds determine the relationships with the people they study. Even though a *native anthropologist* may feel "at home," the community who are the object of their study may not feel that way. All scholars, including *native* ones, strive to negotiate legitimacy to gain trust in the field. By sharing the language and cultural rules, however, *native anthropologists* may negotiate this legitimacy in different ways (Jacobs-Huey 2002).

Born and raised in Japan, I conducted research as a "native" or an "insider" of the society. While my background in education and sociology made my research subjects a natural choice, I later realized that my research would invite questions regarding the objectivity of my study, as speaking as a "*native*" *anthropologist*, or being an "insider," which was a controversial topic in anthropology. However, as I explain below, I was also an "outsider" to the communities I studied. As a positioned subject, an ethnographer "occupies a position or structural location and observes with a particular angle of vision," and any ethnographic findings are "subjective" in addition to being "*partial*" (Rosaldo 1993; Clifford 1986; Kondo 1986). Thus, multiple levels of contextualization are required to examine my positioning towards each community in the neighborhood (my field site), which also helps destabilize the boundary between "insider" and "outsider." I take an *autoethnographic* approach to my field experience and findings in order to contextualize my study from various perspectives. What does being a "native" mean, in particular, in ethnographic research in education? How does the environment that appears "at home" shape the interactions of ethnographers and the communities they study "at home"? How does being a "*native*" *anthropologist* "at home" influence the processes of interpretation in educational research?

Since the neighborhood I studied was a *minority* community due to multiple factors (historical origin, social class, ethnic backgrounds, legal citizenship, etc.), the space of my field site has been formed by the historical and sociocultural forces of modernizing Japan. By first contextualizing each group's structural location in Japanese society, I will present the multiple contexts that existed in my field site. Second, I will add and describe my main field site, the public elementary school, into this picture, and third, I will analyze the implication of my encounters with teachers, children, and community members to discuss the influence of these multiple contexts on my interpretation of ethnographic data and the role of interpretation in this study. By situating myself in an ethnographic description and by analyzing my interaction with the people I met, I revisit my field experience to examine my *positionality* in this study. The purpose of these steps and procedures is to consider the role of interpretation in this study, taking an *autoethnographic* approach to my *fieldwork* and research outcomes. At the end, I hope to examine the contribution that a "*native*" *anthropologist* or an anthropologist "at home" can make towards a *national anthropology* (of Japan), through the analysis of multiple contexts and my *positionality* in my study as well.

Research Report

Research Trajectory

I have been conducting research on educational policy and practice for *minority* and *immigrant* children in Osaka, Japan, since the mid-1990s. During my initial *field-work*, from 1998 to 2000, I examined the educational program and practice for recently arrived *immigrant* children in a multiethnic neighborhood. I chose this neighborhood as my field site due to the fact that (1) it was multiethnic, with a history of bottom-up empowerment and that (2) the communities worked together with the school. For these two reasons, I thought the school was a good place to examine how the newly arrived *immigrant* children were being accommodated and “integrated.” The focus of my research has broadened since then, from understanding the actual practices in school and community to examining the configuration of Japan’s emerging “*multiculturalism*.”

The goal of conducting an ethnographic study of a particular school in a neighborhood was to find out how new *immigrants* are incorporated in a multiethnic neighborhood in a relatively homogeneous Japan. I started from the school because documents, both published and unpublished, were available and because the school was one of the meeting points for the people of various ethnic and cultural backgrounds in the neighborhood. In the broader space outside of the educational arena, I wanted to examine the incorporation or integration patterns of Japanese society, which was slowly becoming more mixed. I asked questions such as: What kind of incorporation occurs? How does the cultural and ethnic homogeneity in Japan affect educational practices for incorporating new *immigrants*? How do other social groups (ethnic groups, social classes, social actors) understand the whole experience of developing a *multicultural* education program in Japan? Later on I asked, how do former informants/children remember these experiences?

As a Japanese national trained and working in the USA, bringing certain “international” traits to Japanese educational communities, I was treated as a “somewhat” different researcher in my home country. This might have been because of my affiliation with an institution outside Japan (most of the time I was affiliated with a university in the USA, but for 2 years with a university in Singapore); however, it may have been due to my being a researcher and anthropologist, studying my own culture by means of observing the interactions of people and everyday life and by interviewing them. In order to examine the cultural implications of what I observed, I sometimes had to ask questions that a nonnative researcher would not have asked. As the Japanese language is context dependent, it allows listeners to interpret the meaning according to the situation where the conversation takes place. Questioning, even for clarification, is not regarded positively, for this puts the communicators as equals, which disturbs the hierarchy between the two when there is clear status or age difference between the two. Due to my training in anthropology, or due to my exposure to the American culture, at the teachers’ meeting in my field site I found myself clarifying the

meaning of each phrase or word more than other participants. For example, when a teacher in charge of the education of foreign residents in my field site spoke about the educational philosophy behind the education, he used the phrase, “the education that nurtures ethnic identity of foreign children,” I had to clarify this by asking, “What do you mean by ethnic identity?” “It means an ethnic background,” he said. I continued, “Then, is it similar to the education that cherishes ethnic identity of foreign children?” “Yes, it is.” “What specifically do you mean by ‘cherishing one’s ethnic identity?’” I asked again. And the teacher would say, “When Ms. Okubo is participating, our meeting is disturbed. The discussion does not move forward.” My interpretation of this communication was as follows: If I were a researcher with a non-Japanese cultural background, the Japanese participants that I interacted with would not take me as somewhat different, but due to my role as a researcher doing anthropology of the culture that was regarded as my own, some thought I was strange or annoying, for I was someone who paused during the conversation or raised questions that would interrupt the fluidity of conversations.

On the other hand, as I was also studying *minority* and *immigrant* communities, or children of mixed cultures, I was following linguistic and cultural “others” as well. To these communities, I was also a cultural “other.” There was more space for me to ask questions or pause. The traits that I exhibited via my ethnographic inquiry did not invite much suspicion, for there was a larger divide between our cultures. Despite taking the interactions with me as being asked annoying questions, the participants would conclude that this was because I was Japanese, or because I have not been living in Japan. When I conducted an ethnographic study in the USA, I was allowed to ask questions more freely as a “non-American” researcher.

In light of these experiences, I discuss the impact of a *native anthropologist* doing research on multiethnic communities in this paper. What does it mean to conduct research as a native *anthropologist*, to negotiate the boundaries within a multiethnic neighborhood as both an *insider and outsider* to the cultures? How does this experience of negotiation affect the processes of the interpretation of ethnographic data and research outcomes?

Field Site: Miyako Neighborhood Seen Through an “Objective” Lens

Miyako, my field site, is a multiethnic neighborhood in urban Japan. It is located in Osaka Prefecture, which is in the midwest region of Japan. Almost half of the residents in Miyako are regarded as members of a former outcaste people (Burakumin), whose status goes back to the beginning of the seventeenth century. Japanese society went through a process of modernization and transformation in the last century, but discrimination against Burakumin still continues in employment and marriages, even after their civil rights movement in the mid-1960s (Davis 2000). Since successful members of the Buraku have been moving out of the

community, in 2000, only 30 % of the residents in Miyako were members of that community, while the rest were non-Buraku(min) who had moved into the community for economic reasons. As a result, less than half of the residents, including those who moved into the community for economic reasons, shared a consciousness of being members of the Buraku community. But residents who had been living there for generations were attached to Miyako, and some of those who had left the community in their early 20s were returning to Miyako after experiencing the outside world. Some returned for economic reasons, while others came back to seek the comfort of living with their families. Those who moved into Miyako in the 1970s and 1980s were referred to as “in-migrants” (*ryūnyūsha*). In a sense, Miyako Buraku was closed to outsiders, although there was no physical barrier between the community and the outside world.

Ten percent of the residents (about 300) of Miyako Buraku had a Korean background. Some were North or South Korean nationals with special permanent residency status. Some were legalized Japanese citizens, and others were Japanese by virtue of having been born after 1985 and of having one Japanese parent. Their ancestors migrated (and some were even forced to migrate) some time between 1910 and 1945 to Japan during the annexation of the Korean peninsula. The Koreans I met in my field site were second-generation Koreans, who had actually heard of their parents’ hardships after migrating to Japan; third-generation Koreans, who shared a memory of Japan’s colonial past through talking with their parents and grandparents; and fourth-generation Koreans, who did not necessarily have a personal connection with Korea, besides the fact that it was their ancestors’ homeland.

Adding another layer of complexity to this were Vietnamese refugees, who began residing in this neighborhood in the late 1980s. Many of them were refugees and their family members. The refugees, most of them from South Vietnam, had left Vietnam after the fall of Saigon in 1975 and arrived in Japan after spending a few years in refugee camps in Southeast Asian countries. Their family members joined them through the ODP (Orderly Departure Program, a family reunification immigration program) between 1980 and 2003. Some of them have legally naturalized and become Japanese nationals, and their children were born in Japan.

Chinese *immigrants* were children and grandchildren of the Japanese who had migrated in the prewar years to Manchuria, the northeast part of China that was under Japan’s control. They began returning to Japan, due to their Japanese ancestry, mainly after the normalization of Japan–China relations in 1972. Although they were regarded as Chinese, in terms of biological ancestry, they were either Japanese, half-Japanese (children), or quarter-Japanese (grandchildren). However, only a few families were naturalized Japanese citizens, and most of them had permanent resident status (different from Korean residents) and kept their Chinese nationality at the time of my research in 2000.

Miyako, with its Korean, Vietnamese, and Chinese populations, thus has been created by the global flow of people under the influence of geopolitical effects and globalization. Children in the neighborhood attended Miyako Elementary School, a public elementary school which was founded in the mid-1970s as an outcome of the Buraku movement. Since I was conducting an ethnographic study of their school

life, I met their parents through them at school, which was one of my main field sites. Most of the teachers at Miyako were Japanese, commuting from outside the neighborhood. Two third-generation resident Koreans were working as teachers at school, and other resident Koreans were working as instructors at the Korean education center in the neighborhood. Some of the instructors working for the Community Youth Center were from Miyako Buraku in the neighborhood or from other Buraku. My *fieldwork* unfolded within this space created by people of different structural locations in Japanese society.

Autoethnographic Description of My Positionality

Miyako Elementary School: Main Field Site

Unlike many scholars who visited Miyako Elementary School knowing that it was a Buraku school, I only discovered this fact after I selected my field site. I visited Miyako during my preliminary research in 1997 because I had heard that so-called “newcomer” Vietnamese children were studying at Miyako. Unless you were from the area or studying about *minority* education/education for the Buraku, the fact that the neighborhood was a Buraku community was not obvious. Since the school had an office for the teachers’ association for the education for resident foreigners in the prefecture, I visited the office to inquire about the current situation of *immigrant* children and to ask them if they knew of any possible schools that could accept me as a field researcher. The office suggested that I ask Miyako, and I then had meetings with the principal and a headteacher of the school. The headteacher told me, “I heard you would be doing research at our school next year. As you know, this school is assigned as a special school for promoting Dowa education (education for the Buraku), so I hope you will understand this and cooperate with us.” I did not fully understand what he meant. What did he want me to “understand” and what kind of “cooperation” was he asking for? (Okubo 2005), this was my initial reaction. Gradually I came to realize the implications of his words after I started my *fieldwork* in Miyako the following year, and I had to readjust my research project from a study of recently arriving *immigrant* children in urban Japan to a study of *immigrant* children in a “Buraku” neighborhood. Despite human rights education and other enlightenment efforts, some Japanese tried to avoid any association with them. This was exemplified by a Japanese senior scholar’s advice, during my *fieldwork*, not to emphasize the Buraku in my study, for I would be referred to as a researcher of a particular type. Under these circumstances, I later realized that the “cooperation” he mentioned had more meaning than I was initially able to absorb.

In addition, being a Buraku school, Miyako was also used to having guests and even researchers for a day or a short period of time. Guests and researchers were there to learn the school’s programs and activities as part of Dowa education, i.e., the education for the Buraku community, as it was one of the two Buraku schools in

the city. The education for resident Koreans and *immigrant* children and the education for physically and mentally challenged children were added to Dowa education, under the framework of *multicultural* education based on “human rights” education, which was another name for the Buraku education. Being a Buraku neighborhood was a decisive factor that differentiated the experiences of these *immigrant* children from those living in other parts of Japan.

Since Miyako was a school for promoting *minority* education, teachers at Miyako Elementary School were divided into two categories—a smaller number of teachers who had been active in promoting and developing education for the Buraku and foreign residents (resident Koreans), and a larger number of teachers who were reluctantly teaching there as a result of regular transfers that happen every 5–10 years. Among the former group, some of the teachers had taken the positions out of an ambition to become a vice principal or principal in the future, rather than out of their concern and passion for these children’s education. Thus, for the teachers working at Miyako, the school was a site of contested meanings. The school was also a site of another contestation—on the one hand, the school functioned as Ideological State Apparatus (Althusser 1971) and produced Japanese national subjects (Balibar 1991), and on the other hand, the school institutionalized (with some distortion) a localized idea of *minority* education that originated in grassroots educational activities for *minority* children. Moreover, the teachers had personal lives and beliefs that influenced their decision-making regarding their support and participation in community events, such as the Vietnamese New Year’s Festival, organized by an outside school association in the neighborhood.

My Encounter with the People/Research Participants

Since my point of entry in my field site was Miyako Elementary School, my encounter with community members, neighbors, and teachers was mainly through the school and its teachers. On the first day of my *fieldwork*, I was introduced to the teachers at Miyako at a teachers’ meeting as a graduate student of a Japanese university who had studied abroad in the USA and was doing research on Vietnamese children and their education. Not knowing that the number of Chinese children was increasing in Miyako, I had addressed only Vietnamese and their after-school educational activities at school in my initial research proposal. Although I have rarely visited the university in Japan where I finished my master’s, teachers in Miyako thought of me as a graduate student studying in Japan, rather than in the USA. This perception continued throughout my *fieldwork*, and even held currency when I went back to Miyako after my *fieldwork*. This might have been because teachers were more familiar with my university in Japan, or it might have been because they could not imagine that I was doing research for my dissertation for a US school. Whenever I was introduced to other people, I added that my research at Miyako was for my dissertation research for Berkeley, and not for my Japanese university.

Compared with foreign researchers who did not share the language or cultural rules of Japan, I was an “insider” (native) of the society at Miyako Elementary School, but I was not completely one of them. In addition, being a graduate student

did not have any professional implication in the Japanese context. Thus, being a “young,” “female” (graduate) “student,” it was difficult for me to establish a professional relationship with some teachers. One teacher even suggested that I should not live in the neighborhood due to my middle-class background. All these events made me question the meaning of the *fieldwork*, and by the end of my 18 months of *fieldwork* I had come to realize that, in contrast to their initial openness, they actually did not want anyone in school for more than one semester (3–4 months). The more I tried to engage with them as a researcher, the more I felt as if I was being alienated. The teachers were not used to long-term *fieldwork*, either, although they had frequent visitors to the school. In accepting visitors, the school and teachers expected the researchers to give positive reviews and feedback of their educational programs. This is probably because of the nature of teachers working with *minority* students; in a larger educational system, these teachers were doing extra work that other teachers would not have volunteered to do. I was aware of this fact as well; however, as a researcher, I gave my opinions and feedback based on the interpretation of my ethnographic data and experience.

To the children at Miyako, I was introduced by the principal as a “trainee,” but the students were told to refer to me as a “teacher.” In order to separate myself from teachers and to keep my position as a researcher in school, I told the teachers that I would prefer not to be called a “teacher”; however, they said that it would be awkward if an adult who was not a teacher was present in the school site on a daily basis. Thus, I had to accept my title as a “teacher” (*sensei*) from teachers and children at Miyako, but the children looked at me slightly differently from other teachers, because I was not teaching. There were a few other teachers who did not teach in regular classrooms in Miyako, such as teachers in charge of the Japanese language classes for new *immigrants*, teachers in the school infirmary, teachers taking care of children in the after-school daycare center in school, and teachers/helpers in charge of mentally challenged children.

My *positionality* of being an “insider–outsider” was further complicated outside school—in the neighborhood, when meeting neighbors who had different social locations, languages, discourse styles, and cultural rules. Japanese nationals who had lived in Japan throughout their lives have experienced the same complications of their positionalities in interacting with communities; however, the fact that I was not closely affiliated with a Japanese institution made me appear to be not rooted in Japan. Although the sense of self is constructed and shaped interactively with society in Japan as in many other societies, I would say that belonging to or being a member of organizations is one of the larger factors that constitutes one’s social identity in Japan, as many anthropologists have discussed (Nakane 1970; Rosenberger 1994).

Before I conducted my research in Miyako, a researcher who had been studying the Buraku in another area for several decades said that it would usually take 5–10 years to “understand” the community. The difficulty of entering the Buraku community was known to the scholars doing research among them. The second day of my field work, the vice principal of Miyako took me to the Community Youth Center and the Community Center. The close relationship between the school and the community was a unique feature of Miyako as a Buraku school. With the

assistance of the principal, I was able to live in one of the apartment complexes for the Buraku. When I visited the community leader with the principal regarding this, the community leader accepted my request to move into one of the community apartment complexes, saying, "We have many young men in our neighborhood. You should consider marrying one." Whether it was a test or a challenge to me as a member of the dominant group entering their community, I am not sure. But from his words, I realized that I was entering their territory. Although the Buraku were marginalized in the larger society, the Buraku community had a certain power within Miyako, the neighborhood; however, by phrasing it that way, I may be undermining the discrimination against the Buraku in contemporary Japan.

While I was doing my *fieldwork*, the Buraku community was facing the abolishment of special measures for the community which had been in effect since 1969. Facing this change, each community was trying to educate community members with the goal of "self-help" so that the community as a whole could be self-sufficient. However, it turned out that Miyako was regarded as a failure case for this Buraku reform. When I told other scholars familiar with the Buraku issue that I conducted research in Miyako, their responses were that my experience must have been tough. The more "successful" Buraku communities, according to the scholars familiar with the Buraku communities in Osaka, seemed to have had a more positive and collaborative relationship with schools, teachers, and researchers. If Miyako's efforts towards the change as a whole were functioning as well as other more successful communities, the greetings of the Miyako community leader may have been different. Or was it the expression of their true feelings towards outsiders to the neighborhood?

The resident Koreans had their own center for after-school educational activities for children of a Korean background. This was expanded to include Chinese and Vietnamese in the second year of my research. They also assisted the activities of the school's Korean ethnic club and Vietnamese ethnic club. Thus, at the early stage of my research in following Chinese and Vietnamese *immigrant* children in school and the neighborhood, I met with the Korean instructors. During my stay in Miyako, I also encountered more people interested in the education of foreign children, including children with Korean, Chinese, and Vietnamese backgrounds through teachers at Miyako Elementary School and at a research institute for *minority* issues. They were Japanese teachers, and Korean and Buraku activists and parents. With them, I was a "researcher" interested in the history and current situation of *minority* education of the neighborhood, and I was also someone who cared about their empowerment. In this sense, I was an "insider" for those who were interested in *minority* issues and their education, regardless of their ethnic backgrounds or occupations.

My encounters with Chinese and Vietnamese parents and community members, who did not necessarily share the same languages and cultural rules as I did, had another implication. Since I met them through the children and teachers at Miyako, for them I was a "teacher" at Miyako helping out in Japanese language classes for their children. Since I lived in Miyako, I also ran into them at stores, stations, neighbors' places, and community events such as after-school classes for children and the Vietnamese New Year's Festival. Due to my limited Vietnamese ability and inability to understand Chinese, our conversations were in either limited Japanese

or Vietnamese, or occurred with the assistance of the children or a teacher who understood the language. Despite this language barrier, as a “teacher” living in Miyako and as someone who helped out at community events, I was able to interact with some of them. Similar to my interactions with Korean and Buraku neighbors, the way in which I developed my rapport was not necessarily a direct result of my ethnicity, gender, or social class background, although I do not deny that these factors influenced my research and limited my purview. Living in Miyako, participating in community events, and visiting my neighbor’s houses, I met with Chinese and Vietnamese parents whom I had not known through schools.

Research Approach: Ethnography

Ethnography, Qualitative Methods, and Long-Term Research

During my initial *fieldwork* between 1998 and 2000, I lived in my field site and conducted participant observations of everyday practices. In particular, I examined the educational practices directed towards 1.5-generation Chinese and second-generation Vietnamese children in school and within their local community, where *minority* groups with different historical, cultural, and political locations reside. I conducted participant observations of class activities of the public primary school in my field site and in the neighborhood where I lived, as well as formal and informal interviews with teachers, children, parents, and other residents both in and out of school. Between 1998 and 2008, I conducted formal interviews from 30 to 120 min with more than 120 individuals in person and phone interviews with four others. Between 2009 and 2010, I conducted about 70 informal and formal interviews including 24 recorded ones. In 2011, I visited my field site to collect reports and newsletters, as well as libraries to gather the information on educational and immigration policies in Japan, but no interviews were conducted. I interpreted my ethnographic data by employing “triangulation” of other data obtained from other qualitative research methods, official statistics and reports, and literature.

In July 2008, 10 years after I conducted my initial *fieldwork*, I went back to my field site, Miyako, in order to find out how these Chinese and Vietnamese children were doing. I had a chance to return to Miyako briefly in 2001 and 2004, but I had not had a chance to meet most of the children in Japanese Language Classes at Miyako Elementary School. During this follow-up, the purpose of my study was to update the situation of the Chinese and Vietnamese children from the Japanese Language Classes. In addition, I wanted to document how these children remember their experiences at Miyako, which I described as the “production of ethnic others” in my dissertation project. In particular, I wanted to ask them what they remembered about Japanese Language Class activities, and what they actually “learned” about Japanese culture/society and about themselves from these experiences.

Miyako, the neighborhood, had gone through much transition. The special measures for the Buraku community, which had supported the development of the community since 1969, were abolished in March 2002. As a result, the name of the community center had been changed from Miyako Liberation Center to Miyako Human Rights Community Center, following the trend of other buildings that were associated with the Buraku community. Now, “human rights” have taken over “liberation.” Before the end of these measures, incidents regarding the embezzlement by community leaders of funding allocated for the Buraku communities were reported. Miyako was one of these communities covered in the media. Due to this incident, the branch office of Miyako had been put under the custody of Buraku Liberation League (BLL) Osaka Federation to promote a democratic reform of the Miyako BLL branch. A couple of people in the leading positions of a branch office of Miyako BLL had disappeared when I went back to Miyako in July 2008. The leader of the community, who had voiced his complaints to schools and teachers about the school’s interest in the conscious-raising aspect of Dowa education and not in the achievement of students in the community, had also left Miyako.

I was interested in understanding how this policy change towards the Buraku had affected the neighborhood as a whole, and the cultural and local politics among different groups, and thus, educational programs for Chinese and Vietnamese *immigrant* children in the area. As I was revisiting my dissertation materials for publication during this visit, my perspective was more “objective” than it was as an ethnographer. A noticeable change was that the neighborhood’s education center organized by Korean residents, which had been a branch of the Buraku center, had split into two sections; the center for the education for “internationalization” became the city’s official center for *multicultural* education, while the center for community education (for ethnic minorities in Miyako) turned into a nonprofit organization. The city’s system for supporting human rights has also shifted from being based on human rights issues centered around the Buraku to falling under the framework of “*multiculturalism*” (*tabunka kyōsei*).

Framework for Ethnographic Research Methods

My research was theoretically influenced by two anthropologists doing research on education and learning. The late John Ogbu, my advisor during the dissertation project, suggested that I should not stay in classrooms to understand education. He conducted a comparative study of the academic achievement of *minority* communities using the concepts of identity, “cultural frame of reference,” and “*minority* status” in society as analytical lenses. He classified minorities into “involuntary” minorities, those who find themselves in the country against their will, and “voluntary” minorities, i.e., *immigrants*. He recommended that I go out into the community and talk with parents, not only teachers and children, and observe them at home to discover educational practice and people’s attitudes and behavior towards education. Jean Lave was another person who inspired me during my *fieldwork* and writing.

Her approach was the *ethnography* of learning as a social practice, not only in school but also outside school to understand educational practice and discourse. She advised me not to be associated with teachers during my *fieldwork* in school, which was difficult as I was introduced to the children as a “teacher” at the school, conducting research for my graduate study. She also suggested following a small number of people, children, all day to understand them in depth, rather than staying in school. Due to their advice, although my *fieldwork* started in the school, my study expanded beyond the school to the children, communities, and teachers outside school.

Accordingly, the frameworks for my research were mainly the macro-study of education (Ogbu) and situated learning (Lave) to understand learning and everyday practice in the larger cultural–historical, social, and political contexts, with a focus on the social and cultural formation of subjectivities (Ogbu 1987; Lave and Wenger 1991). Based on these frameworks, I designed my research project and employed ethnographic research methods during my *fieldwork* to understand educational phenomenon in my field site. In order to get a holistic picture of the educational phenomenon in Miyako, a series of ethnographic studies and follow-ups from multiple angles were necessary. However, as I did not limit this study to the school site, I may have diverted my attention from educational practice within school per se. This could have been another reason why my assessment of educational practices was more critical, compared with other researchers back then.

Re-examining the Research Findings from an Autoethnographic Perspective

Here I re-examine my research findings by adding myself and my interaction with the people in my analysis in order to understand the *partiality* of my perspective and the ways in which my anthropological knowledge was constructed. As Narayan (1993) says, not only our *fieldwork* interaction, but our scholarly texts are also influenced by our locations in our field site and in a larger society. It is our responsibility to understand the process of the construction of anthropological knowledge by analyzing our ethnographic descriptions.

In my article published in *Intercultural Education* in 2006, I argued that the Chinese and Vietnamese children were further marginalized by the educational programs in the school community in Miyako, despite the school’s enthusiasm and commitment for “*multicultural* education based on human rights education” and despite the teachers’ efforts and hard work. Marginalization was due to the transition that the Buraku and resident Korean communities experienced in the late-1990s, along with the local government’s interest in promoting “internationalization” and exchange with foreign residents. This conclusion was based on my ethnographic research in Miyako, from analyzing the data collected through negotiating multiple contexts and boundaries in Miyako (Okubo 2006). Although I acknowledged the efforts and hard work of the teachers at Miyako, my analysis was rather critical of their educational practices. How were the processes of interpretation shaped in this research?

Revisiting my time spent in Miyako and talking with a few teachers who became close during my subsequent *fieldwork*, I realized that, as mentioned, I was unwanted by Miyako Elementary School as a long-term field researcher. They were used to having short-term visitors, but not a researcher for more than a semester. I had been able to attend teachers' meetings in school for half a year, but in the following academic year, not all the information of the meetings had been shared with me. This had made me more of an "outsider," who also happened to be a "native" of the culture I studied. I was constantly struggling to find a way to create a more professional relationship with teachers after the initial phase of interviewing them about the educational activities and children at Miyako. Although other so-called "native" *anthropologists* have experienced an identity crisis as a result of not being able to distance themselves from a familiar culture, I did not have to go through this process (Ohnuki-Tierney 1984; Kondo 1986; Rosaldo 1993; Jacobs-Huey 2002). I emotionally and cognitively shared the language and cultural rules with the people/research participants, but I had a certain distance from some of the teachers at Miyako, and thus, I was able to keep a sense of reflexive perspective.

The issue of losing one's identity as a researcher, which many "native" *anthropologists* also experience, did occur to me at the early stage of my research; however, I was able to regain my identity as a researcher in interacting with teachers as a way to resist their denial at school. This emotional detachment from Miyako Elementary School is reflected both positively and negatively in my analysis of the educational program for Chinese and Vietnamese children. I was able to connect the events outside the school with educational activities in school. This may partly be due to the advice I received during my dissertation project, which was to conduct a macro-analysis of schooling and not to be associated with the school and teachers by children and parents. At the same time, however, I might have missed the details inside school, despite my awareness of the time and effort that teachers spent for the children. I did not examine the pedagogy of the school nor the curriculum of the school as an educational designer would have done. Thus, my knowledge is constructed more by the data I gathered outside school in order to make sense of what was happening inside school. Moreover, since I had more interaction with certain teachers and community activists, who tended to be critical of school, my perspective may have been influenced by their views. This point will require further attention to examine the limitations of my project.

The Role of Interpretation

Interpretation in This Chapter

I presented my results through conferences and publications, including my dissertation, based on my field study conducting *ethnography* of Miyako. As I employed a "triangulation" as a method, juxtaposing my ethnographic data with publications and data from other sources, I did not resort solely to my ethnographic data in my analysis although *ethnography* played a significant role in my study.

After publication in a Japanese edited volume in 2008, a teacher who was a leader of the association for the education for foreign residents in Osaka questioned my intention for writing my chapter and wanted to have a meeting with other teachers. When I mentioned that incident to a teacher whom I trust, she said he probably does not want anyone to criticize their educational practice. The meeting did not occur due to a scheduling conflict during my stay in Japan, but I sensed that my work was not received favorably by the Japanese teachers who are working for *immigrant* children with the association. It was because I argued that the educational efforts of the school and teachers did not necessarily lead to the full integration of the *immigrant* children. I argued that *immigrant* children were marginalized in school and community, which I interpreted as an initial phase of integration.

Some scholars have given a positive evaluation of these educational efforts, for they compare them with the past, when there was little educational support for *immigrant* children, and they seem to have grounded these practices based on the ideal of *multiculturalism*, human rights education, and philosophy inspired by scholars (Paulo Freire, James Banks). Observing a gap between the school's understanding of what *immigrant* children should be like and the children's and communities' understanding, however, I could not simply say that the school's attempt was successful. The culture of positive evaluation of educational practices and policies among academic scholars probably originates in (1) the general tendency in Japan not to critique others and (2) the difficulty of the collaboration between researchers and teachers and schools. Academics regard school teachers as practitioners and not scholars, and teachers look at researchers as scholars who do not understand actual practices. Due to this twisted relationship, the two cannot create a mature relationship that could allow both sides to freely express themselves, which includes critical assessment of each other's work. And lastly, (3) there is little criticism because Japanese scholars and the public are aware that teaching is a very challenging job, and that only a small number of teachers will actually dedicate themselves to nonmainstream populations such as *immigrants* (Lewis 2011; Ota 2000; Gordon 2011).

In my publication in 2008, I presented the suggestion that a different conceptual schema is necessary for solving this issue (Okubo 2008). Due to criticism from Japanese teachers, I wonder whether I should have followed the lead of other Japanese scholars and produced more supportive documents for teachers, and included more positive evaluation of their educational practice. I also question what my role was as a *native anthropologist* negotiating multiple boundaries within the field site. Although I wanted to examine the effects and implications of the educational program, I sensed that what I wrote, based on my long-term ethnographic study, was not welcomed by school teachers. This partially resulted from my relationship with teachers and community activists, which was influenced and shaped by my ethnographic research methods to situate the school as one of my field sites to understand how *immigrant* children were integrated into Japanese society.

The difference of my perspective from that of teachers in my field site was also illuminated by another event. The year 2000 was the first year that the national anthem and flag became mandatory in school ceremonies. Activists and a small

number of teachers held study groups for teachers to examine the implication of the government's decision on resident Korean, Vietnamese, and Chinese communities from a historical context of Japan's invasion of these countries during World War II.

The tension around the change of the national state policy was further complicated by another tension in the neighborhood. During my *fieldwork*, the resident Korean community in the neighborhood was split into two—one that had official support from schools and the city and the other that was more based on the activism of ethnic minorities, including new *immigrants* in the area. Their split impacted the Miyako Elementary School's and the Vietnamese community's decisions regarding which Korean group to ask for support in organizing the neighborhood's Vietnamese community festival in 2000 (Okubo 2005). Knowing the internal conflict of the resident Korean community in Miyako, a scholar conducting research on resident Koreans in another neighborhood in Osaka understood my predicament and even advised me to find another field site.

If Miyako Elementary School took pride in itself for its "*multicultural*" education based on "human rights" education in a true sense, there should have been some discussion among teachers regarding the two incidents; however, the school and teachers stayed detached from these political issues that impacted the children and parents in Miyako, as if nothing had happened. Not living in the neighborhood, many teachers were not aware of details of the tensions and conflicts in the area. They learned about the events from the principal and the teachers in administrative positions at school.

Further discussion of my *positionality* towards each community is necessary to contextualize and examine the role of interpretation in my ethnographic study. The fact that I was a graduate student affiliated with the US institution was more favorably taken by resident Korean, Chinese, and Vietnamese communities than by teachers. The children of some resident Koreans were studying in the USA or have studied in the USA. Some Vietnamese had relatives in the USA and mentioned that their siblings or parents were in the USA. I did not meet with any Chinese in Miyako with relatives in the USA as they were mainly from the northeastern part of China, but they were curious about my experience as a foreigner in the USA. To these communities, I was a Japanese national who had experienced being a cultural "other" from living in a foreign country, as they did at the time of my research. But I should not forget that my cultural and linguistic background as being a member of the dominant culture in Japan must have put me in a more powerful position towards them.

My *positionality* towards the Buraku community was more complex. The discrimination against the group is said to be still present although its form has become more subtle. To them, I was a member of the dominant Japanese living in their community. As they are culturally and ethnically the same as Japanese, the only factor that divided us was whether our ancestors were community members or not. Being a member of the dominant Japanese culture, I was in a position of power vis-à-vis/compared to them in society; however, as I explained in my study, they had a certain power within Miyako. In addition, my association with the community was through my research, and the members that assisted me with my research were

those who were not reluctant to share their experiences with me. As many ethnographers may have experienced, I sometimes felt that I was at their mercy to continue my research.

This was true not only for my association with the members of the Buraku for my project, but continued throughout my *fieldwork* in Miyako. In this sense, the *positionality* of an ethnographer towards the people in the field in collecting field data is vulnerable. The interpretation of ethnographic data is influenced by whether we meet someone who can assist us in the field and by who they are.

Anthropology “At Home” and National Anthropology (of Japan)

Through the discussion in this paper, I demonstrated that no anthropologist is “at home” in a strict sense. I was an “insider” simply because I shared language and cultural knowledge with the teachers and some children, but at the same time, my gender, age, class background, and most importantly, the fact that I was an unwanted long-term fieldworker created a certain barrier between the Japanese teachers and myself, which was different from the one I experienced with my neighbors, who had different ethnic backgrounds. My research findings could have been different if I had been able to develop a different kind of rapport with the teachers. However, at the same time, my positionality gave me a fresh perspective in analyzing the *multicultural* education program, contextualizing it with events happening outside school. In this sense, our interpretations are embedded in particular cultural settings of our field sites.

The concept of the “*native*” anthropologist has been questioned due to an anthropologist’s multiple identities, hybridity, or being a “virtual” construction as a *native ethnographer*, which leads me to conclude that only the difference between ethnographic Self and native Other remains, and not the difference between “insider” and “outsider” (Narayan 1993; Kondo 1986; Weston 1997; Rosaldo 1986; Bunzl 2004). The effort to bridge the difference between the Self and Other can be made by being conscious of this epistemological divide and by sharing and returning our research findings to the field, which is also important for the professional ethics of anthropologists. To this, I would like to add that studying the culture “at home” puts one in the position of the privileged for understanding the contexts better than those who do not share the culture, but can create other power dynamics—different from the ones that result from one’s background. Being an insider within Japanese culture and a native speaker of the Japanese language, I was expected to rely on contextual meaning in speaking Japanese, which placed limits on my ability to interpret what others were saying.

From my experience as an anthropologist “at home,” I second Sonia Ryang (2004)’s suggestion that anthropology of Japan, which has been studied as a “national” cultural entity, needs to be de-territorialized and denationalized, and a

critical understanding of Japan's colonialist role in Asia must be developed (Ryang 2004: p. 199, p. 203; Appadurai 1996). The events I experienced in Miyako captured these moments, which enabled teachers to choose or not to choose to practice this understanding. Although the current state of Japan's "national" anthropology is said to be a product of a two-way, unequal, and asymmetrical communication between Western and Japanese researchers, partially due to the peripheral position that Japan holds in the hegemonic structure of anthropology as an academic discipline, I would encourage more researchers from these countries to publish their studies to the world (Ryang 2004: p. 2, p. 203; Ota 1998; Kuwayama 2004). If the power relationship that exists within the production of anthropological knowledge defines communication with researchers from a peripheral position as they argue, the digital revolution, which is creating more opportunities for communication to anyone with internet access, may make a difference in the future.

With a hope to denationalize Japan's anthropology without reinforcing the "national" culture of Japan, I demonstrated the *partiality* of my interpretation from an *autoethnographic* study of my field research and research findings of multiethnic Miyako and from the understanding of the role of interpretation in my study. I hope that I was able to illuminate the complexity that exists in Japanese society, demonstrate the *partiality* of my interpretation by examining my *positionality* as a *native anthropologist* from multiple angles, and present a nuanced portrait of Japanese culture and society. The ways in which my interpretation of ethnographic data unfolded in educational research were foreshadowed in these discussions.

Conclusion

Adding myself by using an *autoethnographic* lens was a way for me to rediscover my "positioned" knowledge and "*partial*" perspectives and how I conducted my research as an anthropologist. This process also de-constructed the division between being an "insider" and "outsider" of one's culture. As the *fieldwork* is shaped by the people we meet, a person studying a "home culture" may not necessarily feel "*at home*." Sharing similar beliefs and ideas may affect our interaction with the people more than our backgrounds do. Using an *autoethnographic ethnography* and examining my interaction with my research participants, I revisited and re-examined my research findings. Through this process, I have realized that being an *anthropologist "at home"* was beneficial, but at the same time, it also re-enforced a distinction between ethnographic Self and Other. At the end, I discussed the role interpretation played in this study, why my analysis produced a more critical assessment of educational programs back then, and the possible contribution that I, as a Japan anthropologist (not necessarily as an *anthropologist "at home"*) can make, in denationalizing the field of Japan anthropology. I hope that these discussions have contextualized my analysis of the role of interpretation in ethnographic educational research.

Acknowledgements I would like to thank my field site, which I call Miyako Elementary School and Miyako neighborhood, and the participants in my research who generously shared their experiences with me during my field research. I also like to express my great appreciation to Kathryn Anderson-Levitt and Neriko Doerr for commenting on the earlier versions of this chapter. The field research for this study was assisted by the Annual Fellowship of the Center for Japanese Studies at the University of California, Berkeley (1998–1999); Japan Science Society (1999–2000); Postdoctoral Fellowship of the Faculty of Arts and Social Sciences, National University of Singapore (2008); and a grant from the Abe Fellowship Program (2009–2011) administered by the Social Science Research Council and the American Council of Learned Societies in cooperation with and with funds provided by the Japan Foundation Center for Global Partnership.

3.5 Us and Them: What Categories Reveal About Roma and Non-Roma in the Czech Republic

David Doubek and Markéta Levínská

Introduction: Interpretation and Categorization

In this text, we focus on one aspect of our research, which investigates in detail the topic of education in the context of relationships between the Roma minority and the non-Roma majority. The aspect we would like to address in this paper is the identification of the “object” of our research—the Roma minority. The scope of our research is much broader and is not limited solely to the questions of ethnicity or identity; however, the clarification of this particular topic has turned out to be of extreme importance to us and it provided an important insight.

Apart from the need to understand whom our research involves and what is its actual subject, it is also important to mention that the Roma identity is not only a neutral delimitation of a certain part of social reality, but also a factor playing an important role in a number of other aspects of the relationship or the conflict between the minority and the majority.

Determining who Roma actually are is not trivial at all, although it might seem so. Even though every Czech citizen imagines a relatively concrete picture when someone says Roma or Gypsy, there are a number of Roma who do not fit at all into that image. The word Roma is not printed on their foreheads, they do not have any “Roma identity card,” and they often do not even know that they are Roma and they learn of this fact only after they start attending school. Roma are a certain social

category and belonging to this category is not something given, complete and final. Partly, people belong to this category because someone designates them as Roma and partly because they themselves identify with this category; however, in both cases it is a result of a particular interpretation of various features.

Similarly, also the categorization done by a researcher is not a mere theoretical or logical game, the main purpose of which would be to put things in order or to define the studied subject—it can involve another, hidden agenda. As the disputes between the advocates of the “cultural” and “social” concepts of Roma identity dominating the Czech academic world show (the hidden theme of these disputes is whether investments should be made in Roma cultural activities or in social programs trying to offset the consequences of social exclusion), categorization has consequences for the category as such. Therefore, it is absolutely necessary to reflect on the consequences of categorization and on its other dimensions.

Context and Outline of Our Research

The Czech Republic has been criticized by the EU for the fact that a large proportion of Roma children obtain their education at elementary practical schools. The elementary practical schools are a relic from the communist era, they are a separate branch of the educational system which is primarily intended for mild mentally disabled children and from which it is difficult to progress to higher levels of the educational system.

Poor school performance and the resulting limited access to the labor market is a serious social problem. Also, the relationship between the Roma minority and the non-Roma majority is problematic and often painful. These issues are in the center of attention, and the elimination of poor school performance is seen as one of the tools that could help to eliminate the poverty and marginalization in which a large number of the members of the minority find themselves.

Our research focuses on the topic of Roma students' poor school performance. However, we do not understand this failure only as an issue of narrowly defined school performance, “intelligence,” or “adequate developmental maturity for school attendance.” Due to the fact that poor school performance is associated with a certain, not neutral, social classification, and that our previous research (long-term research performed by the Prague Group of School Ethnography) shows that the school is a space where a number of other things, apart from giving instructions to students with the aim of educating them, take place, which can also contribute to poor performance, we are interested in social factors contributing to Roma students' poor school performance. We focus on the perspectives of the actors, in particular Roma, but also of the members of the majority contributing to the situation in which Roma currently find themselves. As anthropologists, we base our approach on the assumption that social reality develops as a process and through interactions between individual participants, who always base their actions on their understanding of the world, and these interactions are thus a result—sometimes intentional and

sometimes unintentional—of this understanding. In order to understand what happens between the actors involved, it is essential to investigate the meaning which the individuals give to their actions, how they interpret their situation. Also, the interpretations of the actors are not static—they change depending on the context and on the situations in which the persons find themselves. For these reasons, it is necessary to study the actions of the actors in context and over the long term. It is necessary to spend time with the actors, to talk with them, and to ask about their interpretations. In the case of Roma, there is also the factor of a certain cultural difference and isolation from the social mainstream. For these reasons, we choose the traditional anthropological approach of “participant observation” in its broad sense (Malinowski 1922, pp. 2–22).

In the first, 3-year research project entitled “The Value of Education from the Perspective of Romany People (Education as Seen by Romany Mothers),”¹ we sought to understand what value do Roma attribute to education. The second project entitled “Function of Cultural Models in Education” focused, based on the experience from the previous research, on further investigation of cultural concepts which Roma use in relation to school and education within a broader context of education, and on research of social impacts influencing the attitudes and approaches of the involved actors. In both cases, the research was conducted as anthropological field research whereby the researchers stayed in the field and interviewed the actors, and their primary intention was to capture the perspectives of individual participants as well as the context and local social processes. This text discusses the outputs of both researches.

Initial Questions

We investigated the reasons of Roma students’ poor school performance for the first time in the 1990s when we performed a longitudinal research study at elementary schools in collaboration with the “Prague Group of School Ethnography.” The research took 9 years over which we observed the development of students in one class from the 1st through the 9th grade. During the interviews, teachers occasionally mentioned that school attendance should be adapted, shortened for Roma students, because they, for some reason, possibly because of reaching sexual

¹ The first 3-year project (2005–2007) took place in the East-Bohemia region, mainly in town communities, and its title was “The Value of Education from the Perspective of Romany People (Education as Seen by Romany Mothers).” The second project entitled “Function of Cultural Models in Education” (2008–2010) was conducted in the West-Bohemia region, where there are scattered rural socially marginalized localities in the surroundings of two cities. Both research projects were supported by the Czech Science Foundation (Grant No. 4 06/05/P560 and Grant No. 406/08/0805). Currently, we are starting a third, 4-year project (2012–2015) entitled “Decision-Making Processes of Assistance Professions in the Area of Intercultural Relationships” (GACR, Grant No. P407/12/0547).

maturity earlier, cease to attend school regularly starting from the 7th to 8th grade, which results in their poor school performance.²

Initially, we assumed that the possible reason behind the poor performance of Roma children at school might be a different approach to education or the failure to understand the value of education and the opportunities it provides, which, we presumed, could be explained by a different set of values ingrained in a different culture. More or less unconsciously or automatically, we presumed that education has its undeniable transparent value that goes beyond dispute. Apart from that, we knew about insufficient preschool preparation of Roma children (e.g., the Roma children in the Czech Republic are not used to draw the way children from the majority are), about the absence of colored pencils in Roma households, and about the language barrier which is caused by the fact that Roma children do not speak Czech competently. We suspected that there is some turning point during elementary school attendance when Roma children are transferred to the special school and we wanted to find out under what conditions and why this happens.

We also regularly, as volunteers, attended open-air school stays of one of the “special schools” based in Prague (basically a school for children with mild mental retardation), where a large part of students belonged to the Roma community. As students, we were surprised to see that these were definitely not mentally handicapped children. Of course, their level of literacy could be disputed, but they were able to play strategic board games (checkers) with any trouble at all. This amateur observation in combination with later observations from elementary schools motivated us to investigate the issues of Roma and their education in greater detail.

Based on these indications, pop-cultural (promoted by the Roma studies) image of Roma, according to which Roma are basically nomads who were forced to settle down and in whom there is still dormant “restless blood,” we assumed that there may exist some core of the Roma culture that is incompatible with the majority’s culture of professional career and that this conflict is the reason behind poor school performance and other phenomena accompanying education.

Our initial broad question was thus as follows: what role can Roma culture play in school performance? If the teachers say that the Roma students are “different,” what is this difference? Can we ask such questions at all? And who are actually Roma?

The Roma Minority in the Czech Republic

While it is probably not necessary to explain the context to Czech readers, we should provide some basic information about the situation and position of Roma in the Czech Republic for foreign readers.

² The opinion that Roma children mature earlier, or that they are sexually mature earlier, is a myth derived from the fact that Roma girls often become pregnant earlier than the girls from the majority. However, this has nothing to do with the alleged earlier onset of pubescence. To the contrary, some studies even suggest that sexual maturity begins later in Roma children (Sivakova 1992, p. 40).

According to various sources and also according to our field experience—the majority of Roma living currently in the Czech Republic are Roma who moved from Slovakia after World War II in several migratory waves (Janků 2007). These are people who had lived a settled way of life in Slovakia from the thirteenth to fourteenth century (Daniel 1994). They moved to the Czech Lands in search of work, mainly to the border areas from which the German population had been deported and where there was a demand for labor (Davidová 1995). There were also smaller groups of Hungarian, Romanian, and German (Sinthi) Roma and a specific group of migrating Olah Roma which lived nomadically (Davidová 1995, p. 10). However, providing any exact numbers is impossible.

After World War II the Roma were referred to as citizens of gypsy origin and the state declared its intention to improve their standard of living, in particular in the areas of social conditions, health, and hygiene. The state did not take into consideration specific features of Roma culture; more precisely speaking the migratory Roma were forced to settle, their horses and carriage wheels were confiscated (by the law), and they were forbidden to use their mother tongue. The state pursued mainly a policy of assimilation (Davidová 1995, pp. 190–214). Assimilation tendencies were enforced also by the Act on Common Educational System adopted in 1948 introduced by Otakar Chlup, which stipulated Czech as the only official teaching language for the Czech Republic.

The “cultural backwardness of Gypsies” was emphasized in the 1970s and 1980s and stress was put on acculturation and later on social integration. As the Czech educational system became more differentiated during the communist Czechoslovakia era, Roma were routinely sent to the so-called special schools. Special schools were primarily intended for educating children with mild mental retardation. A transfer to a special school was proposed either immediately during registration to the elementary school or during the first grade after it became apparent that the pupil was not able to keep up with the pace at the regular school. Starting from 2005, based on the new Education Act,³ special schools were renamed to practical schools. They use the same curriculum as other elementary schools, and, theoretically, it is possible to submit an application to a secondary school offering education with a school-leaving examination. In the past, students who studied at a special school were able to continue their studies only at a vocational training school, and any other education path was thus blocked. There were only a few exceptions who achieved university education (see Davidová 1995).

The employment policy of the communist regime focused on creating artificial employment. Because even unskilled people had the duty of holding a job, Roma became a source of cheap labor for which, however, there was no use in the newly established market economy. The state controlled the educational structure of the population by regulating the number of available positions at secondary vocational schools and vocational training schools and universities, and it did not focus on supporting cultural minorities.

³New Education Act No. 561/2004.

After the revolution in 1989, the law adopted in 1991⁴ recognized Roma as a nationality and they formally acquired equal rights. The end of artificial employment was not dealt with in a systematic way and a large part of the Roma population never found a new job after the state enterprises and farms disintegrated. The state, which had been until then assimilating and patronizing Roma, in fact resigned from any intervention, it gave Roma “freedom,” which practically meant it gave up all responsibility for them, leaving them at ground zero. In general, “Roma failure” is interpreted by claiming that “Roma were not ready to deal with the changes in society.” The fact that the grounds for this failure had been very well prepared is usually completely omitted. In fact, some Czech intellectuals led by V. Havel or L. Hejdiánek were aware of the desperate situation of the Roma minority as early as 1978, predicting the consequences of assimilation accompanied by segregation in special schools and elsewhere. They also pointed out the negative impact of prejudices in Czech society which incline to nationalism (Davidová 1995, pp. 211–212). The practice of educating a significant part of Roma children in special schools continued after 1989.

Open and hidden xenophobic attitudes caused Roma to start seeking asylum in Canada and Great Britain, the countries they considered to be free of prejudices, on a massive scale starting from 1997.⁵ This politic scandal attracted attention to Roma issues and the government established the Governmental Commission for the Roma Community Issues acting as its advisory body.⁶

As has been already mentioned, the New Education Act enacted in 2004 formally guarantees equal access to education to all citizens regardless of their nationality. Formally, the Act abolished special basic schools, but there now exist the so-called basic practical schools in the section of special schools, instead. According to the Education Act,⁷ Roma children may or may not fall under the regime of education of children, students, and students with special needs due to sociocultural disadvantage.⁸ School directors have no methodology available to

⁴No. 153/1991 SR.

⁵This can be very well illustrated by a story which the author experienced when he met his friend (white) at the Helsinki airport who was just returning back to the Czech Republic from Canada where he had visited his sister who had moved there. The friend described the shock he had experienced in Canada where, during a trip to the wilderness, he encountered a SUV driven by a Roma family by one of the lakes who welcomed him warmly by saying how happy they were they met a Czech person here in a foreign country and in the wilderness.

⁶In this same year this situation resulted in the drafting of the so-called Bratinka report (which became Government Resolution No. 686/97 adopted on 29.10.1997) “Report on Situation of Roma Communities.”

⁷Section 16(1) of the new Education Act No. 561/2004.

⁸Social disadvantage means a family environment with low social and cultural status, threat of pathological social phenomena, institutional education ordered or protective education imposed, the status of asylum seeker, and a party to asylum proceedings in the Czech Republic under a special legal regulation (Section 16(4), Act No. 561/2004).

determine which students come from socioculturally disadvantaged environments, even though when there is a larger number of students with special needs, the directors can apply for an assistant teacher.

Another scandal, which caused panic in Czech governmental circles, happened in 2007, when the Czech state lost a lawsuit where 18 Ostrava children filed a petition accusing the Czech Republic of violating their right to education (Čánová 2007). These events led to increased interest by Czech politicians in Roma issues, mainly because they wanted to avoid criticism from the European Union. However, it must be said that in spite of this attention, the situation of Roma in the Czech Republic continues to be poor, mainly due to the stigmatization attached to the Roma identity and due to a combination of economic and political factors such as ill-conceived privatization of state and municipal apartment houses, which created socially excluded locations (ghettoes), a lack of job opportunities in certain regions, poor legal environment, the related boom of predator loan providers, etc.

Roma in the Czech Republic often do not have an official job and live only on social allowances and various unofficial sources of income. Many Roma children do not finish even the elementary education. If they get a job, they usually do manual unskilled work. They are often pushed to town peripheries. Despite their difficult economic situation, the majority views them as parasites who abuse the social system, do not work, and live on allowances.

Research: Design and Reality

The first part of the research conducted solely by Markéta Levínská was broadly a school ethnography-inspired research aimed at question of “values.” While sensitive to the context, it was mainly about attitudes Roma mothers expressed towards education. The research design was aimed at obtaining as much narratives from Roma mothers in a setting as possible. Since these narratives needed to be put in a context, a setting consisting of one small town was selected where the researcher could compare a contextualize. The context played an important role but the focus was mainly on the narratives about values.

The second part conducted by the team of Markéta Levínská, David Doubek, and Dana Bittnerova built directly on the first research. It was designed from the beginning as holistic anthropological fieldwork where the researcher spends time in the field collecting all kinds of data and as much as possible speaks with all involved participants. While we tried to pursue the question of “values” further by means of the search of “cultural models” (a rather specialized concept taken from the cognitive anthropology), we also systematically observed all other things that we had the luck to witness. So besides interviews with Roma participants, we also mapped genealogies and cemeteries, talked to people from the majority, took part in fairs, joined some communal works, were just hanging out, and so on. We tried to get the sense of the field in the broadest meaning. For such a complex issue as the Roma success in schools, we believe there is no better approach than this.

Possible cultural differences, many unclear sources of misunderstandings between majority and minority, effects of the context of the intercultural conflict, and permanent intrusion of nonschool factors into almost every situation a Roma child experiences in the school make any narrow research approach bound to failure.

We need to note here some conventions in the text below. We sometimes quote directly the actors and for that purpose we use italics. When we mention “cultural models” which are basically structures of interpretation that actors share and routinely use in their lives, we use small capitals. One more “convention” needs to be noted: whenever we use “*white*” or “*black*” we use these terms as native terms. That means they are used as native actors would use them to designate members of majority (white) or minority (black).

Starting Points

Based on our current experience and on our studies, we now know that 6 years ago, we took a very naïve approach to research of the reasons behind Roma children’s poor school performance. Most importantly, we believed that it would not be a problem to identify who belongs to the Roma community, i.e., who is and who is not Roma, because we thought this is a question generally publicly discussed. We expected that the teachers would be interested in our work, that they would be willing to collaborate, and that they would benefit from the results of our research. We also expected, that from the perspective of Roma, poor school performance is a kind of “revolt” against the majority. A comparison with adolescent children trying to liberate themselves from the authority of their parents was something that offered itself. We saw this “revolt” as one of the reasons why education “has no value for them.” We also presumed that the institution of school has basically no place in Roma culture and that we are therefore dealing with fundamental opposition. We believed that Roma children, due to the very nature of their culture, are not interested in school, because their culture is oral, not literal. At the same time, we were not able to conceive that school could be “something so alien to someone,” because going to school is “so easy.” It was difficult for us to understand why Roma in fact are “not keen on” school. Before we started the field research, also Roma identity was a non-problematic constant for us.

Initial Problems: Seeking Direction from Official Institutions and Their Position on the Roma Category

The first problems appeared very early, in the initial phases of the first research by Markéta Levínská. At the beginning of the first project, she thought that she would run the statistics for one region on how many students are transferred during

compulsory school attendance and how many actually study at elementary school and how many at practical school. Marketa assumed that her work would be based on these data and she would specifically monitor the causes and circumstances of transfers, which she also viewed as the key problem. However, the idea of running the statistics proved to be completely unrealistic. Marketa found it absolutely impossible to access any data on transfers because schools doggedly refused to comment on the number or identity of students.⁹

Schools' "fear of speaking out" was obvious. Marketa had already encountered it during her initial search for a suitable locality for long-term research. This "fear" was essentially manifested in two ways: in better cases it took the form of very politically correct communication, where the researcher was very cautiously informed about the school and its Roma students, while in other cases the very "existence" of Roma children was totally denied. The absence of Roma children at a given school was expressed in a politically correct way: "*We don't differentiate between children and they do not officially declare their nationality.*" School representatives explained that no one has declared Roma nationality at the school and that it is not the school's responsibility to collect information of this kind.¹⁰

Some schools identified themselves as "white," arguing that they would not permit themselves to be suspected of having Roma students. We believe that schools with a "sufficient number of Roma children" which refused to participate in the research study were concerned that their school may be identified as "Roma," which would lower its prestige. In principle it was the special/practical schools that were not "ashamed" of their Roma students and their representatives spoke openly with us about their professional careers. One special/practical school which refused to classify children as either Czech or Roma and provided information in summary form was the exception. Several schools agreed to participate after some persuasion on our part, but it was evident that the school management was uncomfortable with participating. It may have been fear that the school would be accused of racism or provision of personal information, despite the fact that the research survey was strictly anonymous. One of the main arguments was that no official records exist, that the school does not collect information on the ethnicity of its students.¹¹

The absence of declarations of Roma nationality that we commonly encountered on an official level led us to doubt the existence of cultural selfhood and pride,

⁹ We lacked sufficient "political" support for collection of data that could be statistically processed. We were not a well-known agency conducting a statistical survey, nor did we give the impression that someone "powerful" was backing us, which would make it unwise to refuse our requests. Repeated rejections and excuses deterred us from conducting a statistical survey because the low number of respondents would not render a representative sample.

¹⁰ Prior to the revolution in 1989 it was common practice among schools to collect all information about students' family background.

¹¹ Refusals were also justified by the Act on Protection of Personal Data 101/2000 Coll., which forbids transfer of information to third parties. When we mentioned the Ministry of Education's interest in these data, schools replied that they are responsible to the school's founding authority (usually the municipality), not the Ministry.

which we had assumed people have when they belong to an ethnic group. We had viewed belonging to a nationality as an automatic, unquestionable cultural value and it was unfathomable to us why someone would voluntarily give up this value. It must be noted that Roma in the Czech Republic are not persecuted by the government and declaring oneself as Roma can result in many benefits.¹² We had automatically assumed some degree of ethnocentrism and the lack thereof, or rather denial thereof, confused us.

Marketa was also disappointed when a successful Roma family, which cooperated with the school and whose children continued on to study at high school, refused to speak with her.¹³ Marketa did not understand the reasons but it was clear that the family did not wish to be associated with research on Roma.

But this attitude does correspond to official figures. The preliminary results of the 2011 census show that “More people in the CR declare affiliation to George Lucas’ Star Wars Jedi knights than to the Roma nationality” (Herger and Kašpar 2011). Officially, a total of 5,199 people declared Roma nationality which is barely half compared to the previous census in 2001.¹⁴

Unofficial estimates, however, range in the hundreds of thousands. Declaration of ethnic identity leads to some advantages, but in the eyes of Roma themselves, that is apparently not the case. The explanation may be sought, e.g., in the fact that being Roma in the Czech Republic means, for example, difficulty finding work.¹⁵ It is not surprising that Roma do not officially declare “their” nationality and it is necessary to recognize that they may perceive Roma identity in relation to their position in the community (Bittnerová and Moravcová et al. 2005). The authors state that being Roma may mean belonging to a specific community that is connected by family ties, secondly Roma identity may be perceived as a cohesive community of Roma in the Czech Republic, and thirdly Roma perceive themselves as citizens of the Czech Republic (Bittnerová and Moravcová et al. 2005, p. 233). One’s self-perception is then influenced by which boxes are checked off on the census form. It is above all members of the Roma elite—i.e., those adhering to the second form of perception stated above—who declare Roma identity

¹² In some places, declaration of Roma nationality would open up the possibility that the municipality would establish a committee for ethnic minorities through which Roma could advocate for some rights on the basis of legislation. There would be a hypothetical possibility that children would be taught in Roma language in school. That would naturally give rise to questions such as whether to speak Roma, what is the potential of Roma as a language, etc.

¹³ The family was addressed by the deputy director, who had an excellent relationship with the family.

¹⁴ See <http://www.scitani.cz/slodb2011/eng/redakce.nsf/i/home>.

¹⁵ Our Roma informants said that when they arrange a meeting with a potential employer by phone, they are told that the position is available. When they go to the company office, the employer, based on the applicant’s appearance, states that the position has been filled. Sometimes they are identified as Roma because of their names and are rejected immediately. Roma who cannot be discerned as Roma by the majority speak of the shame they feel when members of the majority tell disparaging stories about Roma.

(Bittnerová and Moravcová et al. 2005, p. 228). But most of the issues our research focuses on do not affect these people and official figures do not provide any guidance as to their identity.

Looking for a Locality, Gatekeepers and Actors' Point of View

It proved impossible to find Roma through official avenues; the researcher sensed that it was a kind of hidden identity that she would have to search for among the actors themselves. She did not want to give up as she felt that the Roman identity constant remained indisputable, it was just that official institutions pushed it aside for various reasons relating to political tactics.¹⁶

The fact that official institutions hinder researchers' access and use various strategies to obfuscate issues as a way to survive in the world of government administration is not uncommon and should not surprise experienced school ethnography researchers such as we are. Nonetheless we could not but notice the conformity among denials of the Roma category, combined with the chronic lack of success of these purportedly nonexistent students.

As typical to fieldwork, we had to go through many failed attempts to gain access to actors in both localities as it was clear that we would not gain any ground through official avenues.

In the first case of a locality in Eastern Bohemia, it was a journey of gradual entry and rejection by schools, where, e.g., a researcher discovered a school that was open to cooperation while in the proximity of one of the town's Roma communities. She conducted regular monitoring for a period of 3 months, but unfortunately after the first conflict that occurred between parents, a teacher, and the school management and which resulted in transfer of one Roma student to a practical school (Levínská 2008, p. 44), the director asked the researcher to discontinue her monitoring and in fact tried to check her field notes. Fear of a public scandal, despite assurances of the anonymity of results and explanations of the reasons for regular monitoring and of how the focus is on interaction between the teacher and children, led to the conclusion of this research stay. This experience taught us that contrary to the participant observation plan, the researcher cannot participate in some situations without consequences, and the manner in which we used to conduct school ethnographic research (where the researcher sits in the classroom and observes interactions) cannot be used in the context of this sensitive issue.¹⁷ But remote investigation or use of secondhand data was also impracticable owing to the aforementioned "official" approach of

¹⁶ It was much easier to conduct research in schools before the EU criticism and enactment of the law on protection of personal data; institutions' fear of "problems" is much greater now.

¹⁷ The situation has changed dramatically from the 1990s. Teachers are now very careful when speaking with strangers, emphasizing anonymity of the school and the teacher.

brushing aside or ignoring the issue. It was clear that we would have to gain the trust of the actors themselves from the “bottom up,” outside of official institutions and primarily in nonconfrontational situations. Based on the series of failures with “testing out” schools, the researcher finally decided to work primarily with social fieldworkers, one Roma and the other from the majority, owing to whom she managed to gain the trust of local Roma actors and attain research results.

However, a shocking finding from the aforementioned failed research stay at the school was that the Roma student mentioned above was not forced to transfer to the special school; her parents chose this school. And it was not the only case of Roma parents who requested that their child be transferred to a practical school; in interviews the parents gave the justification that their child had an older sibling there, that the child was afraid of the teacher. In other cases they expressed satisfaction that their child earns top marks at the practical school. Roma children expressed similar satisfaction, stating that the practical school is better, easier, that they did not understand the material at the basic school. These arguments seem understandable with some children who could be characterized as socially disadvantaged, but other children seemed to be “average” in terms of success at the normal school and would clearly fit in there. The first research project paradoxically showed that the practical school, contrary to the fact that it is essentially a tool of segregation, is very popular among Roma. How to understand this popularity alongside lawsuits against the government?¹⁸ How to understand that the actors showed no signs of animosity or contempt for the school?

The selected approach definitely led the researchers to view reality through the actors’ eyes, but instead of a simple revelation of “differing values,” this perspective led to further questions. At the same time methodological and practical limitations, which arise when the researcher works alone and the development of trust goes too far and the actors use the researcher to attain their own goals, came to light. This type of developed trust and alliance also tends to cement the view that the actors’ needs and views are a given, which severely limits the possibility of delving more deeply into the studied issue.

For this reason our next research project was designed as a team effort. Drawing on experiences from the previous field study, we chose a noninvasive form of participant observation based on a very relaxed approach to actors; we interviewed actors in environments in which they felt safe, and we observed them where we were allowed to do so and our results are derived from a comparative review of actors’ responses and a critical approach to the data obtained. The key to the critical approach is comparative review of several researchers’ views, a type of “Rashomon strategy” (compare Rodseth 1998, p. 60), where two or three researchers participated in most situations and interviews and they reflected together on every interview and situation. We suspected that contradictions and discrepancies that appeared in the data required an unbiased approach and comparatively reviewing

¹⁸ If we disregard the fact that the lawsuit against the government was politically and externally motivated by a human rights advocacy organization.

different viewpoints allows for multiple paths from which to view a given situation. Of course the team view has its risks, i.e., a shared error seems more likely. The goal of the Rashomon strategy is not to unify but rather to compare and therefore we tolerate deviations in interpretation. The idea is that the reader pieces together the resultant image, similarly to the way that viewers do with films where the same story is gradually presented through the eyes of different narrators, like in the famous film *Rashomon* by Kurosawa.

We chose the locality for the second research project because it was “officially” recognized as a marginalized locality and we also had some informal contacts at the local school and local town council. But even here we went through an initial phase, which took up the first year of the research project, during which we were rejected and we wasted a great deal of time in meetings to which no one came and in visits to Roma actors who were data-poor as they either would not talk to us or responded to all of our questions in an uncertain, evasive way. However, this phase is unavoidable and important as the researcher can become familiar with the area, conduct interviews with members of the majority, and situate himself in the context. The actors also have time to observe the researcher and get used to his presence.

It was not until the second year in the field that we managed to penetrate the circle of Roma actors. The gatekeeper, once again a Roma social worker, played a key role here as well as she was able to view many things from both Roma and non-Roma perspectives and she acted as a sort of interpreter for us as well as a translator (metaphorically speaking, because all of our actors speak Czech perfectly).

Two or all three of us attended most of the interviews and situations, and often we were unable to reach complete agreement on what it was we had actually experienced and how to interpret these situations. We took notes about the same situation (although not all of us remembered specific details equally well) and we compiled all of the data in the end, so that the work of all three researchers was based on the same notes. But our intuitive reading, given by the differing experiences and orientation of each researcher, occasionally diverged. Sometimes we had doubts about the extent to which we were viewing the same issue and to what extent we were capable of coming to a shared conclusion and what to do about variations in notes and observations and in the researchers themselves because the data cannot be considered merely as the notes on paper or in the dictaphone; in social research the researcher himself is a “tool par excellence” (Hammersley and Atkinson 1983, p. 18). But we consider some retention of differing viewpoints methodologically desirable. That which we are observing is not just one objective reality but human interaction with everything that helps form it in every individual situation, interaction based on a particular interpretation of the world. Reduction of contradictions to “errors” or “marginal deviations” would give way to abstraction, which is always based on some hidden theoretical assumption, and that we sought to avoid. We must always retain data that may refute our conceptualization. In our case, it is precisely a certain level of variation between viewpoints that could provide more information than subordination to one authoritative idea (Barth 2001, p. 435).

But the field stay and the selected methodological strategy continued to disrupt our original naïve image of authentic Roma culture, which professes its own values, which run contrary to the norms and values of the majority. For one because we had

trouble clearly delineating this “culture.” We recall frequent discussions in the kitchen of our “base camp,” where we discussed how we should consider our informants, who is and who is not Roma, whether it plays any role, and what parts of their stories are “authentic” and which are not.

Categorization as Means and Object of Analysis

Research and common sense all build on categorization. Human thought, perception, and action are based on categorization. We never deal in our thinking an perception with purely singular instances of things. We always categorize, and whenever we call something “a shoe” or “a roof,” we put that particular thing into a category and all other intellectual or practical activity like comparison, sentence making, roof repair, or shopping for shoes employ the categorization. Categorization is mainly automatic and unconscious as it draws from language and culture or language and culture build on categorization (Lakoff 1990, p. 6). Categorization concerns things of the world as well as social categories. All categorization is in fact human creation even though there are deep philosophical issues of why and if it actually “fits” the world.

When we build any theory we also categorize. Either we make some formal categorization system from the ground up (as in mathematics or physics) or we use common sense categories (as in social sciences); however we do it in more systematic and reflected fashion.

Names like “Czech,” “blacks,” “whites,” and “Roma” designate social categories that are used routinely by actors, actors are also subsumed under these categories. This categorization is thus part of their world that needs to be studied. However, the researcher needs to be cautious when using a social category in her analysis as the category cannot be just taken as a formal intellectual device. It is important to be aware of how actors use the category and what that category is composed of. Failing to do that can lead to severe confusion.

Exactly to that confusion we induced ourselves initially when we took the category of “Roma” for granted. During the fieldwork and during our discussions it was made more and more clear that the easy delineation of Roma as simple cultural and social entity based on shared culture and distinctive physical appearance that we took for granted is far from unproblematic.

The First Paradoxes in Categorization: A Confrontation with Fieldwork

One very telling example that we encountered at the very beginning of our second fieldwork is the story of Mr. Železný. It is a well-known story, one might say a fundamental story, and although at first it may look out of place in a text about

education, it will take us straight to the heart of the confusion surrounding categorization. Mr. *Železný* was a Roma, a *tattooed, flat-headed gypsy, who had had several stints in prison, who along with several Roma friends raised a ruckus in local restaurants during the 1990s, which meant that he didn't pay his bills and made threats to the wait staff. The police took no action in the matter and so local restaurateurs came up with their own vendetta scare tactic, dressing up in white hoods and making threats in front of one of the buildings in which Železný lived at the time.* This alleged scare tactic or vendetta truly scared the families which were in the buildings and they purportedly ran off into the forest and were afraid to return home... *it probably wasn't much fun.* . . . In this atmosphere of intensified emotions, this mutual terrorizing led to an incident in one of the restaurants in which *that Hryzal, who allegedly represented the intimidated Roma community, stabbed that Vikář, because Vikář was the bartender at the hotel, and the people who had gone after the gypsies with sticks and chains were there. In this act of revenge for the Ku Klux Klan scare tactic, the vengeful attacker Hryzal, representative of the gypsies, was white (brother-in-law to a Roma family), while Vikář, the stabbed bartender, was black.* A man nicknamed *Kámoš* (friend), also a pub owner at the time, was identified by the judicial system as the individual behind the Ku Klux Klan attack though it is difficult to say whether he actually led it. The victims reported that the attack had been racially motivated and following an investigation *Kámoš* was sent to prison for 6 months. Our informants talk about the paradox of *Kámoš: his mother is a gypsy and he only finished elementary school.*

The example tells about the confusing nature of the category *Roma* as reflected by speakers from the local majority group and also frames the whole situation in the locality as being somehow upside down.

When you sit in front of a “marginalized building” talking with its inhabitants, it is clear that they form a community that belongs together, which shares experiences and a world view. Perhaps it would be logical (and polite) to speak of them simply as Roma. But on what grounds can one base such classification, when they themselves avoid this classification to some degree? By phenotypic characteristics? Many of those of whom we speak have darker skin (with great variability in the distinctness of hue) and black hair, but some do not, some are completely “white,” and we would probably not classify them as Roma out of context. By language? Practically all of them speak Czech without a notable accent, and aside from a few exceptions, they can't speak the Roma language, although some families also speak an “ethnodialect” (Bořkovicová 2004, p. 292). By family origin? But how to determine which family is Roma and which is not? By social patterns, i.e., by some assumed family relationship norms, number of children per household, access to money, or to work? By adherence to particular traditions, such as avoiding reheated food? By a preference for special schools over regular schools? By functional illiteracy level? By unemployment level? By crime level?

The first attempt to address the diversity we observed was to not define the studied group ethnically, but rather spatially or socially, through the marginalized locality. Even teachers with whom we spoke stated that they identify Roma children by appearance, sometimes by name, and above all they “know them” because they grow up in a given locality.

It was also a practical measure because as mentioned above, it was impossible to begin by investigating an officially declared “Roma ethnicity.” Such an attempt would be utterly counterproductive because setting out among Roma actors by saying, we’re looking for Roma, tell us who they are, would be ridiculous. Beginning generally and socially from the marginalized locality seemed sensible because in the eyes of the majority, they are “gypsy buildings” and in any case the emergence and functioning of these localities is closely linked to the Roma ethnicity. As stated above we encountered many paradoxes here that did not fit into established assumptions and we often caught ourselves in embarrassment speaking of our participants in terms of *Roma* behavior or *Roma* concepts.

But using the local aspect as a defining principle does not work very well either because the localities that we researched became marginalized during the process or as a result of gradual settlement by *Roma* families in connection with broader economic changes during the 1990s. Thus it does not suffice to consider locality. On the practical level of local discourse, they are *gypsy buildings*, teachers, pediatrician, and employers; neighbors talk about *Gypsies/Roma/those black people*, etc. The problems that the residents of these ghettos face (*booze, slot machines, prison, shark loans, not working*) are contextualized in speech by their connection to the people at hand—Roma—and, thus contextualized, they are connected again and again to Roma. People are not viewed as Roma because they live in these buildings; rather they end up here because they are Roma. Roma identity or categorization must therefore take priority over the local aspect. We needed to find the key to the categorization issue.

We faced an unusual situation where, on the one hand, we had a particular hypothetical Roma culture and identity built on this culture, an indisputable problem in schooling of the purported carriers of this culture and, on the other hand, these same actors, who do not declare affiliation to this culture and official institution that deny their existence. There are huge ambiguities should we attempt to define this culture and identity ourselves. And at the same time if we were to tell anyone on the street that Roma do not exist, they would take us for crazy because *Gypsies are everywhere* and the problems of Roma communities are considered one of the most pressing issues in society (owing to massive media coverage).

Jenkins’ Theory of Ethnicity and Categorization

According to Jenkins (Jenkins 1994, pp. 198–218) who builds on Fredrik Barth’s transactionalism, ethnicity may be viewed as social identity, which is defined in two ways.

The first way is via internal definition, meaning identity is determined by the way it is internally formulated and declared by members of a particular group or community. This identity is experienced subjectively, as the subject feels s/he is someone and the particular classification provides some vital meaning and place in life. Even though it is experienced subjectively it is derived socially. The subject professes membership in a given group, which may also require the subject to fulfill

particular things to be a member. Jenkins calls this definition the group perspective. This is the way ethnicity is mainly seen and studied by anthropology.

The other way is external definition, where a particular group is defined by an external observer or actor, typically on the basis of some criteria, which may or may not be recognized or internalized by the group, and which is selected by the observer in respect to the goal towards which his definition is directed. Jenkins calls a group defined in this manner a social category. A typical example is social class and other ascriptive categories (gender, race, age, etc.). While the validity of internal definition depends on consent and sharing amidst members of the group, validity of external categorization depends either on some authority or the categorizer or his power to enforce the categorization.

According to Jenkins this division internal–external is primarily useful for analytical purposes because in practical life every social identity is the result of permanent friction between self-definition and social categorization (am I a woman at all, if I don’t clean or cook or speak with other women?). Self-definition must be understood as a process that stems from continual transactions (interactions) with others—with members of one’s own group as well as “external” transactions, which categorize us as a group in some way—and where external categorization may be internalized by the group. External categorization may also be derived from internal definition criteria.

While group identity draws its strength and permanency and validity from relationships within the group, the validity of a particular categorization stems from the power or authority wielded by the external categorizer in relation to the categorized circle of individuals. Ideally external categorization and internal categorization coincide and then the categorizer has a position of authority within the group. In the opposite extreme case, external categorization is in sharp contradiction to internally built identity and its validity and “acknowledgement” depend on the power of the categorizer.

Roma Identity: Internal Definition and External Categorization

From the perspective of practical language (i.e., how they are discussed locally), they are sometimes called *Roma*, other times *Gypsies* or *Gipsies*, depending on the situation. Speakers from the majority use the term “*Roma*” when they don’t want to appear as racists, and they use “*Gypsies/Gipsies*” when they want to give the impression that they speak to the point. Roma also call themselves Roma or Gypsies/Gipsies. They use “*Gypsies/Gipsies*” when speaking of a conflict with the “white” majority. They also commonly use Roma in a similar, but less derogatory context. Thus “*Roma*” is seen as the polite or proper variation of that which is identified by the word Gipsy. This relates to a particular effect that is produced by the speaker’s game between “hypocrisy” and “sincerity.” An apparently neutral

term is “*our people*,” which is used by our actors when they speak of particular goals, requirements, etc. or is used by more eloquent or enlightened members of these communities. It is sometimes said that Roma reserve the right to use the word *Gipsy* for themselves, and that the majority should not be entitled to use it. Pragmatics, then, testify that there is a reflected element of group identity, which, however, is not uniform and is charged with tension.

If we were to address the issue of how Roma define themselves internally within their own community, we soon encounter problems. Rather than seeing a coherent community which shares an “agenda” or clear ideology, we see a broad spectrum of diverse identities. The identity defined by belonging to a particular family is always the strongest—Roma agree on that point. But this identity does not lead to any broader community identity and on the contrary: although marginalized buildings are deemed Roma communities, in reality they are much closer to an aggregation of isolated families, which *as a group* are not connected by any factor other than the fact that fate has brought them together in one building. From many field cases we are aware of the difficulty with which this aggregation works as a group, as demonstrated in an inability to reach agreement or care for the common areas of the building. One odd bit of evidence is, e.g., an incident in which someone from one of our buildings—no one knows who—took off the metal roof from the entire apartment building and sold it to the material salvage center; no one tried to prevent him from doing so, no one could, help from outside had to be called in. When rain started to leak in, the residents appealed to the town agency in charge of managing the building to come and repair it. The town leadership was naturally angered by the Roma residents’ behavior and placed the blame on all of the building residents. No one realized that the residents are practically unable to forbid each other from doing something. Each resident does as she/he pleases and the only accepted authority is the external authority. When we asked our informant about this issue, she gave us an answer that was very confusing to us in that she can’t imagine which of the residents would act as a “leader” or “head,” she said “*Roma don’t know how to govern themselves.*”

If we take the external definition, Roma as a category, we face the issue of what to categorize them by. And must we define them, or can we use a field definition, a categorization that will not be a completely ad hoc construction, a categorization that will resonate with what they truly are, that will be ethnographically real? For we are aware that this is not an entirely artificial social category; on the contrary, the opposite is true.

Looking at Roma as a category based on the internal characteristics of this category is pointless and frustrating in regard to the fact that it is difficult to determine which features the category should have and which requisite and sufficient conditions it should meet. Unquestionably the fact that this is not a theoretical category, but a “natural” social category, which exists regardless of the ideas and plans of researchers needing to define a particular group of people simply and definitively, plays a role here.

Category as a Schema (Cultural Model)

Nonetheless we are concerned with Roma and not with some spatially determined entity of “residents of a marginalized locality.” Since the marginalization and poor school performance seen in all of our participants is closely related to the fact that these people are, on a symbolic level of reality (which is read and interpreted by the majority and the minority), GIPSIES. We use capital letters here to emphasize that by this label we mean a particular web of associated meanings, a “schema,” i.e., cultural category that develops in a historical process of symbolic communication between actors and groups of actors, which we are accustomed to call culture (Strauss and Quinn 2003). Therefore we do not mean the truest reality of what each person is like “really,” inside, but what others consider him to be (and what he considers himself to be). In practical social discourse, which influences their lives and which they shape through their lives, they *are* GIPSIES. In principle it makes no difference whether they are called Roma or Gipsies.¹⁹ The significant point is that this fact complicates their lives in the social context, whether externally or internally, consciously or unconsciously. They are (in the sense of a race over hurdles, which they have to run) that which their environment considers them to be. Whether they protest or whether they identify with this label is another matter. But in the sense of a hurdle, a social mirror, they are. They may not be aware of it immediately; they may become aware of it once they start school, as some of our Roma mothers stated (with some bitterness).

Connecting particular physiological characteristics with cultural categorization or ethnic identity is naturally questionable and smacks of racism. But the subjective experience of a different body, where this difference is granted some social meaning that the subject continually faces, is decidedly not irrelevant.

Our Roma are therefore *externally* categorized as GIPSIES and this categorization affects their lives *internally* in significant ways. But what kind of categorization and definition is it? What is the importance of such a category? Being a Roma in this sense means being a member of a category that is not determined by any one clear criterion, but a category like “family resemblance,” a category that is formed by a chain of overlapping subgroups, which have common features but are not unambiguously connected by any one criterion (Wittgenstein 1993, p. 46, par. 67; Lakoff 1990, p. 16). Wittgenstein used “games” as the famous example of the family resemblance type of category (Wittgenstein 1993, p. 45, par. 66).

Jenkins does not directly express his views on categorization in his work, but it seems that by categorization he means creating a certain class based on a certain criterion. This is basically the traditional approach to categorization whereby a category is determined by sufficient and necessary conditions that must be shared by all members of the category (Lakoff 1990, p. 16). Within such category, none of the members is privileged. All of the members are basically identical and the category has clearly defined boundaries. The GIPSIES category evidently does not

¹⁹ We feel it is more polite to use the word Roma and our informants have never objected to it.

meet the criteria of this kind of categorization. On the contrary, it shows features typical for family resemblance-type categories where the question is not whether someone belongs or does not belong to a category (either has or lacks a common feature), but where members belong to the category to a greater or lesser extent and where the category is defined more by means of prototypes or good examples.

One example of such prototype may be thinking along the white–black axis, that is, one of the generative principles of the GIPSY schema where GIPSIES are considered “black” and ethnic Czechs “white.” The reality is in fact much more colorful and the color of the skin often cannot be used for deciding who is “black” (Roma) or “white” (non-Roma)—see the above story with Mr. Železný. It is only a conceptual model, a prototype, to which someone conforms to a greater and someone to a lesser extent. A model that evidently relates to the racism of “whites,” which can be hidden to a varying degree. However, this model is not limited only to the categorizers from the majority.

For instance, one of our Roma informants, when describing how her mother prepared her and her sister for life, reflects along the lines of exactly the same model:

Because my mother probably knew that Roma have these complexes, that a woman must first of all know how to cook and take care of children, she taught my sister this, who was darker than me and who would probably marry someone darker. . . in my case, she taught me mainly those letters.

The informant seems to be supporting the theory that the darker the skin of the potential groom, the stronger his traditional stances, which is, in our opinion, a typical example of metonymical thinking associated with the GIPSY cultural model or scheme. In this case, the thinking is taking place internally and speculatively, from the position of a “native theoretician.”

The internal verbalized definition of the group called Roma is neither clear nor unambiguous. We encountered a clear internal definition from the perspective of the family, family membership. In several cases, we encountered an identification in the sense of “we, people from this house.” Occasionally, there was a reference to the fact that “we, Roma, do it differently” (mainly in connection with children, family life, cooking). In fact, we suspect that the entire internal–external distinction might be misleading. The membership and its meaning is not clear even to the members themselves—they raise questions, doubts, contemplate, theorize, simply put they categorize the same way as those on the outside of the group. The internal–external dichotomy in thinking is misleading also because concepts and meanings are not stuck to one side or the other, but are rather communicated.

Distanciation and Categorization

There is one powerful definition besides the inside-family identity mentioned above. It is the rather paradoxical shared self-defining/self-categorizing perspective we call “distanciation.” Distanciation is a special phenomenon that can be

encountered among Roma very often. It is quite common that during interviews the interviewed distanciate themselves from other neighbors in the house, who are some way “worse” than the interviewed. This is typical mainly for discourse relating to how “white” see them or how they might appear “from the outside”—A Roma mother (about her son’s schoolmate):

He has Gipsy parents and they are backwards, they simply do not go with the times and still live somewhere in the communism era. No even communism, even further, they are simply buried in the past and they just... they just leave the kid, there is the first day when kids go to school and they’re carrying a bag, the kid feels ashamed, that’s obvious, and then when you see these parents, you just see it, they are not normal. Well, it is not good to say that, but I just think that people like this just should not have kids at all

(*Sára, our informant quoted from an interview in July 2009*). There is a permanent reference to distance: we do not want to be those they tend to consider us to be.

In romological and Roma studies literature, there is an effect similar to the above-mentioned distanciation described on two levels (Sekyt 2004, p. 196; Jakoubek 2004, p. 50). The first is the “institute of ritual impurity,” a type of discourse whereby different families (using relatively flexible keys and variable symbolic means) talk about other families as “impure.” The second is the discourse of “the chosen one” whereby “Roma” is the chosen in contrast to “Gadjo.” Both these schemes show strong structural resemblances with the above-described distance—in both cases we are dealing with a kind of distanciation. The first case is practically identical to the examples described above. In this case, “ritually impure” are allegedly the items, people, or activities that are somehow related to traditions, whose origin can be traced back to the values of purity and impurity carried to the present by traditions from the ancient Indian system of castes (working with fire, theft, dog eating, etc.). The second case is allegedly a kind of extension of the first one, where the “caste system” among Roma families is extended to the non-Roma “white” surrounding. As “unequal” it can then be subject to theft, fraud, or derision without loss of face.

The resistance some local municipalities meet when some Roma do not want to take the job of street cleaner may very well be a part of exactly the same distanciation discourse. In our opinion, it is not that they do not want to touch cigarette butts lying on the street due to their ancient caste traditions (of which they are aware through invisible instincts and unwritten laws). More likely, they do not want to be seen in public doing the job that has the lowest prestige in the eyes of the majority. The aversion to being seen sweeping streets belongs to the same concept shared both by the majority and the minority. Interpreting of this aversion by the majority as pure laziness is a mistake. In fact, it is an aversion to being seen as a DIRTY GIPSY. (Maybe, one could pose the question what is more important—whether it is being seen by relatives, by other Roma, or by anyone in general).

The discourse of being the “chosen one,” which is considered to be the instance of a group instinct where only one’s own group is considered to be “people,” while all the others are barbarians (Allport 2004), is, in our opinion, merely an inversion of stigmatization as understood by Goffman (1963). The “inequality,” which is attributed to

Roma families as their inherent core value; the concept, according to Jakoubek (Jakoubek 2004, p. 149), that PEOPLE ARE IN PRINCIPLE NOT EQUAL is just an extension of another concept, namely, that GIPSIES ARE IN PRINCIPLE NOT EQUAL TO WHITE PEOPLE. Statements such as “*Gypsies are a people for which there are no solutions,*” “*The only people in the world that will steal from you after knowing you for seven years,*” “*Gypsies will never work,*” and others circulate in Czech and Slovak popular discourse as sayings and pearls of wisdom, and together with fragmental experience they contribute to the shared schema (as specified above) of the GYPSY. Everyone who is in some way synecdochically labeled as a GYPSY (through the heterogeneous family resemblance category where the decisive role can be played by anything ranging from family ties, location, skin color to other “features”) is in the end confronted with this concept, and this concept defines the relationship between the “majority” and the “minority.” We think there are very few “*white people*” who can imagine the experience when you *learn for the first time that you are a Gypsy*. And when you learn this, you usually also learn that you are worthless, unusable, and excluded in one way or another. In this context (maybe) the idea that it is not immoral to steal from someone who denies you of dignity does not sound that foreign. We consider the structural resemblance between distancing inside marginalized locations and contempt shown in front of outsiders to be identical to the way the majority sees the minority. Distancing is an example of self-definition which is fully based on the adoption of an external categorization.

In connection with the explanation of the “institution of ritual impurity” and the “Indian trace,” it is surprising that nobody specifically mentions, for instance, the associations that dog eating brings to mind among the majority. As if these “Indian traditions” have a more immediate discourse connection to what white neighbors consider pure and impure. At the same time, Jakoubek himself (Jakoubek 2005, p. 168–169) shows how transient and manipulatable the determination of who “the superior one” is, along with the basis for that superiority, can be; why shouldn’t what is considered “impure” be of the same transient nature? What is important is the discourse or concept PURE-IMPURE, which, however, can in our opinion be directly translated into dichotomies accompanying Roma, i.e., backward/not backward, acceptable/unacceptable, or adaptable/non-adaptable. What is important here is that Roma, which are divided into one group or another, are seen through the eyes of a third person (figuratively speaking).

Anyone can raise the objection that this kind of differentiation is made without being actually seen by the majority—that they occur as gossip between Roma themselves. However, this is not a valid argument. Decidedly, the massive nature of the symbolic contact between the majority and minority is absolutely apparent among our actors: their children watch the same adolescent movies, they listen to the same hip-hop music, the mothers cook the same meals, and their fathers share nostalgic memories of their military service. Forests of satellite dishes in apartment windows embody the fact that they are not alien to this world, but they are, however, somewhat distant from it.

Conclusion

An authentic Roma identity cannot be found in the field. Our research shows that differentiating between an authentic community of “natives” and the external world is false, because the “natives” are in many aspects defined through concepts that are not authentic and are taken over from the majority’s categorizations.

This shows that for the identity of a group, the process and history of transactions between two groups can be more important than the traditional origin. This is true especially where there is a very long history of conflict and where the identities may be formed directly and precisely by this conflict. Therefore differentiation between the minority and the majority need not be based on the clear existence of a minority or on its desire for self-determination. Regardless of the fact that we believe that the right to self-determination is an undeniable human right, Roma self-determination is in our case closely related to a number of non-Roma agendas, often of academic origin, whereby Roma studies scholars/folklorists need Roma as their romantic dream, anthropologists need Roma as “their” natives and primitives, and racists need an enemy. A number of actors is in clear opposition to such self-determination; they do not want to see themselves or be seen as a specific minority.

This fact, however, does not mean that it would not be possible to investigate the impact which culture, let’s say Roma culture, has on education and other things. We only need to dismiss the idea that this culture is something shared by all Roma, the ideal common denominator that forms a basis for all Roma and which makes them fundamentally different from the majority. If we reject this traditional, classic idea of culture as replication of uniformity (Wallace 1967, p. 26), which in fact is a kind of traditional categorization, and if we accept, for instance, the “distributive model of culture” (Schwartz 1978, p. 423; Sperber 1985, pp. 77–78) which understands culture as a certain population of meanings which are historically shared by certain people, which can change and are not fixed to a certain identity, we have room for theoretical conceptualization of deviations and variability, which are unthinkable under the traditional common denominator model. This also opens up the possibility of seeing Roma as a community, which is different in certain aspects because it shares some different meanings, but which is also absolutely identical to the majority in other aspects. However, we have the opportunity to see this difference also as something nonuniform, which gives us room to investigate and respect things that are exceptional inside the community. How is it possible, for instance, that in one of the researched localities, where we might expect some cultural norms to apply requiring girls to marry early and take a position in a family, there is a young woman who is 26 years old, single, has completed her education, is a vegetarian, has a job, is self-sufficient, yet is not ostracized despite all of that. And when she wants to leave the building to look for a new life, she has nowhere to go?

3.6 Working Backwards: A Methodological Autobiography

Deborah Golden

Introduction

Soon her eye fell on a little glass box that was lying under the table: she opened it, and found in it a very small cake, on which the words ‘EAT ME’ were beautifully marked in currants. (Alice’s adventures in Wonderland, Lewis Carroll)

In this paper I set out what I call a methodological autobiography, based on a reflective account of ethnographic work in which I have been engaged over the last two decades. Throughout, I will attend to the texture of doing ethnographic work—what it feels like on the ground and in the mind—as a means of shedding light on the nature of the ethnographic enterprise. In particular I shall focus on the quality of purposeful wandering that accompanies the process of ethnographic research. The choice of this focus reflects a personal way of working, but also, perhaps more importantly, it is an emphasis that has evolved over many years of teaching ethnographic research methodology, as a counterbalance to students’ desire to put everything in order very quickly, sort it all out, and provide answers according to what they already know. Rather, in the following, I shall suggest that the work of ethnography unfolds, quite often without preplanning, and, even if preplanned, there are often unintended consequences. Hence, making sense of what has unfolded most often takes place after the fact. In this regard, the “methodological autobiography” that this essay shares with the act of research itself is the same characteristic of working backwards.

A Word of Caution: The Confessional Turn

The recent confessional turn in qualitative research writing requires that researchers reveal personal sources of possible bias, in the same way that they reveal scholarly sources and the backstage of the work. It is suggested that such revelations may give readers more insight into the makings of the research, thereby providing them with enhanced possibilities of evaluating the work. But how are we to know what must be revealed and what kept hidden? What are the limits, if any, to our self-confessions? In responding to this question, it seems to me to be vital to keep our focus on what it is that really interests us out there in the world outside of ourselves. If we keep that focus, then the choice of what is to be said and what not becomes clearer—only what may shed light on the people and lives about whom and which we seek to learn. In this essay too, a word of caution, any autobiographical material is only of interest if it serves to shed light on the issue at hand, namely, the ways in which research turns out to be what it is.

Purposeful Wandering

As part of my master's degree in social anthropology at University College London, I wrote a short thesis based on a textual analysis of Jewish circumcision, in an endeavor to ask why radical interference in the integrity of the body is considered to be a prerequisite for belonging to a community. Subsequently, I submitted a proposal for doctoral work that was to look into the meaning and use of circumcision among Jews in Israel, including the ultra-orthodox. I arrived in Israel towards the end of 1990, with a view to doing my fieldwork in one of the ultraorthodox neighborhoods of Jerusalem. I took to wandering around some of these neighborhoods, so as to get the feel for where I thought I wanted to be. But I hesitated in renting a room, could not seem to find my place, or imagine myself being able to do so. It was the time of the mass influx of immigrants from the former Soviet Union, and outside of the orthodox neighborhoods, the Jerusalem streets were very different from how I had seen them some years before:

All of a sudden there seemed to be no time and no place free of the presence of the newcomers. You could hear Russian at every turn, the central pedestrian mall in the city was filled with Russian professional musicians playing classical music to the passers-by in the hope of a bit of money, there were crowds of people outside the Ministry of Absorption, new delicatessen shops selling sausage and dark bread, Russian-language instructions at cast points, Russian-speaking employees at bank, offices and shops, and handwritten ads in Russian for every possible service stuck onto trees, bus-stops and electricity poles. Newcomers always seemed to be stopping you in the street to ask you how to get somewhere or other. Sometimes they'd talk in halting Hebrew; sometimes they'd dig into their pockets and haul out some scrappy piece of paper on which somebody else had scrawled a name and address. Israelis seemed continually to be talking about the newcomers: excitedly relating stories of meetings with relatives they never knew they had, complaining about the dogs they had brought with them, wondering at the blonde

beauty of some of the women and the elegance of others, airing suspicions about their motives for coming, or certain that this sudden, massive influx of people was a sure sign of divine intervention. An acquaintance said at the time: "If you want to witness a miracle, all you have to do is to go to Ben-Gurion airport. There's one happening there at least once a day." (Golden 1997, pp. 28–29)

In the event, the dramatic presence of the newcomers took over and shaped my research agenda in ways unplanned—the eventual study, based on participation observation carried out in Jerusalem over the years 1990–1992 in a variety of encounters between locals and newcomers, addressed the ways in which Israeli Jews saw fit to prepare the new arrivals for life in Israel. What came to interest me was the cultural rationale behind the ways and means by which Israelis sought to render changes in the newcomers, so that these latter might come to be seen, in the eyes of Israelis, as worthy of belonging. The study looked at notions expressed by Israelis concerning what sort of people the newcomers had to be, or become, in order to belong: what qualities, biographies, and ways of being were considered proof of moral worthiness, and what transformations the newcomers had to undergo in order to be seen to incorporate these appropriate qualities, biographies, and ways of being. The intense drama of the presence of the newcomers had lured me in, but again, in the process of research things turned out differently, as the last paragraph of the study, entitled "The beginning seen from the end," makes clear:

At the time of my arrival in Israel for fieldwork in September 1990, I had the sense that Israel was in the throes of radical change, about to happen before my very eyes. During my twenty months of fieldwork, however, I was not witness to any such dramatic enactment of "before" and "after". That is not to say that enormous changes to Israel were not being wrought by this massive movement of people from one part of the earth to another. On the contrary, there will be, and already have been, significant changes. This study is about what Israeli Jews did during those first unnerving moments when they glimpsed the possibility of powerful, unknown, impending change. It is about their endeavors to maintain some sense of control over what they sensed to be beyond control; about their hanging on for dear life onto what they already knew. (Golden 1997, p. 296)

What I wish to highlight in this story is that dimension of fieldwork that is a sort of purposeful wandering—a meandering alertness—on the ground and in the mind, which makes possible the recognition of the direction to be taken, without there being any explicit indication of this beforehand but, rather, as this presents itself. Going back to the classic methodological appendix penned by William F. Whyte (still today so useful for teaching purposes), attached to his ethnography "Streetcorner society," we see that the same mode of being in the field characterizes the initial stages of Whyte's fieldwork in Boston. He describes how he wanders around the neighborhood trying to find his way into local Italian society, during the course of which he has various encounters along the way. It is only when he meets Doc that he recognizes him as vital to his research, although he was not in any explicit sense actually looking for him. This quality of wandering—by which people and the things they do and say are recognized as worthy of attention—resonates in each and every aspect of ethnographic work: observation, interviewing, and analysis. That is not to say that it exhausts ethnographic work; rather it underpins and serves as its necessary condition.

Sighs, Cracks, and Crevices

Last summer my son and I spent many hours watching the television series *Mad Men*. Because he is not quite a native English speaker, he prefers to watch with the English subtitles, so as to make sure he is not missing any of the dialogue. Watching this way, what becomes apparent is the abundance of sighing that goes on as the protagonists converse with each other or are alone, sighs brought to the viewer's attention by the word placed in brackets at the appropriate moments—(sighs). In our line of work, the sort of wandering that I describe above allows for sighs to make themselves heard and for us to pay attention to the things said and done which, in the daily run of life, are so often overlooked. This mode of work makes manifest a substantial point: the understanding that crucial cultural ideas quite often inhere in the seemingly trivial acts and words that make up daily life. This understanding is analogous to Bourdieu's insight that the body is such a potent and effective site of cultural learning precisely because it is not seen to be such:

The principles embodied in this way are placed beyond the grasp of consciousness, and hence cannot be touched by voluntary, deliberate transformation, cannot even be made explicit; nothing seems more ineffable, more incommunicable, more inimitable, and, therefore, more precious, than the values given body, made body by the transubstantiation achieved by the hidden persuasion of an implicit pedagogy, capable of instilling a whole cosmology, an ethic, a metaphysic, a political philosophy, through injunctions as insignificant as 'stand up straight' or 'don't hold your knife in your left hand'. (1977, p. 94)

Hence, it is of the essence that we remain in that state of meandering alertness, so as to allow these implicit notions to make themselves known to us.

During my fieldwork in Jerusalem I invited one of my friends/informants round. In the local Israeli way of doing things, tea or coffee is always prepared with the appropriate amount of sugar already stirred in, rather than providing guests with a bowl of sugar for them to help themselves. Accordingly I asked my friend how much sugar he takes. He laughed and said that there were two questions Israelis always asked newcomers: "How much sugar do you take?" and "How long have you been in Israel?". (*kama zman ata ba'aretz?*)

That chance remark, duly noted down at the end of the day, subsequently became the crux of the entire study:

"How long have you been in Israel?" was the ubiquitous mode of opening a conversation with a newcomer. Countless casual encounters between newcomers and Israelis were prefaced by this seemingly trivial question. In more formal settings too, at which the newcomers were called upon to introduce themselves, they were almost invariably asked to state, along with their name, how long they had been in Israel. The experience of being thus questioned was so pervasive among the newcomers that it received special attention in the Russian-language satirical paper *Beseder?* where, parodying a Red Army 1920s poster, it covered the front-page of one of the issue. Now was the question "How long have you been in Israel?" anything other than a social tactic for smoothing over those potentially embarrassing moments of meeting a stranger? In fact, there are a myriad ways of smoothing over such moments – no end of questions could have been asked of the newcomers – and the very ubiquity of the question, by which it was rendered seemingly trivial, served to

obscure an act of social, and sociological, import. At the focus of this enquiry, then, is the endeavor to elucidate the sociological import of the question “How long have you been in Israel?” – so often asked of the newcomers – and to examine the ways by which Israeli Jews worked to link the lives of the newcomers with the life of the Israeli nation-state by having them partake in a “shared vision of social time, past and future”. [Lewis 1985, p. 149] (Golden 1997, pp. 7–8)

Forgetfulness

What emerged out of the first study of the processes of endeavoring to transform the newcomers was what I called a “developmental model of belonging,” according to which the newcomers were to follow a certain sequence of coming to belong. First and foremost in this developmental model was the mandate that the newcomers—no matter how old, wise, opinionated, educated, cynical, adept at working the system—were to first imbibe a sort of sentimental Israeli childhood, through singing, hiking, participating in skits, and eating festive food, before they could participate in the life of the country as what they already were, that is, as old, wise, opinionated, educated, cynical, etc. In other words, in the eyes of Israelis, participation in the country as adults was to be underpinned by, and made conditional upon, a more sentimental, childlike, sensory sense of belonging (Golden 2001). At the time, I viewed this through a critical lens. Was this not paternalistic? Surely one could indeed be a full member of the new society—have a deep sense of belonging—without being a child there first. But now, from another vantage point altogether, I think that that is indeed impossible. I myself was born in South Africa and grew up in London, child of South African-Jewish immigrants. It was an entirely secular home, with friends and family around, but no links to a wider more formalized community of any sort. We did not celebrate any festivals at all—no candles on a Friday night, no going to synagogue on *Yom Kippur*, no eating one thing but not another. Nor were these Jewish festivals replaced by the Christian festivals around us or by anything that might be recognized as English or South African culture. Looking back, I think that I grew up in a sort of social-sensory vacuum. Even my mother’s cooking did not serve to attach us to any clearly defined wider community because she drew inspiration from a variety of culinary sources. Now, as a mother myself, I have tried to create a more sensory home for my child—one filled with smells, tastes, light, or festive songs—and I see that I too am not very good at this. None of this is deeply part of myself, so that I may indeed light the candles on a Friday night because it crossed my mind, or there are guests, and then indeed I enjoy the light, but really and truly I can take it or leave it. There is nothing that really feels missing if I forget about the candles—only an afterthought “Oh, I forgot to light the candles” serves as a belated reminder. This social-sensory vacuum in which I myself grew up means that I neither long for nor deeply belong to that particular dimension of Jewish life.

What is it that I am trying to say? Simply, as argued by a long line of anthropologists, that the deepest learning takes place through the body and it is

only by virtue of embodied exposure to, and experience of, sights, sounds, tastes, smells, and textures that the abstract principles of social life come to adhere in our innermost selves. Hence, the anthropological mandate to know a culture means becoming familiar with it, and becoming familiar means, first and foremost, like children, getting to know it through our senses. Just as the Israelis were right in that if they really did want to extend a real invitation to the newcomers, it meant inventing and imagining an Israeli childhood for them, as prerequisite for adulthood; in the same way, the anthropological quest to understand another culture must, first and foremost, be based on sensory immersion. In this latter enterprise, what is important is not that we be reflexive but, quite the opposite, that we be forgetful of ourselves so as to allow ourselves to be washed over by what we see, hear, smell, taste, and touch. Even the intensive, disciplined writing that takes place at the end of every day in the field and produces a rough description approximates a stream of consciousness—a wandering in the mind and across the page by means of which everything that we can remember is noted, without premeditated ordering or selection or censoring. This first instant of noting what we remember is, paradoxically, making note of the forgetting that is a precondition for the sort of sensory immersion described above. It is “putting into words that which is not language” (Hirschauer 2006, p. 415), not only because, as Hirschauer eloquently argues, much of social life is itself “silent” but because immersion in the field is itself, as described above, a sort of meandering in the mind and on the ground that resists, or endeavors to resist, rigorous verbal formulation.

Missing the Point?

Some years later, newly employed in an academic department of education, I was looking to do some research in a formal educational setting. At the time, my son was himself at preschool and my decision to carry out an ethnographic study of a preschool in a neighboring town was perhaps a way to “eavesdrop” and to study what might be going on when I left him at the door every morning. There the children really were children and did not need to be made so. Theirs was a real, not imagined, childhood. Still, this second study was accompanied by similar questions to the first, with a change only in the *dramatis personae*:

The study addressed the ways in which early education teachers saw fit to prepare the children for life in Israel. What came to interest me was the cultural rationale behind the ways and means by which teachers sought to render changes in the children, so that these latter might come to be seen, in the eyes of the teachers, as worthy of belonging. The study looked at notions expressed by the teachers concerning what sort of people the children had to be, or become, in order to belong: what qualities, biographies and ways of being were considered proof of moral worthiness, and what transformations the children had to undergo in order to be seen to incorporate them.

Again, only in retrospect, when called upon to write a coherent account of my scholarly research for the promotion committee at my university, did I realize that

there were fundamental similarities between the two populations with which I had chosen to work. They were both groups of newcomers to the society—being a child and being an immigrant both constitute ways of entering a new society. They were both regarded by the veterans as culturally “speechless” and hence, as legitimate targets for intensive processes of cultural teaching. Some of this cultural work is explicit—what people do and say in the explicit endeavors to make over the newcomers, immigrants and children—as they see fit. But, as I have said, much of this cultural work—and perhaps that which reaches deeper—is implicit and happens, as it were, through the senses and by the way. Although the teacher in the preschool in which I did my fieldwork was keen to show me her purposeful educational work, I ended up writing a series of papers on other things altogether: the girls’ practice of hugging the teacher, the uses of food in the kindergarten, the way in which the day was routinely structured and unstructured. So that much of our work is dedicated to reading between the lines, attending to the cultural work that goes on in the sighs, cracks, and crevices.

It may be that from the point of view of the people in the field—certainly those who dedicate themselves to educational enterprises—research in this mode is missing the point. From the point of view of those whose daily professional practice is made up of intentional and explicit instruction, this side glance at things, this undue attention to the sighs that intersperse conversation, may be silly or even disrespectful. However, given the understanding that crucial cultural learning takes place precisely in the sighs, cracks, and crevices, then the task of research in calling educators’ attention to this aspect of their work would seem to be particularly important. This is even more the case in studies of settings and interactions involving children or others without mastery of verbal speech. Paul Willis (1975), in a study of motorbike culture, makes the point that the cultural codes of minority groups are primarily expressed through the use of the body and other concrete modes of articulation. In his understanding, minority cultures are unlikely to express their innermost meanings in verbal mode because to do so would be to risk destruction or incorporation by representatives of mainstream culture who have mastery of, and strive to exert power through, language and the manipulation of other highly visible “key symbols” (Ortner 1973). Given the lack of mastery of language, then more obscure modes of articulation may come to serve as prime means by which children and other newcomers endeavor to make themselves seen and heard. The children in the preschool which I studied might not be able to say to the teacher that they had had enough of her teaching endeavors during “circle time” and that they were bored and hungry, but they could seize a slight pause in her stream of words to hurl themselves across the room—sometimes seven or eight girls—and hug the teacher, thereby, in their own way, bringing the tedious proceedings to a halt (Golden 2004). Adopting Willis’s insight for research into educational endeavors (broadly understood), it would seem of particular importance to attend to what goes on in the margins, particularly from the point of view of those who wield less power to shape events.

Juxtapositions

‘Well, I’ll eat it,’ said Alice, ‘and if it makes me grow larger, I can reach the key; and if it makes me grow smaller, I can creep under the door; so either way I’ll get into the garden, and I don’t care which happens!’ (*Alice’s Adventures in Wonderland*, Lewis Carroll)

As I have described above, the time in which we are in the field is a time of loosened hold over the chain of events. Like Alice in Wonderland, we are open to persuasion. Later, in the analytic endeavor of making sense of the materials gathered in a way that gives these a beginning, middle, and end or, in academic parlance, a claim or a thesis, or an answer to a question, we seek to take greater charge over the direction of our work. That is, less prone to distraction, our work becomes more purposeful and less wandering. Still, even now, this more focused dimension of our work—the disciplined, rigorous, line-by-line fragmenting of the text into themes and categories—is always accompanied, and complemented by, that more meandering mode. In the act of sitting back and reading and re-reading the notes we have made, we let people, ideas, words, images, colors, and textures wash over and make themselves seen, felt, and heard. Now too, as in the field itself, we are open to the possibility of what may emerge out of unexpected encounters. As Schmidt (2008, p. 358) argues, in an illuminating account of comparison, “comparing is not dependent on shared properties of objects, in which case, paradoxically, these properties would have to be known in advance . . . Comparison ought instead to make use of contrasts and differences, to gain insights from incomparability and inadequacy.” In this act of juxtaposition—sometimes purposeful, sometimes happenstance—the placing of bits and pieces of data side by side may draw our attention to things that would otherwise go unnoticed.

The Last Word

Ethnographic work is multifaceted—dependent upon multiple and complementary ways of gathering, reading, and analyzing data and upon the interweaving of different textures of being, doing, and thinking. In this essay I have chosen to focus on one aspect of this work because, in my understanding, in its unfolding, tolerance, celebration of inadvertence, and chance, of sighs cracks and crevices, not to speak of its making sense after the fact, ethnographic work is a close replica of life itself. Hence, it is so beautifully and eminently suited to the study of people as they go about living their lives.

3.7 Observing Schools in Disadvantaged Neighborhoods in France

Jean-Paul Payet

I would like, in this chapter, to develop the following idea: *ethnography* permits a renewal of interpretive frameworks as they have been defined and fixed at any given moment by a dominant ideology that saturates both public debate and the scientific community. Ethnography can change the conventional way of explaining some social situations or issues. It holds this power because it puts researchers in touch with the lived world of actors. In other words, provided that researchers are ready and willing to question their pre-established views, they find themselves facing a complex, ambivalent, multiple, partly indeterminate, and shifting reality (Blumer 1969; Mead 1934; Simmel 1999; Strauss 1959, 1978). Conventional interpretive frameworks therefore seem to them inadequate, reductionist, and simplistic. The ethnographic experience challenges researchers to refresh their tools for describing and understanding, and that is what I would like to illustrate through my own research on disadvantaged urban schools in France.

The Dominant Ideology About Schooling in France

In French policy, schools are framed/understood within the so-called “Republican” model. Its origins lie in the political model developed in *France* at the end of the nineteenth century, when schooling contributed in crucial ways to the construction of a unified and secular nation. According to this model, schooling must produce

enlightened citizens, freed from control by the Church and from the influence of the particular traits of the citizens' social classes, cultures, or families. Schooling is, in its universalistic aim, "indifferent to differences." Schooling is secular, which means that whatever belongs to culture and religion have no right to recognition there and are relegated to the private domain. The school of the Republic aims to create a direct link between the individual and the nation, and all of an individual's ties to primary groups appear as obstacles to the construction of this privileged link, which must permit and at the same time guarantee the construction of the individual (freed from those ties) and of the nation (made up of equal individuals).

Within this framework, the characteristics of pupils' family milieu are not taken into account (for the sake of equality, defined as formal equality before the law and not as real equality of situations in life). In the 1960s, critical sociology demonstrated the mystification behind such a notion of equality. Schooling, rather than establishing equality of opportunity, is an institution whose cultural contents belong to the middle and upper classes, an institution that divides up and sorts students by social class at a very early age (Baudelot and Establet 1971), but that does so in an insidious manner under the guise of neutral evaluation (Bourdieu et al. 1965). The school of the Republic is a school that reproduces an inequitable social structure (Bourdieu and Passeron 1970).

Within critical sociology, social class is the ultimate variable that explains social inequalities. The cultural/ethnic origin of pupils does not appear as a relevant variable, because it is seen as secondary to the disadvantaged social position of the pupils' parents. However, the emergence, in public debates of the 1980s, of the question of second-generation immigrants (primarily North African) led certain researchers to take the variable of ethnic origin into account in various social fields (employment, housing). My works, beginning in the middle of the 1980s and continuing through the 1990s (Payet 1985, 1992, 1995, 1997), took place during the pioneering phase of studying schooling from the point of view of *ethnicity*. Along with other works (Debarbieux 1996; Henry-Lorcerie 1986; Lepoutre 1997; Lorcerie 1996; Poiret 1996; Trancart 1998; Tribalat 1995; Zirotti 1980; Zirotti and Akers-Porrini 1992), they helped eliminate the taboo on talking about ethnicity at school in the social sciences in France.

Publication of my research on middle schools of the disadvantaged urban periphery (Payet 1995) provoked, in public debate as in the scientific community, two kinds of negative reactions, both framed as defending secular and egalitarian schooling (Payet and Giuliani 2010). One reaction was to refuse the ethnicized description of schooling, which questioned an (idealized) image of the school of the Republic. The other was to challenge the use of ethnic categories, arguing that it was the very act of looking (by the researcher) that created the reality. Without denying the danger of a superficial reading of works of research, my position and that of a number of researchers was that one couldn't describe the process of ethnic discrimination without naming it.

However, my research work has also been widely disseminated to the public and to the scientific community, thus helping to validate the issue within the public debate (HCI 1998; Hébrard 2002; Toulemonde 1997) and to pave the way for works

on the processes of ethnic segregation in French schools (Felouzis et al. 2005; van Zanten 2001). This public visibility was due essentially to media attention given to one research result concerning micro ethnic *segregation* within disadvantaged schools. I showed the existence, within middle schools serving a large proportion of children from immigrant families, of practices for sorting pupils into different classes at the same level of the curriculum, which contradicted the official principle of a supposedly “common” school, that is, one without tracks or streams. A statistical study of class composition showed what I called a “fabrication of classes,” that is, construction of small-scale segregation among students by age, academic level, sex, social class, and ethnic origin. These micro segregations had the major effect of stigmatizing pupils relegated to the “bad classes” (Payet 1992; van Zanten 2001). They produced a systematic association between weak academic level, bad behavior, and foreign origin, which led to a process of ethnicization, both among the teachers in their perceptions of academic difficulties and among the pupils, who appropriated the ethnic stigmas for defensive purposes.

On the basis of this study of class composition, people saw the research as essentially an attack on unofficial practices of social, ethnic, and sexual differentiation, all of which contradict the principle of the equalitarian school of the Republic. However, these segregating practices of classifying students made up only one part of the research, and even interpreting them depended on a broader ethnographic context. In fact, the research aimed to show the everyday functioning of schools in disadvantaged neighborhoods, what local ideologies they produced, how teachers and administrators and other educational professionals worked within them, and how relationships with parents were constructed. It was across the entirety of these spheres of activity that the research demonstrated the institutional production of ethnicity. To a certain extent, focus on the ethnic fabrication of classes obscured the multiplicity of settings and issues within these academic worlds, thus keeping people from grasping the real logic of ethnicization.

In the first place, the goal of the research was not to lay blame but rather to understand (in the sense used by Weber 1975). Discrimination produced by the school did not result so much from unethical behavior, as a simplistic defense of the school of the Republic would have it, but from contradictions actors face within which ethnicity appears as a resource for managing in difficult situations. In the end, the research showed how ethnic and racial stereotypes are actually maintained for the sake of a doctrine and at the very core of an egalitarian “indifference to difference” in the school of the Republic. Such a paradox was brought to light thanks to the way in which an ethnographic perspective opened our eyes and invited multiple interpretations.

Opening One’s Eyes

One of the hardest things to convey—to teach, to explain, to share—about ethnography is its epistemological and practical posture of openness. Concretely, this means letting the research questions build little by little over the course of the study,

and letting the field suggest and shape what will be interesting to study (Becker 1998; Glaser and Strauss 1967; Schatzman and Strauss 1973).

In my studies, I have been guided by big questions that give meaning and coherence to my research work: inequality, injustice, othering, and violence. But these major issues can be addressed from different methodological and epistemological perspectives. The choice of ethnography flows from a perspective that is at once theoretical and concrete. What interests me, as an ethnographer, is to see and understand how these big questions are interpreted in everyday life, in the course of ordinary action. In this I subscribe to Simmel's vision of a society that constructs itself through reciprocal actions between and among individuals (Simmel 1999). Seen from below, from within, and not from above, society is much less neat and simple than institutions, media, or policy represent it. Goffman (1983) said that what justified an interest in sociology was its ability to bring to light versions of reality other than official versions, and ethnography is a good method for doing that.

When starting a study, researchers see reality through the filters of generalities and official versions. In France, schools in the poor peripheries of big cities serve mostly children from immigrant families—postcolonial immigrants (North African and sub-Saharan African, to which Caribbean populations, technically “nationals” but marked by colonial relations, get added) and more recent other immigrants (Portuguese, Turkish, Asian, ex-Yugoslavian). Teachers are, for their part, almost all “white,” meaning that their parents are French or in a few cases European immigrants (Italian, Spanish). The academic level is lower in more disadvantaged neighborhoods, acts of violence more common, and turnover of teachers more frequent. These schools belong to an administrative category (“educational priority zones”) that steers a bit more financial resources their way. These schools are perceived negatively as much in public opinion (media reports emphasize stories of aggression by their pupils) as by teachers, pupils, and their parents. Families who have the social or financial means prefer to avoid these schools, whether by obtaining waivers for other public schools or by registering their children in private schools (which nonetheless remains a minority practice, involving only the highest stratum of families in these working-class neighborhoods and not the majority, who remain captives of schools with bad reputations).

Schools that serve disadvantaged neighborhoods, with a large proportion of children and adolescents from immigrant families, are thus the objects of very powerful social representations: academic failure, violence, (Muslim) religious fundamentalism, etc. These images represent places “seen from afar.” When one gets close, the phenomena that these images capture do not disappear from view, but they take their place within a seamless reality made up of varied activities, exchanges, and relationships. The ethnographic perspective denaturalizes and de-essentializes oversimplifying categories embodied in words used in public discussion but also in scholarly discourse—identity, integration, socialization, origin, and violence.

Multiplying the Observational Categories

An ethnographic study, which implies presence in sites for a long time (from several months to several years in the studies I have conducted), lets one complicate simplistic media images and commonsense representations. The first reason is that, even if they all belong to the same category—i.e., disadvantaged—schools differ from one another. Each school is characterized by a unique history, a specific environment, a particular administrative style, and so on. Comparing the configurations of different schools stimulates reflection on the boundaries between categories and illuminates the internal dynamics of each category of schools studied.

I always took care in planning my study to put together a sample of more than one school (two to four, in general). In schools facing fairly similar problems, one sees varied strategies for solving them. But it is also because the problems are not completely similar, because there are little differences, that the schools' constraints and room to maneuver are fairly large. To observe several schools is also to become aware of a global scale that encompasses them all, for each school occupies a place that is certainly its own but is also interdependent with the places occupied by other schools. Thus, in their reputations with families, schools are ranked. To a certain point, there is an academic market—even if, in France, thanks to strong state control, it would be more appropriate to speak of an unofficial academic market. By comparing several schools, one can link what happens inside a school with what happens outside it, at the level of a larger system—a neighborhood, a city, a regional academic administrative unit, teachers' unions, and parents' associations—that is, with social environments, educational policies, and actors' strategies.

Ethnography lets one complicate a simplistic vision in a second way by providing access to multiple actors. From a distance, one sees only a principal and teachers. Up close, the educational community of a secondary school includes, besides the principal and the collective body of teachers, a multiplicity of statuses and roles: the assistant principal, the academic counselor, the guidance counselor, the academic social worker, the school nurse, the playground and study-hall supervisors, the technical staff, and the concierge. As one gets closer, the non-teaching positions loom larger—whereas they are forgotten in a general discourse that remembers only the teaching function of schooling to the detriment of its functions of moral education and administrative and technical management. Actors are also multiple at the level of the individual. Each actor embodies his or her principal status, but can also hold several roles in different registers—categorical, structural, and personal (Hannerz 1980). Formal groups and networks—groupings by discipline taught, grade level, project, and union membership—and informal groupings, by ideological affinity, by generation, by seniority, by gender, and by social class, turn out to be important in the daily functioning of the school. From up close, categories do not disappear, but rather multiply, intersect, and pluralize. Ethnography permits observation of these identity dynamics, which furnish precious keys to the interpretation of the processes of resistance and change at work in schools (Franchi and Payet 2010).

The life of a school is institutionalized: there are laws, rules, procedures, status, specifications, and mandates. But not all is prescribed or foreseen by texts. And not all that is prescribed is implemented. Ethnography permits us to see the “negotiated order” that Anselm Strauss described so well for hospitals (Strauss et al. 1963). What ethnography observes is how problems specific to a small social organization are defined, constructed, and solved—provisionally, through agreements that can always be revisited. This is not to forget that small organizations are connected to a big organization (particularly in France, where the academic system is very centralized), and that the work of interpretation consists of understanding the patterns that are constructed in the interdependence, or the partial autonomy, of the local and the global (Geertz 1983).

Thus, when one gets close to sites, their unique traits appear: the configurations of spaces, the personalities of individuals, and the dynamics of *interactions*. Time, space, and power take on a lived dimension. Emotions and sentiments weave proximities and distances between individuals on a delicate loom. Relationship with the law, the formal, and the prescribed appears as a constant preoccupation among actors, but it is a preoccupation not so much with complying as with coping. This *phenomenological approach* to sociology (Schütz 1962) does not assume that everything is constructed in the here and now of the situation, for it postulates the existence of preexisting, “taken-for-granted” categories. But it does pay attention to the ways in which stereotypes get activated differentially, the relevance of stereotypes can get suspended, or categories with local meanings can emerge. It also pays as much attention to routines of roles as to events and to adaptations produced by actors in the situation.

Ethnography Versus a Policy Model Based on Cartesian Rationality

Scholarly epistemologies are not universal; they are born and develop in historical, cultural, and political context. I must make this point in order to better explain the status of academic ethnography in France. As I have just shown, the ethnographic perspective tends to emphasize the differences among contexts, combinations of formal and personal characteristics making up a person’s status (Hughes 1971), and logics of rule appropriation and of negotiation. Now, this perspective contradicts the official vision of the egalitarian school of the Republic, which is said to be uniform across the entire nation—the same curriculum taught by undifferentiated teachers to undifferentiated pupils.

One could even go further and add that ethnography, because it captures social organizations “in the flesh,” pulls emotions and affects into the scope of the study. Now, the Western political model draws its framework from the Enlightenment, from the rational order, constructed as the opposite of **emotions** (Lynch and Payet 2011; Nussbaum 1995). Particularly in France, knowledge is represented in its

most noble meaning, as abstraction, reason, and universality. Teachers transmit knowledge; they do not educate the whole child. The ideal model of schooling and of the teacher's role rests, in the French context, on a strong division of labor between school and family: it falls to the family to provide moral education and to guarantee the prerequisites for academic teaching. The notion of a connection between the two spheres of socialization of the child, as in the concept of the educational community in the English-speaking world, is strongly rejected by French schools and teachers.

In fact, the ethnography of schooling as I have practiced it is iconoclastic in France because it doesn't study what happens in classrooms, because it does not focus on the teaching-learning relationship, but rather on other places within schools, on other relationships than those defined by teaching and learning. If one identifies the classroom as the symbolic center stage for the grand French narrative on schooling, then my studies are interested in the backstages. In terms of places, these backstages are the principal's office, the meeting rooms, the playground, the corridors, etc. In terms of statuses, these backstages are occupied by non-teachers—administrative staff, educational aides, social aides, and health aides.

Teachers and pupils are there, too, but they are there in their interindividual *relationships* (outside the classroom), and their roles are not framed in a strictly instructional register. Again, one must note the specific French cultural context: instructional relationships between teachers and pupils outside the classroom rarely take place. Thus, teachers do not oversee clubs or sports activities as in other school systems in Northern Europe or the English-speaking world. As a result, teacher-pupil interactions outside the classroom almost always take place in a register of conflict—punishments, calling in the parents, and other practices—as continuations of conflicts that developed in the classroom or as resolution of classroom incidents or problems.

In these spaces peripheral to the classroom, one also finds parents. They appear in a formal role when they are elected by other parents to various joint councils (administrative council, disciplinary council). Their place in these spaces has gradually grown over the course of the last three decades, as the law has recognized their rights and given them a voice in school management. They are also present in individual or group meetings with school staff, when they are called in, when they visit, or when they intrude. In schools in disadvantaged neighborhoods, social workers in charge of following children and families meet regularly with parents who are in socially precarious situations.

The Lived World of Teachers in Disadvantaged Neighborhoods

What are the problems that everyday living in these schools poses for actors, especially for those who work in them? What are these problems as actors “define” them? Note that this is not about problems rationally described in response to

explicit questions such as “What are the problems you encounter in *everyday life* in schools?,” questions typical of a research method using a questionnaire or interviews. This is about problems as individuals shape them in the course of their activities. Thus observation of the ordinary flow of activities in schools furnishes material to the researcher, whose role is to formulate these problems “as people see them.” This is very much a work of interpretation: even if categories are constructed as closely as possible to the ongoing action, they have been developed by the researcher (Schütz 1962).

I have identified three major problems of actors in their daily work in these schools in disadvantaged neighborhoods. I differentiate them to make them clear, but in reality these different problems overlap. The first problem is that of academic failure and more specifically of the low level of a large part of the pupils, which gets translated into a practical question: how to motivate the pupils? (This main question is declined into secondary questions: how to evaluate the pupils? What work to give them? How to organize the curriculum? etc.) The second problem is that of pupils’ deviance: how to maintain discipline? How to (re)establish order in the classroom and the school? The third problem is the most difficult, given the first two: how to make the school look good? There’s a risk, in fact, that the school’s image is not good or is deteriorating; that the school is losing its best pupils, who enroll in other public or private schools; and that this can worsen the first two problems, feeding a hellish spiral of failure.

These three problems—motivating the pupils, maintaining discipline, and making the school look good—are first-order problems for the actors in these schools. But let us not forget that they operate within the egalitarian framework of the Republic, which forbids taking differences into account and adapting instruction to the social particularities of the local context. The gaze of French teachers must be indifferent to differences (in the sense of being “color-blind” or “class-blind”), for this indifference is supposed to guarantee neutrality, and neutrality produces equality. Yet everything converges, in the daily lives of these schools, to identify the pupils’ social and especially ethnic origin as a principal cause of the difficulties faced by teachers and administrators. Families’ weak social and cultural capital is seen as a handicap difficult to overcome and as the obvious explanation of these pupils’ academic failure. Pupils’ disobedience, incivility, and transgressive and violent actions are, in the “just-between-us” conversations among colleagues, blamed on inadequate childrearing at home and on a culture that cannot be assimilated by French society. (For example, teachers attribute boys’ lack of respect for women to Arab culture.) The significant number of children from immigrant families in these schools is seen as the main reason that French families in the neighborhood, as well as the “most integrated” immigrant families, avoid the school. All other explanations, especially those that would blame the school and its agents (e.g., the concentration of children from families in precarious socioeconomic situations or the higher rate of teacher absenteeism in these schools), are thus removed from consideration.

The attitude of indifference to differences (color- and class-blindness) is certainly made more difficult when the pupils themselves and some of the parents

invoke the category of residential membership (the “housing project,” the disadvantaged urban “periphery,” the “hood”) and of ethnicity. Pupils bring into the school all the signs and codes—in dress, objects, language, music, etc.—of a vernacular culture: a youth culture that hybridizes elements imported from North American ghettos with elements of a traditional culture, themselves the objects of re-appropriation into a new ethnicity. Ethnicity is likewise activated as a defensive tactic by certain pupils or parents to accuse the school of racism, or to reclaim identity, taking the school as a field for self-expression and media attention (regarding wearing of the Islamic veil).

But what research shows is that the ethnic variable, which ought to be banished from the gaze and the actions of school agents in the framework of the Republic, is on the contrary activated in an institutional manner within these schools. Ethnicity is in fact produced not only by pupils and parents; it is also mobilized by teachers, non-teaching staff, and administrators, who use ethnic categorization in their talk and their actions. Thus, in teachers’ ways of seeing the world, foreign origin often calls forth stereotypes and negative judgments. This *stigmatization* particularly affects boys, especially boys of North African origin, who embody in the French imaginary the image of the “unassimilatable.” In fact, boys of North African origin are overrepresented among pupils disciplined for bad behavior and are concentrated in classes for pupils with low academic level and/or little academic motivation.

Study of the composition of classes—what we presented at the beginning of this chapter—demonstrates that school practice an illegal differentiation in a system that officially tracks pupils only after the first cycle of secondary education (the end of middle school). Our study unveiled this taboo practice. But this practice makes sense within a continuum of activities, within a local configuration where problems of instruction, moral education, and management must all be solved at the same time. It is this combination of issues that produces ethnicization and racialization. The construction of ethnically differentiated classes can be reinforced by the ethnicized judgments made by teachers. However, this practice, contradicting the ethic of the school of the Republic, becomes acceptable where it permits the construction of “good classes” which seem to the eyes of those in power in the school to offer a magic solution to their problems. These classes enable, in effect, schools to guarantee more comfortable work to teachers (in reality, to those in dominant positions in the school), on the one hand, and, on the other, to keep in the school the most socioeconomically well-off families of the neighborhood, who are often French (to the detriment of the weakest foreign families) while guaranteeing them socially and ethnically homogenous (“white”) classes (Payet 2002).

Thus, the construction of ethnic and racial frontiers inside the school does not come from lack of the Republican ethic, as those who see themselves as defenders of the school of the Republic want to believe. It is rather, in most cases, the opposite: in the name of maintaining social and ethnic integration in the school, segregation inside the institution seems to the school the most effective solution.

If it is good from the perspective of the heterogeneity of the school population at the level of the school as a whole, this strategy is paid for at the high price of excessive deviance by pupils concentrated in the bad classes, the racialized classes.

Thus pupils pay back the school that segregates them with reciprocal behaviors (Woods 1983) in the form of increased violence. The latter leads to professional burnout of the teachers assigned to these classes. The maintenance of a “safety barrier,” defense of a border between good and bad pupils, implies increasing activities to control pupils, which is translated in turn into secondary deviance (Becker 1963), and decline of teacher morale and school climate. Even more than construction of classes for weak and unmotivated pupils, it is the denial of the ethnic character that makes pupils uncontrollable. Denial of racialization—pupils speak of “classes where they grouped all the Arabs,” but academic agents counter by citing random assignment or the unique criterion of academic level—adds to the pupils’ humiliation and leaves them no source of pride but to turn the stigma on its head. Pupils ethnicize and accentuate their deviance, thus making the initial prediction of failure and violence come true, and masking the fact that it is a self-fulfilling prophecy.

What ethnographic work shows is not only the process of institutional ethnicization and racialization by the school. What it shows is the accomplishment of this process and at the same time its denial. Ethnicity is the object of a continual back-and-forth between its emphasis and its censure, between its enactment and its denial. In front of pupils and parents, school actors hold to the official, secular discourse of the Republic; in their professional “just-between-us,” they abandon the politically correct discourse for ethnicized talk.

This double language shows how academic actors’ belief in the egalitarian school of the Republic gets put to the test. Locked inside a framework that makes no distinctions, they find no way out except to blame its failure on the populations claimed to be holding back from integration into French society (Franchi 2004). They maintain an abstract discourse on the integrating virtues of French schooling, but legitimize ethnicizing discourse about and discriminatory practices towards pupils and parents who are immigrants or from immigrant families. This contradiction is little recognized by some academic actors, while it makes others unhappy. It is as much the denial as a troubled conscience that creates exhaustion among professionals on the ground. They feel overwhelmed by the situation, constrained to act against their values. They slide down the slippery slope of ethnicization, but they cannot admit it. The essentialist perception of the other thus operates as a defense against weariness and self-reproach. Exhaustion, produced by denial, feeds latent racism; that in turn makes the paradox grow and requires reinforcement of denial. And so on and so on, in an infernal spiral.

Ethnographic Interpretation

In what ways is ethnography a good tool for capturing this contradictory, unstable reality of the institutional production of ethnicity through alternating methods of censure and emphasis—this paradox of racialization and denial of racialization?

In the first place, ethnographers move within different spaces of the social organization they observe (Becker 1983), between what Goffman (1972) calls the “stages” and the “backstages” of the actors’ worlds. At school, teachers are on stage when they are in contact with pupils or parents; their back stages are spaces protected from contact, where they find themselves with peers, among themselves. On the stage of the school of the Republic, they play the official role of the neutral teacher, “indifferent to differences” (Bourdieu 1966), evaluating only the academic competencies of pupils and guarding against judging their capacities in light of their social milieus. Back stage, actors relax, let the mask fall: in the teachers’ lounge, a discourse of complaint stigmatizes the culture of children from immigrant families.

Is this a lie or denial on the actors’ parts? Therein lies an important challenge to interpretation. From a distance, as mentioned, the reading of school practices of ethnicization/racialization is one of indignation vis-à-vis institutional actors who are judged as unethical. Up close, observing professionals at work, it is striking that most of them are acting in their official role with strong convictions. They defend the ability of the school of the Republic to integrate and believe in the neutrality of their position. They try to convince themselves that classes are segregated only because of the low level of the pupils, and not through deliberate sorting. They deny the racial nature of the classes, contradicting the pupils and the parents who accuse them of being discriminatory. But the ethnographer sees the effects of denial on the actors themselves in the form of moral and emotional exhaustion.

In the second place, ethnographers gain access to a different reality than researchers who conduct interviews, a reality that contradicts both the ideal of the professional self and the interactional nature of their work. On the one hand, in a research interview, the moral stakes of presenting an acceptable face are paramount. One thus sees professionals insisting on the rewarding aspects of their profession and obscuring the “dirty work” (Hughes 1971). On the other hand, the interview reconstructs, instills an order, produces a rationality centered on the individual—it creates a coherence of the “self.” Now, this consistency in a line of behavior, which Goffman (1972) calls face, is put to the test by action. In real situations, individuals are in interaction and the ethnographer can capture the work of individual interpretations one in relation to another—work that leads to agreements, misunderstandings, or conflicts between interpretations.

Watching actors behave within a situation, they grasp the complex nature of challenges to fairness. Actors hesitate over which line of behavior to follow, they contradict themselves, sometimes they fail.

That is what happened in this encounter between a (female) counselor¹ and a pupil’s father. The counselor has called in the parents without explaining why, and the (North African) father has come straight from work. It is the beginning of the afternoon, the father having worked since early morning; he is tired, but he apologizes anyway for being a little late. The counselor explains to him that his (adolescent) son insulted a (male) mathematics professor. The father says that he disapproves of his son’s behavior. The counselor adds: “If that had

¹ *Conseillère d’éducation*, a woman who fell within the academic rather than social work category, but did not teach and did not necessarily participate in the class councils mentioned later.

happened with my son, I would have given him two slaps. But of course, I'd prefer that it's handled by the parents. To me, it's not a school problem, but a life problem." The father answers that she could have given those slaps to his son.

The counselor phones a study-hall supervisor to find the pupil. While waiting for several long minutes, silence settles on the counselor and the father, interrupted by one short exchange:

Counselor: And how are things at home?

Father: No problem, not a problem.

Counselor: So you have to believe that he's taking advantage of that at school.

It is only at this moment that the father asks about the situation that led to the insult. The counselor replies that the teacher asked him to change his seat.

The pupil enters the office. His father, in a cold rage, reprimands him: "You say 'fuck you' for a seat? And if your professor gives you a slap, what are you going to do then, hit him?" Then, moving toward him: "You piece of dirt! I'm the one who will give you a slap!" and he strikes him violently.

The pupil holds back his tears with difficulty. The father looks at his son with disdain. The counselor says to the pupil: "Fine, I think that you have understood that neither your father nor we agree to your use of such language." The father orders his son to apologize to the professor. The pupil leaves the office, followed after a while by the father, who says to the counselor: "The next time..." The counselor cuts him off, "But I don't think there will be a next time." The father then adds, "The next time, you will give him a slap." The father having left, the counselor lets drop, "That's what I call a badly resolved conflict."

Later in the day, the (female) homeroom professor visits her. The counselor tells her about the meeting with the father and says with bitterness, "He told me that we should have given him a slap ourselves." The homeroom professor, who then listens to the entire story, is surprised by the insulting behavior of the pupil, who is usually very well behaved. She asks if the incident is not related to an event that happened the prior day: rejection of the pupil's program plan, due to mathematics grades that were too low.

By staying in the counselor's office after her interaction with the pupil's father, the ethnographer could witness this second interaction between the counselor and the homeroom professor. He thus learned that the counselor had not been informed of the larger context in which the incident of the insult took place. The mathematics professor had simply asked her to punish the pupil. Neither the professor nor the counselor had sought to understand the reasons for the pupil's behavior. The mathematics professor had not informed the counselor about the class council,² which had turned down, the day before, the pupil's program plan, and the counselor had not asked for further explanation about why the professor asked for punishment beyond what he had said: "I asked him to change his seat." The ethnographer linked these observations to other bits of information gathered during his long presence in the institution, notably bits of information that revealed a moral division of labor between the teachers and the counseling staff (Payet 1997). Many teachers (such as the mathematics professor) refused any interaction with pupils that touched on moral education, limiting their role to

² In France, a "conseil de classe" is a meeting in which teachers, in the presence of and under the authority of the principal, share their evaluations of each pupil in their class and make decisions about future placement. Student representatives and elected parents are present.

instruction in their discipline. They left to the counseling staff the task of applying sanctions and seeing parents. They delegated that part of the “dirty work” (Hughes 1971) of a profession that they saw ideally as within the sole sphere of transmission of disciplinary knowledge.

Nonetheless, in her story about her interaction with the pupil’s father, which she later repeated for the homeroom teacher, the counselor made the variable of ethnicity salient. She blamed the father for the meeting’s failure, on the grounds of an ethnicized characteristic—North African fathers’ violent approach to child rearing. She thus activated and reinforced the stereotype of the inadequacy of Arab culture vis-à-vis the values of French society. She admitted certainly a “badly managed conflict,” emphasizing through this expression the typical register (counseling, mediation) of her professional role. But, unable to explain the reasons (delegation of the “dirty work” by the mathematics professor) that she lacked the resources to behave well, she opted for the conventional and stereotyped explanation of the “violent” culture of North African families. This explanation also had another advantage, in that it let her hide from herself her own role in the reproduction of the stereotype.

Ethnography has a unique ability to capture situations in which action is maladjusted. But the ethnographer does not interpret this maladjustment as simply a trait of the actor. He does not look down on the actor to blame her lack of professionalism or ethics. Rather, he analyzes the way in which the action is shaped by a series of institutional constraints that weigh on the actor and on her capacity to determine a coherent, effective, and ethical way of acting (Payet et al. 2011). He highlights the paradoxical injunctions, the contradictory norms that deprive the actor of resources she needs to act (Payet et al. 2008).

Interpretation that comes from a process based on observation and on understanding of the *actors’ perspectives* is not about blaming. It does not use conventional categories that seem too general and simplistic. Thus racism is not a relevant category for describing and analyzing the process of ethnicization and racialization at work in the schools observed. Asked about their values, the school professionals emphasize their commitment to tolerance and rejection of racism. On the ground, they nevertheless invoke categorizations that devalue the culture of origin of a segment of their students. They adopt attitudes that are interpreted as a form of distancing and sometimes of disdain by pupils and their parents who suffer the objective consequences (precariousness) and subjective consequences (humiliation) of school failure and social exclusion. These attitudes lead pupils and their families to ethnicize their own behaviors (as in the case of the father whose actions match the stereotype of the Arab father who beats his children), according to a process of self-fulfilling prophecy (Merton 1968).

The categories that interpretation proposes in the context of ethnographic research are the opposite of a moralizing perspective. They reflect the multiplicity of registers of action and instability of meanings produced by actors in the ordinary course of their activities (Payet et al. 2010). When it does not guarantee this understanding of the issues and constraints within which actors act, actors reject the interpretation. This is often a sign that the interpretation remains incomplete,

that the process of interpretation has stopped at too superficial a level, not penetrating to the reasons that make people act.

I will illustrate this point with an example in the context of another study, conducted in South Africa on the transformation of schooling since the end of apartheid. Our study took place in four schools, most of which were in the former black or mixed townships of Johannesburg, mainly in Soweto. Within an essentially ethnographic study, we administered a questionnaire to the pupils. Several questions addressed corporal punishment at school. The results showed that this practice still very much continued, despite its official abolition. They also showed that this practices persisted all the more where the school was disadvantaged and situated in environments that had not benefited from racial desegregation.

This finding was particularly troubling to the teachers of these schools, who thus were made to look incapable of adapting to change, incapable of transforming their pedagogical practices. It likewise posed problems of interpretation to us, for we had trouble understanding why it was precisely in black schools, between black teachers and black pupils, who embodied the struggle against apartheid and the winning of new rights, that the practice of corporal punishment persisted to such an extent.

We reported back the results during workshops with the pupils and during workshops with the teachers (the two conducted separately). I would like here to evoke the reporting back to the teachers at the most disadvantaged school of the study sample, which was also the only school in the sample that had seen no racial desegregation (all the teachers and pupils were black). Although the study had been conducted in a convivial way in this school, this moment of reporting back provoked latent aggressivity in the form of anger, disappointment, or uneasy silence towards us from the teachers. There was not a unified block opposing us; reactions were varied: some openly showed their lack of interest, others added to the stereotype of the “hitting” teaching, others justified the recourse to force in order to maintain order in class and constrain the pupils to work in a social environment that supported learning very little, and finally others called on us for practical solutions—solutions we did not have.
