The central reason for interference with individual conduct which Mill rules out as improper is moralistic. His examples include the prohibition of the eating of pork by Muslims when they are in the majority and the prohibition of Sunday trading by Christians. Majority disapproval of a form of conduct, however genuine or intense, is never a good reason for interference. Appeals to purely religious reasons, such as that the conduct in question is "forbidden and abhorred by the deity," are never justified. Instead, it has to be shown that the conduct harms others without their consent. Even then, the harm of the conduct must be weighed against any harm resulting from the interference. But there is no case for such balancing when the conduct is merely disliked or disapproved of. From this it is clear that Mill would not regard the mere fact that an act violates the moral values of someone else, even when these values are shared by the community at large, as a relevant harm. However, it is a different matter if, for example, it can be shown, as some have argued, that unchecked violations of a society's shared values would lead to a distinct harm, such as the breakdown of law and order. Mill's intention is to revise the whole framework within which issues of individual liberty are discussed. Enlightened people might agree with him that, where the majority's values are mistaken, they should not be imposed on all. But Mill points out that even enlightened people go wrong in merely wanting to replace the majority's values with their own better values. The correct framework is one in which, in the absence of harm to others, individuals should be allowed to engage in conduct that goes against the majority's values, whether or not they are enlightened.

Mill also excludes paternalistic reasons for interference with individual conduct. The fact that a person's conduct is imprudent, or that it harms himself, is never a good reason to forcibly stop it. This is the case when the person is aware that the conduct is harmful and yet chooses to proceed with it. But Mill gives the example of a public official forcibly stopping an ignorant person from crossing an unsafe bridge. Interference is justified when there is no time to warn him of the likely and unwanted harm if he crosses the bridge. A distinction is sometimes made between weak or soft paternalism and strong or hard paternalism. The former permits interference only when the person's decision to act in a self-harming manner is encumbered in some way, such as in the case of the bridge example when the person is uninformed about the consequences of the act. The probability or certainty of the harm is not in itself a good or sufficient reason for interference, in the absence of the encumbrance. On the other hand, strong or hard paternalism justifies interference even when there is no encumbrance, provided that the likely harm is serious enough. Mill is against strong or hard paternalism, but his bridge example shows that he favors at least some version of weak or soft paternalism.

Mill's view on the proper basis of social intervention is often formulated in terms of a distinction between self-regarding and other-regarding conduct. It is said that he defends the absolute freedom to engage in self-regarding conduct, while he allows for interference with other-regarding conduct when the balance of costs and benefits of such interference is better than that of noninterference. The area of self-regarding conduct is then identified as conduct that does not affect others, or which does not adversely affect them. This account of Mill's view has led to the objection that we are not isolated individuals but live in human societies and, except for the most trivial forms of conduct, all our actions will affect others in some way. The class of self-regarding conduct is therefore practically empty. But the objection is misplaced. Mill clearly acknowledges that all conduct in society can affect others. He wants to rule out certain kinds of effects as irrelevant for the purpose of

interference. It is best to formulate his view in terms of a distinction between relevant or good reasons for interference and irrelevant or bad reasons for interference. The absoluteness applies to his claim that moralistic and paternalistic reasons for interference are always or absolutely ruled out as irrelevant, whereas harm to others is always a good reason for interference. The alternative account, in terms of different areas of conduct, with the self-regarding area to be kept absolutely free of intervention, runs into the difficulty that an area of conduct, identified in general terms, can have different effects in different circumstances. One cannot rule out in advance that a type of conduct, which is normally harmless, could in certain circumstances be harmful. Consider Mill's examples of drunkenness in private as opposed to a policeman being drunk on duty. In the latter case, the policeman would be unable to perform his duty properly, whereas the private citizen, drunk at home, would not be in similar breach of duty. But as some have pointed out, if a high proportion of the population are drunk at home at the same time, there could be serious harm caused by the inability to respond to an unexpected emergency. It is a different matter, however, to justify interference with private drunkenness simply because the majority disapproves of mere drunkenness, even when there is no harm.

For Mill, a free society must have freedom of thought and discussion, as well as freedom of action. Such a society provides a social environment in which individuals can reliably form their opinions, and, where appropriate, act in accordance with them. Part of the justification for freedom of discussion is that it exposes and eliminates error and thereby facilitates the discovery of true beliefs. In the absence of discussion, and in the presence of censorship, we can never be sure that the received opinion is true, or partly true. The truth may lie wholly or partly with the suppressed opinion. However, Mill does not treat freedom of discussion simply as a truth-tracking device, effective as it may be. It is even more important for him that people should not hold on to their beliefs, even if true, in a dogmatic manner, with little or no understanding of their meaning and the grounds supporting them. Truth should be held as a living truth, sensitive to the available considerations that count for or against it, rather than as a dead dogma, which does not properly influence conduct. Mill sees intellectual progress not simply in the replacement of false by true views but also in the way in which we seek the truth, arrive at our cherished beliefs, and hold on to them. "Knowing the truth" is the ultimate goal. Those with this aim are willing to subject their views to argument and evidence and are willing to modify or reject them when the evidence or argument goes against them.

Mill's case for freedom in society extends beyond freedom of discussion to freedom to act in accordance with one's fundamental beliefs and values when these do not cause harm to others. He attacks the role of custom in directing people to uncritically accept or reject ways of life. Customs are bad when they limit people's conceptions of permissible or worthwhile human lives without their reflecting on or considering alternatives. Mill believes that because people's personalities and potential interests are so diverse, there is no one way of life that suits all persons. If there were, the distinctive human faculties of choice, judgment, and discrimination would not be exercised in the blind acceptance of customs, or in the imposition of one way of life on all. It is when individuals exercise choice that they realize their individualities. A society in which individuals are free, both in thought and in action, to explore and to conduct "experiments in living" without harming others would be a rich and diverse society. Each person would be autonomous in choosing a worthwhile life in accordance with his or her own values, influenced but not coerced by discussion with others and by the examples they set.

Mill's Utilitarianism

Mill was brought up to be a utilitarian, and the version of utilitarianism that he knew in his youth was Bentham's: seeking to maximize happiness. Happiness was construed in hedonistic terms as pleasure and the absence of pain, or where both were present, as a balance of pleasure over pain. This provided a basis for social reform through an attack on social institutions that were not conducive to the maximization of happiness. Until he was 20, Mill remained faithful to Benthamite utilitarianism. Then he had a mental breakdown and a period of depression. He discovered that he would not be personally happy even if all the

social reforms he had advocated were realized. During the process of his recovery and after that, he was open to new influences and became critical of aspects of Bentham's doctrine. Although he always considered himself a utilitarian, the version he subsequently developed emphasized qualitative, as opposed to mere quantitative, differences in happiness.

In his essay *Utilitarianism,* he famously declared that a human being dissatisfied was better than a pig satisfied. The qualitatively superior pleasures are those involving the exercise of distinctive human faculties. Mill uses the choice of competent people as the criterion of the higher pleasures. If those who are familiar with both pleasures agree that one is better than the other, then that indeed is the higher pleasure. Mill regards the intellectual pleasures as higher than purely sensory pleasures.

This helps to explain the high value that he places on the development of individuality. A person who has individuality would be enjoying the higher pleasures as he or she would be exercising the distinctive human faculties. Those with individuality act autonomously in choosing appropriate ways of life for themselves, rather than simply and unreflectively following custom. Mill claims that his case for individual liberty rests on utilitarian grounds, although he construes utility in a different sense from Bentham's. What he wants to avoid is not only a defense of liberty as a natural right but also one that relies on Benthamite utilitarianism, appealing to a purely quantitative notion of happiness. It would then be hard to explain why the majority's deep displeasure with the unorthodox and custom-defying conduct of individuals should be discounted, in the way that he obviously wants to. Unlike a Benthamite utilitarian, Mill does not regard liberty as a mere means to happiness, replaceable, where appropriate, by alternative means. Instead, for him the exercise of liberty in making considered choices between lifestyles and acts is partly constitutive of having individuality. Developing one's individuality is Mill's conception of a good life. Unlike other conceptions, individuality is not identified with a single substantive way of life, such as that of a person living in accordance with the details of a specific religion, or an unworldly scholar forsaking the pleasures of the outside world for the solitude of the library, or a happy and prolific parent devoted to the upbringing and friendship of children. People's autonomous choices are likely to lead them to a diversity of individual lifestyles, each one suited to a particular person but none suited to all.

Given that an environment of freedom produces diverse expressions of individuality, as well as some mechanical and unthinking conformity with custom, there is the political issue of whether one person's individuality, or freedom, can be traded off against that of another's in order to bring about the maximum development of individuality. In other words, is individuality a goal that ought to be maximized? It is a feature of Bentham's goal of maximizing happiness that it is permissible to trade off the happiness of one person in order to further the greater happiness of others. If the majority is made happier by suppressing the liberties of a small minority, then such suppression is justified from the Benthamite perspective. But in setting harm to others as the threshold to be crossed before there can be social and political interference with the conduct of individuals, Mill effectively prohibits such trade-offs. Each and every individual has the liberty to develop her individuality, or not to do so, independently of whether or not such development, or its failure, contributes to the maximization of aggregate individuality.

Individual liberty here amounts to a right. This appeal to a right to individuality seems to be an appropriate formulation of the role of individuality in his defense of liberty. My rights are often understood as setting limits on what others may do in order to promote good ends. Thus if I have a right to life, then unless I have forfeited it by, for example, threatening the innocent lives of others, I may not be deliberately killed in order to save more lives. Saving lives is a good end, but it should not normally be pursued by violating the rights of others. Depending on the strength of the right, there may, however, be some situations in which its violation is justified, such as, for example, in order to avoid a major disaster. But violations of a right are not justified just because there is a slight balance of good consequences over bad in doing so. Some indirect utilitarians would defend such rights by arguing that sometimes the best way to promote a desirable end is not to aim at it directly and consciously, but rather to conform to certain useful rights that are generally productive of the best consequences. For example, those who seek

happiness might be well-advised to seek it indirectly by engaging in various activities spontaneously and for their own sakes. They might in the long run find greater happiness by adopting such an indirect strategy. Whether or not Mill embraces some version of indirect utilitarianism in his defense of individual liberty is a matter of debate. It is at least compatible with one of the lessons he learned in recovering from his mental breakdown. He then realized that happiness is better achieved by seeking other things as ends in themselves.

So for Mill, the liberty of individuals should not be curtailed even in the cases of those who, when given the opportunity to develop their individualities, repudiate it and instead voluntarily submit themselves to the direction of customary practices. Although Mill once quoted with approval the remark, "Some men are wise, some are otherwise," he does not, in *On Liberty,* confer power on the wise to impose their opinions and values on others. Such coercion by the majority is unjustified. But it is also unjustified when it is imposed by the minority with more enlightened views. Coercion is incompatible with the development of individuality, which requires free choice as a crucial condition. It is also corrupting to the wise. But the wise have the freedom to point to new and better ways of life. Indeed, they have the obligation to help others to improve by advising and persuading them.

Representative Government

Although Mill was fearful of the tyranny of the majority, in his essay *Considerations on Representative Government,* he argues for some form of democracy or representative government. In large communities it would not be practicable for all citizens to participate directly in the affairs of the state. Some form of representative government is necessary, which leaves ultimate sovereignty in the hands of citizens. Citizens would still be able to participate directly in some public affairs, such as by service on juries, and of course in the exercise of the vote. Democracy is best for his society at the time. A good government is one that is adapted to the capacities of its people, while at the same time also helping them to improve their capacities. Despotism, even when it is benevolent, is bad because it is not conducive to the moral and intellectual development of a people. In a despotism, it is only the despot who is actively engaged in politics, while the people remain mentally passive. Political participation has educational effects in that it enlarges the interests of citizens. Democracy is best because it allows for the widest participation. One needs the franchise to participate, and so Mill seeks to extend the rather restricted franchise of his day to include women and the working class. He does not go so far as to propose its extension to all adults because he believes that there are certain minimal requirements to be met. The first seems to be a competence test, which excludes the illiterate and the innumerate, unable to do simple arithmetic. Those who do not pay taxes, and those who receive parish relief, should also be denied the vote because they might use it to extract money through taxes from others, without any cost to themselves.

But the suggested restrictions seem unjustified, given Mill's belief that a crucial aspect of political participation is that it promotes the intellectual and moral education of citizens. The uneducated are incompetent in certain respects, but they are not necessarily incompetent to make certain political decisions when the facts are presented to them. They may well have greater moral strengths than some of the educated. If Mill is right, then political participation can also improve their general competence and capacities. The same considerations also apply, perhaps to an even greater degree, to those who are not taxpayers.

In *On Liberty,* Mill states that his case for liberty applies only to human beings with mature faculties, and not to children. It also does not apply to "backward" societies in which a paternalistic despotism would be appropriate. His doctrine of liberty is relevant only when people have the capacity to benefit from free and equal discussion. In societies that have reached the relevant stage of development, it looks as if no further distinction is made between adults belonging to different social groups as far as the stated capacity is concerned. The denial of the vote to some of them therefore deprives them of the improvement of which they are capable.

Mill argues strongly for allowing women and the working class to vote. Apart from the educational effects of political participation, he thinks that only those who have the vote have the means to effectively protect their own interests. They

cannot rely on others to do so, not because others are narrowly self-interested, but because others do not share their perspectives of where their true interests lie. Even well-meaning employers, whose circumstances are very different, might not understand the plight of ordinary workers who go on strike for better conditions. Nor would even loving husbands or adult sons understand the point of view of women confined to childbearing and to looking after the home. Mill's exclusion of certain groups from receiving the vote can perhaps be partly justified if they do not in fact have distinctive interests different from those of the groups with the franchise. But it seems most unlikely that, for example, the interests of very poor non-taxpayers are duplicated by those of taxpayers, although Mill seems to think that all manual laborers have similar interests.

There remains the question of whether giving the vote to non-taxpayers hands them a license to act selfishly in taxing others indiscriminately. Here Mill's other proposals are relevant in eliminating, or at least severely limiting, the extent to which one group can pursue its own interests at the expense of the rest.

Mill believes in giving plural votes to the "instructed minority." According to him, democracy does not require that the votes of all citizens should have the same weight. The more intelligent voter should be given two or more votes. In the absence of a reliable national system of examination that picks out those with superior mental ability, Mill maintains that a person's occupation can be used as an indicator of superior mental ability, such as being a banker, merchant, or manufacturer, or being a member of the liberal professions. He also suggests relying on whether or not people have passed major examinations, such as their being university graduates. He places a safeguard against the abuse of power by those with plural votes by ensuring that their combined votes should not outweigh the total votes of others. Mill thinks that with plural votes there would be greater diversity of views in parliament, thereby enhancing discussion, the pursuit of truth, and social progress.

For similar reasons, he favors proportional representation. To be elected to parliament, each candidate must have a certain quota of votes. Voters can choose from the whole gamut of candidates in the country. Each voter expresses several preferences. Once a candidate has received the required quota, other voters who have voted for him will have their second preference counted, and so on. In this way candidates with enough support scattered throughout the country, rather than concentrated in one locality, can still be elected. This is likely to ensure greater talent, as a voter has a choice from the whole country and is not limited by what is offered in "the local market."

Mill believes that parliament should serve as a forum for discussion of ideas, while the technical aspects of legislation and administration can be left to an expert body of professionals who are ultimately responsible to elected members of parliament. The presence of the instructed minority in parliament, and the greater weight given to their votes, enable unpopular views to be heard and to have influence in challenging prevailing views. Mill believes that ideas are crucial to social progress, and the instructed would have great authority if they are united. The social power of those with ideas and convictions is much greater than the power of those who are motivated solely by interests. To be most effective, the instructed should exercise their own judgments and express their own views on the issues they discuss, rather than being bound by pledges to vote in conformity with the views of those who voted for them. Mill also opposes secret ballots. For him a parliamentary vote is a public duty to be exercised with accountability. Members of Parliament should promote the common good and not their personal or class interests.

We can see how Mill's proposals reflect his account of good government. Adapting to prevailing social circumstances involves giving recognition to the inequalities of educational qualifications and intellectual capacities of different groups. At the same time, good government must provide opportunities for people to improve their capacities. The extension of the franchise gives greater protection to groups with different interests from socially more favored ones. It also enables groups, whose current circumstances are somewhat confining, to extend their perspectives and interests.

Women and Personal Independence

In the case of women, receiving the franchise is only part of what is required for them to be treated

equally with men. In *The Subjection of Women,* Mill argues that the current marriage institution subordinates wives to their husbands, making them the equivalent of slaves. Such "marital slavery" deprives the relationship of husband and wife of "marital friendship," which can only be realized when there is equality between them.

Women are also unjustly denied entry to the professions and to educational institutions. They lack "personal independence," which is "an element of happiness." They often enter into unequal marriage relations because there are no better options. Without equal opportunities, women's achievements would not match those of men. The current differences between men and women are regarded as "natural," when in fact they are the products of social circumstances. Until men and women have equal opportunities, Mill believes, we will not know the nature of women. And until then, the relationship between men and women will continue to be marred by false and untested perceptions.

Just as Mill argues for personal independence for women, he also believes that workers need to be given a degree of independence in the arrangements of their working lives. In *The Principles of Political Economy,* he maintains that some cooperative partnership between workers and capitalists, involving the sharing of profits, would be better than the current relationship of dependence of workers on capitalists. But an association of workers themselves, with unequal wages for different types of contribution, would be even better.

Mill was critical of existing property arrangements and the vast inequalities they generated. In his posthumously published "Chapters on Socialism," he is sympathetic to a version of socialism, but he rejects as disastrous the alternative offered by revolutionary socialists of forcibly taking over private property. The present system of private property has many possibilities for peaceful improvement. One change is a decentralized form of socialism, which starts off in small units of villages or townships and is extended, if it proves successful, to other similar small units. However, he thinks that at the level of management, and given current human motivations, a capitalist system, which allows managers to keep all the profits derived from successful management, might be better. He does not offer a final verdict on the overall superiority of one system to the other. Instead, he maintains that, with the present intellectual and moral capacities of people, some system of private property needs to be maintained, but not the current flawed version.

Mill claims that, whereas "backward" countries need increases in production, advanced societies need better distribution. He looks forward eventually to "a stationary society" in which there is a high level of material prosperity for all, and people will focus on nonmaterial improvements in social life. Among the benefits of such a society would be the enjoyment of the "beauty and grandeur" of nature. Presumably, the society will also be truly free.

MILLENARIANISM

Millenarianism, millennialism, or chiliasm refers to a set of ideas that has its origins in the Christian New Testament book of Revelation 20, a passage that declares a messianic reign on earth for a thousand years (hence the term, influenced by both Latin and Greek words for a thousand). The literal expectation of a period of 1,000 years tends to be ignored in most expressions of the belief, even though some modern biblical literalists down the centuries have hung onto it. For example, 2 Esdras 7:28, a text that is roughly contemporary with the book of Revelation, has a messianic period of 400 years. In the book of Revelation, the millennium is not the final goal of the divine purposes, which takes place when the New Jerusalem comes down from heaven to earth, and there are new heavens and a new earth (Isaiah 65:17 and 66:22). This belief is sometimes combined with the millennium (e.g., in some Fifth Monarchy texts of seventeenth-century England and perhaps also in the work of Joachim of Fiore). In the book of Revelation it should be noted that the millennium is depicted as a time of perfection when humanity is not subject to the ravages of evil. The coming of the millennium would be preceded by anxiety and disaster, so human history is not a gradual process of improvement of conditions in the world (what is often described as the postmillennial position). The Last Things are linked with the First Things as the new age is seen as the Garden of Eden, in which there would be the removal of sin and the causes of sin.

What is distinctive about belief in a millennium is that it is very much "this worldly"; this feature has pervaded discussions in both religious and secular contexts.

The discussion of the millennium in this entry is based on Jewish and Christian sources rather than on similar kinds of understandings in other religions, but this background offers an important heuristic category with which one might approach such phenomena in other religions. There are overlaps between millenarianism and utopianism. The origin of the latter, however, is from Plato though it was given its "utopian" formulation by Thomas More in his book of that name. Such secular evocations of a future age of perfection were common in the modern period, when the intertwining with the Christian tradition took place.

Also important for the study of millennialism are those strands within the New Testament that exhibit an outlook investing present persons and events with a decisive role in the fulfillment of what Norman Cohn terms "the pursuit of the millennium," that is, bringing the new age about by human action rather than leaving it to some kind of divine intervention. So, the present becomes a moment of opportunity for transforming the imperfect into the perfect; history and eschatology become inextricably intertwined; and those who have been privileged to stand on the brink of the new age believe they enjoy a role in history. 1 Corinthians 10:11 is typical in speaking of Christians as the "ones on whom the ends of the ages have come." The present is marked by an awareness that a unique fulcrum in history has been, or is about to be, tipped.

It is with regard to a "this worldly" eschatology that sociologists have used the term, thereby reflecting the widespread "this worldly" eschatology of fringe groups in Christian history who have held the belief. Sociologists consider that people with millennial hopes are often desperate and alienated and that millenarian movements, whether in Christianity or in other religions, all look forward to an imminent reversal of political arrangements in this age, so that the downtrodden (among whom are the holders of the millenarian beliefs) either become the leaders in the new age or have a share in a quality of life denied to them in the old age. Examples of such millenarianism exist, but the general sociological theory is too simple. People have been attracted to millenarianism for a wide variety of reasons. For example, Christian radicalism has often appealed to educated but disaffected intellectuals such as Thomas Muentzer in Germany.

Karl Mannheim's discussion of the "chiliastic mentality" in *Ideology and Utopia* (1929) illuminates this kind of thought and action, as he uses the "chiliasm of the Anabaptists" and other events of the sixteenth century. Of significance for

Mannheim was the moment when apocalyptic hope, with a millenarian hue, was fused with the demands of the oppressed strata of society. It is a necessary reminder of the way in which apocalyptic symbol, and social and political movements together, may make a potent mix of social revolt. Mannheim describes the characteristics of those who actualize the apocalyptic and eschatological texts as those who typify what he terms "the chiliastic mentality." He describes the heart of his understanding as the moment the eschatological hope interferes with the world and conditions historical events. Acting on such beliefs disrupts patterns of behavior and relating, which is exactly what we find in some parts of earliest Christianity. What is more, time is, in some sense, hallowed, as the present becomes a particular, propitious moment. Whereas Mannheim makes great play of the fact that this way of linking the millennial and political action is a feature of the modern period, it echoes themes from the New Testament, wherein characters such as Jesus and Paul were not just interpreters of sacred texts or prognosticators of the fulfillment of their promises, but they live out the promises, and they believe themselves dwelling in the midst of the fulfillment of these promises and so act accordingly.

Mirror of Princes' Genre

Mirrors of princes are advice literature, outlining basic principles of rulerly conduct and of the structure and purpose of secular power, often in relation to either a transcendental source of power or abstract legal norms. Such texts were as popular in the Latin West as in the Islamic world, or Byzantium. In the Islamic world, an emphasis on pragmatic guidance, on the administrative and procedural aspects of governance, while stressing the role as moral exemplars of those holding power, prevailed: Mirrors of princes were, to a greater degree than in the West, manuals of effective governance. They consequently encompassed a wider range of themes and sources, and their influence on Western thought becomes clearly visible in works from the thirteenth century onward. Islamic mirrors also drew on a variety of pre-Islamic traditions and, with their often strictly regional focus, similarly foreshadowed later developments in the West. Byzantine literature, with its emphasis on one hand on collections of maxims and examples, and, on the other, individualized advice to specific rulers, reflected the situation in Western Europe for much of the tenth through the thirteenth century and drew on similar sources of antique and early church thinking about power.

In the West, mirrors emerged with the acceptance of Christianity as official religion in the fourth century and include, for instance, book 5 of St. Augustine's *Two Cities* (c. 410), which linked the office of emperor to the maintenance of a moral society, and sought to exemplify the duties of royal lordship and the responsibility of the ruler for the moral welfare of his subjects. It has to be read alongside Pope Gregory I's *Pastoral Care* (c. 590): Though centered on the role of bishops, rather than secular lords, the emphasis in *Pastoral Care* on humility as a key virtue of those holding worldly power, on the moral temptations of secular might, and on the need to provide moral leadership by example made it a key reference point for future writers.

A series of writings produced in seventh-century Iberia and Ireland were also influential, foremost among them Isidore of Seville's *Etymologies* (c. 630), which contains a classic definition of royal power: *rex a rectum agere* (the word *king* derives

from acting righteously) and *non regit qui non corrigit* (he does not rule who does not correct). This definition formed the basis for most medieval thinking about kingship. A widely copied treatise on virtues and vices by the so-called Pseudo-Cyprianus (c. 690), an otherwise unknown Irish writer, established a clear link between moral and political authority and explained how the personal moral shortcomings of individual rulers influenced the fortunes of their people. This extended to royal responsibility for floods, famines, and foreign invasions (as divine punishment for a ruler's failure to abide by a strict moral code). In the eighth century, *De Institutione Regia* (On the Royal Office) by Jonas of Orleans (c. 831), centering on the *communitas* (community) of the faithful and drawing on Isidore and Pseudo-Cyprianus, offered a clear distinction between the tyrant and the just ruler in relation to their engagement with the moral imperatives of a Christian community. During the period from the tenth to the early thirteenth century, few mirrors were written. Instead, political theories were formulated in historical writings, often aimed at royal patrons and designed to offer a series of models of respectively good and bad political behavior. The so-called coronation *ordines* (orders), accounts of the liturgy celebrated during a ruler's coronation, and a rich genre of advice literature emerged, normally in the form of letters.

Mirrors of princes experienced a revival in the twelfth century, most famously in John of Salisbury's *Policraticus* (c. 1159), which applied classical concepts of the organological structure of society (the realm resembling a body) and which, for the first time, discussed the right to resistance (the murder of tyrants), but which was still deeply rooted in familiar models of royal power. The same is true of texts like Godfrey of Viterbo's *Speculum Regum* (Mirror of Kings) of circa 1180–1183, Helinand of Froidmont's *De regimine principum* (On the Government of Princes) of circa 1200, and Gerald of Wales' *De Principis Instructione Liber* (Book on the Education of a Prince) of circa 1217. It was the beginning reception of Aristotle in the thirteenth century, however, that profoundly transformed theoretical writings about kingship. Much of this revival centered on the court of Louis IX of France, with Gilbert of Tournai's *Eruditio principum et Regum* (Education of Princes and Kings) and Vincent of Beauvais' *De morali principis instructione* (On the Moral Education of a Prince), both circa 1259. The Aristotelian influence, mediated via translations of a different Islamic tradition of kings' mirrors (including the pseudo-Aristotelian *Secretum Secretorum*), became apparent not so much in the content of these texts as in their structure and presentation (which became more thematic and abstract, drawing less on historical, biblical, or exegetical precedent). This changed with the two perhaps most famous examples of the genre, Thomas Aquinas's *De regimine principum* (c. 1255) and the eponymous work by Giles of Rome (c. 1277–1279), which became the most widely copied mirror of the Middle Ages. These texts combined established thinking with references to natural and feudal law, elaborated the right of resistance, and stressed the responsibility of the ruler to work for the common good. The increasing 'national' focus of these texts (commissioned by or written for specific rulers, rather than as general academic treatises) led to a flowering of vernacular texts from the thirteenth century, with either translations of Giles' text or independent works appearing in Old Norse (c. 1255), Castilian (1292–1293), or Catalan (1327–1330). This also corresponded to a desacralization of theoretical writing, which drew increasingly on Roman law (rather than theology), fed into the humanist writings of Petrarch (1382), and aimed at rulers of smaller territorial entities such as Austria, Hainault, Brabant, Holland, and Florence. The Western tradition of mirrors laid the foundations for later Renaissance theories of politics and political theory, and thus for modern political science.

Modernization Theory

Modernization theory denotes a diverse body of literature on development produced by a group of economists, political scientists, and sociologists during the 1950s and 1960s. A simple dichotomous concept lay at the core of the paradigm. Human societies were either traditional or modern. With the history of Western industrialization as a benchmark, these theorists defined a modern society as a technical, cosmopolitan, secular, and dynamic entity able to control nature and expand scientific knowledge. Most importantly, modernity required the rationalization of authority, a complex division of labor with a differentiated yet interdependent structure, and mass political participation. In contrast, traditional societies lacked these features. With simple economic and social structures, traditional groups looked inward, resisted change, remained passive toward nature, and maintained parochial political systems. This crude dichotomy served as the unifying conceptual framework for the modernization paradigm.

Modernization scholars conflated an explanatory theory of prior Western development with a prescriptive theory aimed at transitioning recently independent, poor, traditional countries into modern industrial states. Deeply influenced by the behavioral revolution in social science, leaders of the modernization research program emphasized the use of empirical methods to uncover the laws that governed this transitional development process. The theory assumed that modernization was a global phenomenon in which diverse postcolonial traditional societies would irreversibly converge around a universal form of modern society. This Western model exhibited certain components and historical phases that applied to any society without reference to specific culture or geography. Because all societies moved through the same lengthy stages, modernization theorists formulated a systematic blueprint to rapidly accelerate this development process through state intervention and advanced technical knowledge. At the zenith of its influence during the cold war, the paradigm provided the most explicit and scientific plan for reshaping developing nations into modern states.

The Origins, Development, and Zenith of the Modernization Paradigm

The modernization paradigm originated as a new type of sociological theory to frame the ongoing changes among a burgeoning number of postcolonial nations in the years immediately after World War II. At the vanguard of this movement, Talcott Parsons, Edward Shils, and Marion Levy drew heavily from Émile Durkheim's classic study of industrial society and Max Weber's iconic conception of modernity to pioneer a holistic approach to development. They argued that the transition from an agricultural to an industrial economy involved a fundamental transformation of the entire social structure. With a myopic focus on economic policy in postcolonial countries, these theorists ignored the inseparable links between these agrarian societies and their traditional cultures, social structures, and political institutions. Given these links, the introduction of new technology into a peasant society would not automatically engender industry. Rather, the growth of an industrial economy required that the entire nation morph into a modern society. These sociologists therefore set out to construct a grand theory that would explain this process.

In *Toward a General Theory of Action,* Parsons and Shils established the conceptual and analytic core of the fledgling paradigm. Their sociological theory asserted two basic assumptions. First, a society represented the integration and interaction of individual, social, and cultural subsystems. A proper combination of systems produced a stable society in a state of static equilibrium. Second, individual behavior explained the operation of these systems, and groups of individuals held cultural values that influenced their actions. Parson and Shils defined these collective values as "dichotomous pattern variables" in order to construct two polar ideal types corresponding to "traditional" and "modern" societies. Development therefore involved the movement from traditional to modern values, along with a necessary transformation of individual and social subsystems. This transitional challenge, conceptual dichotomy, and functional mode of analysis anchored the ensuing array of modernization theory research.

Levy pioneered the application of Parsonian social theory to comparative political analysis and advanced several key propositions of modernization

theory. In *The Structure of Society,* Levy joined an updated version of the conceptual dichotomy with a functional approach to abstract the United States and Western Europe as archetypes of advanced modernity. Although the Soviet Union was also a modern state, it connoted a pathological deviation from the healthy capitalist path of Western liberalism. All other countries wallowed in various stages of underdevelopment in the residual traditional category. Though he considered modernization a holistic process, Levy viewed the primary problem as the maintenance of order and social control during the transitional period of modernization, while also steering these countries away from the unhealthy path represented by the Soviet Union. The state therefore had to lead the development process to keep a lid on disequilibrium. Backward traditional societies required the intervention of a highly centralized, powerful, and often authoritarian state. Consequently, Levy introduced the proposition, later picked up by Walt Rostow, that the bridge toward modernity need not necessarily be democratic. However, with proper assistance from the United States, the end point of transition would eventually be liberal democracy.

Modernization theory became the dominant paradigm of political development studies in the 1950s and early 1960s under Gabriel Almond's leadership of the Committee on Comparative Politics. In an important strategic move, the members of the Committee on Comparative Politics adopted a modified version of the Parsonian traditional–modern dichotomy stripped of explicit references to Western civilization. Although modernity was still based on the history of the United States and Western Europe, these assumptions were now implicitly buried within the concept. The modern polity was simply a democratic Keynesian welfare state. The redefined framework positioned the modernization paradigm as the lodestar for political development among academics and political elites. Within the academy, the new dichotomy unified the various area studies research programs under the leadership of the modernization theorists. A variety of scholars began to marshal empirical evidence to measure how close each developing country came to resembling the archetype of global modernity. In the context of the cold war, the theory became attractive to both American and postcolonial elites who wanted clear and justifiable plans for modern development devoid of blatant ethnocentricity. By the time the Committee on Comparative Politics held its last formative meeting in 1959, modernization theory had established itself as the core locus for development studies.

The modernization paradigm reached its apogee in 1960 with Almond's formative introduction to *The Politics of Developing Areas,* a book that he coedited with Coleman. Invoking a modified version of functionalism, Almond defined a system as a comprehensive, interdependent, and demarcated unit that integrates all actions and structures within a whole, so change in one subsystem produces consequent changes in all other parts. However, in a departure from Parsons and Levy, Almond shifted the focus toward the political subsystem. He posited that all political systems perform the same basic functions, processing *inputs,* such as interest articulation and public demands on services, and producing *outputs* in the form of rules, public goods, and conflict resolution. Thus, the concept of a political system applied to all independent societies regardless of geography, culture, or time. However, the structures that perform these universal functions varied according to the degree and form of specialization. With the American constitutional system implicitly at the apex of structural development, Almond defined modern structures as highly complex and differentiated, whereas traditional structures remained simple and underdeveloped. By establishing comparative politics as the systematic study of these structures, Almond effectively expanded the boundaries of the discipline to encompass the globe.

Social and Material Exemplars of the Paradigm

The modernization research program produced two principle strands of theory. Sociocultural theorists, exemplified by Daniel Lerner and Karl Deutsch, generally explained modernization from a series of variables and mechanisms rooted in cultural values and behavior. In contrast, more materialist scholars accepted these behavioral foundations but focused instead on economic growth as the driving variable behind modernization.

Lerner emphasized cultural values supporting modernity and accordingly defined the

traditional–modern dichotomy as behavioral patterns exhibited by groups of individuals within society. Examining survey data from Middle Eastern countries in his manuscript *The Passing of Traditional Society,* Lerner inferred that because the direction of social change always moved from the traditional to the modern, modernization was unequivocally a unilinear process. That society formed an interlocking system in which "all good things go together" was the corollary of this irreversible process. Lerner used these propositions to construct a four-phase logic of the modernization process that began with urban migration economic development, accelerated through increased literacy rates, catalyzed with advanced media communications, and culminated in mass political participation. Because Lerner assumed these phases were reciprocal and mutually reinforcing, he saw deep and rapid modernization as a systemic, progressive, and universal process that produced social and political stability.

In a similar exploration of the modernization process, Deutsch argued that the mechanism of social mobilization determined economic and political development. Modernization constituted two stages. First, economic development broke down traditional processes of social life, such as old institutions, expectations, and identities. Subsequently, these elements had to coalesce around a new stable and modern pattern. Deutsch assumed these processes of social mobilization produced jointly reinforcing effects and eventually reached a "take-off" threshold that produced significant social and political change. However, before this point, these processes generated a tremendous strain on the capabilities of the government to satisfy the increased needs of society. Deutsch argued that there was a real and immediate danger of these countries adopting communism to deal with these challenges. In this sense, modernization would *not* automatically produce capitalist democracies. To steer these countries away from the pathological option offered by the Soviet Union, the United States needed to deliberately intervene in the social mobilization process by offering technical knowledge and development assistance.

Seymour Lipset advanced a more materialistic version of modernization theory that linked economic development and institutional legitimacy to the endurance of democracy. Drawing on a global range of social and economic indicators, Lipset presented the seminal correlation between high levels of wealth, industrialization, urbanization, education, and the persistence of democracy. As a result, countries with high chances of sustaining democratic political systems in 1959, such as Israel, Japan, Lebanon, and the Philippines, resembled European institutions and economic conditions. Unlike other modernization theorists, Lipset carefully stipulated that his conclusion did not support a necessary or causal relationship between the variables examined. However, insomuch as his work posited a probabilistic correlation between wealth and democracy, it supported American cold war development policy to shape the institutions of foreign countries through economic aid and direct political intervention.

In the popular *The Stages of Economic Growth,* Rostow constructed a similar materialist theory that posited an evolutionary model of modernization dependent on a phased process of economic growth. In the transition across the Parsonian dichotomy, Rostow argued that all societies passed through five stages: the traditional baseline; a precondition period; the great take-off; a drive to maturity; and, finally, modern society. Although modernization meant global convergence, the specter of Soviet communism provided countries starting this economic process with an alternative to Western-style capitalism. Specifically, Rostow pointed to the precondition phase as the most politically dangerous point when nations might become infected with the "disease" of communism. In simple language that resonated clearly with the American political elite fighting the cold war, Rostow provided a theoretical justification for massive economic aid programs and direct military intervention in countries to fend off communism until these fledging nations could "take off" toward "healthy" capitalism. Until nations such as Vietnam left the runway, democracy and human rights would have to wait.

From Criticism to Rapid Demise

By the mid-1960s, the modernization juggernaut started to slow down. Attempts by Mancur Olson and Richard Bendix to highlight problematic aspects of the theory foreshadowed its ensuing demise. Olson directly challenged the conventional

materialist wisdom that intense levels of economic aid would strengthen poor countries. Although Olson agreed with Lipset that the absolute income level correlated with stability, his evidence underscored that the rate of growth during the transitional period was directly correlated with instability. Bendix came out swinging against the crude cultural variants of modernization theory. He rejected the traditional–modern dyad, the notion of global convergence, and the functional approach that conceived complex societies as natural systems in equilibrium. Instead, Bendix proposed a historical-comparative analysis to bring spatial and temporal differences back into focus. Subsequent scholars essentially picked up the baton from these early critiques.

As the 1960s came to a close, Samuel Huntington looked back at the postwar deluge of authoritarian military coups and leveled his classic critique of modernization theory. In the groundbreaking *Political Order in Changing Societies,* Huntington posited that rapid economic development replaced traditional governing structures and social norms with modern expectations and aspirations. When these new social demands outpaced economic growth, the public turned to political participation to effect change. Unfortunately, developing states often lacked the institutional capacity to respond to complex social and economic demands. This gap between public expectation and state efficacy undermined political stability as social groups resorted to alternative avenues. Contrary to the functional holism of modernization theory, Huntington argued that all good things do not go together. Economic development did not automatically birth strong and effective political institutions. Rather, in a slew of nations throughout Africa, Asia, and Latin America, the attempt to cross the traditional–modern bridge resulted in state paralysis and violence, followed by authoritarian or communist coups to restore order.

Dependency and world-systems theorists shifted the unit of analysis from domestic society to the capitalist world economy and leveled a series of popular critiques against the modernization paradigm. In the most coherent articulation, Immanuel Wallerstein argued that the capitalist division of labor entailed the historical development of unique types of production for different products in core, semiperipheral, and peripheral regional zones of the world. Each zone had independent political and economic requirements corresponding to the type of labor employed. Furthermore, this global production structure linked zones together through terms of unequal exchange and thereby promoted asymmetrical development. Over time, these differences grew into severe disparities among states, making global convergence impossible. As a result, contemporary underdeveloped nations could not follow the same path toward modernity as the West had followed. Instead, each state needed to find a unique route dependent on its own historical characteristics.

The modernization paradigm thus found itself under attack from conservative critics, such as Huntington, and more leftist world-systems theorists. Set against the historical backdrop of profound pessimism and cultural upheaval as the Vietnam War devolved into a quagmire, a new generation of political scientists rapidly discredited and abandoned the once mighty modernization research program.

Contemporary Reexamination and Revival

Despite the nearly universal rejection of modernization theory by scholars throughout the 1970s and 1980s, the end of the cold war ushered in a proliferation of globalization discourse throughout the 1990s that resurrected core elements of the old paradigm. Just as in the 1950s, explanatory and prescriptive theories of modernization returned to influence both academics and American political elites.

Within political science, a new body of research reexamined both cultural and materialist strands of modernization theory. Once again, the cultural strand claimed that democracy and stability depended on cultural institutions, practices, and values. Specifically, these scholars pointed to social trust and legitimacy as necessary variables for the survival of modern democratic states. However, this scholarship left itself open to charges of teleological inference, as it was difficult to determine whether cultural variables were the cause or effect of democratic institutions and economic development.

In a more productive move, a reconsideration of the materialist modernization hypothesis yielded an insightful conceptual innovation to explain why

so many rich countries were also democratic. This research separated modernization into "endogenous" and "exogenous" concepts. The former stipulated a causal relation between development and the probability that poor countries transition to democracy, whereas the latter posited that wealth simply makes democratic states less likely to collapse into dictatorships. Debates surrounding the logic and empirics of these two arguments attempted to directly grapple with the democratization phenomenon without the muddled assumptions of the old modernization paradigm.

In a wave of optimism reminiscent of the post–World War II decade, the American political elite eagerly entertained a group of prescriptive theorists led by Francis Fukuyama that trumpeted a progressive vision of history converging on a global model of modernity. Heralding advances in global communication and transportation technology, the new modernization theorists envisioned the United States once again leading poor countries toward their inevitable future as capitalist democracies. Times had changed, though. As a model for development, neoliberal free-market capitalism had replaced the old Keynesian welfare state. Similarly, the pathological alternative to Western development had switched from communism to Islamic extremism. An army of technocrats set out to remake postcommunist and developing countries, only to engender a series of increasingly severe financial collapses, concomitant with a gradual slide in several countries toward authoritarian rule. As a global economic downturn tarnished neoliberalism and the United States and Western European countries struggled to contain an endemic fiscal crisis, prescriptive modernization theory drearily headed back to the cemetery.

Modus Vivendi

A *modus vivendi* is literally a "way of living," a working arrangement between contending parties that enables peaceful coexistence while the parties attempt to work out the dispute. In contemporary political theory, it has become associated with a way of thinking about the stability of a society characterized by deep pluralism—whether ideological, religious, national, cultural, or ethnic. The term has also become associated, in particular,

with the work of the American philosopher John Rawls and his account of the conditions required for a society to be not only just but stable. This entry reviews Rawls's analysis and its limitations.

For Rawls, a "well-ordered" society is one in which citizens affirm the same general conception of justice, not because of enforced religious, cultural, or philosophical ideology, but on the basis of publicly justifiable principles and the considered judgments of its citizens. A well-ordered society not only advances the good of its members but is also effectively regulated by a shared conception of justice. This "political" conception of justice, Rawls claims, is one that could gain the assent of citizens, despite deep pluralism. A society organized around such a conception is stable, Rawls argues, not in an empirical sense but in the normative sense: It rests upon a publicly justifiable conception of justice, wherein society is conceived as a fair system of cooperation, and citizens as free and equal.

Rawls contrasts this conception of a well-ordered, stable society with that of a "mere" modus vivendi. A modus vivendi, for Rawls, is akin to a treaty between states. The terms and conditions of a treaty represent an equilibrium point between the two parties, but each remains ready to impose its will on the other if the advantages of breaking the agreement begin to outweigh the costs. Stability is thus conditional and fragile. By analogy, a society founded on a modus vivendi is neither well-ordered nor stable, and social unity only ever apparent.

However, there have been attempts to rescue the notion of a modus vivendi from this Rawlsian analysis. The more seriously one takes pluralism, the greater the pressure on the Rawlsian conception of a well-ordered society. A more realistic account of stability might require embracing something like a modus vivendi. And there might be a form of modus vivendi that is less than a Rawlsian overlapping consensus, but more than a mere peace treaty. Rawls seems to assume that a modus vivendi entails that the parties remain committed to overturning the arrangements whenever possible. But a modus vivendi might well acquire resilience and commitment over time, just because of the persistence of plurality and the increasing awareness of the parties that this is indeed the best way to proceed, given the circumstances they face.

Mohism

Mohism names a philosophical tradition from ancient Warring States China associated with Mozi (5th to the early 4th centuries BCE) and his school. Mozi's followers, the Mohists, formed a quasi-religious and paramilitary community committed to promoting social and political reform through propagating the doctrines of their teacher. The community appears not to have survived the unification of China under the Qin Dynasty (221–206 BCE).

As with the case of their chief rival Confucianism, Mohism is primarily aimed at offering a solution to the social and political chaos perceived to characterize Warring States China. For the Mohists, the desired outcome is a state of ecumenical order in which "right" rather than "might" prevails over human affairs and where the least well off are cared for. To this end Mohism made various policy prescriptions addressed especially to the political elite.

Within Mohism, a policy prescription is to be justified (or rejected) in terms of its conforming to various criteria of moral rightness. The two main criteria are a policy's propensity to promote the impartial benefit of the world (suggesting a form of state consequentialism) and accordance with the Heaven's will (suggesting something in the region of a divine command doctrine of right). Whatever the relative status of the two criteria, the impartial benefit of the world—sometimes narrowly construed in terms of people having their

basic material needs met—appears to be the operational criterion by which Mohist policy prescriptions are justified.

Mohist writings contain a state-of-nature account, reminiscent yet different from that of Thomas Hobbes, in which it is argued that people fight in the primitive state because of widespread conflict over values. The conclusion is drawn that unity in people's moral views, maintained by a panoptic hierarchy of rulers and leaders through education and coercion, is a necessary condition of social and political order. In the area of governance, Mohists advocate that rulers make government appointments on meritocratic considerations rather than kinship and social background. In political economy, they inveigh against aristocratic extravagance in funeral rituals, music display and lavish expenditure in general. In the area of international relations, not only did the Mohists condemn military aggression as immoral, they were also involved in lending aid to states threatened by military aggression through their expertise in counter-siege technology.

Finally, Mohism also includes a religious dimension to its political doctrines though here, as elsewhere, the underlying concern is ultimately with social and political order. Apart from the (already mentioned) notion that Heaven's will is a source of right, the claim is also made that widespread belief in the existence of providential ghosts—supernatural agents of Heaven—that punish the wicked and reward the just is useful and necessary to the maintenance of social and political order.

MONARCHOMACHS

The monarchomachs ("those who fight against monarchs") were sixteenth-century French Calvinist theorists who criticized absolute monarchy and religious persecution, while defending various related doctrines of ancient constitutionalism, social contract, and resistance to unjust or tyrannical government, up to and including tyrannicide. Although French Calvinists had long offered intellectual justifications for resistance to persecution, the term *monarchomachs* is generally reserved for those who wrote after the St. Bartholomew's Day Massacre of 1572, an event that made clear that henceforth persecution had royal support. The three most important figures in the movement were Francois Hotman, the author of *Francogallia* (1574); Theodore Béza, successor to Calvin as leader of Geneva and author of *On the Right of Magistrates* (1574); and the pseudonymous Stephanus Junius Brutus, the author or authors of *Vindiciae, Contra Tyrannos* (1579), often thought to be Philippe Mornay du Plessis. The Scottish thinker George Buchanan is also often included, as he was by the Scottish absolutist George Barclay, who coined the word *monarchomach* as a term of abuse. While they did not agree among themselves on all matters of method or substance, they shared a great deal and are usefully thought of as a group.

The idea that unjust laws might be disobeyed or resisted is an old idea in political theory, and so is the idea that some rulers act so lawlessly or tyrannically that their rule might be resisted *in toto*. The

monarchomachs, however, contributed novel modern elements, including a pre-Lockean characterization of fundamental constitutional law as a contract between king and people. When the contract was broken by royal overreach, not only was the duty to obey lost but under at least some circumstances a right or duty to resist—to enforce the contract—came into existence.

Hotman was an important legal scholar in the humanist tradition, who taught Roman law at a number of institutions including the University of Paris. Like other legal humanists, he was skeptical that the Roman law had continuing legal meaning for European societies, and he argued for renewed attention to the (broadly Germanic) customary law of France. Roman law was often opportunistically deployed by apologists for absolutism, who noted that *voluntas principis legis habet valorem* (the will of the prince has the force of law). But Hotman maintained that the customary constitution of the French kingdom was broadly opposed to the royal absolutism emerging in the theory and practice of the French monarchy. Instead, it rested on popular consent made manifest in the Three Estates, which Hotman maintained had even held the authority to elect kings. With its emphasis on the Frankish and Gallic—that is, not Roman—origins of the kingdom, Hotman's book became the standard collection of legal-historical evidence drawn on by antiabsolutists in later French debates.

Béza's *On the Right of Magistrates* overlaps considerably with the longer *Francogallia,* but draws much more heavily on biblical arguments than on constitutional history. The conclusion that magistrates who rule tyrannically should be resisted by force remains the same.

Vindiciae, Contra Tyrannos (The Vindication [of Liberty] Against Tyrants) is a somewhat different work. First, it freely uses Roman legal arguments alongside ancient constitutionalist ones. The author explains the foundation of government in a contractarian way and draws on Roman legal reasoning about contracts; he also draws on the natural law thinking associated with parts of the Roman legal tradition. Second, it is less thickly tied to the details of *French* constitutional history in particular than is *Francogallia* and is less theologically specific than *Magistrates,* and so appears more like a general normative political theory to modern eyes. Third, it offers a theory of organized resistance that builds on constitutional structures. The author argues that individual persons should not take it on themselves to resist, but that subordinate magistrates within the constitutional order may organize armed resistance to protect that order against tyranny. This is an important and original contribution to the theory of resistance, one that circumvents the traditional problem that "the people" have no institutional mechanism for reaching a unified collective decision to resist. Finally, unlike Hotman, the author of the *Vindiciae* characterizes France's judicial *parlements* as constitutionally appropriate bodies that might check royal power in the absence of the Estates General.

The great intellectual rival of the monarchomachs in their own day was Jean Bodin, who, in his book *Six Books of the Republic,* defended a near-absolutist conception of sovereignty and denied that ancient constitutions or mechanisms of consent could coherently limit the authority of a sovereign king.

Francogallia and the *Vindiciae* in particular remained widely known in Calvinist Europe; the French Calvinists (Huguenots) who fled to Amsterdam took the monarchomach intellectual legacy with them. The *Vindiciae* was published in English and condemned and burned in England during the turbulent 1680s. The crisis of the years before the Glorious Revolution—the suppression of Calvinist Puritanism by the suspected crypto-Catholic Charles II, the Exclusion Crisis over whether the openly Catholic James II would be allowed to take the throne, the attempted assassination of both Charles and James, and the intermittent turns to absolutism and rule without Parliament—resonated with the French events of a century before, and the English supporters of resistance turned to the earlier French works. After the Glorious Revolution, *Francogallia* was translated into English and published as an important piece of Whig ancient constitutionalism, with an attached argument that the Estate-centered ancient constitution of France was the ancient constitution of all Europe—and that the book therefore confirmed the legitimacy of parliamentary resistance to absolutism.

Montesquieu, Baron de (1689–1755)

Charles-Louis de Secondat, baron de la Brède et de Montesquieu, was an aristocratic owner of Bordeaux vineyards and, along with Jean-Jacques Rousseau, one of the two philosophers who defined the contours of the eighteenth-century French Enlightenment. Born Charles-Louis de Secondat, he inherited from an uncle the lands around the village of Montesquieu and a seat on the provincial court, the *Parlement de Bordeaux*. Secondat thus became the baron of Montesquieu and *président à Mortier* in the Bordeaux court. The baron eventually sold his magistracy, preferring the delights of Paris salons and European travel. He subsequently passed 2 formative years in England. Then, alternating between Paris and his estate, the Chateau de la Brède, he spent 20 years working on *De l'esprit des lois* (The Spirit of Laws, 1748), which became the master text of Enlightenment science.

Early Works

Montesquieu published two early books that merit attention. The first, the *Persian Letters* (1721), was an epistolary novel that followed two Asian travelers in their philosophically motivated voyage to the allegedly enlightened West. Montesquieu satirically reversed the usual trope regarding the superiority of things Western over the habits of others. A best seller, the book was arguably the opening shot of the French Enlightenment across the bow of a complacent establishment. Its ironic, skeptical, and heretical tone encouraged in readers the kind of detachment that they would be called upon to acquire if they were to take part in the rational criticism of ancient superstition. But the work could also be read as a cautionary tale against the attitude of the skeptical Enlightenment. Its protagonist, the Persian Prince Usbek, was an antihero, a devotee of Enlightenment science, to be sure, but at the same time a man who, despite his learning, was prey to cognitive illusions and uncontrollable rage. The book projected a double vision of Enlightenment. Enlightenment in this treatment was a moral and cognitive template for the critique of society, but it came with a warning about the motives of those who took part in it: A despotic impulse is potentially at work in those who seek mastery through cognitive resources alone.

Montesquieu's second book, *Considerations on the Causes of the Greatness of the Romans and Their Decline* (1734) did no favor to the republican cause in exhibiting the sad fate of self-government in the natural life cycle of the Roman republic from birth to maturity and then to slow death in a despotic empire. There is speculation that, had he not been scared off by the censor, he would have published at the end of the *Considerations* a little essay advocating, in contrast to Rome, the superior staying power of liberty-loving England.

The *Considerations* was also an essay on historical causation, a reply to Christian providentialism. For Montesquieu, the success of Christianity had a purely secular explanation. *Considerations* was, in addition, a critique of Machiavelli. The latter praised Rome's imperial ambitions because for the Italian author only external war could unite a republican people and stave off internal corruption. This fascination with war as a continuation of domestic politics filled Montesquieu with horror. He continued the debate with Machiavelli in *The Spirit of Laws* where he argued that commercial interests would eventually render such a disruptive politics impractical.

The Spirit of Laws

It is useful to consider two distinct views of that vast and sometimes disorderly edifice *The Spirit of Laws*. For Raymond Aron, it was the foundational

text in modern sciences of society. From this perspective Montesquieu's aim was to identify the complex chains of causality that, over many generations, establish the "spirit" of various and diverse peoples and nations. Institutions and ways of thinking that are seemingly remote from one another combine to create a determinate political effect. Different kinds of "commerce," distinct climates, populations, terrains, religions, different systems of laws, customs and manners, contingent events that set precedents—all play a role in the constitution of what is called "cultures," more specifically "political cultures," which might be one way of rendering Montesquieu's term *esprit* (spirit) into contemporary social science idiom.

The role of commerce, that is, markets and market societies, loom large in this argument. Markets are celebrated not for their own sake but for their political effects in taming military impulses or the predatory instincts of princes and in opening civilizations to one another. Montesquieu called commerce a form of "communication" among nations. Often accused of naïveté on this subject, Montesquieu was far from sanguine about all the effects of this sort of communication. Commerce could destroy people as well as lift them up. It all depended on the particular circumstances. Montesquieu did, however, predict that commerce would eventually permit humans partially to transcend the horizon established by the nation. But like present critics of globalization, he never thought that the state could ever be fully transcended.

There is another view of this great book. As it is specifically the spirit of "laws" that the title announces, this second account deserves priority. *The Spirit of Laws* is a great exercise in comparative law and constitutional thinking. As such, as Jacob Levy has argued, it recovers the arguments of ancient constitutionalism—this stretches to Aristotle's understanding of constitution as amalgamating customs and institutions, the prime example being medieval "Gothic" monarchy—and makes its conclusions available to modern constitutional thinkers like James Madison and Benjamin Constant. In this respect Montesquieu was an alternative to the modern rationalism of Thomas Hobbes and John Locke's contractual arguments.

At the heart of the constitutional project is Montesquieu's typology of regimes. For Montesquieu, regimes come in three sizes. Like the bowls of porridge that confronted Goldilocks, these regimes are typically small, medium, and large, that is to say, republics, monarchies, and despotisms. It is important to add that none of these constitutional forms of government is a self-sustaining institution. To work well, each "form" of government requires a "principle." Form and principle are the two elements of the regime. The principle is best understood as the mentality or social psychology of the people who live under these forms or make these institutions work, namely, virtue for republics, honor for monarchies, and fear for despotisms.

Virtue was no mild palliative. It called for harsh monastic discipline, especially in the "democratic" version of the republic. (There was another variant, the aristocratic republic that called only for moderation in the elite.) "Virtue" assured that republican citizens would be obedient to their own laws, no simple task.

As for monarchical "honor," it was not only the distinctive claim of the landed aristocracy, however important, for other, nonaristocratic social groups could live by their own standards of honor, creating the spectacle of a diverse and plural society animated by standards that meant something different to each group. Honor had an important task. It encouraged individual ambition and political disobedience. Both gave a needed centrifugal spin to the polity that was a counter-weight to the centralization of power in the throne. What Montesquieu thought about how monarchy worked suggests interesting parallels to other heterogeneous, decentralized, pluralist societies, wherein the central problem is the absence of moral consensus. For Montesquieu honor was fluid and unstable, an ever-changing medium that allowed each group to maintain its self-defined sense of dignity against other groups and against the state. He effectively asked why we should expect moral or any other kind of unity except of the loosest procedural kind in a society with this kind of centrifugal individualist spin to it. Honor made the formal and legal organization of monarchy workable, paradoxically, by specifying when actors should engage in illegal behavior, something that no set of formal rules could logically have justified. This illegal adherence to legality constituted the complex "spirit of the laws" in monarchy. It was the predecessor to its democratic equivalent, the doctrine of civil disobedience.

The "fear" of despotism erased both virtue and honor, which the despot had to destroy if he was going to rule. Montesquieu had evidently a dim view of Hobbes's conclusion that only fear could found states. Incidentally, Montesquieu describes bad government as despotism, thereby avoiding Aristotle's name for it, tyranny. For Montesquieu, the bad governor rules like the master of a household, like a *despote,* a patriarch who rules over women and slaves. One can detect a protofeminist critique in this analogy. Bad government is bad because it is patriarchal. There is much to explore here: For instance, in book 19 Montesquieu argues that the freedom available specifically to women correlates well to the general level of freedom in a state.

Let us return to the question of size and the progression of small states to expand into larger polities. (Montesquieu's prime example was always classical Rome.) The republic is typically small. Any exercise in territorial expansion would threaten to undermine the very bases of republican self-rule. (This was obviously a dilemma for figures like Madison, who sought an "expanded" basis for republican government.) The expanded republic, that is, democratic government presiding over too much territory, will eventually, Montesquieu thought, resort to monarchical devices of rule where the political role of ordinary people would be diminished. Monarchy, in turn, is threatened by its own temptations to imperial expansion. This aggrandizement leads to the unraveling of monarchy into despotism.

Montesquieu's association of despotism with rule over vast distances gives his thought an anti-imperialist hue. However, this tendency is offset by the evident imperial temptation in book 10, chapter 4, when the author speculates that conquest by an enlightened power over an unenlightened people might be justified when in the unenlightened country abusive rule is combined with a mentally paralyzed people—Montesquieu calls it *la tyrannie sourd* (deaf tyranny), the symptom displayed by a people who are not capable of understanding their own distress.

The story of regime transformation—from republic to monarchy to despotism—seems to favor the republic over politically worse alternatives, but this is a false conclusion. For Montesquieu, only despotism is rejected, and occasionally it is not all that firmly rejected. Where there are no other alternatives and administration seems like a rational response to dire necessities—Montesquieu's view of China where a large hungry population faces an always endangered rice crop—then even despotism was quietly accepted. Montesquieu's critics dislike his tendency to assign despotism to a region, namely, the hot climates of Asia, but he also saw despotism in England under Cromwell.

To avoid despotism, a people would be fully justified in finding refuge in either a republic or a monarchy. Both are legitimate forms of rule. At the same time, they appeal to different moral standards and attract different partisans. Importantly, they are not suitable to every historical circumstance. This still begs the question whether, nevertheless, the republic was a superior form of government because, in terms of territorial extent, it stood further away from despotism than did monarchy. This is a misleading analogy. The opposite claim could be made. Highly disciplined citizens make republican self-government possible, but for Montesquieu this very discipline cuts off too many other kinds of freedom, almost certainly the freedom of women, but also the freedoms associated with local self-rule, regional autonomy, the possibility ethnic or religious enclaves, vast differences in ways of life, all of which the republic could not sustain or tolerate and only monarchy was (potentially) good at sponsoring.

Montesquieu famously proposed that neither monarchies nor republics are intrinsically free by their nature. The potential of monarchy to tolerate the freedoms inherent in plural and diverse lives was only a potential. Montesquieu was a monarchist in the context of French politics, but a reformist monarchist. For instance, the sacral duties of the king were scarcely mentioned in the text. As for the republic, not only does the discipline of citizenship (one form of freedom) call for the sacrifice of many other kinds of liberty, but the very effort to establish the republic might too easily skid off the road, as had happened, Montesquieu thought, during the effort to establish an English republic during the civil war. These passages on England could easily have been read on the eve of the French Revolution as a warning to French Republicans. France was too large to go down the road traveled earlier by the Puritan revolutionaries. But this does not mean that there were no checks and balances in the customary French constitution as it existed. It is the

very essence of the ancient constitutionalist argument that Montesquieu passed on to Madison and Constant to claim that practices that have evolved over the generations could easily have as much wisdom and prudence in them as any wholly new contractual document.

For Montesquieu, the French courts or *parlements* preserved public liberties through acts of dissent to royal decrees. Montesquieu, who was something of a free-thinking skeptic in matters of religion, was nevertheless an ally—a detached ally—of the Jansenist jurists and religiously motivated pamphleteers who sought in the courts a center of resistance to both Pope and Crown. Between 1748 and 1771, when the courts were effectively squashed by Chancellor Maupeou, *The Spirit of Laws* could be read as a sophisticated repository for an ideology that promoted the constitutional rights of the *parlements* and hinted at their transformation into an English-style parliament. At this pragmatic level of political engagement, Montesquieu's thought was hostile to the pretentions of executive power and accordingly sponsored pluralist politics and a rule of law mediated by a "division of powers" that pitted French courts against the concentration of executive and legislative power in the hands of the king.

Montesquieu never used the somewhat misleading phrase "separation of powers," which famously entered into public discourse across the Atlantic by both Federalists and anti-Federalists in the debate over the preservation of American constitutional liberties. Both parties nevertheless agreed on the gist of Montesquieu's argument, that however unwisely united or allied the executive and the legislature may be, all was not lost for political liberty if judicial independence could be sustained.

Ironies can be detected in Montesquieu's argument about English liberty and in the Americans' appropriation of that argument under the heading of the division of powers. First, Montesquieu's portrait of England in book 11, chapter 6 and in book 19, chapter 27 captures only a transitory moment in English political life before it set out on the path to parliamentary absolutism with an executive strictly subordinate to the legislature (though in reality the executive as prime minister dominates parliament). The result is the standard Westminster model of democratic government. The way in which parliamentary democracy fuses executive and legislative power obviously violates the spirit of Montesquieu's separation of power doctrine that instead the Americans took over in an experiment, which is now the standard alternative to Westminster, namely, presidential democracy.

Second, the Americans were designing a constitution for a republic but adopted a mechanism of rule, separation of powers, which for Montesquieu was central to the establishment of monarchy. The legal doctrine of the separation of powers of book 11, chapter 6 depends on the social basis of monarchical government set out in book 2, chapter 2, where the author insists that monarchy requires "intermediate powers," "intermediate ranks," and "channels through which power flows," giving as examples the independence of nobility, clergy, cities, and other associations. Because of the argument about intermediary bodies, Montesquieu enjoys the reputation as the great theorist of the pluralism. However, he thinks that pluralism works best under monarchy and possibly not at all under the more unified republic, whereas his readers want to adopt his concern for diversity and pluralism to the democratic project.

There is a way out for some interpreters of *The Spirit of Laws*. Montesquieu famously hints that in England one may find a republic hiding behind its monarchical form. Readers have taken from this claim the idea that England was not a monarchy at all, but a republic. But this idea makes nonsense of Montesquieu's warning about the dangers inherent in an English republic. In any event, for Montesquieu, "form" carries much weight. In adopting Montesquieu's remedies for the constitutional problems of monarchy, the Americans may have created a free and richly diverse society, but they may also have diluted what Montesquieu thought were the powerful effects of fully republican participatory citizenry.

Montesquieu as a Monarchist

Montesquieu was a monarchist in terms of his political hopes for France and for the rest of Europe. Even with democratic amendments, England was still monarchical in its form and principles. But was Montesquieu purely and simply a monarchist, or is there also enough room in his vast work for a republican thinker? This is too complex a topic to develop here. Suffice it to say

that the monarchical Montesquieu was well adapted by Edmund Burke, Madison, and Constant to their various projects and needs, but Jean-Jacques Rousseau, an attentive and close reader of Montesquieu, seized upon Montesquieu's republican themes. Rousseau was closer to his predecessor than is sometimes supposed.

The typology of regimes remains the key to Montesquieu's thinking. From Montesquieu's writings we can see it as an example of government whose citizenry is undercommitted to public things. By contrast Montesquieu's republic was a model of overcommitment to public life. Thus, monarchy countenanced heterogeneity, that is to say, pluralism and diversity, which the republic could less well tolerate. The possessors of monarchical "honor" were, however, filled with "prejudices" that arose from close attachment to their respective local traditions, habits, and circumstances. In monarchy, customs attached people to their roots. They acted from within entrenched local understandings and addressed the general good from partial perspectives.

In the republic, however, customs acted upon citizens in order to release them from rooted local understandings. There, the pull of custom was justified only to the extent it freed people from partial perspective.

Montesquieu offered a political philosophy that intensively explored the continuum of possibilities in different kinds of commitment to public and private life. In the two decent, if opposed, regimes thus theorized, he proposed two contrary origins for effective political action, neither of which was wholly commended and neither of which would be always successful in avoiding the worst outcome, despotism. He left it up to his readers to resolve the ambiguity and ambivalence always present in his encyclopedic reflections on the subject.

MULTICULTURALISM

Multiculturalism is a political idea about the proper way to respond to cultural diversity. Multiculturalists argue for more inclusive conceptions of citizenship, justice, and democracy, which extend special recognition and rights to cultural minority groups. The origins of multicultural theory can be traced in part to the dissatisfaction with liberalism's inattention to the value of community and the legacy of historic injustice against racial and ethnic minority groups, and a search for more inclusive ways to accommodate the racial and ethnic diversity generated by immigration to North America and Western Europe in the latter half of

the twentieth century. Multiculturalists contend that the proper response to cultural diversity is to supplement the common set of civil, political, and social rights with a set of group-differentiated rights and accommodations for marginalized groups. Although multiculturalism has been used as an umbrella term to characterize the politics of a wide range of historically disadvantaged groups, including African Americans, women, gays and lesbians, and the disabled, most self-identified theorists of multiculturalism tend to focus their arguments on immigrants who are ethnic and religious minorities (e.g., Latinos in the United States, Muslims in Western Europe), national minorities (e.g., Catalans, Basque, Welsh, Québécois), and indigenous peoples (e.g., Māori in New Zealand, Native peoples in North America).

Multiculturalism is closely associated with "identity politics," "the politics of difference," and "the politics of recognition"; they all share a commitment to revaluing disrespected identities and changing dominant patterns of representation and communication that marginalize certain groups. But multiculturalism is also a matter of economic interests and political power; it demands remedies to the material and political disadvantages that people suffer as a result of their minority status. Examples of multicultural accommodations include exemptions from generally applicable law (e.g., religious exemptions), state subsidies for the pursuit of group practices (e.g., public funding for minority-language schools), special political representation rights (e.g., ethnic quotas for party lists or legislative seats), or limited self-government rights (e.g., qualified recognition of tribal sovereignty). This entry provides an overview of the philosophical foundations of multiculturalism and considers its main weaknesses.

Foundations of Multiculturalism

One possible philosophical foundation for multiculturalism can be found in the communitarian critique of liberalism. Liberals are ethical individualists; they insist that individuals should be free to choose and pursue their own conceptions of the good life. They give primacy to individual rights and freedom over community life and collective goods. Some liberals are also individualists when it comes to social ontology (what some call methodologist individualists or atomists). Atomists believe that you can and should account for social actions and social goods in terms of properties of the constituent individuals and individual goods. The target of the communitarian critique of liberalism was not so much liberal ethics as liberal social ontology. Communitarians reject the idea that the individual takes precedence over the community and that the value of social goods can be reduced to their contribution to individual well-being. They instead embrace ontological holism, which views social goods as "irreducibly social." Charles Taylor combines a holist view of collective identities and cultures to a normative case for a multicultural "politics of recognition": If diverse cultural identities and languages are irreducibly social goods, then there should be a presumption of their equal worth. The recognition of the equal worth of diverse cultures requires replacing the traditional liberal regime of identical liberties and opportunities for all with a scheme of targeted rights for marginalized groups, such as limited self-government rights for the Québécois.

An alternative foundation for multiculturalism is liberalism. Will Kymlicka has developed the most influential theory of multiculturalism based on the liberal values of autonomy and equality. Culture is said to be instrumentally valuable, for two reasons. First, it enables individual autonomy. One important condition of autonomy is having an adequate range of options from which to choose. Cultures provide contexts of choice, which provide and make meaningful the social scripts and narratives from which people fashion their lives. Culture is also instrumentally valuable for its connection to individual self-respect. Echoing theorists of communitarianism and nationalism, Kymlicka says there is a deep and general connection between a person's self-respect and the respect and recognition accorded to the cultural group of which he or she is a part. It is not simply membership in any culture but one's own culture that must be secured because of the great difficulty of giving it up. Kymlicka moves from these premises about the value of cultural membership to the egalitarian claim that because members of minority groups are disadvantaged in their access to their own cultures, they are entitled to special protections.

One might question whether cultural minority groups really are "disadvantaged" in the way that

Kymlicka suggests; why not just enforce antidiscrimination laws, stopping short of any positive accommodations for cultural minority groups? He replies that state neutrality with respect to culture is a chimera. Whereas states may avoid official establishment of religion, they cannot avoid establishing one language for public schooling and other state services. Although offered as a general normative argument for minority cultural groups, liberal multiculturalism distinguishes among different types of groups. It offers the strongest protection to indigenous peoples and national minorities (indeed, Kymlicka's theory of multiculturalism is a theory of nationalism). Immigrants are viewed largely as voluntary economic migrants who are expected to integrate. Immigrant multiculturalism is understood as a demand for fairer terms of integration through mostly temporary group-differentiated measures (e.g., exemptions, bilingual education) and not a rejection of integration.

Other political theorists have looked beyond liberalism in search of more pluralistic bases for multiculturalism. This is especially true of theorists writing about diversity and multiculturalism from a postcolonial perspective. On such a perspective, the case for tribal sovereignty rests not simply on premises about the value of tribal culture and membership, but also on what is owed to Native peoples for the historic injustice perpetrated against them. A postcolonial perspective also seeks models of constitutional and political dialogue that recognize culturally distinct ways of speaking and acting. Multicultural societies consist of diverse religious and moral outlooks, and if liberal societies are to take such diversity seriously, they must recognize that liberalism is just one of many substantive outlooks based on a specific view of man and society. Liberalism is not free of culture but expresses a distinctive culture of its own. This observation applies not only across territorial boundaries between liberal and nonliberal states, but also within liberal states and its relations with nonliberal minorities. As Bhikhu Parekh argues, liberal theory cannot provide an impartial framework governing relations between different cultural communities. Instead, he argues for a more open model of intercultural dialogue in which the liberal society's constitutional and legal values serve as the initial starting point for cross-cultural discussion while also being open to contestation. James Tully surveys the language of historical and contemporary constitutionalism with a focus on Western states' relations with Native peoples to uncover more inclusive bases for intercultural interaction.

Critique of Multiculturalism

Some critics contend that the multicultural argument for the preservation of cultures is premised on a problematic view of culture. Cultures are not distinct, self-contained wholes; they have long interacted and influenced one another through warfare, conquest, and trade. Today through global migration and economic and communications networks, people in many parts of the world live in multicultural contexts and possess multiple identities. Indeed, many cultures themselves are already cosmopolitan, characterized by cultural hybridity rather than purity. Even traditional cultures are not untouched, for good or for ill, by the global exchange of information and knowledge. Moreover, aiming at preserving a culture runs the risk of privileging one allegedly pure version of culture and freezing that in place, regardless of surrounding social, economic, and political conditions. Some multicultural theorists accept the cosmopolitan view of cultures as overlapping, interactive, and interdependent in their formation, but they still maintain the importance of special protections for minority groups to preserve the distinctiveness of their cultures.

A second major criticism of multiculturalism is that it is a "politics of recognition" that diverts attention from a "politics of redistribution." We can distinguish analytically between these modes of politics: a politics of recognition challenges status inequality and the remedy it seeks is cultural and symbolic change, whereas a politics of redistribution challenges economic inequality and exploitation and the remedy it seeks is economic restructuring. Working-class mobilization tilts toward the redistribution end of the spectrum, and the gay rights movement toward the recognition end. Critics worry that multiculturalism's focus on culture and identity diverts attention from, or even actively undermines, the struggle for greater economic equality, partly because identity-based politics may undermine potential multiracial, multiethnic class solidarity and partly because many

multiculturalists tend to focus on cultural injustices while ignoring economic injustices. Ethnic and national minorities have engaged in both modes of politics, seeking remedies to material disadvantages and marginalized identities and statuses. In practice, both modes of politics are required to achieve greater equality across lines of race, ethnicity, nationality, religion, sexuality, and class, not least because many individuals stand at the intersection of these different categories and suffer multiple forms of marginalization.

Perhaps the greatest weakness of multiculturalism is that it may threaten rather than promote the freedom and equality of individuals. Multiculturalists have focused on inequalities *between* groups in arguing for special protections for minority groups, but group-based protections can exacerbate inequalities *within* minority groups. This is because some ways of protecting minority groups from oppression by the majority may make it more likely that these groups will be able to undermine the basic liberties and opportunities of vulnerable members. Group leaders may even exaggerate the degree of consensus and solidarity within their groups to present a united front to the wider society and strengthen their case for accommodation. As feminist critics emphasize, some of the most oppressive group norms and practices revolve around issues of gender and sexuality. Extending group rights to patriarchal cultural communities may help reinforce gender inequality within these communities. Examples include the use of "cultural defenses" in criminal law, recognition of religious arbitration over family law, and self-government rights for indigenous communities that deny equality to women in certain respects. This critique is especially troublesome for liberal defenders of multiculturalism who aim to promote intergroup equality while preventing intragroup oppression. Liberal multiculturalists stress that group rights need not and often do not have this effect since ethnocultural groups in Western democracies do not seek to limit the basic liberties of their own members. But this empirical premise may not be born out in a great many cases. The challenge then is to identify whether a particular case of minority group rights is consistent with ensuring the freedom and equality of all group members. If not, liberal multiculturalists would in principle have to argue against extending the group right or extending it with certain qualifications, such as conditioning the extension of self-government rights to national minorities on the acceptance of a constitutional bill of rights.

A fourth critique of multiculturalism is expressed more in public opinion rather than political theory. At the start of the twenty-first century, there is talk of a retreat from multiculturalism as a political program in the West. There is little to no retreat from recognizing the rights of national minorities and indigenous peoples; the retreat is restricted to immigrant multiculturalism. Part of the backlash against immigrant multiculturalism is based on fear and anxiety about foreign "others" and a nostalgia for an imagined time when everyone shared thick bonds of identity and solidarity. Nativism is as old as migration itself, but societies are especially vulnerable to it when economic conditions are especially bad or security is seen to be threatened. In the United States the cultural "others" are Latina/o immigrants, especially unauthorized migrants. Since September 11, 2001, Muslim immigrants have also come under new scrutiny in the United States, and concerns over security and terrorism have been invoked to justify tougher border control. The number of Muslim immigrants in North America remains relatively small in comparison to the numbers in Western Europe, where Muslims have become central to the merits of multiculturalism as a public policy. In Western Europe, the concern is not only over security but also the failures of multiculturalism policies to integrate and offer real economic opportunities to foreigners and their descendants in the host societies.

The backlash against multiculturalism raises new challenges for defenders of multiculturalism. What is the relationship between multiculturalism and the integration of immigrants, especially those who are ethnic and racial minorities? Are liberal multicultural terms of integration really the most inclusive terms of integration? What is the relationship between liberalism, culture, and religion? Understanding the challenges that immigrants are said to pose to liberal values requires sustained engagement not only with the ideas of culture, ethnicity, and nationality but also religion and race and the political and economic effects of these different categories in particular contexts.

Multiplicity

The concept of multiplicity has attained prominence largely through the philosophy of Gilles Deleuze (1925–1995). Deleuze developed the concept in his book *Bergsonism* and explored its political ramifications most relentlessly with Félix Guattari in *A Thousand Plateaus*. A multiplicity is an entity that originates from a folding or twisting of simple elements. Like a sand dune, a multiplicity is in constant flux, though it attains some consistency for a short or long duration. A multiplicity has porous boundaries and is defined provisionally by its variations and dimensions. Deleuze and Guattari redefine as multiplicities many of the key terms of Western political theory—including race, class, gender, language, state, society, person, and party. Their method aims to render political thinking more nuanced and generous toward difference.

Deleuze employs the term *multiplicity* as part of his broader project to overturn Platonism. Human cognition, according to Deleuze and his predecessors Friedrich Nietzsche and Henri Bergson, simplifies the world of intuition. This often benefits human survival and flourishing. It ensures, for instance, that humans can trust that an "apple" contains good nutrition even though humans only ever encounter *this* or *that* apple. Platonism codifies the common sense belief that human concepts match up with nature's articulations. Plato posited a universe of the One and the Multiple in which humans perceive inferior copies of perfect ideas. The doctrine reassures humanity that orderly patterns transcend the world of manifest difference. Modern philosophy's task, for Deleuze, is to break from the Platonic cast of mind and grasp multiplicities in their singularity. A multiplicity is neither a copy of a model nor a fragment of a higher totality, but a purely unique event. The concept helps humans conceive and appreciate a world where things creatively evolve to form new and surprising assemblages.

Deleuze differentiates two types of multiplicity: one that aligns with Platonic metaphysics, science, and common sense, and another that intuits a deeper reality. Deleuze designates the first type of multiplicity quantitative or numerical. Quantitative multiplicities, most simply, can be counted. They are actual, objective, and extensive; are represented in space; possess an identity; and differ in degree from one another. The intellect, for example, adds up the apples in a barrel, confident that they are fundamentally the same despite differences in size, color, ripeness, and so forth. The other type of multiplicity Deleuze denotes qualitative and continuous. Qualitative multiplicities, such as a human mood,

cannot properly be counted. They are virtual, subjective, and intensive; are experienced in lived time; and differ in kind from one another. Many of the dichotomies that recur throughout Deleuze's philosophy—arboreal and rhizomatic, molar and molecular, the major and the minor, the organism and the Body without Organs—aim to dive beneath surface appearances to capture the elusive singularity of each society, language, politics, or individual. Deleuze emphasizes that the two multiplicities coexist and interpenetrate. Each type of multiplicity captures a side of being and perception. Science accurately portrays one side of reality—the one that coheres into regular patterns that can be observed and catalogued. Philosophy's role, however, is to tailor concepts for purely unique events.

The concept of multiplicity reconfigures the ancient dispute between reason and poetry. Quantitative multiplicities can be captured through logical, mathematical, or scientific propositions. Qualitative multiplicities require a broader palette to color in the nuance of each thing, and here, philosophy forms alliances with painters, authors, directors, or sculptors. Philosophers create concepts that align with artistic percepts. That is one reason that Deleuze cites artists such as Virginia Wolff or Marcel Proust. When Wolff experiences herself as a school of fish, she portrays the lived sensation of being a qualitative multiplicity open to powers and affects circulating in the universe. Deleuze constructs philosophical concepts, such as the virtual, to describe the source of animal-becomings that permeate our subjectivity. For Deleuze, philosophers should investigate the world using the tools of both reason (quantitative multiplicities) and poetry (qualitative multiplicities).

Politically, the concept of multiplicity draws attention to minority-becomings. Majorities are quantitative multiplicities; the actors, positions, and votes are discrete and perceptible. Minorities can also be quantitative multiplicities, if their properties are clear and distinct. Minority-becomings, however, are qualitative multiplicities. They constitute fuzzy sets that elude the standards of the majority or minorities. Deleuze acknowledges that politics is always composed of a majority, minorities, and minority-becomings. Democracy requires the governance of majorities, but a politics of difference also welcomes and respects minority-becomings, that is, unfamiliar ideas, actors, positions, practices, and parties. The politics of multiplicity radicalizes liberalism by extending receptive generosity toward elements that perplex or transform social norms.

The example of gender may illustrate the stakes of Deleuze's project. Male and female are quantitative multiplicities, recognized by biological distinctions and assigned cultural roles and norms. Within the realms of Platonism, science, and common sense, this binary aggregate is real and corresponds to a natural division. Deleuze supports the feminist project to make females, a "minority," equal to men. Yet Deleuze also thinks that this duality conceals a great deal of gender's complexity. Gender is a qualitative multiplicity that enfolds genetic variation, parenting styles, social roles, cultural norms, charismatic friends, music, and public policy. Beneath the crude binary of male and female flow a plurality of tiny sexes. A politics of multiplicity may help these virtual sexes cross the threshold into actuality in such fields as family law, athletic competition, economic justice, and cultural representation. A politics of multiplicity also instills hope that political bodies can be transformed through careful chiseling of their borders.

MULTITUDE

In the vocabulary of the Roman historians Sallust, Tacitus, and Quintus Curtius and the philosophers

Seneca and Cicero, the term *multitudo* is one among many to refer, more or less pejoratively, to the crowd, the populace, or the masses. It appears in the margins of some philosophical texts from the Middle Ages, but it is only in the context of early modern political thought that it becomes a major concept (in its Latin and English form). In the work of Thomas Hobbes, and most prominently in the writings of Baruch Spinoza, the multitude is a major political factor and it becomes an element of one of the first attempts to develop a modern concept of democracy. Hardly in use for many centuries, the term has reappeared rather recently, through attempts of several contemporary political theorists and philosophers to revitalize and actualize some elements of Spinozian political thought.

For Hobbes, the unorganized masses represent a serious threat to social stability and political order. Because the multitude is composed of a multiplicity of different subjects with different capacities, desires and opinions, it cannot be treated as a reliable entity of political life. Rather it is the unified body of a people that is necessary to found a commonwealth that can be governed by a sovereign. The multitude only reappears in times of crises when the unity of the people dissolves and the sovereign power of the state is in jeopardy.

Whereas Hobbes excludes the multitude from politics proper, his successor Spinoza takes the almost opposite direction. For him, too, the multitude, which is prone to superstition and subjected to effects it cannot control, on one hand remains an unstable and unpredictable factor in politics that can turn into a mob any day. On the other hand, the multitude is nothing less than the very basis and ultimate reference point of state power. The moment in which the multitude, guided by just laws and reason, manages to act in concert is the moment of the greatest power imaginable. The state is nothing above or beyond its citizens; rather, it is the combined, collective power of the multitude. Only a political system that can successfully integrate the diversity and heterogeneity of the multitude will reach stability and will be able to fully use the knowledge and potential of its citizenry. Although Spinoza's official political philosophy does not endorse democracy as the best form of political rule unconditionally, his insistence on the constituent power of the multitude in all political systems places him firmly in the tradition of radical democratic thinking.

The idea that the foundation of political power is not to be found in any preestablished unity (as the homogeneity of a people or a nation) or in a process of a unifying political act (as the legal constitution of a "body politic") has strongly attracted contemporary political theorists searching for new ways to think about political struggle and community beyond substantive unity. Most importantly, for several theorists coming from the Marxist tradition, especially Antonio Negri, the concept of the multitude has proven fruitful for the purpose of describing political mass movements and social resistance against the globalized political and economic system. Merging Spinoza's conception with Karl Marx's idea of "living labor" as the ultimate creative and productive force, a new, materialist concept of the multitude has emerged that has been successfully introduced into current debates on the state of global democracy and global resistance. Just as state powers ultimately depend on the multitude, the global capitalist system depends on the multitude of living and working subjects. The self-organizing multitude is the site where knowledge, value, and affects are produced.

According to some authors, the system of global capitalism will not be able to rule and exploit the multitude indefinitely. The rise of new technologies and new forms of affective labor and the increasing complexity of global communication and interaction might help the new global multitude to resist the parasitic global powers that keep them from realizing a form of real global democracy. Other theorists, such as Paolo Virno, resist the rather utopian and sometimes even determinist assumptions underlying such an outlook but still insist on the use of the concept for analyzing contemporary political struggles and contemporary forms of life. Speaking of multitude rather than class can at least help to reveal that in the age of increasing immaterial production and global flexibilization of the workforce, the sphere of labor has lost its autonomy, and the demand to be productive and creative has spread across contemporary life.

Although many theorists agree on the productivity of the concept of multitude for social analysis, its value for political theory remains controversial. Serious doubts have been raised whether this notion successfully refers to a new political

subject and whether the Spinozian concept can be applied to contemporary politics. It may be useful to rethink global democracy not only from the perspective of legal and political institutions but also in terms of the heterogeneous democratic mass movements and their social struggles. Yet there may be less reason to believe that political history will eventually take the turn to the liberation and peaceful self-organization of the multiplicity of political subjects.

Mythic Narrative

Mythic narratives are narratives of a particular kind. If narratives are, broadly speaking, ways of linking events, mythic narratives are successions of events that grant them not simply meaning but also significance.

After being neglected for a long time by political theory, mythic narratives are today getting more attention. So, for example, Chiara Bottici and Ajume Wingo have recently argued that we need to explore not only the conditions for public reason but also the conditions for public mythic narratives. Public mythic narratives play an important role in political mobilization. They convey the crucial beliefs of a social group or society in an emotionally effective way and may not be incompatible with the principle of the autonomy of individuals.

This entry discusses the difference between mythic narrative and narrative in general. It examines the role of mythical narrative in politics and in the normative issues that politics raises.

Narrative and Mythic Narrative

The concept of narrative has been widely debated. This increased sense of the importance of narrative reflects the attention to the symbolic dimension of politics, the postmodern critique of the "grand narratives," and the emphasis on language that followed the so-called linguistic turn. Social and political theorists have investigated the ways in which narratives, as succession of events, contribute to making sense of the political world in which we live. Narratives make sense of our experience, and in so doing, they contribute to shaping the identity of both individuals and social groups.

Not all narratives are alike. As a series of events, the basic performance of a narrative is to provide meaning. Even a very banal series of events such as "This morning I took a shower, then I had breakfast while reading the newspaper" is a narrative; it provides a meaning to the beginning of my day. But narratives relevant to politics are usually much more complex than this. Examples of studies of political narratives include Henri Tudor's discussion of the Nazi myth of the Aryan race and Wingo's analysis of the narrative of the American founding fathers. The degree of complexity, drama, and symbolic impact of a narrative can vary substantially. If simple narratives, such as the morning routine mentioned earlier, occupy one end of the spectrum, mythic narratives are at the opposite side in terms of complexity.

A myth does not simply provide meaning but also significance to human existence. *Significance* is more than meaning; something can have meaning and still remain completely insignificant. Mythic narratives add significance and drama by accounting for the origins of things or where things are going. It is from the identification with such a drama that the specific *pathos* of a mythic narrative derives.

Mythic Narratives and Politics

Mythic narratives convey the fundamental beliefs of a social group or society and therefore influence

politics in a variety of ways. Most often they are not learned but rather apprehended through a more or less unconscious cumulative exposure to them. By watching television, listening to political discourse, seeing advertisements, going to school, and so on, we are exposed to a large variety of stories, some of which have a deep mythical impact on our psyche. When this happens, mythic narratives influence our political choices in ways that, to a large extent, escape our capacity for critical scrutiny. Christopher Flood suggests that, having entered our basic and most fundamental perceptions of the world, mythic narratives are consequently difficult to dismantle. Contemporary examples of such narratives include nationalist myths (Tudor), the myth of the proletarian revolution (Georges Sorel), and the narrative of a clash between civilizations (Bottici).

To conclude, political mythic narratives are mapping devices through which we look at the world, feel about it, and also act within it as a social group. Properly speaking, political mythic narratives cannot be falsified because they are not scientific hypotheses about the constitution of the world. They aim to create their own world and can therefore always potentially reinforce themselves. The practical dimension of a political myth cannot, however, be separated from its cognitive and aesthetical dimensions. Mythic narratives provide fundamental cognitive schemata for the mapping of the world: By reducing the complexity of experience, they enable us to come to terms with the multifaceted character of the political world we live in. On the basis of these mapping devices, people also *feel* about the world and *act* within it. Myths thus have an aesthetic dimension; they cast events in a dramatic form.

Myths

Myths are narratives that provide significance to our actions and conditions of existence. Myth is, however, a difficult concept to define. The reason for this is that it has been the object of much theoretical speculation, and every author has found in it the objects with which he or she is most familiar. Linguists have found a world of signs and names, psychologists a product of the deepest parts of the human psyche, philosophers a primitive form of philosophy, sociologists and anthropologists the expression of the fundamental beliefs of a society, and so on.

In the face of this richness, it is surprising that political theorists have largely neglected the topic of myth. Political theorists often dismiss myth as a primitive form of thinking, which disappeared with modern politics. Political myth, in particular, has thus remained a relatively marginal topic. Recently, however, scholars such as Chiara Bottici and Ajume Wingo have explored the relevance of myth for political theory. They highlight the importance of myths and other forms of symbolism for both political mobilization and the preservation of a polity.

Common language depicts myth as false and unreal, as in the expression "myth of progress." The idea that myths are false and unreal is misleading. Contemporary theorists of myth all agree that myths are much more than this: Myths contain the fundamental beliefs of a social group or a society and, as such, cannot easily be dismissed.

The Genealogy of Myth

Common language tends to depict myth as a false account of reality, as in expressions such as "the myth of welfare" or "the myth of progress." This approach is misleading and derives from a series of

prejudices against myth that are rooted in the Western evolution of the concept.

Mythos is an ancient Greek word that means "word, speech." As such it was used as a synonym for *logos,* the word associated today with "reason." It is only relatively late, around the fifth century BCE, that the term *mythos* specialized in the sense of "narrative, tale." It is when philosophers started to vindicate the difference between their professional activity and that of traditional poets such as Homer and Hesiod that the term *logos* began to specialize in the sense of "discourse, calculus, reasoning" and, as such, to be distinguished from "myth," that is, "tale, narrative." Still, the idea of the falsity of myth was not yet part of the primary meaning of the term. For instance, even Aristotle seems to value myths: In his *Poetics,* he says that *mythoi* are the constitutive elements of poetry, whose truth is even superior to that of history because the latter tells facts as they happen, whereas the former tells them as they could have happened according to the different human characters.

It is only with the affirmation of monotheism that myths came to be associated with paganism and polytheism and therefore with the idea of false and deceitful tales that are potentially dangerous. In a monotheistic worldview, there is no space for the pluralism and polytheism of myth. It is not by chance that in Europe during medieval times, ancient mythical material either fell into oblivion or, when possible, was read as an allegory of the superior truth of the Christian message.

The end of the Middle Ages and the affirmation of modernity did not bring with it a better evaluation of myths. Perceived as a primitive form of thinking, myths were believed not to possess any truth. In their attempt to ground the autonomy of the individual on pure reason alone, philosophers during the European Enlightenment associated myth with superstition. As a consequence, every effort was made to eliminate it from politics. It is only in the ambit of aesthetics that myths were given a legitimate place.

Romanticists attempted to revaluate the power of myth, by arguing that it is in the ambit of myth that human beings could find liberation from the abstractness of reason and intellect. In so doing, however, Romanticists simply reproduced the same dichotomy of "myth" versus "reason" upon which Enlightenment was based and did not promote a full abandonment of it.

Contemporary Approaches

More recently, various theorists of myth have shown that, in fact, modernity never got rid of myth. Quite on the contrary, it is in typically modern phenomena such as the big social movements and nationalism that myth's specific political role becomes conspicuous. Well-known examples are the Nazi myth of the Aryan race, which Ernst Cassirer explored, and the proletarian myth of the general strike, which Georges Sorel analyzed.

Recent anthropological theorists have proposed that human beings are all "primitive" in that we all share certain fundamental needs. Myths did not disappear from modern politics, notwithstanding all the rationalism that has entered it. Myths are narratives that contain fundamental moral and theoretical beliefs of a society, and thus there is no reason why they should have disappeared. They respond to a fundamental human need, that is, to live in a world full of meaning and significance, which modernization has not been able to obviate.

Anthropological research has also been useful for revealing the similarity and analogies between mythical beliefs across cultures and epochs. Psychologists have tried to explain this phenomenon by looking at the psychological invariants that they display. In particular, psychoanalysts have pointed to the role of unconsciousness in this process. By relating myths to other forms of symbolism, myths can be seen as collective manifestations of the human psyche that reveal and conceal at the same time its deepest unconscious tendencies (Sigmund Freud, Carl Jung).

The discovery of the role of the unconscious has been crucial for an understanding of the functioning of myth. Together with psychology, hermeneutics and phenomenology have also provided research in this direction. Whereas Kàroly Kerènyi has analyzed the way in which myths, by telling the origins or destinations of things, "ground" (*begründen*) the world we live in, Hans Blumenberg has argued that myths are narratives that respond to a need for significance that changes according to circumstances. Precisely because a myth has to ground a world that continually changes over

time, it is best understood as a process rather than as an object.

A myth typically expresses itself through variants: In each context the same narrative pattern must generate different variants in order to accommodate the new circumstances. If it cannot do so, it ceases to be a myth and becomes a simple narrative. Every narrative can provide meaning that is generally understood, but myths, in contrast, also provide significance. Indeed, as Bottici claimed, something can have a meaning and still we remain completely indifferent to it, whereas something that is significant is something we feel close to.

Significance can be generated on both conscious and unconscious levels. By underlining that myths are processes of continual elaboration of narrative plots that take place in between the two levels, phenomenological research converges with much of the sociological and political research on myth. Sociological and political researchers have been analyzing the ways in which myths convey crucial beliefs of a social group or society by producing and reproducing them in the most different social settings: from official media and propaganda to art, film, advertising, and dinner conversations.

Myths and Politics

A political myth is the elaboration of a common narrative, which grants significance to the political conditions and experiences of a social group. What makes a political myth out of a simple narrative is neither its claim to truth nor its content. For instance, there is nothing political per se in the fact that the world is about to disappear. Notwithstanding this, the narrative of the millennium, which stems from this idea, worked as a political myth, and as a powerful one in certain contexts.

What makes a political myth out of a narrative is (a) that it solidifies and reproduces significance, (b) that it is shared by a given group, and (c) that it can address the specifically political conditions in which a given group lives. A political myth must respond to a need for significance (otherwise, it would be a mere narrative and not a myth), and it must be shared because it must address the specifically political conditions of a social group. One can define politics in the more general sense of whatever pertains to the *polis* (polity) and to decisions concerning the fate of a community or, in a more restricted sense, as the specific form of power that is characterized by the threat of recourse to legitimate coercion. In both cases, politics concerns the life in common, and this is ultimately the reason why, in order to be *political,* a myth must be shared.

The first consequence of this definition is that a political myth cannot be reduced to the stories taken from books and archives. These are only *some* of the products of the process of elaboration of political myth. To establish whether a narrative is a political myth or not, we must look not only at its production but also at its reception, at the ways in which it is shared, at the worldview it promotes, and at the sort of actions it invites. Political myths have a clear practical purpose. They are not only the result of social groups that are already given, but they can also be the means for creating new groups. To put it bluntly, political myths are both the result of, and the means to create, a common identity.

The second consequence is that political myths are not usually learned once and for all but rather are apprehended through a more or less conscious cumulative exposure to them. According to Flood, this also explains the solidifying power of political myths and their capacity to condense into a few images or "icons." By means of a synecdoche, any object or gesture—a painting, an image, a song, a film, or an advertisement—can recall the whole work on myth that lies behind it. This is also the reason why it is often difficult to analyze them: The elaboration of a political myth takes place through icons that allusively refer to the given narrative instead of explicitly conveying it.

Today, the elaboration of a political myth can take place in the most different settings: speeches, arts (visual and performing), rituals, and social practices. This pervasiveness is exponentially augmented in contemporary societies. Due to the role of media in our life in general and of politics in particular, we are exposed to a potentially infinite number of icons. All this has further increased what Flood has called the "primacy effect" of political myth. By remaining at the unconscious level, political myths can deeply influence our basic and most fundamental perceptions of the world, thus rendering them particularly hard to dismantle later on. If political myths have always been difficult to analyze, precisely because their elaboration

takes place at a more or less conscious level, then the recent emergence of powerful new technologies has rendered them less and less perceivable and therefore more subtle. Political myths have become the unperceived lenses through which we experience the world. They are part of our basic components of everyday perception of politics, and for this reason they tend to remain unquestioned. A recent example is the myth of the clash between civilizations: Often criticized as a scientific theory, according to Bottici, it has nevertheless become a lens through which many people across the globe perceive and feel about our political world.

The fact that political myths largely sit in the unconscious makes it particularly difficult to evaluate them. Properly speaking there cannot be a single and identifiable myth-maker. This, however, does not mean that we have no criteria according to which they can be judged. They cannot be judged simply according to their "truth," because they do not aim to "describe" the truth of the world but rather to create their own world. They are not disinterested scientific theories about the constitution of the world, but expression of a determination to act within it. It is therefore from a practical point of view that we must judge them. Political myths put on stage certain models of conduct, and it is therefore such models we must examine, to judge whether they are appropriate to the political values we choose and the political circumstance we live in.

As Wingo has stated, political myths are not therefore always incompatible with the principle of individual autonomy. There can be circumstances in which they are, as is the case of oppressive political myths such as that of the Nazi Aryan race. But this is not always the case. They can also be the means for a political critique and thus for autonomy. For instance, the proletarian myth of the revolution has also been, at times, a means for a critique of injustice and exploitation. Still, as the use that totalitarian regimes have put myths to has shown, even the same myth can turn into a means for oppression in a different context. In conclusion, it is always at the particular circumstances in which a political myth operates and at the specific variants of it that are at work that we must look in order to evaluate them.

N

Narrative

Narratives are sequences of nonrandomly connected events. In this general sense, narratives are everywhere. Biographies, curricula vitae, historical texts, letters, novels, reports, medical case histories, law text, and even scientific texts are, or contain, narratives. Narratives are therefore relevant to politics because they are ways of connecting events. By linking together events in space and time, they are a way of making sense of the world. News, discourses of politicians, reports of various kinds, law texts, biographies—all of them are politically relevant narratives. They are means to make sense of the political world and, as a consequence, also of our place within it.

This centrality of narratives raises crucial questions for political theory. If narratives are ways to make sense of the political world we live in, then he or she who can impose them or influence the way we formulate them has the greatest power. Who tells the relevant stories? Which forces determine the crucial narrative plots? In order to discuss these questions, the entry first examines the definition of the concept of narrative and then explores the way in which it influences politics.

Narrative: Toward a Definition

The attention to narrative is a relatively recent phenomenon. The emphasis on language that followed the linguistic turn, the attention to the symbolic dimension of politics, and the postmodern critique of the "grand narratives" have brought about what we may call a "narrative turn" in social and political sciences. Social and political theorists have recently started to investigate the role that narratives play in our lives and our ways of living in common.

Yet, the definition of narrative is still very much contested. The previously mentioned definition of narrative as a sequence of events is a very minimal one, which must be taken as a compromise between different approaches. Structuralists, for instance, typically look for the invariants of narratives. Since Aristotle, it has become commonplace to underline that narratives have a beginning, a middle, and an end. Narratives provide meanings because they contain a trajectory. More recently Russian and then French formalists distinguished between story (or *fabula, histoire*), the basic description of events, and discourse (or *sjuzhet, discours*), that is, their organization through different techniques.

This, however, remains a disputed distinction. Events are always already organized. Properly speaking there are no brute facts: As far as something is perceived and inserted in a sequence of other events, there is already a choice and therefore an organization. This is the reason why different scholars start their investigation of narrative with the observation that a narrative always presupposes someone who tells it. This may appear a truism, but it has the important function of underlining that a narrative always presupposes the choices of whoever created it.

If narratives are not simply objects but processes of telling narratives, then they presuppose

not simply a teller but also an audience. Recently, both linguists and sociologists have underlined that the meaning of a narrative is given not just by the teller but also by the receiver. Meanings are not something that the teller puts in a narrative and are thereafter delivered into the mind of the recipient, but rather are the result of complex processes of telling and receiving. This is the reason why we should qualify the previously mentioned definition by saying that narratives are *perceived* sequences of nonrandomly connected events (Michael J. Toolan). Indeed, a series of events that is not perceived as such by the receiver is not a narrative but a simple juxtaposition of facts.

Narrative and Politics

Narratives are ways to connect events in a nonrandom way, and therefore they are a powerful means to provide meaning to the political world we live in. By connecting events in a nonrandom way, they are a means both for world making and self making. They tell us both what is the sense of our political world in general and also of our place within it. In other words, they are a means for constructing both our identity in general and our political identity in particular.

Which forces determine such a process of narrative telling? In very general terms, we can distinguish between those who emphasize that dominant narratives are means for the missionization and colonization of selves (Michel Foucault) and those who adopt a more interrelational approach underlining the complexity of the process of production-reception and the potentially active role that the receiver can play (Chiara Bottici). In his analysis of the technologies for the construction of the selves, Foucault argued that conversational practices such as letter writing, confessions, teaching, counseling, and so forth, are means for socializing individuals to dominant narratives or truth regimes. This view rightly underlines the normative impact that narrative can have, but it overlooks the variety of possible responses on the side of the receiver.

Furthermore, it overlooks the large variety of narratives that each influence politics and, in particular, the fact that they do it in different ways. As a series of events, the basic performance of a narrative is to provide meaning. Even a very banal series of events such as "This morning the president had breakfast with the prime minister" is a narrative. But narratives that are most relevant to politics are usually much more complex than this. Think of political myths such as the Nazi myth of the Aryan race, that of the American founding fathers, or that of the proletarian revolution (Bottici). The degree of complexity, drama, and symbolic impact of a narrative can vary a lot. If simple narratives occupy one end of the spectrum, mythic narratives are at the opposite side in terms of complexity and practical impact.

NATIONALISM

Nationalism is generally defined in one of three ways: (1) an abstract notion that human society is divided into nations, (2) a sense of belonging to a given national group, or (3) a political ideology that holds that national communities should be coterminous with nation-states and that these communities should govern themselves. These three definitions are frequently augmented by a typology that seeks to distinguish nationalisms either by characteristics or behavior, variously differentiating them as separatist, ethnic, civic, cultural, classical, or liberal.

A single accepted characterization of nationalism is difficult to reach, partly because a commonly accepted definition of "nation" proves elusive. In contrast to states—political units possessing concrete borders, institutions, and the legitimate use of force—nations are far more

amorphous. Scholars debate whether nations are timeless, ancient, or modern and whether nations came before nationalism or vice versa. Those who suggest that nations are modern are further challenged by the need to determine who created nations and why, prompting a debate about whether they were devised from the top down or the bottom up. Some view nations as objective phenomena that are characterized by common language, culture, history, ethnicity, or religion. Others suggest that nations are "imagined," more a product of the mind than of physical reality.

Most nations take the form of nation-states, a situation in which the national community is coterminous with the institutions and legitimacy of the modern state. This objective represents the ultimate goal of nationalists. Stateless-nations exist when a national group believes itself to be a minority within a larger nation-state. Stateless-nations often generate "separatist" nationalisms—one of the most widely cited, and often vilified, examples of nationalism.

This entry provides a concise overview of several of the major issues and questions involved in the nationalism debate. It begins with an exploration of the most common schools of thought concerning nations and their origins and then examines the various typologies of nationalism itself.

Nation: Definitions and Origins

Nationalist Interpretation

Nationalists believe that nations have always existed and that they are a natural product of humankind's need for coherent social organization. According to this view, every nation is unique and is distinguished by individualized characteristics, such as language, culture, traditions, and geographic homeland. Furthermore, as nations are timeless, all nationalists must do is draw people's attention to their unique identity, culture, and history in order to reawaken deeply internalized national desires. Put another way, nations produce nationalists and not the other way around.

The nationalist paradigm is self-sustaining. Because it is assumed that nations have always existed, the past is easily interpreted in terms of national groups and nationalist struggles. Historical information is easily molded to form a coherent historical narrative that supports and advances the interests of national groups today. Thus, for example, modern Scottish nationalists point to the early fourteenth-century "Declaration of Arbroath" as proof of the long-term viability of the Scots as a distinct national community. This document, a letter to the bishop of Rome written by a collection of churchmen and nobles to demonstrate that a Scottish claimant to the throne of Scotland was more legitimate than an English claimant, is now used to show that the Scottish struggle for independence is at least 700 years old. Certainly, nationalists argue, a 700-year-old struggle for freedom from English domination trumps the 400-year-old Treaty of Union signed in 1707. As political legitimacy is enhanced by historical lineage, the notion that nations are timeless helps lend significant support to the claims of modern national communities. Perennial struggles such as that between the English and the Scots are easily explained by looking to a long history of discord engendered by conflicting national agendas.

The overwhelming majority of academics challenge this vision. Scholars point out that definitions change with time. The meaning ascribed to words similar to *nation* during the ancient and medieval periods was often quite different than it is today. Each Greek *polis* (city-state), for example, undoubtedly possessed its own unique *ethnos* (ethnic identity), yet this does not mean that a polis was the same thing as a nation. Without the benefit of widespread mobility or the ability to disseminate ideas broadly, premodern identities were necessarily more limited in scope. Thus, whereas nationalists point to the Declaration of Arbroath as a clear example of a long nationalist struggle, nonnationalist scholars argue that the document actually mirrored an established legal form of the period, used very different definitions than those utilized today, and was written by a collection of individuals whose allegiance was anything but fixed. Indeed, many of its authors were executed for treason only a few weeks later, apparently after having switched sides.

Although it lacks scholarly support, the nationalist interpretation of nations remains potent because it speaks to a common assumption that age brings authenticity. The greater the patina of age, the more "real" something is. If nations existed in the past, perennial struggles such as that between the English and the Scots are legitimized.

Furthermore, it is difficult to step outside of one's own experience. As modern society is intensely nationalized, it is more difficult to imagine an age without nations than it is to believe that nations are timeless.

Modernization Theory

Modernization theory offers a polar opposite interpretation of nations to that forwarded by nationalists. According to modernization scholars, nations were created by nationalists and are entirely modern. Nations are no older than the French Revolution. Rather than being based on a timeless reality, nations were created almost from whole cloth. The Enlightenment generated new intellectual ideas about liberty, freedom, and self-rule. The Romanic movement fostered historic narratives filled with past glories. And the Industrial Revolution necessitated a much broader conception of society than existed previously. These three factors combined to make nations both logical and possible. In an age of rapid urbanization, it was vital that people from often vastly different rural communities be resocialized to live in newly established urban metropolises. The challenge for nationalists was to develop strategies whereby others might be converted to the new secular religion they had begun to create.

The nationalization process demanded that people learn to speak the same language, internalize the same sense of history, and respond to a common collection of traditions and symbols, many, if not most, of which were created to form the foundation of a new national community. It followed that public educational institutions were introduced to teach young people to be members of the nation. Languages were standardized and literacy promoted. Printing presses ran overtime producing books, newspapers, and broadsheets that perpetuated the existence of collective interests and beliefs. Rural traditions, often quite localized, were refashioned from being examples of regional "low culture" to newly nationalized proof of a collective past. Toward this end, romantic composers such as Bedřich Smetana drew on folk culture to create music that was of more interest to a respectable elite than to peasants. The "purity" of traditional rural life was more widely disseminated: A mythology of horizontal unity replaced a vertical notion of class-based difference. All of this was supplemented by the nationalist interpretation of history. French school children learned of the great nationalist hero Jeanne d'Arc and her efforts to defeat English invaders intent on destroying France. English children learned about Alfred the Great's successful fight against Viking invaders. Students in the United States were raised on tales of the struggle against English oppression and the fight for freedom, while also being told that their nation-state represents the pinnacle of social and political evolution. The newly created national mythology quickly became self-perpetuating, generating its own legitimacy via the logic just described.

Among scholars, the modernization argument is currently dominant, yet there remain divisions. First, scholars differ about the precise process whereby nations were constructed. For some, nations are a direct result of the French Revolution. When the French people asserted their right to choose their own government, they encouraged a much larger belief in self-determination and in a set of collective interests held by the people at large. The notion of "the people" became a potent ideological force that was translated into action by groups beyond the borders of France who were anxious to find liberty, equality, and freedom of their own. Where one nation existed, others necessarily followed.

Other scholars, most notably Liah Greenfeld and Philip Gorski, find the origin of modern nations in the Protestant Reformation. In England, the act of nationalizing the church essentially made God an Englishman. Safe in the knowledge of their divine grace, the English people went on to form a world empire and the first industrialized state. Clearly the national idea worked, so other states such as France, the United States, Germany, and Russia soon followed suit by nationalizing their own people. Meanwhile, in the Netherlands, Protestants used biblical imagery to fashion themselves as God's chosen people. Although they might face a fierce challenge from Catholic Spain, theirs was a divinely ordained struggle that would succeed; unity was both called for and achieved. Like England, the Netherlands soon became a world economic superpower, prompting others to follow its model. If we extend this argument to its logical conclusion, it follows that the success of nation-states soon inspired stateless groups to

adopt the nation as a rhetorical tool; the language of the nation-state was every bit as effective for promoting the interests of minority ethnic groups as it was forwarding the goals of the state. Stateless-nations were born.

Still another version, most closely associated with Ernest Gellner, suggests that nations were created by the immediate needs of the Industrial Revolution. Industrial society required that not only should people be capable of living together in close quarters, but they also needed to possess a common language that would allow for the kind of rapid retraining and easy mobility required by industrial capitalism. Nationalists soon met this need by creating an educational system, new traditions, and a common mythology that bound together the proletariat and the bourgeoisie.

If nations were created, one is left with the question of who created them. Thus, the second major debate among modernization scholars focuses on whether nations were created from the top down by political and economic elites, by subalterns whose strong sense of identity necessitated that elites adopt folk culture as their own, or by some combination of both bottom-up and top-down forces. Most existing scholarship assumes the top-down explanation. If industrialization made nations necessary, then the work of converting low culture into high culture must necessarily have been undertaken by social and political elites—government officials and factory owners—in whose interest it was to formulate the most productive economic system possible. In contrast, critics argue that such a widespread conspiracy would demand considerable premeditation and planning: a level of foresight for which there is little obvious substantiation. Yet there is also scant evidence to show that the bottom of the social ladder involved itself in any effort to make regional culture national. Most subalterns were simply anxious to survive and had little time to create nations. In the past several years, a growing chorus of young scholars adopted the third view, that nations are actually the product of an ongoing negotiation that is neither bottom up nor top down. Groups from across society added their voices and ideas, gradually shaping modern nations. Although more and more studies reflect this third view, the bottom-up/top-down debate among modernization scholars is far from settled.

Postmodernism

It is arguable whether a truly "postmodern" interpretation of nations and nationalism exists, although many interpret Benedict Anderson's widely cited notion that the nation is an "imagined community" as representative of postmodern scholarship. Reacting against the idea that nations are falsified or invented, Anderson places stress on the idea that nations are created and exist purely within the minds of believers. Whereas all communities are imagined—no community larger than a family is physically tangible—nations differ from these in the way in which they are imagined. Whereas people have always believed themselves connected to others they will never know, Anderson suggests that in the past, these links were thought of in terms of threads of kinship. Nations do not involve direct family linkages, however, and therefore separate themselves from older concepts of community. Even more important, Anderson claims that nations represent what he calls a "deep, horizontal comradeship." They extend beyond class so that all members of a nation, regardless of their material wealth, are equally obliged to all other members. These imagined connections make nations tremendously powerful social networks and make it possible for people to willingly die for an idea.

For Anderson, the process of imagining nations is inseparably connected to the development of "print capitalism," and he places great weight on the distribution of ideas through books, newspapers, and other printed products. Like modernization theorists, Anderson emphasizes the role of Enlightenment ideas and the role of industrialization; indeed, Anderson's view should probably be interpreted as another variation of modernization theory rather than as an example of postmodernism.

Ethno-Symbolism

Ethno-symbolism represents the most recent approach to understanding the historical evolution of nations and nationalism. Developed by Anthony D. Smith, a student of Ernest Gellner, ethno-symbolism suggests that nations as they are known today are modern but they are not invented. Nationalists could not create nations ex nihilo because nations are based on almost timeless

ethnie: various traditions, historical memories, language, and other sociocultural factors. Whereas nation-like identities are almost primordial, nationalism itself is modern, a relatively new creation based on a reformulation of ancient ethnie to meet contemporary demands. Reformulated or not, the long roots of modern nations and nationalism offer important clues, argues Smith, about why nationalism is such a potent ideology. Invented traditions could not possibly spark an almost organic allegiance. In contrast, ethnie change very slowly, carried along by a people over time, passed from elders to the young. Although not biological, these traditions give the impression of being an organic building block of the people. It is no more possible to separate people from their cultural base than it is to remove their brains.

One of the most famous examples of the "invented traditions" that modernization theorists cite as evidence of the creation of nations is the development of Scottish Highland dress during the late eighteenth and early nineteenth centuries. In essence, the argument holds that a Quaker factory owner developed the so-called short kilt so that his Highland workers would not be caught in the factory machinery. In the years that followed, tartan fabric was transformed into a symbol of clan membership and countless family tartans were developed and catalogued to meet market demand. Meanwhile, the kilt became a popular national outfit for Scots from both the Scottish Highlands and the more Anglicized Scottish Lowlands. Ethnosymbolists challenge this narrative, noting that distinctive Highland clothing far predates the specific form of the kilt and that, although tartan fabric might not have been closely identified with specific families, it represented a significant fashion statement in Scotland. Furthermore, it is impossible to argue against the primacy of clan loyalty in Highland life. The precise markers of Highland distinctiveness may have changed, but the peculiarly Highland culture certainly existed in the more distant past, forming an important component of regional identity—so much so that the English government actually passed a law against Highland dress in 1747.

The debate about the origin and definition of "nation" persists, with none of the major schools of thought willing to yield an inch. Although an agreed-upon explanation for the historical evolution of nations is probably unattainable, the need for consensus about a definition of "nation" remains urgent.

Typologies of Nationalism

Given division over the definition of nation, it should not be surprising that there is little consensus over the nature of nationalism. For many, nationalism is inherently divisive, a product of the far right of the political spectrum. Nations accentuate differences, demanding that like people are placed together at the expense of those deemed to be outsiders. It follows that the logical result of nationalism is xenophobia, violence, and even genocide. Others note that, more often than not, nationalism is banal; nations exist to bind people together, to create unity. Sometimes violence is a result of nationalist activity, but such situations are rare. The far more common face of nationalism is that of countries such as France and the United States, where patriotic celebration is more prevalent than violence and where nationalism is celebrated by fireworks, not fire fights.

With agreement seemingly impossible, scholars of nationalism instead posit an extensive typology of nationalism. Most frequently, one finds reference to ethnic, cultural, banal, separatist, classical, and liberal nationalisms. In essence, this taxonomy is based on a series of assumed opposites that address either the defining characteristics or the behavior of national groups.

Ethnic Versus Cultural Nationalism

By far the most common distinction is that between ethnic and cultural forms of nationalism. According to this view, some nations are defined primarily by racial characteristics, whereas other nations are identified by cultural traits, such as common language, traditions, or history.

Racism and nationalism are not the same things, but ethnic nationalism joins the two ideologies together. According to this classification, ethnic nationalists believe that the world is divided into distinct ethnic or racial groups. Because nationalism assumes that members of the same national groups should be joined together in a self-governing state, ethnic nationalists use racial arguments to justify self-rule. Those who are not part of the

ethnic group represent a threat because they promise to dilute and so undermine the nation. Those who see nationalism as a divisive ideology often cite ethnic nationalism because the inherent sense of racial threat often leads to violent behavior. The genocide carried out by Bosnian Serbs against Bosnian Muslims during the 1992–1995 Bosnian War is often mentioned as an example of the result of ethnic nationalism.

Whereas the ethnic variety is seen as the sinister face of nationalism, the cultural form tends to be more celebrated. According to this classification, nations are made unique by having distinctive markers such as language, history, or traditions. These common traits should be celebrated and saved, the members of the national community protected. National claims are premised on the idea that speakers of the same language enjoy more in common with one another than with nonspeakers. Likewise, if cultural traditions are shared, those who take part are bound together by common interests and ideas. The nineteenth-century Irish-Ireland movement stands as a clear example of cultural nationalism. Participants in this movement pointed to Ireland's history of Gaelic speaking and sports as obvious distinctions between the Irish people and the British regime in Ireland. Efforts were made to protect the Irish language by promoting Gaelic speaking; to isolate Irish-speaking areas, or Gaeltachts, from Anglophone influence; to raise Gaelic games, such as hurling, to widespread popularity; and to demand an Irish government that would actively promote these interests.

Banal Versus Separatist Nationalism

Most media discussion of nationalism focuses on national groups anxious to separate from established nation-states. Separatist groups may be cultural or ethnic in nature, but they are unified by their belief that nations should govern states. When larger nations subsume smaller ones, the smaller nation is justified in attempting to create its own state. Separatist groups include the Irish Republican Army (IRA) in Northern Ireland, Parti Québécois in Quebec, Euskadi Ta Askatasuna (ETA) in the Basque Country, and the Scottish National Party (SNP) in Scotland.

The tactics adopted by separatist groups to attain their objectives vary widely, ranging from terror campaigns as waged by ETA and the IRA to the democratic approach utilized by Parti Québécois and the SNP. Likewise, the various groups imagine the precise nature of their nations differently. Thus, on one hand, the SNP bases its call for Scottish independence primarily on economic factors, suggesting that the British government does not fairly represent Scottish interests. The SNP refers to this argument as "civic" nationalism. On the other hand, Parti Québécois bases its call for an independent Québec on cultural and linguistic differences, arguing that if Québécois culture is to be safeguarded, Québec must separate from the rest of Canada.

Although separatist nationalism is most cited in news coverage, according to social scientist Michael Billig, the reality is that most nationalism is "banal." The political leaders of countries such as the United States, United Kingdom, New Zealand, or France are not usually termed nationalists, yet the people of these countries are often more nationalist than are those where separatist movements are active. In stateless-nations, where national groups struggle to create their own nation-state, nationalist leaders must constantly work to mobilize the population. In contrast, most people in successful nation-states are unconsciously nationalist. Among these communities, nationalism exists to unify a people. Nationalism is simply a fact of daily life and a day-to-day reality. Discussion of the "national interest" stands in for impassioned calls for struggle.

Of course, unifying nationalism can quickly and easily change shape as needs alter. During international sporting events or in the face of external threats, "banal" nationalism quickly transforms into a more active "hot" nationalism. The group's nationalism thus becomes overt (though it is often called "patriotism" rather than "nationalism"). Flags proliferate. Rhetoric is impassioned. For example, in the months and years after the terrorist attacks of September 11, 2001, Americans mobilized along nationalist lines, drawing on rhetoric of national unity to create a sense of certainty amid fear. The external threat posed by "the terrorists" necessitated an immediate and unified response. Of course, within these calls for unity was a sense that it was "us" against "them," generating the type of xenophobia that critics of nationalism point to when

suggesting the often divisive nature of nations and nationalism.

Classical Versus Liberal Nationalism

In recent years, political philosophers tackled nationalism after previously expressing little interest in the topic. In particular, a debate raged about the morality of nationalism. Given that even the most inclusive "banal" nationalism can become exclusive when a feeling of collective threat is experienced, there is a very real question whether nationalism can be conceived as "ethnical."

"Classical nationalism" demands that members of the nation be vigilant about protecting their ethnocultural group. Citizens might be expected to buy goods manufactured in the nation-state or to actively protect indigenous culture at the expensive of "foreign" threats. Although not inherently dangerous, classical nationalism can easily become exclusive if outsiders are deemed a threat to the community.

Philosophers, led by theorist David Miller, challenge the notion that nationalism must necessarily show a negative face and suggest that "liberal nationalism" might actually promote democracy, human rights, and global stability. The argument in favor of liberal nationalism branches out from the debates outlined previously in this entry. Miller, for example, argues that there is little reason to quibble about the distant ethnic origin of nations or to suggest that nationalists lie about their history. Although there may be ethnic roots and although there is considerable inaccuracy in nationalist history, nationalities are capable of rapid change—within a generation, perhaps—and even the most questionable nationalist mythologies are not completely wrong. Likewise, the reality is that the most successful nations are not those with a single ethnic community, but are instead multiethnic. These successful nations tend to be democratic and tend to forward a strong sense of social justice.

As nations demand that members feel a high degree of obligation to their national community, there is potential to use nationalism to promote positive social and political values. According to Miller, nations lend themselves far more to social justice than to injustice. The more that is asked of a national group, and the more those demands involve the promotion of fairness, the stronger the state and the international community become. Claiming that there is much to be gained by protecting common culture, Miller adds that the state is in an excellent position either to assist in this protection of a national culture, if doing so would be beneficial to the larger national project, or, in cases where culture is hotly contested, to adopt a neutral policy that robs *all* competing groups of potentially divisive power. Finally, he adds that nations help support the idea of strong democracy. Nationalism demands that the people are loyal to the nation first, putting the interest of the national community ahead of personal interests. It demands that people trust one another. Trust is an essential cornerstone of democracy; thus, nationalism promotes democracy.

Naturally there are many critics of liberal nationalism. If nations have long histories, perhaps they are not as easily manipulated to advance Enlightenment ideas, as those promoting the idea of liberal nationalism would have it. Likewise, even if a sense of internal harmony reigns, the tendency to quickly move from a banal to a "hot" form of nationalism is ever present. Perhaps the notion of a kinder and gentler nationalism is little more than a romantic idea.

The End of Nationalism?

During the early- to mid-1980s, when many of the books at the heart of the debates were published, many scholars predicted the disappearance of nations. If nations were invented to meet the specific needs of the Industrial Revolution, or if they developed as a result of print capitalism, then, scholars suggested, nations and nationalism would eventually outlive their usefulness. The realities of a globalizing world of multinational corporations, instant communication, and rapid transportation would deterritorialize identity. Just as print may have made it possible to identify with a heretofore unimaginable number of people, so modern technology and modern capitalism engender the possibility of a global identity. Surely, scholars suggested, new realities will turn us all into citizens of the world.

The reality seems to be rather different. It is true that the post–9/11 world is undoubtedly more globalized, the Internet makes it possible to

instantly communicate worldwide, and Islamist terror organizations apparently seek objectives not defined by nationalist agendas. Yet the answer to these concerns is anything but postnational. The American response to the terror attacks of September 11, 2001, was decidedly nationalist. Politicians still communicate with constituents using nationalist language. Global communication and easy world travel actually promotes difference as people vigorously seek out the "other." Flags continue to be potent symbols. Nationalist struggles for self-determination continue to take place around the world. Although it is possible that nations and nationalism will eventually diminish in importance, that reality has yet to be realized.

NATURALISM

This entry provides an overview of the naturalistic trends of ancient political thought and contrasts them with variants of contemporary naturalism. It also presents a selection of key naturalistic theses in ancient political thought.

Naturalism in Contemporary Philosophy

There are two main variants of contemporary naturalism: methodological and substantive naturalism. At the core of methodological naturalism is a particular understanding of the relation between philosophical inquiry and contemporary science (hard science, like physics; soft science, like sociology or political science; or both). According to methodological naturalists, philosophy needs to be congruous with scientific methodology. Methodological naturalism is developed as a reaction to the practice of armchair conceptual analysis that dominated Anglo-American philosophy since Friedrich Ludwig Gottlob Frege and maintained a strict division between philosophical and scientific inquiry. According to the philosophical tradition of conceptual analysis, philosophy differs from science in both its object of inquiry and its methodology. Philosophy aims at the study of logical relations between concepts with the aid of a priori analysis. Some methodological naturalists claim that philosophical inquiry must be altogether replaced by scientific inquiry (replacement naturalism). Some others adopt the more moderate thesis that the goal of philosophical inquiry is to provide norms of proper theorizing on the basis of successful scientific practices (normative naturalism).

Substantive naturalism takes two forms: ontological naturalism and semantic naturalism. Ontological naturalism is the thesis that reality consists of one type of entity: natural entities (also referred to as physical entities). Natural entities are the objects of study of the natural sciences and to which the laws of nature apply. For example, ontological naturalists deny that there are mental events or properties (e.g., thoughts or emotions) that either are not reduced to, or do not properly cause, physical events or properties. Semantic naturalism is the thesis that nonnatural predicates (like "good" or "beautiful") have the same reference as relevant scientific predicates, that is, predicates that are used in the language of hard or soft sciences, and that a proper philosophical analysis of nonnatural predicates should identify their coreferential scientific counterparts. For example, a proper analysis of "good" should show that it refers to the same property as "utility maximize," which is amenable to proper scientific inquiry. (This classification of contemporary naturalism relies heavily on Brian Leiter's useful classification.)

Naturalism in Ancient Political Thought

Assimilating naturalism in contemporary philosophy with the naturalistic doctrines of ancient political theorists and philosophers may lead to confusion. For example, though the political philosophies of Plato and Aristotle have important naturalistic trends, these thinkers are hardly methodological naturalists. The congruence of philosophical inquiry with political science, which methodological naturalism about political philosophy could be taken to recommend, makes sense only in a context in which philosophical and scientific inquiries are properly individuated. However, philosophical and scientific inquiry about the political realm are not neatly distinguished but are rather interwoven in Plato's and Aristotle's philosophies. It is equally misleading to take naturalistic elements in Plato's political philosophy to indicate commitment to substantive naturalism. Plato does not identify nature as the proper object of a natural science (at least as natural sciences are currently conceived) and allows nonphysical entities (e.g., souls) to be parts of the causal network of nature.

The naturalistic trends of ancient political thought are best captured by reference to two kinds of naturalism: "explanatory" and "justificatory." Nature is invoked by ancient political theorists in order to explain social phenomena (e.g., the development of city-states and the emergence of law) and to justify and recommend social arrangements (e.g., specific constitutions). Nature is also understood in primarily two ways: either broadly as world nature, that is, an arrangement of the world that includes human nature, or more specifically as human nature.

Explanations by reference to nature (either world nature or human nature) may be of two types. On the one hand, reference to nature may explain why something is *possible*. In this sense to say that X is natural (or by nature) is to say that world nature or human nature makes it possible that X occurs. In this manner we should understand Aristotle's theses in *The Politics* that the city (*polis*) exists by nature (1.2, 1252a30–31) and humans are by nature political animals (1.2, 1253a2–3). Aristotle's point is that humans have an innate impulse for political life, which is accompanied by an inner capacity to develop practical wisdom and moral virtue. The innate capacities of humans make it possible for political organizations like cities to exist. (This account of Aristotle's views follows Fred D. Miller, Jr.'s, interpretation.) On the other hand, reference to nature may explain why something is *necessary* or *unavoidable*. In this sense, to say that X is natural is to say that world nature or human nature not only makes possible but somehow necessitates that X occurs. Thucydides refers in this sense to human nature to explain why in war and especially in civil strife (*stasis*), men will always engage in acts of extreme immorality: "And numerous and horrible were the things civil strife produced in cities—these have occurred and will always occur as long as human nature remains the same" (3.82.2; cf. 3.45). Thucydides' point is that human beings have innate immoral and destructive tendencies. These tendencies are, even under the rule of law in peaceful societies, hard to restrain (3.84). But in a lawless strife, they always manifest themselves with brutality.

In naturalistic justifications one adduces normative reasons in favor of something. This is how we should understand references to human nature within the context of the Stoic theory of appropriation (*oikeiôsis*). The Stoics believed that there is an innate tendency of human beings to identify with and care for other human beings. They further acknowledge that bad education might "corrupt" this natural tendency in human beings, which indicates that for them the natural tendency of appropriation has a normative dimension (*Diogenes Laertius,* VII, 8). Their point is that we should avoid the destructive function of education and follow our natural tendency instead. In a similar manner we should understand Callicles' reference to world nature when he claims that according to nature, it is just for the more powerful to have more (*pleon echein*) than the weaker (*Gorgias,* 482e2–484c3). According to Callicles, human laws have inverted the moral order that exists according to (world) nature. They postulate that it is bad to do wrong (i.e., to take more than others), whereas what is bad, according to nature, is to suffer injustice (i.e., have less than others). By referring to what is just, according to the natural order of the world, Callicles intends to recommend taking more (*pleonektein*).

Naturalistic justifications presuppose naturalistic explanations. For example, the fact that the tendency of appropriation is natural explains why

it is necessary that human beings will feel (up to a degree) compassion for each other. Similarly, the fact that injustice, as having more, belongs to the natural order of the world explains its existence in the world. However, naturalistic explanations do not exhaust the content of naturalistic justifications. Their additional point is that we have normative reasons to conform to what is natural.

A final distinction worth drawing concerns two senses of human nature. On the one hand, human nature may signify a particular person's capacities or abilities, which require education and habituation to be properly developed in stable traits of character. For example, this is how we should understand Plato's account of the nature of the philosopher kings in book 6 of *The Republic* (485b10–487a8). Plato refers inter alia to the abilities of the philosopher kings for quick learning and for strong memory (486c1-d3) and their tendency to be sociable and gentle (486b6–13). These natural abilities need to be developed through the appropriate education in the perfect city (487a7–8) in order to become stable traits of character. On the other hand, human nature may signify the stable traits of character of a particular person who has received the appropriate education and habituation. This is how Plato uses the term in *The Republic* (395d1–3) when Socrates asks: "Haven't you noticed that imitations (*mimêseis*), if they continue from early childhood onward, turn into habits and nature (*phusis*) of one's bodily gestures and one's tone of voice and one's state of mind?" In this passage Plato refers not to one's natural abilities that need to be developed by appropriate education (which involves mimetic activities as its predominant feature), but to the *outcome* of that education, one's developed personality. (A similar distinction between two senses of human nature is drawn by Aristotle in *Nicomachean Ethics,* II.1, 1103a17–26.)

Some Naturalistic Theses in Ancient Political Thought

The pre-Socratic philosophers were primarily interested in the study of world nature. Some of them (Alcmaeon of Croton, Anaximander of Miletus, and Heraclitus of Ephesus) believed that rules of justice govern the workings of the world and are analogous to rules of justice that govern social conduct. For example, Anaximander believed that all beings in the world came from some *apeiron* (unlimited) stuff. In this original state there was a dynamic balance of opposites, which is (world) justice. When some entities come into being from this original *apeiron* stuff, they upset the original, just balance. Their "injustice" is punished by their decay and ultimate destruction. Political justice is an analogous balance of power in social arrangements.

With the Sophists a new theme emerges: the relation between nature (*phusis*) and positive law or convention (*nomos*). Two camps of thought may be distinguished. On the one hand there are those who take nature and positive law to be antithetical. The following illustrates two of the forms this antithesis may take:

1. According to (world) nature, it is just that powerful people pursue their own advantage and have more than others. Positive law tries to restrain and curb the demands of nature by making some type of social equality (conventionally) just. This is the way Callicles formulates the antithesis between nature and law in the *Gorgias*. It is an antithesis between two conceptions of *justice:* natural justice and conventional justice.

2. Justice is conformity with the laws of one's city. Failure of conformity with the laws results in punishment and shame when it becomes public. However, conformity with the laws of one's city frequently conflicts with the demands of human nature (that one pursues one's natural inclinations). So the best course of action is to conform with justice in public (so as to avoid punishment and shame) and nature in private. This is how Antiphon formulates the antithesis between nature and law, on one reading. It is an antithesis between two different kinds of *harm* resulting from violations of the demands of nature and law, respectively.

On the other hand there are those who take nature and positive law to be compatible. For example, Protagoras argues in Plato's *Protagoras* (320a6–328d2) that as a result of Hermes' distribution, all humans share in justice (*dikê*) and moderation (*aidôs*), and this sharing enables them to form societies. Justice and moderation can be understood as natural capacities that need education and habituation to develop into virtue proper.

The fact that these capacities are natural is suggested by Protagoras's explanation of why the sons of some people famous for their virtue are not as virtuous as their fathers (326e6–328c2). Protagoras ascribes the difference in virtue to people's "natural" aptitude (see the use of *euphuestatos* in *Protagoras* 327b8): Some people are by nature able to achieve a higher degree of virtue than others, though all of us are by nature able to achieve the level of virtue necessary for participating in society. Protagoras rejects both that conventional justice is incompatible with natural justice and that the law is ultimately harmful to the citizens. On the one hand, conventional justice is in fact the development of a natural capacity for virtue. On the other hand, the benefit human beings gain by observing laws is not simply avoidance of shame and punishment. Protagoras takes the formation of societies to be necessary for the survival of individuals (322b1–323a4) and thus to serve more basic interests than the ones Antiphon's account allows for.

It is impossible to do justice here to the naturalistic trends of Plato's and Aristotle's philosophies. Only an outline of some of their positions is presented here. Like Protagoras, Plato believes that there is no irreconcilable conflict between law and nature. Not only is conventional justice compatible with human nature but it is instrumental to the perfection of human beings and the attainment of psychic harmony. People attain justice in their souls by performing conventionally just actions (*The Republic,* 443c9–444a2). Further justice is a property of the world nature understood as the world of the Forms, which the social arrangements in the perfect city of *The Republic* imitate (500b8–501c9). The social arrangements of the perfect city are explained and justified by reference to both the demands of human nature and the demands of world nature. Only in the perfect city is human nature fulfilled and only the perfect city imitates the just order of the world of the Forms. Plato's explanatory and justificatory naturalism is intertwined with his elitism. He claims that few people (the philosopher kings) are able to understand the nature of true justice and act morally if left free. The majority of people are unable to attain moral perfection on their own. For this reason they should subordinate themselves to the authority of the philosopher kings in the perfect city (474b3–c3).

As noted, Aristotle holds that the polis exists by nature and that humans are, by nature, political animals. Aristotle resorts to human nature to explain how political organizations are possible. In addition to these two theses about the naturalness of polis, he maintains a third thesis, which is central to his naturalism. He claims that the polis is, by nature, prior to the individual (*Politics,* 1.2, 1253a19). His point is not that human beings can exist only in societies. He is best understood as saying that the polis is more complete than each of its citizens taken on his own and thus that social life is a more perfect form of life than solitary, asocial existence. Aristotle also holds some notorious views about the nature of women and slaves (*Politics,* 1.13, 1259b18–1260a24). He takes women to be, by nature, subordinate to men because their faculty of deliberation lacks authority and cannot properly guide their actions. He also believes that some human beings lack the faculty of deliberation and thus are unable to rule themselves. These people are, by nature, slaves and should be subjected to the despotic rule of a master.

Objections to Naturalism

The basic problem for both explanatory and justificatory naturalism concerns the viability of a proper account of nature. On the one hand, the idea that world nature includes a normative just order conflicts with contemporary substantive naturalism and methodological naturalism. (Physical science does not reveal and its methodology is inconsistent with the assumption that there exists such an order.) On the other hand, it has proven notoriously difficult to differentiate between what is the direct result of one's natural makeup and what is the result of one's cultural upbringing.

Natural Law

The tradition of natural law goes back to antiquity (notably Marcus Tullius Cicero); it was then incorporated and further developed in Christian moral philosophy (Augustine, Thomas Aquinas, John Duns Scotus, and William of Ockham) and saw its most important development as a response to the civil and religious wars during the early modern period. In the seventeenth century, natural law theory clearly was at the height of its theoretical development (Thomas Hobbes and Samuel von Pufendorf were the most important theorists), and its influence across most of Europe not only was felt in dominant political discourses but also was prominently present in the curricula of most law students. Its increasing theoretical elaboration and differentiation dominated moral and political philosophy, and on the practical side, its wide-ranging dissemination during the seventeenth and eighteenth centuries influenced the formation of European bureaucracies and civil servants.

Since the fifth century BCE, natural law has provided a system of norms, and since no later than Cicero, it claimed validity and judicially binding force for all human beings. This claim was universal and founded on the assumption that all rational beings were able to grasp and thus follow these dictates of right reason. Such an assumption is controversial, and the development of increasingly sophisticated natural law theories bears testimony to the attempt to argue for such a universal system of binding norms. This complex and far from coherent tradition can be divided into three main strands of natural law theories: (1) pagan or ancient, (2) Christian, and (3) modern. Natural law theories also provided the general foundation for the Western idea of the social contract as the underlying rationale of legitimate state authority, as well as the basis for international law and the claim that each human individual is the bearer of inalienable rights, which should not be confused with modern human rights. Nevertheless, in its different variations, such a claim to a universally binding system of norms still informs modern discussions about human rights and their status and validity in a multicultural world with conflicting customs, religious beliefs, and moral values.

Pagan Natural Law

Before Plato, ancient philosophers perceived natural law as belonging exclusively to the natural sphere and not to that of the human. Heraclitus was the first who perceived natural law as being also part of the constitution of the polis and, more importantly, as the inherent order of the universe. His concept was, however, still limited to the physical powers and did not anticipate the later connotation of a normative system. Applying natural law to the social human sphere, Heraclitus thus described the mutual dependence of the ruling and the ruled. His system expounded the exercise of power in society and already showed some awareness that it was related to the idea of justice, but conceptually there was no clear distinction made between the natural order of things and a normative order.

This concept resurfaced in Stoic and Thomist philosophy as eternal law (*lex aeterna*), which aimed to establish this distinction and to found a normative system of morality and law. Antiphon, a philosopher who belonged to the Sophist School, still argued that right should be derived from the natural order of things, that is to say, the limited concept of physical natural law. In this conception human law is artificial and thus not natural. The inherent consequence for Antiphon and other Sophists (e.g., Hippias) was that only the natural is correct and hence binding. The notion of just and unjust depends on what is perceived as being prescribed by nature. Laws decreed by humans are secondary and arbitrary and thus do not have the same obligatory force as natural laws. Only nature can provide the foundation of obligatory laws.

Anonymus Platonis was the first who argued against this position and combined these naturalistic arguments with the theory of a contract in which humans engaged for their own benefit and thus protected the weak against the strong. All enjoyed freedom and property in this society, but according to Anonymus Platonis, this decreed right was still perceived as being established against nature and thus remained nonobligatory. Another Sophist, Iamblichus, took this argument up and developed it further, arguing that following Protagoras's theory of human culture, people had joined in only society because they could not survive in isolation. Men had committed themselves to establish society by contract only because it had proved impossible to live in society without the rule of law. It was on these necessities that the regulations of a normative order were based, and these regulations allowed for the existence of justice among men. In this new concept and understanding, the idea of what was naturally right began to change significantly.

Plato, too, founded the order of society on human needs, which demanded the division of labor and the institutionalization of the exercise of political power. Similar to Iamblichus, Plato believed that the legal order was ultimately founded on human nature, precisely because it provided the necessary framework to serve human needs. However, he never called his theory a natural law theory, because he believed that the transcendental being of the idea was the true foundation of his theory of justice. Plato clearly overlooked that this position was still deficient to prove the obligatory character of the normative order of a polis, and much more so a universal normative order, beyond a concrete political entity. His argument can only inform humans about their self-interest in the existence of such an order, but not that they should always perceive it as absolutely binding on all their actions.

It was Aristotle who developed a clear understanding of the decisive difference between purposeful rational actions and behavior that is oriented according to existing norms. He distinguished between the possibility and the reality of the human condition. This allowed him to show that the notion of a natural foundation of human political society was indeed "natural," not because of human self-interest, but because it was inherent in human nature to realize its full potential in a political association. This argument encountered immediately the problem of whether these norms were universal. In the end the argument did not go beyond Antiphon's earlier assumption that the natural and legal order were to be seen as the same thing.

It was Cicero who, building upon the Greek Stoic tradition and notably Chrysippus, made considerable progress regarding this *problematique*. For him man was not a political but a social being. This meant, among other things, that the conception was no longer aimed at a specific political and economic experience of the Greek polis, but could be universalized. The law of nature is perceived as a universal commanding and prohibiting norm that obliges all human beings. In this way, the connotation of natural law shifts toward a demand or duty that obliges all human beings. The imperative character of natural law also meant that Cicero and the Stoics had to elaborate on the difference between law *(lex)* and right *(jus)*. In the context of this argument, law was equated with right reason; this allowed Cicero to identify an alternative source for the authority of law. It was possible for Cicero to claim that "law . . . is the distinction between just and unjust things, produced in accordance with nature" (Cicero, *On the Laws,* II-13, p. 134). Thus natural law had received a prominent and independent existence, which superseded and informed positive law (*jus civile*) as well as international law (*jus gentium*). This kind of law is assumed to be eternal and omnipresent. It prescribed the duties each human being had toward his fellow beings. Everybody could conceive these duties because of his right reason (*recta ratio*). Despite the remaining terminology of *jus naturale* (right of nature), the emphasis had thus clearly been shifted from right to the prescribing law of nature.

Christian Natural Law

The foundations of pagan natural law—that is, eternal nature as the basis for universally binding right and human reason as a way to conceive of these existing norms—were at odds with Christian religion. Because according to Christianity the world was founded ex nihilo by divine revelation, which transcended human reason and understanding, it would have been expected that Christian

theologians would criticize pagan natural law. However, Augustine (354–430) and, following him, Aquinas (1224–1274) incorporated pagan natural law into Christian theology and philosophy. Augustine is indeed very close to Stoic Ciceronian philosophy and effectively claimed that pagan natural law was fully absorbed by Christian morality. This was fostered by the fact that Christianity had eventually become the exclusive state religion of the Roman Empire in 381 under Theodosius the Great. Aquinas was the first to elaborate a systematic natural law theory, in his *Summa theologiae*. He combined aspects of the heterogeneous traditions of pagan natural law, Roman positive law, Greek natural philosophy, the early church fathers, and early scholasticism in an impressive systematic doctrine. Despite this achievement he was unable to forge a coherent theory free of contradictions stemming from these opposing traditions. He divided right into eternal law (*lex aeterna*), natural law (*lex naturalis*), human law (*lex humana*), and added the divine law (*lex divina*). This allowed him to incorporate divine law into the pagan teleological concept of right.

The foundation of Aquinas's theory of law was the revealed order of God's creation. In contrast to the pagan natural law theory, Aquinas perceived this order as a normative one and not as a previously held order of being. The eternal law, which humans could perceive because they were endowed with reason, informed the positive human law. Duns Scotus (1266–1308) introduced a fundamental critique of this natural law tradition, because he doubted that the obligatory force of natural law could be derived from reason alone. He claimed, on the contrary, that only God's will could introduce binding norms to humans. This dramatic shift of the argument introduced the notion of voluntarism; that is, that for him, any rational norm or law depended on the will and enforcement of a lawgiver. Only on this basis could he comprehend the possibility of effectively binding and obliging human will by norms. Ockham (1285–1349) developed this voluntaristic natural law theory further, but it was only in the seventeenth century that it developed its full potential, notably in the theory of Hobbes.

The Spanish Scholastics revived the Thomist natural law theory in the fifteenth and sixteenth centuries. Francisco de Vitoria (1485–1546) is the most prominent of these thinkers, followed by Vázques de Menchaca (1512–1569) and Francisco Suárez (1548–1617). Vitoria contrasted the allegedly superior competence of the theologian against the allegedly deficient competence of the jurist. This was part of the centuries-long struggle between these two faculties that is now conveniently and slightly misleadingly summarized as the process of secularization. At the time of Vitoria's own writing—despite the upheavals caused by the Reformation—the theologians were still clearly in the stronger position and the importance of religion for the sixteenth and even seventeenth centuries should not be underestimated. The question of whether the prospect of eternal life in paradise was jeopardized by behavior in this world was of paramount concern. Man in the postlapsarian state (after the fall) was in a morally precarious situation, prone to sin and potentially inclined to mischief toward fellow men. The reason for establishing state authority—able to decree and, if need be, enforce laws—lay exactly in this need to address the shortcomings of men's deficient *fallen* nature. Thus state authority is necessary to remedy individual human deficiencies. The contrast between theologians and jurists is less straightforward and obvious because theologians like Vitoria claimed superiority even over legal and *worldly* matters. This dominance of the theologians regarding natural law theory, as well as its implications for international relations, was profoundly challenged in the early seventeenth century.

Early Modern Natural Law

The predominant theory of political and social philosophy of the seventeenth and eighteenth centuries can be identified in the "modern" or postscholastic natural law tradition, which was inaugurated and shaped by the influential writings of Hugo Grotius (1583–1645) and then further developed by philosophers and scholars like Hobbes (1588–1679), John Locke (1632–1704), Pufendorf (1632–1694), and Christian Thomasius (1655–1718) or later modified by Francis Hutcheson (1694–1746), Christian Wolff (1679–1754), or Emer de Vattel (1714–1767). Conventionally, Grotius and Vattel are perceived as the starting and end point of "modern" natural law theory. It is characteristic of this new approach that it was

undertaken by jurists and philosophers, stemming from a Protestant background, against the predominance of theologians. The natural law theories of the seventeenth and eighteenth centuries are therefore an essential part of the process of secularization. Grotius had still maintained, relying heavily on Cicero and the Spanish scholastics, that natural law was universally binding. He claimed that this assumption rested not only on a theoretical and conceptual basis, but also on the fact that natural law was indeed manifest within human experience. Despite Grotius's importance for the development of international law, his contribution to the natural law theory is less innovative than claimed by later natural law theorists such as Pufendorf. Regarding the discussion on which grounds natural law could be universally obligatory, Grotius ignored the insights of Duns Scotus and Ockham and it was Hobbes, and following him Pufendorf, who truly rose to this challenge.

Hobbes wanted to know the source for the existence of norms and on which basis they could really claim validity. His concept of the state of nature is key to this new approach. The passions and the fear of death dominate in this natural state and make man a potentially dangerous being who might want to harm others. Consequently, man is forced to be extremely cautious toward his peers. Second, man has a right to everything (*jus in omnia*) in the state of nature, but as Hobbes is quick to show, this results in the war of all against all, because this right is not protected and not enforceable. On the contrary, everybody might claim, with the same right, the same thing. Therefore, even if we wanted to, we should not trust other people as long as there is no sovereign to protect our rights. Hobbes's main aim in the construction of the state of nature was to demonstrate compellingly the need to leave it, which is achieved by creating the civil state endowed with sovereign power. The sovereign is created either by conquest or contract. The negative and dangerous predicament of the state of nature is eventually overcome by the creation of the *Leviathan* and it is difficult to argue against the compelling argument that man is indeed better off under the legal framework of a state endowed with legitimate and exclusive authority to provide the means to enforce law and peace and to protect its citizens. The only valid criticism is that of Locke, which has been constantly reiterated. Locke simply questioned whether Hobbes's concept of an absolute sovereign would not indeed rather endanger than foster man's liberty and security, if there were no mechanisms for controlling the sovereign to ensure accountability and thus effective prevention of misuse of the sovereign's (unlimited) power.

But this aims rather at the outcome of the contract than at its logic, which was actually shared by Locke, and its ability to create a state endowed with sovereign power under the conditions of the Hobbesian state of nature. His reference to the laws of nature is an important prerequisite for the contractual creation of a state to leave the state of nature, of which the first was to seek peace. But how is it possible that man can trust others and be prepared to engage in a contract under the conditions of the state of nature? For a satisfactory answer to this obvious contradiction one needs to consider time, which is exactly what Hobbes did in his theory. The social contract is not meant to be a contract that is made and fulfilled at a single moment in time, as is the case in a property contract. In Hobbes's creation of the state by contract, this is obviously not the case. There is no defined moment in time at which any of the contractual partners can claim to have fulfilled their obligation. It is a permanent effort that everybody subscribes to in making such a contract. This continuous performance demanded by the contract provides the safeguard against those who do not adhere to the contract, taking advantage of the good faith of those who do. Because of this procedural character the trust we invest in others remains a calculable risk. We can, therefore, seek peace and not be thrown back to the second best, inherently much less stable, and consequently much more dangerous situation, which is to rely on our capacity for self-defense. This allows for a realistic and fairly secure framework in which the sovereign can be created (cf. Hobbes, *Leviathan,* XVII, p. 120). Once the sovereign is in place, he will declare the necessary laws to organize civil society and will take the responsibility of safeguarding the adherence to these laws. From here on, other questions and problems ensue, as manifested in Locke's criticism.

However, it was Pufendorf rather than Locke who took up Hobbes's theory in an innovative and original way. The underlying discourses in natural

law theories had been changed dramatically by Hobbes. Three areas of concern can now be identified: (1) The question of the source and obligatory character of universal rights and laws, as described in Hobbes's state of nature (right to everything and natural laws), had been poignantly resurfaced. (2) Closely related to the state of nature scenario, the troublesome question of whether self-interest or sociability was the prevailing character of human beings needed to be addressed. (3) Natural law theory had to tackle the issue of how to legitimate sovereign state power and to what extent the natural laws actually informed and potentially limited the exercise of this power. In Pufendorf's natural law theory, these aspects were interwoven. Departing from the Hobbesian concept of a state of nature, Pufendorf tried to reconcile the assumption of human self-interest with the idea of man's sociability. Similarly to Hobbes, Pufendorf claimed that the potential insecurity and the lack of legitimate and enforceable justice in the state of nature were its main disadvantages. This was, above all, a juridical argument, because at the heart of these disadvantages lay the absence of a legitimate sovereign power capable of administering peace and justice. Very similarly to Hobbes, Pufendorf argued that there could be no obligation for man without a coercive sovereign authority. In *On the Duty of Man and Citizen,* Pufendorf maintained that

> the true and principal cause why heads of households abandoned their natural liberty [in the state of nature] and had recourse to the constitution of states was to build protection around themselves against the evils that threaten man from man. . . . Admittedly, natural law teaches that men should refrain from all infliction of injuries. But respect for that law cannot guarantee a life in natural liberty with fair security. (Pufendorf, *Duty of Man,* II-5, p. 133f)

But these negative consequences that resulted from man's self-interest in the lawless state of nature were counterbalanced in Pufendorf's theory by a second aspect of man's nature.

This combination of man's self-interest with his sociability was profoundly innovative, because sociability was no longer mutually exclusive with self-interest. On the contrary, Pufendorf maintained that, in the long run, only sociability will guarantee and foster the realization of man's self-interest. This assumption differs not only from the classical Aristotelian understanding of human nature but also from that of Grotius. Pufendorf had asserted that sociability was not only a human inclination, in the sense of Aristotle or Grotius, but also the fundamental natural law that everybody should respect and pursue for the sake of their own interests. This is the argumentative link that Pufendorf establishes between sociability and self-interest.

Thomasius followed Pufendorf's natural law theory to a considerable extent, reiterating the attacks against the natural law theories of Protestant theologians and insisting on the separation of theology and jurisprudence. In the various stages of his writings on natural law, Thomasius carved out a coherent theory of how to achieve peace and security for a society made up of different Christian confessions such as Calvinists, Lutherans, and other dissenting "sects." The role the state was to play in this endeavor was considerable, insofar as, similar to Hobbes and Pufendorf, Thomasius relied on the concept that all laws are derived from externally imposed obligation. These obligations were no longer linked to moral or religious demands but were conceived as an autonomous domain of external obligations imposed by a political superior. The reintroduction of morality (via the *decorum* and *honestum*) in his *Fundamenta* introduced the notion of love into morality, which was later taken up by Hutcheson. But at the same time, this move now served effectively to establish a hierarchical structure of the political sphere of external laws (*justum*) over the sphere of morality.

Both Pufendorf and Thomasius fostered the picture of a linear and purposeful development from Grotius to their own writings. But the early modern natural law is far from being just one coherent tradition or doctrine, despite the opposite claim by some of its leading adherents at the time. The predominant contemporary debates about the state and sovereignty, morals and religion, or toleration and resistance were all closely linked and argued with references to natural law. Pufendorf's work played a central role in many of the contemporary debates of the early eighteenth century. Although most of the various discourses later used some aspects of Pufendorf's theory, it was frequently exploited with near contradictory aims and purposes. The translation of Pufendorf's writings on

natural law by the Huguenot refugee Jean Barbeyrac (1674–1744) guaranteed widespread dissemination of these writings all over Europe. Thus Pufendorf was easily accessible to the French republic of letters. The different influences and various adaptations of the natural law tradition by the philosophes are difficult to define. It is not only the relationship between Pufendorf and Barbeyrac that makes it difficult to assess Pufendorf's direct influence but also the very fact that natural law for contemporary Francophone intellectuals was filtered by at least two generations of French-speaking Swiss jurists (notably Jean-Jacques Burlamaqui and Vattel). The influence of natural law was more self-evident in its university-based guise in Scotland than in its less outspoken form in the French salon culture.

The Scottish philosophers were deeply influenced by this Protestant, continental—mainly Dutch, Swiss, and German—brand of thought. In particular, three generations of professors holding the chair of moral philosophy at the University of Glasgow (Gershom Carmichael, Hutcheson, Adam Smith) proved to play key roles in incorporating the natural law tradition. Consequently, the importance of Pufendorf's natural law theory for the Scottish brand of moral philosophy has been stressed for a long time. The most significant contribution to the natural law tradition was made by Hutcheson, whose moral philosophy was founded on virtue, which manifested itself in beneficial *caritas* or *benevolence*. Hutcheson's approach not only highlights a crucial conceptual discrepancy between Pufendorf's theory and his own, but it seems also clear that their intentions were less congruent than Hutcheson had implicitly suggested. Hutcheson criticized Pufendorf and Hobbes, in that he asserted that virtue is a natural sentiment in man and thus independent from, and possible without, civil laws.

The crucial argument at the heart of Hutcheson's own theory in the course of his controversy with Bernard de Mandeville (1670–1733) was that the differentiation between the state of nature and civil society does not tell us anything about the natural disposition of man. Thus it remained still to be clarified in how far virtue and *moral sense* were natural to man. However, Hutcheson was far from being satisfied to derive human sociability from a calculation of self-interest or divine laws. He countered Mandeville by trying to strip Pufendorf's doctrine from its Hobbesian premises. Underpinning Pufendorf's arguments with this completely different emphasis allowed him to reconcile Shaftesbury's arguments with Pufendorf's natural law theory. Virtue and *moral sense* lay thus at the heart of Hutcheson's doctrine and were responsible for man's deeds in the state of nature as well as in civil society, as it was inherent in human nature to follow the lead of moral sentiments independently of exterior dispositions. Hutcheson's theory thus anticipated and informed the utilitarian philosophy of the nineteenth century. This idealistic outlook on man's nature eventually manifested a radical departure from Pufendorf's skeptical perception of human nature, which underpinned his natural law doctrine. The fundamental question, which all philosophers discussed, was how moral obligation could be established and secured in order to foster human society. Natural law constituted one important part in this intellectual struggle to analyze and envisage the improvement of human society. But differing concepts of the scope and function of citizenship led to contrasting adaptations and deployment of elements from the same canon of natural jurisprudence.

Natural Law and International Law

The key argument of the natural law theorists concerning international law consisted in the assertion that interstate relations could be regulated by a code of law, enshrined and present in natural law. The assumption that natural law itself could already be perceived as an obligatory law was indispensable for this theory. Grotius maintained that right could exist only with a corresponding obligation. But because for him natural law was demanded by right reason and given by God, the obligatory character of nonpositive natural law could become the basis for legal relations among sovereign nations. This notion of obligation derived from natural law is at odds with the strict voluntaristic idea of right in Hobbes. Hobbes's differentiation between the *foro interno* and *foro externo* is crucial, because it reveals one fundamental difference from most other natural law theorists, who believed the laws of nature to be already sufficiently binding on man and sovereign states. The early modern tradition of international law, from the Spanish scholastics to Grotius, did not attempt to justify international law with a theory of

sovereignty. Rather, it was basically concerned with empirical conditions of war and peace, and the possibility of establishing regulations that would allow restrictions on war and that could also foster and secure peace treaties. Because it proved impossible to avoid war in the first place, their writings aimed to circumscribe warfare. Among the early modern natural law theorists, the Swiss theorist of jurisprudence Vattel presented the most significant theory of international law on the basis of natural law. Similar to Vattel, Pufendorf had already advanced this kind of argument. Both thinkers used the Hobbesian state of nature as the fundamental insight into interstate relations. They did not stop there, but applied the laws of nature in order to overcome this anarchic scenario of an unregulated right of everybody to everything. Their theory of duties, derived from natural law, provided the basic means by which the sovereign is urged to comply with the commands of natural law in international relations. Whereas Hobbes highlighted the problems occurring from the absence of any sovereign power governing the relationship between nations, Vattel pursued an opposite route. If one perceives the obligation to follow natural laws as characteristic of the state of nature, as Vattel did, then the equation of the state of nature and international relations can be seen not only to describe the potential conflicts, but also to provide the means by which they may be settled. A certain weakness in this natural law argument cannot be denied, if one reads Vattel's assumption of the validity of natural laws against the Hobbesian concept of the state of nature. The idea of sovereign states reproduces the antinomy of rights as perceived in the state of nature, and this problem still remains for our own time as far as the relationship between nations is concerned.

Natural Rights

Wherever human beings have experienced a common life together under government, they have made claims upon and against one another, as well as upon and against the government that claims authority over them. When doing so, they have relied on particular political vocabularies or languages in which to express those claims. Sometimes the words in their vocabulary are new, invented in the course of political thinking and activity. Sometimes they are drawn from existing political or legal vocabularies or taken over from ordinary language and put to new use. So it was with the language of natural rights, which emerged in

Europe in the medieval period and was employed by a succession of thinkers and writers down to the eighteenth century and beyond. The exponents of natural rights language drew upon the languages of Roman law and canon law in developing a vocabulary to express claims to those things to which human beings were entitled prior to, and independent of, the claims of political authority. This entry provides a thumbnail sketch of some of the pivotal moments in the history of the development of this vocabulary.

At the center of these developments was one word in particular: the Latin word *jus*. In the Roman law tradition, a jus was originally understood to be something objectively right or just that specified what was due between persons and things as parts of an ordered whole. This understanding harked back to an older idea, owed to the Greeks, that justice was the condition of any complex whole in which the parts fulfilled their particular functions. The Greeks had construed nature as a complex whole and found in it the pattern for justice between persons under government. Thus Aristotle, for one, distinguished between natural right or justice (*physikon dikaion*) and legal right (*nomikon dikaion*), the latter being grounded in and beholden to the former. The Romans had absorbed these ideas and translated them into their own idiom. In the process, they had come to emphasize the customary rights (*jura*) of persons, which specified what was right or proper for them as Romans, over natural rights (*jus naturale*), which specified what was proper for them as creatures, but they had retained the idea that what was specified was in essence objective: a thing that was allowed to people if they satisfied an independent standard set by custom or by nature.

Thomas Aquinas reversed this emphasis, restoring the primacy of nature over custom upon which Aristotle had insisted. In his writings he identified several meanings of *jus,* but on his account its primary meaning was "the just thing itself," the object of the virtue of justice. What was just, in turn, was given or conditioned by the rule or law that specified what was due to each person in justice. Of these rules, the most immediately salient was the law of nature (the *jus* or *lex naturae*), which God had promulgated at the creation to regulate the order that He had made. Natural law provided an ideal standard for human interactions even as it furthered the good of the universe as a whole. It was through doing their parts in this whole that individual human beings would flourish: There could be no conflict between the good of the individual and that of the whole. If people had been imbued by God with certain powers and faculties, then this was to enable them to perform the duties prescribed by His laws. Accordingly, the meaning of *jus* could be extended to include not only what was objectively right, but also those possessions or powers that enabled human beings (subjects) to do right—an ambiguity apparent in the rendering of *jus* into modern English variously as law, duty, or right.

Aquinas's position involved a further ambiguity, in that the law of nature, which specified what was right, existed both beyond the world (as rules in the mind of God) and within it (as the natural inclinations of each thing toward the end God had in mind for it). The distinguishing characteristics of modern natural rights theories may be understood as growing out of attempts to clear up these ambiguities: The idea that natural rights can be assigned to individuals who then possess ownership and discretion over them has its origins in the notion of subjective right. The subjective right, according to Aquinas, is subordinated to objective right. The idea that such rights cannot be prescribed—in the sense that they belong to human beings as human beings (not as creatures of God or members of particular political communities)—has its origins in the notion of human beings as bearers of natural powers, propensities, and faculties that enable them to perform certain actions or entitle them to certain sorts of treatment, which, according to Aquinas, are ordered to divinely instituted ends.

These two lines of development are conceptually independent of one another, but they were closely intertwined historically. As a result, the history of natural rights theories has come to be written in two quite distinct ways: as a history of the development of the idea of subjective rights and as a history of the development of the idea of human dignity as the basis of those rights. Richard Tuck has argued that the origin of natural rights as subjective rights should be traced to the conciliar movement of the fifteenth century, in particular to the writings of the French theologian Jean Gerson, whereas Brian Tierney has emphasized instead the contributions of Gratian, William of Ockham, and

the Spanish scholastic thinker Francisco Suárez to the doctrine that human sociability and dignity are the bases of all law and right. Their accounts should not be read as disjunctive alternatives but rather as two sides of the same story.

On Tuck's view, it was Gerson who first distinguished categorically between jus as a power or possession of persons and what was objectively right. In establishing this distinction, Gerson had equated jus with ownership (*dominium*), which belonged to people naturally and which licensed in them the power (*facultas*) of obtaining whatever was necessary for their preservation. This had the effect simultaneously of individuating rights, as rights were now rooted in individual subjects, and of assimilating freedom (*libertas*) to rights (*jura*), as it was generally acknowledged that freedom was one such facultas. It was left to others to work through the wider possibilities inherent in this position.

In the first instance, this work was undertaken by a group of Thomist and neo-Thomist theologians based at the University of Paris in the late fifteenth and early sixteenth centuries. Among these theologians, the most significant were Conrad Summenhart, John Mair, and Jacques Almain. Summenhart was credited by Tuck with elucidating the notion of subjective rights as active rights, that is, powers that enabled individual human beings to claim what they required for themselves. Mair and Almain contributed the innovative notion that the most effective way to claim such things was to appropriate them for one's own use. Thus it could be said that people had property in the things that they used to preserve themselves. One striking implication of this manner of speaking was that, other things being equal, freedom, as much as any other right, would count as a property and so might be traded like any other property, in exchange for protection or preservation. On this basis, a strongly individualistic doctrine of natural rights might conceivably be used to justify absolute government just as easily as to hold such a government to terms. Perhaps for this reason, others were unwilling to countenance the idea that the right to liberty could be traded away.

Writing in response to the St. Bartholomew Day's Massacre of 1572, in which scores of French Protestants were summarily executed by the Catholic authorities and numberless others died in the violence that followed, some Protestant thinkers argued that men were born in a condition of natural liberty and that this liberty was a privilege of nature that could never be rightly withdrawn or disavowed. From this they inferred that government must therefore originate in an act of free consent, because there could be no such thing as government without the decision of naturally free people to establish it, a point that the *Vindiciae Contra Tyrannos* of 1579 underlined emphatically. In parallel, they played up that aspect of natural law thinking that emphasized the natural powers and sociable propensities of human beings and played down the notion of natural law as a set of divine rules standing outside the world. This allowed them, on the one hand, to suggest that governments had certain responsibilities toward their subjects and could be resisted (if not removed) if they failed to meet those responsibilities and, on the other hand, to dispense with appeals to divine law or religious obligations to justify their rights and liberties. Natural rights in this context meant those basic powers or freedoms that political authority, itself the product of a social contract or agreement, had to take into account. If these rights retained the connotation of duty in being derived from natural law, there was little sense that they were the correlates of objective duties to God.

A further series of refinements to natural rights language was introduced by thinkers of the early School of Salamanca, including Francisco de Vitoria, Domingo de Soto, and, latterly, Suárez. Vitoria had been trained at the University of Paris, and on his return to Spain he began to disseminate the ideas he had inherited from Mair and Almain. It was by this rather circuitous route, whose windings have been charted by Annabel Brett, that Suárez came to restate systematically the view that jus in its strictest sense referred to the moral power that every human being has over oneself and one's own property, or with respect to what is due to one, especially in the matter of one's own preservation. This view subsequently entered the mainstream of Western political thinking in the seventeenth century via the writings of the Dutch jurist Hugo Grotius.

Grotius argued that in its most fundamental sense jus meant a capacity or power possessed by an individual human being that enabled him to do or have something justly. To have a jus, in this

sense, was to be able to engage in certain beneficial actions without censure or external restraint. Grotius thereby extended Suárez's emphasis on self-preservation, placing self-interest at the center of a juridical system that composed a complex whole. But he also echoed the Protestant thinkers of the preceding century in suggesting that this whole operated according to principles of sociability lodged in human nature. Famously, Grotius insisted that these principles would be operative even should it be granted that there were no God and He had no care of human affairs (the so-called *etiamsi daremus* clause).

By subsuming natural law into human nature, Grotius decisively removed discussions of rights from the ambit of moral theology into that of moral philosophy. He opened the way for discussions of rights that, appealing to certain natural facts (such as the fact of being human), came in time to be cast in the language of human rights that is so ubiquitous today. But he continued to conceive of rights as elements in a complex of juridical relationships fixed by law—albeit a law that merely codified certain natural propensities and characteristics of human beings—and so was able to use jus in its objective sense too, the meaning it bore in the title of his great work of 1625, *De Iure Belli ac Pacis* (The Rights of War and Peace). Matters took another turn with Thomas Hobbes.

Hobbes stipulated peremptorily that the subjective meaning of jus was the only legitimate one, that the right people had by nature (*jus naturale*) was a liberty to do whatever they judged necessary to their preservation, in contradistinction to the law of nature (*lex naturalis*) by which they were forbidden to destroy themselves. Law and right, he declared, differed as much as obligation and liberty, and the two should not be confounded. Thus it was Hobbes who opened the way for rights to be discussed and asserted without reference to law at all, and to be filled out with whatever content the individual judged necessary to his or her preservation and flourishing.

Natural rights thinkers after Hobbes recoiled from the more extreme implications of his views, but they accepted his stipulation that a right was paradigmatically a liberty. So much is evident in the writings of John Locke and Samuel von Pufendorf. With Locke, these liberties were understood as grants from God, the pendants of duties to Him, our neighbors, and ourselves, which were derived from natural law. Where Pufendorf followed Grotius in discovering the basis of this law in man's characteristics, Locke treated it rather as a set of divine commands to be inferred from without. In reconnecting rights with law, Locke was able to specify the content of those rights to the triumvirate of life, liberty, and estate. In Locke's view, any government that threatened these rights vitiated its authority, because government was an agency authorized only to protect people and maintain their rights.

In the eighteenth century it was a crude version of Locke's view that predominated. Locke was taken to have said that under the law of nature (which was construed in Grotian rather than Lockean terms) every man had the right to life, liberty, and property, and it was the job of government to secure these. It was a version of natural rights doctrine along these lines that seems to have inspired the American Declaration of Independence and the French Declaration of the Rights of Man, though it is worth noting the Hobbesian undertones in both: The rights they proclaim are generous in number and scope, and the first speaks of the right to pursue happiness—something very much at odds with Locke's own understanding of rights.

Whether or not these declarations marked the apotheosis of natural rights language, it was already coming under attack. Jeremy Bentham pronounced natural rights simple nonsense—indeed nonsense upon stilts—having earlier rejected natural law as the standard of morality. For a long time this attack pushed natural rights language into retreat, but it has recently attracted renewed attention following the rediscovery of Aristotle and Aquinas by analytical philosophers. The language of human rights, meanwhile, has taken on a life of its own.

Negative Dialectics

Negative Dialectics (1966) is often seen as the most fully developed philosophical text of Theodor Adorno (1903–1969). Adorno was a philosopher, sociologist, and theorist of music and literature. A key member of the Institute of Social Research, commonly known as the Frankfurt School of critical theorists, he returned to West Germany in 1949, after having lived in exile in the United States since the late 1930s. Adorno wrote prolifically on topics in social and political thought, philosophy, and aesthetics. His influence in Anglophone social theory has grown steadily since the first translations of his work in the late 1960s. In recent years, Adorno's ideas on negativity and identity, instrumental and administered society, the culture industry, and twentieth-century musical forms have been influential in social and political theory, Continental philosophy, cultural studies, musicology, and literary theory.

Negative dialectics is also the name of a system of thinking that Adorno maintains would better be called an antisystem. The work is a culmination of his lifelong grappling with Immanuel Kant's critical philosophy and Georg Wilhelm Friedrich Hegel's metaphysical idealism. Adorno aims to take elements from Kant and Hegel while denying the systematic claims, by Kant to categorically separate intelligibility from sensibility, and by Hegel to integrate all aspects of particularity as moments of an all-encompassing conceptual universality. According to Adorno, both systems inculcate passivity, an uncritical acceptance of existing social hierarchies and institutions. However, both philosophers are seen by him to offer crucial resources for a more critically conceived and socially transformative philosophical outlook. From Kant, Adorno draws the point that concepts can never wholly cover or exhaust the particularities they comprehend. Adorno calls this the preponderance or priority of objects over the subjects who seek to know them. Its consequence, in his view, is that metaphysical idealism fails in its attempt to set the mind over the world and that positivism, which claims to deal pragmatically with the facts as we find them, misses or conceals the intrinsically dynamic quality of things. From Hegel, Adorno takes the insight that dialectical thinking is consistent reflection upon what he calls the nonidentical, that is, difference or particularity. Adorno argues that Hegel saw that identity in thought (i.e., categorization of different instances under the one concept) is dependent on nonidentity but failed to do justice to this insight. Negative dialectics, in contrast to its Hegelian counterpart, refuses to consign differences to any overarching conceptual identity. Hegel propounds a logic of total integration, whereas negative dialectics points to what Adorno calls a logic of disintegration.

Philosophers must think against their own grain in an effort to acknowledge the gap between things and their conceptual, covering ideas. Adorno notes ironically that the use of concepts to unseal the nonconceptual places negative dialectics (the mode of his own thinking) in the situation of baron Münchhausen, who sought to pull himself from a swamp by his own hair. But this need not make impossible the project of thinking both with and against concepts. Adorno provides a sociological argument for negative dialectics to bolster the purely philosophic effort. Drawing primarily on Karl Marx's theory of value, with additions from Georg Lukács's development of the idea of reification, Walter Benjamin's allegorical rendering of commodities, and Alfred Sohn-Rethel's paralleling of logic and economics, Adorno argues that the capitalist economic principle of exchange is at once the substratum and the effect of the philosophical principle of identity. This means that the transformation required to break the stranglehold of identity thinking is not only a conceptual change but a social or economic shift away from the exchange relations of capitalist society. If it is through those exchange relations that individuals

and performances are made commensurable and identical, then a change in the social relations will carry with it a change in the manner and effects of our thinking. Despite his largely pessimistic outlook on modern history, Adorno was yet hopeful that human beings want their social relations to be based on freedom and that a society reconciled with reason would be nonviolent and free.

Under the regime of what he calls "identitarian thinking"—which mirrors the dominance of capitalist commodity exchange—ideas, physical objects, and human subjects are categorized and traded as purely fungible entities. By contrast, in what he calls the reconciled condition, both human existence and conceptual thought would exist above identity and above contradiction. Adorno is certain that this is a utopian condition; yet it is not inconceivable or purely imaginary. Indeed, Adorno suggests that we already conceive such a world whenever we speak of identifying *with* people and things instead of identifying them *as* objects with this or that value and as persons of this or that type. It seems then that Adorno's philosophy is not a logic-baffling invocation of nonidentity in every respect so much as an argument for a notion of identity that escapes the framework of identitarian or classificatory thinking. He says as much, in stating that the logic of identitarian thought says what something comes under or what it represents, whereas the thinking of nonidentity tries to say what something is.

This alternative sense of identity, a sense in which nonidentity contains identity, can hardly be stated without paradox, and *Negative Dialectics* is an enigmatic work that seeks to open up the sensory and lived world through concepts but without reducing the world to concepts. Adorno's suggestion that for thinking to be true it must think against itself evinces his awareness of the paradox. Negative dialectics is an antisystematic philosophy that aims to think conceptually while questioning the invariance and categorization that concepts themselves require. His questioning of the embedded idea of identity as exchangeability points to the seriousness of Adorno's refusal to sanction assumed patterns of thought rather than to the absurdity of that refusal.

Negativity

Negativity, together with cognate words such as *the negative* or *negation,* is a common term in political theory, but it remains an elusive concept. The paradox of the negative is that it is, in principle, averse to definition or identification because this would render it fixed, positive. Sometimes used casually to describe a state of mind or attitude, it also has profound significance within certain philosophical traditions. Negativity is especially crucial for critical approaches and in particular for dialectics, where it received its most elaborate development in the philosophies of Georg Wilhelm Friedrich Hegel and Karl Marx. In the twentieth century, negative thinking is perhaps most associated with the Frankfurt School, but existential phenomenology is also important in locating negativity ontologically. The terminology of the negative has subsequently been eschewed by poststructuralists, deconstructionists, and vitalists, who instead espouse affirmation, creativity, and difference. It is these three approaches to negativity—critical–dialectical, phenomenological–ontological, and poststructuralist–affirmative—that structure this entry.

Before proceeding with this discussion, it is germane to acknowledge that disparate references to the negative appear in additional contexts, usually as an adjective. For example, Isaiah Berlin famously distinguished between negative liberty, or freedom from, and positive liberty, or freedom to. In this case he supported the negative version. Michel Foucault, on the other hand, distinguished between negative and positive approaches to power but commended the positive version: not because he favored power as such, but because he advocated an analytics that recognizes its productive, constitutive force as opposed to its merely coercive, negating capacities. In recent political philosophy,

too, one sometimes finds references to negative theology: an allusion to an absent God associated with messianic themes found in thinkers such as Jacques Derrida. More prosaically, political writers often use negativity as a pejorative description of attitudes that seem unduly pessimistic. This ranges from casual expressions of exasperation (e.g., "Oh, you're just being negative!") to charges that a theory is unhelpfully negative or nihilistic because it offers no constructive alternative.

Negativity, Dialectics, and Critical Theory

The preeminent thinker of the negative is Hegel. For Hegel the dialectic is the movement of negativity and it is negativity that drives the dialectic. His work unfolds an ontological, logical, and historical process of becoming that works itself out through the internal operations of the negative. A thing (or subject) does not possess any positive, self-sufficient identity. Situated among other things (or subjects), it develops a provisional but increasingly complex identity over time by excluding or negating, by differing from, what it is not. In more technical language: Determination is negation and negation is determinate. Rather than the inert logic of Aristotelian contradiction that leaves A and non-A opposed, there is a lively interpenetration of initially antithetical terms, engendering a third that is more than the sum of its parts. Through this process of determinate negation and synthesis, phenomena assimilate aspects of their others and thereby expand to become more encompassing, more rational. To put it another way, phenomena that at first appear most immediate and simple according to common sense are actually the most abstract. They become concrete through a process of mediation, whereby false or limited assumptions are negated and greater relationality enriches their overall significance. Imagine, for example, the sort of argument deliberative democracy favors. While two participants might start with crude statements of their respective interests or opinions, reasoned conversation is intended to negate prejudices vulnerable to critical interrogation; the result is a more informed, more valid, perspective that exceeds what either interlocutor initially believed. Interacting with the material world through, say, creative labor similarly entails the negation of immature presumptions, as more effective ways of re-forming nature are explored through experience; as a consequence, both matter and consciousness are changed through their encounter. Indeed it is difficult to escape this dialectical movement of the negative, because to criticize it is to bring another antithesis into play that feeds into the dialectical process of enriching knowledge and experience.

Without needing to ascribe any mysterious agency to it, one can see why this movement of the negative has a progressive impetus. Most dialectical thinkers endorse this sense in which criticism has a progressive, emancipatory trajectory without necessarily believing it will culminate in a completed totality, such as communism or absolute knowledge. It is, rather, the creative–destructive ferment of the negative that is important. The model of thesis, antithesis, synthesis captures this dynamism poorly, and Hegel's supporters tend to view it as an unnecessarily crude formula for the lively productivity of the negative as the internal dynamism of things.

What remains powerful about dialectics is the critical purchase it gives on the present. An enduring implication of Hegel's philosophy is that any institution or identity is a contingent, provisional stabilization that contains the forces of its own destruction and overcoming. Everything is in motion because every positive form depends on what it is not and contains internal lacunae and tensions, limits and one-sidedness, and hence falsity, contingency, and openness. In this sense temporality is an important aspect of negativity because everything evolves over time, propelled by its own lack and dependency on relationships with its others. Every given object or meaning is alive with possibilities not yet realized, and in this sense it is not (yet) what it has the potential to become. Negativity thus implies a resolutely historical, interpretive, contextualizing approach to all phenomena.

As a consequence, negative thinking mounts a fundamental challenge to ideologies that present meanings or institutions as ahistorical or essential. This is the critical logic Marx applied to the material world to show that capitalism and its accompanying liberal values are temporary, social phenomena. Not only can they therefore be changed by collective action, but a dialectical interpretation of history also discloses which forces are in ascendancy, the weaknesses and anachronisms of the prevailing system, and the interests

that its preservation serves. Feminists have used a similar logic to challenge beliefs that the family is a universal, natural arrangement as opposed to a historical institution fecund with internal antagonisms. From such perspectives, the legacy of Hegel and Marx is not a redemptive grand narrative but a way of engaging critically with the current state of affairs that recognizes every apparently positive form as shot through with negativity. Negative thinking undermines the self-assurance of common sense and dominant interests to break the spell of the given. Politically it suggests radical praxis: action informed by theory and theory informed by analysis of contemporary experience and social structures. It summons a negation of conditions as they are, hence the negative's affinity with revolution and revolt, rejection, refusal, opposition, and radical questioning.

This kind of negative thinking was best exemplified in the twentieth century by the first generation of critical theorists, notably Theodor Adorno, Max Horkheimer, and Herbert Marcuse. For them, the crucial insight of Hegel, but especially of Marx, was that negativity operates within society and not merely in thought. Critical reasoning means identifying the contingencies, antagonisms, irrational shortcomings, and transformative forces operating beneath the surface of late modern societies. They quickly reached the conclusion, however, that history had prematurely ended, the transformative impetus of the negative being foreclosed by a combination of monopoly capitalism, total administration, instrumental (calculating, technological) reason, and the anesthetizing effects of mass culture. The sense in which the positive or affirmation is the enemy of negativity comes across clearly, indeed militantly, in their work. Thus Adorno rails against a fetish of the positive and sets against it the seriousness of unswerving negation that refuses to sanction things as they are. In *Negative Dialectics* he would practice a resolutely nonidentity thinking, struggling to sustain the openness of the dialectic against every form of closure by keeping in play the fragments and antagonisms that subvert every positive synthesis.

There was also a more precise form of positivism the critical theorists attacked. When Adorno and Horkheimer wrote a series of essays on sociology during the 1950s, methodological positivism was their main target. In these essays, they warned against the trend for methods of natural science to be applied to the human sciences, with positivists insisting on a fact/value separation that reduced sociology to the observation, classification, and recording of facts. As a consequence, the (negative) critical or normative dimension is evacuated from the study of society to become impotent abstraction, whereas social science is rendered positive in the threefold sense of replicating the empirically given as a reified reality, uncritically endorsing the facts as they are, and becoming an instrument for use by powerful elites averse to change. As they summarized it, the philosophical impulse to transform "ought" into "is" surrenders to an acceptance of the "is" as the "ought." This situation was exacerbated by the rise of logical positivism, whose aim was to cleanse language of normative terms such as *liberty* or *justice,* now presented as no less chimerical than ghosts or gods in their metaphysical obsolescence. Marcuse voiced similar concerns in his book *Negations,* arguing that negativity had been almost entirely extinguished from late modern culture.

When Marcuse identified such societies as one-dimensional, it was the second dimension of the negative he found suppressed. Some of the chapter headings of *One-Dimensional Man* are indicative of his concerns: "Negative Thinking: The Defeated Logic of Protest"; "From Negative to Positive Thinking: Technological Rationality and the Logic of Domination"; "The Triumph of Positive Thinking: One-Dimensional Philosophy." Marcuse, like Hegel, practiced determinate, immanent negation: an identification of the suppressed possibilities of the present at its current level of techno-productive development, specification of its irrationality in developing massive military and ecological threats to life itself, and analysis of the system's failure existentially to satisfy its own ideals of freedom. Against this totality he called for a Great Refusal, although his work is testimony to the difficulty of identifying oppositional forces capable of setting the negative in motion once more.

Negativity as Ontological

Much modern thinking remains in the shadow of Cartesianist dualism, which presents consciousness and the material world as ontologically dichotomous. An advantage of dialectics is its

demonstration of the irreducible reciprocity and entwining of such oppositions. This has a twofold significance for considerations of negativity. First, as the existential phenomenologist Maurice Merleau-Ponty argued, dialectics had fallen into crisis by the mid-twentieth century because its practitioners rarely managed to sustain its negativity. Failing to negotiate the complex relationships and reversals between subject and object, they fell onto one side of the Cartesian divide, espousing either positivist realism or moralistic idealism. Reinvigorating dialectics, he concluded, required a return to ontology in order to locate the negative within Being itself. Second, Merleau-Ponty's principal interlocutor was his fellow phenomenologist Jean-Paul Sartre, who had also tried to identify negativity ontologically but had replicated the Cartesian divide between an inert, fully positive material world in itself and a free, transcendent consciousness that is the source of all meaning and change: hence the title of Sartre's major work, *Being and Nothingness*. The negative is equated here with consciousness (nothingness) that is untrammeled by, and disengaged from, the world, thus precluding the all-important exchanges or mediations that critical thinking requires.

Merleau-Ponty argued in response that negativity is neither Being nor non-Being, but the effulgent interworld between where a dense and layered texture of mediations proliferates. Like Hegel he emphasizes the importance of difference in setting this "between" in motion, but he is also influenced by Martin Heidegger, who had invoked Heraclitus's claim that it is the cleavages, intervals, and joints within Being that are the condition of meaning or history and without which there would be merely a repetition of the same (Sartre's plenitudinous in-itself). Unlike Sartre's consciousness (for-itself), this negativity is not a hole or void in Being but a productive rift or fold within its very fabric: generative difference rather than transcendent subjectivity. In some ways this brings Merleau-Ponty's thinking closer to Gilles Deleuze's cosmology, but he persists in equating Being with existence and speaks here of a natural negativity. Although this is not necessarily human existence, the generativity of the negative is traced to the reflexivity of the self-sensing body that touches and is touched by itself. It is in this noncoincident, reversible relationship that an interval or slippage, a productive differentiation, occurs in the flesh of the world, opening it to contingent unfolding wherein meaning and matter are inseparable. For the political actor this underpins realization that he or she is ineluctably situated within a complex, shifting field of forces and reversals to be interpreted from within, whereas for the critic it means constant vigilance against dualist presuppositions and sclerotic concepts or powers. Whether or not Merleau-Ponty still calls this a "hyperdialectics," its practitioners are more reflexive, and the field they engage is more multiplicitous and contingent than the dialectical choreography of Hegelian or Marxian negativity.

Poststructuralist Affirmation

It is currently fashionable for radical political theorists to eschew the language of the negative and to embrace affirmation instead. This stems partly from hostility to dialectics, in particular to the allegedly Christian–humanist metanarrative of redemption that underpins the logic of the negative. A second factor is Nietzschean vitalism as developed by Deleuze. Deleuze draws attention to the relationship between the noble and the slave described by Nietzsche in *The Genealogy of Morality*. Or rather, there is no relationship between them and certainly not the sort of dialectical struggle for recognition Hegel had described. For Nietzsche the slave's opposition is one of mean-spirited resentment that says no to life and ushers in a history of nihilism, whereas the noble simply ignores the slave's pale existence and instead says yes to life, embracing its wild vitality. Deleuze espouses this exuberant, creative affirmation over what he sees as the joyless seriousness of the dialectic. Ontologically, too, he takes issue with the logical, binary form the dialectic seems to take in opposing and reconciling contradictions, arguing that difference is more fundamental and unpredictable, more open to chance and the event, than the orderly advance of the dialectic.

Derrida, too, insists that deconstruction is not negative or nihilistic but positive—linked to promises, responsibility, laughter, and dance rather than to critique and rejection. He proposes deconstruction precisely as a way of escaping the dialectic of opposition and assimilation: Instead of synthesizing binaries, he reveals their undecidable multiplicity. His notion of internal genesis and interminable

spatiotemporal deferral—*différance*—nonetheless draws on Ferdinand de Saussure's structural linguistics, which still has, as Derrida acknowledges, an affinity with Hegelian negativity inasmuch as it relies on the claim that in language there are only differences without positive terms.

Neoclassical Economics

The term *neoclassical economics* delineates a distinct and relatively homogenous school of thought in economic theory that became prominent in the late nineteenth century and that now dominates mainstream economics. The term was originally introduced by Thorstein Veblen to describe developments in the discipline (of which Veblen did not entirely approve) associated with the work of such figures as William Jevons, Carl Menger, and Leon Walras. The ambition of these figures, the first neoclassicists, was to formalize and mathematize the subject in the aftermath of the so-called marginalist revolution.

Economics is, according to one definition, the science that studies human behavior as a relationship between ends and scarce means that have alternative uses. Neoclassical economics pursues this study by means of supply and demand models that determine prices based on the subjective preferences of producers and consumers. Neoclassical economics relies on subjective preferences for determining prices in order to escape from the so-called objective value theory of classical economics, according to which the value of goods could be established by reference to some basic commodity (usually corn) or the labor input required to produce a good. Neoclassicists hoped that by jettisoning objective value, economics could be placed on a more scientific basis as an essentially descriptive and predictive theory of human behavior.

Political theory, by contrast, involves both positive and normative elements. It is a positive science to the extent to which it aims to describe and predict political behavior. It is a normative science to the extent to which it prescribes how agents should behave in the political arena and what the best political institutions are. Neoclassical economics is relevant to both of these elements.

Method Versus Subject Matter

Neoclassical economics can be understood in terms of both its subject matter and its method. The subject matter of economics deals with variables, such as incomes and prices, and aggregates like gross national product, employment levels, and inflation rates. The method offers a way to think about large-number interactions within markets, although in principle the range of social institutions can be extended to include politics. The characteristic features of the neoclassical method are instrumental rationality, methodological individualism, economic self-interest, equilibrium analysis, and the use of mathematical techniques.

Instrumental Rationality

Agents are supposed rational in the broad sense that their behavior can be explained in terms of their preferences. Preferences are assumed to be determined by the agents' desires and beliefs and well ordered with regard to outcomes. For many purposes, preferences can remain specified only up to certain abstract structural features, such as consistency (in particular, preferences must be transitive), completeness (all bundles of goods must be ranked), and convexity. This latter requirement

forms the basis of "relative price analytics," focused on the behavioral effects of changes in the relative prices of different objects of value. More specifically, rational individuals are assumed to respond to any increase in the price of a good by consuming less of it. This simple relative price proposition turns out to be surprisingly powerful in predicting behavior in economic settings and includes specifically the basis of institutional analysis: Institutions yield different social outcomes because they alter the "incentives" that agents face.

Methodological Individualism

Neoclassical economists conceive of economic behavior as a complex of exchanges between rational *individuals* and tend to discount, and sometimes dismiss, notions of group rationality. Often, the rational actions of individuals will not advance the purposes of a group to which those individuals belong or, for that matter, advance the aggregate interests of group members, because of "prisoner's dilemma" problems. In a (one-shot) prisoner's dilemma, it is never rational to cooperate although cooperation is mutually beneficial. Neoclassical economists therefore regard it as question-begging to offer explanations of social phenomena in terms of the interests or purposes of groups (be they races or genders or social classes—or even families or firms). They do not, of course, rule out the possibility that groups *may* act in the aggregate interest of their members. But whether groups do or do not so act is a contingent matter—and certainly not one that is logically guaranteed by the assumption of *individual* rationality.

Economic Self-Interest

In principle, agents' preferences could have any content whatsoever: agents could be benevolent or could be driven by group interests or a desire to comply with group norms. But in practice, there is a strong tendency to ascribe predominantly self-interested motives to agents and, relatedly, to rely more on institutional mechanisms that bend interests to the service of duty than on agents' inherent sense of dutifulness. Accordingly, the first question economists are likely to ask of institutions is what (economic) incentives they give rise to. Equally, when individual agents interact, neoclassicists generally assume that each agent maximizes his or her own well-being, considered apart from the well-being of the other agents with whom he or she interacts.

Equilibrium Analysis

In the resultant interplay among rival interests, neoclassical economists tend to conceptualize stable social outcomes as forms of "equilibria," in which the strengths of the various contenders are in balance. Analysis proceeds by examining changes in external circumstances that would alter the strength of different forces and thereby induce all to change their behavior in particular directions. The "external circumstances" in question include policy changes by governments and changes in broader institutional arrangements—though there is an issue as to how far government action should be regarded as "external" to the social system.

Mathematical Techniques

Economists have been much drawn to the use of mathematical techniques to formalize the large-number interactions with which they deal. To be sure, sometimes the use of those techniques obscures rather than illuminates analysis, and sometimes, it seems, economists can become so captivated by the techniques as to treat them as ends in themselves. Nevertheless, it would be foolish to deny the power of mathematics, or of abstract reasoning more generally, in dealing with the kinds of issues that economics has engaged.

Other Applications of the Neoclassical Approach

The neoclassical approach to economics can be extended to nonmarket decision making. Markets are only one social setting in which large numbers of independently motivated actors interact to jointly produce social outcomes. Politics, the law, the church, academia, science itself, and the arts are other examples of social settings that involve a similar coordination of individual behavior. Moreover, increasingly, these spheres of activity mutually interpenetrate, so that a satisfactory analysis of some phenomenon in one arena often requires appeal simultaneously to the political and social and economic forces that are in play. Neoclassical economists have seen their methods

as a way of combining and synthesizing these forces within a single frame of analysis—hence the application of economic methods to the study of political processes in particular.

Perfectly Competitive Markets

The distinct features of the neoclassical approach to economics can be usefully illustrated with brief reference to classical economics, in particular to Adam Smith's metaphor of the "invisible hand." Smith's metaphor expresses the idea that, under certain conditions, the behavior of agents who act in their own interests can also ultimately promote the public interest. Smith claimed specifically that the freely operating market under the "system of natural liberty" (without force or fraud) would constitute such an invisible hand process. Although agents are assumed to be neither particularly benevolent nor cooperative by nature, the exchange processes that the free market allows were seen to mobilize vast benefits from large-scale human cooperation that are individually not attainable.

The neoclassical version of this claim is embodied in the so-called fundamental theorems of welfare economics, which assert that all perfectly competitive equilibria are Pareto optimal, and all Pareto-optimal points are equilibria of a perfectly competitive market under some initial distribution of goods. Pareto-optimality is defined as the situation in which all possible mutually beneficial moves have been made. Interestingly, the neoclassical version of this result follows David Ricardo's formulation in which gains from exchange arise from exploiting natural differences among agents according to principles of comparative advantage. In the Smithian version, by contrast, the gains from exchange arise not merely from natural differences but from gains from specialization (which generates artefactual differences in each individual's productive capacities).

Although the fundamental theorems of welfare economics are typically derived under fairly demanding conditions, including perfect knowledge on the part of consumers, the results can be extended to more sophisticated settings in which there is risk and where agents are not necessarily ideally rational or perfectly informed. In these more complicated settings, the idea has been to treat information as a good that commands a positive price and to treat calculation as costly, so that certain kinds of imperfect rationality will be a rational response to calculative limits. Even so, the results are dependent on perfectly competitive conditions: Where there are imperfectly competitive conditions, some departure from optimality is to be expected, with the size of the expected losses broadly a function of the asymmetries in market power between buyers and sellers in a given market.

There is, however, a more significant limitation to the fundamental theorems of welfare economics. The theorems are restricted in their scope to private goods that are excludable. Markets cannot guarantee the optimal provision of public goods and collective consumption goods. Indeed, under plausible conditions, nonexcludable goods (such as defense or law and order) and nonpatentable discoveries may not be provided at all. Even accepting the limited normative reach of Paretian concepts, therefore, markets cannot reliably deliver much that is required for their successful operation, such as a secure system of property rights, and many goods that are important for human flourishing, such as public health measures or plausible theories about the working of the economy.

Further, Pareto-optimal outcomes are not necessarily just. Pareto-optimality is consistent with slavery if slaves cannot purchase their own freedom. It is also consistent with very large disparities in income levels. Although the fundamental theorems of welfare economics state that any Pareto-optimal outcome can be realized by a suitable initial redistribution of goods, perfectly competitive markets remain neutral with regard to distributive issues. In other words, the neoclassical defense of perfectly competitive markets can offer only a partial foundation for a comprehensive theory of cooperation, because the normative basis of evaluation that the neoclassical approach offers is too thin. Political philosophers such as Robert Nozick (1974) and David Gauthier (1986), for example, have taken this lack of normative justification as a starting point to embed markets into broader theories of social and economic cooperation that balance efficiency considerations with concerns for justice.

Nevertheless, the neoclassical analysis of markets carries important normative implications: First, the analysis demonstrates that the benefits available from human cooperation are considerable.

Neoclassical economics depicts social interaction as potentially "positive sum": Benefits enjoyed by some individuals need not imply a loss to others and can often lead to additional gains. Second, in mobilizing the mutual benefits available, there is a significant task of coordination among individual participants, a task that markets perform well for private excludable goods. Third, in part, markets work well in this coordination role because they induce predominantly self-interested persons to serve others' interests. It might be said that markets economize on benevolence, which tends to be a scarce good for many human interactions. Finally, the neoclassical account helps to identify cases of "market failure"—cases in which markets cannot guarantee optimal outcomes.

Normative Analysis and Democratic Decision Making

The economic approach tends to conceptualize normative analysis in terms of choice. Choice is invariably comparative, and so normative evaluation is framed as a comparison of the arrangement/policy/institution being evaluated with the relevant alternatives (say, the situation that would prevail in the absence of the action under assessment). Specifically, "market *failure*" (however understood) is relative to the demonstrated success of some notional alternative to the market. In short, when anything in the prevailing situation is judged undesirable, the neoclassical response is always to ask: compared to what? Many think that growing unemployment levels, inflation, underprovision of public goods, or significant inequalities in the distribution of income, wealth, and consumption require the government to step in and provide a remedy. Neoclassical economists, by contrast, insist that government intervention is justified only if there is a reasonable expectation that democratic politics will do better in relation to the policy issue than will the market.

On this view, the prospects for effective political intervention in the economy cannot be properly assessed without an empirically informed and realistic account of the workings of democratic politics in agreement with the analysis of markets drawn from conventional economics. Over the past half-century, neoclassical economists have sought to provide just such a theory under the rubric of "public choice theory" (or sometimes "rational choice political theory" or "positive political economy").

Public choice theorists follow the neoclassical approach in assuming that political agents, like economic agents, are essentially self-interested. Voters are, after all, the same individuals who act as consumers in markets; and those who exercise political power, such as bureaucrats and politicians, can be thought of as producers of policy outcomes. Like other producers and consumers, these individuals are more likely to act in the general interest of the community if encouraged to do so by institutions, norms, and legal coercion. Accordingly, many public choice theorists are concerned with those features of democratic institutions that seem most relevant in inducing self-interested politicians to act in the interests of voters. Consequently, the main focus of public choice analysis has been on electoral competition, specifically on whether such competition shares the virtues and efficiencies of market competition.

Much of the analytic firepower of public choice theory has been focused on the peculiar properties of majority rule. Even when individual voters have well-defined transitive preferences over electoral options, the collective, operating under majority rule, may well exhibit intransitive preferences, because the composition of the majority can change. In fact, the issue is not just one for majority rule. The famous Arrow (1951) impossibility theorem shows that under reasonable restrictions, transitivity can be absolutely assured only if one appoints one of the group members as effective dictator. In much the same spirit, Richard D. McKelvey (1976) demonstrates that, in general, it is possible to move from *any* policy outcome to *any* other by a sequence of moves all of which are approved by the majority.

These theorems are developed at a quite abstract level and the question of how deeply they bite in practice remains controversial. However, the voting paradoxes, on which they depend, can be avoided only if individual preferences lie in one dimension and are such that outcomes closer to any voter's ideal are preferred over outcomes that are farther away (which seems on its face to be a very restrictive condition). In this special case, the outcome of the voting procedure corresponds to the median along the one dimension of

the individual ideal points (see Anthony Downs, 1957). For a two-party system this means that there are forces that tend to make both parties locate at the same median point. This median-voter outcome has some normatively desirable features: It will normally involve some level of public goods provision and some significant redistribution from richer to poorer citizens (see Meltzer & Richard, 1981).

The public choice approach has proven controversial among political theorists; one critic referred to it as "democracy bashing." However, as public choice proponents have insisted, if moving from markets to politics is taken to transform the motives of the participants, some explanation of this rather remarkable alchemy is required. It cannot simply be assumed.

One influential criticism of the public choice approach is that it ignores the ways in which democratic discussion can transform individual preferences. Deliberative democrats argue that individual preferences are shaped in a process of public deliberation and they must be publicly justifiable. On their view, political outcomes are seen not as compromises between given and irreducibly conflicting private interests, but rather as the result of mutual deliberation that ideally leads to rational consensus. In this case, voting procedures could be replaced entirely by public deliberation. This possibility, however, seems remote in a pluralistic society where individuals may hold irreconcilable values. Moreover, similar problems can be shown to emerge in the aggregation of majority beliefs even where no conflicts of interests or values are present. A majority of some decision-making group might believe proposition *A* and a majority believe proposition *B,* but no majority believes both *A* and *B*. Majorities, in general, do not hold rational beliefs even when all the individuals have totally rational beliefs.

One particular challenge conventional public choice theory faces is the "paradox of voting." Rational individuals vote only if the costs of voting are lower than the benefits of voting. As such, it seems that a rational individual will not vote at all, because the economic benefits of voting are negligible: The chances that one's own vote makes a difference in any reasonable-sized electorate are close to zero. To solve this problem, and thus to explain actual voting behavior, Geoffrey Brennan and Alan Hamlin (1998) developed the expressive account of voting, which regards voters as rational but claims that, in the context of democratic participation, their rationality takes a distinctive form.

The expressive account of voting assumes that most people have a desire to express their support of things of which they approve and their opposition to things of which they disapprove. Brennan and Hamlin argue that voting behavior reflects such an expressive desire. Voting is much like cheering at a football match. Football fans cheer for their team not because they believe that cheering will cause their team to win. Instead, they cheer because of the expressive satisfaction that it provides. But if this is so, then individuals may vote on quite a different basis from the way they act in markets: The considerations that weigh in choosing an asset portfolio are not the same as those that weigh in deciding who to vote for. This implies that individual self-interest may play a much smaller role at the ballot box than orthodox public choice theory suggests. The expressive argument thus may provide some justification for a kind of two-hats account of voter and consumer behavior.

One of the primary virtues of the economic approach to political analysis is that the formality and analytic explicitness of the economic method encourage clarity about the precise assumptions being made about political processes. Just as the normative evaluation of markets involves both a positive, descriptive component and then an assessment of the properties of the social outcomes to which markets give rise, so political analysis proceeds in two steps, in which the positive analysis of political processes and their normative evaluation of the resultant outcomes are undertaken separately. This separation of positive (or factual) and normative (or evaluative) analysis is a point on which neoclassical economists insist. And even if one were skeptical about the merits of rational choice political theory, one might nevertheless regard that separation as an important principle of sound normative analysis.

Conclusion

Neoclassical economics should be of interest to political theorists for two rather different

reasons. First, many issues of interest to political theorists have an economic dimension. For example, environmental measures may have costs in terms of the general well-being of individuals (including, specifically, the poorest); pursuing distributive justice will often serve to reduce that which is to be distributed; otherwise attractive policy measures may have undesirable incentive effects; and so on. Second, neoclassical economics offers both a framework for analysis of how institutions work and a substantive body of relevant propositions and empirical evidence. The domain of such institutional analysis includes, specifically, the political institutions that, at least on some readings, are the core of political philosophy's concerns.

Neo-Confucianism

Neo-Confucianism refers to the broad-ranging revival of Confucianism that began in the eleventh century CE during the Song dynasty (960–1278) and continued until at least the early Qing dynasty (1644–1911). Neo-Confucians were critical of the influence of Buddhism and Taoism on their society, and yet they drew on Buddhist and Taoist ideas to articulate their distinctive interpretation of Confucianism. Neo-Confucianism is perhaps most famous for its metaphysical doctrines, but it also represents important and influential developments in political philosophy that dominated Chinese theorizing about politics for close to a millennium. It was during the Song dynasty that the Chinese civil service examination system attained its mature form, underpinning a literati culture whose core texts emphasized the responsibilities of the elite to their own moral cultivation and, as a result, to the well-being of "all under heaven." These dual responsibilities were often articulated in terms of the ideal of "inner sageliness and outer kingliness (*neisheng waiwang*)."

The roots of what would become the neo-Confucian ideal of the sage king lie deep in the Chinese past. Scholars have traced it to the shamanic kings of Chinese antiquity, and by the classical era it was manifest in many ways. The slogan "inner sageliness, outer kingliness" was widely used by neo-Confucians to express the intimate relation, or even identity, that they saw between inner moral cultivation and external, political action. "Politics" or "kingliness" here takes on an extremely broad meaning: Moral cultivation requires actualization in terms of the sociopolitical

order at each stage and level of political engagement. Personal and public are intertwined. Perhaps the most succinct recognition of this appears in passage 2:21 from the classical-era *Analects:*

> Someone said to Confucius, "Why do you not take part in government?" The Master said, "The *Book of History* says, 'Oh! Simply by being a good son and friendly to his brothers a man can exert an influence upon government.' In so doing a man is, in fact, taking part in government. How can there be any question of his having actively to 'take part in government'?" (Confucius, 1979, p. 66)

In other words, being virtuous in the most intimate of contexts still has political significance. Neo-Confucians expand on this basic idea, arguing for the creation of a variety of nonstate institutions that straddle any distinction between moral and political. They also provide a metaphysical theory that justifies seeing all aspects of one's moral/political life as interdependent.

Neo-Confucian political theory centered on the ways in which neo-Confucians endeavored to guide the ruler, and the polity more generally, to do the right things. In practice this often meant trying to limit the power of the state and ruler. No limits were needed if the emperor was following the Way, but efforts to guide the ruler functioned as limits insofar as the ruler is not perceived as following the Way. There are three primary, interrelated sources of guidance. First is the theoretical grounding for limits and guidance provided by *li,* which has been translated as "coherence" or "principle." Second is ritual ceremony and the sense of ritual propriety that serves to restrain rulers. Last is the vexed and complicated world of laws and institutions, which sits in an uncomfortable relation with the central Confucian belief that it is ultimately the quality of the person that matters most. In each case, attention must be paid to the precarious balance that neo-Confucians sought to establish between providing grounds for the respect and obedience that all individuals, themselves included, owed to a sage ruler, and yet leaving room for them to educate and criticize a flawed but improvable leader.

The metaphysical doctrine of coherence (*li*) applies at both micro- and macro-levels. It refers to the way that things in a particular context fit best together. Universal coherence (*tian li*) is the way that all things fit best together; often this is elaborated in terms of things being in harmony. In both cases, *li* is understood to be an objective fact not alterable by anyone's opinion, though it is sensitive to differences in local context. When one follows the pattern of universal coherence, one is following the Way (*tao*). Neo-Confucian political philosophers use coherence in two complementary ways. First, it is invoked to justify the reverent attitude on the part of subjects toward their ruler, as a hierarchical ordering of human society was understood to be part of coherence: namely, the way that humans best fit together. At the same time, coherence also justifies asking the emperor to heed the advice of his minister. The minister's claim to authority would be based on a deep knowledge of the classics—which express the early sages' articulation of coherence—and on extensive personal cultivation. Still, in practice, loyalty and obedience tended to come first.

The second form of guidance is ritual (also romanized *li,* but an entirely different Chinese character). A great deal of the daily life of Chinese emperors was subject to ritual regulation, as were most of their public performances and major decisions. Contemporary scholars have noted the ways in which this ritualization could, in certain circumstances, empower individuals to stand up to rulers, to "speak truth to power." The resulting checks to imperial authority were significant, even though hardly inviolable, and martyrdom was sometimes the price one had to pay for insisting on ritual correctness. In any event, rituals clearly did function to constrain emperors, both in everyday circumstances of which there is no record—because whatever temptation the emperor resisted, thanks to ritual requirements, was not recorded—and in famous cases of conflicts between an emperor and his court.

The Chinese term *fa* refers to the third and final source of limits on, and guidance for, the ruler and his ministers. *Fa* is usually translated "law," but it is important to understand that for neo-Confucians, *fa* has broad and narrow meanings. Narrowly understood, *fa* refers to legal codes; when used more broadly, it is better translated as "institution" or "system." Legal codes are one type of institution, but when *fa* is used in its broad sense, a much wider

range of institutions is envisioned. One famous discussion of *fa* lists property arrangements, schools, marriage ceremonies, and expectations for military service. To some degree, *fa,* in both of these senses, served to constrain or direct governance—and, in particular, to limit the ruler.

The classical Confucian Xunzi held that governance was by men, not *fa*. This belief, that it is the interpreters and implementers of *fa* (in both senses) who are decisive rather than the *fa* themselves being crucial, would also dominate neo-Confucian thinking on these topics. Neo-Confucian philosophers like Zhu Xi (1130–1200) believed that no institution (*fa*) is perfect, and all institutions require good men to interpret and implement them. Similar sentiments can be found in many of neo-Confucian writings. Although the important Ming dynasty thinker Luo Qinshun (1465–1547) recognized the importance of institutions, noting that they are necessary for general moral improvement and increasing material prosperity, he, too, maintained that in order to institute or reform *fa,* one must get hold of the right men.

One side of the neo-Confucian view of *fa,* in short, is that they are not fundamental guarantors of good governance. This stemmed in part from the harsh criticism many neo-Confucians leveled against the radical institutional reforms instituted by Wang Anshi (1021–1086) in the early Song dynasty. Rather than top-down institutional reforms, most neo-Confucians wanted stress put on personal moral cultivation; interpreters have labeled this an "inward turn." It would be a mistake, though, to see Song dynasty neo-Confucians as relying solely on individuals' solitary efforts at moral cultivation. Recent scholars have emphasized the "middle-level" institutions that neo-Confucians came to emphasize as critical supports for individual improvement and, ultimately, as a basis for reforming the state apparatus itself. Zhu Xi and other neo-Confucians promoted and wrote extensively about institutions like academies, village compacts, and regulations for family lineages. Such institutions, Zhu hoped, would help to reunite the shattered link between "inner sageliness" and "outer kingliness" and thus lead to the broader realization of coherence.

It is significant that some thinkers from the Song dynasty and later wanted to push the role of institutions even more into the foreground. The clearest instances of this trend come from the late Ming and early Qing dynasties, and in particular, from the trenchant political manifesto *Waiting for the Dawn,* completed in 1663 by Huang Zongxi (1610–1695). For our purposes the key is the emphasis Huang puts on *fa,* which he uses in the broad sense discussed earlier. A healthy polity is based on well-designed institutions like schools, property regimes, and ceremonies that train people to be social citizens rather than selfish egoists. Huang contrasts these institutions with those promoted by recent rulers, which he characterizes as "anti-institutional institutions" (or "unlawful laws"): In this case, the educational system, property regime, and ceremonies are designed solely to glorify the one family who happens to occupy the throne—whether they deserve it or not. Huang then famously asserts: "Should it be said that 'There is only governance by men, not governance by institutions (*fa*),' my reply is that only if there is governance by institutions can there by governance by men" (Huang, 1993, p. 99). He goes on to explain:

> If the institutions of the early kings were still in effect, there would be a spirit among men that went beyond the institutions. If men were of the right kind, all of their intentions could be realized; and even if they were not of this kind, they could not slash deep or do widespread damage. (Huang, p. 99)

This is certainly not the modern notion of "rule of law," but its recognition that good institutions can restrain even the worst of men is nonetheless important.

In conclusion, neo-Confucian philosophers clearly recognized the need to guide and constrain rulers. They did not retreat from politics but, to the contrary, put forward a variety of proposals and values—including the roles of ritual, middle-level institutions, and the ideal of *li*—that met with varying degrees of practical success. As modern Chinese critics have pointed out, though, the continued belief in a unified realm of moral politics, overseen by a sage king, has left China vulnerable to leaders who justify horrible excesses in the name of their individual sagely vision. One of the major themes of post–neo-Confucian political theorizing since

the beginning of the twentieth century, therefore, has been whether Confucianism today can and should come to accept some version of democracy and individual rights.

Neoconservatism

Neoconservatism is a new conservatism that began to exert influence on American politics after 1945 and reached the height of its power during the administration of George W. Bush (2000–2008). Neoconservatism combines conservative social policies with liberal economics and a Realpolitik (i.e., realist) approach to foreign policy.

Neoconservative social policies are characterized by opposition to abortion, same-sex marriage, and sexual liberation, especially for women. They favor "family values," which they associate only with traditional families; they defend prayer in the schools, the right to bear arms, capital punishment, and harsh legal penalties for young offenders. They are closely allied with the Christian Right and share the latter's opposition to secular liberal culture and its inclination to promote individuality, diversity, and critical thought while undermining community, cohesiveness, shared values, and nationalism.

Despite their communitarian approach in the social sphere, neoconservatives speak the language of rugged individualism, independence, and self-reliance, where economics is concerned. They favor free markets with minimal government regulation, corporate capitalism, and the Protestant work ethic, which champions sobriety, diligence, and thrift. It is commonly observed that neoconservatism suffers from a conflict between the conservative and communitarian social policies on one hand, and the liberal and individualistic economic policies on the other. But the conflict may not constitute any intellectual confusion if the values of community, cooperation, and mutual dependence belong to the sphere of women and the family, while rugged individualism and competitiveness belong to the manly sphere of business and profits. Moreover, the contrast between the two spheres may not be all that great when we consider the fact that it is not petit bourgeois economics that is championed, but corporate capitalism, which requires hierarchy and conformity for all except the chief executive officers.

The admiration for capitalist economics distinguishes neoconservatism from the classical conservatism of Edmund Burke, which harkened back to a landed gentry whose wealth was more stable

and less portable. But no such landed gentry existed in the United States except in the slave-owning South. As a result, American conservatism was associated with the Confederacy and had a decidedly anti-American flavor, until the emergence of this new conservatism that is rooted in bourgeois economics.

Despite their paean to populism, neoconservatives are not willing to allow the market to determine the values of society. They believe in a vanguard elite that can shape the values of society and the will of the people. Deeply influenced by the elitist, antiliberal, and antimodernist ideas of Leo Strauss, Irving Kristol, the father of neoconservatism, denounced the liberal elites of the United States—lawyers, judges, doctors, professors, and teachers—and maintained that they should be replaced by conservative elites. The latter would respect religion, promote family values, and harness the Protestant work ethic at the heart of the market economy, while undermining the liberal and hedonistic culture that the market generates—a culture that is epitomized by the social unrest of the 1960s, a culture that is so intoxicated by freedom that it cannot meet the existential threat of Communism.

No one was as candid as Samuel Huntington, who declared that America's liberal institutions had to be suspended—at least until the Communist threat was averted. In contrast to supposedly feeble-minded liberals, Senator Joseph McCarthy grasped the gravity of the Communist threat. Irving Kristol tells us that the first generation neoconservatives—Daniel Bell, Irving Howe, Gertrude Himmelfarb, Jeane Kirkpatrick, Nathan Glazer, Norman Podhoretz, and others—were devotees of Leon Trotsky until they were "mugged by reality" in the form of Joseph McCarthy, who convinced them that the world was a dark and dangerous place and that liberals could not fathom the harsh realities of political existence.

With the collapse of the Soviet Union in 1989, the neoconservatives experienced a crisis of identity. In the absence of the "evil empire," their political program lost its raison d'être. But with the terrorist attacks on the Pentagon and the World Trade Center in September 2001, neoconservatives regained their stride and the ear of the U.S. president. America's unmatched power on the international stage led the second generation of neoconservatives—William Kristol, Robert Kagan, Francis Fukuyama, Paul Wolfowitz, Richard Perle, David Frum, and others—to insist that the United States must take advantage of its "unipolar moment" to defeat all her enemies once and for all. The goal of "full spectrum dominance" was outlined in great detail in the famous Internet think tank, "Project for the New American Century," long before the Bush administration came to power and the events of 9/11 made the implementation of this foreign policy a reality. The invasions of Afghanistan and Iraq were intended as the beginning of a series of small wars that were intended to eliminate all enemies and achieve American global dominance. But the conquest of these small and powerless countries (without nuclear weapons or air forces) turned out to be a much greater challenge than anticipated. Despite holding high-level positions within the administration, many of the neoconservatives blamed the incompetence of the Bush administration for its failure to implement their ideas. But they did not question those ideas. However, political theorists should reflect on whether the foreign policy of the neoconservatives could be implemented by the most competent administration imaginable. And, if such a super-competent administration could exist, would it be desirable for the United States, let alone the world?

Neo-Kantianism

Neo-Kantianism refers to a cluster of academic philosophical trends that dominated German universities in the Wilhelminian era (1870–1918). The founding of the German state came with a crisis of orientation. An initial wave of liberal university appointments gave way to repression of Catholics, laws against socialists, and political anti-Semitism. In this atmosphere, a return to Kant represented recourse to an Enlightenment philosopher who was both unassailably German and deeply humanistic, whose thought had earlier given rise to Prussian institutions of military and educational reform, and who promised a genuine intellectual alternative to the then regnant "worldviews" of materialism and pessimism. Issued at a time of cultural and political malaise (Bismarck's Germany alienated many and inspired few), the call for philosophy to return "back to Kant" (so formulated by O. Liebmann) was initially quite vague, but the brief spell of liberal university appointments produced several vibrant intellectual centers that exerted far-reaching influence beyond the ivory tower, as measured by the many reform socialist movements and political theories of the early twentieth century that can be traced to personages trained in one or another center of neo-Kantian thought.

The most important "schools" of neo-Kantianism are the Southwest German School, centered at the universities of Heidelberg and Freiburg and represented by Heinrich Rickert and Wilhelm Windelband, and the Marburg School of neo-Kantianism, represented by Hermann Cohen and Paul Natorp. Whereas the Southwest German School produced more nationally conservative thinkers (late in life, Rickert even joined the NSDAP [National Socialist German Workers Party]), the Marburg School inspired many reform socialists, among them Eduard Bernstein and Victor Adler.

Among those who shaped the Marburg School was Friedrich Albert Lange, whose popular *History of Materialism* impressed even the young Friedrich Nietzsche. Lange and his literary executor, protégé, and successor at Marburg University, Hermann Cohen, helped restore "critical idealism" to its rightful place at the foundation of both the sciences and the humanities by arguing that materialism (i.e., the assumption that the worlds of human making, the state, and, more generally, civilization, are determined by their evolutionary physiological and material economic conditions) was nothing but a heuristic hypothesis and hence proof of the "sufficiency of the hypothesis" (a Platonic expression). With one stroke, this Kantian turn in philosophy restored the possibility of ethics as the foundation of a politics of reform, education, and social activism. This was of great consequence for the development of European socialism in that it provided a philosophical alternative to Marxism, arguing for legal reform rather than revolution.

The term *neo-Kantianism* obscures the intellectual originality of some of these critical idealists, who deviated from Kant in significant ways. In terms of political philosophy, Cohen, for example, takes issue with Kant's emphasis on morality and justifies legality as the more pertinent concern in the construal of a state based on the pursuit of justice. Echoes of this political theory are evident in the works of Hans Kelsen and Ernest Barker. As an epistemological school with a decidedly political bent and with an emphasis on a common "transcendental method" rather than a shared doctrine, Marburg neo-Kantianism was the point of departure for many intellectuals of the twentieth century, including the religious socialist theologian Karl Barth; the neo-Marxist theorists Walter Benjamin, Ernst Bloch, and Georg Lukács; and the social philosopher José Ortega y Gasset. In Russia, neo-Kantianism's influence, though long repressed by Stalinism, continues today as an alternative to both religious-mystical and dialectical-materialist schools of political thought. In the United States, Ernst Cassirer's *Myth of the State* (posthumously published in 1946) was the last contribution to political theory of a Marburg neo-Kantian.

As a decidedly secular theory of the state, Cohen's introduction to Lange's book on materialism argued for a "resolution" of the content of religion into ethics. On the other hand, in a move reminiscent of classical metaphysics, Cohen's own work on ethics reintroduced the "idea of God" as the "law of truth" into ethics. Though emptied of any specific cultural content, this "law of truth" indicates the asymptotic point of meeting of nature (as the mathematical construal of determinate

characteristics of "being") and of an "ought" that is no more than the formal direction in which the state (understood as any concrete totality of laws) is to move in order for it to approach the realization of the ideal. Religious readers dismissed Marburg neo-Kantianism as too abstract. Cohen's epistemology does without reference to a "thing in itself" that is somehow anticipated or striven or responded to by our perception and intellection; rather epistemology proceeds from scientific knowledge that progressively corrects itself and therefore constantly requires a reevaluation of its presuppositions. This leads to a fluid and dynamic set of categories of thought. Ethical theory proceeds on the analogous assumption of certain "facts of culture" whose validity and progressive reshaping rests on similarly axiomatic presuppositions, in this case presuppositions of agency, freedom, responsibility, and so forth. One of the characteristic aspects of German law, the law of associations, known in English legal theory through Ernest Barker's translation of the Prussian legal theorist Otto Gierke, was used by Cohen as a paradigm to show how larger social or rather legal formations proceed from the speech acts involved in contractual law. Associations and other particular formations also allow Cohen to argue for the perpetual value and necessity of minorities and their constitutive role in the structure of the state. By this, Cohen fought a battle against the totalistic and homogenizing tendencies of modernist conceptions of the state.

The rise and decline of neo-Kantianism is tied to the careers of individuals appointed to full professorships in the 1870s and nearing retirement in the second decade of the twentieth century, that is, shortly before, during, or after World War I. But the moment most generally associated with the official demise (or dismissal) of neo-Kantianism was the meeting, in 1929, at Davos (Switzerland), between Cassirer and Martin Heidegger. At this meeting, which, largely due to Heidegger's account, is remembered as an intellectual duel, the question of the legacy of Kant was prominently raised, and it seemed, to many of the young intellectuals assembled at Davos, as if Heidegger had successfully deconstructed neo-Kantianism as little more than "Wilhelminian bourgeois philosophy." Today it seems that, even though Heidegger may have won the duel, it is preferable to think of the state in terms of an ongoing experiment in establishing justice for all, and of states as necessary fellow wanderers on the path of humanity to a Kantian "world peace," rather than in the terms of the collective expression of the biological striving to persist of a particular people, as the Nazi state endorsed by Heidegger was conceived. Recent political thinkers indebted to Kantian critical idealism include Jürgen Habermas, John Rawls, and Agnes Heller, a student of Lukács.

Neo-Platonism

Neo-Platonism is an interpretation of Plato that posits not only a realm of eternal essences, or Forms, above the flux of material existence, but a principle of unity higher than being, to which the forms owe their integrity, both as individual entities and as a class. Because the philosopher's goal is approximation to this perfect unity, the regulation of corporate or individual life in the lower sphere can be of interest to him or her not as an end but as a means to emancipation. The founder of neo-Platonism, Plotinus (c. 205–270 CE), regards the political virtues as the lowest in an ascending scale. His pupil Porphyry (c. 232–c. 305) devised a more rigid system in which the political or practical virtues are the lowest of four categories. They must, however, be achieved before the higher virtues can be cultivated, and Porphyry, as an adherent of the Pythagorean tradition, believes that the philosopher has a role in shaping civic harmony. Iamblichus (c. 245–325)

and Macrobius (fl 400) hold a similar view, though social goods are less interesting to these thinkers than the posthumous rewards that accrue to the individual from his patriotism. Proclus (410–485) composed a commentary on Plato's *Republic,* in which the justice of states is understood to be good insofar as it mirrors the godlike harmony of the cosmos and enables the soul to rise above the transitory and plethoric phenomena of the material world. Neo-Platonism acquired an increasingly religious character, and its later beneficiaries include the Christian Nicholas of Cusa and the Moslem Abu Nasr al-Farabi.

Before the Roman conquest of the east, the Greek philosopher was often an aristocrat or a legislator; under this foreign yoke he was more commonly found in opposition than in authority, when he could be found at all. By the third century CE, the supine maxim of the Epicureans—"live unknown"—had become the watchword of the Pythagorean sect, although its founder was supposed to have governed cities. A similar change in the temper of Platonism is illustrated by Plotinus, who is commonly agreed to have been the first great philosopher after Aristotle and the pioneer of the disciplined and creative exegesis of Plato's works that we now call neo-Platonism.

Plotinus

Plotinus studied in Alexandria under the obscure Ammonius Saccas from 232 to 243 CE, but if there was a successor to Ammonius after his death in 243, it was not Plotinus. Instead the latter set off to fight the Persians in the train of the Emperor Gordian III. Because Gordian was the senatorial candidate for the throne in an era of civil strife, it has been inferred that Plotinus, who bears a Roman name, was also attached to the senatorial party; his biographer Porphyry states, on the other hand, that his intention was to converse with Persian and Indian philosophers. The same witness adds that he "fled" to Antioch after the death of Gordian, and again it has been argued, by those who believe that the emperor was assassinated by his own troops, that the danger arose from his loyalty. We cannot, however, be certain of the manner of Gordian's death, except that it coincided with a defeat of the Roman army by the Persians; the flight of Plotinus may have been prompted simply by a desire to escape the enemy. Perhaps following his original design, he came to Rome, where his circle included rich Italians and natives of his own city. He appears to have owned no property, relying instead on the hospitality of unmarried women. There is evidence of a friendship with the Empress Salonina, but what we hear of his dealings with the Senate indicates not that he was well liked by that body, but only that he was not afraid to incur its enmity. The senator Rogatianus was on the point of taking up the consulate when he decided, at the instance of Plotinus, to inconvenience his colleagues by resigning the post and adopting the austere and secluded life of a philosopher. When Plotinus formed the notion of setting up a city of philosophers in Campania, with a constitution modeled on the teaching of Plato's *Laws,* he was unworldly enough to seek funds from the emperor, but the impoverished Gallienus would have spurned the project even if it had not been opposed, as Porphyry avers, by hostile members of his court. It was in Campania, at the house of a rich friend, that Plotinus died in 270 of an illness whose symptoms resemble those of leprosy, deserted by all friends except Eustochius, an Alexandrian doctor who may been the first to disseminate an edition of his works.

The edition that has survived is that to which Porphyry gave the title *Enneads,* because, after he divided and distributed the writings of his master, he arranged them into six cycles of nine. Of these, the first cycle, representing ethics and the discipline of the body, is the only one to contain a treatise *On Virtue.* In this short essay Plotinus denies that the civic virtues—fortitude, prudence, temperance, and justice—can have any place among the transcendent principles. In this world, they perfect the inchoate harmony of the social group; in the higher world, that harmony is eternal and can be impaired only by the exercise of any dynamic faculty. We must speak of a paradigmatic relation, not one of similarity, between the goods of the higher realm and those of ours. At the same time, insofar as moral discipline brings measure to human lives and imparts a beauty to our activities, it produces a resemblance to the divine, because measure and beauty are both properties of the intellectual realm, in which the highest of conceivable goods are realized. Furthermore, the quotidian virtues remove the obstacles to the elevation of

the soul to a higher sphere. Wisdom or prudence frees us from the caprice of the body, temperance subdues the passions, fortitude induces contempt for death, and justice subordinates the lower faculties to reason. In this treatise, then, the political virtues—so described because they are nursed and manifested in political society—are prized chiefly because they promote the assimilation of soul to intellect. Plotinus held, however, that the highest principle is not intellect but the ineffable source of unity and existence, which he terms the One, the Good, and, sometimes, God. It is by virtue of the ubiquitous causality of the One that a house or a chorus retains cohesion; it is because they conduce to integrity in the soul and work together for the soul's deliverance from the body that wisdom, temperance, fortitude, and justice are goods in a limited degree.

Porphyry

In reducing his master's system to a series of aphorisms, Porphyry devoted a long and partly original chapter to the virtues. Distinguishing four categories—the political or practical, the cathartic, the philosophical, and the paradigmatic—he follows Plotinus in granting the political virtues only an emollient role in freeing the soul from the vanity and discord of the body. Although he deplored the contumacy of Christians, and may once have been engaged in an affair of state, he left no treatise on political science. The only associations that he contemplates in his extant works are philosophical brotherhoods, especially those held together by a regimen of abstinence. In his *Life of Pythagoras* and his treatise *On Abstinence,* he declares not only sacrifice but the eating of meat unworthy of a philosopher, and he compares the Pythagoreans to other elective societies, such as the Essenes and Brahmins, who were held together by mutual assistance, communal labor, and the renunciation of superfluous goods. Opponents of this way of life protested that it would not only rob priests and artisans of their livelihood but deprive civic life of a visible symbol of concord. Porphyry replies, in the Pythagorean tradition, that it is the custom of killing and eating beasts that breeds injustice and internecine war in the human sphere. In any case the sanctity and fecundity that the Pythagoreans ascribed to their emblem of justice, the tetractys or number 4, sufficed to prove that they did not despise the political virtues. Similar facts and arguments are rehearsed in the longer treatise *On the Pythagorean Life* by Porphyry's younger contemporary Iamblichus who concurred with him in regarding the sacrificial cult as inferior to the intellectual path of the philosopher, but maintained that there are lower gods who require these ministrations and humans who are the better for offering them. This belief that the cosmos as a whole demands not a uniform but a hierarchic polity also governs the Pythagorean theory of government in the civic realm. Both Iamblichus and Porphyry record that Pythagoras met his death when he and his friends were driven from the city of Metapontum in southern Italy by a populace that had tired of their austere and patrician government, and perhaps also of their refusal to cultivate friendship with outsiders. The political ideal of the Pythagoreans, in short, was one of equality among oligarchs, though with the sanction that these oligarchs were forbidden, like Plato's guardians in the republic, to derive material profit from their rule.

Both philosophers studied Plato's *Republic* as a prolegomenon to his *Timaeus*. Porphyry understood it as an ethical treatise preparing the soul for the contemplation of divine activity, and Iamblichus apparently held that its subject is the ideal city, conceived as a microcosm of the universal order. Philosophy in the Latin-speaking world was never so sharply divorced from political activity, and around 400 CE, Macrobius, a pagan of the senatorial class, produced a commentary on the sixth book of Marcus Tullius Cicero's treatise *On the Commonwealth,* in which the statesman Scipio Aemilianus learns in a dream that his soul is destined to be a star. Macrobius endorses Cicero's reasoning that no man would come through the toils of public life with unblemished honor unless the promise of fame were reinforced by the hope of immortality. Adducing Plato's arguments for the natural immortality of the soul, he also follows Plato in finding the pattern and source of civic harmony in the unfaltering revolution of the spheres. At the same time it is evident that the arithmology of the Pythagoreans, the ascent to the loftier virtues in Plotinus, and the musical proportions that determine the alignment of the planets are of more interest to him than anything on earth.

Proclus

Proclus was a thinker of more intellectual substance. Born in Byzantium and raised in the prosperous territory of Lycia, he was equipped for political life by birth and wealth, but, as a pagan of integrity, could not aspire to any of the numerous offices that were now reserved for Christians. Settling in Athens, where he was not a citizen, he nonetheless took part in civic assemblies, financed education from his own purse, and undertook the restoration of ancestral cults that had fallen into abeyance. His biographer Marinus adds that his virtues were of the noetic order, higher than the political and attainable only by those who can escape the importunities of the body and fix their minds resolutely upon the most lasting objects. According to Marinus, he mastered the theory of politics from Aristotle's book of that name, together with Plato's *Laws* and *Republic*. His commentary on *The Republic* was among the most voluminous of his writings and thus accords to the work a prominence that it had not hitherto enjoyed in Platonic schools. Declining to arbitrate between those who held that its subject is justice in the soul and those who read it as a political treatise, he argues that the justice of individuals and the just city are of a piece, the latter differing from the former in the multitude of its parts as a material entity differs from its form. Like his predecessors, he regards *Timaeus* as Plato's masterpiece. Observing that it begins as an epilogue to a discussion of the ideal constitution, he suggests that *The Republic,* which embodies this discussion, was conceived as a propaedeutic symbol of harmony in the universe, whereas the story of a mythical war between Athens and Atlantis, which precedes the cosmological speculations of *Timaeus,* mirrors the elemental conflict between the forces of generation and those of permanence. In Athens, which corresponds to the ideal, legislation represents the graduated diffusion of power from the transcendent principle. In Egypt, the proliferation of roles obscures the threefold division of the ideal commonwealth, and previous authors, Porphyry included, had matched each role with an order of daemons. Proclus, however, maintains that the seven occupations fall into three tiers, each corresponding to a class of gods, with the number four, or tetractys, at the base (which is also the center) as the cement of political unity. Even in praising his adopted Athens, Proclus is a typical neo-Platonist, who can admire a human institution only insofar as it exemplifies the taxonomy of divine powers in the cosmos under the indivisible fatherhood of the One.

The Legacy of Neo-Platonism

In 529 CE, the Athenian schools of philosophy were closed by the doctrinaire emperor Justinian, and only an underhand negotiation preserved the neo-Platonic school in Alexandria. It was probably the intransigent paganism of the neo-Platonists rather than any public fomentation of dissent that inspired these measures. If this philosophy left an enduring mark on Christian thought, it was in the writings that appeared, about this time, under the name of Dionysius the Areopagite. Until the author's claim to have been a disciple of Paul was exploded in the fifteenth century by Lorenzo Valla, these texts could be cited to prove that there was a precedence of honor among the angels that prefigured the distribution of ministries within the church. Dante in his *Convivio* annexes one of the nine angelic orders to each of the cosmic spheres, and the most impressive work in this tradition is also one of the latest, Nicholas of Cusa's *Catholic Concordance*. Dominic O'Meara (2003) suggests that a newly discovered tract, *On Political Science,* is inspired by Dionysius and discerns a late flowering of the pagan school in al-Farabi's treatise *On the Perfect State*. Certainly both works are neo-Platonic, if this term connotes a studious indifference to the contingency of human institutions and the multiplicity of human ends.

Neo-Republicanism

Before understanding the contemporary political theories called "neo-republican," ushered in by the "republican revival" of the late twentieth century, we must consider the earlier republican traditions that inspired them. Republicanism as a political theory stresses the importance of citizen virtue, political participation, a distinctive conception of liberty, and widespread dedication to the common good. But republicanism as a descriptive term has been applied to so many institutions, practices, commitments, and historical periods that it risks confusing casual observers, a concern expressed by Thomas Jefferson and John Adams long before it was voiced by present-day scholars. For the sake of clarity, we may classify republican theories according to the historical traditions from which they derive or according to the principles that distinguish them.

Historical Traditions

Classifying republican theories according to their earliest historical influence generally means aligning them with either ancient Athens or ancient Rome. Athenian republicanism, taking its bearings either from a stylized reading of Aristotle's political theory or from a romanticized version of Athens' actual practices, highlighted the transformative potential of strict civic education and virtue, widespread political participation, and orientation toward a transcendent common good. (Aristotle also focused on political institutions and rule of law as means of containing political conflict.) Roman republicanism took its bearings from Roman jurisprudence and critiques of Athenian populism that rejected the latter's institutional instability and political excesses. It contrasted the independence of free citizens with the dependence of slaves. Subsequent theories of republicanism can be classified as either neo-Athenian or neo-Roman. This classificatory scheme carries significant appeal. Some scholars have divided republicanism more broadly into Greek and Roman traditions, a strategy with the advantage of including theorists such as Jean-Jacques Rousseau, who took his bearings not primarily from Rome or Athens but from the disciplined, ascetic, ancient Greek city-state of Sparta. Contemporary neo-republican theorists can draw upon the Greek tradition, the Roman tradition, or both.

Perfectionist and Institutional Republicanism

Alternately, we may classify theories of republicanism according to their thematic affinities and group them into two distinct traditions: perfectionist and institutional republicanism. The former tradition attempts to combat political problems by improving people morally and politically; the latter emphasizes institutional innovations, including separation of powers and rule of law, in order to uphold individual freedom. The distinction between perfectionist and institutional traditions corresponds roughly, although not perfectly, to the Greek/Roman distinction, and contemporary neo-republican theories can draw upon either tradition or both.

Theorists in the perfectionist and institutional traditions share an emphasis on citizen virtue, republican liberty, and dedication to the common good regardless of their historical era, but they conceptualize those themes quite differently. The perfectionist republican conception of liberty resembles what the twentieth-century philosopher Sir Isaiah Berlin called "positive liberty," a liberty that actually requires self-control or self-mastery and a formative moral and civic education. The "perfectionist" element derives from an aspiration to perfect, or at least radically improve, human beings through that formative education and through the practice of virtuous political participation. Virtuous political participation embodies citizens' liberty and represents an end in itself, partially constituting not only the good life for individuals but the common good for all. Many perfectionist republicans, whether neo-republicans in the contemporary era or theorists from past centuries, insist on a significant measure of economic equality to avoid relations of dependency that might undermine citizens' political autonomy. Perfectionist republicanism differs sharply from liberalism, because its proponents may prioritize the community's good over any particular individuals who comprise it and may also conceptualize statecraft as soulcraft. Stated differently, perfectionist republicans may encourage government to shape citizens' inner selves and pathways

to happiness, aspirations that liberals tend to place out of political bounds.

Perfectionist republicanism encompasses, for example, the political theory of Aristotle and the political practice of Sparta, in the classical world; the works of Rousseau, Gabriel de Mably, and many early American Anti-Federalists, during the early modern era; and Hannah Arendt, Alisdair MacIntyre, Benjamin Barber, and Carole Pateman, in the modern or neo-republican era. In other words, it encompasses the tradition sometimes called "civic humanism" and also forms of participatory democracy that advocate civic education, civic virtue, public deliberation, orientation toward the common good, and the intrinsic (as opposed to merely instrumental) value of political participation. The point is not to establish definitively that all of those theorists and practitioners are rightly called both perfectionist and republican. Scholars have long debated such labels. The larger point is that the listed theorists and practitioners are deeply embedded in past and current discussions about republicanism and cannot be excluded without unduly silencing a broad range of scholarly voices.

Institutional republicans, conversely, regard free political institutions as constituting citizens' liberty, with liberty conceptualized as freedom from domination. Freedom from domination means the status of being immune to arbitrary interference by others. Yet institutional republicans distinguish this type of freedom from the liberal ideal of noninterference typically associated with what Berlin called "negative liberty." Liberals who champion negative liberty might regard any given law as a necessary evil, an interference with freedom tolerable only because it prevents other, worse interferences with freedom. But institutional republicans who defend freedom as nondomination can regard positive laws as instruments of freedom insofar as they prevent relations of domination. Just laws interfere with citizens' lives for the sake of safeguarding all citizens from the arbitrary interference of other individuals, groups, or institutions. Further, institutional republicans object to the conception of liberty as noninterference because noninterference does not preclude relations of subservience. A slave "lucky" enough to have a beneficent master would be in a relationship of domination even if the master chose not to interfere most of the time. Thus, institutional republicans may object to practices, relationships, or institutions that involve the *potential* for domination—the potential for arbitrary interference with one's choices—even if no one is currently being dominated. Such a stance might translate into redistributionist public policies if the public were to deem great economic inequalities a potential source of domination. It might indicate extensive governmental regulation of private companies and industries in order to ensure that workers and small businesses would never fear domination by "big business" or multinational corporations. The main point for institutional neo-republicans is that liberty as nondomination must be the supreme political value.

Institutional republicans also generally champion mixed government—combining elements of monarchy, aristocracy, and democracy—as an essential resource for balancing power and preventing domination. Republican theorists in the institutional tradition include Marcus Tullius Cicero and Polybius in antiquity; Niccolò Machiavelli, James Harrington, baron de Montesquieu, and James Madison, in the early modern eras; and Philip Pettit, Quentin Skinner, Cass Sunstein, and Maurizio Viroli, among the neo-republican theorists of the present day.

Neither the Greek/Roman nor perfectionist/institutional classification scheme implies exclusivity. Specific theories or practices might combine elements of both. Aristotle shares the institutional focus on mixed government and rule of law; Rousseau devotes much of his *Social Contract* and his constitutions for Poland and Corsica to institutional bulwarks of republican freedom; and a range of early American republicans combine Greek and Roman, perfectionist, and institutional elements. The same can be said of certain contemporary neo-republican theorists, such as Michael Sandel and Benjamin Barber, who call for an increased governmental role in shaping political virtues and moral dispositions while also respecting constitutional limitations and rule of law.

The Republican Revival

Republicanism has often been framed as a theory of opposition: opposition to political theories and practices deemed corrupt, oppressive, or alienating. Aristotle's republicanism—which advocated

the rule of law, civic virtue inculcated by strict education, and the balancing of different economic classes against each other—opposed Athenian democracy's populist excesses. Rousseau's republicanism opposed not only the existing French monarchy but also what he took to be an alienating, oppressive, property-dominated political theory espoused by seventeenth-century social contract theorists such as Thomas Hobbes and John Locke. The late twentieth-century republican revival in North American and European scholarship, which informed the contemporary neo-republican movement, opposed a liberal tradition that some scholars regarded as excessively individualistic and morally hollow.

Republican revival scholars, including historians Bernard Bailyn, Gordon Wood, and J. G. A. Pocock, as well as neo-republican political theorists, have challenged earlier interpretations of European and American political theory for allegedly overlooking vital republican influences. They have interpreted the early sixteenth-century theorist Machiavelli, for example, not as a conniving, amoral advisor to princes (a fairly traditional view) but rather as a patriot who championed virtuous republics, rule of law, balanced institutions, and pursuit of the common good. Such neo-republican scholars have also challenged a long-standing interpretation that viewed American history as a narrative dominated by the liberalism of seventeenth-century theorist Locke, a narrative that emphasized property rights, limited government, and individuals' independence, all rooted in natural law that existed independently of government and could legitimate popular revolution. The revised view interprets American history through the lens of misunderstood republican influences (derived primarily from English theorists but occasionally from Romans and Greeks as well) that advocated rigorous civic education and citizen virtue, public deliberation about the common good, and hostility to social and economic hierarchies.

Legal scholars such as Bruce Ackerman and Cass Sunstein have drawn upon the republican revival historical narrative to inform neo-republican theories of constitutional interpretation and judicial politics. Sunstein emphasizes the early American value of public deliberation to promote a kind of "deliberative democracy," not only among citizens but among elected officials. Toward this end he advocates strong judicial protection of individual rights, especially minority rights, to establish the civic equality that equal public deliberation would require. Ackerman utilizes republican revival scholarship to oppose the emerging legal doctrine of "originalism." Originalism would limit constitutional interpretation to discovery of the written constitution's understood meaning at its time of enactment or amendment and thus would curb what some conservatives feel to be inappropriate judicial activism. Ackerman locates, in the founders' underappreciated republican principles, a commitment to popular sovereignty that could override constitutional rigidity and allow Supreme Court justices to forge constitutional law enshrining widely held, deeply considered public convictions.

Neo-Republican Theory and Liberalism

To reiterate an earlier point, the republican revival that paved the way for contemporary neo-republicanism arose out of dissatisfaction with the liberal tradition's predominance in the United Kingdom, North America, and Australia. The political theory of liberalism comes in many varieties, but all of them stress the importance of limited government, individual rights (with property rights often accorded special prominence), and individual autonomy: the individual's ability to decide his or her life plan without interference from others, consistent with a similar liberty for others. Some critics have charged liberalism with promoting greed, selfishness, and the breakdown of traditional community values (by allowing individuals the right to choose their own paths to fulfillment). Socialism, communism, and anarchism represent several of the more influential ideological challenges to liberalism. Although these ideologies themselves contain many variations, socialism generally advocates limitations on private property and state control of economic distribution and key industries; communism generally advocates the elimination of private property; and anarchism may advocate the elimination not only of private property but of state governments as well (sometimes allowing for small-scale, democratic governance at the local level). Neo-republicanism challenges liberalism less radically, so much less radically that neo-republicans and liberals have debated the extent to which neo-republicanism differs from liberalism in the first place.

Neo-republicans with roots in the perfectionist tradition tend to criticize liberalism for an impoverished conception of liberty, an excessive emphasis on rights to the exclusion of duties, and a failure to appreciate civic virtue and political discourse, which help us to discover and promote the common good. Liberalism's emphasis on autonomous individuals allegedly debases public discourse into a series of private votes or market transactions, as each individual chooses his or her conception of the good life without looking to fellow citizens for input. Neo-republicans rooted in the institutional tradition join perfectionist neo-republicans in attributing to liberalism an impoverished conception of liberty and an excessive emphasis on rights to the exclusion of duties, but with less emphasis on public deliberation about the common good. Theoretically, citizens need not participate extensively in public affairs for the conditions of nondomination to obtain, although institutional neo-republicans may differ on the levels of citizen participation required. Institutional neo-republicans generally place more weight on constitutionalism and the rule of law as the forces responsible for ensuring nondomination.

Responding to the neo-republican critiques, some liberal scholars accuse perfectionist neo-republicanism of dangerous tendencies toward coercion or exclusivity. Advocating "statecraft as soulcraft" might require a very strong and intrusive government, one that could override citizens' autonomy in the best of circumstances or tyrannize over them in the worst. Further, the impulse to mold citizens around a single norm of virtue or communal identity might exclude a range of legitimate values and voices. Institutional neo-republicans can avoid most of those criticisms, but some liberal scholars question whether institutional neo-republicanism differs from liberalism in most important respects. For example, they question whether republican freedom differs essentially from liberals' conception of liberty as noninterference. They also question whether republicanism's emphasis on civic virtue differs meaningfully from that of other political theories. They point to a civic strand within the liberal tradition that requires inculcation of specific liberal virtues such as toleration, reciprocity, and self-reliance. Some have proposed versions of a "republican liberalism" that stress the importance of citizen duties as well as rights, common interests as well as self-determination, without jettisoning liberalism as an overarching political philosophy.

While perfectionist neo-republicanism unquestionably diverges from liberal principles, future scholarship will continue to debate the philosophical distinctions between institutional neo-republicanism and liberalism, as well as the prospects for neo-republicanism to inform public policy and the public philosophy.

Network

Broadly defined, a network is a group of interdependent actors and the relationships among them. Networks vary widely in their nature and operation

depending on the particular actors involved, their relationships, the level and scope at which they operate, and the wider context. The actors within a network might be people, states, transnational corporations, or a mixture thereof. The relationships between actors are always interdependent, but they can vary from close ties, such as those within a family, to occasional impersonal and mediated interactions. Networks can appear at the level of the school playground or high court justices around the world. They appear in unstructured social environments and in highly formalized, rule-bound settings.

Network theory arose from a number of overlapping trends in social theory. Most of these trends arose as part of a shift to rather ahistorical forms of social analysis in the first half of the twentieth century. Functionalism, structuralism, systems theory, and other such approaches attempted to explain social facts in terms of synchronic relationships and patterns of historical narrative. The nature and behavior of a unit derived from its function or place within a larger whole. The concept of a "network" appeared as one way of describing some of the relevant wholes; a network was a whole composed of a set of actors or units and their relations to one another. Within the social sciences, the concept of a network became popular in all kinds of areas. In ethnography, it provided a way of conceptualizing not only family relationships but also migratory patterns from tribal villages to cities. In social psychology, it provided a way, especially within sociometry, of examining the interpersonal relationships within groups so as to identify informal leaders and social rankings. For many people, the most obvious uses of the concept of a network today are within information technology. The World Wide Web is the "net," a set of interlinked computers forms a network, and so on.

The concept of a network often forms one of three items in a classification of different modes of coordination and organization. Networks differ here from hierarchies and markets. One difference is the basis of the relationships between actors: Whereas markets are based on property rights and contracts, and hierarchies are based on something like an employment relationship, networks are based on the exchange of resources. Another difference is the medium of exchange between actors: Whereas markets rely on prices, and hierarchies rely on authority, networks depend on trust. A third difference is the means of resolving conflicts: Market systems use bargaining and the courts, hierarchies use rules and commands, and networks use diplomacy. A final difference might be culture: It is thought that markets have a competitive culture, hierarchies instantiate a culture of subordination, and networks encourage a culture of reciprocity.

The distinctive properties of network forms of coordination are usually traced to the interdependence of the actors within the network. This interdependence means that none of the actors can attain his or her aims unless he or she cooperates with the others. Hence networks differ from markets in which actors are independent of one another and able to achieve their goals through buying and selling. The interdependence of the actors within a network also means that no one actor can order the others to act in a certain way: No actor is so dependent on another that it has to obey that other's commands. Hence networks differ from hierarchies in which the authority of one actor enables it to ensure the compliance of another.

Some theorists have sought not only to distinguish networks from other types of organization but also to draw up typologies of different types of network. One simple typology is that between formal and informal networks. Formal networks are associated, say, with legalism, planning, the management of decisions, and a structured allocation of resources. Informal networks, in contrast, are linked with trust, discussion, collegiality, and unstructured exchanges. If we ponder the distinction between formal and informal networks, we might notice that formal networks closely resemble hierarchies. It might seem, therefore, that all these typologies should not be taken as offering a discrete set of distinct organizational forms. Rather, they offer us ideal types taken from a larger spectrum of different possibilities.

Advocates of networks ascribe a range of advantages to them. Typically networks are said to offer a kind of dynamism and flexibility that hierarchies cannot, and yet also to foster cooperation and stable relationships in a way markets cannot. Some advocates of networks argue that these advantages are especially relevant to the contemporary world. They argue that the world has become increasingly complex and interconnected, and the pace of change is becoming faster and

faster, all of which puts a premium on the kind of dynamism and flexibility associated with networks. Many contemporary problems require the state to draw on diverse organizations for specialist funding, resources, and expertise. They also argue that the rise of new knowledge-based industries means that prosperity and efficiency increasingly depend not on competition but on the kinds of cooperative and open practices that facilitate the exchange of ideas and information. Public sector, voluntary sector, and private sector organizations all benefit from stable and creative relationships based on trust and participation.

Not everyone is so enamored of networks. Even advocates of networks often argue that they are not always appropriate and that the state should rely on a mixture of hierarchies, networks, and markets, adopting whatever organizational form is most apt in any given case. Other critics worry that the explosion of networks has gone too far. They accept that networks have benefits, but they argue that beyond a certain point they lead to a fragmented and unwieldy system of governance. The state loses the ability to effectively implement public policies. Perhaps the main criticism of networks, however, is that they can undermine democratic values such as accountability. The sheer institutional complexity of networks obscures who is accountable to whom for what. Even if networks are more responsible to citizens, and even if they allow for more participation, they still might threaten some of our democratic values.

New Left

The term *New Left* describes a broad range of left-wing activist movements and intellectual currents that arose from the late 1950s. Often regarded as synonymous with the student radicalism of the 1960s, culminating in the uprisings of 1968, it may also refer more narrowly to particular segments within or alongside the 1968 movements that sought to give them theoretical coherence and political direction. New Left radicalism related campus protest to U.S. civil rights activism; to third world national liberation struggles; to mass strikes and university and factory occupations in a diverse array of countries; and to wider forms of anti-capitalist and countercultural protest. The diversity of sources and forms of revolt complicates attempts to identify shared features of the various currents, but among those most commonly cited are a libertarian and democratic impulse; an emphasis on cultural as well as political transformation; an extension of the traditional Left's focus on class struggle to acknowledge multiple forms and bases of oppression, including race and gender; and a rejection of bureaucracy and traditional forms of political organization in favor of direct action and participatory democracy. In theoretical terms, the New Left's major contribution was to a process of revision and diversification within or around Marxism, especially with regard to concepts of class, agency, ideology, and culture.

New Left currents first arose in Europe in response to the perceived moral discredit of official communism following Nikita Khruschev's "secret speech" in February 1956, which revealed the extent of political repression under Stalin's leadership. French and British groupings adopted the label "New Left" to denote their search for a socialist "third way," distinct from official communism/orthodox Marxism and from mainstream social democracy. Antinuclearism and opposition to cold war bipolarity were critical rallying points for the disaffected communists, independent socialists, and young radicals who formed the New Left's constituency. Anticolonialism and the rise of the "third world" acquired increasing salience, especially after the Cuban Revolution of 1959. In the United States, the New Left grew out of student

socialist activism, especially as this intersected with, and was inspired by, the black civil rights movement. The main U.S. New Left organization, Students for a Democratic Society, was founded in 1960 and published its political manifesto, the Port Huron Statement, in 1962. As American involvement in Vietnam escalated, opposition to the war, seen as the overarching symbol of cold war imperialism, became the major focus for U.S. activists and their counterparts elsewhere. New Left movements generally avoided traditional and party-political forms of organization in favor of strategies of mass protest, direct action, and civil disobedience. The highpoint of New Left activism was reached in 1968, as a wave of radical protest swept across the globe. The revolutionary mood dissipated through the 1970s, although important lines of continuity still exist between the New Left movement and new social movements such as feminism and environmentalism. A minority of activists went on to found clandestine "revolutionary" organizations practicing violent direct action; examples of these include the Red Army Faction (also known as the Baader-Meinhof gang) in West Germany and the Weather Underground in the United States. Others moved into far-left parties and groups that proliferated in the 1970s.

The New Left produced no unified body of political theory. In many countries, including the United States, it was primarily an activist force, although in France, West Germany, and Britain, theoretical production was an important concern. The range of theoretical influences on which New Left currents drew was extremely diverse, including the philosophical existentialism of Jean-Paul Sartre, various forms of revisionist or neo-Marxism, the "third worldism" of Frantz Fanon, the guerrilla strategy of Régis Debray, the Marxist structuralism of Louis Althusser, Maoism, and Trotskyism. Initially, the rediscovery of Marx's early writings, particularly his concept of alienation, was key—part of a humanist reorientation within European Marxism in which the ethical and moral dimensions of Marx's thought were emphasized as an alternative to the sterile economism of orthodox communist interpretations. The concept of alienation was influentially reworked by the Frankfurt School thinker Herbert Marcuse, whose *One-Dimensional Man* (1964) argued that advanced industrial capitalism had created a totalitarian society in which human needs and interests are constructed and manipulated through consumerism and communications media so that resistance to the status quo appears irrational and impossible. Despite the pessimism of his analysis, Marcuse was sympathetic to the student movements and, in common with the sociologist C. Wright Mills, whose 1960 "Letter to the New Left" helped forge transatlantic connections within the milieu, invested hope in the potential of peripheral social forces such as students, racial minorities, and third world national-liberationists to effect radical change. This was part of a broader theoretical trend in which the agency of the working classes of advanced capitalism, increasingly viewed as co-opted and depoliticized by consumerism, came to be doubted, although this remained a controversial issue within the New Left.

Thinkers of the New Left also made groundbreaking contributions to analysis of culture and communications. Departing from Marxist orthodoxy and convinced that new conditions of consumer capitalism required fresh thinking, British theorists, including Stuart Hall and Raymond Williams, theorized culture as constitutive rather than simply reflective of social and economic processes. They offered pioneering studies of the role of advertising, television, and the mass media, as well as investigating the potential of youth and other subcultures to challenge and subvert ideological messages. Antonio Gramsci, an interwar Italian Marxist whose analysis of capitalist hegemony drew attention to the role of ideology and culture in reproducing capitalist dominance, was a critical influence. As it developed within and beyond the New Left, "cultural studies" drew on new theoretical developments, notably structuralism and post-structuralism, to become a discipline in its own right. Such gradual permeation and mutation are also characteristic of the wider theoretical legacy of the New Left, whose life span encompassed the early careers of numerous notable intellectuals and activists, including Perry Anderson, Tariq Ali, Daniel Cohn-Bendit, Rudi Dutschke, Stuart Hall, Tom Hayden, C. Wright Mills, E. P. Thompson, Ralph Miliband, and Raymond Williams. The British journal *New Left Review*, founded in 1960, is the most significant surviving forum of the original New Left: It continues to demonstrate the eclectic and experimental approach to theoretical and

political questions that gives the New Left its distinctive character.

New Liberalism

New liberalism refers to a body of distinctive legislation on social welfare enacted between 1906 and the outbreak of World War I. Herbert Samuel, Winston Churchill, and David Lloyd George were three of the government members most directly involved. The expression, however, was in use already. At the time of the defeat in 1895 of an earlier Liberal government, the Spencerian libertarian Joseph Hiam Levy voiced the hope in the *Personal Rights Journal* that John Bull had begun to realize what the "new liberalism" means.

The reforms were not the outcome simply of pressure from working people for increased social security. Wider perceptions of economic decline, compared with Germany and the United States, and awareness of evidence of the persistence of poverty and ill-health (from the work of Charles Booth and Seebohm Rowntree) were fueling anxieties over the condition of Britain. More fundamentally, a shift was arising in ways of conceptualizing the state and society, to which new liberalism was a political response. Older conceptualizations of the state as reactively regulative of the spontaneous lives of its citizens (as for John Stuart Mill and Herbert Spencer) were facing explicit challenges from idealist social thought, associated directly with Thomas Hill Green, David Ritchie, and Bernard Bosanquet, and echoed strongly in the Fabian socialism of Beatrice and Sidney Webb. The state and its citizens were part of a moral or organic unity, "society." In particular, society was a unity in which governments and "successful" citizens had the (hitherto neglected) power through social action to constitute, and thereby enhance and not merely regulate, the social, moral, and material lives of the poor. A "good society" could be directly achieved as the deliberate end of policy, or, in the application of Spencer's orthogenic social evolution contributed by Ritchie and Leonard Trelawny Hobhouse, and compatible with orthodox idealist social thought, the state could take control of the direction and pace of social evolution.

Herbert Samuel, familiar with these ideas, argued in 1895 that classical liberalism, as based on Jeremy Bentham's utilitarianism and Adam Smith's economics, was "sapped and raddled." In the *Progressive Review* for December 1896, he characterized the "newer Liberal school" as favoring an extension of the powers of the state

> to enforce, whenever possible, such conditions of employment as the public conscience approves as just, to improve the surroundings of working-class life, to render the resources of education equally available for the poor and the rich, to alleviate the miseries of unemployment and the destitution of the old, to reform the system of land tenure, to take under public control any industry which it is found can be managed in that way with greater advantage to the community, and to provide a fair standard of comfort for all who are in State employ.

His *Liberalism* of 1902 called for, from an idealist intellectual foundation, old age pensions, labor exchanges, and workmen's compensation, all prefiguring actual legislation. The state was to be the agent of the community.

Winston Churchill emphasized mitigation of the consequences of failure, with provision of a

minimum below which persons cannot fall yet above which they may compete with vigor. In 1901 he described Rowntree's *Poverty: A Study of Town Life* as making his hair stand on end. Rowntree's research in York had found that the poverty of the people there extended to nearly one fifth of the population; nearly one fifth had something between one and a half and three fourths as much food to eat as the paupers in the York Poor Law Union. To Churchill thus was a terrible and shocking thing. Seven years later, in the Liberal government at the Board of Trade, he declared his dedication to new liberal innovations in a letter to Asquith: "The Minister who will apply to this country the successful experiences of Germany in social organization may or may not be supported in the polls, but he will have at least left a memorial which time will not deface of his administration." He outlined a 2-year plan, giving pride of place to his own interest: labor exchanges and unemployment insurance; national infirmity insurance; state industries—afforestation and roads; modernized Poor Law, that is, classification; railway amalgamation with state control and guarantee; education compulsory until age 17. "I say," he finished, "thrust a big slice of Bismarckism over the whole underside of our industrial system, & await the consequences whatever they may be with a good conscience" (quoted in Jenkins, 2001, pp. 146–147).

Under the Liberal government formed in 1906, a range of innovations stand out. In 1906, local authorities gained powers to provide meals for needy schoolchildren, and in 1907 school medical inspection of children was introduced. In 1908 the Children Act (owing much to Samuel) abolished the committal of children to prison, instituted a system of juvenile courts, and gave some protection to children suffering from parental neglect. Samuel was involved too in the Prevention of Crime Act (1908), which established a national system of "Borstals" for reformatory education; in the authorization in 1910 of vocational guidance in schools; and in the Probation of Offenders Act of 1907, which effectively inaugurated probation in Britain.

In 1908 old-age pensions were enacted (pressure for which dated back for 30 years). They were for people older than age 70, and they were means-tested, noncontributory, and paid through the Post Office. In the area of work there was legislation on workmen's compensation provisions, on labor exchanges to promote the "fluidity" of labor (owing much to Churchill and William Beveridge), and on regulation in certain trades of wages and hours worked.

The National Insurance Act of 1911 is especially notable. It introduced two independent contributory schemes of health and unemployment insurance. Both involved a tripartite financial structure, in which contributions for each insured person came from the insured person, the employer, and the state. The health insurance scheme was administered through "approved societies," but unemployment insurance was directly undertaken by the state (though with provision for the involvement of trade unions). The Webbs complained that health insurance would be open to the manipulation of malingerers and would do little to prevent ill health, but it did secure the medical benefit of free access to general practitioners and a cash sickness benefit to the insured person, designed to compensate for the interruption to earnings. It owed much to Lloyd George's desire to build on old-age pensions, but on a contributory basis. He visited Germany in August 1908 to study its insurance schemes. The development of concrete proposals for Britain proved a struggle, with interested parties—the friendly societies, the commercial insurance companies (such as the Prudential) with large financial interests in door-to-door collection of premiums for death or funeral benefits, and the medical profession—all having much to lose in the face of a novel statutory provision. Eventually agreement was reached that friendly societies and the "industrial" insurance organizations (and trade unions and employers) could administer the scheme as the "approved societies." Insurance was compulsory for all workers earning up to the point income tax became payable, but selection of the approved society was a personal matter. Doctors providing the medical benefit were organized into panels, by a separate administration. Statutory unemployment insurance, planned in a symbiotic relationship with the provisions of the Labour Exchanges Act of 1909, was virtually without precedent anywhere. The experimental scheme (associated with Churchill, with assistance from Beveridge) was confined initially to trades without casual employment and where unemployment was

cyclical, temporary, and predictable (such as building, shipbuilding, mechanical engineering, iron founding, and construction of vehicles). It was markedly less controversial than health insurance.

The Royal Commission on the Poor Laws, appointed by the Conservatives in 1905, reported in 1909. Its majority and minority reports wanted the poor law abolished, but differed over what provision should replace it. New liberalism largely left it alone. However, the administration of old-age pensions and insurance was beyond the poor law's remit, thus terminating its hegemony over legally based assistance for poor people.

New liberal benefits in the form of cash payments may have been designed to achieve a fairer society, but recipients were free to choose how to spend them. This feature was not incompatible with more orthodox liberalism, but it represented a dilution of the "pure" new liberal ethos most clearly associated with its earlier reforms, embodying a direct tutelary role through the provision of services rather than cash. However, it did open up a chasm between the Liberals and the Webbs, who preferred measures ensuring people were employed and cured over unsupervised payments.

New liberal reforms dropped from the headlines as two general elections were triggered in 1910 around a constitutional crisis involving the House of Commons and the House of Lords over the Lords' rejection of the 1909 budget's financial measures, partly associated with them. New liberalism, though, is not the whole story of twentieth-century Liberal governments: A prominent Liberal minister at the time, John Morley, could object to homegrown "Prussian bureaucracy" (in his *Recollections,* Vol. 1). New liberal thinking survived World War I, but Liberal political muscle was wasting away.

The reforms were not part of an "unfolding process" in which they could be counted a necessary step toward the "welfare state" of the 1940s. Rather, they represented divergent Liberal incorporations of idealist social thought and its organic view of social problems coupled with its character-building solutions at a point in time.

New Right

The term *New Right* is usually attributed to the American author and former Republican activist Kevin Philips (1940–). It has been used with increasing frequency since the mid-1970s, in association with political and intellectual movements in several countries, including the United Kingdom, Australia, and New Zealand, as well as the United States. More recently, it has been used in connection with populist politicians in certain European states, such as Jörg Haider (1950–2008) of Austria and Pim Fortuyn (1948–2002) of the Netherlands.

However, most commentators trace the origins of the New Right to developments within the American Republican Party in the early 1960s and associate it with Barry Goldwater (1909–1998) and his 1964 campaign for the U.S. presidency. Although Goldwater's bid proved unsuccessful, the broad framework of ideas that informed his campaign was subsequently sustained within generously funded think tanks such as the Heritage Foundation and the American Enterprise Institute. Generally speaking, these ideas were not new at all; the only novelty was the vigor with which they were expounded.

Ideas

The New Right is commonly supposed to advocate a mixture of "traditional" social values and economic liberalism. One familiar theme is the importance of the family. Authors associated with the New Right typically argue that well-adjusted children cannot be raised unless both parents are

present. From this perspective, they oppose any legislation that eases the process of divorce, especially for couples with children, and condemn any system of taxation and state benefits that either penalizes the nuclear family or encourages childbirth outside that institution. The notion of civil partnerships between individuals of the same sex is regarded with abhorrence.

New Right authors, notably Charles Murray (1943–), have identified children born out of wedlock with a growing "underclass" of individuals who are liable to participate in violent crime and other forms of "delinquency." In the United Kingdom, a variation on this theme was put forward by the Conservative politician Sir Keith Joseph (1918–1994), who spoke in 1974 about a "cycle of deprivation." The idea that overgenerous welfare benefits generated a "dependency culture" became a commonplace of right-wing political commentary in the 1980s.

In economics, many members of the New Right have been influenced by the work of Friedrich von Hayek (1899–1992), in particular by *The Road to Serfdom* (1944), in which he argued that state intervention in economic matters would lead to the extirpation of liberty in other crucial respects. This libertarian aspect of the New Right was also expounded by Robert Nozick (1938–2002), especially in his *Anarchy, State and Utopia* (1974), in which he defended inequality arising from freely negotiated contracts against the more redistributive implications of John Rawls's (1921–2002) *A Theory of Justice* (1971).

The Political Fortunes of the New Right

The increasing potency of the New Right as a political force after 1970 can be attributed to international and domestic factors. On the one hand, American failure in the Vietnam War accentuated existing fears of communist encroachment. On the other, there was a growing feeling within some liberal democracies that the state had taken on excessive responsibilities in the economic sphere, while becoming too "permissive" in moral matters. In the eyes of the New Right, there was an obvious link between these factors, epitomized by the tendency of left-wing activists in the West to attack such "bourgeois" institutions as marriage and the family. On this view, the moral and social fiber of the West was being undermined so that it would be less capable of resisting the armed forces of the Soviet Union. The same process was making it more likely that liberal democracies would adopt communist ideas without direct Soviet intervention, either through revolution or even by peaceful democratic means.

The answer, for the New Right, was to stiffen the sinews of liberal democracy through the adoption of an ideology that provided a mirror image of communism. When postwar prosperity in the West was seriously undermined by the economic shocks of the mid-1970s, the New Right was ready to provide an alternative to the centrist policies that had generally prevailed in liberal democracies since 1945. In the United Kingdom, New Right ideas never enjoyed widespread public popularity, but Margaret Thatcher (1925–) endorsed them in full, and having taken the leadership of the U.K.'s Conservative Party in the same year that Kevin Philips coined the term *New Right,* she embarked on an 11-year stint as prime minister in 1979. Ronald Reagan (1911–2004), who was elected to the U.S. presidency the following year, adopted a similar ideological stance.

Although the political pioneers of the New Right owed their success (at least in part) to luck, it was not long before a plausible rationale was provided for this turn of events. In a globalized economy, it was argued, capitalists were sure to favor states whose governments advocated free-market thinking. At the same time, potential overseas investors would like to feel that they were putting their money into countries with relatively stable societies. If their theoretical utterances were any guide, Thatcher, Reagan, and similar politicians in countries like Australia and New Zealand offered a combination of increased social stability and greatly enhanced profit potential, compared to the situation under their moderate predecessors.

Although politicians of the New Right have enjoyed no more than mixed success in office, the impact of their ideas has proved to be enduring. In the United Kingdom, for example, "Thatcherite" policy initiatives were largely retained and, in some cases, pushed even farther by the Labour Party during the premiership of Tony Blair, prime minister from 1997 to 2007. In the United States, the influence of the New Right over the Republican Party was exemplified by the thinking of Newt

Gingrich (1943–), Speaker of the House of Representatives from 1995 to 1999.

The Coherence of the New Right

A major problem in assessing the New Right is the sheer diversity of individuals and groups commonly covered by that term. For example, European populist leaders like Haider and Fortuyn exploited antipathy toward immigrants to increase their public appeal. Whereas some might regard this as a logical product of New Right thinking, it could also be argued that the New Right emphasis on freedom implies unhindered movement of peoples across international boundaries. Similarly, some New Right pronouncements on dependency could be taken to imply that the "feckless" poor should be deterred from producing children, through one means or another. Yet in countries like the United States, some members of the New Right have joined forces with the Religious Right, who uphold the sanctity of life regardless of circumstances.

The problem here is that the term has proved all too successful, and that any right-wing ideologue who eschews the "middle ground" of politics is virtually guaranteed the "New Right" label, whether he or she wants it or not. A more telling criticism is that even "orthodox" representatives of the New Right, like Margaret Thatcher, have embraced incompatible ideas in economic and social matters. Especially since the collapse of communism, it has become clear that left-wing ideas played a relatively minor role in eroding traditional morality within liberal democracies. Critics argue that the impact of the free market has been a far more subversive force. On this basis they argue that, in defending the market as a bastion of liberty, the New Right may have unwittingly proved far more destructive of shared moral understandings than either the Old Left or the New left.

Nietzsche, Friedrich Wilhelm (1844–1900)

Friedrich Nietzsche is a provocative thinker who, although largely neglected during his lifetime, now exercises a wide influence in many areas of the humanities. His legacy for the study of politics is, however, hotly contested. This entry reviews central concepts in Nietzsche's thought, as well as controversies concerning them, and then examines the significance of Nietzsche's work for political theory.

Nietzsche was born on October 15, 1844, to a Lutheran pastor and his wife in Röcken, Prussia; his father died when Nietzsche was 4 years old. Nietzsche's academic training was in the discipline of philology (classics) rather than philosophy, and he achieved considerable academic success at a young age. However, at the age of 34 he took early retirement from the University of Basel due to ill health. He spent the next decade moving around Europe in search of affordable accommodation in a climate conducive to his well-being. Despite proposing to (at least) two women, Nietzsche never married. In 1889, he suffered a mental breakdown while in Turin, Italy, from which he never fully recovered. The last decade of his life was spent in the care of his mother Franziska and sister Elisabeth. During those years he lapsed in and out of lucidity and was incapable of writing.

Apart from a brief stint in the Prussian army, which ended when Nietzsche injured himself while trying to mount a horse, and his friendship as a young man with the composer Richard Wagner, Nietzsche's life was relatively uneventful. However, if he is correct that "the greatest thoughts are the greatest events" (Nietzsche, *Beyond Good and*

Evil, section 285, 1886/1973, p. 195), then by this standard, his life was full of events. Each of the works produced from *The Birth of Tragedy* (1872) to his last, including his quasi-autobiography *Ecce Homo* ([Behold the Man] 1908) is original, challenging, arresting, exacting, and unsettling.

Signature Concepts

A sense of Nietzsche's innovative thinking can be gleaned by regarding some of the concepts, ideas, and phrases he originated. He is well known for the doctrine of the will to power, although exactly what this doctrine means is widely debated. Nietzsche sometimes presents the will to power as a monistic metaphysical thesis, according to which the urge to increase power surges through every living thing. As one of his oft-quoted formulations of this doctrine in *The Will to Power* declares, "The world itself is the will to power—and nothing else! And you yourself are the will to power—and nothing else!" (Nietzsche, 1901/1967, section 1067). From this perspective, human beings are manifestations of the will to power, and a fundamental human motivation is the desire to increase one's power. According to this outlook, every human action is driven by the will to power, even actions that seem self-denying.

This view that the exertion of power is all-pervasive in human life, even if it is sometimes masked, helps us to understand another of Nietzsche's unique ideas—his distinction between master and slave moralities. Master moralities are doctrines that affirm and promote the values of strong and powerful individuals. They emphasize martial strength, courage, hardness, cruelty, competition, conflict, and glory. Master moralities are elitist: They do not hold that all human beings can attain these heights, but rather accept that some, and usually most, members of society will have to live by different and lower standards. The paradigmatic slave morality for Nietzsche is Christianity. Christian values like meekness, mildness, humility, turning the other cheek, loving one's enemies, and blessing the poor in spirit both appeal to, and serve the interests of, those who are themselves weak in mind, body, and spirit. As an egalitarian doctrine, Christianity contends, however, that its values and virtues are equally applicable to all individuals, weak or strong, great or humble. Nietzsche claims to expose this egalitarianism as an expression of Christianity's will to power, for it provides a way in which a weak majority can dominate and emasculate a stronger, superior elite.

The egalitarian pretensions of Christianity are, in Nietzsche's estimation, driven by what he labels the *ressentiment* of the weak. Seeing that some people are superior to them in strength and nobility, the weak majority resents rather than admires their greatness. Inferior individuals react to the greatness of others by devising a morality or value scheme that brings everyone down to their lowest common denominator. Nietzsche depicts Christianity as having achieved what he calls a "transvaluation of values" by overturning the master moralities of ancient Greece and Rome. Modern doctrines of liberalism, democracy, and feminism, all of which are premised on a belief in human equality, arise in the wake of this transvaluation. The influence of Christianity on Western culture and politics has been, in Nietzsche's estimation, momentous and largely (but not wholly) deleterious, for it is a herd morality that has spawned other herd moralities.

Nietzsche thinks, or perhaps hopes, that the reign of Christianity is waning. He is well known for the pronouncement, voiced first by a character dubbed "the madman" in *The Gay Science* (1882/1974) that God is dead. This claim does not commit Nietzsche to the belief that God was ever alive: Rather, what he seems to mean is that belief in a Christian god is beginning to decline in Europe, partly as a result of the rise of modern science. Thus the second part of the madman's claim that "God is dead" is that "we have killed him." It is unclear what will replace Christianity, but there are hints that Nietzsche looks forward to a new transvaluation of values, with the rise of what he calls the *Übermensch*. This Nietzschean term can be translated as the "overman" or the "superman," but as neither is satisfactory, it is preferable to retain the German original. These *Übermenschen,* or "higher" humans, will institute an era of cultural and ethical renewal by promulgating new (or ancient) ideals of self-love, self-assertion, independence, individuality, creativity, and generosity.

A distinguishing feature of these Übermenschen will be their ability to affirm the idea of the eternal return (or the eternal recurrence) of the same.

Although this doctrine of eternal return is sometimes presented by Nietzsche as if it were a metaphysical belief that history repeats itself over and over again, most contemporary interpreters read it as a psychological or existential thought experiment. According to this interpretation, great individuals can affirm the idea of reliving their life over and over, just as it has been in every detail, with all its pleasures and delights, suffering and indignities, great and small. Thus the passage titled "The Greatest Weight" (section 341) in *The Gay Science* presents two possible individual responses to the prospect of the eternal return of the same. One is to "throw yourself down and gnash your teeth and curse the demon who spoke thus." The other is to declare, "You are a God and never have I heard anything more divine" (Nietzsche, 1882/1974, pp. 273–274). Great individuals are able to respond in this second way, having the courage, self-love, and joy in life to want to live their own life over and over again, not least because it is their own.

As his view of moral schemes as expressing the will to power, his claim that ressentiment fuels Christian values, and the thought experiment of the eternal return all testify, Nietzsche was profoundly interested in the psychology underlying the adoption of ethical positions. He continually inquires into the psychological sources for judgments about what is good or bad, noble or base, attractive or repugnant. Nietzsche described himself as a psychologist, as someone committed to penetrating the depths of human motivation, however murky they may be. This central role that he accords to psychology in explaining morality also brings us to another of his leading conceptual innovations. Nietzsche uses the term *genealogy* to describe a particular way of approaching morality historically, one that he takes his own writings to exemplify. His genealogical investigations into the origins of moral ideas and ideals typically reveal the origins of lofty moral concepts, such as altruism and self-denial, to lie in base, mundane, and material interests. These all-too-human origins have, however, been forgotten or covered over with the passage of time, so that uncovering the history of morality requires a hermeneutics of suspicion that refuses to take things at face value and insists upon interrogating morality's self-representation.

Contested Meanings

Nietzsche's readers continue to debate the meaning of each of these key ideas—and of many others from his fecund texts—as well as trying to determine whether and how his various ideas relate to one another. The continuing puzzle of Nietzsche's legacy for philosophy in general and political theory in particular can be linked directly to the innovative and demanding nature of his antisystematic philosophical style. In an aphorism from *The Twilight of the Idols* (1889/1968), Nietzsche proclaims his mistrust of all systematizers: "The will to a system is a lack of honesty" (section 26, p. 27). His inveighing against "all systematizers" need not, however, mean that Nietzsche's thought is devoid of all coherence, consistency, or continuity. What it does mean is that his readers have to work to find these things in his thought, for Nietzsche refuses to present his ideas and arguments neatly packaged.

Any overview of Nietzsche's thought must also make some reference to his idiosyncratic writing style. In all his writings after the four essays that comprise the *Untimely Meditations* (1873–1876), Nietzsche eschewed any overtly clear, coherent, and continuous treatment of traditional scholarly topics. From *Human, All Too Human* (1878) onward, his work exhibits a variety of writing styles and philosophical topics mixed together. The most conventional of his later works in terms of scholarly style is *On the Genealogy of Morals: A Polemic* (1887), which is broken into three essays. But as its subtitle signals, this work is not conventional in any other regard. These tendencies toward stylistic diversity and frequent changes of focus challenge the reader to lend coherence to (or impose coherence upon) Nietzsche's seemingly disjointed reflections. One consequence of his unorthodox and exacting writing style, and the requirement it makes of the reader to seek out continuity in his views, is that there is wide disagreement among Nietzsche scholars about what he is trying to teach us. This ambiguity ranges across all aspects of his thought—from his views on metaphysics to ethics to epistemology to aesthetics. The debate about Nietzsche's meaning is just as evident when it comes to assessing the significance of his work for political theory.

Political Ideas

There is no discrete work in which Nietzsche explicitly addresses political questions; instead, his observations about politics are scattered throughout his texts and interwoven with his views on all manner of topics. The nearest thing we have to an extended reflection on politics comes in book 8 of *Human, All Too Human,* "A Glance at the State." This comprises 45 numbered sections whose length varies from one line (section 482) to three pages (section 472) and whose topics range across a wide diversity of political matters. From looking at the titles Nietzsche gave to just four of the sequential entries, we can see how varied are his foci: Consider "Of the Nobility" (section 440), "Subordination" (section 441), "Conscript Armies" (section 442), and "Hope and Presumption" (section 443). Because of this variety in style and topic, it is hard to retrieve a clear and distinct position on politics from book 8. Any such attempt is further confounded by the fact that the rest of the book also contains observations about politics.

However, even if we could recover a clear position on politics from this work, there is still the problem that many of Nietzsche's ideas changed over time. It is commonplace to distinguish three phases in his corpus. Nietzsche's middle period comprises *Human, All Too Human,* "Assorted Opinions and Maxims" (1879), "The Wanderer and His Shadow" (1880), *Daybreak* (1881), and the first four books of *The Gay Science* (aka *The Joyful Wisdom*). This period is demarcated, at one end, by contrast with his early writings such as *The Birth of Tragedy* and the *Untimely Meditations,* with their enthusiasm for Wagner and Schopenhauer. It is demarcated at the other by the sui generis *Thus Spoke Zarathustra* (1883) and Nietzsche's subsequent writings.

This tripartite periodization is salient for any attempt to elicit Nietzsche's views on politics. The early writings evince some enthusiasm for a classically inspired renaissance of German culture under the guidance of artists like Wagner. In the middle period, Nietzsche is much more interested in the future of Europe in general than of Germany in particular. From these writings onward, he continually excoriates German nationalism and refers repeatedly and positively to the idea of being a "good European." It is also usually agreed that his political views are more moderate in the middle period than in the later works. One issue that scholars must address, therefore, when advancing their interpretations of Nietzsche, is to what extent their findings are shaped by the particular texts they draw from and, conversely, whether they can extrapolate from a particular text or set of texts a view that belongs to Nietzsche unmodified.

Nietzsche and Nazism

In the first half of the twentieth century, Nietzsche's name was typically associated with German and Italian fascisms. Any automatic association of Nietzsche with Nazism has since been discredited and can be explained, to some degree, by the artful machinations of his sister Elisabeth, who was a Nazi sympathizer, and the highly selective use of some of Nietzsche's writings. In his landmark book *Nietzsche: Philosopher, Psychologist, Antichrist,* Walter Kaufmann debunked the idea that Nietzsche subscribed to any conception of a master race, was an advocate of German nationalism, or supported anti-Semitism. Kaufmann concluded not only that there was no basis for the Nazi appropriation of Nietzsche's thought but, rather more extravagantly, that Nietzsche's views were more antithetical to Nazism than were the views of any earlier or contemporaneous prominent German.

Yet to accept that Nietzsche's politics are not synonymous with Nazism leaves open the question of whether some elements of his thought could be taken to nourish fascist beliefs. Whereas Nietzsche abandoned any trace of German nationalism with his earlier writings, and had many positive things to say about the tenacity of the Jewish people, he does not, for example, recoil from the use of violence: Indeed, at times he glorifies violence and cruelty. He is also relentlessly critical of modernity, which could foster a belief that a dramatic reorganization of social and political life is necessary. He is full of admiration for strong and powerful individuals who pursue their course—be it political or artistic—with little regard for its impact on others. And despite Kaufmann's best attempts to disentangle Nietzsche from Nazism, some questions about this continue to be debated by scholars today. These include whether there are any anti-Semitic aspects to Nietzsche's thought, exactly what role his sister played in endearing him to the Nazis, and to what

extent he can be held responsible for the use of his ideas by fascists.

As this indicates that, although any ready, uncritical association of Nietzsche with Nazism has been jettisoned by most Nietzsche scholars, there is still considerable controversy about what exactly Nietzsche has to contribute to our understanding of politics. In the English-language scholarship alone, three major rival approaches to this question can be discerned. The first sees a defense of some form of aristocratic politics in Nietzsche's writings; the second finds no politics at all. The third approach plumbs Nietzsche's thought for resources for the ongoing revitalization of democracy.

Aristocratic, Nonpolitical, and Democratic Nietzsches

One school of thought contends that Nietzsche calls for a massive reform of the political and social structure of modern societies. On this interpretation, Nietzsche is an elitist who is fiercely critical of all modern political doctrines—liberalism, democracy, socialism, and feminism—because at root they perpetuate the false Christian belief in equal human worth and dignity. Instead of political organization being premised on any version of this belief, Nietzsche recommends the revival of some form of aristocratic rule, according to which a stratum of superior individuals rules, and political and social life are set up to protect and promote the interests of that elite. Proponents of this view often point to passages resembling this one from the fifth book of *The Gay Science* (section 377), "We Homeless Ones":

> We "conserve" nothing, neither do we want to return to any past periods; we are not by any means liberal; we do not work for "progress"; we do not need to plug up our ears against the sirens who in the market place sing of the future: their song about "equal rights," "a free society," "no more masters and no servants" has no allure for us. We simply do not consider it desirable that a realm of justice and concord should be established on earth (because it would be the realm of the deepest leveling and *chinoisierie*); we are delighted with all who love, as we do, danger, war and adventures . . . we count ourselves among conquerors, we think about the necessity for new orders, also for a new slavery—for every strengthening and enhancement of the human type also involves a new kind of enslavement. . . . We are no humanitarians; we should never dare to permit ourselves to speak of our "love of humanity." (Nietzsche, 1887/1974, pp. 338–339)

On this interpretation, Nietzsche's searing criticisms of the politics of his day were designed partly to persuade his readers that a dramatically different form of politics is desirable. Proponents of this view cite passages in Nietzsche's writings that suggest that the democratization of Europe is preparing the conditions for its own supersession: By spreading the idea of political equality, democratization ultimately makes people more amenable to subjection to a strong leader. At the end of a long paragraph in *Beyond Good and Evil* to this effect, Nietzsche concludes that "the democratization of Europe is at the same time an involuntary arrangement for the breeding of tyrants—in every sense of that word, including the most spiritual" (Nietzsche, 1886/1973, section 242, p. 154).

A very different view of Nietzsche's significance for political theory is held by those who maintain that his real interests lie outside of political structures and relationships and focus instead on the abilities of individuals to shape themselves. The first principal exponent of this view was Kaufmann, who, from the 1950s onward, translated many of Nietzsche's works into English and strove to clear Nietzsche's name of its baleful political connotations. Kaufmann also aims to offer a comprehensive reconstruction of Nietzsche's thought. However, having argued that Nietzsche was not a protofascist, Kaufmann offers no further discussion of political matters. He maintains, instead, that Nietzsche's central concern lay with the individual's quest for self-perfection. Fellow proponents of the view that politics is of no relevance to Nietzsche argue that questions of political self-determination were beyond his remit. On this view, Nietzsche writes exclusively to and for individuals, not institution builders.

Some proponents of the nonpolitical Nietzsche find support for their reading in Nietzsche's self-depiction as "the last *anti-political* German" (*Ecce Homo,* "Wise" 3, emphasis in the original). However, in the context in which Nietzsche was writing, "anti-political" need not imply indifference to questions of political organization. Instead, to be anti-political meant to resist the modern idea

that the political sphere should be separate from, and not answerable to, other spheres such as culture and religion. Originally the term had pejorative connotations, coined as it was by critics of this position. Nietzsche, characteristically, transvalues the term to make it a badge of honor. He does not see politics or the modern state as the highest good in human life but believes that they should be subordinate to other values and ends, such as the flourishing of culture and the well-being of higher human beings, his Übermenschen. Indeed, in a work written in the same year as *Ecce Homo,* Nietzsche uses the term *anti-political* when outlining his belief in the necessary antagonism between politics and culture. According to him, "All great cultural epochs are epochs of political decline: that which is great in the cultural sense has been unpolitical, even anti-political" (Nietzsche, 1889/1968, *Twilight of the Idols,* "What the Germans Lack," 4, p. 63). This suggests that the flourishing of culture is not indifferent to, or detachable from, the state of politics; rather, when political power is strong, it is more able to shape and determine culture; when political power is weaker, cultural development enjoys more autonomy.

Nietzsche is not an anarchist; he accepts the state can provide a useful framework for social order. However, he insists that it should not be exalted or considered an end in itself. This is especially so in the modern era, when the state's rationale is the preservation of life rather than any higher goal. A powerful state should not be mistaken for the pinnacle of human excellence. In this we see the other side of his anti-political coin: Just because a state such as Bismarck's Prussia displays great military strength does not mean that it has a vibrant culture. And just because a state, such as France, may be defeated in war does not mean that its culture is inferior. Nietzsche's belief that the state is not worthy of worship, that there are higher goals in life, particularly those to do with cultural achievements, is reiterated in the third of his *Untimely Meditations* on "Schopenhauer as Educator." In section IV of that essay he reports that he is "concerned with a species of man whose teleology extends somewhat beyond the welfare of a state . . . and with [this kind of man] only in relation to a world which is again fairly independent of the welfare of a state, that of culture" (Nietzsche, 1874/1983).

A variation on this theme that Nietzsche has no philosophy of politics holds that even if he did express views about political matters, they do not add up to an organized, prescriptive theory of politics. Irrespective of any illusions he might have harbored to the contrary, this line of interpretation concludes that Nietzsche has nothing to teach us about politics. His opinions about political matters are of no philosophical importance.

A third position agrees with the first position (i.e., that Nietzsche's thinking *is* relevant for politics) but construes its relevance in a completely different way. These scholars see Nietzsche as offering useful ways of strengthening democracy, of making it more robust, vital, and inclusive. The general thrust of this reading is that whatever Nietzsche says explicitly about politics does not exhaust the value of his contribution to our understanding of politics. If we turn from his overt remarks about politics and train our gaze instead upon his ethical and ontological claims, we find inspirational ways of thinking about a politics that is more egalitarian, creative, and progressive that are not available in the work of canonical political thinkers of the past or in the work of major political thinkers of the present.

Nietzsche in the Plural

Nietzsche was, from the start, claimed and acclaimed by readers with a wide array of political commitments. There is, therefore, nothing especially unusual about the existence of these competing schools of Nietzsche interpretation today. Because of the elusive nature of his writing and his rejection of systematic thinking, some textual evidence can be found to support all of these positions. But to say that all are plausible is not to say that all are equally plausible. Proponents of the aristocratic Nietzsche need to clarify what role higher human beings should have in a politics of the future: Should they be actual rulers or simply oversee a political process that leaves them largely free to pursue other goals? Nietzsche's many dismissive remarks about political activity suggest that he does not see this as a particularly worthy endeavor, but it is unclear how higher human beings could control a regime and keep it on track while playing only a minimal role in its maintenance. Partisans of the second approach—that Nietzsche is a

nonpolitical thinker—still need to address the question of what mode of political organization is most conducive to promoting individual self-creation and self-overcoming. Some regimes provide their members more latitude and resources for private self-creation than do others. Adherents of the view that Nietzsche's political comments carry no philosophical weight also need to supply and defend criteria for determining what claims do and do not carry philosophical weight in his writings.

To complicate even further this question of what Nietzsche contributes to our understanding of politics, we need to recognize that these three divergent approaches are underpinned by different views about hermeneutics and the function of political theory. Those who find an aristocratic Nietzsche claim that they are taking him at his word, even though they may personally dislike the position they attribute to him. Proponents of the third school of thought—the democratic Nietzsche—tend to follow, if only implicitly, Michel Foucault's approach to Nietzsche interpretation. According to this approach, Nietzsche's ideas are there for his readers to use as they will, even if this requires their distortion and deformation. There is no need to be faithful to Nietzsche's supposed intentions if his ideas can be made useful for our purposes.

Given the ambiguities surrounding his meaning, the question remains as to why anyone seeking to deepen their knowledge of political theory would read Nietzsche at all. There are, after all, many other nineteenth-century thinkers who offer a more straightforward view of politics: Marx, Tocqueville, and John Stuart Mill spring to mind here. One thing that Nietzsche's interpreters all agree upon is that reading his work is a bracing experience. He forces us to read, and reread, carefully and curiously: Nietzsche demands active readers, not slavish followers. He offers us ideas and ways of thinking that are not available elsewhere. He requires us to rethink many of the things we readily take for granted, stimulating us to interrogate what is usually left unthought in our approaches to politics, whatever they may be.

Note: Section numbers refer to original numbering by Nietzsche; page numbers refer to the works listed in the Further Readings.

NIHILISM

Nihilism has always been a term of abuse. Almost no one in the history of philosophy claims the title of nihilist for his- or herself; rather, from the first use of the term in philosophical disputes of the eighteenth century, *nihilism* has been a charge by one school of thinkers against another. Although many groups have been accused of nihilism, the accusation generally is taken to mean that a thinker, or thinkers, denies the existence of any natural values and, hence, denies the possibility of any moral scheme whatsoever. Alternatively, it can mean that philosophy renders life meaningless in some fashion or deprives human action of any intelligible purpose. Here we shall be concerned to understand the two most common uses of nihilism:

1. As an accusation against rationalists and materialists, typified at first by Baruch Spinoza, but later by science in general and especially Darwin
2. As an accusation against postmodernists, typified by Friedrich Nietzsche

The term *nihilism* is also sometimes used with reference to a Russian nihilism, derived mainly from fictional characters in the pages of Dostoyevski and Turgenev who are either (or both) supremely egoistic or suicidal. Insofar as this term has real historical purchase, it probably describes a small movement of the 1860s whose intellectual content is similar to that contained under (1) above.

Although he did not invent the term, F. H. Jacobi (1743–1819) was the first to introduce it into philosophical discourse in a detailed way in his *Letters on the Doctrine of Spinoza* (1785). Although it may seem bizarre to modern readers, for whom Immanuel Kant is a touchstone for moral philosophy, it was Kant (and, to a lesser extent, Johann Gottlieb Fichte) who were Jacobi's main polemical targets even though he developed his criticism through an interpretation of Spinoza.

Spinoza's philosophy, in Jacobi's view, had begun the march to nihilism through its radical monism centered on the idea of a universal substance. Neither faith nor free will was compatible with this premise, though Spinoza's followers sometimes denied it. The mistake, Jacobi argued, began with the belief that all cognition could be reduced to the understanding of efficient causes. Not only did this leave no room for creation or miracles, but it also excluded the possibility of real choice and, thus, any kind of morality. Kant's critical philosophy, Jacobi believed, while seeming to refute Spinoza's perspective, had actually compounded it. Although Kant sought to restore a space for subjectivity, he left the Spinozistic picture of nature largely untouched and merely constructed an alternate realm that had no direct point of contact with the real world. Kantianism was nihilistic to Jacobi because it created this subjectivity out of thin air and left it powerless to affect material events governed by natural laws. So Kant's dualism was no improvement on Spinoza's monism and perhaps worse in that it created the illusion of having countered it. From Jacobi's perspective, the only alternative was to understand divinity and faith as the true ground of subjectivity and human freedom as well as the properties of the natural world.

Although he meant the term to target only critical philosophy's efforts to reconcile subjective freedom with Spinozistic necessity (and not simply the latter by itself), it is easy to understand how, by extension, Jacobi's charge of nihilism could eventually be lodged against every kind of materialism and, indeed, against modern science in general. Thus Dimitri I. Pisarev, one of the primary figures in most descriptions of Russian nihilism, was known for little more than his introduction of Darwin's ideas to Russian-language readers. Through the mid-nineteenth century then, nihilism was a charge generally hurled against those who appeared to deny free will via scientism or mechanism.

In the late nineteenth century, Nietzsche began to use the charge of nihilism in a related but slightly different way. Ironically, he was then accused of leading a movement that he had only meant to identify. Like his predecessors, Nietzsche used the term *nihilist* to name a philosopher who, in some sense, deprived the world of foundational sources of meaning. Although this might include scientists, Nietzsche was much more concerned with modern historians, who documented the variety and flux of moral systems across cultures and periods, and with philosophers like Schopenhauer, who demonstrated the fundamentally chaotic, time-bound nature of experience. Although these authors were not nihilists, Nietzsche argued that such work would have a nihilistic effect on European culture by depriving its morality of theological foundations without providing any kind of alternative.

Though Nietzsche saw his own philosophy of anthropocentric valuation as a corrective to this situation, his keen diagnosis of modern historical relativism was seen by many as an endorsement of it. Again by extension, the term *nihilism* came to be deployed against any kind of moral or historical relativism and, eventually, against the group of writers known collectively as postmodernists. Although it is true that many postmodernists share Nietzsche's belief that morality has no firm *natural* basis, it is largely their opponents, and not the postmodernists themselves, who draw the conclusion that there are therefore no values whatsoever or that no morality is possible. In the twentieth century, then, the charge of nihilism has been used largely against post-Nietzscheans like Michel Foucault, Jacques Derrida, and Richard Rorty, although it is not uncommon to see writers, especially in the Catholic tradition, who continue to use it in its former sense of representing the outcome of rationalism or Darwinism.

In sum then, the term *nihilism* has been used in two nearly opposite meanings. In the first case, it named writers who made the world so predictable that it deprived human beings of the capacity for moral choices; in the second case, it named writers who made the world so unpredictable that it deprived human choices of any meaning. In both cases, these writers existed largely, but not entirely, in the minds of their opponents.

NONVIOLENCE

Nonviolence has its roots in almost every religion in the world: Jainism, whose chief precept is *ahimsa* (non-harm); Judaism, which commands one to pursue peace; Christianity, whose three peace churches—the Society of Friends, the Mennonites, and the Church of the Brethren—have been witnesses to nonviolence for hundreds of years; Islam, whose nonviolent exemplar Badshah Khan (1890–1988) was an inspiration to Mohandas Gandhi (1869–1948); and Buddhism, one of whose most recent nonviolent exemplars is Thich Nhat Hanh (1926–).

Nonviolence, however, is understood in various ways by various theorists: It is a way of living, a political strategy, and a moral or spiritual principle.

Some theorists, such as Gene Sharp (1928–), regard it solely or primarily as a political strategy. Others, such as Thich Nhat Hanh and Leo Tolstoy (1828–1910), may prefer to regard it solely or primarily as a way of life or a moral principle. Still others, such as Mohandas Gandhi and perhaps Martin Luther King, Jr. (1929–1968), regard nonviolence in all three ways: a way of life that is at the same time a moral principle and a political strategy.

Gandhi was probably the first person to attempt to treat nonviolence somewhat scientifically, as a way of life to be tested against experience as a hypothesis and modified accordingly. Disliking the term *passive resistance* because nonviolence can be active as well as passive, and disliking the term *nonviolence* because it seems merely a negation when it is often quite positive and productive, Gandhi solicited ideas for a new term and, with the help of others, coined the term *satyagraha,* which means, literally, clinging to truth. The Hindi word *satya* means truth, the word *sat* means being, and the word *graha* means grasping. Gandhi believed that because all people are finite beings, they cannot, by their nature, grasp the entire truth in any circumstance; they must of necessity discover more of the truth in beings outside of themselves. Thus, to destroy or kill another being precludes one from discovering the full truth. To cling to truth, one must be nonviolent. So for Gandhi, the pursuit of truth, which he also called God, is the highest pursuit, and nonviolence is the only means by which one may attain it.

However, for Gandhi, the pursuit of truth is active. One must cling to the truth as one sees it, but in clinging to it, in refusing the demands of others that tear one from that truth, one may not harm others lest one also destroy whatever they might possess of the truth. To the extent that one's nonviolent actions win others over to the pursuit of truth via nonviolence, the greater the overall movement is toward truth.

Among those who studied Gandhi's techniques were Richard Gregg (1885–1974), who visited and interviewed Gandhi in the 1920s, and Joan Bondurant (1918–2006), who visited and interviewed him in the 1940s, both for extended periods of time. Both Gregg and Bondurant focused on the dynamics of his nonviolent political action, including his constructive programs. Gandhi's constructive programs were an integral part of his efforts to help people overcome their own powerlessness through self-education, self-employment, and self-sufficiency. After Gandhi's assassination in 1948, more writing about Gandhi's political strategies emerged, most notably the writings of Sharp, who recognized Gandhi's strategic brilliance. In 1973 Sharp published a work, *The Politics of Nonviolent Action,* which has become a classic in the field of nonviolence understood as a political strategy. Although the work was not focused on Gandhi, it relied heavily on many of Gandhi's insights but added greatly to the systematization of nonviolent tactics, the theory of nonviolent strategy, and the history of nonviolent action when employed as a political or social strategy.

In 1982 Richard Attenborough's Academy Award–winning film *Gandhi* popularized Gandhi anew. The film contributed to such an increase in scholarship about nonviolence that the field is now wide and diverse.

Sharp and others who have spun off of Sharp's groundbreaking work, such as Peter Ackerman (1946–) and Jack DuVall, insist that nonviolent strategic action need not be underpinned by a moral or spiritual commitment. They eschew the use of the term *nonviolence* because they believe that the spread of nonviolent political action can be accomplished more effectively if people are not led to think—wrongly, they argue—that one must accept nonviolence as a moral principle before one can practice nonviolent strategy. They argue further, that nonviolent strategic action, even without a moral underpinning, is far more preferable to violent strategic action, both in terms of the reduction in harm that accompanies all conflicts where it is used and in terms of the long-term benefits that nonviolent strategic action brings to conflicts. These benefits, they claim, include democratization of political processes and a decentralization of power.

Central to understanding nonviolent strategic action is the notion that power in an institution or government rests on the consent of those governed: If the governed withdraw their support, the leadership falls. Thus, power can be gained and oppressors toppled by enabling those who are governed to overcome fear, educate themselves in general and about nonviolent strategy and tactics in particular, and grow in numbers around a particular cause or set of causes. The extent to which those with grievances reject violence in pursuing their

goals is, in large part, the extent to which they will attract greater numbers and credibility—and, thereby, power—to their cause.

Founded in 1914, the Fellowship of Reconciliation (FOR) has been active in promoting a spiritually based form of nonviolence that is, at the same time, politically active. FOR maintains an active staff of approximately two dozen people, many of whom have been involved in successful nonviolent movements and actions in the Philippines, Latin America, and the Middle East. Among its members is James Lawson, a civil rights leader who was instrumental in desegregating Nashville, Tennessee, through lunch counter sit-ins and store boycotts. Students whom he trained, among them Bernard Lafayette and John Lewis, became the youth leaders of the civil rights movement in the United States and have remained leaders late into their lives.

The Southern Christian Leadership Conference (SCLC) is another organization important in the history of nonviolent social action in the United States. Under the leadership of Martin Luther King, Jr., Lawson, and others, SCLC played a major role in the civil rights movement of the 1950s and 1960s.

Oaths

Oaths—promises that are made binding by the swearing of the maker on something that that person holds to be sacred—were a central feature of the political tradition of ancient Greece and Rome, and they played an important part in the Jewish and early Christian traditions of the ancient world. In Greece, the oath was the way in which religion contributed to social harmony and political stability. The Attic orator Lycurgus of Athens was said to have claimed in the fourth century BCE that the oath was what held Athenian democracy together.

Various things were required for an oath to be officially sworn. First, the person swearing the oath made a declaration, which was either an assertion about past events or a promise to undertake certain actions in the future. (Oaths can thus be either "assertory" or "promissory.") Then the swearer had to specify a sacred power that was to be the witness to the declaration and the guarantor of its truth. In the Greek world, Zeus or one of the other gods was the usual guarantor. Finally, the swearer had to specify a curse or punishment that he or she would receive if the assertion was false or if the promise was not carried out. In ancient Rome, oaths were sworn upon the Jupiter Stone in the Temple of Jupiter, which was on the Capitoline Hill.

Perhaps the most famous ancient oath in the contemporary world, the Hippocratic Oath, taken by doctors when swearing to practice in accordance with ethical guidelines, was made on the authority of Apollo, Asclepius, Hygeia, and Panacea. Other famous oaths from the ancient world include God's promise in the book of Genesis never to destroy the world by flood again and Aegeus's promise to Medea in Euripides' *Medea* that he will grant her asylum in Athens in exchange for using her magical skills to ensure that his period of childlessness comes to an end.

It was in the ancient world as well that the oath became the cornerstone of the legal system and a prerequisite of witness statements at trials. As a result, Walter Burkert, professor of classics at the University of Zurich, has argued that the oath underpinned and tied together religion, politics, morality, and both civil and criminal law. Indeed, as a project established at the University of Nottingham to study the oath in ancient Greece has shown, oaths are referred to or uttered in almost every surviving text from that time period. Oaths also played a significant part in Germanic and Norse chivalric culture in feudal Europe.

OLIGARCHY

Oligarchy (*oligarkhía*) denotes the rule of the rich few. In ancient Greece (where the name originated), oligarchy was a political regime in which the ruling power (*arkhé*) was held by a small group of wealthy citizens (*óligoy*) or a class chosen by census. The regime of the Four Hundred that overturned Athenian democracy in 411 was an oligarchy. Since its inception, the term has referred particularly to the determination of a social class to acquire political power in order to further its own interests and so implied not simply a government *by* the few, but rule by *and for* the few. Oligarchy tends therefore to be unfavorably contrasted with *aristocracy,* rule of the few (best and wisest) for the benefit of all, although from the point of view of modern egalitarian ideals, both will seem objectionable.

Oligarchy in Antiquity

Oligarchy is a form of class rule, and so from the beginning, efforts to analyze it have focused on the distinctive character of oligarchs and their class interests. In *The Republic,* Plato depicted oligarchic men in the following way:

> Men of this stamp [oligarchs] will be covetous of money, like those who live in oligarchies; they will have, a fierce secret longing after gold and silver, which they will hoard in dark places, having magazines and treasuries of their own for the deposit and concealment of them; also castles which are just nests for their eggs, and in which they will spend large sums on their wives, or on any others whom they please. (Book VIII)

In *The Politics,* Aristotle echoed Plato's view that acquisitiveness and a fixation on economic wealth are integral to an oligarchical class mentality and hence oligarchical public culture. Thus Aristotle treated oligarchy as a degenerate political regime not only because the few exercise power in their own interests, but also because they construe those interests in a narrowly economistic fashion. Both Plato and Aristotle noted a closely related deficiency of oligarchical regimes: their tendency to exacerbate antagonisms between the rich and poor. Oligarchical elites, they argued, typically enjoy their status and privileges at the expense of the populace or the many, those whose lives depend on their own work, either because they own no property at all or because their holdings are too small to exempt them from liability to work. Although in *The Republic* Plato ranked oligarchy above democracy, he condemned both regimes for conflating political authority and private power. In one, political authority is predicated on the private interests of the wealthy; in the other, it is predicated on the private interests of the poor. Plato argued that this precludes civic friendship, unity, and peace. This influential analysis strongly implicates the class connotations of oligarchy in its failings as a political regime.

In Athens, the theoretical identity of oligarchy as a class and as a model of political power came to be shaped precisely in its actual struggle against democracy. In the Pseudo-Xenophon's (or Old-Oligarch's) *Constitution of the Athenians* (c. 430s BCE), oligarchy was directly opposed to democracy. The opposition between them reflected rival interpretations of political equality. The democratization of Athenian society consisted in a progressive expansion of the community entitled to an equal share in public responsibility. Initially, this privilege was restricted to those who belonged to the narrow class of the knights or nobles. They were later joined by members of the middle class that fought in the *hoplite* and eventually by the lower class of *thetes*. In this way political equality (*isonomia* or equality before the law, and *isegoria* or the equal right to speak in the assembly), initially reserved by those who shared a privileged social position (equal treatment of social equals), was transformed into a principle distributing political rights without regard to social position. The Pseudo-Xenophon was among the first to regard this process as a degeneration of the ideal of political equality typical of democratic regimes. Later on, Plato's *Laws* and Aristotle's *Politics* offered a more systematic account of this contrast between good and bad equality (associated with oligarchy and democracy, respectively).

According to Aristotle, both arithmetical equality (treating different individuals equally or making the unequal equal) and proportional equality (treating different individuals differently or making only the equals equal) are important in a good

government but only if they are used in the right domain. For instance, from the fact that all should be treated equally by the law or in a tribunal it does not follow that they should also share equally in political power. On the other hand, from the fact that official responsibilities are discharged by an elite, it does not follow that only the members of this elite should have the right to sit in the assembly or enjoy legal equality. The dualism of equality emphasized in the oligarchical polemic against democracy had tremendously important effects on the meaning of democracy, which came to be defined as a mirror image of oligarchy. Both regimes, Aristotle argued, apply the two equalities in an absolute and simple way: proportional equality becoming the privilege of the few (in oligarchies), arithmetical equality that of the many (in democracies). From an Aristotelian standpoint, these regimes are equally problematic in that they both institute monopolies of political power. Yet, by mixing the two kinds of equality propitiously, each can check the other, effectively neutralizing the monopolistic tendencies of both the few and the many, or so Aristotle maintained. He concluded that although the best form of government must institute equality before the law and equal access to the law-making process (making and obeying laws was the condition of freedom), some magistracies should nonetheless be distributed according to competence or by election. The good constitution (*politeia*) was thus a mixed one. In this context, Aristotle associated oligarchy not simply with social status and property ownership but also with personal qualities, intellectual and moral. Presumably, property owners were required by their business to develop and refine those mental qualities that any government would also demand. In the end, then, Aristotle did not regard oligarchy as irredeemably bad; it becomes vicious only when unmoderated by countervailing forces (the same could be said of democracy). For this reason the mix of the two would produce a good constitution.

Although oligarchy, through its antithetical relation to democracy, came to absorb some aristocratic attributes, it was never confused with aristocracy. The aristocratic ideal of a ruling class stressed distinctive natural or acquired individual qualities, in particular, certain ethical virtues (courage, honesty, wisdom, prudence) and intellectual skills (competence in administering and devising financial plans). Property was not essential to the characterization of aristocracy as it was in oligarchy. The polemical confrontation between democracy and oligarchy makes this clear. The identification of democracy with the "rule of the poor" and the emphasis on the low economic status of the ruling demos gave property a central role in that confrontation. Thus oligarchy, and not aristocracy, was the polar opposite of democracy; democrats equated oligarchy with the predation of the wealthy, whereas oligarchs assumed that democratic regimes must be inimical to the interests of the propertied classes.

Oligarchy in Modern Society

The specters of class legislation and of the politics of economic resentment reemerged in the eighteenth century with the reinvigoration of democratic ideals. In "Federalist 10," we read that the main risk to which a free government is exposed comes from factions, in particular, those factions that defend the interests of religion and property. Fanaticism on the one hand and envy on the other are the two dangerous passions that the republican constitution must tame without sacrificing freedom. But although the Federalists proposed the republic as a mixed constitution in a way that recalled ancient Aristotelian ideals, the moderns added something new to the classical analysis.

Two and a half centuries earlier, Niccolò Machiavelli undertook to simplify the classical typology of regimes, particularly the Aristotelian one. Machiavelli distinguished only two basic forms of government: one good (the popular or "republican") and one bad (government by the one or the few). However, he did not equate the former with simple democracy but conceived it on the model of the Roman Republic, as a mix of aristocratic and popular elements. For Machiavelli, government by the few is inherently bad in all its forms; unlike the authors of antiquity, he made no exception for aristocracy. His innovation was remarkable and inaugurated a way of thinking about government that is close to ours: No matter how good an aristocracy might be, rule by a political elite is acceptable only if the people retain, and regularly exercise, the right to monitor them and hold them to account.

So although the dualism of democracy and oligarchy was as central in the modern political tradition as it was in ancient Athens, it persisted in an altered form. After the French Revolution, commentators often directly identified oligarchic power with the aristocratic ancien régime and leveled some distinctive objections to it. According to this new critique, oligarchical government was subversive of peace and moreover ineffective in coping with the complexity of modern society. Giuseppe Mazzini, a leading European advocate for democratic national self-determination, strengthened his claim for a new continental order by depicting the European powers of his times as oligarchic and naturally predisposed to war. To him, oligarchy meant a system of social and political power that aimed to protect a privileged class. This, he maintained, inevitably exposed both domestic and international community to a permanent risk of conflicts and instability. Mazzini concluded that oligarchy promotes war whereas democracy promotes peace. Karl Marx discerned a similar linkage between an oligarchical class structure and a propensity toward conflict. His analysis of the Bonapartist degeneration of the democratic revolution of 1848 and the repression of the Commune of Paris of 1871 referred explicitly to the dictatorial power of an oligarchic class. To Marx, oligarchy was identical with capitalist dictatorship (with proletarian dictatorship as its opposite) or the use of the coercive power of the state by the dominant class in order to perpetuate its economic supremacy over the entire society.

Under modern conditions, oligarchy did not simply put liberty and security at risk. It was also a symptom of increasingly bureaucratized modes of social control. John Stuart Mill, a founding father of modern liberalism, denounced the oligarchic structure of power in mid-nineteenth-century English society and recommended several democratic reforms as a corrective (especially the extension of suffrage to women and to members of the working classes). To some extent, Mill's arguments reprised those of the ancients. Thus he contended that the republics of antiquity persisted only because the competent few were effectively checked by the many and because under purely oligarchical conditions there is no way to guarantee the choice of competent magistrates. But Mill put a new twist on this familiar argument. Although aristocracy and nobility were becoming ever more anachronistic, he noticed that complex modern societies increasingly depended on a class of competent, responsible, and conscientious administrators. This threatened a new, bureaucratic, form of oligarchy, which Mill named *pedantocracy*. Writing several decades after Mill, Max Weber similarly suggested that modern government could be characterized as a bureaucratized incarnation of the sort of privileged clerisy that had first emerged in the Catholic Church.

The path of analysis that Marx, Mill, and Weber inaugurated in the modern conceptualization of oligarchy was extremely important. It indirectly inspired a new critique of parliamentarianism that became influential at the turn of the twentieth century. But to understand this, we need first to see how the relationship between democracy and oligarchy was transformed by the development of modern systems of electoral representation.

All Power Is Oligarchic

In antiquity, the selection of rulers by election was not associated with democracy but rather with aristocratic and oligarchical regimes. For Herodotus, Aristotle, and Plato, electing leaders presupposed hierarchical discrimination—for, to be electable, one must prove oneself to be superior, or in some way specially worthy of the public responsibilities for which one hopes to be selected. But this sense of distinction conflicts with democratic ideals of equality and for that reason ancient democracy rejected election in favor of sortition (selection by lot). As anyone who has served on a jury knows, lottery is necessarily *indiscriminate*—blind to the qualities of the chosen. By contrast, candidates in an election must bring out their differences and claim for superior qualifications. This led the ancients to perceive a close affinity between election and oligarchic or aristocratic rule and to doubt the compatibility of election and democracy. In the eighteenth century, this tension between democracy and election was reasserted by baron de Montesquieu, the Federalists, and Emmanuel Joseph Sieyès. Nevertheless, these writers all believed that modern government had to be a mix of democracy and oligarchy, equality and inequality. According to them, the novel forms of political representation characteristic of modern

political systems are crucial for combining these otherwise incompatible elements.

By the end of the nineteenth century, many scholars observed that established systems of parliamentary government were drifting inexorably toward oligarchy. As Carl Schmitt pointed out, after several decades of performance, parliamentarianism has

> produced a situation in which all public business has become an object of spoils and compromise for the parties and their followers, and politics, far from being the concern of an elite, has become the despised business of a rather dubious class of persons. (*The Crisis of Parliamentary Democracy,* Preface to the second edition [1926])

As a result, the eighteenth-century ideal of a propitious mix of oligarchy and democracy, which the Federalists touted as the crowning achievement of the modern republic, came to be regarded with mounting skepticism. This was particularly so among those who argued that social and political inquiry should proceed on the model provided by the natural sciences. In the late nineteenth and early twentieth centuries a number of political analysts impressed by this ideal of an unsentimental, value-free, and rigidly empirical form of social science developed a distinctive "theory of elites." The three most influential of these elite theorists were Gaetano Mosca, Vilfredo Pareto, and Robert Michels. They maintained that the electoral system upon which the parliamentary government relied was not a mixture of democracy and oligarchy but rather truly oligarchical. Elections served to gather popular support for government by a minority, thus making oligarchy irresistible and legitimate. The classical opposition between democracy and oligarchy gave way to the theory that all social and political organization is fated to become oligarchical, no matter how democratic it was originally intended to be. Without leaders to speak for it, the demos is necessarily a voiceless, formless mass. In the eyes of these theorists, then, democratic regimes are incapable of concerted political action unless oligarchical elites impose order and purpose from above. Michels gave the name of the "iron law of oligarchy" to this phenomenon, which he thought universal, that is to say, observable in all forms of social life, from industry to government, from parties to unions.

By asserting that all forms of government are necessarily oligarchic, the theory of elites obliterated the older, classical distinction between democratic and oligarchical government. The ideal of a democratic society systematically ruling from below was dismissed as ideological or absurd or impossible. Differences in forms of government were nothing but the circulation of elites by different methods. In this view, oligarchy becomes a social necessity, not a degeneration or a corrupted form of government. In addition, modern electoral politics gave birth to a new kind of oligarchical organization: the political party. Although purporting to be receptive conduits of a democratic will, political parties are in reality would-be elites. Electoral competition forms the venue in which they vie for control. Once they win power, however, parties govern as oligarchies, standing above the ruled and imposing their will upon them. And when out of office, they are little more than oligarchies-in-waiting. Michels's "iron law," the claim that all political power, regardless of origin or democratic intent, ends up imposing itself oligarchically, thus poses a fundamental challenge to modern democratic ideals. It is a challenge to which representative democracy is still struggling to find an answer.

ONTOLOGY

Ontology is a traditional branch of philosophy concerned with the "science of being" and thus with the basic categories of existence or reality and their relations to one another. The term *ontologia* has its origins in scholastic writings of the seventeenth century, but the ideas and questions associated with ontology have their origins in various strands of ancient philosophy, including Aristotle's definition of metaphysics as the science of being qua being; the statement in Plato's *Sophist,* which opens Martin Heidegger's *Being and Time,* that the meaning of being remains perplexing; and the claims of the pre-Socratic Parmenides of Elea that only the one being "is" and that nothingness does not exist. In analytic philosophy, ontology has come to designate the study of the entities whose existence must be presupposed when affirming a scientific theory.

Nevertheless, ontology is still often associated—and in some cases identified—with metaphysics and therefore with traditional problems of free will and determinism, the relationship between spirit and matter, and the nature of eternal or divine truths, which are common to premodern and theological doctrines that are today considered by many political theorists to be defunct. As a result, many contemporary political theorists have sought to avoid engagement with ontological questions. This is especially true of dominant forms of contemporary liberal theorists, who take as their starting point the idea that there can be no agreement on fundamental issues concerning human nature or the human good. These theorists instead aim to establish a basic structure of rules for social life without relying on deep ontological commitments, which they consider to be more properly matters of private faith. It is in this spirit that John Rawls, for example, refers to his liberal theory as a political rather than a metaphysical one.

On the other hand, depending on how the terms are understood, metaphysics can be treated as simply one type of answer to the ontological question "What is the meaning of being?" In this respect, proclamations of the "death of metaphysics," the "death of the [metaphysical] subject," or the beginning of a "postmetaphysical age" need not close the door to ontology as a relevant field of inquiry. And, indeed, many recent critics of liberalism, from communitarian, feminist, post-Marxist, and poststructuralist circles, engage in such inquiry. They accuse theorists of the liberal approach, who seek to distance themselves from ontology, to have merely assumed a position from which ontological questions seem dismissible and to have continued to rely covertly on an incoherent ontology of the disengaged human subject or the subject prior to its attributes and ends. These accusations, in turn, have led critics to a renewed interest in the relationship of ontology to political thought, although some contemporary theorists maintain that an ontological perspective does not necessitate any political or ethical doctrine and that ontology and politics should rightly be kept apart.

The turn to ontology in political theory has focused not on the science of being per se, but rather on our human being, or, to borrow a phrase from the early Heidegger, on our "being-in-the-world." As political theorists with different approaches to ontology have converged in opposing commitments to the disengaged or disembodied subject at the heart of methodological individualism and liberal theory, they have explored the constitution of the human subject in its relation to

language, historical context, and social forces. This may not seem to be a faithful or proper use of the term *ontology*. However, theorists supporting this human ontology—which may or may not be humanist—can and often do move on to address topics of traditional ontology, such as the fundamental nature of identity, difference, space, time, and truth. In this way, the turn to ontology goes beyond the social constructivist thesis that we create our social world and its truths through our practices and discourses. Although in many instances the contemporary theorists who turn to ontology share social constructivism's anti-foundationalist and anti-essentialist orientations, they nevertheless make positive assertions about the nature of reality. However, wary of resurrecting the dogmatic metaphysical claims of premodern ontologies, many of these theorists openly acknowledge the contestability of their claims. Stephen White thus refers to the ontological turn in political theory as a turn to "weak ontology," opposing it to "strong ontology," which would make ultimate claims about the way the world is and insist upon an external ground for political thought and action. White argues that it is necessary to wrap ontological commitments into political thought so that contemporary critics of foundationalist theory avoid falling into a nihilistic trap of tearing down old values without providing alternatives; those supporting weak ontology, for White, acknowledge its own limits, allowing contemporary theorists to affirm positive moral and political judgments without replacing one foundational truth with another. Although one may question whether the ontologies that White calls "weak" can consistently and coherently maintain the self-critical stance he attributes to them, and whether "strong" ontologies are necessarily unable to indicate their own limits, this characterization of "weak" ontology does capture much of what contemporary theorists who turn to ontology have sought to do.

Ontology and Difference

The initial step in political theory's ontological turn—the critique of the disengaged subject—focuses on the concepts of identity and difference. The idea behind the disengaged subject is that this subject can rationally choose its ends because it exists independently of the experiences, attributes, and heritage that constitute its "thick" character and because this character is not required for a purely rational choice. But this notion of the subject is incoherent, because no entity could exist if the properties and attributes that define what it is were removed. If all a thing's properties were secondary and inessential, the subject supposedly standing behind them would amount to a nullity: The only "thing" that has no properties is nothingness. On the other hand, a subject's attributes or properties, which delineate its identity and, in the case of a human subject, allow it to make choices, are necessarily relational. Saying a subject is green, for example, signifies a relation to another subject (it is green for another who perceives this quality) and to other things that have the same or different colors or even no color at all. Its properties all being relative, if the subject is no longer treated as an independent and transcendent entity, then its identity becomes a product of its relations to others. Its identity, what it is, is constituted by its differences, by what it is not.

However, here it becomes necessary to distinguish two types or orders of constitutive difference. The first type constitutes identities but can also harmonize them in their differences from one another. This approach, which is often associated with Hegelian dialectics (although there are several ways to read Hegel on this point), holds a subject's identity to be secured in relation to an other or others, analogous to the way the identity of "white"—in the sense of its meaning or its place in a schema of color—is given through its difference from "black." White is defined by its difference from or opposition to black—white is white because it is not black, and so forth—and, similarly, a subject's identity is delineated only by reference to the way it differs from what it is not. This conception makes difference constitutive, but also mediating: It separates terms such as *black* and *white, subject* and *other,* establishing their distinct identities, but it also collapses these differences, as each term reciprocally holds the other's identity in its own, allowing an identity between them to be attained. Differences on this level have a spatial quality, in the sense that they may be organized in terms of their proximity to, or distance from, the identity they anchor. The place of "white" is determined not only through its relation to its opposite, "black," but also through its relations to various

intermediate shades of gray, some that are similar and closer to it and others that are farther away. Similarly, one could consider a political subject's identity to be defined by its relations both to friends or allies who are similar to it and to enemies who are alien. At this level of difference, a displacement of identity occurs, as the subject's identity is dependent on others who are external and even opposed to it. However, the end result is a return to identity, now established across constitutive differences. Identity can even be established between opponents, between friends and enemies, as each is necessary to the other's being.

The second type of difference is also constitutive, as a subject's identity, again, is constituted by its relations to others. Unlike the first type, however, this difference does not secure or delineate a subject's identity by relating it to others who are also identified through the relation. Rather, it relates the subject to an Other (the capitalization is intended) that is enigmatic and indefinite, unable to act as a secure anchoring point that would allow an identity to be defined through contradistinction. Taking again the example of a political subject, one could imagine its encountering something or someone that could not be categorized as either a friend or an enemy. This Other would not provide the sort of marker needed for the subject to position itself against it. Thus, with respect to this kind of difference, the spatial terminology of proximity and distance no longer functions: The difference in question is fugitive and cannot be located on a spatial—or, for that matter, a temporal—continuum that would fix its position relative to the subject whose identity depends on it. This second-order difference thereby calls into question the adequacy of a conception that organizes differences by degrees ranging from similarity all the way to polar opposition, as the first type of difference does. For many political theories that follow the route into ontology, this Other displaces the subject in a fundamental way: As it cannot be identified or fixed itself, it calls into question the capacity for a subject's identity to ever be finally settled.

Contemporary debates among the political theories that take the ontological turn often concern how this second-order difference or Otherness is conceptualized. One common formulation holds it to be a fundamental lack of being within the subject that prevents the subject from ever attaining the completeness of a fixed and full identity but that drives the subject to seek this impossible fullness. Another holds it to be an excess of movement or becoming that always destabilizes the subject in indeterminate ways but also compels the subject toward new forms of being. Theorists advocating quasi-theological conceptions—associated, for example, with Charles Taylor's communitarianism—treat this Other as a fugitive moral source partially open to human reflection and able to orient the subject toward moral agency. Others, associated with Jacques Derrida and Emmanuel Levinas, hold it to exercise an absolute but ultimately impossible moral imperative of responsibility to that dimension within others that exceeds identification and categorization. Some feminist theorists hold that it marks a sexual difference that disrupts attempts to establish clean and final divisions between male and female or masculine and feminine. These formulations share the idea that although this difference is part and parcel of the being of language, it is never fully expressible. Language, which is structured through the relations of difference and opposition characteristic of the first order of constitutive difference, can beckon toward this second-order difference but never grasp it completely. Disagreements over the formulation of this difference also relate to questions of immanence and transcendence in political philosophy. As Otherness cannot be fully grasped in language or experience, it prompts questions as to whether it indicates something transcendent to being or a multiplicity that remains immanent to being. All of these ontological formulations invite the charge that they merely repeat and return to the kind of claims to Truth found in premodern metaphysical ontologies. Their proponents' shared response to this charge is that political theory is impoverished if the risks inherent in ontological speculation are not taken.

Ontology and Politics

The diverse turns to ontology in political theory inspire many different reformulations of key concepts in politics. By developing the theme that the subject is not pregiven and is instead constituted through its relations, it introduces questions over the nature of power and resistance at this

constitutive level. As second-order difference fundamentally displaces the identity of the subject, many political theorists hold that individual and collective subjects can secure themselves only to the degree that their relation to this enigmatic difference is effaced or repressed, so that subjects can be constituted through relations to identifiable others such as friends, enemies, and so forth. Power, in this sense, creates subjectivity through a constitutive exclusion of excessive difference and the hegemonic act of securing an identity, while resistance appears in the way this exclusion is never final and the certainty of the subject's identity is always again called into question. Alternatively, some political theorists use their ontological explorations of difference to theorize new forms of pluralism that go beyond the kind of friend/enemy relations that are common in political thought and practice, or, more generally, to theorize new forms of ethical and social being. Recent theories of "radical democracy" are almost all indebted to the turn to ontology in political theory, and the disagreements among various strands of radical democratic theory are frequently ontological in nature. According to these theories, like many others that play a part in the ontological turn, the domain of politics extends beyond the narrow confines of institutional practices or the restrictions imposed by the separation of public and private realms. They hold politics to be a contestation that reaches into the way modern subjects are constituted and represented, and democratic politics to be a mechanism to expose the relations of power involved in these constructions and to challenge the social and political truths that organize them. Mainstream political thought and practice, they maintain, are devoid of crucial issues about the constructed nature of identity, power, and truth because they refuse to engage in the ontological inquiries that would allow these issues to come to light. Conversely, they argue, it is by confronting these issues that the space of politics is opened up.

Organization Theory

Organization theory examines bureaucratic entities such as firms, schools, states, hospitals, political parties, and nonprofit groups. These social collectives share explicit goals, and hierarchies and employ written documents to manage work. Researchers in this area are motivated by the ubiquity and importance of bureaucracies in contemporary society. The formal organization is used to coordinate complex tasks in a wide variety of settings, such as manufacturing, education, politics, and medicine.

Organization theory addresses questions about the logical status of organizations, the relationship of individuals to organizations, the organization's legal and social environment, and the dynamics of entire industries. Scholars interested in the logical status of organization are concerned with the nature of organizations. These scholars ask whether organizations are in any sense different from the mass of individuals who constitute them. Those interested in the relationship between organizations and individuals focus on how the bureaucratic environment affects the activities and well-being of individuals. Others ask how the actions of firms are determined by other firms, the state, and the public. Organization theory informs political theory by showing how organizations

accomplish their goals and relate to individuals and the state.

The Logical Status of Organizations

Contemporary organization theory starts with the work of sociologist and economic historian Max Weber. Weber's writings provided a basic definition of the organization that has acted as a benchmark for subsequent work. Weber defined an organization as a group of people who participated in a formal hierarchy with clearly defined roles. Within the organization, work was managed by professional supervisors who relied on expert training and written documentation. Weber's commentary provided additional insights into the nature of organizations. Organizations are a particularly modern phenomenon because their existence relied on widespread literacy, a modern cash economy to pay workers, and the delegation of duties according to ability instead of inherited status. The modern bureaucracy stood in stark distinction with earlier forms of social life, such as kinship groups, which relied on inherited occupational statuses, informal social ties, and coordination of work through nonwritten personal contacts.

Later scholars asked whether there was any reason to ascribe organizations with a special logical status. Did organizations possess properties that were not easily reducible to those possessed by individuals? Weber's commentary on organizations suggested that from the perspective of the individual, organizations appeared to be timeless entities. For example, citizens perceive the state to be a permanent entity that has existed before them and will likely exist into the indefinite future. Thus, the organization is a stable arena for action that merits special attention.

Scholars in the twentieth century provided different answers. In the 1950s, behavioral scientists Herbert Simon and James March focused on the routines enacted by individuals within the organization. From this perspective, the organization is defined by its goals and the individuals who perform routine tasks that accomplish those goals. Thus, the organization is highly analogous to a computer that is defined by the hardware and the programs it implements.

In contrast, economists such as Ronald Coase and Oliver Williamson focused on contractual obligations to distinguish those within the firm from those not in the firm. The organization was defined as those people bound to owners through contracts that limited access to the labor market. Both economists emphasized that contracts between employers and workers created social boundaries between the firm and other market participants. In a similar vein, management researcher J. D. Thompson argued that there was a "core" of workers who were needed to operate the technology that helped the organization accomplish its goals. Joan Woodward defined organizations by their relation to their core technology. Thus, the organization deserved special attention as a stable pattern of technology and social relations.

The Individual and the Organization

Organization theory has often emphasized an asymmetry between the individual and the bureaucracy. Organizations are often depicted as large and immutable social entities that can overwhelm individuals. Indeed, legal scholars often observe that organizations are granted rights analogous to those for people. The law, especially in the United States, often gives organizations rights and privileges that are distinct from the people who work in the organization. It is routine for organizations to own assets, file legal complaints, and act on behalf of other people and organizations. They can be fined and punished by the state. The consequence of this legal doctrine is that organizations can possess a distinct advantage in conflict with individuals. Due to their ability to acquire substantial resources and act consistently without the need for unchanging personnel, organizations can sustain conflict in ways that can be matched by few individuals. It is also the case that the law creates circumstances where individual workers may not be held accountable for their actions.

Organization theory also asks how individuals behave within bureaucratic settings. Workplace psychology takes the organization as an additional factor affecting individual decision making and personal well-being. For example, in studies of mental health, organizations play an important role because they are a potential stressor. However, much organization theory takes the view that the bureaucratic environment is a distinct context for

human action. The hierarchy of authority, the organization's goals, and its routines are influences that present incentives and constraints that deserve special attention. The organization is viewed as the place where individuals are rewarded for their actions in the market.

Much writing focused on the emotional and social dimensions of life inside organizations. Some early writers argued that individuals developed close personal attachments to organizations. Administrators developed a strong identification with the organization itself, even to the detriment of their other personal relationships. Phillip Selznick described how administrators were torn between their formal obligations and their loyalties to the "locals" the organization served.

By the mid-twentieth century, much theory viewed the organization as a choice-making environment. Neoclassical economics relied on models of organizations that viewed individuals as making optimal choices from clearly defined options. Scholars of the Carnegie School emphasized that organizations operated in complex environments where information was scarce and there was great ambiguity about goals. Instead of making optimal choices, organizational participants were forced to settle for satisfactory choices. This was called bounded rationality theory.

Carnegie School writings have found popularity among political scientists who find that policy decisions happen when unexpected political events force state agencies to address issues with whatever policy ideas are available. These models cast the individual actors as passive agents who exploit opportunities generated by the organization. In contrast, a neoclassical economist would view government decisions as the product of an administrator's attempt to maximize some goal (e.g., votes or budgets) with a clearly defined set of strategies. The difference stems from the need to model different phenomena. Political scientists are interested more in group decision making where many actors opportunistically respond to a variety of ill-defined problems, whereas economists focus on fairly well structured decisions.

The Organization and Its Environment

Jeffrey Pfeffer and James Thompson drew organization theory in new directions in the 1960s and 1970s when they observed that firms depend on outsiders for survival. Firms require money, workers, and legitimacy if they are to continue operating. Organizations are political entities that must accomplish a task and respond to social pressures. Resource dependency theory states that behavior is a response to resource streams. This observation led to the "open systems" perspective in organization theory, which de-emphasized the distinction between behavior inside organizations and what happens outside the organization. Theorists working in the open systems tradition closely examine how investors, state regulators, consumers, professional groups, and voters all impact the structure and behavior of organizations. In contrast, closed systems theory designates styles of research that emphasize the internal workings of organizations, such as workplace psychology and bounded rationality theory.

Open systems theory soon resulted in a profound change in organization theory. Starting with the work of John Meyer and Brian Rowan in the late 1970s, organization researchers in sociology, education, and political science posited that organizations were strongly influenced by their political environment. If organizations needed to show that they were legitimate, then it was possible for persons outside the organization to wield tremendous influence. Administrators had to do whatever social elites demanded, or they risked the possibility that the organization would fail. Outsiders who disapproved of the organizations could withhold funds, approval, or certification.

The link between social environments and organizations inspired a wide variety of research. Some scholars believe that organizations were very sensitive to their environment. Administrators working in a complex and vague environment needed to show to investors and other supporters that they were legitimate. This argument suggested that behavior reflects social values. For example, firms may want to show that they treat workers in fair ways. A concern with showing fairness may lead administrators to appoint ombudspersons or create policies that facilitate worker complaints. Education provides another insightful example. Schools provide written curricula so that outsiders may see what they are teaching. The school does this to show it adheres to cultural standards about what is appropriate in schools.

The sensitivity to social environments has encouraged these scholars to focus on conformity. If the public has well-established ideas about what is appropriate for organizations, firms and other organizations within a sector will adopt the same procedures to satisfy these cultural imperatives. Though organization theorists have recognized the importance of social conformity, there is disagreement about the consequences. One strand of scholarship asserts that these pressures for conformity are very strong. Models of legitimate organizational behavior become taken for granted by workers and managers. Deviations from these models lead to harsh sanctions. A college, for example, that refuses to teach courses that are considered "normal," such as literature or chemistry, may not obtain accreditation, may be viewed as illegitimate by scholars, and potential students may avoid the institution. These pressures would make survival difficult for this hypothetical college.

In contrast, other organization theorists describe a more complex relationship between organizations and their environment. Working from the ideas described by John Meyer and Brian Rowan, scholars question the linkage between organization and environment. It is often argued that organizations show only minimal compliance with social expectations and legal regulations. Administrators expend much effort on shielding workers from an intrusive public. The organization's public image is designed to assure outsiders that work is legitimate so that workers can have discretion over their jobs. This process is called *decoupling*.

Much of this research is inspired by schools, which claim to enforce teaching standards but allow teachers much liberty in how they conduct their classroom. According to this view, school teachers prize the autonomy of their classroom and resist attempts at external control and standardization of teaching. School practices such as lesson plans and classroom visits are designed to assure outsiders that the institution is doing what is considered proper. Once outsiders have shifted their attention elsewhere, teachers may continue to conduct their work as they see fit.

The recent emphasis on organizational environments coincided with the rise of population-level organization theory. Michael Hannan and John Freeman introduced the idea that the population of organizations was an important unit of analysis. In much the same way that biologists study populations of living things, Hannan and Freeman thought that it was worthwhile to study populations of organizations, such as automobile manufacturers, newspapers, unions, or churches. The key theoretical insight was that the creation and disbanding of organizations could be modeled analogously to the birth and death of organisms. Competition over resources affects the ability of organizations to enter and survive in their environment. This strand of research has been called organizational ecology. Later renditions of ecological theory have avoided biological analogies and focus more specifically on competitive processes. Much empirical research discusses how crowding within market niches affects exit and entry into markets. Current research uses the language of demography to describe population processes and how specific organizations establish their identities within these populations.

A third approach to organizations and environments focuses on networks. Scholars in this tradition attach great importance to the relationships between firms. Early work focused on the social relationships between managers. Inspired by Marxist social theory, some organization researchers believed that managers acted together as a sort of ruling class. These scholars then examined how firms were related by analyzing corporate boards of directors. Two firms were related if there was at least one executive who was on both boards of directors. Analysis of these data showed that leading American firms did belong to dense interfirm networks, but it was difficult to link a firm's position in this social structure to particular outcomes, such as market share or profitability.

Later uses of network theory employed a purely structural perspective. Scholars were less interested in investigating class politics and more interested in describing an organization's network. For example, management scholar Ronald S. Burt has argued that networks may have "structural holes" that represent economic opportunities. Burt's argument is that the absence of ties between two groups of organizations represents an absence of trade. An entrepreneurial firm could then act as a "bridge" between blocks of firms that were previously disconnected. Sociologist Harrison White is well known for applying network analysis to the study of organizations. He argued that a firm's identity

depends on networks. An organization develops its identity based on the other firms and individuals who interact with the organization. This theory is different from the traditional view of organizational identity, where managers develop the firm's identity in an attempt to target an audience. Other scholars use network theory to describe worker relations within organizations, the relative position of firms within an industry, and the use of social ties as resources.

Links to Political Theory

Organization theory raises a number of issues for political theory. One issue is the organization's status in society. What rights and obligations do organizations have? Social scientists, unsurprisingly, have offered a wide range of opinions. The economist Milton Friedman once said that firms have no duties except to make profits for shareholders within the confines of the law. James Coleman offered an intermediate position. He noted that rights given to organizations may be justified, but there are also serious costs. All people may benefit from organizations that have legal rights because they promote risk taking and insulate owners from actions carried out by rogue workers. Coleman also noted that individuals may be at special disadvantages in disputes with organizations. Managers may use the firm's resources to promote their own interests, at the expense of their obligations to customers. Critics of contemporary health care practice, for example, may point out that health maintenance organizations may have reduced health care costs, but often at the expense of high-risk patients who are arbitrarily denied coverage for innovative procedures. Critics have lodged that this might not happen as often if HMO (health maintenance organization) managers were directly liable for their decisions.

The policy implications are unclear. Some critics have argued that limited liability should be abolished or that the corporation's legal status be reduced in other ways. The purpose of this reform is to make individual workers and managers more responsible for their actions. Other critics have responded that making shareholders directly liable for their actions, without the protection of the corporation, might reduce investment in firms and thus limit economic growth. These critics also appeal to fairness; a person who owns one share of stock should not be exposed to the same risk as the manager who is responsible for an action.

A second issue is the conflict between the formal and informal dimensions of the organization. A central theme in organizational research is that the formal written rules are an incomplete description. Organizations are saturated with values, networks, and informal practices. This raises a problem from the perspective of political theory. It is often thought that good behavior is based on abstract principles as embodied in written rules. This is the motivation behind the concept of "due process." Decision making improves when individuals follow rules that were developed by legislators, managers, or other authorities. However, as sociologist Viviana Zelizer notes, this is incompatible with everyday life in organizations. Rules are often underdetermined and incomplete and cannot cover all situations. Rules may also be viewed as antiquated and irrelevant. In practice, workers and clients in firms develop their understandings of what is appropriate. For example, it is expected that the police not arrest every person who violates some aspect of the law. The police are expected to make judgments about which rules are important and which violations merit attention. These choices depend on the community's values, the police officer's relation to citizens and other officers, and informal practices developed within a police department.

Often, policy makers have sought to diminish the influence of the informal by increasing formal rules. However, this approach has limits. One limitation is that circumstances change. The event that motivated a new rule may not be relevant for future decision making. Another limitation is that many situations are difficult to describe, and it is best to shift decision making to those persons with great experience. In the best circumstance, workers within an organization may develop interpretations of rules that best help them accomplish their goals.

A third issue is that organizations may be responsible for increasing risk. A number of scholars have observed that organizations may have a large role in creating the conditions for disasters. Charles Perrow has argued that organizations are complex systems that concentrate hundreds or thousands of people into relatively small spaces. For this reason, organizations enable disasters. For

example, manufacturing firms often require that large numbers of people work in close proximity to each other, often in hazardous conditions. The deeper point that Perrow makes is that disasters are a normal aspect of organizations. Highly complex technological systems often have flaws that are difficult to detect and nearly impossible to predict.

Diane Vaughn makes an even more critical point about risk and organizations. Even when managers have a good sense of the risk involved, they often develop a culture within the organization that is highly tolerant of risks. Accidents become "normal," and deviance from safety procedures is accepted. In a highly influential analysis of the 1986 space shuttle disaster, Vaughn argues that engineers were well aware of the risks involved with the design and operation of the *Challenger* shuttle but had developed a tolerance for that risk. Case studies such as Vaughn's raise critical questions for political theory. How should the public evaluate the risk created by organizations? If workers develop a dangerous tolerance for risk, how should their actions be regulated? How can outsiders even properly evaluate risk when the knowledge for doing so is held by organizational insiders?

A fourth issue raised by organizational theory concerns democratic control. As noted throughout this entry, there are many ways that organizations can evade public scrutiny. They can ritualistically satisfy public regulations, insiders can monopolize knowledge, and executives can attempt to co-opt the state. Voters, state regulators, and private accreditation groups may find it difficult to monitor organizations for these reasons.

Political scientists have usually focused on two mechanisms to counter these tendencies: periodic monitoring and problem response. In the first case, outsiders periodically audit or investigate an organization. This helps mitigate problems associated with resistant insiders or with organizational cultures that tolerate risky behavior. On the other hand, it is possible that organizations may use minimal candor and transparency to satisfy auditors. Managers of publicly traded firms may provide information in ways that hide a firm's financial difficulties, or elected officials may distort public statistics to enhance their image among voters. In the second case, regulators investigate bureaucracies only when clients complain. For example, a city may choose to lightly regulate its police department but increase monitoring when there are reports of police abuse. This may help address the problem of bureaucracies ritualistically obeying public regulations because regulators can save resources for the worst abuses and thoroughly investigate them. However, the problem remains that organizational insiders may hold knowledge that outsiders need to complete their monitoring. So far, political theory has not addressed in depth how the public may make organizations less resistant to public scrutiny.

Finally, organization theory has been brought to bear on the issue of how democracy, science, and other Western institutions have spread to the rest of the world. Under the rubric of world polity theory, numerous scholars have argued that states belong to a global political system dominated by the Western capitalist democracies. Much in the same way that individual firms signal their legitimacy by mimicking more established firms, states show they are legitimate by adopting democracy and other Western practices. Furthermore, there is now a global community of nongovernmental organizations that bring Western values and practices to every region of the globe.

The international transmission of democratic governance raises important questions for democratic theory. Is the adoption of democracy ritualistic or genuine? For example, how often do states adopt open elections only as a pretext for continuing an authoritarian government under a new guise? Does democracy encourage freedom within states? There is evidence for both views. It is the case that many repressive states claim to introduce elections, only to arrest people not in the ruling party. However, recent scholarship suggests that once a state adopts democratic practices, it is under pressures to faithfully implement them, though the process may be slow. It has been argued that democratic states join an international community that exerts normative pressures on state leaders.

Conclusion

Organization theory is the study of firms, schools, states, and other bureaucratic entities. Starting in the late nineteenth century, scholars looked at the firm as a rationally ordered system. Throughout the twentieth century, this view came to be seen as

incomplete. Organizational life is characterized by uncertainty, ambiguity, cultural values, and networks. Organizations are designed to accomplish certain tasks, but they also must respond to external social and legal pressures. This contemporary perspective raises important questions for political theory. Rather than being extensions of the public, organizations may have complicated relationships with the rest of society. The organization may grow to acquire its own rights, present new risks, and evade public accountability. Its goals may be amended or subverted by these social processes. For these reasons, organization theory will continue to provide insights for political theory.

Orientalism

Orientalism can refer to several distinct but related phenomena. Contemporary scholars typically use the term to refer to Edward Said's theory that Western ideas about "the Orient," often stereotyped or overgeneralized, are complicit with a broad history of Western colonial and neocolonial domination of the East. In this conception, Orientalism is both a general discursive formation related to material and historical relations of domination and a quality of specific texts, ideas, or actions. More specifically, however, Orientalism may refer to the scholarly discipline of the eighteenth and nineteenth centuries that encompassed the study of languages, literatures, religions, philosophies, histories, art, and laws of Asian societies, especially ancient ones. This scholarship also inspired broader intellectual and artistic circles in Europe and North America, and so Orientalism may also denote general enthusiasm for things "Oriental." Finally, Orientalism was a school of thought among a group of British colonial administrators and scholars who argued that India should be ruled according to its own traditions and laws, thus opposing the "Anglicanism" of those who argued that India should be ruled according to British traditions and laws.

Said introduced Orientalism as a subject of political theorizing when he argued that Orientalism was a general historical phenomenon by which the West represented, analyzed, and ruled over "the East," or "the Orient." Central to Said's thesis was that the stereotyped, romantic, and racist images of "the Orient" common in Western literature, philosophy, and popular discourse should not be analytically separated from histories of Western scholarship about the East or from the political histories of Western domination of the East. Said analyzes Western texts that posit a fundamental division between East and West; assume authority over, and ascribe negative characteristics to, the former; and, together with other such works, form a general discourse of Western mastery of the East. Orientalism in this understanding tells us nothing about its ostensible subject, the East, but reveals much about the West, whose self-perception requires the contrasting "Other" of the East. Using Said's formulation, the history of Western political thought can be read for assumptions, tropes, techniques, arguments, conclusions, and consequences that both derived from, and contributed to, Western colonialism in Asia. Said's original formulation has been thoroughly criticized, but his framework has also been extensively applied, revised, and extended, particularly by scholars in the field of postcolonialism.

Said named this very broad phenomenon after a more particular scholarly practice that emerged in late eighteenth-century European centers of learning and their colonial outposts, when the study of the languages, literatures, religions, laws, and art of the Orient became a major focus of scholarly attention and intellectual energy. In this era, the number of Europeans researching the Orient dramatically increased, and new forms of institutional support in universities and scholarly associations encouraged Orientalist research and its dissemination. A frequent theme of this scholarship was that Asia had once been host to great civilizations that had since fallen into their current state of decay, and Said theorized the significance of this idea for the authorization of Western scholarship and colonialism. Many Orientalists were connected to a colonial bureaucracy, but others were not, and their positions on colonialism varied. Orientalism as a scholarly field was dominated by research in the French, English, and German languages and associated centers of learning, and its subjects ranged geographically from the North African Mediterranean to East and Southeast Asia. One of the most significant "discoveries" of Orientalists was that Sanskrit and many European languages were related to each other, which implied that Europe and India shared historical origins. This "discovery" has been credited with the origins of the comparative method in the humanities and social sciences. During the twentieth century, "Orientalists" began to favor the term *Asian Studies* to describe their work, in an effort to distance it from the associations with colonialism and neocolonialism of the term *Orientalis*m.

In the wake of this Orientalist research, scholars and artists took up ideas about Asian societies, arts, and traditions in their intellectual and creative works, and images of and ideas about the Orient or specific peoples or parts of it became common tropes in popular literature and even decor. Thus Orientalism was a significant philosophical and aesthetic movement that reached beyond the relatively specialized circle of Orientalist scholars, beginning in the late eighteenth and into the nineteenth centuries, and in some forms and places it lasted much later. The history of Western political thought of the late eighteenth and nineteenth centuries, including but not limited to the Enlightenment, Romanticism, liberalism, and socialism, abounds with theorists who drew on Orientalist research or common assumptions about Asia, often in order to draw a contrast between an Asian government or society and those of modern Europe, or to find in Asia a picture of Europe's past.

The terms *Orientalism* and *Orientalist* first took on a markedly political meaning in the English language, however, to signify those English scholars, bureaucrats, and politicians who, over a period spanning the late eighteenth and early nineteenth centuries, fought changes in colonial policy in India brought by the "Anglicists," who argued that India ought to be ruled according to British law and institutions. The Orientalists, in contrast, argued that India ought to be ruled according to local laws and traditions, and some of these Orientalists were those who conducted research on ancient laws of India and traditional legal structures in an effort to codify them and thus produce texts by which a colonial bureaucracy could govern. As contemporary historians have revealed, British efforts to understand,

codify, and govern according to what they believed to be local tradition often brought about significant changes in social and political life in India.

OTHER

The other—in contradistinction to the *same*—is a key concept in strands of continental philosophy, Lacanian psychoanalytic theory, and their application by social scientists. The precise function of the term differs among theories and should be used in a strict technical sense. While "the other" is always taken to be constitutive of the self-same subject, this often means that it is a means for the subject's self-positing. Thus, in much of psychology, identity proceeds from the autarchic act of separation from a real or imaginary "other" through practices of inclusion/exclusion that form and sustain boundaries. By contrast, in Jacques Lacan's and Emmanuel Levinas's ethics, the subject is constituted in a purely heteronomous manner through exposure to a radical Other.

The modern origins of the term lie in German idealism. Johann Gottlieb Fichte's insight that subject-formation depends on others was radicalized in Georg Wilhelm Friedrich Hegel's master–slave dialectic. While this "socialized" the solipsism of Kantian autonomy, Hegel's view was that, once constituted, consciousness feels threatened by its other and aims at destruction or synthesis. This "allergic" effect of otherness has since inspired many theories and critiques. It often resonates implicitly, for example, in Carl Schmitt's political theology whereby all political phenomena are analyzed in terms of the friend–enemy distinction and willingness to fight to death. Contemporary social scientists use the Hegelian version of the term while carefully rejecting the historical necessity of any mastery over others. Thus, in postcolonial and gender studies the "othering" of particular individuals or groups is analyzed as part of processes of control that can be resisted, as in Simone de Beauvoir, Edward Said, and Michael Warner on the "othering" of women, colonized peoples, and subjects of homosexual desire, respectively.

A significant modification to the "allergic" view of otherness occurred in existentialism. Building on the phenomenological distinction between reflective and prereflective levels of experience, existentialists substituted the autonomous subject by the autarchic existent that relates to its existence independently and prior to its consciousness of others. Consequently, the relation with others becomes secondary to the problem of solipsistic existence. For Jean-Paul Sartre, the other is not a life-threatening fact but a construct of being in order to display/limit its existence (at the cost of alienation). In 1936 Levinas cast doubt on existential autarchy in *On Escape*. The absoluteness of the existent was described as "deficient" because it is experienced as a suffering by the "living thing" (*le vivant*). Levinas's innovation was to claim that the reverse of this is a persistent if impossible "desire for escape" from having to be or not be. These ideas can be related to Levinas's mature work on ethics and responsibility culminating in his view that the only way I can sample freedom from solipsism entails becoming hostage to the demands of the other man and live and act "*as if* [italics added] I were devoted to the other man before being devoted to myself" (Levinas, 1989, p. 84); hence, "to be I signifies not being able to escape responsibility"; "to be a self is to be responsible before having done anything" (Levinas, 1996, pp. 17, 94). This freedom-in-subjection, however, is never realized, because responsibility is infinite and entails the endless inadequacy of my initiative and action; hence, the subject becomes "obsessed" and "persecuted" by otherness. Simon Critchley, using Freudian categories, diagnoses the Levinasian ethical subject as a "traumatic neurotic," "split" between itself and a demand that it cannot meet and marked by an experience of "hetero-affectivity" (Critchley, 2007, p. 61). He warns that the "internalization" of this

is "nothing other than the experience of conscience," and "without the experience of sublimation, conscience cruelly vivisects the subject" (Critchley, 2007, p. 87).

In Levinas's post–World War II theoretical trajectory, the experience of otherness was analyzed as "non-intentional affectivity" and "consciousness without intentionality." The themes were chosen so as to fall neither into the being–nothingness opposition nor the notion of the existent: insomnia/wakefulness, eros/the "feminine" and, finally, the trauma of radical passivity/infinite responsibility. The restless, wakeful insomniac feels exposed to the other but is neither fearful nor occupies a position of mastery; the subject of eros reaches out to the beloved with an attitude of "patience," not power or powerlessness. Occasionally Levinas articulated this with the idea of the infinitely demanding yet never present scriptural God, but overall Levinas prioritized ethics over metaphysics. Otherness is neither the result of an act by the self nor an original freedom of the empirical other but an "event in existing different from the hypostasis by which an existent arises" (Levinas, 1989, p. 50). The event is the epiphany of the other's *face,* whereby a particular other becomes a sign of absolute alterity—capitalized Other—and commands responsibility not by virtue of its difference but through the affective surplus that it produces in me. Levinas confusingly wrote the term inconsistently with and without a capital "O," but commentators have adapted a convention systematizing the two uses. "The other" means a particular social other whom I can see and know by virtue of our differences; in this case visibility, representation, and knowledge act as "bridges" over our separateness; this is not other in fact but "someone co-opted into the world of the solitary ego which has no apparent relationship with the other-qua-Other, for whom the other is an alter ego known by sympathy, that is, by a return to oneself" (Levinas, 1978, p. 85). The Other means the absolutely unknowable and un-representable dimension to the—necessarily social—human experience that cannot be undone or neutralized and that the daily confrontation with any others' *face* epitomizes. Even in murdering another, its Otherness remains: It has not been negated or controlled. Thus Levinas's theory constitutes a critique of both Husserlian and Sartrean views of the other, respectively, as another me in the visual field and as object. Social phenomena cannot be analyzed solely in terms of knowledge of others because "knowledge does not surmount solitude. By themselves reason and light consummate the solitude of a being as a being, and accomplish its destiny to be the sole and unique point of reference for everything" (Levinas, 1987, p. 65). Society, then, must be understood in terms of the traumatic experience of otherness that is both irreducible and linguistic. Language is constitutive of all ordinary human experience but the obsessive and radically passive dimension of the traumatic exposure to the Other via each other's *face* is a condition for language: The "face to face founds language" (Levinas, 1969, p. 290). Without the patient disposition of individual beings to serve (serve, not "tolerate") each other, there could be no language and no complex human association. The domain of ethics, therefore, cannot be equated with the rules and laws of the symbolic order. Any notion of measured responsibility in systems of legal or political morality is derivative of the anarchic and infinite responsibility that obsesses me before any other-as-Other. This means that the conception of the self as autarchic/sovereign (and, by extension, any construction of a community out of an archic perspective or, alternatively, of any *arche* out of a conventionalist or social point of view) is flawed. No one can rest in identification or indifference on the basis of knowledge or lack of knowledge of others. Always-already prevented from self-identity, "I" relate to myself in the accusative: *me*. To be *me* means to occupy a singular position of radical passivity before the other-as-Other that no initiative can consummate and no inaction evade, to the point of obsession and persecution.

Levinas rejected criticisms that his ethics valorizes relations of spatiotemporal proximity at the expense of political and legal responsibility within communitarian and corporate forms of human association, most forcefully in *Otherwise Than Being: Or Beyond Essence*. He clarified that responsibility for the neighbor-as-Other is not exclusive but, on the contrary, it is constitutive of all forms of responsibility to innumerable others irrespectively of how distant or obscured these are:

> The others that obsess me in the other do not affect me as examples of the same genus united

> with my neighbor by resemblance or common nature, individuations of the human race, or chips off the old block. . . . The others concern me from the first. Here fraternity precedes the commonness of a genus. My relationship with the Other as neighbor gives meaning to my relations with all the others. (Levinas, 1981, p. 159)

This is at odds with any ontology of the state or any other political association because it exposes the contingency of sociality and demystifies/denaturalizes any existing bonds. The neighbor "absolves himself from all essence, all genus, all resemblance" and always concerns me "from the first time (even if he is an old friend, an old lover, long caught up in the fabric of my social relations) *in a contingency that excludes the a priori* [italics added]" (Levinas, 1981, p. 86). This contingency occasions a responsibility for "the other man, . . . the stranger, the sojourner, to which nothing binds me—nothing in the order of the thing, of the something, of number or causality" (Levinas, 1989, p. 84).

Derrida's criticism about the impossibility of the other's "pure presence" prompted Levinas to engage with issues of language and representation through a distinction between the "saying" and the "said." Infinite responsibility to the other-as-Other must not be collapsed with the content of particular actions and decisions—which are the "said"—but "traced" in the impossibility to justify these to *every* other. This impossibility results in delirium or contradiction—the saying that belies the said—which inevitability attaches to every justification. To say that one is infinitely responsible for the other-as-Other, therefore, is not to privilege one particularity over another at the expense of universality; rather, the message seems to be that the responsibility is anarchic. Therefore ethics cannot be used to "authorize" or justify any decision or action (or inaction) just as no justification or authority can be the sufficient cause or reason of a decision or action. In this regard Critchley's (2000) work on the relation between the Levinasian ethics and deconstruction is seminal.

A related but radically different use of the term is crucial in Lacan's reformulation of the Freudian unconscious following the linguistic turn (viz., the insight that signifying elements have no positive existence and no fixed relation to what they signify but are purely constituted by virtue of their mutual differences). The absolute otherness of things-in-themselves is the unfathomable Other of language, the "Real," generating nothing but horror. The emergence of the subject that can engage in social relationships requires the passage to a gentrified "imaginary other" who acts as a mirror. This requires the agency of the "big Other," namely, the symbolic order. Conceived in terms of the grammar of a language, the "big Other" consists of the performance by humans of insubstantial impersonal rules. There can be no "functioning" social relationships without a fine balance among these three registers of the Other. The total suspension of impersonal Law (i.e., without submission to *some* law) will leave the subject left open to the horrific otherness of others; if the operation of the impersonal Law becomes so efficient that it totally shelters each subject from its neighbor's alterity, human subjects are reduced to cogs; if a subject relates to the Law directly and stops mirroring itself in each of its confusingly many human others, this is a subject without uncertainty close to psychosis.

Slavoj Žižek, using Lacanian theory, has charged that the Levinasian use of the term fits into an era of political correctness and serves what Alain Badiou called the "permissiveness" through which contemporary Empire operates (Žižek, 2005, p. 134). Žižek argues that the ethical priority Levinas accords to the other-as-Other occurs at the expense of third parties ("the Third") and, therefore, acts against the requirements of justice and universality. Consequentially "the true ethical step is the one *beyond* the face of the other . . . for the *third*" (Žižek, 2005, p. 183). Žižek's critique is by no means conclusive. Arguably the "Third" is never a purely transcendental fact but an empirical one, as he or she can only have an impact on me *as* a face; indeed in the Levinasian scheme of things, obsession with the other-as-Other renders complete facelessness and impersonality impossible even in the modern highly complex world run by bureaucracies (Diamantides, 2007, p. 182). In a separate, highly complex, argument Critchley suggested that commitment to justice-politics is needed to sublimate the Other's infinite demand on the subject. This means a transformation of the ethical subject from obsessing about responsibility to a particular other-as-Other into a political subject,

"identifying a particularity in society and then hegemonically constructing that particularity into a generality that exerts a universal claim"—mentioning, by way of example, the case of indigenous identity that is "a political achievement and not an accident of birth or an extra-political cultural given" (Critchley, 2007, p. 91).

P

PACIFISM

The term *pacifism,* which is now applied to a number of historical and contemporary stances toward war, did not appear until the early twentieth century. In 1902, a Frenchman at an international peace congress used, and perhaps even coined, the word *pacifism* to mean *antiwarism.* Its linguistic roots, of course, suggest more positive implications: making or doing peace.

Nevertheless, the common element in pacifist positions is negative: disavowal of war and/or participation in war. Many pacifists disavow both a state's use of armed force in interstate conflicts and their own personal participation in such armed force. Yet this distinction is important because some pacifists disavow participation in war, seeking to disassociate themselves from their government's policies by refusing to serve in the military, pay taxes, and so forth, without seeking to alter their government's military policies or to propose a political alternative to those policies.

Pacifism is not necessarily passive in the face of perceived wrongs—that is, it usually opposes, often quite vigorously, injustice and other wrongs—but it calls for nonviolent means to overcome such policies and actions. It agrees with just war proponents about the goal of a just peace, but it disavows the use of armed force to achieve that goal and/or participation in the use of armed force.

Types of Pacifism

Pacifism is distinguished from several other approaches to war, particularly just war theories (which hold that war can be ethically justified under certain conditions) and political realism (which downplays the role of moral norms in the realities of international life and stresses the need to wage war in some circumstances). All of these approaches have a variety of forms. It is important to recognize the numerous varieties of pacifism because interpretations and evaluations depend on the type(s) of pacifism under examination.

The following typology distinguishes four main types of pacifism according to their mode of reasoning (i.e., whether the reasoning is nonconsequentialist, consequentialist, or some combination). In addition, the ground of a pacifist position may be particularistic (e.g., based on revelation) or universalistic (e.g., based on natural law or reason). The pacifist position may apply to certain individuals or groups who can apprehend those fundamental principles, or to all individuals and groups, including states, because the fundamental principles are universal and human beings have the natural capacity to grasp and apply them in statecraft. The ground of each pacifist position will also include various philosophical, theological, and anthropological premises. And it will determine, in part, who may and should be agents of pacifism—individuals, religious and other organizations, or the state.

It is also important to consider both the *strength* or *stringency* and the *scope* or *range* of pacifist

positions: On the one hand, there is a question about the strength or stringency of the disavowal of war—that is, whether this disavowal is absolute, presumptive, or relative. On the other hand, there is a question about its scope or range—that is, whether it applies to all wars, only to modern wars, or only to certain kinds of modern wars, and whether it is limited to warfare itself or if it also extends to other or even to all armed force (as some anarchist pacifists hold).

Legalistic-Expressive Pacifism

This first type of pacifism, often represented in religious traditions, views nonviolence as obligatory. Its ethical framework is nonconsequentialist because it holds that some features of acts and policies other than their intended and foreseen consequences make them right or wrong; those features include fidelity to the moral law or witness to certain values or expression of particular virtues. Whatever its form, this type of pacifism cannot accept the use of armed force by states against other states, even to avoid terrible consequences. Hence, it tends to be absolutist.

Historically, legalistic-expressive pacifism has often been sectarian in the sense that it stands in opposition to the society's dominant moral framework, including just war theory. Indeed, some interpreters hold that absolute pacifism, the total rejection of violence and war, usually stems from world rejection, rather than being an independent or freestanding position.

Insofar as it rests on a particularistic ground, such as revelation, this type of pacifism cannot easily offer directions for states. It functions largely in a prophetic mode. In order to offer directions for public policies, it would need to find a broader epistemological basis (e.g., natural law) or to appeal to the society's dominant moral framework (e.g., pacifist appeals to just war criteria to condemn the war in Vietnam or to reject the use of nuclear weapons).

Some proponents of legalistic-expressive pacifism (e.g., some Mennonites) oppose participation in war, and express their opposition through conscientious objection or refusal. They disassociate themselves from the war without offering pacifism as an alternative for the larger society. Legalist-expressive pacifism stands in sharp contrast with the next type of pacifism, which offers an alternative for national policies based largely on claims about the likely consequences of pacifism.

Consequentialist Pacifism

This second type of pacifism holds that if individuals, groups, and even nations would adopt pacifism as their policy, their actions would on the whole produce a net balance of good over bad effects. Even though it is directed at national policies, this type of pacifism is not merely a political position because it is based on a moral imperative to produce the greatest good. Its predictions about the consequences of a state's adoption of a pacifist stance depend on some contested assumptions about human nature and the world. For example, critics of this type of pacifism challenge the effectiveness of nonviolence, especially in confrontation with totalitarian regimes pursuing oppressive and even genocidal policies.

It is difficult to defend absolutistic pacifism from a consequentialist perspective—at most, nonviolence would appear to be presumptively rather than absolutely justified. And the fundamental problem remains: the justification of claims about the positive long-term effects of pacifist policies in the face of immediate consequences that appear to be terrible and perhaps even irreversible if pacifism is followed. However, consequentialist pacifists stress that wars do not always achieve their ends, are almost always unsuccessful for one side, and are often unsuccessful for both sides. Furthermore, they note the comparative costs of nonviolent and military efforts. They also brush aside charges of ineffectiveness, observing that insufficient effort has been devoted to making pacifist policies work, in contrast to military solutions. Some versions of consequentialist pacifism are negative rather than positive. They hold that pacifist policies would produce the least evil. In its modern form, this negative pacifism often blends with technological pacifism (the fourth type) because of the terrible and indiscriminate destructiveness of modern war.

Redemptive-Witness Pacifism

The third type of pacifism combines features of the first two types. Whereas the first type holds that pacifism is right even if it is ineffective, and

the second type holds that pacifism is right because it is effective, the third type holds that pacifism is both right and effective. Pacifism is faithful to a revealed moral code or expresses fundamental ethical values or virtues, and it also—perhaps therefore—produces good consequences.

In this version of pacifism, by renouncing the use of lethal force, individuals, groups, or states indicate that they are trustworthy (i.e., that they will not harm others) and express their trust in others. Thus their actions can evoke others' trust and trustworthiness. Redemptive-witness pacifists consider nonviolent actions and policies to be therapeutic and even redemptive. Even if nonviolent agents are attacked, their attackers will fail in the larger public forum when they attempt to justify their actions.

In combining elements of the first two positions, this third type of pacifism is subject to objections about both the obligatoriness and the effectiveness of pacifist actions. In particular, pacifist claims about effectiveness often appeal to contested views of human nature and metaphysical or theological beliefs, such as the Quaker conviction that it is possible to reach God in every person, Mohandas Gandhi's contention that the law of suffering works, and Martin Luther King, Jr.'s, insistence that unmerited suffering is redemptive. Critics charge that this type of pacifism is foolishly unrealistic and hopelessly optimistic in face of historical evidence that shows accepting suffering does not transform oppressive regimes so much as beget more suffering.

Technological Pacifism

The fourth type of pacifism is different because it accepts just war criteria but holds that a rigorous application of these criteria entails negative judgments about modern, especially nuclear, wars. Modern weapons of mass destruction violate the standards of discrimination and/or proportionality for the just conduct of war (*jus in bello*). Wars involving these weapons—or potentially involving these weapons—may also fail to meet standards of reasonable chance of success and proportionality that a state must satisfy if it is to undertake a war justly (*jus ad bellum*). Some nuclear pacifists emphasize one or the other of these sets of standards, while others apply both.

The distinctiveness of this position is that its criteria are drawn from the just war tradition, that it is shaped by the available technology of warfare, and that it applies only to the present age. Its "no" to modern (especially nuclear) warfare is what attracts the label "pacifist," but its logic of reasoning is clearly distinctive vis-à-vis the other types. Even though its proponents may use absolutistic language, technological pacifism is a contingent position that could change as weapons and defense systems develop. Because it is based on just war criteria, technological pacifism is addressed to states as well as individuals and religious communities. However, it may not offer clear policy directions about the possession of weapons of mass destruction. For example, employing just war criteria, the U.S. Catholic bishops disavowed the *use,* not the *possession,* of nuclear weapons, and offered a strictly conditional acceptance of nuclear deterrence for the present. Because this fourth type is an extension and application of just war criteria, the remainder of this entry will focus on the first three types of pacifism.

Debates About Pacifism in Politics and Public Policy

As is already evident, debates about pacifism often focus on whether it is a legitimate option in politics and public policy. One of the major twentieth-century critics of pacifism, the political realist Reinhold Niebuhr, expressed genuine appreciation for absolute legalistic-expressive pacifism that calls for nonparticipation in violence without attempting to offer a political alternative. For him, this type of pacifism is a legitimate part of a general religious withdrawal from the world, including political responsibility, in an effort to attain perfection. As such, this type of pacifism stresses a stringent interpretation of the requirements of neighbor love and reminds society of the distinction between the ideal and the real, thus helping to maintain an uneasy conscience about war and participation in war. However, Niebuhr views this form of pacifism, though valuable in these ways, as politically irrelevant and irresponsible.

The second and third types of pacifism, which claim to offer effective political alternatives, are, from Niebuhr's perspective, even more confused and mistaken when they interpret neighbor love to

mean nonviolent resistance, rather than pure nonresistance, and when they affirm that humans are basically good and can and will respond to nonviolent resistance. Some of the claims and counterarguments about effectiveness and consequences were previously noted.

Important developments have occurred in the pacifist tradition in recent years, as John Howard Yoder, Stanley Hauerwas, and others have developed pacifist positions that challenge the powerful realist conceptualization, classification, and critique. Several points are noteworthy.

First, even though many contemporary religious pacifists operate from a legalistic or expressive perspective, they often refuse to accept consignment to political nonparticipation and irrelevance. Rejecting or qualifying the mainstream definition of politics that focuses on the use of force, they argue that the "political" has to do with the *polis,* that is, with people's common life and their conversation about the good. Hence, pacifists can legitimately challenge and attempt to reshape the sociocultural context, such as militarism, of political decisions to wage wars.

Critics sometimes charge that pacifists should stay out of the discussion about the justifiability of particular wars, just as in Vietnam or Iraq, because, after all, pacifism disavows all wars or at least modern wars. Pacifists respond that they can still argue against particular modern wars by invoking publicly available just war criteria. And they can challenge society to apply those criteria rigorously and with integrity, rather than simply as a way to legitimate every war.

Opponents also charge that pacifists are inconsistent when they favor one side over another in armed conflicts. However, neither logical nor moral inconsistency is evident when pacifists view the ends and cause of one side as ethically superior, even in a violent conflict.

Against dismissals of their proposals as unrealistic and idealistic, pacifists stress that political realism actually holds an impoverished view of political reality, particularly by concentrating so much on armed force. According to pacifists, realists often cannot appreciate the potential of nonviolent alternatives because of their closed view of reality. Properly understood, pacifists note, even just war theories generally require that armed force be a last resort, after nonviolent alternatives have failed.

Critics admit that pacifists helpfully remind society of the presumption against the use of armed force and the need to seek nonviolent alternatives to armed conflict. However, they charge that pacifists neglect another part of the just war tradition: the set of requirements for the just conduct of war (*jus in bello*), including the principles of discrimination between combatants and noncombatants and of proportionality. Pacifists seem to share with realists the conviction that war is hell and even murder, and the only moral question is whether or not to enter it. As a result, even though pacifists remind the society of the moral boundary between peace and war, they tend to neglect the importance of moral conduct in war after that boundary is crossed.

A final question addresses whether the state should exempt pacifists from conscription for military service and, if so, which pacifists and under what terms and conditions. After a vigorous debate in the United States about conscientious objection, particularly during the Vietnam War, this issue disappeared with the adoption of an all-volunteer army in 1973, but it can be expected to return to the policy debate if military conscription returns. When states with military conscription consider whether to recognize conscientious objection to military service, there are often debates about the fairness of exempting pacifists from military service and about the need to require them to perform an alternative service, as well as about the conditions they have to meet in order to qualify for exemption, such as sincerely holding certain kinds of pacifist beliefs.

Pain

Serving as the backdrop to issues such as torture and cruelty, political theorists approach *pain* in terms of its sociolinguistic ambiguity. To political theorists, the central question is not only how to define pain from a physiological perspective, but also how to see pain as a world-altering force that influences our understanding of agency, community, and government.

The first thing to note about these issues is how the meaning of pain has changed throughout the history of political thought. In Ancient Greece, there were as many as six groups of words linked up with pain, stretching from a shooting pain (*odunè*) to feelings of mourning (*penthos*) and worry (*kèdos*). The church fathers, above all Augustine, limited these meanings to a paradigm in which pain was a sign of sin and human finitude. Encouraged by the Cartesian revolution in modern philosophy and science, this paradigm was replaced by the competing visions of liberalism and utilitarianism, which interpreted pain as either a physiological disturbance that one defines on an individual basis or as lack of pleasure that decreases a society's overall happiness.

Contemporary theorists focus on issues of knowledge and politics following from these modern visions of pain. In *Contingency, Irony, and Solidarity,* for example, Richard Rorty affirms the claim by Judith Shklar that cruelty is the worst thing we do, but goes on to criticize liberals and utilitarians for claiming to know the difference between justifiable and nonjustifiable pain. Such knowledge is groundless, Rorty argues, foregrounding the contingency of our desire to avoid suffering. In another critique, Wendy Brown draws on Nietzsche to identify what she calls "wounded attachments." Wounded attachments arise when a person or a group blames someone else for the pain they feel from not being their own masters, and in turn bases their identity on the pleasure that arises from this blaming. According to Brown, these attachments define liberal democracies, which undermine the goal of freedom as self-mastery by relying on, and in some cases promoting, cultural and economic inequalities.

A set of themes has emerged from these critiques. First, without a physiological essence, pain is a politicized phenomenon whose meaning depends on issues of culture, economics, and religion. Not only does this view collaborate with neurological studies focusing on chronic pain, it underscores the value of approaching pain in a contextually informed manner. Second, visions of and attitudes to pain help to shape political action. The visions and attitudes do so because they define the limit between the tolerable and the intolerable, and because this limit directs our notion of legitimacy. In an age where torture, cruelty, and genocide remain high on the agenda, pain will thus continue to preoccupy political theory.

Paine, Thomas (1737–1809)

Thomas Paine was a radical democratic political propagandist and inventor who played a pivotal role in the American Revolution and participated in the French Revolution. Born in Thetford,

United Kingdom, to a modest working class family and raised as a Quaker, Paine lived a tumultuous life characterized by unremitting professional failure and personal tragedy in his early years, extraordinary literary success and political prestige in his middle age, and misfortune and controversy in his final two decades. The largely self-educated Paine tried his hand at staymaking (his father's profession of corset making), excise collections, and shopkeeping before he published his first political pamphlet in 1772, *The Case of the Officers of Excise,* which urged salary increases for excise officers in order to prevent their poverty and corruption. He went on to become an enormously influential political thinker who helped popularize radical and liberal causes, including the abolition of slavery, women's rights, the rule of law, natural and civil rights, written constitutionalism, free trade, the advancement of science, welfare state policies, land reform, and deism. Since his death, Paine has been considered an inspiration for working-class radicals, internationalists, land reformers, libertarians, freethinkers, socialists, and progressives of all stripes in the United States and Great Britain.

Paine's ideas as a political thinker are bound up with his life as a political actor. With a letter of introduction from Benjamin Franklin, Paine decided to make a fresh start in America at the age of 37, where he established his reputation as a bold polemicist. He returned to England in 1787 to promote his design for a single-arch iron bridge, but ran afoul of the law. He was convicted of seditious libel for publishing the antimonarchical *Rights of Man* in defense of the French Revolution's aims. He sought refuge in France, where he became an honorary French citizen, but soon fell out of favor with the dominant Jacobin Party. He was imprisoned and nearly lost his life for pleading that deposed King Louis XVI be spared from the guillotine because of his support for the American Revolution. On his return to America in 1802, Paine was reviled for the unorthodox religious views he expressed in *The Age of Reason* and for misguided attacks on George Washington, who was unfairly blamed for Paine's imprisonment. Because he relinquished the rights to his publications in order to make them widely available to the public, Paine died in poverty.

Paine in America

Paine made a signal contribution to revolutionary political thought almost as soon as he arrived in Philadelphia. In January 1776, just over a year after his arrival in America, he anonymously published *Common Sense,* a fiery pamphlet that articulated many of the liberal egalitarian themes and ideas that Paine would further develop in his subsequent writings. *Common Sense* was the first major document to call for total independence, and the 43-page pamphlet sold over 100,000 copies in its first three months alone and was immediately translated into French. Even though his ideas were not particularly original, Paine popularized ideas associated with radical egalitarian philosophers and liberal social contract theorists like John Locke.

What set Paine apart from other political writers in this era was his adoption of a clear, direct, and forceful style of writing that helped democratize political discourse. Scholars credit Paine with introducing a new literary form that expanded the public sphere to include average readers unschooled in Greek and Latin. Unlike contemporary writings laden with classical references, foreign expressions, and flowery language directed at elites, *Common Sense* used plain arguments and commonsensical reasoning that avoided the abstruse language associated with philosophical writings. Paine used his ability to present complex problems in a straightforward manner, which enabled him to demonstrate the interdependence of public and private interests in the American cause.

Paine invoked universal principles of natural rights to justify the American struggle against British despotism. Setting a pattern he would follow in his subsequent writings, Paine described the American struggle for freedom and equality as a struggle that concerns mankind as a whole. Even though many of his arguments in support of independence made points specific to the American case, Paine exhibited a cosmopolitan orientation that made him a self-styled citizen of the world.

Progress and Enlightenment

Like liberal social contract theorists before him, Paine sought to demystify government by tracing its origins back to the voluntary consent and self-interest of political actors. He consistently emphasized the need for each generation to govern itself

free from the encumbrances of custom and tradition. A product and exponent of the Enlightenment, Paine was an uncompromising critic of the superstitions, ignorance, and tyranny associated with the past and an equally unapologetic champion of the reason, science, and freedoms he identified with the future. He was a fearless advocate of free inquiry and free speech in politics, society, and religion. The freedom to examine and criticize errors was essential to the promotion of freedom and the advancement of society.

Paine called for a complete break with the ideas, practices, and institutions of the past, especially aristocracy, monarchy, and hereditary succession in all its forms. This break with the past is most evident in his enthusiastic endorsement of both the American and French Revolutions. In his view, a revolution signifies more than a mere change in the form of government. A revolution entails a complete change in social and political attitudes, ideas, and principles.

Perhaps the most pervasive theme in Paine's writings is the idea that no generation owes anything to the ones that came before it. As he stated in *The Rights of Man,* his reply to Edmund Burke's conservative critique of the French Revolution, "Government is for the living, not the dead." Each generation has the opportunity and even the responsibility to begin the world anew. Precedents in law and politics carried no weight for Paine unless they were consistent with right principles.

Popular Sovereignty and Representative Government

Even though Paine never articulated a full-fledged theory of government, he consistently championed an egalitarian form of republicanism based on the principle of popular sovereignty. According to Paine, the term *republic* did not refer to a specific form of government, but to the legitimate end of government. In all cases, this was the public good, which demands security for the natural rights to life, liberty, and property of all.

Paine's egalitarianism helps account for his advocacy of simplicity in the structures of government. Many of his contemporaries looked to the unwritten British Constitution as a model of institutional balance, but Paine rejected the complexity associated with the separation of powers, bicameralism, and other structural arrangements found in mixed governments. Instead, Paine advocated a democratic government with a unicameral legislature. Because there are no fixed distinctions of class in a democracy, Paine believed it would be ludicrous to have one part of government check another part. He expected strict adherence to the rule of law to keep government officers in check. This stance made Paine deeply suspicious of executive power and averse to the idea of lodging extraordinary power in the hands of a single person

The chief source of security for the rights and interests of the people rests on the strength and vitality of society, not on the particular form of government. Paine drew a sharp contrast between society and government that helps explains both his distrust of political authority and his confidence in the people. Whereas society conforms to the goodness and sociability of mankind, government is rooted in mankind's loss of innocence. Society meets the common interests of individuals because it is based on natural principles of equality and freedom that enable individuals to prosper. In contrast, government is an artificial contrivance that tends to produce war, poverty, debt, and other social and political ills. In fact, it bears primary responsibility for corrupting human nature. Government is a necessary evil, so the less it governs, the better. Paine anticipated that the progress of society and civilization would make government less and less necessary over the long run.

Paine's hostility to government, however, did not lead him to embrace anarchy. He was not opposed in principle to governmental activity per se, but to the wasteful and immoral objects that most governments have historically pursued. He distinguished between representative governments based on election from royal and aristocratic governments based on hereditary succession. Government by hereditary succession is in all cases a criminal monstrosity based on injustice. It violates the principles of nature because it substitutes the accident of birth for the requirement of ability. The absurdity and artificiality of royalty are evidenced by the fact that imbeciles and children so often find themselves on the throne. He ridiculed the notion that abilities could be passed on from parent to child and quipped that the word "Nobility" stood for "No-ability."

Hereditary government is an evil because it tends to sanction many varieties of exploitation and violence, including unnecessary wars of succession. The inequality in hereditary governments also tends to destroy sympathy for the plight of the lower orders of society. Another reason that Paine opposed monarchy and aristocracy is that they breed laziness and idleness among the ranks of the privileged. Moreover, the maintenance of their lifestyle often required exorbitant taxes that robbed workers of their rightful property.

Where direct democracy is not possible, the only legitimate form of government is representative government because it alone is based on the natural right to self-government. Representative government is superior in every respect to hereditary government because it combines power with knowledge. For one thing, it tends to elevate only those who are mature and qualified enough to govern. For another thing, it is stable because changes in government are less likely to provoke violence or intrigue. In addition, it is more responsive and accountable to the people. Government based on equal representation is more likely to pursue the interest of the entire nation and not just favored classes, religions, industries, or regions. Paine also believed that representative governments are more likely to live at peace with one another because the national prejudices fostered by monarchs were likely to disappear with the spread of natural rights and common sense.

Written Constitutions

Paine was a strong proponent of written constitutions because he viewed them as constituent acts of the people. He believed that there were two aspects to any constitution: first, as the origin of government and the source of its power; and second, as the chief restraint on the powers of government. A constitution is antecedent to government and forms the basis of its legitimacy—as long as constituted by the people. To ensure that a constitution reflects the will of the nation, Paine recommended ratifying conventions like those used in the United States. Once established, the purpose of a constitution is to serve as a control on government by setting legal limits on its powers. In keeping with the idea of progress, Paine argued that every constitution should be subject to amendment by the nation.

Economics and the Welfare State

Paine's views on economics paralleled his views on politics. Paine generally supported the emergence of a new capitalist economic order. At a time when many European powers were pursuing protectionist and mercantilist policies that impeded commerce, Paine avidly supported free trade because it was conducive to peace and the prosperity of all parties. He also supported the sanctity of contracts and the creation of a national bank in the United States to promote the circulation of money and facilitate trade.

Paine inveighed against wasteful government spending and high taxes, but his criticisms were rooted more in humanitarian concerns for the poor than in libertarian arguments for small government when it came to fiscal policy. The thrust of his assault on tax and spending policies focused on policies that benefited the privileged at the expense of the poor. Paine believed that the money saved by avoiding unnecessary wars instigated by monarchs could be used to fund programs to alleviate the suffering caused by poverty, illness, accidents, and old age. These ideas were most fully developed in *Agrarian Justice* and the second part of *The Rights of Man,* where Paine proposed programs that anticipated the development of the modern welfare state: public education, the creation of a progressive tax system, maternity benefits, family allowances, unemployment insurance, old-age pensions, an inheritance tax on large estates, and outright grants to 21-year-olds that would enable them to become independent. This kind of public support is a right, not an act of charity. Because the rich derive so many benefits from society, they owe a part of their affluence to the rest.

Religious Dissent and Deism

A staunch proponent of religious freedom and toleration, Paine opposed attempts to enforce religious orthodoxy as a violation of natural rights and an impediment to progress. Even though he always argued for freedom of individual conscience and professed to believe in God, his writings became increasingly hostile toward all forms of organized religion. One of his primary objections to organized religion concerned the fact that it is so often used to justify illegitimate political practices and forms of government, including monarchy.

Paine's views on religion were most fully articulated in *The Age of Reason,* a full-throated assault on the inconsistencies and absurdities of revealed theistic religion. Paine professed to be a deist, someone who believes in an impersonal God who has created the universe but refuses to interfere in human affairs, but his scathing criticisms earned him a reputation as an atheist, especially in the United States. He rejected all established churches as human inventions used to keep mankind in ignorance and subjection. Religion must be compatible with the understanding of reason. Unless one has direct personal communication with God, revelation is nothing more than hearsay, subject to the same evidentiary requirements one would use in any other area of life. The word of God was not to be found in obscure religious texts written by poets, but in the natural world. By studying Creation itself, Paine believed it would be possible for humans to discover the immutable laws of nature and set humankind on the path toward greater enlightenment and progress.

Though the nature of God is ultimately unknowable, Paine was confident that the best way to serve God was by promoting moral goodness and the cause of human freedom. This was Paine's own lifelong endeavor and perhaps his greatest legacy to radicals and freethinkers.

PAN-AFRICANISM

Pan-Africanism arose as a philosophy to restore the humanity and dignity of people of African descent. It is based on a basic and simple proposition, the idea that African people are human beings who think and have a right to live on the planet Earth. Pan-Africanists in the twenty-first century continue to confront old questions of the hierarchy of humans that became embedded in Anglo-American thought from the period of the slave trade to the present.

The Pan-African movement was the principal agency for the self-definition of the African people in the twentieth century. One of the principal credos of Pan-Africanism was that the people of one part of Africa were responsible for the well-being of Africans in every part of Africa, and Africans everywhere were to accept this responsibility. This movement has been manifest at the subjective level of race consciousness of African peoples and the objective level in relation to the organizational forms that Pan-Africanism has taken over the century. The organized form is more widely known with the written record focusing on the seven Pan-African Congresses held between 1900 and 1994. In institutional terms, the Organization of African Unity was the most concrete manifestation of Pan-African aspirations. Today, the African Union represents the organizational form of state-centered Pan-Africanism.

The quest for self-definition arose out of the concrete realities of the partition of Africa and the massive violence, destruction, genocide, and division that arose at the end of the nineteenth century and the rise of racism and racial violence in the United States. The small intelligentsia in the African diaspora was the main spokespeople for the ideas of African independence and dignity.

Pan-Africanism from below was manifest in the consciousness of the ordinary Africans on both sides of the Atlantic. This brand of Pan-Africanism inspired the largest mass movement of the twentieth century on both sides of the Atlantic in the form of the Universal Negro Improvement Association (UNIA). The UNIA had branches in all parts of the world, with its newspaper, the *Negro World,* acting as the voice of the Pan-African movement in the period of the Harlem Renaissance.

Pan-African consciousness of Africans rose to become a force in international politics following the Italian invasion of Abyssinia in 1935. The global Pan-African movement was a major force of the antifascist movement similar to those who were fighting against fascism in Europe. The ideas of Ethiopianism that was a variant of Pan-Africanism had been widely held among Christianized Africans during the nineteenth century. Taking the biblical references to Ethiopia as the basis for the rallying point around the independence of Africa, Ethiopianism as a brand of Pan-Africanism represented a manifestation of spiritual and cultural autonomy for Pan-Africanists. In this period of fascism and war, the Pan-African scholars such as W. E. B. Du Bois, George Padmore, C. L. R. James, and Aime Cesaire articulated the ideas of liberation and redemption. In the French speaking territories, Négritude was another variant of Pan-Africanism.

During the nationalist phase, the period of the struggle for self-determination and independence, the intellectual leaders of the Fifth Pan-African Congress in Manchester, United Kingdom (like Kwame Nkrumah and Jomo Kenyatta), became actively involved in politics. The nationalist movement embraced the idea that independence was to be the basis for the regeneration and reconstruction in Africa. Cheikh Anta Diop of Senegal and Frantz Fanon of Martinique were among those who transcended the preoccupation with governmental structures and sought to link the Pan-African project to the decolonization of the mind. Fanon traced the mental illnesses associated with colonial rule in Algeria and linked the transformation of the health and sanity of the people to Pan-African liberation and African unity. Diop reflected on the importance of African matriarchal traditions in what he called the Southern cradle of human transformations and invoked the contributions of the Egyptian civilizations in his writings on the cultural and linguistic unity of Africa that was to be the basis of Pan-Africanism. Walter Rodney and Julius Nyerere were among some of the noted Pan-African scholars who defined the Pan-African agenda in the twentieth century.

Struggles against colonialism and apartheid were the principal reference points for Pan-Africanism on the African continent between 1960 and 1980. The Organization of African Unity (OAU) was formed in May 1963 as a compromise between countries who wanted full mobilization to counter Belgian and French incursions in the Congo and countries that wanted appeasement with imperialism. This compromise led to the formalization of Pan-Africanism of African states. The Pan-African News Agency and the Africa Cup of Nations (in soccer) are the two Pan-African institutions most well-known to Africans at home and abroad.

In 1964, the OAU created the Liberation Committee with the mandate to support militarily, politically, and diplomatically those countries still under apartheid and colonial rule. However, OAU member states undermined one of the principal tenets of Pan-Africanism with the clause of noninterference in the internal affairs of African states, which protected dictators who were members of the OAU.

Pan-Africanism was at all times a brand of nationalism and internationalism. In the twentieth century, the civil rights movement in the United States acted as a beacon for this internationalism, and it was from organizations such as the African Liberation Support Committee (ALSC) of the United States that the internationalism of the movement was realized to embrace the mobilization of Africans in all parts of the globe. Malcolm X had been at the forefront of exposing U.S. racism, and other leaders such as Martin Luther King, Jr., Angela Davis, and Kwame Ture (formerly Stokely Carmichael) were well-known voices of the civil rights movement. Writers and cultural artists such as Amiri Baraka, John Coltrane, Lorraine Hansberry, Toni Morrison, Alice Walker, and James Baldwin carried the message of black dignity beyond those formally organized in political organizations. Jazz artists and African American singers were representatives of this movement, and

their messages of "respect" and black pride were communicated widely throughout the world.

Bob Marley was another notable Pan-African spokesperson of the century, with a universal message in his music of African unity, love, peace, and human emancipation. Africans and non-Africans alike embraced his music and ideas and his message of Pan-African emancipation. The Rastafari movement was an expression of Pan-Africanism from the grass roots and could be distinguished from the Pan-Africanism of states as manifest in the OAU. It was this vibrant Pan-Africanism from below that influenced the new variation of Pan-Africanism that transcended states, which is manifest in the declarations of the sixth and seventh Pan-African Congresses, held respectively in Dar Es Salaam, Tanzania, in 1974, and in Kampala, Uganda, in 1994.

By the end of the twentieth century, African women had emerged with a new definition of Pan-Africanism that emphasized the humanity of Africans and not simply the independence of states. The struggles against violence, warfare, destruction, and violation had taken the Pan-African discussion to a new level. In the process, there was a sharp distinction between the Pan-Africanism of the leaders and the ordinary people.

Paradigm

A *paradigm* is a generally accepted or widely shared set of concepts, assumptions, values, and practices that constitute a way of understanding or approaching a particular discipline, especially a scientific discipline; it is similar in some respects to Michel Foucault's concept of an episteme. It is typically impossible to completely characterize the underlying logic of a particular paradigm because a paradigm consists, at least partly, of a set of pretheoretical commitments that determine how we see the world. In this sense, a paradigm is as much the language in which we formulate our concepts as it is a particular set of concepts. Thus, a paradigm is perhaps best thought of as a practical model for how to think through or handle a particular class of problems, rather than as a set of explicit rules that we might follow.

Originally, the word *paradigm* was a grammatical term for the set of the inflected forms of a word that serve as a model for the inflection of other, similar words. Thus, the forms of a regular verb like "walk"—walk, walks, walked, walking—provide a paradigm for the conjugation of related verbs. The word *paradigm* came to have its contemporary sense in Thomas Kuhn's work on scientific revolutions. Kuhn used the word *paradigm* to describe the predominant way of thinking during periods of what he called "normal science," in which most researchers share a relatively fixed approach to their field. In this sense, a scientific paradigm tells researchers what kinds of problems they should solve, provides methods for solving those problems, and gives them tools for evaluating the success of their solutions.

The features of a paradigm in this sense are not dictated by the nature of a given field but rather represent one specific approach among other possible alternative approaches. Kuhn argued that different paradigms are incommensurable insofar as they do not share the same theoretical language or evaluative criteria. That is, the concepts and assumptions of one can never truly be translated into the language of the other, making comparisons between them difficult at best. Therefore, Kuhn suggests that the choice between two rival paradigms may be arbitrary and irrational. For example, astronomers were not forced as a matter

of logic to switch to the Copernican model of the solar system, but they could always adduce new hypotheses to make the old Ptolemaic system work. So Kuhn compares the shift from one paradigm to another that occurs during a scientific revolution to the "*gestalt* switch" that occurs when we abruptly perceive something in an entirely different way, such as when we go from seeing the famous duck-rabbit image as a duck's head to seeing it as a rabbit's head.

Pareto, Vilfredo (1848–1923)

Vilfredo Pareto was a pioneering Italian economist and social theorist, whose positivist approach to the study of society was crucially influenced by his early training as an engineer. The young Pareto did not seem destined for an academic career. Until 1893, he worked in business but also dabbled in politics and journalism. He was an outspoken advocate of free trade and British liberalism—a stance guaranteed to breed disillusion in the Italian setting, where protectionism and rampant clientelism hindered democratic development. By the early 1890s, Pareto's economic interests had become more theoretical than practical, and he began to publish contributions to the fledgling discipline of mathematical economics. These writings were sufficiently impressive to earn him a chair at the University of Lausanne in Switzerland, which he held from 1893 to 1907.

By the turn of the century, Pareto was losing interest in pure economics and rekindled his interest in political polemic, albeit in a more detached, scholarly manner. In *Systemes Socialistes* (1902), he mounted a scathing attack on socialism, which he eccentrically equated with any form of government intervention, including the imposition of tariffs. He also made it clear that his youthful infatuation with democracy was misguided. In *all* forms of government, he now concluded, leadership is by the few at the expense of the many. While he agreed with Marx that history was essentially a struggle for scarce resources, he took exception to the German's assumption of causal asymmetry between economic and political power. The clash between different interests, according to Pareto, could not be reduced to one schematic form. The powerful will always exploit (or to use his preferred term *spoliate*) the powerless, but the sources of their power are many and various.

Pareto did not, however, abandon his interest in economics. In *Manuale di economia politica* (1906), he developed his famous idea of Pareto-optimality, which assumes that a society is enjoying an optimum allocation of its resources at the point where no one can become better off without making someone else worse off. Any change beyond this point cannot be justified on economic grounds. Such a change must be based on moral and political considerations. In specifying the limitations of pure economic theory, Pareto was expressing his growing dissatisfaction with neoclassical economics, which posited an abstract world of (ideally) rational economic agents maximizing their utilities in an (ideally) free market. By now, he was convinced that human actions were largely sustained by sentimental beliefs, resistant to the dictates of logic. Economic functions could not be studied in isolation from other social processes—and the science capable of comprehending the full range of social action was sociology, or—to be more precise—*political* sociology, whose primary task was to analyze the distribution of power in society.

Bored by his lecturing duties and sustained by a massive inheritance, Pareto resigned his chair in 1907, retreated to a mansion in the Swiss countryside, and devoted himself to the production of his masterwork, *Trattato di sociologia generale* (1916), possibly the most suggestive work of political science published in the twentieth century. He begins by dividing human activity into "logical" conduct, in which means and ends are objectively related,

and "non-logical" conduct, where they do not correspond. The latter, we learn, is the principal ingredient in social life, and it supplies the basic premise of his *psychological approach* to social dynamics. Instinctive drives, which typically underlie nonlogical conduct, are the main sources of action for Pareto, though human beings contrive the delusion that their actions reflect rational deliberation and theoretical constructs. To illustrate his point, he divides these constructs into two elements. One varies over time and place and comprises the justifications and explanations we apply to our behavior. He calls these "derivations" because they derive from the *constant* elements in a theory, which correspond to deep psychological imperatives and are called "residues" in his parlance.

Pareto identified two main classes of residues. Class I reflects the "instincts of combinations"—the capacity to create and invent. Class II manifests the instinct of "aggregate persistence"—the natural human tendency to conserve and consolidate. Each class corresponds to a personality type. Borrowing terminology from Machiavelli, he divides social actors into two categories: foxes (cunning, clever) and lions (stolid, forceful). His famous theory of elites is founded on this distinction. Although all societies are oligarchic, regardless of what their constitutions might suggest, the ruling elite will consist primarily of either lions or foxes. For him, history is the graveyard of elites, as no ruling group can consistently combine the contrasting qualities required to sustain their domination. The foxes are good at manufacturing consent by forming alliances and striking deals, but they are incapable of wielding force when necessary. Their attempts to buy off or persuade their opponents ultimately prove futile, at which point they will be overthrown by an elite of lions, who understand coercion but lack adaptability. Requiring the assistance of class I types, the class II elite is eroded from within, as their psychological limitations allow the foxes to infiltrate their ranks and gradually transform the nature of the regime. Believing that history displays a constant pattern of circulation between these two types of elites, Pareto welcomed Mussolini's takeover in 1922, as it seemed to confirm his theory that an elite of foxes (effete parliamentary "democrats") would be violently supplanted by an elite of lions. Despite his cyclical theory of historical change, Pareto assumed that society had a natural tendency to remain in a state of equilibrium—an assumption that leads some commentators to view him as a pioneer of functional analysis.

Although Pareto's works are as complex as the reality he tried to capture, critics have often reduced his thought to simplistic formulae, depicting him as a science worshipping positivist, a psychological reductionist, and/or a protofascist ideologue. True, he applied the inductive/experimental method to the study of social phenomena, stressed the uniformities of human behavior due to fundamental dispositions embedded in human evolution, and criticized democratic regimes and humanitarian values as shallow and fraudulent; yet he did not deny the limitations of the scientific method. Nor did he ever deny the creativity of the human being as a semiotic animal, capable of actuating and intensifying certain instincts by engaging in symbolic discourse. Even less did he gainsay the dangers of nationalism, censorship, and racism—doctrines with which he is sometimes associated. Still, Pareto was a Machiavellian pessimist, who highlighted the irrational side of social life and who poured scorn on the creative power of *reason*. He will never be a hero to *progressives*.

Pareto-Optimality

Pareto-optimality is a concept of efficiency used in economics and political science named after the Italian sociologist Vilfredo Pareto. A state of

affairs is *Pareto-optimal* (or Pareto-efficient) if and only if there is no alternative state that would make some people better off without making anyone worse off. More precisely, a state of affairs x is said to be Pareto-inefficient (or suboptimal) if and only if there is some state of affairs y such that no one strictly prefers x to y and at least one person strictly prefers y to x.

The two so-called fundamental theorems of welfare economics contain the most famous applications of the concept of Pareto-optimality. The first theorem states conditions under which the allocation associated with any competitive market equilibrium is Pareto-optimal, whereas the second theorem states conditions under which any Pareto-optimal allocation can be achieved as a competitive market equilibrium following the use of lump sum transfers of wealth.

The set of states of affairs and the set of people whose preferences are relevant for determining Pareto-optimality depends on the context. For example, in the first and second fundamental theorems of welfare economics, the set of people includes every member of the economy, and the set of possible states includes every technologically feasible allocation of commodities. Alternatively, the Nash equilibrium to the prisoner's dilemma is said to be Pareto-suboptimal because each player prefers an outcome different from the outcome resulting from the equilibrium strategies.

The concept of Pareto-optimality is often not very discriminating. A state of affairs x is Pareto-optimal provided that for any alternative state of affairs y, one can find at least *one* person who strictly prefers x to y. If one takes a sufficiently wide view of preferences and includes preferences informed by moral principles or other sentiments, such as envy, then many states of affairs satisfy this condition. The concept of Kaldor-Hicks efficiency or potential Pareto-efficiency is more discriminating and finds wider use in economics. According to this concept, a state of affairs x is inefficient if there is some alternative state of affairs y, such that at y there is a set of possible lump sum transfers of wealth from those who are better off under y to those who are worse off, such that with these transfers, everyone is at least as well-off under y as under x.

Economists typically find Pareto-optimality to be extremely plausible, indeed indisputable, as a *necessary* condition that good laws, policies, and allocations must satisfy, although few would claim that it *suffices* to make a law, policy, allocation of commodities, and so on, good. A common reason (outside of economics) for rejecting it, even as a necessary condition for a state of affairs to be good, is its reliance on subjective preferences.

PARLIAMENT

The idea of a deliberative body meeting to provide counsel can be found in both classical and medieval forms. Numerous bodies such as the Athenian Assembly or the Roman Senate share some resemblance to the modern constitutional idea of a *parliament* by virtue of the fact that they: allowed deliberation on policy or law; reviewed and advised on policy and law; controlled the raising of finance and military manpower; provided representation of certain groups; or controlled other power brokers whether imperial or religious. However, there is no cohesive idea of parliament until early modern constitutional thought. Tracing this early institutional history of parliaments has been important for political theory because of the potent modern mythologizing of early forms of civic assemblage and the strong desire to identify such institutions as democratic precursors of modern parliaments.

Ancient and Classical Parliaments

Athenian Democracy

Athenian democracy in particular has frequently been referenced by political theorists as a

historical example of a democratic parliamentary body. Within the Athenian political system, major political decisions were made at mass meetings of the citizen body, with a balance of political decision making between the council and the assembly. The council represented a widening of political participation from the existing council of nobles. Solon initially created a citizen's council of 400 in 594 BCE, demonstrating this changing philosophy of representation within the *polis* (city-state) toward a republican constitutional form. The successor council of 500 established by Cleisthenes in 507 BCE was chosen annually by lot, with each tribe allocated 50 places. Each councilor had to be over 30 and could serve for only 2 years during his lifetime. The council sat every day, and its presidency rotated between the tribes, with a foreman being drawn by lot from the presiding tribe every 24 hours.

Functionally, the Athenian council existed to direct the assembly, another precursor to modern parliamentary forms. With roughly 40 meetings in a year, the assembly also had provision for anyone to speak to the people on matters of interest. In a special emergency, such as a military threat, the assembly would meet for an extraordinary assembly. Sources for the operation of the council and assembly include the historical works of Thucydides, Xenophon, the political work of Aristotle, and the oratorical speeches of Demosthenes and Aeschines. Historians disagree about the reality of popular participation within the council and assembly. Despite the possibility that every Athenian male could sit on the courts, participate in the council and the assembly, and hold many offices, there is evidence to suggest that effective political power was exercised by an active elite minority.

The Roman Senate

The Roman senate provides a contrast to the Athenian democratic institutions. Functionally, it was similar to its Athenian predecessor. It was a deliberative rather than a law-making assembly, so it had the power to make official appointments and declare war. However, membership was more constrained because only Romans of senatorial class could be members; and it became an increasingly subservient body as the Roman polity evolved into an empire.

Nordic Parliaments

Norse communities provide examples of medieval institutions that were conceived right from the start as a form of popular representation. The Icelandic Althing (founded c. 930 CE), the Faroese Ting (founded c. tenth century CE), and the Tynwald on the Isle of Man (founded c. 979 CE) all lay claim to being the oldest parliamentary institutions in the world. Made up of annual outdoor meetings composed of all free men, the assemblies decided on laws and dispensed justice. Presided over by a law speaker, the Thing also had the power to elect chieftains.

The Growth of Constitutional Thought

The Evolution of Royal Councils

Other parliamentary bodies evolved from advisory councils. In England, the Anglo-Saxon *Witenagemot* (Meeting of Counselors) and its successor the Norman *Curia Regis* (Royal Council) were advisory councils to the king composed of nobles who held their lands directly from the king. The tension between nobles and the crown and their desire to constrain his tax-making and legislative authority provoked the evolution of the council into a parliamentary body. Thus in 1215, the nobles secured *Magna Carta* (the Great Charter) from King John, a constitutional document, that agreed for example that the king could not raise taxation without the council's consent. In 1265, a rebellious noble, Simon de Mountford, called a parliament of his own supporters without the consent of King Henry III. Edward III recognized this body in his Model Parliament of 1295, which included not only ecclesiastical and noble figures, but also representatives from the country's boroughs. This theme of the development of parliamentary structures being hastened by noble resistance and a noble insistence on the monarchy governing with their consent is echoed in the French Wars of Religion in the sixteenth century. Again, French protestant nobles used a renegade parliamentary body to challenge the crown's absolutism.

Ideas of Parliamentary Authority

Parliamentary institutions were further strengthened by the growth of constitutional theory that

focused on the functions of particular bodies, their legitimacy, and their agreed limits. The state was embodied by the assembly of the relevant estates in the presence of the king, so that a parliamentary body acted with the monarch as the guardian of the realm. Thus in England, Sir Thomas Smith argued in the sixteenth century that absolute judicial and legislative authority lay with parliament and that judges were accordingly unable to render acts of parliament void. Thus, even before popular sovereignty became the dominant explanation for parliamentary authority in the civil wars of the seventeenth century, European parliamentary bodies had already asserted their place in relation to ecclesiastical and monarchical authority.

Participatory Democracy

Participatory democracy is a form of government in which the citizens have the opportunity to make decisions about public policy. It seeks to promote self-rule and self-determination, with individuals actively making the decisions that determine the laws by which they are governed. Citizens are given a central role in the decision-making process through, say, public discussion, negotiation, and referenda. The role of the state is less to make decisions on behalf of its citizens than to provide them with information and sites and spaces for communication and dialogue.

Participatory democrats express ideals of self-rule that can be traced back at least as far as early modern forms of civic republicanism. Self-rule is, in this sense, a moral value that predates the rise of liberal democracies. Indeed, after the rise of liberal democracies, civic republican values inspired many radical, and even Marxist and anarchist, critics of liberal government. However, current debates about participatory democracy took off in the 1960s when political theorists such as Benjamin Barber and Carole Pateman made strong normative arguments for greater citizen involvement. Perhaps more importantly, it was also in the 1960s that new social movements arose, including the American civil rights movement and the women's movement, championing groups that were excluded from representative institutions.

One of the best ways to grasp the nature of participatory democracy is to think of it as an alternative to representative democracy. Most participatory democrats, at least since the late nineteenth century, have been inspired in part by dissatisfaction with the restricted opportunities for participation provided in modern representative democracies. In representative democracies, citizens delegate the tasks of decision making and policy implementation to elected officials and appointed bureaucrats. Their participation is thus largely restricted to the election of politicians who then "represent" the interests of their constituents in making decisions and holding the bureaucracy to account. Advocates of representative democracy argue that it is more efficient, especially in large states with large populations. Many participatory democrats counter with normative arguments about self-rule and citizenship: We are perhaps free only insofar as we actively determine the rules under which we live. In addition, some participatory democrats argue that popular participation leads to more effective policies in that it promotes trust, understanding, and consensus. These arguments for participatory democracy often bring it into close alignment with other forms of radical democracy, including associative democracy and deliberative democracy. Associative democrats typically advocate more participation but in the context of a pluralist system in which power is divided among a

number of groups and associations. Deliberative democrats argue that citizens should decide which laws and policies they ought to pursue through public dialogue and debate.

Although participatory democracy can be an alternative to liberal democracy, it is important to recognize that participation is a continuum. Participatory democrats simply stand farther along this continuum than do their representative counterparts. The radical theorists and social movements of the 1960s did not typically want to do away with all democratic elections, representatives, and assemblies. Rather, they wanted to give greater voice to excluded groups.

So, democracy is, almost by definition, about providing avenues for popular participation. Varieties of participation include the electoral process, grouping, citizen-government, and more direct participation. The electoral process allows citizens to select their representatives. Group participation allows citizens to combine in associations within civil society, and it allows these groups to have a greater or lesser voice in policy making: common groups include churches, businesses, and trade unions. The concept of "citizen-government" refers to a diverse set of mechanisms by which citizens can convey their opinions and preferences to politicians; the mechanisms include public meetings, congressional hearings, and citizen surveys. Although participatory democrats value all of these forms of participation, they often place a particular emphasis on more direct forms of participation. Methods of direct participation include initiatives, referendums, and citizens' juries.

Participatory democracy has been implemented within temporary experiments and small groups. There have been televised examples of deliberative opinion polls: political scientists collect a group of diverse citizens and let them make decisions and formulate policies. Various private and voluntary organizations have constituted themselves as cooperatives or adopted highly participatory forms of decision making. Community development corporations arose in response to economic issues within communities and became instruments of participatory democracy as they promoted the same principles of democracy within the organization and by means of affecting change in their respective communities. However, critics often argue, despite such experiments, that such extensive participation is simply too costly or too difficult to operate effectively in large, diverse, modern societies.

Passions

The *passions* have become a recent focus of interest in political theory, though opinions differ on the extent to which full appreciation of the passions has been neglected throughout the history of Western political thought. The new (or renewed) interest has been driven by at least three distinct strands in contemporary intellectual history: new work in the philosophy of mind and psychology that has questioned conventional accounts of the relationship between emotions and reason; growing questioning of, if not discontent with, the dominant paradigms of John Rawls and Immanuel Kant in contemporary political theory; and practical concerns of a more meaningful experience of democratic citizenship.

There has been a growing sense of the inadequacy of contemporary suppositions about the workings of the mind with regard to the nature and functioning of reason and passion. Passion can be regarded as a particularly strong or evident, and

perhaps more self-conscious, manifestation of the more general phenomenon of emotion. To understand the place of passions in political theory, it is helpful first to understand more general trends in the assessment of the nature of emotion.

Although there is no agreement on the precise meaning or use of the relevant terminology, there is a general acknowledgment among scholars from diverse disciplines, including psychology, philosophy, and literature, that there is a much more complex relationship among what had been called the faculties of reason and emotion than what was previously thought. New theories of the intricate interconnectedness of reason and emotion have been developed from a wide number of perspectives. On the one hand, it is recognized that for the very experience of emotion to be possible, there are a number of cognitive conditions to be fulfilled, cognitive conditions that at times overlap with what has sometimes been called reason. For example, the emotion of anger is only possible on the condition of an assessment that one has been wronged in some way. Judgment can be regarded as a structural condition for most forms of emotional experience. On the other hand, it is also acknowledged that pure cognitive and rational processes unassisted by affect (such as we might find in robots and other forms of artificial intelligence or in individuals with abnormal brain functioning) are deficient in certain types of understanding and thus quite incapable of making appropriate decisions. Such calculations might neglect the existence of special relationships among people or neglect a particularly important aesthetic dimension of the matter at hand.

This general direction of analysis leaves plenty of room for questions to debate, including the nature of bodily and neurological inputs and their explanatory force for emotional experience; the degree to which emotion can be reduced to cognitive components; and the relevant place for a concept of the subconscious in mapping out emotional experience.

Historically, passion had been used as a term to connote the passivity of the subject with regard to emotional experience. More recently, it has taken on the sense of those emotions felt in a particularly intense way and that are most likely to motivate individuals to act. In that sense, passion can be considered the most overtly political form of political experience, especially with the suggestion that it can be felt not only individually, but also shared among individuals under certain conditions.

In addition to this focus on the functioning of the human mind and how reason and emotion intersect in an empirical sense, there has been new attention, among scholars of political theory in particular, on the appropriate place of reason and emotion in a normative theory of politics. Analysis and deconstruction of the Rawlsian paradigm in political theory, a paradigm that had been dominant in Anglo-American circles of contemporary theory since the 1970s, has revealed a less purely rationalistic basis for politics than previously acknowledged. Specifically, both defenders and detractors of the general Rawlsian approach have recognized that his theory leaves more room for emotional life than previously acknowledged. This is particularly relevant to his understanding of the need for a desire for justice among citizens of properly constituted societies, a desire that Rawls recognized as essential to democratic politics early on in his career with his 1963 article on Jean-Jacques Rousseau. In this reconfigured form of Rawlsianism, emphasis on the neutrality and impartiality of the state has given way to an emphasis on the need for particular commitments and dispositions among the citizenry that are necessary to motivate them to choose and sustain a just regime. In more general terms, and as has been made more explicit in broader discussions of contemporary political theory, although reason may be essential for working out a just procedure for well-functioning liberal democratic regimes, a normative model also requires an emotional substructure to ensure a strong commitment among all citizens to the values of their regime. At the least, strong emotions and passions associated with attachment to basic values of equality, freedom, and justice are regarded as essential for the solidity and stability of any democratic and/or liberal regime.

There are political theorists and political scientists who press further on this issue. For some, it is not enough to suggest there is only a set of passions linked to basic liberal-democratic commitments that are relevant for an understanding of liberal-democratic politics. The traditional normative model, by either ignoring or sidelining the passions in day-to-day political deliberation, engenders an unrealistic and unhealthy model of

proper political functioning. For these theorists, a deeper understanding of citizenship requires us to appreciate a wide array of emotional and passionate expression and to see it as normal and desirable in ongoing political life. If we can learn to appreciate the expression of political passion, political elites and the media might come to understand that political behavior in contemporary democracies is not as dysfunctional as it is often thought to be. This understanding can in turn reconcile citizens to a greater extent with their own functioning democracies and decrease what has been regarded as a widespread sense of cynicism and alienation. Although this may not provide direction for broader policy initiatives, this theory suggests that a more positive appreciation of emotionally driven behavior as endemic to political life will assist in enhancing the democratic dialogue and strengthening the practice of citizenship.

All three strands explored here converge on the need to acknowledge a more central role for political passion than previously acknowledged in political theory; they also acknowledge that such a call must have its caveats. The consequences of mass emotional manipulation can also be dangerous, and stories of the interwar period and beyond are still close enough at hand to recognize this fact. In this context, the challenge for a new generation of theorists will be to combine this appreciation for passions in political life with some mechanism or criteria that will allow for the adjudication between good manifestations and somewhat dangerous or inappropriate ones.

People, The

In common usage, *the people* can designate either (a) unspecifically, a group of persons, such as a nation, tribe, race, or other form of community, which may or may not be perceived to share a collective identity; or (b) politically, the total body of enfranchised or eligible citizens of a state. Either way, the people of a geographical region or country are not usually coextensive with its population, which includes, for instance, other ethnic groups or foreign residents. The politically defined people are subject to the legal order of a state and, depending on the state's constitution, possess some form of influence or control over its institutions and government. In direct democracy, the people are the ultimate source of political authority; under absolute autocracy, where the sovereign personifies the state, the notion of citizenship is arguably meaningless and the distinction between people and population is redundant. Yet in practice, every form of government requires some form of consensus and distribution of power to avoid the breakdown of society, which is corollary to noncompliance among disempowered masses and uncoordinated government by sovereign citizens; and vice versa, the claim made by most modern governments that political authority derives from the people can be reconciled with a range of methods, despotic as well as liberal, by which the will or approval of the people is communicated to the political authority and translated into policy.

This entry provides a survey of the ways in which the people have been conceptualized as a body politic and their will represented in government.

It begins by comparing how popular will was accommodated in the government of ancient city-states and modern country-states and concludes with remarks on how in post-Romantic conceptions, the people have come to be viewed as an agent with a collective identity and mass mentality on which to establish state ideology or policies of control and coercion.

The People as a Source of Authority

The English noun *people* derives from the Latin *populus* and conveys much of the meaning originally attached to the word in Roman political thinking. Like the people of a modern nation state, the *populus Romanus* comprised the whole of the citizen body (even though in accordance with ancient norms the latter excluded women, children, slaves, and foreigners) and was perceived collectively as a group that acknowledged Roman law and displayed a sense of common statehood. Indeed, by the late republican period, the expression had become a technical designation for the Roman state, synonymous with *res publica* (literally the "public matters"). Furthermore, the *populus* included the *plebs* (poorer citizens or, increasingly, the urban masses of Rome) and thus disregarded, like its modern equivalent, social differences in wealth and status in favor of political unity.

But etymology is of course not a purely formal development, detached from contemporary society. Prior to the French Revolution, *the people* stood (like its French counterpart *le peuple*) primarily for the commoners, as distinguished from the nobility or the official classes. The modern usage, designating the legal subjects of the state at large, became predominant in the course of the nineteenth century, simultaneously with the reorganization of modern states on the basis of the nonmonarchical forms of government attested in the classical tradition. The model of choice was the constitution of republican Rome, which had evolved between the deposition of the last Roman king, Tarquin, in 509 BCE and the assumption of power in 31 BCE by the first Roman emperor, Augustus. The republican system, based on a division of power between the senate, the electorate magistrates, and the popular assemblies, was both flexible and indirect enough to be adaptable to the demographic and political conditions of modern country-states. The other ancient tradition of nonmonarchical government, exemplified by the democratic constitution of Athens in the fifth and fourth centuries BCE, presupposed comparably small city-state units with a high degree of interaction and integration between rural and urban inhabitants. The world's first and possibly most direct form of citizen rule, democracy was too radical for unmitigated adoption in modern states. It was generally despised as mob rule prior to the cautious reappraisals by John Stuart Mill and the British historian George Grote. To this day, the influence of ancient democracy is restricted mostly to the sphere of theory and ideology, rather than institutions and practice, notwithstanding the proliferation of self-advertised "democratic" governments in the twentieth century.

In both the republican and the democratic systems, the will of the people was established through voting in assemblies, although in contrast to its Roman counterparts, the Athenian assembly (*ekklesia*) was a place of deliberation as well. The latter was open to all adult male citizens and accorded each of them an equal vote and voice, even though in actual practice the development of policy proposals and speech making was left to charismatic and knowledgeable individuals from distinguished families. The assembly acted as a court and elected those few magistrates (notably generals) who were not appointed by lot. But the primary function of its meetings was to decide on policy and legislation. Whereas the Greek assembly was essentially identical to the citizenry and the sovereignty, ordinary Roman citizens had to be convoked by magistrates and met in a number of separate assemblies (*comitia*), and instead of developing policy and legislation, they only voted on proposals brought to them by magistrates, which required subsequent ratification by the aristocratic senate. In addition, the assemblies had the power to confirm or elect certain magistrates, such as the tribunes, who were meant to "represent" popular interests in the decision-making processes of the legislative bodies. Thus, although the *populus Romanus* championed a common political identity, the actual running of the state entailed a division of the citizen body into aristocracy and plebs, and a

corresponding distinction between those subject to government, the ordinary people, and those who govern, the senate.

The two key principles of the republican system, popular representation and the division of powers, lent themselves particularly well to implementation in modern states because neither of them required universal suffrage or the abolishment of oligarchic institutions. Political representation in particular denotes nothing more than the presence of some sort of procedure by which the will of the ordinary citizens is communicated to the legislative authority, such as a monarch or a parliament. This procedure usually involves "representatives" who could be elected by the people or appointed by the legislative body itself. Modern interpretations of the principle range famously from the absolute and potentially despotic soverign advocated in Thomas Hobbes's *Leviathan* who, once authorized by the people, must rule unencumbered as he sees warranted, to the more liberal notions of social contract proposed by John Locke and Jean-Jacques Rousseau, according to which governments possess authority only with regard to specific goals sanctioned by the citizens. Locke and Rousseau delivered the blueprints for many of the parliamentary governments established after the American and French Revolutions. Although these are now habitually known as "democracies," we need to remind ourselves how much the modern norm differs from the classical constitution: Instead of participating directly in decision making, the agency of the voter is almost always restricted to choosing between candidates who were nominated by political parties and thus tend to represent the views of their party rather than the voting citizen. This system disregards not only the notion of binding delegation, in which elected representatives accurately and consistently represent the wishes of those who voted for them, but also Edmund Burke's more conservative system involving a "natural aristocracy"—a body of representatives chosen on the basis of their personal qualities to act as free agents in accordance with their own best judgment.

The People as a Collective Agent

In the nineteenth century, the people increasingly came to be seen as a collective body whose political cohesion was rooted in the same national spirit that determined other cultural traits, such as language, religion, and ethnicity. At the core of this normative conception of identity is a biological metaphor that views people as individuals undergoing a life cycle: They are born, mature, prosper, and in due course die, or are (through migration, mixture, or technological or ecological change) transformed. Correspondingly, individuals and people alike were thought to have a "character" that was not subjective and historically contingent but objective, intrinsic, and more or less constant. This idea of individual identity writ large may be implicated when nationalist historians and politicians invoke certain aspects of culture and traditional custom as a guideline for policy decisions. Moreover, some prehistorians still classify and analyze their find assemblages in terms of *archaeological cultures* attributable to a group of people (usually the remote ancestors of a particular region's present inhabitants), an approach that presupposes an unproblematic and fixed relationship between material culture and ethnicity and offers unfortunate opportunities for political manipulation.

The notion of the people as a unified being with an inherent consciousness was originally developed by the German philosophers Johann Gottfried von Herder and Georg Wilhelm Friedrich Hegel and gave rise to the concept of the *Volksstaat,* a "people-state" in which government institutions are in perfect agreement with the spirit of the people. This notional people-state resonated with the nationalist ideologies that spread in post-Napoleonic Europe, especially those relating to the unification movements in Germany and Italy, though given the growth of similar intellectual trends in postcolonial contexts in the Americas and Africa, it would be misleading to speak of a direct or necessary relationship between nationalism and philosophical idealism. The emergent nation-states were compatible with the principles of the people-state insofar as government was based on the autonomous rule by a homogeneous group of co-nationals. In actual practice, the high-minded notion of spiritual harmony between people and government allowed for a range of doctrinaire interpretations of the people's will, to the effect that political representatives could be regarded as superfluous and minority opinions as degenerate.

Both in Nazi Germany and in Soviet Russia, the professed concord between leaders and the people was periodically reaffirmed through mass events and popular acclamations in order to uphold the illusion that the people were sovereign in spirit as much as in fact.

The retrospective analyses of the totalitarian regimes of twentieth-century Europe have nurtured a variety of sociological approaches studying the people as a mass society. Initially, in the 1950s and 1960s, these were pessimistic in outlook and subscribed paradoxically to the same people-as-individual metaphor as the Volksstaat concept. In this perspective, the widespread receptiveness to Nazi and Bolshevist ideology was at least in part explicable by the derooted condition of modern society, as manifest in the impersonalized relations of capitalist economy, bureaucratic government, and life in industrialized urban sprawls in general. In some sense, the study of mass movements diagnosed collective groups of people in terms of the symptoms and neuroses observed in distressed individuals. Thus, the mass society whose traditional forms of custom and morality had been rapidly eroded by modernity was thought to display the same insecurities and lack of orientation that made social outcasts susceptible to extreme ideas promulgated in the political agitation of ruthless leaders.

Mass culture analysis has been somewhat discredited in recent years because it failed in its chosen task of establishing a clear relationship between political extremism and the sudden disruption of traditional associational structures. Furthermore, it runs the risk of producing an upmarket version of elitism that does not substantially differ from the indignation that ancient intellectuals were already prone to voice over the fickleness and lack of political sophistication of the poorer citizenry. For instance, although few modern commentators would doubt that political awareness was unusually developed and widespread among the Athenian citizen body, concerns about the supposed folly of the people typically ran high among philosophers living under the democracy. The association of the normally neutral word *demos* ("people") with the poor majority of the citizens and the corresponding understanding of *demokratia* as "mob-rule" was born almost concurrently with Athens's democratic constitution. Similarly, ancient perceptions of mass psychology foreshadowed their modern successors in the assumption that the uneducated people were particularly impressionable and easily overwhelmed by the machinations of charismatic orators. Thus, when Athenian conservatives rationalized the events of the Peloponnesian War, they found that the *demagogues,* originally a neutral term for expert "leaders of the people," had plied the masses with flattery and misled them into making decisions that were bound to ruin Athens's political standing as a Mediterranean superpower.

More recent studies favor a constructionist approach to collective identity, focusing on the context and defining parameters of individual choice. In this position, group identity, whether political or ethnic, is never inherent or naturally determined but deliberately adopted as a motive for individual allegiance and action. Moreover, the changing balance of political authority between the people and the state is seen less as the zero-sum game as it used to be. For instance, while the accession of the first Roman emperor had reduced the formal influence of popular assemblies in state affairs, most scholars would find it difficult to decide whether the political power of the ordinary citizens had "really" declined or increased. If anything, the scope for dynamic interaction between leadership and people had vastly expanded under the empire thanks to the abundance of public spectacles and other opportunities for popular acclamations, which became an important source for imperial legitimacy. The reciprocal relations between emperor and people, and the concomitant exchanges in symbolic capital, are too complex to allow easy differentiation between hegemony and obedience.

Performativity

Performativity names a clutch of theoretical approaches that overturn traditional understandings of identity and agency by arguing that identity, rather than *preceding* action, emerges only as the *product* of reiterated acts. Identity is performative, then, in the sense that repeated action brings it about. Performativity also relocates agency from being grounded in a fixed identity that would precede it, to appear only within the repetition of acts.

Performativity has come to be closely associated with the arguments and writings of Judith Butler, but it has deep philosophical roots that stretch back to the conception of discursive practices in Michel Foucault, to speech act theory, and to the genealogical approach to subjectivity and history first articulated by Friedrich Nietzsche. Performativity is neither an empirical thing that can be observed *in* the world, nor is it an abstract idea *about* the world. Rather, performativity names a theory *of* the world—of how both human identity and political agency work in that world. As a theory of identity, performativity must be differentiated primarily from essentialism, but also from certain senses of radical constructivism. As a theory of agency, it must be distinguished from both voluntarism and determinism.

Essentialism insists on the existence of a fundamental human essence, which establishes identity and serves as the ground for all human agency. Agency, our capacity to act, depends on this essence (and, on some accounts, is thus determined by it), and our identity is thus a reflection or expression of our underlying essential being. In stark contrast, the theory of performativity sees human identity as formed *through* a repetition of practices and behaviors; we "are" only (in) what we do. Identity and agency cannot be established prior to entry into the cultural, social, and political realms; rather, both who we are and our capacity to act emerge only *within* those realms. What appears to be the prior "essence" of human identity appears only afterward, comes about only by way of performativity. In refuting essentialism, performativity thereby also eschews any determinist account of human action because it denies the notion of a presocial essence that would determine our actions.

However, the concept of repetitive *performative* acts must be carefully separated from the notion of a theatrical *performance*. This central distinction allows performativity to resist the temptations of voluntarism and the dangers of certain forms of radical constructivism. Although performative actions are chosen actions, agents cannot choose any act (cannot perform any identity) they wish because they act against a background of cultural norms and behavioral expectations (and their identity emerges within that context). Identity is thus analogous to theatrical performance to the extent that who we are emerges only over time, through repeated actions, gestures, and behaviors; there is nothing deeper than the "character" that we play. But human identity is also nothing like a theatrical performance because we cannot play any character we wish. We must operate within the roles that are available to us, only rarely can we switch roles, and the penalties for playing our "characters" incorrectly (through so-called gender deviance, or queer sexuality, or a host of other non-normative practices and appearances) prove to be extremely high. Thus, the theory of performativity offers an account of human agency attentive to the social and political contexts that both enable and constrain action, and it provides a theory of identity linked but not reducible to material, bodily existence.

Perpetual Peace

The term *perpetual peace* is associated with the German philosopher Immanuel Kant (1724–1804) and his 1795 essay titled "To(wards) Eternal Peace: A Philosophical Sketch" ("*Zum ewigen Frieden. Ein philosophischer Entwurf*"). The term *perpetual peace* refers to both (a) a type of enduring peace and legal state that Kant thought should and could be attained among existing European states, and potentially spread across the globe, and (b) a process or logic by which that lasting peace might be attained. Kant's conception of perpetual peace has been remarkably influential: within academia as the basis of contemporary democratic peace theory, and outside academia as a constant reference point for projects of international institution building, such as the League of Nations, the United Nations (UN), and the European Union (EU).

Historical Context

Though Kant's conception has attracted the most interest, he was not the first to use the term perpetual peace, and his essay should be read, at least in part, in the broader context of a tradition of writing on perpetual peace. That tradition would include the Abbé Charles-Irénée Castel de Saint-Pierre's essay *Paix Perpetuelle* (1712), Jean-Jacques Rousseau's *A Lasting Peace Through the Federation of Europe* (1761), and perhaps Jeremy Bentham's *A Plan for a Universal and Perpetual Peace* (1789). These authors all shared a concern for establishing lasting peace and legal order among the states of Europe, though they differed considerably in their understanding of how such a peace might be achieved and what institutional arrangements would maintain it. It is Kant's conception of eternal peace, however, that has been the primary focus of both historical and contemporary discussion.

The immediate context for Kant's essay was the Peace of Basel between France and Prussia that brought an end to prolonged hostilities between France and the first coalition of monarchical states. In this context, Kant's essay can be read as expressing support for this treaty, the First French Republic, and envisioning a path by which a more enduring peace could be established and maintained. The more general context of the essay is Kant's lifelong effort to elaborate on the political and legal arrangements under which humankind can fully exercise its autonomous moral capacities.

Kant's Idea of Perpetual Peace

Kant's conception of perpetual peace includes a stringent definition of the meaning of peace, an account of the domestic and international institutional forms required to secure peace, and an account of the logic or process by which these institutional forms emerge and are capable of guaranteeing perpetual peace.

Kant defines peace as an end of all hostilities and a removal of the underlying causes and reasons that are the source of hostility. Perpetual peace as the permanent removal of the causes of hostility is distinguished from a mere postponement of hostilities that leaves the underlying causes untouched. Because humans in the natural state find themselves in a state of war, the state of peace must be founded, secured, and guaranteed. Although humans are potentially moral beings, their moral capacities cannot be counted on, thus this peace must be founded in such a way that it would be secure among a people of "intelligent devils." To found such a state of peace, anyone who might mutually affect another should be brought under *lawful* relations. Domestically, this means bringing people under *republican civil constitutions*. Internationally, this means brining nations into an ever-expanding *free federation of states*.

Kant believed peace could be founded and secured domestically in civil constitutions of a republican form. A state is said to be republican if it embodies three principles. First, it guarantees the freedom of all members of society, freedom being understood as a right not to obey external laws that one has not consented to. Second, all subjects are to be governed by a single common legislation. Third, an equality of all citizens before the law must obtain, meaning no one can obligate another under law without at the same time subjecting oneself to the same law. Republicanism is a constitutional principle according to which executive

power is separated from the legislative power, and the idea of an original contract, or consent of the governed, is seen as the only basis of rightful legislation. Republicanism is distinguished from forms of despotism, in which laws represent the arbitrary will of the ruler against the general will of the public. Significantly, in Kant's view, democracy was a form of despotism (to be contrasted with true republicanism), because it united the executive and legislative powers in the hands of the same people. Kant thought that domestic peace could be founded by means of republican constitutions without relying on the moral motives of subjects. Driven together by internal or external conflict, relying on purely selfish propensities, a people could erect a republican constitution that promotes the common good by impeding or balancing private interests.

According to Kant, however, domestic republican constitutions are not sufficient to found and guarantee eternal peace. Just as individuals in a state of nature find themselves in a lawless state of war, nations find themselves in an analogous lawless state of nature that tends toward war. Thus nations, like people, must be brought into legal relations in order to guarantee peace. It is generally assumed that Kant thought legal relations among nations (*Völkerrecht*) should be based on a *free federation of states*. Nations should freely enter into a union of nations (*Völkerbund*), which would be similar to civil constitutions but would retain the independence of the member nations. This free federation of states can be distinguished from stronger forms of association, such as a world state or a state of nations (*Völkerstaat*). The union of nations is also distinguished from weaker forms of alliance and treaties. Republican nation states are to come together in a legal federation that, gradually extending itself across the globe, would guarantee an end to all war. There remains some interpretive debate whether Kant thought a free federation of states would be sufficient to secure eternal peace, or whether he thought it was a second-best but imperfect compromise, required by the reluctance of nation-states to submit their sovereignty to a single, unified, coercive government.

Having specified the institutional forms necessary for eternal peace (i.e., domestic republican constitutions and a free federation of states), Kant further elaborates on a logic by which these institutions might produce and guarantee peace. Kant developed what might be called a "republican peace" theory. He thought that organizing domestic constitutions on the republican model would lead to eternal peace in at least two ways. First, because republican states require the consent of citizens to go to war, it is far less likely that republican states will initiate wars. This is because in republican states, decision-making processes are responsive to those who will bear the full costs of going to war. By contrast, in non-republican states, it is easy for a ruler to decide to go to war knowing that the subjects will bear the costs of the decision. Thus, Kant suggests that a world consisting of nations organized on the republican model would be sufficient to guarantee peace, or at least to greatly reduce incidences of war. It is this logic of a "republican peace" that continues to be influential and the source of much discussion. Second, Kant seems to have thought that even if republican domestic constitutions weren't sufficient to guarantee eternal peace, they were more likely to form and enter the sort of federation of free states that could secure peace. Again, the logic is similar. Because republican states are responsive to the interests of citizens, it is more likely that republican states will enter a federation of states, even at the expense of the domestic ruling class, when it is in the interests of citizens to do so.

Finally, Kant supplements his account of republican peace with a seemingly strange account of how nature and history are teleologically ordered to bring about eternal peace on the model of a free federation of republican states, even if one lacks the moral fortitude to do so by one's own will. This teleological account of nature and history must be understood in light of Kant's entire philosophical project; only then does it become clear why Kant thought such an account was necessary. Therefore, Kant's defenders think his idea of perpetual peace, the free federation of states, and the logic of a republican peace can be detached from his teleological account of nature and history.

Influence and Reception of Kant's Idea

Kant's idea of perpetual peace has been influential in at least two contexts. First, it has served as a model for projects of international institution building, such as the League of Nations, the UN, and the EU. Kant is thought to have provided a

philosophical justification for highly federalized forms of transnational and international organizations, and against more hierarchical forms of world government and more anarchical forms of nation-based sovereignty. Second, Kant's ideas are the basis of an influential theory or research program in international politics known as *democratic peace theory*. Following Kant, democratic peace theorists posit a relationship between forms of domestic constitutions (democratic) and propensities for waging war. Democratic peace theory appropriates the logic of Kant's argument, insisting that democratically constituted nations responsive to and representative of citizens' interests will be less likely to go to war. It should be noted, however, that contemporary theories of democratic peace, while appropriating the logic of Kant's argument, differ in their assessment of the democratic state. Whereas democratic peace theorists insist democracy is the best form of state organization, Kant categorized democracies as a form of despotic rule, no less likely to go to war than other forms of despotic rule.

Critics

Critics of Kant's idea of perpetual peace have focused on three different points. First, some have questioned whether a free federation of states is capable of guaranteeing perpetual peace. Kant's account of lawful relations in the republican civil constitution suggests that submission of individuals to a single coercive sovereign power is necessary to secure peace. This suggests that the appropriate analogy for lawful relations among nation-states would be for each to nation to submit to a single world-state with coercive sovereign power. Second, critics have questioned both the logic and empirical validity of Kant's claim that republics are inherently peaceful. As a conceptual matter, there's no a priori reason to think that public policy responsive to citizen preferences will lead to fewer wars. As an empirical matter, it is unclear whether republican nations have in fact been more peaceful than other nations. Critics have suggested that while republics may refrain from fighting one another, they are just as likely, perhaps even more so, to go to war with nonrepublican nations. Finally, critics have objected to the teleological account of nature and history that Kant thought necessary to guarantee perpetual peace and to motivate moral action.

Pessimism

Often misunderstood as a negative disposition, *pessimism* is a long-standing tradition in modern political philosophy with roots in ancient philosophies of the self, such as Stoicism and Epicureanism. Like its opposite, optimism (which takes a variety of philosophical forms in liberalism, Marxism, and pragmatism, for example), pessimism presupposes modern linear conceptions of time, which replaced the cyclical accounts of ancient philosophers and historians in the late Renaissance period. Although its best-known exponent is probably Arthur Schopenhauer, pessimism appears at least as early as the works of Jean-Jacques Rousseau. Other prominent pessimists are Giacomo Leopardi, Friedrich Nietzsche, Sigmund Freud, Miguel de Unamuno, E. M. Cioran, Albert Camus, Theodor Adorno, and Hannah Arendt. This entry summarizes the major themes of pessimism and briefly describes some of the major trends within the pessimistic tradition.

Central Themes of Pessimism

The principal idea of pessimism is that the human condition (but not necessarily human nature) is marked by severe and persisting flaws that cannot be eradicated. Different pessimist philosophers disagree over the central features of the human condition and over the nature of the flaws. So, for example, a pessimist might agree that technology has become more powerful, yet deny that this improves the prospects for removing the systematic injustice and unhappiness endemic to human

affairs. Although some pessimists (e.g., Rousseau, Cioran, Adorno) have at times maintained that there is an active deterioration of human society under way, the more common stance of the pessimist is simply to deny the existence of progress while maintaining the linear historical perspective of modern temporality. Theorists of decline thus form a subset of the pessimistic tradition, and the thesis of decline is not included in the writings of many of the best-known pessimists like Schopenhauer.

Many theories of pessimism begin with an ontological assessment of the circumstances of human consciousness. Pessimists often emphasize the close connection between linear time-consciousness and consciousness per se. Human self-awareness is distinguished from animal intelligence, many have argued, by our sense of past and future and our related sense of identity as something stretched out over a linear temporal framework. This account of consciousness is hardly limited to pessimists; nor does it distinguish between those pessimists, like Schopenhauer, who believe that time, as an a priori mental structure, does not derive from some preexistent metaphysical or ontological frame (see *The World as Will and Representation*) and those, like Rousseau, who accept the more common Newtonian account of a natural universal time (see *Discourse on Inequality*). But pessimists stress consequences of the time-bound quality of consciousness that are not emphasized elsewhere.

Although time-consciousness is a necessary condition of reasoning, this does not, for the pessimists, establish its beneficial character because, according to them, it also entails considerable burdens. Chief among these is the awareness of our own eventual death, which time-consciousness brings about and which animals are supposedly free from. The idea that all life must end in death is not, to the pessimist, cause for despair or inactivity, but it does set an existential bound to our purposes, which optimistic perspectives often fail to acknowledge. If death is not to deprive our lives of meaning, we must have an understanding of meaning or value that can accommodate the universality of this border to our experience.

Time-consciousness also implies that we are fully aware of the transience of all things, including those we value most. The impermanence of all objects is taken by pessimists to deprive us of security in any achievement or possession. Thus, to live a time-bound existence is to live with our feelings of desire and loss magnified by our sense of time future and time past without any corresponding increase in our sense of enjoyment. Though we have the same physical pleasures and pains that animals do, enlarging our mental universe through time adds to the latter more than the former.

Although pessimists do not necessarily view history as having a universally negative trajectory, they do believe that, because of the ontological conditions previously described, history consistently generates irony in that it repeatedly exemplifies the thwarting of technological or scientific efforts to improve the conditions of life. Leopardi even went so far as to argue in *Moral Essays* that human happiness was sustained by illusions and that, as reason progressed and destroyed these, human beings were increasingly deprived of the basis for happiness. More commonly, Schopenhauer argued that material progress encouraged a belief in increasing satisfaction, which itself turned out to be illusory.

Because of this and other paradoxes, pessimists have often spoken of human existence as absurd or as partaking of absurdity, terms made especially popular by Camus. These words evoke a persistent mismatch between human desires and the means available to achieve them, or again, between our pursuit of happiness and our capacity to reach or sustain it. Thus, while pessimism is not itself a result of unhappiness, it certainly constitutes an explanation for widespread unhappiness, especially when that unhappiness is not explained by physical distress.

Given this diagnosis, the great division within pessimism regards what sort of life practice constitutes an appropriate response. One kind of pessimist counsels resignation of one form or another. Authors like Rousseau and Schopenhauer have suggested a withdrawal or quasi-Stoic distancing from ordinary human affairs to minimize frustration. Writers like Nietzsche and Camus, however, while in no way retreating from the pessimistic conclusions previously noted, have argued that there is nonetheless a basis for an active engagement in life. They suggest a form of action that is focused on the present. That is, they suggest combating the effects of time-consciousness

by detaching one's motivations for action from a set of values that project justification into the future and considering, insofar as this is possible, only their contribution to problems immediately at hand.

It is often suggested that pessimism must end by endorsing suicide, but in fact pessimists uniformly oppose suicide, except in the circumstances of extreme physical suffering that many other moral systems also make an exception for. What is true is that pessimists take the arguments for suicide seriously and do not simply assume, as other perspectives do, that the continuation of life is simply or naturally good. Rather, they agree that establishing the goodness of life is a central philosophical problem.

Philosophical exponents of pessimism often employ a distinctive, aphoristic style in their writings. The aphorism (shorter than an essay but longer than a maxim and more structured than a fragment) provides a quick analysis into a large issue without necessarily suggesting a resolution. A set of aphorisms together can thus produce both the sensation of and insight into the ontological disjunction that is central to the pessimistic analysis. It was Schopenhauer's use of this style that both brought him fame and, perhaps as much as his conclusions, distinguished his approach from that of more academic philosophers writing in a mandarin style.

Varieties of Pessimism

Pessimism has appeared in at least three major forms: cultural, metaphysical, and existential.

For cultural pessimism, the burdens of time-consciousness appear particularly in the area of social mores. Rousseau first brought the central elements of cultural pessimism together in the 1750s in public letters and *The Discourses*. In *Discourse on Arts and Sciences* he argued that European morality had not been improved by the intellectual developments of the Enlightenment. Instead, he took the side of the Spartans against the Athenians and argued that morality required material and even intellectual simplicity. In *A Discourse on Inequality*, Rousseau discussed at more length the obstacles to happiness that emerge as human beings transition from an animal-like existence, which is innocent of time, to true human consciousness with all its attendant difficulties. In his later works, Rousseau insisted on the high degree of flux in temporal affairs, that is, on the refusal of the universe to remain fixed in any one form for analysis or security. Rather than disparaging reason, then, Rousseau's claim was that the Enlightenment's celebration of reason had not sufficiently appreciated reason's opponent—a chaotic universe that resisted its power.

The political theory of the cultural pessimists reflects this sense of the relative weakness of human beings' ability to alter these circumstances. Rousseau clearly defends a republican form of government in *On the Social Contract*, for example, but he does so because of its potential to arrest, but only temporarily, the social dynamics unleashed by time-consciousness. The formation of a general will removes individuals from their time-bound individual goals and creates a community that exists primarily in the moment. The emergence of a true sovereign thus recreates some of the conditions of prehuman animal existence. Even in this text, however, Rousseau is clear that no form of government can endure indefinitely; the best governments merely last longer than others. But their success is not marked by permanence but by giving their citizens an experience of freedom through participation in the general will.

By contrast, metaphysical pessimism, typified by Schopenhauer, rejects this kind of political solution as well as the attention paid to cultural questions and focuses more completely on the individual's personal situation. As a Kantian, Schopenhauer largely eschewed questions of the origin of consciousness and concentrated on its structure. He emphasized, as earlier generations of pessimists had, the centrality of time. Unlike the cultural pessimists, however, Schopenhauer, taking some Kantian positions to a certain extreme, considered time to be fundamentally unreal. Hence, he considered our conscious experiences to be illusory. However, he doubted the ability of any form of social or political organization to deliver us from this illusion.

The illusory nature of human experience had, for Schopenhauer, two important consequences. First, relief from the suffering induced by time-consciousness does not return us, as it did in Rousseau's work, to a condition of animal happiness, but rather to boredom, the pure experience of

time. Second, escape from the dilemma of pain and boredom is to be sought only through personal practices of asceticism or self-denial. In this, Schopenhauer followed the Stoics, who suggested that suppression of desire was the best route to the relief of unhappiness. Although Schopenhauer believed that compassion for the suffering of others was appropriate, both as a moral and political principle, in fact the state could do little to relieve the suffering created by time-consciousness. Schopenhauer's concrete recommendations thus involved fortifying the self against external incursions and a retreat to private experience.

In contrast, Nietzsche, who called himself a "Dionysian pessimist," attempted to turn Schopenhauer's own conclusions against him and describe a pessimism that was specifically activist in its orientation. Nietzsche argued that Schopenhauer's condemnation of suffering relied on the sort of moral and metaphysical premises that he otherwise specifically condemned. Rather than lament our illusory fall into time, Nietzsche suggested that we celebrate the conditions of flux and dynamism that earlier pessimists had spurned. Although he acknowledged the suffering that linear time-consciousness produces, Nietzsche argued that using such suffering as a basis for withdrawal falls into the trap of measuring life as a whole from a utilitarian perspective. Schopenhauer, that is, had attempted to hold up a dynamic world to a static measuring stick, without saying where the measuring stick came from. By contrast, a more fully pessimistic perspective would not draw a distinction between the self and the world in flux and would thus allow for a posture of engagement. Suffering could be endured when it was understood as the inevitable accompaniment of change, freedom, and individuality. However, Nietzsche did not spell out in any specific terms what sort of political behavior would result from this posture.

In the twentieth century, pessimism has often been associated with existentialism. Though this identification is not incorrect, it should be noted that it is much more true of figures like Camus than of others like Jean-Paul Sartre. Camus' description of the absurdity of the human condition in *The Myth of Sisyphus* became a touchstone of contemporary pessimism and influenced writers across a wide range of perspectives. Though twentieth-century pessimists were more likely to follow Martin Heidegger's approach to temporality than Rousseau's or Schopenhauer's, the outcome was much the same, that is, an image of human consciousness as fundamentally disconnected or at odds with the universe it is forced to inhabit.

In his earlier works, Camus' response to this was not so different from Schopenhauer's, that is, a retreat into an existence of aestheticized experiences that afforded momentary escape from the ordinary conditions of consciousness. However, in his post–World War II writings, especially *The Rebel,* Camus began to articulate a more politicized pessimism.

Camus emphasized first that the pessimistic diagnosis described a condition that all humans shared and thus created a basis for a sense of solidarity. Schopenhauer had done much the same, but the solidarity that he described was the purely passive one of sympathy and compassion over shared pain. Camus, in emphasizing that we also shared the experience of absurdity, described this as a context that could stimulate political participation. Like Rousseau, he emphasized that such participation could not be stretched out over time but must reject the temporalization of experience by focusing on the moment. But rather than it leading him to the idea of the general will, Camus took this point to imply that we should abjure long-term judgments of benefit and make sure our contributions to political life have an immediate effect. A theatrical director himself, he repeatedly used the metaphor of acting, not to aestheticize politics, but to describe an activity whose benefits are nonexistent if they are not immediate, both for the actor and for her audience. For Camus, this kind of participation was exemplified by the work of the French Resistance, in which he had taken part. The resistance, he argued, had fought without any particular hope of long-term success, but simply with the sense that their actions *enacted* freedom in the moment of their occurrence.

Since Camus, the general task of reconciling human freedom with the burdens of temporality has been taken up most specifically by Adorno and Arendt, both of whom have emphasized, in rather different ways, the potential for a strong political dimension to pessimism. In sum, the tradition of pessimism, having taken firm root nearly three centuries ago, remains a distinctive and vigorous approach to political theory that deserves

continuing attention as one of the main approaches to have developed in the modern West.

PHENOMENOLOGY

Phenomenology is best understood as an internally contested tradition or movement within twentieth-century philosophy that is distinguished by its radical openness and commitment to describing phenomena as they appear, without distortion by theoretical commitments or presuppositions. Phenomenology has been important in the human sciences both as a negative means for criticizing predominant forms of behaviorism, positivism, and naturalism and also as an alternative positive approach to the human sciences, also known as social sciences. Phenomenology has had less influence within the discipline of political science than in the other human sciences. Increasingly, however, phenomenological approaches are being used in combination with interpretive approaches to challenge the predominant positivistic forms of political science. Likewise, though the historical relation between phenomenology and political theory is minimal, there is an increasing number of contemporary political theorists explicitly drawing on the phenomenological tradition. Though there is no single phenomenological approach to political theory, a diversity of phenomenological approaches have emerged, each of which provides an alternative to the neo-Kantian normative form of political theory that has dominated in the past 40 years.

Phenomenology has been understood in at least four different ways: as a *disciplinary field* in philosophy, as a specific *method or domain* of inquiry, as a *tradition or movement* in the history of philosophy, and as a general *orientation*. It is sometimes thought of as a *disciplinary field,* distinguished from other disciplines within philosophy, such as ontology, epistemology, logic, and ethics. Indeed, the *Oxford English Dictionary* defines phenomenology as the science of phenomena as distinct from ontology. Understanding phenomenology as a disciplinary field is problematic, however, because some of the most prominent self-identified phenomenologists did not make such disciplinary distinctions. Indeed, early adherents to phenomenology often equated phenomenology with philosophy as such, or less ambitiously, as the basis for epistemology, ontology, or ethics. Similarly, any attempt to understand phenomenology as a method or area of inquiry runs into the same problem. Many prominent practitioners of phenomenology rejected the notion that phenomenology is a method or that its area of inquiry was circumscribed. Thus, the most promising way of understanding phenomenology is as a tradition or movement within the history of philosophy.

The term *phenomenology* has been in use at least since Georg Wilhelm Friedrich Hegel's *Phenomenology of Spirit* (1807). In the nineteenth century, the term distinguished a descriptive approach to philosophy from hypothetical-theoretical or analytical approaches. Phenomenology as an influential *movement or tradition* within the history of philosophy becomes discernible in the early twentieth century with the publication of the *Logical Investigations* (1900) by the German philosopher Edmund Husserl. Narrowly conceived, the phenomenological movement would also include the prominent philosophers Martin Heidegger, Maurice

Merleau-Ponty, Jean-Paul Sartre, Emmanuel Levinas, and their contemporary disciples and adherents. More broadly conceived, the phenomenological tradition could include early twentieth-century English linguistic phenomenologists such as Ludwig Wittgenstein, J. L. Austin, Gilbert Ryle, and the contemporary English language adherents to Wittgenstein. Most broadly conceived, the phenomenological movement would include those thinkers and approaches that were directly influenced by phenomenology. Such a list would include prominent twentieth-century thinkers such as Hans-Georg Gadamer, Hannah Arendt, Jürgen Habermas, Michel Foucault, and Jacques Derrida, along with influential movements such as hermeneutics, structuralism, and deconstruction. So conceived, the phenomenological movement is quite expansive, including thinkers and approaches that are often in deep disagreement with one another. Thus, the phenomenological movement is best understood *as an internally contested tradition* or ongoing debate, united by shared dilemmas, shared oppositions, a shared set of abstract commitments, and a shared orientation. As such, phenomenology has been one of the most influential traditions in twentieth-century philosophy.

Although there is considerable disagreement within the phenomenological tradition, at a sufficient level of abstraction a phenomenological approach can be identified by reference to shared oppositions, a shared set of commitments, and a shared orientation. Phenomenology is a *descriptive* approach to philosophy. As such, phenomenology can be distinguished from *normative* approaches that pronounce on the goodness or badness of phenomena; from *analytic* approaches that aspire to make true propositional statements, valid arguments, or analyze linguistic meanings; and from *natural science* approaches that aim at causal explanation of phenomena. Phenomenology aspires toward adequate descriptions of phenomena, or the way things show up in *our experience* in a *meaningful* way. Phenomenology takes experience and meaning as the proper locus of philosophical inquiry and attempts to clarify or make intelligible the way things seem meaningful and the background structures that make meaningful experience possible.

Adequate description of meaningful phenomena as they seem in experience is approximated by (a) avoiding seeing phenomena through distorting philosophical presuppositions and abstract theories and (b) retaining a radical openness or receptivity to phenomena as they present themselves. Although phenomenology aspires to achieve a nondistorted relation to phenomena, it should not be confused with varieties of foundationalism that hold that we can have unmediated, certain, or final knowledge of reality. Rather, phenomenologists believe the only way we can check our descriptions of phenomena is by constantly and repeatedly returning from our descriptions to the phenomena as they appear in undistorted experience. Phenomenologists are committed to constantly reworking descriptions and theories in light of a radically open or receptive relation to phenomena as they appear. Thus, the basic aspiration of a phenomenologist to "return to the things themselves" should be understood as an *orientation,* or a commitment to description undistorted by presuppositions, and a radical openness to phenomena as the final arbiter of competing descriptions.

Phenomenology and the Human Sciences

In the twentieth century, there emerged within the human sciences an increasingly articulate "phenomenological perspective." This phenomenological perspective has mostly defined itself in *opposition* to the prevalent forms of positivism, behaviorism, and naturalism that approach the human sciences as if they were continuous with the natural sciences. By contrast, phenomenologists resist the a priori assumption that methods and forms of explanation that predominate in the natural sciences must be appropriate to the human sciences. Phenomenologists approach social phenomena openly, without presuppositions as to which methods or forms of reasoning are appropriate to apprehend the phenomena.

Though they start with a radical openness toward social phenomena and a willingness to consider whichever description or explanation provides the best intelligibility, there is a notable tendency toward antinaturalism among adherents to phenomenology. That is, most phenomenologists believe that an openness to social phenomena reveals a logical and methodological asymmetry of explanation and concept formation between the natural and social sciences.

Phenomenology tends toward antinaturalist forms of social explanation for two reasons. First, phenomenological openness to phenomena results in a heightened awareness of the nonrational dimensions of human existence, habits, nonconscious practices, moods, and passions that resist the forms of explanation prominent in the natural sciences. More important, the phenomenological openness to phenomena as they appear results in an emphasis on *meanings* as the proper locus for understanding social action. These meanings can be subjective or objective, private or social, conscious or embodied, but all social explanation adequate to the phenomena will proceed by reference to these meanings. Phenomenologists tend to view social scientific explanation as a second-order enterprise, requiring an understanding of the meanings, ideas, reasons, intentions, and motives of social participants. These meanings, in turn, are intelligible only in terms of the background practices, rules, conventions, and general worldview(s) that constitute a form of life. Phenomenology reveals that neither meanings nor the background contexts within which meanings are intelligible can be grasped by the sorts of physicalist and naturalist forms of explanation that predominate in the natural sciences.

The phenomenological approach to the human sciences has affinities with recent analytic philosophy of language and action influenced by the later Ludwig Wittgenstein. Although both approaches emphasize the centrality of meanings in social explanation, and thus the asymmetry with explanation in the natural sciences, phenomenology can be distinguished from analytic approaches to the human sciences by its more expansive understanding of "meanings." Whereas recent analytic philosophy has emphasized the centrality of linguistic, symbolic, and conscious meanings, phenomenology has focused on a much wider range of meanings, including unconscious, pre-reflective, prelinguistic, and embodied meanings. The most influential adherent to the phenomenological perspective in the human sciences was the Austrian sociologist Alfred Shutz.

Phenomenology and Political Science

By contrast with the other human sciences, the phenomenological perspective within political science has remained largely underdeveloped. This can be attributed to the emergence of varieties of interpretivism within political science, heavily indebted to the later Wittgenstein and his English-language adherents. Interpretivism does much of the work in political science that phenomenology does in other human sciences, criticizing predominant forms of positivistic explanation and providing alternative forms of explanation more sensitive to meanings. Although interpretivism has proven adequate for displacing predominant positivistic forms of explanation, as a basis for an alternative approach to explanation in political science it has serious limitations. This is because interpretivism emphasizes the centrality of linguistic, symbolic, and mental meanings, often neglecting a wider range of precognitive, pre-reflective, nonlinguistic meanings embodied in social practices. A truly phenomenological approach to political science, committed to understanding and explaining political phenomena by reference to the whole range of meanings and background contexts of social participants remains to be developed.

Phenomenology and Political Theory

Historically, political theory has remained on the borders of phenomenology. The major early figures of the phenomenological tradition, though often politically active, mostly refrained from theoretical reflection on politics. On the face of it, phenomenology seems to be of little relevance to contemporary political theory. This can be attributed to the explicitly *descriptive* orientation of the phenomenological tradition and the reluctance of prominent phenomenologists to deal with matters of normative justification. The descriptive orientation of phenomenology stands in stark contrast to the normative bent of most contemporary political theory. To the extent that political theory has become an abstract exercise in normative justification, applied ethics, or reasoning about ideal forms of social relations, it would seem that phenomenology has relatively little to contribute to political theory. That said, phenomenological approaches to political theory can be discerned in the works of early phenomenologists, and increasingly, philosophers working in the phenomenological traditions have taken up issues central to political theory.

Beneath the variety of emerging phenomenological approaches to political theory, they are united

in their rejection of the predominant neo-Kantian or Rawlsian approaches. As such, phenomenology provides a critical alternative to the type of political theory that has come to predominate the past 40 years. Phenomenology functions as an alternative approach to political theory in at least three distinct ways: (1) by radically reconceiving political theory as a descriptive practice, focusing on issues of interpretation and explanation as opposed to normative justification; (2) by accepting the predominant normative approach to political theory but supplementing it with phenomenological description when required; or (3) by accepting the normative orientation of political theory but radically reconceiving normative justification and normative judgment.

Descriptive Phenomenology as Political Theory

A phenomenological approach to political theory might entirely reject the prevailing normative orientation of political theory and reconceive political theory as a descriptive practice. It might do so in three distinct ways. First, a purely descriptive phenomenological approach to political theory might aspire to provide adequate descriptions of specific political phenomena, such as authority, legitimacy, power, freedom, responsibility, and processes of socialization, that have historically been the focus of political theory. A phenomenological description of these phenomena would stand in contrast to both normative accounts of the phenomena and analytic linguistic analysis of the same concepts. Second, a descriptive phenomenological approach to political theory might aspire to provide systematic or very general descriptions of the social world in its entirety. Phenomenological political theory conceived along these lines would be distinguished from political science that avoids systematic or broad description and alternative systematic approaches to studying politics that are theory driven, such a formal theory, rational choice theory, behaviorism, and forms of positivism. The phenomenological approach would be distinguished by a commitment to remaining open to phenomena as they appear and refusing to make phenomena conform to theoretical presuppositions. Third, a descriptive phenomenological political theory might aspire to offer an ontology of the social world. Such an approach would clarify the unique ways in which the social or political world exists and the conditions of possibility of the being of such a world. Hannah Arendt's work on the public world exemplifies such a descriptive ontological approach grounded in phenomenology.

Descriptive Phenomenology Within Prevailing Normative Political Theory

Alternatively, a phenomenological approach to political theory might accept the predominant normative orientation of contemporary political theory but provide a needed descriptive supplement. To the extent that all normative theory inevitably makes descriptive claims about the world, humans, and institutions, phenomenological description might contribute to such normative theory. Thus, communitarian critics of liberalism, such as Charles Taylor and Alasdair MacIntyre, have explicitly drawn on phenomenological descriptions to question the presuppositions of liberal political theory. These critics believe that phenomenological description reveals the liberal conception of the subject and the relation between individual and society, to be ideological or radically at odds with reality. Phenomenology might go beyond critique and attempt to provide alternative descriptions of subjectivity, institutions, and the social world, on which a less ideological and more realistic political theory might be based.

Phenomenological Reconception of Normative Political Theory

Phenomenologists sometimes accept the normative orientation of contemporary political theory while rejecting the prevailing neo-Kantian conception of normative justification. We can distinguish between two such types of *normative* phenomenological political theory. The first rejects neo-Kantian forms of normative justification in favor of forms of normative justification that more closely track actually existing normative practices. Thus, some phenomenologists, such as Hubert Dreyfus, subscribe to neo-Aristotelian conceptions of normative judgment as masterful contextual judgment, or *phronesis*. On this account, actual normative judgment consists in doing the appropriate thing in the appropriate way at the appropriate time. Such

contextual judgment is an art or a capacity that is acquired through practice and is irreducible to rules or abstract principles. A normative political theory based on such contextual judgment would recognize the need for experienced artful judgment, would organize institutions such that positions would be occupied by people with the relevant capacities, and would organize society so as to produce leaders and citizens with the capacity for contextual judgment. Likewise, some contemporary political philosophers, such as Michael Walzer, draw explicitly on the phenomenological tradition in order to reject neo-Kantian forms of abstract justification in favor of social interpretation. For Walzer, actual normative practices of justification consist in mediating competing interpretations of historically inherited communal values. An adequate phenomenological account of our normative practices shows that there is no perspective outside of historically inherited values that we can abstract to in order justify our preferred interpretations. A political theory sensitive to the interpretive nature of justification would give up on abstract justification in favor of historically situated persuasion. Finally, some existential phenomenologists, such as Sartre, think actual normative practices and normative judgment consist in making decisions, taking a stand, or being committed, without recourse to principles grounded in abstract universal reason. A political theory that accepts an existential or decisionist account of practical reasoning would renounce a view of politics that attempts to ground decisions in universal reason and would instead focus on issues of commitment, integrity, and sincerity.

Finally, some phenomenologists, rather than grounding normative justification in an account of existing normative practices, have reconceived normative justification as *ontology*. In the second half of the twentieth century, there have emerged multiple phenomenological approaches to ethics, each of which conceives of ethics as ontology. Ontological approaches to ethics and politics attempt to ground normative "ought" claims in the being or essence of things. Thus, phenomenologists have attempted to adequately describe the being of man, or the being of society, and from such descriptions, derive judgments about what is a good person or a good society. These phenomenological ontologies of man and society have varied widely, and so too have the ethics and politics derived from them. Existentialist phenomenologists have emphasized that the being of man and society is a function of the choices we make. Communitarian phenomenologists have emphasized that the being of society precedes individuals, and that individual choice is always situated in, and constrained by, prior historical communities. French phenomenologists, such as Lévinas and Derrida, have drawn on phenomenological ontology to defend forms of ethics and politics that are radically open to the Other or open to possibilities yet "to come."

Although there is a wide variety of phenomenological approaches to political theory, each stands in stark contrast with predominant ways of doing political theory. Phenomenological political theory holds the promise of a radically reconceived form of political theory that is more adequate, both descriptively and normatively, to political phenomena as they appear undistorted by theoretical presuppositions of how we think they ought to appear.

Philosopher King

The ideal of a *philosopher king* was born in Plato's *Republic* as part of the vision of a just city. It was influential in the Roman Empire and

revived in European political thought in the age of absolutist monarchs. It has also been more loosely influential in modern political movements claiming an infallible ruling elite.

In Plato's *Republic,* the leading character, Socrates, proposes the founding of a city in a speech as a model for the individual soul. Such a just city will require specialized military "guards," divided subsequently into two groups: rulers who will be "guards" in the sense of guardians, dedicated to what is good for the city rather than for themselves; and soldiers who will be their "auxiliaries" (Cooper, 1997, Books 2–4). Already at this stage of *The Republic,* it is stressed that the guardians must be virtuous and selfless, living simply and communally as do soldiers in their camps (p. 416e), and Socrates proposes that even wives and children should be in common (pp. 423e–424a).

At the outset of Book 5, Socrates is challenged by his interlocutors to explain this last proposal. In response, Socrates expounds three controversial claims, which he acknowledges will expose him to ridicule. The first is that the guardians should include qualified women as well as men: thus, the group that will become known as "philosopher kings" will also include "philosopher queens." The second claim is that these ruling men and women should mate and reproduce on the city's orders and to serve its eugenic interests, raising their children communally to consider all guardians as parents rather than attach themselves to a private family household. These children, together with those of the artisan class, will be tested, and only the most virtuous and capable will become rulers. Thus, the group to become known as "philosopher kings" will be reproduced by merit rather than simply by birth. Finally, and crucially for the present topic, Socrates declares that these rulers must in fact be philosophers:

> Until philosophers rule as kings or those who are now called kings and leading men genuinely and adequately philosophize, that is, until political power and philosophy entirely coincide . . . cities will have no rest from evils . . . there can be no happiness, either public or private, in any other city (473c–473e).

Socrates predicts that this paradoxical claim will elicit even more ridicule and contempt from his Athenian contemporaries than will equality for women rulers or communality of sex and children. They saw philosophers as perpetual adolescents, skulking in corners and muttering about the meaning of life, rather than taking an adult part in the battle for power and success in the city. On this view, philosophers are the last people who should or would want to rule. *The Republic* turns this claim upside down, arguing that it is precisely the fact that philosophers are the last people who would want to rule that qualifies them to do so. Only those who do not wish for political power can be trusted with it.

Thus, the key to the notion of the "philosopher king" is that the philosopher (man or woman, as we have seen) is the only person who can be trusted to rule well. Philosophers are both morally and intellectually suited to rule. Morally, because it is in their nature to love truth and learning so much that they are free from the greed and lust that tempts others to abuse power. And intellectually, because they alone can gain full knowledge of reality, which in Books 5 through 7 of *The Republic* is argued to culminate in knowledge of the forms or ideas of virtue, beauty, and above all goodness. The city can foster such knowledge by putting aspiring philosophers through a demanding education, and the philosophers will use their knowledge of goodness and virtue to help the other citizens achieve these so far as possible.

So the emphasis in the Platonic notion of the "philosopher king" lies more on the first word than the second. While relying on conventional Greek contrasts between king and tyrant, and between the king as individual ruler and the multitudinous rule of aristocracy and democracy, Plato makes little of kingship per se. That he had used the word, however, was key to the later career of the notion in imperial Rome and monarchical Europe. To Marcus Aurelius, the Stoic emperor, what mattered was that even kings should be philosophers, rather than that only philosophers should rule. To François Fénelon, the cardinal charged with the moral education of the grandson of Louis XIV, the crucial issue was that kings should possess self-restraint and selfless devotion to duty, rather than that they should possess knowledge. The enlightened despots of the next century, such as Frederick II of Prussia and Catherine the Great of Russia, would pride

themselves on being philosopher kings and queens. But philosophy by then had left behind Plato's focus on absolute knowledge, signifying instead the free pursuit of knowledge and the implementation of reason. Meanwhile, in the Islamic world, the medieval philosopher Abu Nasr al-Farabi had championed the notion of a religiously devout philosopher king. The notion of such a figure acting as the interpreter of law or jurisprude inspired the Ayatollah Khomeini and the revolutionary state that he shaped in Iran. Finally, and more broadly, the notion of the philosopher ruler has come to signify a general claim to domination by an unaccountable, if putatively beneficent, elite, as in certain forms of Marxism and other revolutionary political movements.

Philosophes

The thinkers who called themselves *philosophes* were a diverse group who lived in France in the eighteenth century and led an intellectual movement that came to be called the Enlightenment. They are usually credited for inventing the language and concepts that were used during the French Revolution, but they did not participate themselves in the Revolution because all the most prominent members of the group had already died when the Revolution broke out in 1789. The group includes figures like Voltaire and Jean-Jacques Rousseau, who disagreed on many fundamental issues. What united them intellectually can best be seen in the *Encyclopédie,* published by Denis Diderot and Jean Le Rond d'Alembert between 1751 and 1772. The *Encyclopédie* was an ambitious, twenty-eight–volume attempt to account for all aspects of human knowledge, both theoretical and applied. It was also a highly effective propaganda tool that sought to disseminate the ideas of the philosophes. Paradoxically, given the appropriation of the language of the philosophes by the leaders of the French Revolution, the philosophes (with the notable exception of Rousseau) did not put political theory at the center of their concerns. Tactical prudence is a partial explanation for this fact: any writing that offended the Church or the State could cause legal trouble. However, even if self-censorship is taken into account, it is clear from the writings of the philosophes that there was no thought of questioning the legitimacy of the French monarchy or imagining alternative systems of government. The focus of their intellectual and propaganda efforts was elsewhere. The philosophes sought to draw all the consequences (including political consequences) of the scientific revolution.

As d'Alembert writes in the preface to the *Encyclopédie,* philosophy (what the philosophes do) is another name for science. The philosophes were enthusiastic backers of the New Science. The tree figuring the subdivisions of knowledge that appeared at the beginning of the *Encyclopédie* was adapted from the divisions proposed by Francis Bacon in the *Advancement of Learning* (1605). Like Bacon, the philosophes divided human learning according to three faculties: memory, reason, and imagination. Philosophy was the domain of reason. In the *Encyclopédie,* philosophy was divided into natural and human; human philosophy was divided into logic and morals; morals was divided into general morals and particular morals (i.e., jurisprudence); jurisprudence was divided into natural, economic, and political jurisprudence. For the philosophes, what is now called political theory was jurisprudence, or the science of laws. Thus, politics was derived from jurisprudence, and jurisprudence was derived from morals. It is worth comparing this system with the one proposed by Thomas Hobbes in *Leviathan* (1651).

Hobbes divided philosophy into natural philosophy and politics. Political theory was therefore one of two branches of human knowledge. For the philosophes, it was a branch much farther down the tree.

The equation between political theory and jurisprudence was characteristic of the natural law tradition, illustrated in the seventeenth century by Hugo Grotius, Samuel von Pufendorf, and John Locke. The philosophes believed in the existence of a natural moral order, consistent with the dictates of reason, and knowable through the exercise of our rational faculties. Any rational being had an immediate sense of what was just and unjust. This sense was the first foundation of legislation, and it existed even in the absence of positive laws. For the philosophes, it manifested itself most clearly in a negative way, through the sense of outrage one felt spontaneously before the illegitimate use of force and the oppression of the weak by the strong. Oppression was an insult to both nature and reason.

The philosophes followed Locke in arguing that political authority was based on a contract between the government and the governed. Diderot claimed that nature gave no one the right to rule and that freedom was a divine gift. Only parental authority, within limits, had a natural foundation. Political authority was based on the consent of the governed. The philosophes applied this notion to all forms of government, including France's monarchy. They argued that the king had the right to relinquish his crown, but could not transmit it to someone else without the consent of the nation because it was the nation that had crowned the king. In legal terms, the crown was the nation's property and the king had usufructuary rights (i.e., the right to enjoy a property one does not own) to the crown. The king himself was a member of the nation and had the right to govern, but not the right to change the system of government. The transmission of the crown to the king's oldest son could not be subject to challenge because it was a condition of the contract between the king and the nation. Only if the royal family was extinguished and no heirs could be identified through the rules of succession would the crown revert to the nation. The *Encyclopédie* has a long article on "freedom," which is divided into natural freedom, civil freedom, political freedom, and freedom of thought. Natural freedom is the right to do anything that does not hurt others. Civil freedom is the freedom that comes from obeying the laws, when the laws are enforced by an independent judiciary. Citizens have political freedom when a clear separation of powers makes them confident that they need not fear the actions of their fellow citizens. Freedom of thought is the ability to think rationally and without prejudice.

The belief in progress the philosophes had was based on their belief in the fundamental importance of the progress of science and technology. In his *Essay on Manners* (1756), Voltaire described the history of the world as the history of the progress of the human mind, from feeble beginnings to the tremendous accomplishments of the present. Voltaire did not focus on political and military history, but rather on the ways in which advances in scientific and technical knowledge had changed human behavior in all aspects of life. In that sense, the succession of political regimes and the adoption of this or that system of government were less important than the emergence of softer, more rational, and less violent ways everywhere. For Voltaire, progress in the arts and sciences went hand in hand with better government and a decrease in religious and political passions. Voltaire's advocacy of religious toleration flowed from the same principles: because religious minorities like the Protestants were no longer a threat to the state, they should be allowed the protection of natural law (i.e., family and inheritance rights, but no political rights). Voltaire wanted for Protestants in France the status that Catholics had in England. For Voltaire and the philosophes of his generation, belief in progress was therefore tempered by a sober assessment of political and social reality. It is only with the philosophes of the following generation, like the marquis de Condorcet, author of *Sketch for a Historical Picture of the Progress of the Human Mind* (1795), that the belief in progress took some utopian overtones.

The philosophes did not see their mission as limited to the advancement of knowledge. They tried to influence things in a concrete way by appealing to public opinion and swaying it in the direction they wanted. Voltaire spent considerable time and energy for the rehabilitation of Jean Calas, a Protestant who had been wrongly convicted of murder and executed. The Calas case was treated as a symbol of religious fanaticism getting

in the way of true justice. Voltaire's focus was less the French judicial system than religious prejudice itself, which he felt was the root cause of the miscarriage of justice. The biggest propaganda effort was the *Encyclopédie* itself, which was aimed at increasing knowledge and decreasing prejudice. At the same time, public opinion for the philosophes did not mean the population at large but rather the well educated (i.e., a very small segment of the population). In the *Philosophical Letters* (1734), Voltaire insisted that the philosophes were neither a religious sect nor a political party, and he downplayed their influence, which he said was limited to intellectual pursuits and could not possibly threaten civil peace. A recurring feature of the writings of the philosophes is an attempt to educate and influence the rulers themselves, on the assumption that enlightened rulers will work for the public good. Voltaire put great stock in his friendship with Frederic the Great of Prussia before the two had a dramatic falling out. He praised the modernizing efforts of Peter the Great in Russia. Diderot was a protégé of Catherine II of Russia. The "Politics" article of the *Encyclopédie* ends with a complacent allusion to the *Anti-Machiavel,* a treatise written by Frederic with Voltaire's help, and it implies that Frederic is a philosopher king.

Distrust of (or outright hostility to) organized religion, especially the Catholic Church, was a shared trait of the philosophes, who viewed religious fanaticism as the biggest threat to civil peace everywhere. At the same time, the philosophes saw organized religion as the most effective tool for enforcing moral standards in the population at large. Most of the philosophes were deists and observed the rituals of organized religion as a matter of social conformity while believing in an architect of the universe, whose existence could be ascertained through rational means. A few (Diderot and Claude-Adrien Helvétius) were atheists.

The two greatest political theorists associated with the philosophes, the baron de Montesquieu and Jean-Jacques Rousseau, were in a sense peripheral to the group. Montesquieu wrote one article (on "taste") for the *Encyclopédie,* but he died in 1755, long before the completion of the series. His *Spirit of the Laws* (1748) received a cool reception from Voltaire and the other philosophes. Rousseau's contribution to the *Encyclopédie* included one important article on political economy, which foreshadowed the theories of the *Social Contract*. All his other articles were on music. After the publication of the *Second Discourse* (1755), which was derided by Voltaire as naive primitivism, Rousseau kept his distance from the group, and he became estranged from Diderot, who had been a close friend.

There were philosophes on both sides of one of the most important debates of the eighteenth century: the debate on luxury. Voltaire subscribed to the paradox enunciated by Bernard de Mandeville in the *Fable of the Bees* (1714): private vices, public benefits. He saw the development of commerce and the general increase in wealth as a potent civilizing force that curbed violent behavior and favored wiser, more moderate government. The starting point for Rousseau's political theory was the rejection of the idea that greed could be the foundation of a stable political order. Writing on political economy for the *Encyclopédie,* Rousseau argued that the most important task of government was to educate the people in the love and respect of the laws, because the greatest support for public authority lied in the hearts of the citizens. This emphasis on republican virtue was originally a minority view among the philosophes, but it became widespread in the second half of the eighteenth century. Both Montesquieu and Voltaire had praised the English system of mixed government and argued that political freedom was the happy result of the conflict between the king and parliament. Later in the century, there was greater skepticism regarding the stability or desirability of systems based on countervailing powers.

Belief in a natural moral order was not shared by everyone in the group. Neo-Epicureans like Helvétius (whom Diderot criticized) thought of justice and morality as artificial constructs and posited self-interest as the first principle of human behavior. On the other hand, Helvétius followed Locke's theory of consent, and he shared Rousseau's love of republican virtue. The axioms of Jeremy Bentham's utilitarianism can be found in large part in the political theory of Helvétius.

The philosophes were active members of the Republic of Letters, a European network of scientists and writers, and their ideas were disseminated throughout Europe. David Hume and Adam Smith were major interlocutors of the philosophes. The young Adam Smith professed his admiration for

Voltaire, and he wrote an enthusiastic review of the first volumes of the *Encyclopédie*. In Italy, Cesare Beccaria applied the principles of the philosophes to a reflection on penal systems. In Germany, Gotthold Ephraim Lessing wrote about the history of humanity as progress toward the rule of pure reason. The leaders of the American Revolution were well versed in the writings of the philosophes, especially Montesquieu, but also Voltaire and Rousseau.

Philosophical Radicals

The *philosophical radicals* were of group of politicians, philosophers, journalists, and writers who campaigned for British parliamentary reform during the period of 1817 to 1841, and who were associated with the *Westminster Review,* a quarterly journal founded by Jeremy Bentham (1748–1832) and James Mill (1773–1836). The group was a loose coalition with no definitive membership list, but it certainly included James Mill, John Stuart Mill (1806–1873), George Grote (1794–1871), John Cam Hobhouse (1786–1869), John Arthur Roebuck (1802–1879), Francis Place (1771–1854), Joseph Parkes (1796–1865), and Sir William Molesworth (1810–1855), among others. They are often associated with the struggle for the passage of the Great Reform Act of 1832, but they are actually only one part of a complex story that led to this important milestone in British politics. Among the philosophical radicals, parliamentary reform was seen as a necessary condition of introducing more radical social and political reform. Some of the most significant social reforms in the period immediately following the Great Reform Act, such as the Poor Law Amendment Act of 1834, are often associated with the philosophical radicals, although many of the advocates of such reforms, such as Nassau William Senior, were never part of the movement.

What distinguishes this group from others in the lead up to the passage of the Great Reform Act and from other radical forces in British politics in the late eighteenth and early nineteenth century is that they were self-consciously ideological politicians. The precise nature of that ideology is a deeply contested question, and many subsequent historians of the movement, such as William Thomas, have challenged the extent to which anything as coherent as

a single set of doctrines animated such a diverse group. Given that the group included both James and John Stuart Mill, there is some substance to the skepticism about ideological coherence. John Stuart Mill's philosophical development is generally seen as a critical engagement with, and partial rejection of, the legacy of his father and of Jeremy Bentham. That said, the identification of the group as philosophical radicals was freely accepted, and it was underscored by a common identification with the ideas of Jeremy Bentham and his leading philosophical acolyte, James Mill. Both were cofounders of the *Westminster Review* in 1823, a quarterly journal that was explicitly founded for "philosophical radicals." How far this self-identification involved subscription to a series of discrete doctrines or a single theory is a contested question, and it is not easily answered by looking at the contents of the *Westminster Review*. The most famous and systematic account of the theory of philosophical radicalism is that offered by the French historian and political theorist Elie Halévy (1870–1937) in *The Growth of Philosophic Radicalism*. Halévy's account is a philosophical reconstruction that ranges far beyond Bentham and James Mill, and it has proved a controversial interpretation of the development of Bentham's own political theory. This entry does not endorse Halévy's interpretation, but it will emphasize the importance of Bentham and James Mill as the source of some of the deeper contradictions within the movement that ultimately lead to its break up and decline.

Jeremy Bentham and James Mill: The Theory of Philosophical Radicalism

As Halévy correctly points out, the philosophical radicals drew on a lot of ideas and thinkers, including Adam Smith (1723–1790), David Ricardo (1772–1823), and John McCulloch (1789–1864), yet chief among them was the English utilitarian philosopher Jeremy Bentham and, from 1809, one of his principal followers, the Scottish political economist and historian of India, James Mill.

Bentham was 60 years old when he met James Mill, sometime around 1807 and 1808. In 1809, Bentham drafted the *Parliamentary Reform Catechism,* one of the main works that was to inspire radical parliamentary reformers in the 1820s. From 1809, James Mill, together with his young family, began taking working holidays with Bentham at his summer retreat in Oxted. It has been claimed that James Mill converted Bentham to radical reform and a greater sympathy for democracy. Undoubtedly, the association of the two men transformed Bentham's impact on the movement that became philosophical radicalism, in particular by broadening the network of individuals connected to the reclusive "hermit of Queen's Square Place." Yet it would be too simplistic to claim that without James Mill, Bentham would not have turned to radical reform and a commitment to representative democracy; not least because both Mill and Bentham endorsed significantly different conceptions of representative government.

One explanation for the claim that Mill encouraged Bentham to endorse radical reform is based on Bentham's equivocal position on democracy and the franchise in his early writings. In his early works, Bentham adopted a position familiar to that of many eighteenth-century Enlightenment philosophers, who saw their task as guiding the existing powers toward the path of rational and enlightened government. Whether government satisfied the condition of enlightenment depended on how it used power, rather than where power came from and in whose name it was exercised. This approach fit well with Bentham's utilitarian philosophy as one that made the answers to all institutional questions contingent on whether they served the greatest happiness. If enlightened despotism delivered more happiness than republican liberty, then the utilitarian must choose enlightened despotism. In practice, Bentham did support some strategies for political reform during the 1780s on utilitarian grounds, but he became much more conservative following the French Revolution and the Reign of Terror, even going as far as writing a defense of "rotten boroughs"—the archetype of all that was wrong with the English Constitution. Bentham was clearly not a life-long democrat, although few were in the eighteenth century. Yet it would be equally wrong to see Bentham as an occasional supporter of political reform. Bentham's experience in attempting to secure the adoption of the panopticon prison in the face of the opposition of powerful landed interests had demonstrated the way in which particular groups could use positional advantages to frustrate enlightened reforms.

This view was to culminate in his theory of "sinister interests" that was to play such a role in his reform projects in the first three decades of the nineteenth century.

James Mill also became a defender of representative government, but it is clear that his argument in the *Essay on Government* (1820) differed significantly from Bentham's defense of a universal franchise and frequent parliaments. Whereas Bentham chose to adopt the mechanism of a universal franchise as a way of holding the "ruling few" accountable to the "subject many," Mill was more concerned about who should be the ruling few. Mill was committed to the idea that government should be in the interest of the governed, but he was less clearly a utilitarian than Bentham. In order to bring the interest of government into line with that of the governed, it was necessary to confine active rule and therefore the franchise to the middle rank of society. This claim has often been interpreted in class terms, so that Mill is seen as advocating a shift in power from landed aristocracy to the emerging industrial middle class. Yet Mill's view is more complex. His account of the "middle rank" owes more to the idea of an educated elite (people like himself and Bentham) who would understand political economy and social science and therefore support long-term social and economic progress even if it seemed to result in temporary impoverishment during economic downturns. Mill was also fearful of the leveling tendencies of populist radicalism and the effect on the security of property that might result from a universal franchise. One consequence of this was Mill's advocacy of a relatively high property qualification for the franchise and the idea of virtual representation. On this view, groups were represented as long as their interests were represented. Consequently, it was less important to enfranchise the working poor, than to make sure that the "middle rank," who best represented the common interest, ruled. James Mill also famously used the idea of virtual representation to exclude women from the franchise: women's interests were already represented by either their fathers or their husbands, so they did not need the vote. Bentham on the other hand, rejected the idea of virtual representation and advocated—albeit in private—universal franchise, an idea that was to be taken up by John Stuart Mill in on *The Subjection of Women* (1869).

The Struggle for Reform

The events leading up to the Great Reform Act are complex and involve intricacies of party politics that could not have been controlled and would hardly have been influenced by the activities of such a relatively small group. That said, they did have a number of successes, such as the return of two radical members of Parliament for Westminster in the 1820s, one of which was J. C. Hobhouse. James Mill's impact is also significant, in that he argued that parliamentary reform was necessary to avoid the threat of revolution. Given the occasions of mass unrest, popular demonstrations, and the organization of political unions in favor of reform, there was some truth in Mill's argument. Nevertheless, it also illustrates the equivocation at the heart of the movement, between the Benthamite advocacy of a near universal suffrage and the Millian advocacy of a shift of power between social classes or ranks. James Mill's more cautious arguments for an extension of the franchise to a different social rank could be seen to have won the day given the relatively modest expansion of the franchise in the eventual Great Reform Act of 1832.

The End of Philosophical Radicalism

The Great Reform Act finally received royal assent on June 7, 1832. Its consequence was significant in beginning the transformation of subsequent political life in Great Britain. It was the first of a number of reform acts throughout the nineteenth and early twentieth centuries that eventually resulted in adult male and subsequently female suffrage. That said, the immediate consequences were less dramatic. Although the act increased the franchise, it remained very small, comprising around six hundred thousand out of a population of fourteen million. The enactment of the Great Reform Act also transformed the prospects of the philosophical radicals. The reform of Parliament, which had been central to the philosophical radicals' political agenda, was modest, but it opened up the opportunity for many radical ideas to be put into effect. In 1834, the Poor Law Amendment Act was passed, which introduced a system of indoor relief for the poor. Led by Bentham's follower, Edwin Chadwick, and Nassau William Senior, a Ricardian political economist, the new system, with its policy to make poor relief less eligible than the lowest

paid labor, was a far cry from Bentham's panopticon prison. Chadwick's Poor Law system illustrates how the radical agenda that had combined political reform and social and economic reform began to unravel. The association of philosophical radical reform with "less eligibility" and the dehumanizing treatment of the poor and "cold calculation" in policy making became the target of critics such as Thomas Carlyle, Benjamin Disraeli, and Charles Dickens. The latter authors have done much to shape the subsequent popular perception of the philosophical radicals in novels such as Dickens's *Hard Times* (1854).

A relatively modest change in Parliamentary suffrage was sufficient to open up early nineteenth-century government to forces for social and economic reform. Whether this resulted in a nineteenth-century revolution in Government inspired by Benthamite principles remains a contested question. In the period following the Reform Act much radical debate shifted from institutional questions to policy questions. As a consequence of this shift in direction the philosophical radicals faired less well as a group. In terms of party politics they failed to form a significant and coherent group and fell apart over such issues as Lord Durham's mission to Canada. John Stuart Mill had already abandoned the *Westminster Review* and became a more remote figure from the group as his personal life, especially his relationship with Harriet Taylor, soured relations with former friends such as J. A. Roebuck. However, the most important impact of post 1832 politics on the philosophical radicals was the emergence of class politics, manifested most clearly in the Chartist movement from the 1830 to the 1850s. Dissatisfaction with the Reform Act was by no means confined to the working classes, but the rise of Chartism and the growth of class politics in response to wider social and economic changes illustrated the shortcomings of the underlying ideological compromise that was at the heart of philosophical radicalism. Interestingly, Francis Place, the London Tailor, who had been an associate of Bentham and a political organizer of the philosophical radical cause in London, was one of the authors of the original People's Charter in 1838 for the London Working Men's Association, along with William Lovett. Place, who was always a consummate politician, had a much more developed sense of the demands of practical politics than any other philosophical radical. The Chartist's political strategy, with a series of mass rallies and grassroots activism, shifted political attention from Parliament and journals as the main sites of radical politics; a move that was hardly surprising given the narrow electorate even following reform. When Parliament was to serve as the focus of major political changes in the 1830s and 1840s it did so in ways that further marginalized the distinctive contribution of the philosophical radicals.

The repeal of the Corn Laws in 1846 transformed the structure of party allegiance in Parliament and gave birth to the modern Liberal and Conservative parties. Both parties drew on a similar class base but raised ideological differences that were to shape subsequent debates within and between the parties over the relative merits of laissez-faire or state activism. This precisely exposed the ambiguity in the Benthamite utilitarian legacy, the logic of which supports state activism, but the advocates of which tended to support laissez-faire. An ideology that gave no clear direction on this issue and that was taken up by supporters of free trade or of an activist state could never form the basis for a viable political coalition, and this eventually led to the demise of philosophical radicalism as a unified political force.

Philosophical radical ideas did not simply disappear in the face of class politics and the subsequent struggles for parliamentary reform. John Stuart Mill was to retain an important political profile as a member of Parliament for Westminster from 1865 to 1868. He became an advocate of women's suffrage and of a more sympathetic stance to socialist redistribution while remaining one of the most important classical political economists of the nineteenth century. Mill remained an awkward party figure, but his career illustrated the fact that the radical philosophy on which the movement drew did not die with it. Indeed, many ideas were absorbed into the main ideological forms of nineteenth- and twentieth-century British politics. In this way, a relatively short-lived movement was to have an important impact on subsequent British politics.

Philosophy of Social Sciences

The *philosophy of social sciences* seeks to understand the nature of the study of human behavior and social relations. It is consequently a metatheoretical endeavor—a theory about theories of social life. To achieve their end, philosophers of social science investigate both social science as it is practiced, as well as the nature of those studied by the social sciences, namely, human beings themselves, in an attempt to discern the appropriate logic of inquiry for this area of study. The philosophy of social sciences can be broadly descriptive (unearthing the fundamental conceptual tools in social science and relating them to the tools employed in other human endeavors), prescriptive (recommending that a certain approach be adopted by the social sciences so that they can accomplish what the recommender thinks social science ought to accomplish), or some combination of these. Because the philosophy of social sciences addresses an enterprise with enormous political import, and because metatheories of social science invariably are connected to substantive theories of social life itself and moral visions about it, the philosophy of social sciences has had a deep connection to political theory from its beginnings.

Historically, philosophers have often framed the philosophy of social sciences in terms of the question: "Can the social sciences be scientific in the same way that the natural sciences are?" (The approach that answers this question affirmatively is called *naturalism,* whereas that which answers it negatively is dubbed *humanism;* a number of approaches attempt to combine these approaches into a synthetic whole.) Given this framework, the term *philosophy of social sciences* can arguably mislead by suggesting that to be legitimate, the study of human behavior and social relations must be scientific in the way the study of plants and planets is, which is to say that the term seems to imply naturalism. To avoid suggesting this, practitioners sometimes denominate their field of inquiry: "philosophy of social inquiry" or "philosophy of social studies." But by whatever name the field is called, it ought to be clear that whether or how the study of human social behavior is scientific is an open question that is part of the business of the philosopher of social sciences to address.

Naming the area to be studied "social studies" also calls attention to how wide the field of inquiry into human behavior and relations is. In addition to the core disciplines of economics, political science, anthropology, and sociology, the social studies also include such disparate disciplines as archaeology, demography, human geography, linguistics, social psychology, and aspects of cognitive science, among others. This should indicate the range of the field that the philosophy of social sciences encompasses and how diverse the questions, methods, concepts, and explanatory strategies are within this field.

Another question for any philosophical account of the social sciences concerns the boundaries for such an undertaking, and thus how the social sciences relate to disciplines closely allied to them. Biology and neurophysiology, ethology and psychology, and history and cultural studies all surround the mainstream disciplines and have important contributions to make to them. What exactly is the relation of sociology to psychology, for instance? Can or should evolutionary biology ultimately replace sociology? Are the social sciences necessarily historical because human phenomena are so embedded in particular cultural and social conditions that what is discovered is applicable only to them, or can the social sciences be ahistorical, discovering laws or other regularities or causal mechanisms that are universal, applying to all people at all times? These are but a few of the questions philosophers of social science address in their reflections on what is involved and at stake in studying human behavior and social relations.

Three broad areas of concern have long dominated the philosophy of social sciences: the relation between causal explanation and the interpretation

of meaning, the nature of theory in the social sciences, and the role of critique in social science. Examining the sources of these areas of concern gives a good idea of the sorts of questions and approaches philosophers of social science have developed and employed.

Meaning and Cause

Human phenomena are self-evidently meaningful—they are typically performed for a purpose and express an intention, and often follow rules that make them what they are: People don't just move their limbs or emit sounds, they vote, or marry, or sell, or utter sentences, and when they do, their actions and relations appear to be different in kind from the behavior of amoebae or shrimp. Philosophers mark this difference by saying that humans *act,* whereas entities that lack consciousness or that lack the capacity to form intentions merely *move.* How should the interpretation of the meanings of actions fit into the study of human behavior? Does it introduce elements that make such a study different in kind from studying entities whose movements are not meaningful?

Those who give an affirmative answer to these questions insist that social science must either be an *interpretive* endeavor, or must at least provide a role for the interpretation of meaning within it; for them, meaning is the central concept in the social sciences. German theorists of the late nineteenth century initially developed this line of thought most perspicuously in conceiving the social sciences as *Geisteswissenschaften.* (Geisteswissenschaften means the science or study of "spirit;" the term *spirit* harkens back to Georg Wilhelm Friedrich Hegel's *Phenomenology of Spirit,* in which spirit referred in part to the broad intellectual and cultural dimension of a people. It is something of a historical irony that Geisteswissenschaften is a German translation of John Stuart Mill's term "the Moral Sciences"—an irony because Mill's term as articulated in book VI of his *System of Logic* paid no attention to meaning.) Philosophers such as Wilhelm Windlebrand, Heinrich Rickert, Wilhem Dilthey, and other *idealists* argued that human phenomena are the product of conscious and intentional beings who became so by means of enculturation, and this means that the human sciences must concentrate on meaning and its interpretation as they attempt to understand human life.

The idealist line of thought continued into the twentieth century and beyond. Most notable is the application of *hermeneutics* to the study of human social life. ("Hermeneutics" derives from the Greek word *hermeneuein,* meaning "to interpret"; it in turn comes from the Greek word for the god Hermes who carried messages from the other gods. Hermeneutics is the science of the interpretation of written texts. It originated in the modern period in reflections on what it means to interpret the meaning of the Bible.) A number of hermeneutical theories of the social sciences have been developed, the most significant being those of Hans-Georg Gadamer, especially in his masterpiece, *Truth and Method,* and Paul Ricoeur in *Hermeneutics and the Human Sciences.* Hermeneuticists argue that human actions are the expressions of ideas and feelings and as such are essentially meaningful phenomena. To understand them is more akin to interpreting a text or a painting than it is to dissecting the innards of a cell and the causes that produced them. Meaning, not cause, and understanding (meaning) not (causal) explanation, is the rallying point for philosophers of social science of this persuasion, though they offer richly different accounts of what is entailed in interpreting meaning.

A cognate line of thinking developed largely in England and the United States out of the later philosophy of Ludwig Wittgenstein, especially his *Philosophical Investigations,* a work that argued for the essentially social nature of meaning and that parsed this in terms of rule following. Philosophers in so-called analytic philosophy, most notably Peter Winch in *The Idea of a Social Science,* applied this to the social sciences, hoping to show that the study of human beings involves a scheme of concepts and methods of analyses that are wholly unlike those in the natural sciences.

Phenomenology is another branch of idealist philosophy of social science that emphasized the uniqueness of studying beings who are conscious and who know that they are. Edmund Husserl created phenomenology in the early part of the twentieth century; a number of important thinkers, most notably Alfred Schutz and Maurice Merleau-Ponty, developed Husserl's insights, suitably changing and refining them to make them applicable to the study of human social life.

Phenomenologists focus on the fact that human doings are consciously undertaken, and are thus essentially intentional in character. They have an "inside" to them that phenomenologists argue cannot be ignored when studying them. For this reason, humans cannot be studied the way plants and molecules are; instead, the structures of human consciousness must be unearthed and shown how they are expressed in human relations and actions. Human acts are typically gestural in that they express some psychological state and cultural location, and much of what humans do is the result of psychological states and cultural locations—motives, desires, goals, feelings, moods, as well as the "life world" in which psychological beings necessarily exist. The study of human life consequently involves such things as empathy, reliving what others have experienced, grasping the structures of the "life world" of those one studies, and the like. This way of thinking has underwritten a variety of approaches in the social sciences, the most well-known being ethnomethodology, a type of sociology formulated by the sociologist Harold Garfinkel in his classic *Studies in Ethnomethodology*. Ethnomethodology seeks to uncover the "taken-for-granted" structures of everyday life and to delineate how they are maintained and changed over time.

The social sciences that figure most saliently in humanist approaches that centrally feature the interpretation of meaning and consciousness are anthropology, history, and those parts of sociology that focus on the margins of mainstream life. The reason for this is that when confronting the behavior of those whose linguistic, cultural, and conceptual worlds are significantly different from their own, social analysts cannot ignore questions of meaning. Indeed, the first question normally asked in these situations is, what do "they" mean in doing "that"—indeed, what is "that" that they are doing? Is it a religious rite, a political ploy, or an economic endeavor? Do "they" even draw these—to us moderns, straightforward—distinctions? Moreover, these disciplines also strikingly confront a host of questions that trouble philosophers of social sciences, questions that are grouped around the topic of *relativism* (the doctrine that either experience, assessments of value, or even reality itself is a function of a particular conceptual scheme; these are called, respectively, epistemological, moral, or ontological relativism). Do you have to be one to know one? Can one really translate what others in a different culture are saying, feeling, believing, or doing (this is sometimes put as a question about the *commensurability* of conceptual schemes)? Do people in different cultures live in different worlds? Must we assume that others are rational? Is there a conception of rationality that transcends particular historical or cultural locations? Must we comprehend others in their own terms? Is our meaning of the behavior of others what *they* mean by it? Answers to these and cognate questions have significant bearing on how one envisions the social sciences and assesses their achievements.

But not all philosophers of social science believe that meaning is something on which the social sciences should focus. Despite the fact that human actions and relations are clearly meaningful on their surface, some philosophies of social science have denied that meaning ultimately has (or should have) a fundamental role to play in the social sciences. One of the most noteworthy of these is *behaviorism,* an approach that dispenses with inner mental states and cultural meaning altogether, thereby rendering meaning otiose as a category of a final science of human life. Instead, human behavior is conceived as a response to external stimuli, a response regulated by the patterns of conditioning that have been inculcated into the organism. Other variants of the approach that deny that the interpretation of meaning is of fundamental import in the social sciences include *systems theory* and *structuralism*. Systems theory envisions society as an entity whose various parts play functional roles in order to keep it going or keep it in equilibrium; such roles are played out by those who inhabit them, whether they know that they are doing so or not. Structuralism asserts that agents do not create the structure of meanings through which they act; rather, as social subjects, they are created by this structure such that their acts are mere expressions of it. As a result, the job of social science is to unearth the elements of this structure and to reveal its inner logic. In both systems theory and structuralism, the meaning that behavior has for those performing it is ultimately irrelevant in explaining it.

Behaviorists, systems theorists, and structuralists base their approaches on the assumption that

human behavior is the result of prior causes in the same way that the behavior of plants and animals is. This assumption is one that it is difficult even for those who conceive social science to be largely or purely an exercise in the interpretation of meaning to ignore: They too must confront the fact (if it is a fact) that even meaningful phenomena are caused by other phenomena, both meaningful and not. An account of a society's worldview, or the meanings that underlie the actions and relations of its members, does not explain why the society has this worldview or an individual undertakes an act with this meaning, or how worldviews or meanings are transferred to its members or are culturally maintained, or why just these meanings and not others predominate, or what led to deep changes in them. Answering these questions calls for *causal explanations* that pick out the conditions that in certain circumstances produce or prevent certain types of (meaningful) acts and relations. Once this is acknowledged, a number of philosophical questions arise: What are causes? (A *Humean* construal of cause has dominated the answers to this question, but a *critical realist* answer to it has gained numerous adherents more recently.) Are the causes of meaningful human actions and relations of the same sort as the causes of nonmeaningful phenomena? More broadly, if causes can be said to be *explanations* of phenomena, and meanings to be the *interpretations* of them, what is the relationship between explanation and interpretation in the social sciences? Answering these questions leads to questions about the nature of theory in the social sciences.

The Nature of Theory in the Social Sciences

Questions about the role of causes in the social sciences become all the more urgent when it becomes clear that the social sciences investigate phenomena that go beyond the intentions and meanings of behavior. Social scientists are also interested in *systematic regularities* that characterize particular societies or even society as such. They are also interested in mapping out the basic *structures* of a society and the resources, social and otherwise, that underwrite these structures. And they are concerned with the *unintended consequences* of actions and relations. In all of these investigations, social scientists go beyond deciphering the meaning and import of acts and relations to uncover the broader causes and effects of them. Indeed, depending on how broad and successful social science is in this, causal explanations become integrated into theories of (aspects of) social life—theories that typically go far beyond the self-understandings of the agents involved. Keynesian or monetarist theories in economics, kinship theories in anthropology, exchange theory in sociology, and modernization theory in political science are examples of theory in the social sciences. Questions about the nature of social scientific theorizing abound: Can theories in the social sciences involve genuine laws, and what makes a regularity into a law? Can the social sciences make warranted predictions about future actions or relationships? Are the theories in the social sciences reducible to more general or base-level theories? Should the social sciences ultimately aim at explanation in terms of individual actions or in terms of groups or group structures (i.e., should bottom-line explanations in the social sciences be *individualistic* or *holistic*)? How should the relationship between social structures and individual action best be conceived? Are functionalist theories—which are widespread in the social sciences—truly explanatory? In addition to these questions, other questions arise because of the role of the interpretation of meaning in the social sciences; put generally, what ought to be the relation between the interpretation of meaning and causal or functional theories? Do the former constrain the latter, or do the latter constrain the former? Are the latter different in kind because of the former?

To these sorts of questions, humanists have sometimes insisted that causality in the social sciences is a different sort of beast than causality in the natural sciences; others have tried to work out a middle road that attempts to synthesize the best of both the naturalist approach, with its focus on causality, and the humanist approach, which focuses on meaning. The methodological writings of Max Weber are a particularly vivid instance of this.

An important class of theories in the social sciences—so-called *competence theories*—are a distinctive type: Theories of this type possess an essentially normative character because they involve an elaboration of what rationality requires. Examples of this type of theory are rational choice and game theory (including prisoner's dilemma games), Noam Chomsky's theory of transformational grammar,

and Jürgen Habermas's theory of communicative competence. Examining these examples points to ways that theorizing in the social sciences may be fundamentally different from that in the natural sciences.

Meaningful actions involve rationality because they consist of following rules, procedures, principles, and the like. For example, in order to utter a sentence (or marry, or vote, or checkmate an opponent in chess, etc.), a speaker has to act in accordance with linguistic rules that specify what must be done in order for an utterance to qualify as a sentence of a certain sort. Or, again, principles of economic reasoning specify how much product to bring to market in order to maximize profit. An actor's competence is his or her mastery of the rules or norms of rationality that apply to a particular activity, and competence theories are those that seek to detail what these rules and norms are. They proceed by discovering how an idealized actor who is perfectly rational or who has perfectly mastered the relevant rules would behave in various choice situations. Of course, the performance of any given actor may only imperfectly embody this idealized competence, so that one question social science must answer is: Under what conditions do rational actors indeed act rationally? In general: What is or ought to be the relation between competence theories and performance theories?

Another way that theories in the social sciences are different from those in the natural sciences derives from the fact that the entities being explained in the social sciences (i.e., human beings) themselves possess their own theories about what they and others are doing. One might call these theories the agents' self-understandings or their *ideology*. Moreover, it is plausible to claim (though some theorists have denied this) that agents' ideology is an important element in how they behave. But this raises the question, what is the relationship in social scientific theories between, on the one hand, the ideology and the self-understandings of the agents themselves, and, on the other, the theoretical constructs that social scientific observers of their behavior might propose? Does the former take precedence over the latter? Does the former constrain the latter? These are questions that philosophers of the natural sciences need not address because the phenomena studied in natural science are not the product of the ideology of that which is being studied. Indeed, the notion of ideology points to an activity crucial in the social sciences, but one potentially in tension with its scientific aspirations, namely, *critique*.

The Role of Critique in the Social Sciences

Critique becomes a possible dimension of social science because the self-understandings that serve as a basis for the actions and relations of agents may themselves be systematically mistaken. That is, agents' self-understandings may be at variance with their situation, and they may characterize themselves and others (their motivations, their emotions, their beliefs, etc.) in ways that display self-ignorance or even self-deception. They might be under the control of an ideology that may mask their social and personal reality, or they might be the victims of an irrationality that stymies them and makes them act in unintelligent or deluded ways. Such irrationality may lie beneath their frustrations or the social conflicts in which they perforce find themselves. All of this opens up the possibility that in order to understand and explain what such people are doing and how they are relating to others, social scientists must engage in what is called *ideology critique:* They must assess the basic self-understandings of those whom they study as to their truth and rationality, they must explain why and how any self-misunderstandings arose and continue to function, and they must suggest in what ways these misunderstandings can be corrected. Examples of important social theories for which ideology critique is central are those of Karl Marx, Sigmund Freud, Jürgen Habermas, and some feminist theories.

Deconstruction is yet another form of critique in the social sciences, one inspired by the philosophy of Jacques Derrida and postmodernism more generally. Deconstruction is the procedure in which that which is hidden in an entity (such as a category or a social formation) is brought to light and shown to have been part of this entity, even though it ostensibly is something antithetical to it. For example, the category "heterosexual," and a social order based on this category, might rest on a contrast between heterosexuality and homosexuality, in which the latter is typically conceived as defective. But deconstruction might show that heterosexual identity is in fact parasitically dependent

on homosexuality, even as it tries to exclude or subordinate it—indeed, that homosexuality may even be a hidden aspect of the identity of heterosexuals. What is true for the opposition between heterosexuality and homosexuality may also be true for other antinomies: white versus black; colonizer versus colonized; sane versus mad; or the saved versus the damned. In these and similar cases, deconstruction seeks to show how such oppositions inadvertently invert, or collapse, or spill over into one another. In general, deconstructionists believe that schemes of meaning, despite their apparent coherence, often embarrass their own ruling conceptual logic, and so deconstructionists fasten on points of tension, ellipses, silences, or margins to discover the ways these schemes come unstuck or contradict themselves. They do so in part as a way of understanding the nature of the social formations and the tensions within them that these schemes of meaning underwrite.

The assessment of rationality and/or the coherence of schemes of meaning (including ideology critique and deconstruction) raise questions about the *objectivity* of social science. How do social scientists go about assessing rationality or meaning coherence in a way that avoids simply judging others on the basis of the scientist's own predilections? How can such an enterprise be cognitively responsible? Of course, questions about objectivity arise even if assessment of rationality and meaning coherence are thought to play no essential role in the social sciences, for the simple reason that social science investigates phenomena that include the social scientists themselves and that often have close bearing on their own values and what they hope or fear for themselves and their fellow humans. So the question inexorably arises: What role do social scientists' own values, or the values of the discipline, play in their theories, explanations, interpretations of meaning, and critiques, or what role should they play? Can or should the social sciences be *value free* (and what does this entail)? Are the so-called facts of the social sciences genuinely facts, or are they necessarily projections of the scientists' own values? Even more generally, how should objectivity be conceived: Does it require that social scientists become blank slates? Should they remain utterly neutral? Can objectivity be conceived in terms of intersubjectivity?

It ought to be clear that the social sciences are indeed complex enterprises. They involve at least three main undertakings: the interpretation of meaning, causal explanation, and critique. An adequate philosophy of social sciences will perforce have to answer the question, "What is the relationship among interpreting the meaning of acts, causally explaining them, and critiquing the ideology on which they are based?" This question is central in the philosophy of social sciences, whereas it plays no role at all in the philosophy of the natural sciences.

Relation to Political Theory

Even though philosophical theories of the social sciences are metascientific theories (theories about theories), and thus might appear to have no connection to political theories about how societies should best be organized, metatheories about the social sciences are in fact characteristically connected to substantive theories of social life and to moral visions about it. Thus, the philosophy of social sciences has deep connections to political theory. The explanation for this is that what counts as a good theory of social life cannot easily be separated from a sense of what counts as a good society. There are at least two reasons why this should be so: First, metatheories consist in part of accounts of how the knowledge gleaned from social science should be used in social and political life, and questions about how knowledge should be used are inherently normative questions. Second, understanding and explaining social phenomena require assessments of their rationality and the coherence of the meanings that underlie them on the part of social scientists, and such assessments are also essentially normative. Thus, it is no accident that from its very inception, the philosophy of social sciences has been coupled with political theory. This connection has continued right down to the present day.

Arguably the philosophy of social sciences began with the writings of Claude Henri de Rouvry, comte de Saint-Simon, who proposed that human history could be divided into three stages, the last of which—the scientific—would involve understanding social life scientifically and applying its results to politics (a reform in which the "the government of men by men" would be replaced by

"the administration of things"—an administration that would be possible only because of the knowledge that a scientific study of humans would provide). Auguste Comte developed this line of thinking, calling for and roughly outlining a truly scientific understanding of human behavior and society as part of his program to reform politics in what he called the positivist age (one can see the relationship between the philosophy of social sciences and political theory in the title of his most succinct statement of his views: "The System of Positive Polity: A Plan for the Scientific Operations Necessary for Reorganizing Society"). Comte deeply influenced John Stuart Mill, who developed a sophisticated account of social science in book VI of his *System of Logic,* "On the Logic of the Moral Sciences." It is interesting that, against Comte, Mill thought that a human science constructed along the lines of natural science would undergird a truly liberal democratic society, rather than an administered one. In recent years, those who have advocated a naturalist approach in the philosophy of social sciences have continued to draw the connection between their version of naturalism and the use of social science so conceived for political life. Some (ranging from the apocalyptic B. F. Skinner in *Beyond Freedom and Dignity,* to the more measured Karl Mannheim in "The Prospects for a Scientific Politics" in *Ideology and Utopia,* to the more pedestrian calls for social and economic planning such as Harold Lasswell's *A Preview of Policy Science*) have claimed that social science properly understood and practiced underwrites an active use of social-scientific knowledge in the shaping of social life. Others (such as Milton Friedman in *Capitalism and Freedom*), though equally committed to the scientific nature of social science, have claimed that social science underwrites at most a limited role for planning and intervention.

Those who have rejected naturalism for humanism of one sort or another have not been loath to draw out the political implications of their work. Earlier it was mentioned that many German theorists in the late nineteenth century rejected the idea that social science can be like natural science; this line of thought reached it apex in the writings of Max Weber, who wanted to articulate a methodology adequate to the understanding of cultural, economic, and political phenomena, in part because he thought that such an articulation had profound implications for political life (his famous essays, "Science as a Vocation" and "Politics as a Vocation," make this abundantly clear). In more recent times, the somewhat politically conservative implication of the hermeneutic approach is evident in the writings of Gadamer, just as the somewhat radical political implications of ethnomethodology are articulated in the writings of Garfinkel.

Meanwhile, yet other conceptions of social science were being promulgated in part for decidedly political reasons. Thus, Marx's remark in the *Theses on Feuerbach* that "heretofore philosophers have only interpreted the social world; but the point is to change it" was a prelude not just to an alternative account of social life but also to an alternative account with explicit political intentions of how social life should be studied. In particular, Marx envisioned a social science that was not just *scientific* (in the sense of providing explanatory hypotheses that are empirically testifiable), but also *critical* (in the sense that it revealed the ways in which social arrangements and behavior were internally inconsistent and were thus untenable in the long run), and *practical* (in the sense that it provided a course of action to transform the social arrangements so that they no longer were marred by their internal contradictions). In this, Marx was not unlike that other great theorist of human behavior who focused on the ways it is inevitably neurotic and on ways that its neuroses could be managed if not eliminated, Sigmund Freud. In the twentieth century, the so-called Frankfurt School of Max Horkheimer, Theodor Adorno, Herbert Marcuse, and most notably today, Jürgen Habermas, has continued to proffer a critical understanding of social theory as the basis for altering what its thinkers see as the repressive structures of modern life. Other important thinkers have also offered models of social analysis that are explicitly tied to moral and political goals, including Foucault's *genealogy* as a weapon against what he called the disciplinary society, and feminist accounts of social science promulgated as a way in part to undermine patriarchal society.

In general, the deep connection between social science and political action means that philosophy of the social sciences will always have an important relationship to political theory.

PHYSIOCRACY

Physiocracy is an intellectual movement that arose from the encounter between François Quesnay (1694–1774), physician to King Louis XV, and Victor Riqueti, marquis de Mirabeau (1715–1789), a noble landowner, famous for his book *L'ami des hommes* (1758). In the 1760s, the movement gained momentum thanks to the emergence of talented men such as Pierre-Samuel Dupont de Nemours (1739–1817); the abbot Nicolas Baudeau (1730–1792), who placed his periodical (*Les Ephémérides du citoyen*) at the disposition of the school; and Pierre-Paul Le Mercier de la Rivière (1719–1801), a former administrator in the French West Indies who became the author of a major book, *L'ordre*

naturel et essentiel des sociétés politiques, in which the political views of the school were made available to a wider public.

Physiocracy means the power of nature. The term came from the role that Quesnay and his followers gave to nature in the production of wealth. The fertility of mother earth rendered the agricultural sector the origin of wealth, or net surplus (*le produit net*)—industry and trade adding no more than the cost of labor (wages) to this original value. The physiocrats considered free trade, whether international or national, of the utmost importance (Steiner, 1998) because this would reduce costs. The policy was contrasted starkly with contemporary mercantilist thinking, according to which money flows consequent on a positive balance of trade (in which exports were to be preferred to imports), trade was thought to be the source of wealth and power, and monopolies were positively welcome.

In a series of papers published in the *Encyclopédie* during the Seven Years' War (1756–1763), Quesnay outlined how the wealth of the country could be increased by free trade in grain. Building on this, he constructed an argument that demonstrated how taxation of the net surplus could promote the military power of the nation. A systematic exposition of the doctrine was published by Mirabeau—and Quesnay played a major role in the writing of these books—as *La théorie de l'impôt* (1760) and *La philosophie rurale* (1763). Their proposals for a policy of free trade were partially and hesitantly implemented in the mid-1760s, but this prompted political unrest, and traditional grain trade regulation was reintroduced in the early 1770s. Adam Smith was impressed by their arguments and met some members of the group while traveling in France during 1764. Their economic and political views were still current during the French Revolution (Dupont was a member of the Constituent Assembly); and this was not least owed to the fact that major political leaders, such as the marquis de Condorcet or Abbé Sieyès, were well versed in this new political economy, even if they were opposed to important features of it (such as the nature of wealth and of political organization).

Legal despotism (*le despotisme legal*), or the inescapable authority of the law of nature, was the unfortunate name that Quesnay gave to the physiocratic conception of political organization. After the baron de Montesquieu's critique of despotism in the *Spirit of the Laws,* this was an unfortunate choice of terminology. Consequently, physiocratic political theory was easily derided, and then abandoned—notably by French liberal economists who had welcomed it as a proponent of laissez-faire economics, but condemned the physiocrats as political thinkers. Nonetheless, historians and political theorists have come to consider physiocratic theory as an important stage in the making of modern political thought.

In Quesnay's political economy, interest is the focal point of political organization. This contrasts with Montesquieu, who had claimed that honor was the source of action in a moderate monarchy, and to Jean-Jacques Rousseau, who had placed virtue at the heart of his republic (Charles & Steiner, 1999; Faccarello & Steiner, 2008). Enlightened interest is the foundation, thanks to which economic government can perform its function: providing food and realizing supreme military power. Michel Foucault, in this respect, is correct when grounding his conception of liberal governmentality on the physiocratic view of markets (Foucault, 2007): Markets are a clear instance of a social device through which actors are driven by their interest. Hence, in the new form of political organization, the legislator governs by allowing economic agents to carry out the actions that they freely intend. The object of government would be the population in general, and not the three orders of the ancien régime; and political economy would be the cognitive resource.

Economic government could be organized in terms of two different systems. According to Quesnay's (2005) *Despotisme de la Chine* and to Le Mercier de la Rivière's *Ordre naturel,* the king would govern with the aid of adepts in the new science of political economy, so that he might be sure that positive laws were the implementation of natural laws. Quesnay's *Tableau économique* offered a simple decision rule: A good positive law must increase the amount of *produit net* available to the country. In contrast to this technocratic approach, Mirabeau and Dupont (when secretary to A. R. J. Turgot as Louis XVI's *Contrôleur général des Finances*) were in favor of representation for the landed interest in local assemblies, which would have control of local administration, including the administration of the tax system. In

each instance, education would play a major role alongside public opinion in securing an optimum economic order for the nation, conforming to the perspective that Jürgen Habermas (1989) has articulated.

Place

The concept of *place* is familiar in everyday life. We map our spatial world into discrete places, ranging in scale from the microscopic to whole galaxies. Moreover, this concept is a complex one that straddles a number of fields: political science, geography, planning, environmental studies, sociology, philosophy, architecture, and other branches of social theory. Consequently, any discussion of the concept of place must go beyond traditional political theory.

In one sense, the concept of place is obviously political. Politics is to a significant degree about the governance of demarcated territorial units, from ancient empires and city-states to the modern nation-state and subnational divisions and municipalities. In political theory, the spatial elements of politics go back to classical thought. Aristotle offered a kind of place, the *polis* or city-state, as an ideal site for politics, and discussed at length the proper spatial dimensions and physical layout of the polis. Later theorists, notably Jean-Jacques Rousseau, undertook similar discussions about the physical bounds and characteristics of the political community.

Perhaps more importantly, place is a political concept because spaces are constituted through social and political deliberation and conflict. Places are not just political units, but political *creations*.

It should be noted that the concepts of space and place are also used metaphorically in politics and political theory, through terms like public sphere or public sector. Such spatial metaphors reflect how social interactions, political deliberation, and other forms of public life have often been carried out in spatially defined areas, including marketplaces, meeting halls, government buildings, legislative houses, churches, town squares, pubs, and sidewalks. Such spatial imagery lends itself to nonspatial realms of political interaction, such as the Internet (i.e., cyberspace) and other telecommunications and mass media.

The entry elucidates the theoretical and political significance of the concept of place and also notes some of the relevant literature. The entry first defines *place,* a concept that is most clearly developed in the field of geography, and distinguishes it from a related term, *space*. The next section outlines recent and contemporary issues in theorizing about place and place-based politics. The entry concludes with a discussion of the politically controversial nature of place.

Defining the Concept of Place

What is a place? In somewhat technical terms, David Harvey says that a place is a physically distinctive parcel of space with rough boundaries that persists over time. However, though a place is demarcated out of space, the concepts of space and place should be distinguished. The term *space* generally applies to abstract physical dimensions that can be represented quantitatively as measurements

or sets of coordinates. Furthermore, a unit of space, such as a cubic meter or square foot, is universal—it is the same everywhere. Places, by contrast, are particular, distinctive, and concrete and must be described qualitatively. Places are constituted by objects and their various attributes, as well as by social and physical relationships and ascribed meanings. There is also a temporal dimension here—to be a recognized place, these constituents must persist in some arrangement for some period of time. An important point, the constituents *are* the place—there is no preexisting spatial "container" that surrounds them. A spatial unit only comes into real existence in the form of an actual place and its constituents. As noted by Henri Lefebvre, absent actual places, space is abstract and conceptual.

Geographers see places as constituted by both natural (i.e., nonhuman) and social influences: geological, chemical, biological, and ecological forces and interactions; physical substances; living and nonliving things; human artifacts; social relations; human language; and cultural meanings. *All* places qua places, even wilderness areas, the ocean floor, or other places lacking a significant visible human influence, are in some measure human creations. Certainly, the Earth's physical structure, ecology, and topography precede human interaction with the world. However, human beings—and probably other highly evolved animals—must interpret the naturally given in order to map it into bounded, discrete places. Lefebvre thus famously talks about the "production of space" as a social process.

Though places necessarily have some stability, they are also dynamic in terms of character and dimensions, changing in response to natural and social influences. At the same time, places themselves influence the objects, forces, and relationships that constitute them and the beings that inhabit them. Consequently, Robert David Sack describes places and human identities—both individual and collective—as mutually constitutive. Thus, people identify themselves to a significant degree with the places where they live, work, play, or visit, and their interactions with such places shape and modify the character of these locales. Geographers therefore emphasize how culture is spatially embodied, enacted, and developed through places and human interactions with them.

The boundaries of places are also dynamic and ambiguous. Boundaries are porous to countless external natural and social influences that do not respect rigid demarcations. Moreover, boundaries are also often fuzzy, as places shade into one another, even when they have established legal borders. Politics often rely on clearly established boundaries, but such boundaries are continuously transgressed by a variety of forces and interactions. For example, the boundaries of the United States are legally defined with respect to Mexico, but ecological and social influences flow back and forth across the borders, and it may be difficult to determine, for example from a cultural standpoint, when one is precisely in one nation or another. The difficulty of defining a place's boundaries is of course exacerbated by the fact that individual places themselves embrace myriads of shifting, evolving places within their own bounds.

Place in Contemporary Social and Political Thought

Contemporary geographers like Doreen Massey, often reflecting postmodern sensibilities, have put great emphasis on the shifting, unbounded, and internally diverse and hybrid nature of places. With globalization, and its associated increase in the transcontinental flows of people, capital, goods, culture, information, invasive species, and pollution, social theorists have also posited an actual decline in the stability of places and place-based identities, especially since the 1970s. Manuel Castells argues that a "space of flows," constituted by global networks and exchanges of capital and information, is disrupting place-based and identities and relationships. Many contemporary social and political theorists thus talk of a "deterritorialization" of human existence.

Contemporary geographers and political theorists also stress the fundamentally contested nature of places and their boundaries. Because places are partly the result of human interpretation of the spatial world, the creation of places is inevitably bound up with conflictual political dynamics. Relevant political forces here include cultural, moral, religious, ideological, and ethnic differences; power relations (such as race, class, and gender); conflicts over resources and territorial jurisdictions;

and debates over the proper treatment of the natural world.

Given such contestation, no place has a single, undisputed character. How does one define the character of a multiethnic, multicultural city like Toronto, London, New York, Miami, or Los Angeles? Is Northern Virginia really part of the South? Does the cultural character of New Orleans depend on it being a fundamentally African American city? Is the identity of East Jerusalem Israeli or Palestinian? Is Northern Ireland Protestant or Catholic? Are the forests of the Pacific Northwest richly diverse, vibrant old-growth ecosystems, or are they overgrown, "decadent," and in need of management through logging? Is a neighborhood slated for demolition and redevelopment "blighted," or is it a thriving community and home to its residents?

Political and social theorists have accordingly focused on the various political dimensions of the creation of places. Among these are the interaction between conceptual representations of places and the lived experience of place; the role of capitalism in constituting and commodifying the spatial environment; the disruption of place through globalization; the role of racial and class segregation and identities in shaping the geography of cities; the role of economic, political, and sexual privilege in constituting that most intimate of places, the home; the role of home as, conversely, a refuge for women or people of color resisting domination by men or whites; and, more generally, the role of various intersecting social relations in unsettling notions of place as stable or clearly bounded. Most of these perspectives also emphasize the influence exerted by places themselves rather than seeing places as merely passive recipients of social and natural forces.

Another key area for political theorizing about place has been in the field of urban politics. Much of this theorizing has come from urban planners. Reflecting the importance of place in defining identity and culture, twentieth-century planners like Charles-Édouard Jeanneret (a.k.a. Le Corbusier) and Jane Jacobs debated how the built environments of cities and other communities should best be designed to promote certain human goods. As James C. Scott recounts, these debates often revolved around whether communities should be more or less centrally planned by government or business to maximize efficiency and related values like mobility and ease of administration, or whether communities should nurture a complex, diverse street life. While Le Corbusier and other "modernists" inspired mid–twentieth-century, top-down public and private sector redevelopment efforts like urban renewal, Jacobs and other critics of modernism inspired neotraditional planning movements like new urbanism.

Political struggles over place are also central to environmental politics, and environmental political theorists have investigated the contemporary politics of place as an important source of ecological values and resistance against globalization, capitalism, technocracy, and anthropocentrism. Wilderness and biodiversity preservation efforts; environmental justice movements against local toxic pollution and environmental racism; antisprawl movements; neotraditional urban planning; local conservation alliances between environmentalists and resource interests; and efforts to revive local agriculture have all championed the protection of place against what they see as the homogenizing, dislocating, antidemocratic, exploitative, and ecologically destructive character of global capitalism. These movements often affirm the value of a "sense of place." A sense of place entails a detailed awareness of the character and history of one's ecological and social environs, and an identification with, and attitude of care for, one's locale.

The Controversial Nature of Place-Based Politics

Place-based movements have been critically received by contemporary theorists. Harvey and others point out the potential for place-based identities and movements to breed parochialism and reactionary nostalgia and foster impotence in the face of global economic and political forces. It also hardly needs to be said that the protection of ethnically, racially, or religiously defined places from outsiders has led to chauvinistic violence and even genocide. Contemporary political and social theorists also argue that too much emphasis on the importance of place in human social and political life threatens to promote an unfounded, "essentialist" account of human nature as fundamentally dependent on geographic awareness and identity. Moreover, environmental political theorists

caution that an overemphasis on place preservation can lead one to disregard the dynamic character of places and stifle a place's healthy ecological and social development. They also argue that some environmentalists, particularly bioregionalists, tend to overlook the socially constructed and politically contested nature of places and instead see the natural world as providing a ready-made geography, with discrete regions and ecosystems, for human beings to inhabit.

However, a rejection of place-based politics might itself be deeply problematic. Despite the dangers of attachment to place, having a recognized, stable set of places that one inhabits, identifies with, and cares for may indeed be fundamental to navigating the spatial world. Both Hannah Arendt and Martin Heidegger emphasized the importance for human flourishing of coherent, enduring spatial surroundings. More recent theorists, including Iris Marion Young in a discussion of the politics of home, have reiterated similar themes. Indeed, the contemporary theoretical emphasis on places as fluid, porous, contested, hybrid, or diverse may overlook the importance of spatial coherence and stability in human experience.

Plato (427–347 BCE)

Plato was the first ancient Greek political philosopher and indeed the first philosopher to leave a large and systematic body of work exploring the relationship between ethics, politics, metaphysics, and epistemology. His importance is such that Alfred North Whitehead famously described all European philosophy as a series of "footnotes to Plato" (1978, p. 39); he also founded the first prototype of the modern university, known as the Academy, where Aristotle studied under him. He is often seen as the founder of utopianism, though the word was invented by the sixteenth-century humanist and Platonist Thomas More, and so it is in strict terms an anachronism to use it of Plato.

Living in the ancient democracy of Athens (punctuated in his young manhood by two oligarchic coups) and witness to the trial and execution by the democracy of his revered teacher Socrates, Plato left the city for some years afterward, traveling probably among the politically and philosophically distinctive Pythagorean societies of southern Italy, and at some point made the first of three visits to Syracuse. He went on to compose a large number of written dialogues, most of them featuring Socrates as a character. Two of these dialogues are an order of magnitude larger than all the others, and they—*The Republic* (with Socrates) and *The Laws* (without him)—are in modern times considered to be the major works of Plato's political thought, sometimes supplemented by the shorter and more enigmatic *The Statesman.* But in fact, all of the dialogues have some bearing on politics, and many of them—including the sequence of dialogues aligned with Socrates' trial and death, the engagement with the value of rhetoric in *The Gorgias,* and the parody of Pericles' funeral oration in *The Menexenus*—are permeated by it. This entry considers Plato's engagement with Socrates

and Athens, and then explores the respective contributions of *The Republic, The Statesman,* and *The Laws,* concluding with remarks on the purposes of Plato's writings and the overall nature and contribution of his political theory.

Plato, Athens, and Socrates

Plato was born into two aristocratic families in a society in which the place of the aristocrats was politically problematic, though economically privileged. Athens was the leading democracy and intellectual and artistic center of the Greek world, having overthrown tyrants at home and then withstood Persian monarchical military force. By the time of Plato's birth, Athens was locked in a lengthy struggle with Sparta, a complex society allying itself with oligarchies that drastically restricted political participation to wealthy elites, as opposed to the Athenian-led democracies enfranchising the artisans, rowers, and farmers, whom Greeks referred to as the "many" and the "poor." Both before and after their defeat by Sparta and the temporary overthrow, and then restoration, of the democratic regime in 404/403 BCE, Athenian democrats insisted on the equal claim of each (male) citizen to political participation not only in the plenary assembly, but also in being able to be selected by lot to serve as jurors (there being no expert judges) and as officials and members of various public bodies. Democratic equality meant equal laws for rich and poor, equal opportunity to serve in most public roles, and equal opportunity to make one's case in the assembly or the law courts. To exploit that opportunity, in the absence of any formal or public educational system, Athenian citizens—especially the wealthy elite—were increasingly tempted to send their sons for training in rhetoric and other forms of intellectual debate and display by local and visiting experts. Such technical training complemented the pervasive learning of myths and ancient epic poetry, recited to musical patterns, and the tragic and comic drama that the city commissioned for its festivals. Philosophy, at the time of Plato's birth, was a general term for wisdom; there were some speculative texts on the nature of the physical universe with moral implications, but no discipline of ethical or political inquiry.

This was the world that Socrates challenged. While he did his duty as a citizen, he did not seek political power or influence. And although he was born to an artisanal family of sculptors, he did not seek wealth through his teaching; indeed Plato's Socrates proclaims that he did not teach at all. (Socrates left no writing of his own; we know of him from a small number of texts, which paint varying portraits, so we concentrate here on Plato's depiction of him.) Instead, he spent his time associating with a wide range of people: Athenian and non-Athenian, young and old, ignorant and self-proclaimed experts. In Plato's version of *The Apology* that Socrates gave at his trial, Socrates says that he did this in order to understand what the Delphic oracle had meant in telling a friend that no one was wiser than Socrates. Socrates concluded that he was wise only in knowing that he was not wise. But he was driven to inquire not about the nature of reality, as "pre-Socratic" philosophers had done, but about how one should live, arguing that the wise would live virtuously and that it was imperative to discover what the virtues were. The politicians and experts with whom he engaged did not stop to understand the nature of courage before waging war or claim to understand the meaning of virtue when teaching rhetoric. Most important, the democratic procedures of Athens gave no formal weight to knowledge or virtue, allowing citizens to make public arguments and decisions on the basis of their own desires or delusions. These themes—the nature of knowledge and virtue and the importance of knowledge in political rule—dominate Plato's presentation of Socrates and indeed his dialogues as a whole. It is in this sense that all of the dialogues are political.

While Socrates' life had posed challenging questions to democracy, his death at its hands seems to led Plato to a disgust with democracy that matched the disgust of the oligarchical faction in Athens that he had already conceived (despite being closely related to several of the leading conspirators). Athenian democracy was clearly unable to tolerate Socrates. This posed to Plato the questions not only of how one should live as an individual, but of what a society would look like in which someone like Socrates would be valued as beneficial rather than feared as dangerous, and more generally, of what was the nature of political knowledge and how it could be expressed in public arrangements, including rule and education. To

answer these questions, Plato invented a new literary genre and indeed transformed the notion of philosophy itself. In *The Republic,* he focused on the question of an ideal city, to be ruled by philosophers who are akin to Socrates; and in *The Laws,* he focused on a second-best city, where the law itself embodies the knowledge that had been the province of the philosopher kings in *The Republic.* Yet as this formulation suggests, although the city of *The Laws* is clearly stated to be a second-best ideal, this does not mean that Plato's fundamental theoretical and political concerns are not cogently expressed within it. Scholars are divided on whether Plato's works share the same outlook ("unitarian"), or whether his views changed over time ("developmentalist"); a compromise would suggest that although the foci and contexts of the dialogues alter, the underlying concerns and ambitions remain constant. The Socratic investigation of the good life led to the investigation of what sort of polity could accommodate that life, all the while exploring the underlying values and virtues on which such ethics and politics rely, and the associated logical, epistemological, and metaphysical questions that they raise.

The Republic

Whereas many Platonic dialogues, especially those featuring Socrates, end inconclusively in *aporia,* or pathless confusion, *The Republic* succeeds (at least on its own terms) in countering the two most dominant and dramatic challenges that are posed within it: that justice is simply a mask for exploitation by a ruling class of those it rules (advanced by Thrasymachus in Book 1); and that justice is, although not so drastically exploitative as Thrasymachus contends, a social settlement that would be better for each individual to violate, if he could get away with it (advanced by Glaucon and Adeimantus in Book 2, though as a thesis they wish to hear refuted rather than one they endorse). To do so, Socrates redefines justice by means of delineating a virtuous city and a virtuous soul, and then identifying the specific source of justice (widely accepted as one essential element of virtue) within each. This delineation is itself a redefinition, as Socrates carves up social structure and psychology in ways that democratic Athenians, at least, would have generally rejected, but seeks to make this plausible to his elite young Athenian interlocutors.

Specifically against the egalitarian Athenian polity previously described, Plato insists that there must be a separate group of rulers within the city, divided into those performing strictly military functions and those who will exercise a broader guardianship based on wisdom. Thus, he divides the city into three classes and insists that although citizens must be chosen meritocratically for each group, they must be made to believe that where they belong is natural and necessary. (This is to be done in part via the "noble lie" of common citizen earth origin but distinct types of inborn souls. The sinister aspects of this lie have frequently been discussed, not least in Karl Popper's powerful attack on Plato, but the fact that the lie is to be believed, if possible by the rulers as well as their subjects, suggests that it is not a method of propaganda as Popper alleged, but rather a mythic source of social cohesion.) This is a view of politics that bases a notion of rule in the idea that some rule and others are ruled, and where the identity of these groups does not change. Aristotle would dramatically reject his teacher on this point in defining the citizen as one who shares in both ruling and being ruled (*The Politics,* Book 3), but we can also see that although Plato rejects such reciprocity and participation, he is equally rejecting the notion of politics and rule as inherent domination, which is advanced by Thrasymachus in *The Republic,* Book 1. Instead, he is arguing for a notion of rule that is beneficent, aiming entirely for the benefit of the subject, rather than the benefit of the ruler. Indeed, despite their inherent virtue, the rulers of the ideal city are to have an austere regime imposed on them to protect their subjects further: They are not to possess any private property, instead being fed and housed by the city, and they are not to form their own families, instead procreating at the city's orders and raising their children communally. These stringent measures, known imprecisely as Plato's "communism," have had a significant afterlife of their own in political theory, inspiring the French revolutionary Gracchus Babeuf, for example.

The specific parts into which Plato divides the soul would also have been controversial for an Athenian reader, although it has been extremely influential in Judaism, Christianity, Islam, and,

more generally, Western thought since Plato. He subordinates the source of pride and anger, which the Greeks called the *thumos,* to the rule of reason, treating it as a subordinate means rather than as an independent source of value as the competitive, touchy Athenians tended to see it. And he controversially denudes appetite, seen as only part of any capacity for evaluative discrimination, in order to argue that it must be wholly controlled by reason. Finally, while in the case of the city he had argued that political rule will benefit the subject, so he claims that the psychic rule of reason will benefit the whole person by taming his subject appetites and thumos, enabling him to identify himself with his human attributes rather than his lionlike thumos or beastlike appetites. The notion that citizens' happiness—in Greek, *eudaimonia,* which can be roughly understood as a blessed life of good fortune and flourishing—should be the aim of politics, and that this depends on individual self-rule where possible, to be supplemented or replaced by political rule where necessary, is a key contention in political theory.

Who are these rulers to be? *The Republic* is radical in arguing that they must be philosophers, and so refers to them as "philosopher kings." Only philosophers, driven by the love of truth and learning, will be sufficiently indifferent to ordinary desires and appetites to ensure that they will not misuse their power for personal gain. Such a philosophic nature is a requirement for being a philosopher, but it must be allied with a range of physiological and temperamental good qualities, and then perfected by gaining knowledge. Within the just city being described, this will be done by a thorough process of education. Such education must begin at birth, or even before, with proper treatment of pregnant women, and develop through childhood games, stories, and songs that train both body and mind into the habit of being governed rationally and moderately. For example, children are to be educated not to express excessive emotion at funerals. Those youth deemed capable of continuing to a full philosophic education will engage in mathematical studies combined with military training; after the age of 30, they will be trained in philosophy and dialectic; and at 50, those surviving further intellectual and practical tests will be brought to see and comprehend the good in itself, which they will then use as a model for ordering themselves and the city as they alternate turns of ruling with one another.

The notion of the good in itself, referred to as the Form of the Good, together with the other Forms, such as (particularly stressed in *The Republic*) Justice and Beauty, is one of the most complex and influential aspects of Plato's metaphysics. Although scholars are divided as to whether the Forms should be interpreted as another higher world transcending the physical world, their political role is less controversial. The Forms embody the objective political knowledge that the rulers need and on which their rule is based. Yet *The Republic* is able to give only similes for the Forms, rather than to define them fully. The Form of the Good is compared, famously, to the sun: Just as the sun makes visible the physical world, so the Good makes intelligible the world of the Forms (however one interprets that). And most indelibly, the city's predicament insofar as it rejects knowledge of the Forms is compared to being trapped in a cave, in which the prisoners have only artificial firelight and reject the very idea of natural sunlight (an image again of the Forms) as offensive to their own condition. (The role of simile in the dialogue is carried further with the construction of the myth of Er in the closing book, which mixes the traditional Greek notion of Hades with an idea of reincarnation to convey the moral message that the happiness gained from well-ordered souls, and the unhappiness caused by souls dominated by appetite or thumos, continues into any future life. Use of myth by Plato, and its relationship to his rational arguments, is a major field of study in itself.)

The insinuation that existing democracies are like caves carries over into the analysis of the imperfect regimes into which the ideal city is said inevitably to decline. The notion that the ideal city is inherently politically fragile has again been influential. Although the flaw identified by Socrates focuses on the inevitable eventual failure of the philosopher kings to grasp the right moment (*kairos*) for action, later traditions of Greek- and Roman-inspired republicanism would focus on the inherent fragility of popular virtue. In tracing the decline from the ideal aristocracy (rule by a group of philosopher kings and queens) to a timarchy governed by honor rather than reason; an oligarchy governed by the desire for wealth; a democracy governed, or rather not governed, by the

oscillation of moods and desires; and a tyranny dominated by the basest desires of greed and lust, it emerges that only in the ideal city are city and soul in harmony. Only in the ideal city will its inherent psychological and sociological tendencies be self-reinforcing. All the other regimes are by nature unstable. For example, while the oligarch in the oligarchic city still has a measure of order in his soul, though supplied by calculating avarice rather than by reason, his son will rebel against this order and give free rein to his diverse (though not yet overpoweringly tyrannical) desires. So it is not only that the rule of reason establishes the right kind of stability; it is also that only the rule of reason can ensure stability at all.

The Statesman

Although *The Republic* argues for the need for rule and the need for it to be based on knowledge, it says surprisingly little about the precise nature of that connection. What sort of knowledge is relevant to politics? This is explored in a dialogue in which Socrates is featured only at the outset, but the main speaker is described as a Stranger from Elea, who, in the companion dialogue, *The Sophist,* is asked to explain the Elean view that the sophist, statesman, and philosopher are three distinct kinds, rather than being merged into one or two. Having defined the sophist (not once, but seven times) in *The Sophist,* Plato turns in *The Statesman* to do the same for the statesman. Thus, the dialogue focuses on the nature of the statesman, who is defined by his type of knowledge in relation to other types of knowledge, rather than exploring any political structure of an ideal regime.

The statesman's type of knowledge emerges slowly and after several methodological changes of direction. An initial set of divisions of different forms of knowledge or skill (*technai,* in Greek) leads to an estranging definition of statecraft as simply herding the human animal. This is corrected by a constructed myth, this one designed to show that humans are capable of autonomy and that they need specific forms of political care distinct from caring for their other needs, rather than being the animal-like subjects of a generalized herding. But the myth is criticized in turn for having been overly long and complex, and this leads to a discussion of the appropriate kind of measure for philosophical matters (qualitative, in terms of the right or appropriate, rather than merely quantitative). And this qualitative measure, in the domain of time, specified as the notion of the *kairos,* or right moment, will turn out after a further methodological innovation (comparing the division of statecraft to the example of weaving) at the heart of defining political knowledge. The other arts must all be used in the city and are essential to care for various aspects of human life. But the job of the statesman is to determine the right moment at which these arts—and in particular, the arts of generalship, rhetoric, and judging—should be used. The statesman must also try to embed this knowledge in the community, by moderating the opposing temperaments and virtues of his citizens by modulating their opinions and, through arranged marriages, also modulating the characters of their progeny. Thus again, albeit in a few sketched pages at the end of the dialogue, we find Plato stressing the need for knowledge and reason, not only to rule as it were from above and outside, but also to be incorporated into the fabric of life through eugenics, education, and culture.

A final key political innovation of the dialogue is its discussion of law. Famously, the Eleatic Stranger contends that whether rule is according to law or against it is not a valid criterion of rule: only knowledge is such a criterion. But his young Athenian interlocutor finds this hard to accept. The Stranger defends his view by imagining a world in which all decisions and judgments of the arts were entirely governed by law: He imagines that such a world would collapse of stultification and ignorance. Thus, he suggests that law is irrelevant to knowledge, though he concedes that in the absence of a true statesman able to give orders to each person at once for their whole life, law may be an essential, if second-best, expedient. That judgment of law as an alternative to knowledge may seem to be drastically altered in *The Laws,* where law is presented as an embodiment of *nous,* divine wisdom and reason. But in fact, in both dialogues, knowledge provides the fundamental title to rule. Where knowledge is lacking, something else will have to fill the gap, as the law made by nonexpert assemblies can do in *The Statesman.* But law may alternatively be based on and embody knowledge, as proposed by the founders of Magnesia, the second-best ideal city of *The*

Laws, who themselves are implied to possess that knowledge (perhaps not soaring to the philosophical heights, but sufficient for founding the city).

The Laws

Consisting of 12 books and apparently unfinished, *The Laws* is an even vaster and more complex work than *The Republic,* and one that until recently has been sorely neglected in modern discussions of Platonic political theory. Socrates makes no appearance in it. Instead, the discussion is led by an Athenian Stranger who is making a pilgrimage on Crete with two other elderly men, one a Cretan and one a Spartan. Thus, the dialogue is framed by an acknowledgment of the presence of the gods, and this theocratic framework is carried over into the constitutional arrangements they propose for the city of Magnesia (a city that the Cretan has purportedly been invited to help found and lead as a new colony). The discussants refer to a city similar to that described in *The Republic* as the best regime, but as one that should be treated as an ideal for approximation, rather than for wholesale implementation. Thus, in place of *The Republic*'s ban on property and family for the rulers, all the citizens of *The Laws* will be allowed households, but their land will be granted to them by the city, and their fertility regulated within marriages. Similarly, rather than rejecting democracy as a principle of government altogether, Magnesia will blend the principles of monarchy and democracy exemplified by ancient Persia and ancient Athens, respectively, as Crete and Sparta are said to some extent to do. The people will have varying levels of political privileges according to their property class, and will participate in magistracies, but the law will be supreme (and the counterpart to philosopher kings will be adapters of the law, rather than direct rulers).

The notion of law itself is altered in this dialogue: whereas in *The Statesman* it had been defined as a stubborn autocrat who dictates by force, in *The Laws* this is seen as only one method of rule, and an inferior one at that. Better is a double rule of law, in which persuasive preludes or preambles convince most citizens to obey before the autocratic use of force (in the form of a threatened sanction) need ever kick in. But here again, contrary to some interpretations, it is the knowledge embodied in the law that licenses it to rule. The method of rule—whether by applying persuasion or applying the last-ditch option of force—is secondary to that fact, important in itself.

The Laws continues and intensifies the deep concern with the minute details of education and culture that we found in *The Republic.* The first book is almost exclusively about the varying Cretan, Spartan, and Athenian regulation of drinking parties or symposia, and later books give detailed and practical proposals for criminal, civil, and commercial law, proposals that can be shown to draw on a deep knowledge of actual practice in all these cities, and that share both Athenian and Spartan preconceptions in varying respects. Yet there are only two mentions of philosophy in the work, and although it contains one piece of magnificent philosophical argumentation for the existence of the gods and their concern for humans, it is significant that this piece of philosophy is itself devoted to a theological topic. The theological horizon of the dialogue, a dialogue concerned with making itself a suitable subject of study for the future Magnesians, narrows its philosophical horizons while displaying more fundamental political continuity than might at first be recognized.

Conclusion

Plato's political thought is complex and in some respects elusive: The dialogue form should make us cautious as to what extent any given position, even of the leading interlocutor, can be simply ascribed to Plato. Beyond those interpretive disagreements, there is controversy over the basic shape of his thought: whether the pinnacle of philosophical and political ambition in *The Republic* degenerates into compromise and disappointed hopes in *The Laws.* The notion of such a degeneration is often tied to the story of Plato's three journeys to Syracuse. This story is told in 13 Letters, which may be authentically by Plato but are probably a production of his school, and so must be considered with that in mind. Plato had first visited the court of the tyrant Dionysius in about 387 BCE, and is said to have become close to his advisor Dion. When the son of Dionysius succeeded as Dionysius II, Dion is said to have tried to make him a philosopher king, with Plato returning in about 367 BCE to help. The venture failed, Dion was banished, and a third visit

by Plato to Dionysius II a few years later was unsuccessful in persuading him to recall Dion. The writing of *The Statesman* is sometimes associated with the second voyage (it is dated also by possible hints in its precursor and companion *Theaetetus*), and the sad story as a whole, with a transition from *The Republic*'s faith in philosopher kings to the Athenian Stranger's claim that no human can be trusted to rule without corruption. Yet in fact, both dialogues accept that the possibility of a noncorrupt potential ruler may depend on divine fortune. *The Republic* makes no claim that a philosopher king will certainly appear (there is no guarantee of this, though it is said to be possible), whereas *The Laws* does not give up on the rule of reason, even though not associating it with the rule of particular individuals in the second-best city. Rather than seeking evidence of discouragement in this sequence of the three political dialogues or in the dialogues as a whole, one can see the dialogues themselves as a bulwark against discouragement. As surrogates for political activity, and as sites of thinking and questioning, they constitute Platonic political theory as a formidable and still living enterprise.

Pleasure

The nature and desirability of *pleasure* (*hedone* in Greek, *voluptas* in Latin) was a key question in ancient ethics and one that had important political and social implications. Bodily pleasures in particular were frequently felt to require strict control by the individual. At the same time, the provision of access to pleasure also functioned as an instrument of social control.

The imaginary society depicted in the Homeric epics (composed around 700 BCE) placed a high value on the sensual pleasures of life, on sex, baths, food, the last two being offered to guests as part of the rituals of hospitality. Such pleasures were, however, only fleetingly available to the warrior heroes as a result of their efforts in battle. Even here, however, certain pleasures may prove dangerous; two examples in *The Odyssey* are the story of the Sirens (Book 12), whose song lures sailors to their deaths, and the honeyed lotus fruit (Book 9) that makes those who consume it forget their home and thus their identity.

Later periods of Greek culture came to regard pleasure as distinctly problematic. One factor in this change may have been the development of the city-state and the consequent weakening of the aristocratic culture and its replacement with a more collective ethos that tended to view material luxuries, and the physical pleasures derived from them, with suspicion. Thus, the Athenian General Pericles is said by Thucydides (Book 2) to have presented

the availability of pleasure, at the right moment, as one of the characteristic advantages of democratic Athens. Yet he praised the Athenian war dead in the same speech for placing the needs of the city before their personal enjoyment and that of their families. In the account of the physical and ethical impact of the plague at Athens that follows, the citizens' privileging of their personal pleasure is presented as a key symptom of the city's moral collapse.

The Greek moralizing and didactic tradition frequently contrasted the easy pleasurable life with the hard effort of the morally laudable one: In the story of the choice of Hercules, attributed to the Sophist Prodicus (Xenophon, *Memorabilia* 2.1.21–34), the allegorical figure of Vice is associated with pleasure, luxury, and a beautiful appearance. Like Hercules, Odysseus becomes a figure for self-control and moderation (*sophrosyne*) in the face of temptation that were put forward as the ethical ideal.

Among the ancient philosophers, Plato depicted Socrates in *The Philebus* arguing against the proposition that pleasure was the chief good in human life. His disdain for the body, in particular, led to the rejection of physical pleasure and, in *The Republic* (Book 3), Socrates severely criticizes the Homeric depiction of gods and heroes as susceptible to the pleasures of food and sex. However, Socrates, in *The Philebus,* distinguishes between different kinds of pleasure: Mixed and inferior pleasures are associated with various aspects of social life—envy of fellow citizens or the conflicting passions aroused by tragedy and comedy—whereas the intellectual contemplation of geometric form is mentioned as a source of undiluted pleasure. Similarly, philosophical discussions, such as those depicted in the Platonic dialogues, may be a source of pleasure themselves. This distinction between different qualities of pleasure is developed in Book 9 of *The Republic* and given a political dimension: The tyrant is a slave to base and sensual pleasures, whereas the philosopher king enjoys rational pleasures, and the democrat lies between the two extremes, but his freedom to pursue pleasure degenerates into tyranny.

Aristotle, in *The Nicomachean Ethics,* similarly criticizes the unbridled pursuit of pleasure as a lack of moral control (*akrasia*) (7.11–14 and 10.1–5). However, pleasure is defined as resulting when an entity is able to act in accordance with its natural state (e.g., when a body is healthy or when mind is free to contemplate) and virtue is a necessary guide to choosing the correct pleasures.

The Hellenistic philosophers developed contrasting theories of pleasure: for Epicurus, pleasure was the supreme good, but it derived from the absence of physical pain and, most importantly, mental anxiety. Therefore, this entailed a careful choice of physical pleasures in order to avoid those that had potentially painful consequences, like overindulgence. Epicurus also sought to remove sources of needless anxiety, like false beliefs about divine punishment, in order to achieve the state of *ataraxia,* freedom from mental disturbance. The Stoics, by contrast, viewed pleasure with great suspicion and did not accept that it was the natural aim of all creatures. Pleasure was one of the passions that appealed to the lower, "irrational," and impulsive part of the soul: The first stirrings of these passions are felt by everyone, but the wise and rational man or woman will resist them.

In Rome, the distribution of pleasure was used for political ends. The rulers of Rome during the republic, and later the emperors, offered entertainments to the people in return for loyalty and popularity. In consequence, the Latin term *voluptas* (pleasure) is regularly used in the sense of "entertainment." A Stoic like Seneca rejected the games on the grounds that the pleasure they brought made the spectators more prone to vice.

In later antiquity, both pagan philosophers and early Christian thinkers inherited and developed the suspicion of bodily pleasure that existed in earlier philosophy. Both pagans and Christians attributed emotions in general to the workings of demons. Male sexual pleasure was an area of intense concern. In its extreme form, asceticism, Christianity rejected all bodily comforts. In practice, however, in the cities of late antiquity, the pleasures of the public entertainments continued to be offered. Despite the opposition of the church fathers, Christian emperors were powerless to stop providing entertainments for fear of the discontent that would be caused. The ascetic Christians who withdrew from public life to live in isolation perceived the city, with its various institutions of pleasure, as a particularly dangerous place. Early Christianity did, however, allow for a positive form of intellectual and spiritual pleasure: Origen argued in his commentaries on *The Song of Songs* for an intense spiritual joy, and Augustine understood a

type of pleasure (like Plato's intellectual pleasure) to be enjoyed by those who were free from sin.

Pluralism

At its most general, *pluralism* in contemporary political theory is the idea that we should attend to difference and multiplicity in society and politics in contrast with sameness and unity. Beyond that, pluralism can mean many different things. The multiplicity in question can be of political parties, interest groups, spheres of authority, or of religious, moral, or ideological beliefs, or paradigms of belief, or of cultures and ways of life, or of goods or values. The purpose of drawing attention to these dimensions of plurality may be to provide an empirical description of a culture, society, or political system, or to make a normative recommendation to the effect that some such aspect of diversity is desirable and ought to be promoted or accommodated.

The following are four main areas in which conceptions of pluralism have been advanced, either descriptively or normatively. Special attention will be paid to "value pluralism," as it is the least familiar.

Political Pluralism

Pluralism is commonly invoked as a description of politics in modern liberal democracies. In this sense, it refers to the multiplicity of interest groups and political parties that contest power in democratic systems and to the different locations and forums among which that power is divided. This contrasts with authoritarian or totalitarian political systems in which power is not divided or shared but concentrated in a single source, and in which plural interests and beliefs are discouraged.

By extension, pluralism can also mean the normative claim that democratic principles and institutions are superior to authoritarian ones, or that a polity benefits from having a vigorous contest for influence among many competing interest groups—as James Madison argues, for example, in *The Federalist*.

A related but more specific sense of pluralism refers to the doctrine advocated in the early twentieth century by the "English pluralists," G. D. H. Cole, J. N. Figgis, and H. J. Laski, who argued for a radical decentralization of political authority.

Pluralism of Belief

Another widely used sense of pluralism is to label the empirical observation that different people believe different things—particularly in modern societies, and especially when it comes to matters of religion, morality, and politics.

One of the most influential formulations of this claim, and one of the most significant attempts to draw out its political implications, is found in the later work of John Rawls. According to Rawls, modern societies are deeply conditioned by "the fact of reasonable pluralism"—the fact that individuals and groups hold strongly divergent views about how best to live, many of which are equally "reasonable" in the sense that they cannot be demonstrated to be false or inferior to other views. In the face of such reasonable pluralism, Rawls recommends a "political" liberalism that requires people's allegiance to liberal norms not as a "comprehensive" conception of the good, but only in the public realm of citizenship for the purpose of fair social cooperation.

Cultural Pluralism

Yet another dimension of pluralism emphasizes the diversity of human cultures. Again, this can be descriptive or evaluative. Descriptively, cultural pluralism refers to the fact that there are multiple

cultures or ways of life present within a single political society or globally. In its evaluative sense, cultural pluralism is the idea that multiple cultures ought to be accommodated and perhaps encouraged.

In effect, cultural pluralism in its evaluative sense is coextensive with "multiculturalism." Its various forms range from systems in which one culture is dominant but others are tolerated to arrangements in which multiple cultures receive public recognition and support on an equal basis. Both of these possibilities have been argued for within a liberal framework (e.g., Chandran Kukathas and Will Kymlicka). Alternatively, some political theorists have argued that genuine cultural pluralism requires political arrangements that go beyond the constraints of liberal democracy, which are sometimes argued to be themselves culturally biased (e.g., Iris Young, James Tully, and Bhikhu Parekh). Arguments of this kind usually commend intercultural "dialogue," in which liberal voices are no more privileged than others, as a central institution, practice, or image for a just society.

As a description of most modern societies, cultural pluralism is undeniably true. As a normative doctrine, its strengths include its apparently open-minded, tolerant inclusion in the political conversation of many cultural perspectives, some of which have been systematically excluded in the past by narrow and rigid forms of moral universalism. Its weakness is its tendency, especially in its nonliberal versions, to slide into moral relativism. If all cultures must be respected regardless of content, then harmful practices can be legitimated by cultural backing, and individual freedoms and rights, indeed toleration or respect itself, become just the contingent preferences of some cultures among others.

Value Pluralism

Moral or value pluralism is the idea, classically formulated by Isaiah Berlin, that there is a plurality of distinct or "incommensurable" values or goods. These often come into conflict with one another, giving rise to hard choices. For example, when liberty and equality collide, it may be difficult to determine how to rank them or trade them off against each other. Pluralism in this sense is contrasted with moral monism, according to which a single value or small set of values overrides or serves as a common denominator for all others—as, for example, in utilitarianism, where all values are measured in terms of "utility." For pluralists, utility (however defined) is no more fundamental or weighty or all-embracing than other important values. The political implications, if any, of value pluralism are widely disputed, with liberal, conservative, and "agonistic" views being the main players.

Note that value pluralism cuts across the other kinds of pluralism mentioned so far. In contrast with pluralism of belief, value pluralism does not make an empirical claim about the variety of people's actual beliefs, but rather a metaethical claim about the nature of moral (and perhaps other) value. In principle, value pluralism could be true even in the unlikely event that everyone happened to have the same moral beliefs—that is, even if everyone came up with the same answers to the hard choices pluralism imposes on us. In contrast with cultural and political pluralism, value pluralism emphasizes the plurality not of cultures or interest groups, but of values or goods. Moreover, a value-pluralist outlook is not committed by definition to multiculturalist or other pluralist political arrangements because its cultural and political implications are contested.

The concept of value pluralism can be said to have four main elements. First, at least some moral values are objective and universal. In Berlin's account, this means that there are at least some things that have in fact been valued by most human societies over long periods of human history. An alternative version is proposed by Martha Nussbaum, who argues (inspired by Aristotle) that certain goods (or "capabilities") are essential to human well-being. In either version, this first element of value pluralism immediately sets it apart from the relativist view that there are no shared human values. Second, there are several such universal and objective values—their plurality is irreducible. Third, these values often come into conflict with one another—as in the example of liberty and equality.

The fourth element of value pluralism is the most distinctive: The basic human values are "incommensurable" with one another. Literally, this means that the values are not subject to a common measure. The general idea is that they are so distinct from one another that each must be

regarded as an independent consideration, making its own unique claims on us that cannot be translated into any other terms. So, "liberty," for example, speaks with its own voice or has its own unique weight, and the same goes for "equality."

However, the more precise meaning of incommensurability, and the closely associated issues of its ethical and political implications, is vigorously debated. One way of approaching this debate is to look at the different answers people have given to the question of how we can choose among incommensurable values when they come into conflict. There are perhaps three main interpretations of choice under incommensurability, and each of these corresponds to a different account of the kind of politics that best fits with a value-pluralist view.

First, there is what might be called the "subjectivist" view. According to this, incommensurable values are wholly incomparable with one another; consequently, choices among them must be ultimately nonrational, or not guided by any reason that is decisive over others. This view implies acceptance of "agonistic" forms of politics that emphasize the inevitability, even desirability, of contests for power or recognition rather than reasoned debate and consensus. This position has been attributed to William Connolly, for example.

A common objection to the subjectivist-agonistic interpretation of pluralism is that it neglects ordinary moral experience. People are in fact often able to find decisive reasons for ranking or trading off conflicting incommensurables, if not in the abstract then at least in (some) particular cases. For example, it is true that impartial justice cannot be ranked ahead of personal loyalty in absolute terms—that is, in every case. But in a particular case there may be good reason to prioritize one over the other: justice will come before loyalty for the trial judge or public official, personal affiliation will come before impersonal evenhandedness for the parent or child.

Consequently, a second interpretation of choice under pluralism is often advanced: the "contextualist" view. Decisive reasons to choose in one direction rather than another may be generated by context. "Context" is of course open to a range of interpretation, but perhaps the most common understanding upheld by pluralists equates context with culture. Berlin, for example, sometimes refers to the need under pluralism to seek guidance from "the general pattern of life in which we believe." This approach implies a conservative, traditionalist approach to politics, in which moral and political choices are determined by reference to existing cultural traditions or settled ways of life. Such a conservative reading is found, for example, in some of the work of John Gray, and more consistently in the thought of John Kekes.

The problem with the conservative interpretation of pluralism is that although a specific situation may justify a particular value-ranking, cultural traditions claim authority across a range of different situations. Why accept one particular value-ranking as generally authoritative rather than another?

A third account of choice under value pluralism, which might be called the "conceptual" view, appeals beyond cultural context to principles of universal scope. These come from reflection on the concept of value pluralism itself. In Berlin, this possibility is no more than hinted at, but arguments along these lines have been developed by other writers. Here are three possibilities.

1. *Diversity of goods.* If pluralism is true, then there is a multiplicity of irreducibly plural values, and each of these has an independent claim on us. Prima facie we have reason to promote each of these values, hence as many as possible in a given situation—unless or until we have good reason to select some rather than others. Hence, at the level of a society, there's a prima facie case for policies that enable people to pursue more rather than fewer values. Given the general goal of value diversity, liberalism, with its strong emphasis on individual liberty, would seem to be a strong candidate for the best political vehicle within which to pursue that goal.

2. *Reasonable disagreement.* In the pluralist view, cultures or conceptions of the good life are essentially generalized rankings of incommensurable values. Many such rankings will be equally reasonable, and concerning these there is consequently room for people to disagree on reasonable grounds. It follows that, contrary to the traditionalist interpretation, pluralists cannot resolve the deepest value conflicts simply by appealing to a traditional or local conception of the good. Under pluralism, these are subject to reasonable and therefore permanent disagreement. Rather, the optimal political framework from a pluralist

perspective will be one that accommodates reasonable disagreement concerning the good, instead of endorsing and imposing one particular version of the good. Again, liberalism has a strong claim to meet this requirement.

3. *Personal autonomy*. Pluralism rules out reliance on both abstract monist rules, like utilitarianism and traditionalism. Both universal rules and local traditions represent particular value-rankings, which may be challengeable for good reason in particular cases. Therefore, pluralists should be willing to question the applicability of these predetermined norms and to rely on their own judgment in a strong sense. In other words, pluralists should have a capacity for autonomy because there are no ready-made norms conclusive enough to relieve them of that burden. If autonomy is required for good judgment under pluralism, then pluralist judgment is best made in a political environment supportive of autonomy—that is, once again, liberalism.

What kind of liberalism will this be? It will probably be a comprehensive liberalism, in contrast with Rawls's political liberalism, because it is grounded in a controversial account of the nature of the human good. Within the family of comprehensive liberalisms, the proper understanding of liberal pluralism is disputed between two main alternatives: first, a "Reformation" liberalism (so labeled and defended by William Galston), emphasizing the moral authority (within limits) of cultures and an ideal of group-based toleration; second, an "Enlightenment" liberalism, stressing the ethical weight of plural human goods over the authority of cultures, and emphasizing personal autonomy as an especially important (but not always overriding) value.

Political Participation

Unlike other political values and institutions closely associated with the contemporary practice

of democracy—like liberal rights, human equality, representation, elections, and mass parties—*political participation* among broad segments of the citizenry is so fundamental to the practice of democracy that it is impossible to conceive of democracy without it. Despite the diversity of institutional forms in which democracy has appeared over the last 2,500 years, democracy has always indicated a political society in which citizens, relative to members of other kinds of regime, have superior opportunities to engage in political life. How much and what kind of political participation is required in order for a democracy to exist are open questions, but that democracy needs widespread and regular political participation from its citizens is one of the few essential criteria that unites democracies from all times and places and distinguishes them from rival forms of government.

Yet, despite this broad theoretical consensus that political participation is a democratic good, there is still considerable debate within political theory about political participation, especially in three thematic areas. First, political theorists have long disagreed about the reasons why participation is considered valuable and, by extension, about what types of activities properly constitute participation. Second, there is ongoing debate about the permissible criteria on the basis of which a democratic polity might limit participation. And third, to the extent it is held that most contemporary liberal democracies do not maintain a sufficient level of political participation, there is disagreement relating to the empirical causes of this shortcoming, as well as the philosophical question of how to conduct democratic theory in light of it.

Participation as a Good

Although participation is generally held to be a good, the reasons provided for this differ. At least five explanations for the value of participation can be distinguished.

First, there is the *liberal* argument for political participation: that the protection of an individual's private rights and interests is greatly assisted by, and perhaps even demands, political rights to participate as a free and equal member in the institutions of political life. According to this account of political participation, which finds voice in such thinkers as John Locke, Jeremy Bentham, James Mill, and more recently Judith Shklar, civic participation is above all a defensive mechanism against real or potential abuses carried out by government or other citizens. If such participation leads to the enactment of laws and policies, these are less the creative act of a popular will than they are the programming of government in accordance with the pregiven, usually economic interests of civil society. Hence, the liberal model of participation links up with economic theories that understand politics primarily in terms of overseeing markets, protecting property, and maximizing social welfare.

Second, since Aristotle, there is the *teleological* tradition that conceives of political participation as the end of a happy and well-functioning life. Here, the argument is that human flourishing involves the opportunity to engage in civic life with one's peers. This claim was taken up by civic humanists of the Renaissance, like Leonardo Bruni, who celebrated political life as a setting for the realization of human virtue and as a practice that would bring glory to both the individual and the city. Teleological arguments have also been a familiar feature of the so-called republican revival in political thought. According to Hannah Arendt, a major figure in this revival, what makes political participation unique is that it takes place in a context of equality and nondomination, as opposed to the violence of technology and nature and the hierarchies of private and economic life. The political space, Arendt argues, offers participants the opportunity for self-disclosure, as well as the chance to engage in unpredictable, history-making events that escape the repetitive cycles of natural and biological processes. Political participation thus provides a chance to humanize—or rehumanize—one's life.

Third, political participation has been validated in conjunction with the ideal of *autonomy:* a democratic people's capacity to author the laws under which it lives. On this account, political participation enables citizens, otherwise confined by traditional norms and practices (and the hierarchies these usually involve), to consciously direct and refashion the norms and conditions of public life. This is a modern idea. It links participation to freedom in the sense of taking control of the destiny of the polity vis-à-vis forces of nature,

unregulated social processes, and other contingencies. The validation of participation in terms of autonomy can be found among various forms of democratic idealism, whether the participatory democratic tradition inspired by Jean-Jacques Rousseau, the tradition of deliberative democracy as it has been presented by Jürgen Habermas and many other contemporary supporters, or the pragmatic tradition introduced by John Dewey. Autonomy is probably the most ambitious conceptualization of the benefits of political participation insofar as it understands civic life as a tool by which a contingent historical generation might turn to politics to express its unique will and identity. One problem with this view is how to relate the individual participant to the majority, because it is not immediately clear how the participation of a single individual, in a polity with millions of inhabitants, could constitute the meaningful authorship of that citizen. For this reason, theories that treat participation in terms of autonomy are often lead to invoke a common good—as something that either is formed or is presupposed by practices of democratic authorship.

Fourth, a long-standing explanation for why political participation is a good is that it serves a *developmental function* for citizens who engage in it. This development has been conceived intellectually (participation develops the capacity to reason and to think for oneself), morally (participation expands a citizen's ability to trust others, transcend a selfish and overly materialistic perspective, and adopt a common point of view), and therapeutically (participation allows citizens to overcome the alienation, deracination, and anomie of modern life). The developmental argument figures prominently in the justifications for popular government offered by Rousseau, John Stuart Mill, and Alexis de Tocqueville—and, more recently, in the work of political economists who have emphasized political participation as a partial solution to the debilitations of poverty. Although empirical proof of this developmental thesis remains minimal, it continues to be influential, in part because it provides a defense of participation and democracy that makes no claims about complex and controversial processes of authorship and representation. Instead, the developmental thesis relates to the more modest, yet perhaps more palpable, educative benefits of active political life.

Fifth, the developmental thesis has been elaborated in a *community-based,* rather than psychological, manner: namely, as the claim that political participation provides various social benefits to the communities where it occurs. As Robert Putnam has argued, political participation, understood broadly to include not just engagement with government but associational life in civil society, increases the level of social trust within a community and thereby tends to improve communal values like the quality of schools, the crime rate, corruption, and tax evasion.

It is important not to exaggerate the differences between these five models. Because they are explanations for why political participation is a good—not whether it is so—they all share the common perspective of endorsing participation in civic life. Moreover, most democratic theorists subscribe to multiple perspectives. Rousseau, for example, is an originator of both the authorship and developmental models. And civic republicans are likely to acknowledge elements of all the models, with the possible exception of the first.

Nonetheless, these bases for supporting participation are distinct, and they have clear consequences for ongoing debates about how to define what properly may be considered genuine political participation. For instance, theorists informed by either the teleological or authorship models are likely to take a stricter view about what constitutes political participation, arguing that it be confined to formal acts of governmental decision making and not include mere membership in the voluntary organizations of civil society. The teleological and authorship models likewise foster a critical stance toward voting as too occasional, reactive, and binary to sufficiently enable citizens with the capacity to realize their nature or autonomously author the values, norms, and preferences that are to guide a free public life. By contrast, exponents of the developmental account of participation—whether individual or communal—are likely to adopt a wider view about what constitutes political participation. So long as participation promotes a civic education and positive effects for the community, it matters less to such theorists whether the participation is formal or informal, or whether it is linked to a substantial bifurcation between political elites with extensive decision-making authority and everyday citizens whose engagement

is only minimally involved with actual legislation. For liberals, the question of what constitutes participation cannot be separated from the results such participation has in protecting preestablished rights and interests. At the very least, though, liberals are concerned that citizens have full political rights and that, following Rawls, the fair value of these rights be realized.

Limits to Participation

Despite the existence of a broad consensus that, ceteris paribus, participation is a good thing, there is nonetheless widespread acceptance that political participation is not the only value in a democracy, and that, accordingly, political participation might properly be limited on the basis of at least three different criteria. Just how such processes of limitation are to proceed, however, remains controversial.

First, political participation is generally held to be constrained by the need to respect individual rights and liberties. This means, on the one hand, not mandating political participation, but rather respecting the rights of nonparticipants to drop out of the political process. With very few exceptions, such as Belgium and Australia, democracies do not impose mandatory voting; and conscription in the armed services, once a common practice for acculturating youth into a nation's political life, has increasingly been abandoned in favor of voluntary armed forces. On the other hand, limiting political participation in the name of respecting individual liberties means ensuring that both the activities of participation (such as public protests) and their consequences (such as laws) respect the rights of minorities and nonparticipants. The question of how to balance the right of participants to take meaningful political action with the right of nonparticipants and minorities to have their liberties shielded from such action remains a vexing practical and philosophical problem.

A second well-established limit to political participation is that it ought to be structured through a constitutional framework. Although revolution remains, in a certain sense, the paradigmatic example of political engagement, the political participation that democratic theorists usually have in mind is not revolutionary in nature, but rather something that flows through recognized institutions, respects existing legal norms, and seeks change through predefined, nonviolent, well-established channels. To be sure, this constitutional limitation is not universally recognized. In the United States, for example, democratic radicals from the late eighteenth century initially assumed that the meaning of popular government would consist not simply in the empowerment of locally elected legislatures (in place of monarchical authority), but that, additionally, the people at large, whenever they assembled, might override the formal authority of legislatures and other governmental organs. Such a perspective has had little impact, however, both because of the lack of radical energies on which it depends and because of the philosophical difficulties of how to define what might constitute a people at large.

A third limit to political participation involves the claim that it is not just the quantity of political participation that matters, but its quality. The most important theoretical contribution in this regard undoubtedly has come from theorists of deliberative democracy. Although deliberative democrats usually do not reject outright nondeliberative forms of participation—like voting, referenda, protests, or public opinion polling—they look to supplement and reform these practices through deliberative discourse and its alleged capacity for rationalization and legitimation. Even if most contemporary exponents of deliberative democracy no longer share the elitism that shaped the classical accounts of deliberation in Aristotle, Edmund Burke, and Mill, it is nonetheless the case that, in espousing deliberative discourse as the ideal method of political engagement, deliberative democrats focus primarily on how those empowered to make decisions ought to speak to each other and only secondarily on the accessibility of decision-making contexts to ordinary citizens. Whether and to what degree the practice of deliberation might accommodate widespread political participation is an open question in contemporary political theory.

Each of these limits not only represents a standard by which to judge better and worse forms of participation, but also indicates the way other values, irreducible to political participation, play a constitutive role in contemporary liberal democracy.

Nonparticipation

It is a common concern in political science to worry about existing levels of political participation, either because the absolute level is deemed too low (especially in countries like the United States where only approximately one half of the electorate votes) or because of the decline in various forms of political participation—including voting, party membership, and membership in voluntary organizations of civil society—that has occurred in most Western democracies since the middle of the twentieth century.

One question is causal: What explains the low levels of participation and, more generally, what empirical factors are correlated with political participation? Here, research routinely underlines the importance of socioeconomic status, as participation levels are highly correlated with such factors as an individual's income, occupation, and especially education. It is also the case that participation tends to be stratified in parallel with gender, racial, ethnic, and age-based hierarchies. Other important correlates of political engagement include home ownership and the length of residence in a particular locale. With regard to the decline in political participation, popular explanations often emphasize the decline in active forms of recruitment by political parties and voluntary organizations (whereas passive forms of recruitment, like check writing, have increased over the last few decades), a decline in ideological identification, and the stresses of mass society, where both the enormous size of contemporary polities as well as the tremendous technological, organizational, and financial resources required for effective political action within them alienate would-be participants from political life.

In addition to these empirical concerns, there is also the theoretical challenge of how to integrate the lack of full participation into normative models of democracy. Here, three approaches can be distinguished. First, there is the idealist approach that, even when it recognizes that existing levels of participation are too low, responds by arguing for the attractiveness of a polity characterized by greater participation. This approach is reflected by defenses of participatory democracy, such as Benjamin Barber's *Strong Democracy,* which simultaneously critiques existing levels of civic engagement while holding up the ideal of a more fully engaged citizenry. Second, there is the apologist perspective that acknowledges less than full levels of participation, but refuses to draw pessimistic conclusions. One of the oldest claims in this regard is the division of labor argument, found especially among early French constitutionalists like Emmanuel Joseph Sieyès and Benjamin Constant, that political life is a specialized task best handled by professional politicians so as not to burden busy citizens at work in modern commercial republics. In a similar vein, it has been argued more recently that low levels of political participation actually reflect public contentment with politics and a kind of tacit approval of existing laws and social structures. Third, a minority of theorists integrate an appreciation for low levels of ordinary political participation into their democratic theories by distinguishing between an everyday political life characterized by meager participation and special moments of heightened engagement. Both Bruce Ackerman's notion of "constitutional moments" and Sheldon Wolin's theory of "fugitive democracy," for example, present widespread civic activism as an effervescent and exceptional occurrence, taking place against a background of normal politics typified by much lower levels of political activity.

Outside of these three approaches, however, there is also quite simply an unwillingness to face the condition of nonparticipation. This unwillingness can be found in the heavy emphasis placed on voting (which of course is the exception, not the norm, of democratic life); in the way common, nonparticipatory forms of political experience, such as attention to politics and political knowledge, are subsumed beneath a primary focus on more active forms of political behavior, like campaigning and running for office, which are quite rare; and in the widespread assumption that the power of public opinion and the existing machinery of electoral politics are sufficient to make government accountable and responsive to the electorate, despite low levels of formal political participation among the citizenry. In general, then, even though most citizens most of the time are not participating in political life, much democratic theory and analysis proceeds as if this were not the case. How to handle the phenomenon of nonparticipation—and how to distinguish lower from

higher levels—seem a likely avenue of future research within democratic theory.

Political Perfectionism

Political perfectionism is the view that one primary task of the state is to promote the good life. This view is as much about the good as it is about the state. It presupposes an objective conception of the good in the sense that a person's life is worthwhile if it exhibits a certain objective goodness or qualities not reducible to the person's own subjective likes or preferences. As such, political perfectionism is closely associated with ethical perfectionism.

Ethical Perfectionism

Historically, ethical perfectionism has defended the view that the good life consists of realizing a certain goodness inherent in human nature, such as certain intellectual or ethical faculties and virtues that are thought to be distinctively and essentially human. On this view, ethical perfectionism is about perfecting human nature, hence the term *perfectionism*. However, there are contemporary proponents of ethical perfectionism who do not subscribe to such a human nature–centered account of the good life, but to what is sometimes called an objective list approach. According to this approach, a person's life is good to the extent that it realizes some objective goods, such as satisfying social relationships, aesthetic experience, amusement, and play. Different contemporary proponents of this view may give different lists, but most of them think that these values are plural and distinct and that they cannot be organized and ranked into a hierarchy of goods. "Perfectionism" may not be the most suitable term for this objective list approach, for it does not suggest making perfect human nature as such. It does not even suggest, as least according to some proponents, that everyone should attempt to maximize these goods. How many and how deeply these goods should be pursued and realized in an individual's life is a question that does not seem to have a general answer fit for every person. Despite the unfitness of the term *perfectionism* for the objective list approach, proponents continue to use it to describe its position and to contrast it with opposing theories of the good, such as subjectivism or hedonism.

Perfectionist View of the State

Although different theories of political perfectionism may subscribe to different objective accounts of the good, they are united by a common understanding of the task of the state, which is that the state should create favorable conditions for people to appreciate and pursue the objective goods that make their lives better. As such, political perfectionism stands in opposition to the recent doctrine of state neutrality, which holds that the state should remain neutral toward conceptions of the good life and should neither invoke them in any justification of state action nor actively pursue them by political or legal means. In the last few decades, many liberal philosophers have strongly challenged political perfectionism and defended state neutrality. The debate between liberal neutrality

and political perfectionism touches on some of the most fundamental issues in political philosophy, such as the purpose of the state, the basis of political legitimacy, and the proper scope of state's authority.

In the long history of Western political thought, political perfectionism was a dominant view of the state. Many thinkers, from Plato to Thomas Hill Green, were political perfectionists. Furthermore, it seems that the perfectionist view of the state is a natural one. Many people care about the quality of their lives and have an interest in leading a good life, just as they have an interest in health, education, and employment. So if the state exists to help citizens pursue their interests by offering health services and education and promoting the economy, it seems natural that the state should also assist citizens by promoting objective goods that make lives better.

Joseph Raz, one of the influential defenders of political perfectionism, has given a forceful argument for the naturalness of the perfectionist view of the state. The argument has several steps. It starts with the claim that if something is good or valuable, then there is a reason to bring it about. It follows that there is a reason, though not necessarily a conclusive reason, to bring about valuable goods and ways of life, for they can make it possible for people to lead better lives. The second step in the argument is that if a reason applies to citizens, then it also applies to the state, for the state's task is precisely to help citizens to act on reasons that apply to them. In the case of the good life, if citizens have a valid reason to pursue valuable goods and ways of life (call it a perfectionist reason), then the state has a perfectionist reason to guide its action as well, and hence the naturalness of political perfectionism.

But naturalness does not imply correctness. Raz's argument immediately qualifies that although it is natural for the state to act on perfectionist reasons, these reasons may be overridden by concerns for effectiveness or personal autonomy. He argues that the state should not act on perfectionist reasons if such action would conflict with either of the following two constraints: First, individual action by citizens is more effective than state action in pursuing the desired results; and second, it is more important that citizens decide for themselves, even if they make a mistake and do not achieve the desired results, than if they get the desired results without choosing them. So the state should act on perfectionist reasons, but only within the constraints of effectiveness and personal autonomy.

The third and final step of Raz's argument is that although the two constraints may rule out state action in many cases, they do not justify a blanket exclusion of perfectionist goals as proper state pursuits. First, it is not the case that individual action is always self-sufficient. The market and civil society may harm as well as promote valuable ways of life and social practices conducive to the good life. And there is no reason to believe that state intervention in social life always creates more harm than good. The matter can be decided only on a case-by-case basis by looking at the best available evidence on the comparative advantages of state versus individual action. Second, it is also not the case that as a general rule people always prefer deciding for themselves what to do, even if mistakenly, rather than following the dictates of state authority. It all depends on the subject matter of the decision in question and the means of state intervention. One may consider the example of marriage. Many people in modern society want to decide for themselves whom to marry, even though they know that they may make bad choices and that some other agent might make better choices for them. However, when the matter is less personal, such as the promotion of arts and knowledge in society, and when the means of state action do not infringe on personal autonomy in any serious way, such as taxation, subsidy, and advertisement, then there is no reason that people must prefer individual action to state action if the state action is more effective. In sum, whether or not a particular perfectionist goal should be pursued by the state is a question to be judged on the merit of each case; it cannot be rejected in a blanket way by a general exclusionary rule like the doctrine of state neutrality.

Critique and Defense of Political Perfectionism

Despite its traditional dominance and apparent naturalness, political perfectionism has been strongly criticized in recent decades. Proponents of state neutrality have argued precisely for an exclusionary rule—a blanket rejection of conceptions of

the good life as a proper basis for state action. Ronald Dworkin is one such proponent. He states that one of the key tenets of liberalism is the view that political decisions must be independent of any particular conception of the good life or of what gives value to life. Because the citizens of a society differ in their conceptions, the government does not treat them as equals if it prefers one conception or another. But if effectiveness or personal autonomy cannot justify such an exclusionary rule, what general reasons can do so?

Different proponents of neutrality have given different reasons, but one commonly invoked is the idea of respect for people. The idea is that the state would be treating people with disrespect if it justifies a policy or law by appealing to a conception of the good life with which people may reasonably disagree. Coupled with the belief that conceptions of the good life are objects of reasonable disagreement, the idea of respect for people supports an exclusionary rule that bars the state from appealing to any particular conception of the good life, for in doing so, the state would show disrespect to people who hold different conceptions.

Perfectionists have at least two replies to this argument. First, it may be said that the argument is too weak to reject perfectionist pursuits of the state. That a conception of the good is the object of reasonable disagreement does not entail that the conception is faulty or should be discarded. People may be said to be reasonable in making a judgment if they try their best to be intellectually honest, open-minded, and be willing to consider all points of view. But in this sense, reasonable people may still make mistakes so that their rejection of a certain view may be wrong even if it is reasonable. In this case, the state does not necessarily treat them with disrespect even if they disagree. Second, let us suppose that the argument is right and therefore that the state should not appeal to controversial conceptions of the good life (i.e., those that are objects of reasonable disagreement in the previous sense). But the state typically makes many different kinds of judgments and policies that are as controversial as judgments about the good life, such as those on social justice, public health care, national defense, environmental protection, and education, just to name a few. As a result, the argument of respect for people would also require the state to step out of many of its traditional policy areas, and this seems too radical a result for many liberal proponents of neutrality to accept.

In many of the liberal defenses of state neutrality, there is an asymmetrical treatment of the good life on the one hand and of other traditional state pursuits on the other. But why is the state's enforcement of controversial decisions problematic only in the case of conceptions of the good life and not in other traditional pursuits? What arguments can be given to justify the asymmetry? One argument, given by Thomas Nagel, is that on issues about justice, national defense, and such, although citizens may reasonably disagree with a particular policy, essentially all agree on the need for a unified state policy in that area. Local disagreements can be accepted and contained by a higher-order agreement on the need for state action and policy. For example, because citizens agree that a unified national defense policy is necessary for the survival and security of the country, they can reach a higher-order agreement to allow the state to make such a policy, even if it turns out to be controversial in the eyes of some citizens. But no such higher-order agreement can be obtained in the case of the pursuit of the good life, for there is no such necessity for a unified state policy on this matter.

Those who are sympathetic to perfectionism may reply that this is an impossibly stringent criterion of necessity. Such a criterion would exclude other issues that liberals would agree are appropriate objects for the state to pursue; for example, failing to adopt and act on a unified policy on education or environmental protection would not necessarily jeopardize the security or survival of a country. If, however, we move away from such stringent criteria as survival or security to a more relaxed one, such as improvement of the citizens' well-being, then traditional state pursuits such as education, environment, and public health would pass through, but so would perfectionist policies, for they also seek to improve citizens' well-being and can be effective.

John Rawls's argument in *Political Liberalism* can be seen as providing another answer to the asymmetry problem. Rawls distinguishes between disagreement on public policy and disagreement on the reason(s) used to justify that policy. For him, reasonable disagreements over social justice and other public policies can be acceptable so long

as the policies put forward by the state are justified in *terms* that are acceptable to citizens in a constitutional democracy—in other words, so long as they are justified by appealing to what he calls "public reasons," an expression that refers to the shared political values embedded the political constitution and culture of a constitutional democracy. If citizens justify their proposal in public reasons but come to different conclusions about what the state ought to do, this difference can be settled by means of majoritarian voting procedures. What is not permitted is that the state justify its policies—whatever the subject matter—with reasons that are not public and shared, but reasons derived from what he calls comprehensive religious, philosophical, or moral doctrines, which are diverse and not commonly shared by citizens in a liberal pluralistic society. Hence, Rawls's argument against perfectionism is this: because perfectionist reasons are drawn from comprehensive doctrines of the good life, the state may not justify its policies with these nonpublic reasons.

To this argument, perfectionists may reply that not all judgments on the good life as such arise out of comprehensive doctrines or have to be drawn from them. There are many widely shared specific judgments about different aspects of the good life, as the objective list approach argues, such as aesthetic experience, satisfying social relationships, meaningful work, amusement and play, intellectual and cultural achievement, and personal autonomy. These goods are generally regarded as desirable for their own sake, and they can be found in many valuable ways of life. The acceptance of these goods need not presuppose any particular comprehensive doctrine. Rather, they are compatible with a great many such doctrines and are widely accepted by many people in modern society. So perfectionist values—at least a substantial number of them—can be regarded as public reasons to which the state may appeal in justifying its laws or policies. Although Rawls's argument does rule out comprehensive doctrines of the good as the basis of a state's policies, it may not rule out specific values that are commonly shared, and they seem not in short supply in liberal societies.

Politics of Recognition

The *politics of recognition* describes a politics that has arisen in recent years in which groups demand recognition for their identities. The identities at issue have been of many sorts, but include those associated with race, ethnicity, culture, religion, gender, sexuality, and disability. They also include minority nationalities and indigenous peoples. The politics of recognition is often contrasted with the "politics of redistribution"—a politics that treats class as the primary social category and the distribution of income and wealth as the primary issue of social justice. The politics of recognition is sometimes said to have supplanted the politics of redistribution, so that complaints of social injustice have shifted away from material inequalities and toward inequalities that consist in, or arise from, the misrecognition, nonrecognition, or

negative recognition of particular groups. Whether this shift has really occurred and, if it has, whether it should be welcomed are controversial questions. Some theorists regard the separation of the two issues as misplaced, and some, such as Axel Honneth, interpret all social struggles, including those over material inequalities, as struggles for recognition.

Recognition is a necessarily social phenomenon, involving both a recognizer and a recognized. To recognize is to acknowledge, but it is to give acknowledgment of a particular sort. Acknowledgment can be normatively neutral or negative; I might, for example, acknowledge another as inferior or unworthy, but that is not the kind of acknowledgment that people normally seek. "Struggles for recognition" are struggles for positive forms of acknowledgment: for recognition of status, legitimacy, or merit.

Recognition can be given through a society's formal arrangements or rules as, for example, when a society enfranchises a group or accords it a right of collective self-determination. But it can also be sociological, so that a group's enjoyment of recognition depends on the way in which it is viewed and treated by a society's members at large. What is going on in an act of recognition can also vary. Sometimes recognition is a matter of noticing and acknowledging, such that the act of recognition neither creates nor contributes to the value of what it recognizes. When we recognize the achievements of a great novelist or a great athlete, we do not think that the recipient's greatness is a product of our recognition. Rather, the author or athlete has merit independently of our recognition; we simply discover and acknowledge it. But sometimes recognition has a more constitutive role: It confers, rather than notices, value. That is typically true of recognition of status. When a society recognizes the members of a previously subaltern group as "equals," the group's equality of status can be understood as itself a product of the society's recognition: The group's legal or social status consists in the manner in which it is regarded and treated by others.

A third variant is recognition that sits ambiguously between, or that draws on, both of these forms. Consider recognition of a government's legitimacy by the international community. The international community will have criteria of legitimacy so that its recognition consists, in part, in its noticing and acknowledging that the government satisfies those criteria; to that extent, its recognition is not merely an act of will. Yet, in our world, recognition by the international community entails more than mere noticing; the act of international recognition itself serves to confer legitimacy on a government.

Recognition can be either general or particular. It is general when it recognizes by including the recognized in some general category, such as person, human being, citizen, or equal. Historically, struggles for recognition have commonly been for recognition of this general sort. Excluded or marginalized groups have, for example, sought recognition as people entitled to the same rights, freedoms, and status as others who already enjoy that recognition, or recognition as citizens entitled to participate on terms equal with others in the life of their society. Groups have also sought recognition as nations or peoples, entitled to the international status and the collective rights of self-determination that should accompany that recognition.

However, the "politics of recognition" is now more commonly associated with the "politics of difference" than the "politics of universalism," and thus with demands for more particular forms of recognition. Indeed, those demands are often associated with complaints that merely general forms of recognition are inadequate, homogenizing, and oppressive. Many groups now seek endorsement of their particular identities. So, for example, many gays now demand that straight people should endorse the legitimacy or the equal worth of gay sexuality; and an ethnic group or indigenous people might demand that outsiders should recognize the value of its culture and regard it as equal. Although demands for general recognition are normally demands to be included and treated identically with others, demands for particular recognition can be—though they are not always—demands for different treatment. These demands are still normally registered as demands for equality, but for a more "genuine" equality that is sensitive to the different needs of different identities rather than the difference-blind approach.

Demands for particular recognition often go beyond demands for status and become demands for recognition of merit. A minority may demand,

for example, not only that the majority accord it a status equal with their own, but also that they recognize the minority's way of life as possessing a value equal with their own. Demands for recognition of this sort are especially problematic. Given that people possess different and conflicting values, they cannot accord merit recognition indiscriminately. They can recognize that someone else has a status equal to their own and a right to live a life of which they disapprove, but that does not require them, absurdly, to applaud—or to pretend to applaud—what they deprecate. Moreover, when we move from status to merit, demands for equal recognition become unsustainable. We can insist that people accord one another an equality of status, but we cannot reasonably insist that, wherever they cast their gaze, they must discover an equality of merit.

Polybius (c. 200–118 BCE)

Polybius was one of the three greatest ancient Greek historians, along with Herodotus and Thucydides. Polybius agreed with them in writing history as a disciplined intellectual analysis of the past, rather than a mere chronicle of events or propaganda for a political purpose. Like Thucydides, he focuses on political and military history, because this is the information his audience of aristocratic leaders needs to know most in terms of practical lessons. Besides other works now lost, Polybius wrote a 40-volume history of the rise of Rome to world power; only one fourth of it survives, yet this alone runs to about 800 pages. These *Histories* show Polybius's interest both in analyzing the causes of violent interstate interactions and his interest in the characteristics that make states strong or weak in a competitive world.

He was born to an aristocratic and wealthy family in Megalopolis in the Peloponnese, around 200 BCE. Megalopolis was a constituent town of the federal state called the Achaean League, which was organized on democratic principles, and Polybius—though recognizing that some kings could be outstanding leaders—was always wary of one-man rule. He received a sophisticated political education from the circle of men around his father, who was himself a prominent politician. Polybius was elected cavalry commander of the league (the equivalent of vice president) in 170/169, and a bright political future appeared likely. But his policy of caution toward Rome in the Third Macedonian War led the Romans to deport him to Italy as a political suspect, where he remained for decades. In Italy, he began his life over again as an exile, adapting to the situation by writing his massive work on the rise of Rome. He became well known and respected in Roman aristocratic society—though he was not afraid to criticize certain Roman policies. He was allowed to return to Megalopolis in 150 BCE, where he worked on his project for the rest of his life. He lived to a vigorous old age.

Polybius is most famous in the modern world for his argument in Book 6 of the *Histories* that it was the inherent strength of Rome's political system and way of life (its *politeia*) that allowed the Roman Republic to survive the Second Punic War—allowed Rome to fight to victory despite catastrophes such as those Hannibal inflicted on Rome at Cannae (216 BCE). Polybius described the political institutions of the Roman Republic in detail, stressing their basis in a system of checks and balances among three coequal branches of government. These were the consuls, the senate, and the people's assemblies. Drawing on the

political theories of Aristotle, Polybius argued that this "mixed constitution" (neither monarchy nor aristocracy nor democracy but a mix of all three) was a superior system and provided the efficiency of a strong executive (the consuls), the stability of a politically experienced group of leaders (the senate) at the heart of decision making for the state, and the power of public support and unity (voted by the assemblies) for the policies the senate proposed. Moreover, while Aristotle had touted the superiority of the "mixed constitution" in theory over the three simpler forms of government (monarchy, aristocracy, democracy), Polybius could point to the most powerful state of his time where it worked in actuality. Polybius's description of Rome in Book 6 had a profound impact on the founding fathers of the American Republic; Jefferson and Madison employed his work in creating the American system, and especially the idea of a republic as a system of checks and balances among three coequal branches of government. But politeia to Polybius meant more than political institutions: in explaining Roman ability to survive the Second Punic War, he emphasized not just the strength of institutions, but Rome's political culture as well, including widespread ideals of patriotism, physical courage, and self-sacrifice.

In discussing relations between states, Polybius emphasized the negative impact of the lack of international law: the absence of any authority with the power to interpose justice or compromise between fierce competitors meant that war was a normal outcome of the clash of interests between states. The prevalence of war is precisely why Polybius praises the Roman institutions: They enabled the republic to survive the inevitable heavy blows to which any state was liable in the Hellenistic anarchy. Besides the prevailing lawlessness, the other major element in interstate relations that Polybius underlined was what he called the growing interconnectedness (*symplokê*) between the eastern and western halves of the Mediterranean world. The two halves of the Mediterranean had long existed as two separate state-systems, a western system (centered on Rome and Carthage), and an eastern system (centered on the three great Greek monarchies in Macedon, Syria-Mesopotamia, and Egypt)—but starting during the Second Punic War, the two separate systems began to merge into one large system, where events in one part of the Mediterranean deeply affected decision making in the other part. The survival of Rome and the rise of Roman power were instrumental in bringing about the unification of the eastern and western subsystems—a condition reached, Polybius indicates, when he himself was writing circa 150 BCE.

Popper, Karl (1902–1994)

Karl Popper was a major twentieth-century philosopher of science and social theorist. He was born in Vienna, Austria, to a family of Jewish extraction. In his mid-teens, he was influenced by Marxism. The death of some workers in a demonstration that the Austrian communists had organized led him to question the rationality of his commitment to Marxism. Popper initially remained a socialist, but he became discontented with socialism because of problems of bureaucracy and increasingly critical of the Marxist-influenced political tactics of the Austrian Social Democrats.

Popper's initial academic concerns were in psychology, but he also developed strong interests in science and probability theory. His doctorate was related to methodological issues in psychology, and he increasingly turned to philosophy, one product of which was his *Logik der Forschung,* published in German in 1934 (Popper, 1959). Popper developed a striking, fallibilistic theory of scientific knowledge as progressing through "conjectures and refutations." One consequence of this, Popper stressed, was that there are no experts in the sense of people whose ideas were beyond question.

Popper, needing to flee Austria, obtained a lectureship in New Zealand. He started work on his *Open Society and Its Enemies* when Germany invaded Austria. In this and associated work (e.g., *The Poverty of Historicism*), Popper took issue with intellectual ideas he saw as influencing antidemocratic and totalitarian tendencies of the time, as well as offering his own suggestions about politics. Although political philosophy was not his major interest, his political writings are extensive—including essays in various collections of his writings, and the posthumous compilation of unpublished and previously uncollected papers, *After the Open Society*.

Popper's *Open Society* is a passionate work, in which he took issue with what he saw as historicist tendencies in Plato and Karl Marx. Historicism, for Popper, was the view that history has a particular direction or inherent periodization, which it is the job of the social sciences to discern, and which should influence our political goals. Popper, by contrast, argued that our fate is in our own hands. He also criticized utopianism—the bringing of visions of an ideal society to politics and attempts to plan society on the basis of such ideals. Popper argued that social change might be found unsettling and lead to a nostalgia for a stronger sense of community. Popper argued that life in an "abstract" open society, with its relative lack of face-to-face contact, might be unsettling. But accepting this, he thought, was a price that we must learn to pay for our freedom.

Popper's positive ideas included a passionate ethical individualism, which, he stressed, could be altruistic. He argued that what today one would call communitarianism typically misrepresented individualism as egotistical. Popper argued for the protection of the individual. His concerns were not just for liberal rights, but also for freedom from economic exploitation, and he favored a guaranteed income out of taxation. His approach had a Kantian feel to it, in which the significance of government was stressed, and it has some parallels with the recent revival of "republicanism." He also argued that the agenda for governmental action should be determined by a "negative utilitarian" agenda: more precisely by what people from different perspectives could agree called out for remedy, such as suffering and injustice. To this agenda, Popper argued that we should adopt an experimental method of "piecemeal social engineering." This would involve tentative experimentation with solutions to these problems, which—because of human fallibility, and as human actions typically lead to unintended consequences—should be the subject of monitoring. Here Popper stressed "the rational unity of mankind"—that is, that all people could potentially offer such feedback.

The Open Society is packed with ideas—notably in its extensive footnotes. Popper wrote the text in a clear and simple manner, and was concerned that this might give people a misleading impression that it was simplistic. Those approaching his *Open Society* should also consider that when Popper wrote it, he did not have a theory of how ethical and metaphysical claims could be rationally assessed (although in his view they were meaningful). The result is that it was at crucial points "decisionistic," rather than making use of his later view that such ideas can be assessed rationally if put forward as solutions to problems. *The Open Society* was influenced by aspects of Marx's views and by Popper's knowledge of, but disagreement with, Leonard Nelson's criticism of democracy. After World War II, Popper moved to the United Kingdom and taught at the London School of Economics until his (active) retirement.

Popper's later political writings include an acknowledgment of the significance of tradition and a critique of "the myth of the framework"—the idea that we can have fruitful discussions only with people with whom we are in fundamental agreement—although he also stressed the difficulties of reaching consensus. His later explicit realism in the philosophy of science, which he was willing to have described as "modified essentialism," has been argued should lead to modifications of his criticism of Marx's essentialism. Popper's ethical sentiments in *The Open Society* could be described as an egalitarian humanitarianism, and he was clearly looking to experimental, if piecemeal, government-led reform. Over the years, Popper became a little more conservative, but not in any systematic manner. Although he is sometimes grouped with "free market" conservative theorists, this misunderstands his views, and he was, right up to some of the writings of his later years, critical of free market ideology. His final work—included in *After the Open Society*—was a

plea for the introduction of a system of licensing for those involved in the production of television programs because of his concerns about the effects of the depiction of violence on children.

Pornography

There is little agreement about what constitutes *pornography*. The broadest definition, unusual today, is that it is any sort of sexually explicit visual or written material. The most restrictive definition would confine it to sexually explicit material that portrays and celebrates violent and degrading acts. In between are definitions that pick out material that is "obscene," another term that poses definitional problems. Although hard to define, pornography is an important topic for political theory: It raises questions about the relation between the state, law, and morality, and it raises hard questions for the topic of freedom of expression. Should law be used to promote moral views? And is all censorship wrong? Social conservatives, liberals, and feminists debate these questions, and liberals and feminists differ among themselves.

The social conservative view of pornography rests on a number of claims. The traditional family is an indispensable part of the good society, which is possible only if there is a climate of sexual restraint, and pornography—understood in quite a broad sense—tends to undermine that climate. And it is an essential role of the state to promote a moral climate that sustains important institutions. Those claims have been challenged by critics. There could be a good society containing multiple kinds of families, they say, and perhaps we are moving toward it. And sexual restraint may have been necessary in the past only because people were required to conform to a narrow family type. Perhaps, anyway, pornography acts as a safety valve, rather than undermining sexual restraint between people. And finally, states have no mandate from any democratic or constitutional source to promote a way of life that is regarded, by some, as good.

Liberals, however, are torn on the issue. On the one hand, freedom of expression is among their traditional demands, and they will suspect any proposal to restrict it, for they regard barriers to free expression as barriers to social learning. On this basis, they are likely to respond especially sharply to censorship proposals based on the idea of "obscenity," for what is taken to be obscene simply reflects prevailing standards, and obscenity-based censorship will thus be deeply conservative in effect, merely enshrining existing prejudices. Moreover, liberals, unlike social conservatives, object to putting the resources of the state to use in promoting moral views. Those resources should be confined to the prevention of harm. When they are used to suppress things on the sole ground that they are immoral, the implication is that the state is declaring some people's tastes to be unworthy—and no good theory of the state includes that within its legitimate aims.

But suppose pornography *harms?* If it harms people, then liberals will conclude that it must be taken off the list of protected forms of expression—like hate speech in most Western societies. If the harm in question is that involved in its production, then one set of questions arises. If actors in porn movies are assaulted, ordinary categories of crime apply. If criminal offences are held to be mitigated by the victim's consent, then issues arise because here, as elsewhere (e.g., in the case of prostitution), we do not have an agreed idea of what "consent"

requires, and advocates of prosecution are likely to favor a narrower idea of it. If the harm in question is harm occurring after the production of pornography, as a result of its distribution, then matters become more complex. Despite their resistance to limits on expression, liberals will be worried by forms of expression that tend to undermine their own ideals of equal liberty, and pornography that has an obviously inegalitarian tendency—because it portrays and celebrates the degradation of women—will be objectionable. Further, liberals may be driven to rethink the values that underlie their defense of free expression in the first place: Do these values support the freedom to express anything at all, or is their reach restricted to, say, political, scientific, or scholarly discussion? That question takes us to the foundations of liberal toleration itself.

For many feminists, the issue overlaps with the liberals' concerns. Does pornography—at least violent and/or degrading pornography—harm women? Three replies need to be distinguished: (1) pornographic representations amount, in themselves, to harm—they are a form of aggression; (2) viewing pornography leads particular individuals to acts of violence against women; and (3) the diffuse, cumulative effect of viewing pornography reinforces a socially prevalent idea that women are of value only as objects of sexual attraction, so that their ability to attain their own self-chosen aims is comprehensively undermined. Now if the first view claims nothing about consequences, it seems to merge with a moralistic view of the state that needs further defense, whereas if it does claim something about consequences, it seems to merge with one of the other views. The second view, if true, would clinch the matter, but evidence for it is elusive. The third view is compelling—even though evidence is elusive here too—at least to those who agree that we are entitled to make plausible guesses when important matters are at stake, especially when basically no important rival value stands in the way. However, if the issue is diffuse harm, things other than pornography—advertising, romantic novels—may be no less damaging.

Some theorists, however, see (some kinds of) pornography as a positive good. They see it as a way of transgressively breaking down taboos that restrict pleasure, or the categories that restrict pleasure's formulations. Finally, there are those who might agree with restrictionist arguments in principle, but object to censorship because in practice, even if sustained by good arguments, it will embody the bad judgments of the censor.

Positive Theory

Positive political theory, also known as formal political theory, is the study of political phenomena through the use of formal language and analytical models. *Positive theory* distinguishes itself from normative theory in that it focuses on explanation or prediction of political outcomes rather than on normative political ideas. It is also distinguished from other empirical theories, such as anthropological and sociological approaches, in that it aims to develop deductive systems of knowledge. That is, in positive theory, certain statements are given as axioms or assumptions, and other statements, called theorems, are logically deduced from them. Whereas assumptions are supposed to be as simple as possible, theorems make statements about complex political phenomena and generate hypotheses that are testable against empirical observations. Positive theorists acknowledge that every theory-building attempt requires abstraction from reality, and thus, it is necessary to assume certain things. They attempt to make assumptions as explicit as possible, so that once data falsify the implications of a given theory, one can know what part of the theory should be modified.

Although not a defining characteristic, positive political theory, in practice, is mostly developed

within the framework of rational choice theory. Most models in positive political theory follow methodological individualism (i.e., they seek microlevel explanations in which individuals are the units of analysis). Moreover, they assume individuals are instrumentally rational, meaning that the individual has a well-defined preference over the outcomes that can result from her actions, and among her actions, she chooses the one leading to the best outcome. Typically, models include political actors relevant to the topic they study (e.g., candidates and voters in models of elections) and, for each actor, a simple objective is specified (e.g., a candidate maximizes her vote). Models are analyzed to find a stable point, called an equilibrium, in which no actor can be better off by changing her action. Because microeconomic theory has long applied this type of modeling and equilibrium analysis, positive political theory is sometimes called a (micro)economic approach to politics.

The pioneer of positive political theory within the discipline of political science is William H. Riker, who contributed to the field not only by his research on political coalitions, voting, and strategies, but also by building the Rochester school of political science. While Riker's publications in positive theory first appeared in the early 1960s, earlier studies from other disciplines, such as economics and mathematics, inspired Riker and contributed to later development of positive political theory. Among the most influential are Jon von Neumann and Oskar Morgenstern's work on game theory, John Nash's work on game theory and bargaining, Duncan Black's work on voting, Kenneth Arrow's work on preference aggregation, Harold Hotelling's work on spatial competition, and its application to democratic elections by Anthony Downs. Positive theory has continued to develop since then, becoming one of the central methods in various subfields of political science, including comparative politics and international relations.

Positivism

Positivism is a philosophical attitude. Its main features are trust in science, opposition to metaphysics, and unified science. The last is the thesis that all sciences use the same method. Positivists share a common set of philosophical principles. However, sometimes they adopted different views on some important topics. Hence, there have been several strains of positivism—social, evolutionary, critical, and logical positivism. This entry describes each of these, examining the work of seminal thinkers in each of these areas.

The father of positivism was the French thinker Auguste Comte (1798–1857), who developed social positivism. Comte's primary aim was the reform of society. He greatly contributed to the birth of sociology. John Stuart Mill, the English philosopher, was one the best-known representatives of social positivism. Herbert Spencer, an English philosopher and sociologist, put great emphasis on evolution. His view is called evolutionary positivism. Richard Avenarius (1843–1896) and Ernst Mach (1838–1916) were mainly interested in philosophy of science. They gave birth to critical positivism. They asserted that pure experience is the only valid source of knowledge. Critical positivism influenced the development of philosophy of science in continental Europe. Finally, logical positivism was the leading school in the philosophy of science during the first half of the twentieth century. It exerted a major influence on American philosophy. Logical positivists denied the soundness of traditional philosophy. They asserted that many philosophical problems are indeed meaningless.

Social Positivism: Comte and Mill

Comte assigned to positivism the task of improving society. He believed that a reform of society was necessary to prevent moral and political anarchy. The French Revolution had destroyed the old social and political system. Every effort to establish

a new stable system had failed. Comte ascribed these failures to the lack of understanding of the laws that govern the dynamics of society. He believed that these laws have the same status of the laws of natural sciences. They are the subject matter of a new science, which Comte called "social physics" and later "sociology." The laws studied by sociology are important because they can give reliable forecasts, which are essential to predict the effects of the reforms.

Comte affirmed that he had discovered an important fundamental law about the development of ideas. It was the law of the three stages. The law states that human conceptions develop through three stages or phases. Comte called the three stages the theological, or fictitious; the metaphysical, or abstract; and the scientific, or positive. In the theological stage, the aim of research is to discover the first causes of events. These causes are identified with the will of deities. At its highest perfection, the theological stage keeps only one supernatural being—God—as the first cause of every event. The metaphysical stage substitutes the will of supernatural beings with the effect of abstract forces. Eventually, the metaphysical stage recognizes that only one force is needed—nature. The scientific (positive) stage consciously stops the vain search for the first causes. Science more fruitfully searches for the laws of connections between events. Science does not ask "why?" but "how?"

Comte built his classification of sciences on the foundations provided by the law of the three stages. Sciences reach the positive stage according to the complexity of their subject. The simpler arrives first; the more complex arrives later. The first natural science to reach the positive stage was astronomy. The other sciences that have reached the positive stage are physics, chemistry, and physiology (i.e., biology). Mathematics, the indispensable instrument needed by every science, plays a special role. The only science that still has not reached the positive stage is social physics (i.e., sociology). The aim of positive philosophy is to establish sociology as a positive science. Sociology, in its positive stage, can give reliable forecasts based on exact laws. Hence, sociology can help in improving society because reliable forecasts are essential tools to reform the society.

Comte stated that all sciences employ the same methods. Hence, there is no difference in principle between mathematics, natural sciences, and human sciences. Therefore, sociology uses the same method as biology and physics. The unity of science is the unity of method, not the unit of theories. It is impossible to explain all events by means of only one general theory. Every science utilizes the results of the simpler sciences. However, complex sciences are not reducible to simpler sciences. For example, though biology utilizes the information provided by chemistry and physics, it is not reducible to them.

Comte expressed a strong aversion to democracy. He suggested that government had to be i n the hands of industrialists, businessmen, and bankers. Inspired by the organization of the Roman Catholic Church, Comte planned a society based on obedience and hierarchy. He even developed a religion of humanity as a substitute for traditional religion. Women were responsible for the defense of morality. This rather surprising suggestion was probably influenced by his infatuation for Clotilde de Vaux. He met her one year before her death.

In the hands of Mill, who published a sympathetic review of Comte's philosophy, positivism reached some interesting results. Mill pushed the unity of science to the point of considering mathematics a kind of natural science. The laws of mathematics are not a priori, but their origin is in experience. Logic is an empirical science, too. Mill introduced utilitarianism—the theory that the rightness of an action is measured by the happiness that it produces—in the realm of positivism. He opposed utilitarianism to Comte's view that extreme altruism is necessary to produce the greatest happiness.

Evolutionary Positivism: Spencer

For Comte, unified science was the unity of method. For Spencer, unified science was the unity of theories. Hence, Spencer searched for a unifying principle. He believed that evolution is the general principle that can unify all fields of knowledge. Evolution shapes everything. It shapes inorganic matter, living organisms, individuals, and society. Evolution is the process of aggregation of matter and dissipation of motion. The structure evolves from a simple, incoherent, and homogeneous state into a complex, coherent, and heterogeneous state. The reverse process—dissolution—is

the acquisition of motion and the disaggregation of matter. To understand these definitions, look at the nineteenth-century theory about the solar system's birth. Initially, there is a gaseous nebula. Its structure is simple, incoherent, and homogeneous. Matter moves freely in the nebula. Later, matter aggregates into the sun and the planets. Their structure is complex, coherent, and heterogeneous. The gravitational influence of the massive bodies limits the movement of matter.

Both evolution and dissolution remain active in every stage of the life of every structure. There is a permanent competition between evolution and dissolution. During the juvenile phase of its life, an organism experiences the predominance of evolution. The life ends when dissolution prevails. The alternating predominance of evolution and dissolution is the norm in the intermediate phase of maturity. Equilibrium is impossible—its probability is too low. Even human society evolves according to the law of evolution and dissolution. The division and specialization of labor is the consequence of the evolution from a simple to a complex state. Evolution explains why society cannot be stable. There is no equilibrium in the struggle between evolution and dissolution. Hence, society is always subject to more or less radical changes. Every society is destined to ruin due to the final prevalence of dissolution. The law of evolution and dissolution thus governs society and living organisms in the same way. However, society lacks the kind of consciousness typical of living organisms. Society is not conscious, whereas its parts—the individuals—are conscious. On the contrary, living organisms are conscious, whereas their parts are not conscious. On this difference, Spencer based his extreme individualism. Society exists only to benefit the individuals.

Spencer, following Jean-Baptiste Lamarck's theory, believed that the traits acquired during the life of individuals are inheritable. Parents can transmit to their offspring the characteristics and the habits that they acquired as an adaptation to the environment. The organisms best adapted to the environment have greater probability that their offspring is best adapted too. This is the law of the "survival of the fittest." Society cannot intervene to mitigate the life of the "unfittest," because such an action is against the survival of the fittest. Those who care about the suffering of the poor interfere with the evolution. They make the struggle for existence harder for the worthy. Who are the unworthy, the unfittest? They are the unsuccessful and the reckless. They are the poor—this was Spencer's belief.

Critical Positivism: Avenarius and Mach

Critical positivism, also known as empiriocriticism, is the kind of positivism developed by Avenarius and Mach. The German philosopher Avenarius asserted that the distinction between things and concepts (i.e., mental images of things) is ill founded. He argued that in pure experience, the things are not distinguishable from their mental image. Our internal activity creates the two separate entities—the thing and its image—from pure experience. Avenarius called this internal activity "introjection." We can solve many philosophical problems by recognizing that the distinction between things and concepts is not given, but is the result of introjection. For example, the mind–body dualism is a meaningless problem. Introjection creates the distinction between the body and the mind, thus generating a false problem.

Mach was an Austrian physicist and philosopher. "Mach number" is the term for a unit of measure of speed. The name celebrates his pioneering studies on supersonic motion. Mach asserted that the Inertia of a body depends on the mass of the other bodies. Einstein named this principle "Mach principle." He acknowledged the positive influence that Mach's principle exerted on the birth of relativity theory.

Mach is well known for his theory of the economy of thought. The purpose of science is to provide us with an economic description of nature. Scientific theories are not literally true or false. We judge scientific theories according to their usefulness. The measure of the usefulness of a theory is its ability to give reliable predictions and procedures for acting on the world. Mach believed that science is an adaptive response of human beings to the environment. Science helps humanity in the struggle for survival.

Various themes of positivism converge in critical positivism. One theme is Comte's view that positive science gives predictions that help in planning actions. Another is Mill's utilitarianism, applied to the scientific enterprise. Unity of science is interpreted as the unity of physical and psychic.

Evolution explains science as an adaptation to the environment.

Critical positivism inspired the Russian physician and revolutionary Alexander Bogdanov. He held important positions in the Soviet Union in spite of his conflicting relation with Lenin. Bogdanov attempted a synthesis of critical positivism and Marxism. Lenin severely criticized Bogdanov's work. Lenin accused critical positivism of being a disguised form of idealism derived from George Berkeley's philosophy.

Logical Positivism

Logical positivism was the leading school in philosophy of science until the 1950s. It arose in Austria and Germany in the 1920s. Its members were the most distinguished philosophers of science of the first half of the twentieth century. The complete list is so long it would be useless in this context. One can specifically remember Moritz Schlick, Otto Neurath, Hans Reichenbach, Rudolf Carnap, and Carl Gustav Hempel. Their ideas were progressive, liberal, and sometimes socialist. Due to Nazi hostility, many logical positivists left Austria and Germany. They moved to the United States, where they influenced American philosophy. Currently, the influence of logical positivism persists, especially in the way philosophy is practiced and taught. This influence is evident in at least two points. One is the attention that philosophers pay to the analysis of language. The other is the central role played by formal logic and probability theory.

According to logical positivism, the only valid sources of knowledge are logical reasoning and empirical experience. Contrary to Mill's opinion, mathematics is a priori and reducible to logic. Natural and human sciences are grounded on experience. Their method is the same. There is a bi-dimensional unity of science. First, there is the unity of method. This unity is indeed partial because mathematics has its distinctive method. Second, there is the unity of theories, because every science is reducible to physics. Hence, contrary to Comte's opinion, social sciences are reducible to biology, which is reducible to physics.

There is no room for metaphysics in the philosophy of logical positivism. Metaphysics is the result of logical mistakes. One source of logical mistakes is the ambiguity of natural language. Another source is Kantian philosophy, which affirms that one can acquire knowledge without the help of experience, relying only on reason. The persistence of metaphysics in philosophy is a consequence of social and economical struggles. There is an alliance between metaphysics and theology in defending traditional social organizations. The competition between metaphysics and positive philosophy is thus a struggle between different political, social, and economical viewpoints. One purpose of logical positivism was the reform of education, university, philosophy, and art. The final goal was the construction of a "constitutive system" in which every statement is reduced to the concepts of a lower level. At the lowest level, every statement refers directly to the experience. From this goal follows the search for clarity, neatness, and intersubjectivity. They are reachable using a neutral symbolic language. This kind of language eliminates the problems arising from the ambiguity of natural language.

Logical positivists were active in advertising their ideas. They organized several congresses on epistemology and philosophy of science between 1929 and 1937. They planned an *International Encyclopedia of Unified Science* that was never completed. Only the first section, *Foundations of the Unity of Sciences,* was published between 1938 and 1969. It contains two volumes with 20 monographs.

POSTCOLONIALISM

Postcolonialism is a stance framing theoretical or cultural responses to the diverse effects of modern European colonization. It also commonly implies a political commitment, because in the act of responding to the postcolonial condition, the theorist or artist strives to transform oppressive forms of sociality that arose in the context of modern European empire building and have often been sustained, even after decolonization. In seeking to describe, explain, and disrupt this complex history, the field of postcolonial studies is primarily focused on cultural analysis, which draws from various social and political philosophies to encompass a multitude of approaches and emphases that often conflict and contest each other. Accordingly, postcolonialism must be described not only in terms of the key concepts that characterize, unify, and delimit the terrain of postcolonial engagement, but also in terms of the internal debates defining a variety of positions within the broad field of study. In turn, the diversity at the heart of postcolonial experiences, conceptualizations, and expressions of worldly reality prompts new and emerging forms of postcolonial political theory, which challenge received notions of universality, neutrality, and consensus. In so doing, postcolonial political thought transforms established Western political theories and rethinks many of the concepts that conventionally ground political discourse, including power, citizenship, sovereignty, constitutional agreement, and entitlement.

Key Formulations

Colonization is the conquest and control of other people's territories. Imperialism is the policy and ideology of economic expansion that drives colonization. Colonialism is the discursive framework a colonial power mobilizes in order to justify acts of colonization. Much work carried out within the theoretical framework of postcolonialism is critically addressed to colonialism and the cultural practices that it created, and that in turn sustained colonial influence during periods of colonization. Other postcolonial work attends to the ways in which this colonial ideology was contested and disrupted at the time of colonization by the cultural agency of colonized people, eventually resulting in decolonization.

For each of the European colonizers, the existing material and social conditions they found in the colonial locations created particular perceptions and understandings of the inhabitants and determined distinctive ways of acting on them. The way in which the imperial center imagined the colony and its inhabitants significantly affected the type of settlement it engaged in and the system of governance it imposed. In turn, the various modes of establishing colonial relations created various types of imperial self-concept, which were, nonetheless, clustered into a common set of ideological justifications defining a culture of colonialism. The diverse nature of colonial practice also impacted variously on the inhabitants of the colonial locations, determining the particular nature of the transformation of their societies, economies, and cultures, and provoking the distinctive forms of resistance they engaged in. Accordingly, participants experienced colonialism and decolonization in dissimilar ways according to the specificity of their location and the nature of their identification with, or revolt against, a particular empire: The study of this diversity of experience is the focus of much of contemporary postcolonialism.

Other strains of postcolonial thought are tempted to search for generalizations in describing and explaining the vast reach of European colonization in terms of the driving force of capitalism. Indeed, much early postcolonial work on colonial oppression offered explanations inspired by Marxism and couched in universal terms of economic class exploitation. Early critiques of colonialism asserted that no matter where it took place, colonization essentially involved the economic exploitation of the colonized class by the colonizing class. An integral aspect of this early

postcolonial analysis was its contribution to the revolutionary resistance movements and liberation struggles associated with decolonization. This revolution was understood to involve the return of power, reclamation of land, and seizing control of the means of production. In this way, early postcolonial work, such as Frantz Fanon's *The Wretched of the Earth* (1961), was often firmly linked with a Marxist agenda, and the objective was not simply the removal of colonial structures of authority, but also the dismantling of the capitalist system that had been imposed at the time of colonization.

Culturalism is another perspective characteristic of much of early postcolonial thought. At times deliberately countering the economic reductionism of classical Marxist diagnosis and prescription, culturalist analysis privileges the central role culture plays, not only in the maintenance of colonial power but also in the resistance techniques of colonized people. In works including *Orientalism* (1978) and *Culture and Imperialism* (1993), the influential Palestinian-born postcolonial theorist Edward Said first considered the power of colonialism as it is practiced through the manipulation of culture. He examined the way cultural forms, including religion, literature, and advertising, constructed colonized people as exotic, uncivilized, and inferior in relation to the colonizers. The most significant part of this analysis is Said's insistence on the dependence of the colonizing class on this discourse in order to define itself as the embodiment of a superior civilization, thereby simultaneously constructing a moral justification for colonization in the form of the obligation to "civilize" the inferior "other."

However, as Arif Dirlik has argued, culture is at once a tool assisting the construction of colonial hegemony and simultaneously a technique of liberation when colonized people mobilize cultural forms of their own making in order to contest the verity of the "exotic" and "inferior" representations imposed on them. In another influential early postcolonial text, *Black Skin, White Masks* (first published in 1952), Frantz Fanon asserts that, in a social world shaped by colonialism where the identity of the colonized individual has been racially determined and disfigured, a significant political response available to the colonized native is to affirm the authenticity of a positive cultural identity derived from the fact of "blackness." However, Fanon rejects the notion that there are essential qualities and characteristics that capture racial nature and experience, like those celebrated by Aimé Césaire, Leopold Senghor, and other poets and theorists of the Négritude movement initiated in Paris in the 1930s: rhythm, physicality, emotive sensitivity, a mystical connection with the natural world.

Fanon explains that the problem is not simply that Négritude utilizes archaic forms of racial identity to assert a positive cultural presence grounded in past traditions that can lack contemporary relevance; just as colonialism homogenizes the identities of diverse peoples by universally labeling them as primitive and inferior, so too Négritude asserts a universal Negro culture that ignores actual heterogeneity in the problems facing colonized people in different parts of the African continent and diasporas. The promotion by colonized people of their own cultural identity grounded in past traditions usually resists colonial oppression by providing an alternative and positive image of racial and cultural identity. However, both colonialism and Négritude impose an artificial stereotype on an actually diverse collection of people. Fanon therefore insists that colonized people must resist colonial authority, not through abstract and universal ideas, but through localized cultural and political practices aimed at national liberation.

Indeed, much of postcolonial study is devoted to the canon of so-called third world literature, which gave authentic voice to the experiences and national aspirations of colonized people. In choosing their own terms of representation for themselves and their histories, oppressed people undermined the logic of colonial authority by discrediting and dismantling the discourses that supported justifications for imperialism. However, once again, concepts such as "third world" and "nation" are generalizing categories that can work to deflect critical attention from the diverse ways in which suppressed cultural groupings *within* nations may continue to be exploited by class hierarchies that predate colonization, or that were introduced with the imposition of capitalism and remain after decolonization. Suppressed groups within nations may also have been excluded from liberation movements and nation-building processes, complicating postcolonial analyses of decolonization.

Although Marxist and culturalist inflections continue to characterize much contemporary work in postcolonialism, the early tendency to use generalizing categories of analysis is often now attenuated by a careful consideration of the way vast differences in location affected the material circumstances of colonization. This attention to detail and difference enables a more nuanced materialist analysis of colonial power and resistance that is sensitive to the local cultural dimensions of its construction and justification through the complex interaction of class, race, and gender in localized relations of social practice. In emphasizing the heterogeneity of postcolonial experience, a significant strain of contemporary postcolonial study draws on constructivist thought, including deconstruction and poststructuralism, with the result that the early culturalist and Marxist approaches have been supplemented, and somewhat contested, by the development of the more clearly poststructuralist and deconstructionist aspects of Edward Said's argument in *Orientalism,* notably through the respective writings of Gayatri Chakravorty Spivak and Homi Bhabha.

Spivak's work is often addressed to postcolonial theory itself. She insists that the complex nature of colonization and decolonization necessitates a robust and multifaceted analysis through a complex array of theoretical perspectives. Accordingly, she is identified, among other things, as a "feminist, Marxist, deconstructionist." In her celebrated essay, "Can the Subaltern Speak?" (1985), Spivak challenges the assumption that colonized people can adequately represent themselves within the established terms of Western political discourse in order to recover a lost or silenced, definitively "subaltern," speaking position. In fact, she insists that the colonized individual is never a stable site of resisting agency, being always already inscribed with multiple, at times contradictory, sites of identification, including gender and economic class. Where the subaltern might exercise agency within one system, this agency is simultaneously effaced by the other systems of representation. In critiquing the methodological and epistemological assumptions underscoring the notion of representation that lies at the heart of much Western theory, her analysis incidentally attends to the ways in which postcolonial theory derives its terms of reference from the discourse of the colonizer. This occurs because of the privileging, following colonialism, of Western philosophy and literary conventions, and the tendency toward uncritical use of representative political categories, such as "nation," which can naturalize the territorial boundaries imposed during colonization. In so doing, Spivak deconstructs the given centrality of Western style theory and political practice, and without specifying a more positive program, nonetheless holds out the possibility of other types of resistance strategy that do not operate wholly within the terms of reference established in, and by, Western thought and practice. Spivak's work is particularly complex, therefore, because she draws from strains of Western theory, like Marxism and constructivism, while simultaneously warning that postcolonial theorists must attend to the productive bias associated with the Eurocentric worldview of such theories. Spivak, too, is in certain ways guilty of this, but she firmly grounds her own work in a careful acknowledgment of her own situation and privilege.

While retaining aspects of culturalism and the Marxist analysis of class exploitation, Spivak's work significantly contributes to deconstructionist postcolonial theory. Such postcolonialism strategically challenges established representations, such as "the West" and "the third world." In so doing, this kind of thought disrupts the political authority attached to such representations by insisting that such concepts are not certain and true reflections of a given reality. Deconstructionist analysis instead insists on the permanent potential of shifting powers of cultural expression and construction, which are associated with a critical power to disrupt and transform dominant expressions of reality. Although established representations may attain a hegemonic acceptance as certain fact, this belies their actual nature as unstable and transient constructions of a reality that is always in production, and so always open to alteration.

In conducting this kind of analysis, deconstructionist postcolonial theory has often attended to representations that establish the authority of a colonizing class. For Homi Bhabha, the most significant feature of colonial discourse is not that it persuasively constructs a false representation of colonized people as uncivilized and inferior, which then mobilizes a justification for a political end, but rather that it reveals aspects of colonial identity that suggest its own internal conflict and lack

of coherence. Bhabha's own analysis consequently draws not only on poststructuralism and deconstructionism, but also on psychoanalytic theory, in order to attend closely to the process and the politics of colonial identity formation. In fact, Bhabha's work is situated within a long tradition of postcolonial thought, including the works of Octave Mannoni, Albert Memmi, Frantz Fanon, and Ashis Nandy, which also draw on psychoanalytic concepts for the interpretation of the colonial condition, but focus primarily on the psychological effects of colonization on the self-concept of colonized people. Bhabha instead draws attention to the ways in which colonial desire and the self-concept of the colonizer are marked by ambivalence. This ambivalence is discernible in colonial discourse about the colonized "other," which is conflicted by simultaneous instances of attraction toward the alluring, exotic other, and revulsion at the perceived baseness of the other. Furthermore, such revulsion is often coupled with the explicit fear that contact with the other might contaminate or blur the division between colonizing subject and the objects of colonization, thereby undermining the logic of racial distinction that underpins colonialism. According to Bhabha, by manipulating this tension between the simultaneous desires to appropriate the attractive other and to repel the base other, colonialism can be contested or unraveled from within, collapsed by its own internal instability.

With this dissonance in mind, Bhabha elaborates "mimicry" as a resistance strategy that can be used by colonized people. In assimilating to colonial culture, the colonized individual mimes the colonial subject by taking on the pretensions of the "superior" culture and affecting the speech, values, system of production, and fashion of the colonizer, and so is at once recognized as similar or assimilated, yet disturbingly dissimilar: "not quite/not white." The mimic confronts the colonizing subject with a "menacing" and partial reflection, rearticulating and simultaneously alienating the identity of the colonizer through the act of mime, returning the colonial gaze on the colonizer so that the constituting ambivalence of the desire that structures colonial identity is plainly visible: The desire to assimilate and the desire to differentiate is at once marked on the posture of the colonized mime. For Bhabha, when it is self-consciously practiced by colonized people, mimicry marks a sign of political resistance and civil disobedience. However, because it is limited to the deconstruction of the colonizing power, mimicry surely falls somewhat short as a resistance strategy. It offers no alternative vision of society, no positive reconstruction of an alternative relationship.

The evident limits to the usefulness of mimicry in thinking about resistance and transformative agency are the focus of much criticism directed toward deconstructionist postcolonial theory, and indeed constitute the primary debate between poststructuralist and Marxist types of postcolonialism. The critique of fixed representation or cohesive political identity has seriously complicated Marxist notions of political agency, which relies on a coherent notion of an oppositional resisting class. In response, Marxist versions claim that poststructuralist and deconstructionist postcolonialism obscure analysis of the "real politics" behind imperialism and exploitation, namely global capitalism. By emphasizing the fragmentation of identity and history, such theory is also perceived to undermine the collective efforts of resistance against colonization made by oppressed people through their unifying narratives of nationalism. Poststructuralism is thus perceived to be politically motivated by the imperial desire to deflect and deny due recognition of resisting subjects in a deliberate construction of a disabling politics coinciding with the emergence into subjectivity of previously subjected peoples.

Although it does undermine the traditional Western grounding of political agency in a concept of coherent moral identity, poststructuralism is not entirely devoid of a notion of subjectivity. In fact, selfhood is always in construction and defined in relation to others: Subjectivity is situational, relational, and developing. This resonates with attempts by some postcolonial theorists to think identity in terms of diaspora, hybridity, situation, and performative strategy. However, Marxist or materialist postcolonialism not only worries about the scope for agency and resistance in postcolonial theory influenced by constructivism and psychoanalysis, but also criticizes the ways in which such theory privileges "discourse" and "text" as the cultural products of the "speaking subject" under analysis, thereby neglecting the primary political, social, and economic "context" of enunciation. Marxists

including Aijaz Ahmad, Benita Parry, and Arif Dirlik accuse poststructuralist and psychoanalytic theorists of postcolonialism of indulging a privileged class preoccupation with issues of individualism, self-expression, and identity, which they argue shifts critical attention away from the material and social causes of political oppression.

The four key formulations of postcolonialism—Marxist, culturalist, poststructuralist, and psychoanalytic—are often defined against each other in terms of the debates they enter into. These debates are not particular to postcolonialism, but are illustrations of disputes taking place within the broader field of political theory, which have been brought into a postcolonial context. Although the terrain of postcolonial studies is characterized by internal rifts and conflicting philosophical allegiances, a number of key issues and concepts that are particularly relative to postcolonialism have emerged from these debates. Although approaches to these differ according to one's theoretical preference, the engagements they invite may be thought of as unifying features across the field of postcolonialism.

Key Concepts and Engagements

Much postcolonial work employs or interrogates the concept of "place." At a most concrete level of analysis, such work attends to the geographical and demographical consequences of colonialism, particularly by investigating the various ways in which colonialism transformed the places it acted on. The colonial scramble for land and the associated "carving up" of continents resulted in the imposition of new territorial boundaries, which were sometimes quite arbitrary and ignored existing geographical, social, and cultural divisions and distinctive forms of law and political governance. This has had lasting effects, creating serious ethnic tensions that continue to plague war-torn regions of the world today, such as Palestine or the disputed territory of Kashmir.

The postcolonial study of "place" may also involve attention to the dislocation of colonized people and the ways in which their cultural traditions at once survived and were transformed through processes of colonial settlement in new and far-flung places. The study of the postcolonial diasporas and the ways in which exiled migrants and slaves transformed their cultural figurations of "home" in relation to both their homelands and their new situations, as well as in relation to the global dispersal of their relations and traditions, provides significant insights into the postcolonial condition of many communities.

Colonial fantasies of "place," read through cultural forms, including literature and cartography, also provide fuel for the postcolonial analysis of colonial politics. The stark political division between the colonial center and the colonies is often represented in colonial discourse in terms of a spatial metaphor that locates the colonial power center stage in the metropolis and the colonies as circulating around the periphery like dependent moths around a flame. The ongoing tendency to place the colonial power at the privileged center of analysis is discernible in contemporary discussions that employ a politicized conceptual distinction between the first and third worlds, or the "The West and the Rest": The critical deconstruction of the continuing power of such representations is the objective of certain postcolonial analysis.

Another way in which "place" importantly figures in postcolonial studies concerns indigenous people's traditional relationship with their lands, which in locations including Australia and Canada is often nonproprietary and instead grounded in a sense of spiritual belonging that entails a deep sense of obligation and care. Associated with the study of indigenous conceptions of "place" and "belonging" is the criticism of the narrow Eurocentric understandings of communal relation to land and the colonial failure to acknowledge structures of governance that emerge from communal property. This failure of colonial perspective continues to disadvantage indigenous claims for self-determination today.

In raising questions about situated communities and the way colonialism transformed existing power relations and imposed new structures of social domination and convention, the concept of "place" also opens onto the study of postcolonial social interaction. Much postcolonial work considers the "hybridity" of postcolonial communities: the multicultural mixing of people and their traditions as a result of colonial translocations. An important aspect of postcolonial social theory is its emphasis on the ethics of responsible interaction, mutual recognition, and multicultural coexistence,

and increasing attention is now directed toward conceptualizing types of political institutions that can express principles of collective agreement while acknowledging and respecting social diversity.

A second concept preoccupying much of postcolonial study is "production," which closely links with questions of productive control, agency, and resistance. In part, this concerns economic control and exploitation following colonization. However, "production" also entails a dimension of social construction, which refers not only to economic output, but also to the ways in which a community constructs and expresses its sense of self through cultural creations, including literature and art, and its organization as a type of social arrangement or mode of governance. Much postcolonial work engages with processes of cultural and racial identity construction, particularly the ways in which colonialism has impacted on the self-concept of colonized people. Also of interest are the ways in which colonized people have responded to this impact by reinventing and redefining the concepts they use to represent themselves, at times also using new forms of expression, such as the novel, enlisted from the colonizers. Other postcolonial work criticizes the way in which colonialism imposes dominant forms of culture and knowledge, including language and theory, which can undermine authentic expression and can result in the loss of traditions already made vulnerable during colonization.

A third concept too common in work in the area is postcolonial "temporality" and the continuing historical consequences of colonialism. Much of postcolonial study is concerned with the legacy of the colonial past in the present and the question of reparative justice: patterns of globalization, international economic inequalities, systemic poverty and disease, migration, and ongoing military conflicts and border disputes may all be traced back to colonial roots. In fact, many thinkers have been hostile to the notion of *post*colonialism as signifying a historical remove from colonialism, pointing out that for many indigenous people who are still caught up in relations of domination and are still struggling for the recognition of their territorial claims, there is little that is "post" about their experience of colonization. Accordingly, rather than denoting an evaluation of a historical achievement already reached, the term *postcolonial* best describes an ongoing stance of engagement with colonialism, which includes not only tracing its historical impact on material locations, but also resisting habitually imperial modes of action and thought. This involves careful attention to inventing new ways of regarding and transforming the material world and new forms of sociopolitical interaction and governance based on principles of mutuality and pluralism. These concerns define an emerging field of postcolonial political philosophy.

Postcolonial Political Theory

Postcolonial emphasis on place, particularity, historic injustice, and the politics of representation and expression challenges received notions of universality, neutrality, and consensus and calls for a politics of difference and recognition, prompting new principles of postcolonial political thought. Emerging work in this area rethinks many of the concepts that conventionally ground Western political discourse, including power, sovereignty, constitutional agreement, and entitlement.

The crux of the postcolonial challenge involves a critique of the ideal of universality, which underpins the structuring principles inherited by Western political thought as a legacy of the Enlightenment: humanism, consensual public reason, and historicism. Postcolonial thinkers, including Robert Young and Dipesh Chakrabarty, identify the collusion that occurs between Enlightenment philosophy and imperialism when Western norms of human and social experience, political organization, and historical trajectory are presented as neutral and universal, thereby excluding alternative social forms and histories and devaluing them as inferior. Although polarized within Western political thought, both liberalism and communitarianism share this legacy, and postcolonial criticism encompasses both traditions. Thus, political philosophers influenced by postcolonialism assert that liberalism denies difference through its formalization of individualism in an ethic of rights, which assimilates individuals under a common measure of essential human nature that is indifferent to group affiliations and concerns. However, communitarianism also denies difference by positing group unity as an ideal pursued through affiliation and identification. Even so, because it is the dominant

tradition within Western political philosophy, the full force of postcolonial critique is usually directed at liberal cosmopolitanism, and often specifically at John Rawls's (1971) theory of justice.

This liberal vision of justice as fairness is particularly problematic from a postcolonial perspective because it champions individual liberation as the human transcendence of group differences, including race, sex, religion, and ethnicity. This emphasis on individual liberty neglects the political significance of group differences in just processes of public deliberation. In fact, postcolonial historiography demonstrates that ignoring group difference is less often liberating than it is a form of oppression. Colonialism leaves a legacy of oppression and domination that is manifest and experienced through group differences of privilege and disadvantage. Postcolonial political philosophers argue that by ignoring group differences, liberal individualism perpetuates existing patterns of domination because it does not provide the necessary institutional mechanisms to allow disadvantaged groups to achieve public equality with dominant groups. Whereas liberalism strives to remain blind to group differences in the effort to treat all individuals equally, postcolonialism asserts the political relevance of groups and the need to maintain political institutions that recognize group identities and preserve their visibility in the public arena.

Furthermore, Iris Marion Young argues that liberalism does not simply fail to address significant issues of group inequality in the aftermath of colonization; liberal humanism also results in a politics of assimilation that perpetuates cultural imperialism because it presents the Western liberal individual as a neutral and universal human norm. This approach normalizes historically privileged forms of social and political identity and marks "deviant" identities as substandard and inferior. Colonized individuals may aspire to mainstream equality, but they do so in a social environment where the standard has already been set by the colonizing class. Liberalism seeks to eliminate oppression by eliminating group difference, which requires individuals to assimilate to a norm that masquerades as universal and neutral but is in fact particular and privileged, inherited from colonialism. The liberal claim that all individuals are treated impartially simply masks the group privileges that attach to the norm.

Western liberal democratic political institutions are founded on this problematically "universal" notion of the normative (rational, self-interested, autonomous) citizen-self. Democratic processes of public deliberation and consensual agreement take place within a forum that assumes the relevant existence of "but one public reason," exercised by individuals who meet on the common footing defined by their "universal" enjoyment of an "equal standard" of citizenship. The institutional forms of liberal democracy also assume a state-centric view of power: Constitutional arrangements are designed to moderate and mediate the political relation between state and citizen, and both state and citizen are viewed as unified and well-defined entities with clearly defined rights and obligations demarcating their respective boundaries and permitted spheres of engagement. The state itself is understood in terms of undivided sovereignty, defined in terms of the territorial unity described by the *nation,* which is in turn ideally represented as a cultural unity of homogenously identified, equal citizens. Postcolonialism issues challenge these sets of assumptions by insisting on the irreducible multiplicity of subnational cultures, the existence of plural forms of political expression and reason, and the recognition that political power extends beyond the institutional structures of the state to encompass forms of social and cultural domination arising from colonial history, in relations between diverse cultural groups that constitute modern societies.

Rather than subordinating real diversity to ideal principles of overarching identity or universal experience, postcolonial political theory responds to these challenges by devising new forms of political expression and accommodation capable of acknowledging and recognizing political and cultural pluralism. At times, this response occurs within liberalism, as can be seen for example in the work of Will Kymlicka, who seeks to elaborate formal principles of justice based on differential rights protecting the equality of citizen participation in cultural life. More commonly, postcolonial political philosophy escapes the conceptual boundaries defining the political logic of liberalism. For example, William Connolly insists on a necessary ambiguity and fluidity within concepts central to the notion of legitimacy within democratic theory, such as "nation-state," "consensus," and "citizenship."

In his view, such conceptual flexibility is logically required for legitimate democratic practices of political expression. Sharing this view, Duncan Ivison argues that postcolonialism compels recognition of the need to cultivate supple and plural forms of public reasoning capable of registering diverse cultural concerns and interests historically ignored by colonial law.

Such principled pluralism must be reflected in forms of governance capable of mediating difference in order to find genuinely common agreement. To this end, James Tully has developed a notion of postcolonial constitutionalism appropriate for adjudicating the diverse claims for cultural recognition characteristically voiced within postcolonial and multicultural societies. He argues for a dynamic form of conciliation of such claims through constitutional discussions in which participants pragmatically reach periodic agreement on appropriate forms of accommodation and mediation of their differences. Informed by a "spirit of mutual recognition" and a commitment toward the accommodation of cultural diversity, Tully's constitutional framework for postcolonial negotiation and mediation is governed by three primary conventions of justice: mutual recognition, continuity, and consent.

Much postcolonial political thought is similarly devoted to exploring concepts that might successfully express "nonstandard" claims for cultural and political recognition, such as indigenous rights to native title, cultural rights of minority groups, divided sovereignty, and the right to self-determination of "internal nations" within formally constituted political states. Such concepts are created for the purpose of mediating traditional (precolonial) political structures or practices and the institutional forms of Western liberalism imposed with colonialism. When successful, this process of philosophical mediation expresses crucial, and often conflicting, aspects of dissimilar political traditions in a new composite form that transforms them both. Postcolonial political philosophy may accordingly be characterized as the attempt to theorize a hybrid middle ground for the mutual recognition and conciliation of the diverse political conventions, concepts, and practices that now coexist in formerly colonized societies.

POSTMATERIALISM

Postmaterialism is a concept most often associated with the work of American political scientist Ronald Inglehart. In his books, *The Silent Revolution* (1977) and *Culture Shift in Advanced Industrial Societies* (1990), Inglehart argued that the growth of affluence in Western industrial societies in the decades following World War II had lead to a fundamental transformation of cultural and social values. Employing Abraham Maslow's concept of the "hierarchy of needs," Inglehart claimed that once the conditions of material security had been realized in a society, its members were likely to pursue nonmaterial goals focused on personal relations, autonomy, and self-realization, or what might be described as matters concerning the "quality of life." This is precisely what had happened in advanced industrial societies in the late twentieth century. A shift to nonmaterial—or "postmaterial" values as Inglehart dubbed them—had profoundly affected culture and society. Politics, work, religion, family life, and gender relations were no longer regarded principally as the means by which individuals or groups achieved physical security and well-being, but rather as vehicles through which autonomy and recognition of plural identities and interests could be secured. For Inglehart, the postmaterialist shift is empirically demonstrated in data from major surveys indicating intergenerational changes in attitudes and values in industrial societies during the late twentieth century.

The movement toward postmaterialist values is said to have had a profound effect on the nature of politics and collective action over recent decades. In the first half of the twentieth century, the domestic politics of industrial societies were shaped by the conflict between labor and capital. Socialist parties and trade unions sought to secure for the industrial working class basic material security through a mixture of state regulation of production, a more equitable distribution of wealth and income, and the introduction of welfare services funded from general taxation. Parties and interest groups representing the owners and managers of private capital resisted such policies in order to protect the existing distribution of property. But, in the context of a long period of peace and nationally managed economic development after 1945, class-based politics began to unravel. Unprecedented levels of economic growth and technological change, a high rate of employment, a wider distribution of wealth and income, and the creation of welfare states, transformed the conditions of the industrial working classes. The goals of achieving full employment, a living wage, and decent working conditions having been met, the labor and socialist movement had lost its founding rationale. In these circumstances, radical politics moved away from questions of economic ownership and distribution, and toward questions of personal autonomy and the democratic control of public power.

The development of a postmaterialist politics was further facilitated by the massive expansion of education—and particularly higher education—post-1945. Large numbers of working-class and lower-middle-class people were now provided with the opportunity of a liberal education of the kind that undermined parochial worldviews and values. During the 1960s, this context allowed for the flourishing of radical ideas about the expansion of civil liberties, popular democracy, international peace, feminism, and environmentalism that informed the "new social movements." The emergence of these movements in the 1960s can be taken as evidence of the transition from materialist to postmaterialist values. Subsequently, the ideas of such radical political movements came to inform "mainstream" politics, as well as general cultural mores and practices. In this respect, postmaterialist values have left an enduring mark on the societies in which they emerged. Furthermore, Inglehart claims in his more recent work that postmaterialist social and cultural change follows a developmental logic that means it will occur in any society with the right antecedent conditions—namely, a prolonged period of peace and industrial economic development. Thus, postmaterialist values are on the rise in societies such as China and will likely increase the momentum of democratizing movements.

As an account of social and cultural change in contemporary societies, postmaterialism faces a number of problems. First, at a conceptual level, it is not evident that there is any clear distinction to be made between "material" and "postmaterial" values in general. Questions of physical security and well-being and questions of autonomy and identity often go hand in hand. For example,

feminists who argue for women's reproductive rights are concerned with "material" issues—the question of a women's autonomy in respect to her body is inextricably connected to questions of the public control and distribution of reproductive technology. Definitions of "material" needs and wants are socially and historically variant. Second, Inglehart's work has a specific empirical focus on evidence concerning change in cultural and social values in advanced industrial societies in the late twentieth century. However, on the basis of such empirical evidence, Inglehart makes a claim about the general trajectory that industrial societies take as the result of a particular logic of development. As such, Inglehart's theory is a modified form of the modernization thesis, one that considers the economic and technological changes of the modern industrial period (i.e., over the last two centuries) to have had a fundamental effect on the character of social, cultural, and political life. But if we want to demonstrate such a thesis on the kind of empirical basis that Inglehart invokes, we would have to look at intergenerational changes in cultural and social values not just in the late twentieth century, but over at least the last 200 years. The lack of extensive or reliable data in this area severely hinders such an exercise, even before we take into consideration the difficulties of interpreting evidence concerning subjectively meaningful beliefs and values in different times and places. Finally, and related to this second criticism, postmaterialism is open to the charge of economic or even psychological reductionism—political attitudes and actions are reduced to levels of economic and technological development and the affective status of individuals. The importance of specific political practices, discourses, ideologies, movements, and events thus tends to be underestimated in postmaterialist accounts of contemporary socioeconomic, cultural, and political change.

POSTMODERNISM

Postmodernism refers vaguely to a bundle of philosophical ideas associated more or less accurately with a bundle of philosophers and theorists. The ideas include antihumanism, antifoundationalism, antiessentialism, antirepresentationalism, antihistoricism, an ethic of self-fashioning, a predilection for irony, and an antipositivist utopianism. The philosophers and theorists include Jean Baudrillard, Drucilla Cornell, Jacques Derrida, Michel Foucault, Jean-François Lyotard, Richard Rorty, and arguably some of their precursors, most notably Friedrich Nietzsche. Yet although postmodernism is often used in this way, it is at best vague and arguably misleading, because the relevant theorists differ more than they agree, and because little effort is usually made to specify which ideas are being associated with the term.

Superficially, postmodernism conveys a temporal notion of what comes after modernity. It is, at least in this respect, the ideational equivalent of postmodernity conceived as a new social formation. Yet we should be extremely wary of any suggestion that postmodernity as a social formation gives rise to postmodernism as a set of ideas—a suggestion generally made by those who represent postmodernism in hostile terms as the ideology of late capitalism. A slightly more promising suggestion would be to understand postmodernism as a critical reaction to modernist ideas of the late nineteenth and the twentieth century, especially in the arts. Yet this modernism itself often included many of the themes that are most characteristic of postmodernism, such as a kind of self-reflexivity, suspicions of representationalism, and even a kind of utopian politics.

Once we give up trying to locate postmodernism in relation to an alleged modernity, we can concentrate on unpacking it in terms of the themes mentioned earlier.

Epistemological antifoundationalism is the belief that knowledge cannot be grounded in indubitable, timeless, transcontextual principles. This belief leads postmodernists to challenge concepts such as neutrality, objectivity, reason, and method; that there are means by which we might uncover certainties. Postmodernists are skeptical of what is often described as a modern, enlightenment faith in mental processes as a way of gaining and organizing knowledge of the world. Postmodernists challenge the authority of science, law, religion, philosophy, and other master discourses that project a special access to truth. This epistemological antifoundationalism prompts postmodernists to deny that knowledge progresses toward rational self-consciousness and perhaps even freedom. Postmodernists typically reject the concept of the mind as a "mirror of nature" that could accurately reflect the world—a concept of mind they often associate with a tradition of metaphysical epistemology in which truth hinges on the quest for knowledge that is self-evident to a rational mind. Contrary to a popular caricature, postmodernists do not claim that we can never know anything. They just emphasize that knowledge is produced. Their accounts of the production of knowledge vary widely, moreover, from appeals to a pragmatic consensus to accounts of the operations of power.

Antihumanism refers to the broad claim that the subject or individual person is not an unconditioned or autonomous agent. Many postmodernists associate humanism with the idea that man directs himself and history through his rational will and agency. Hence, their antihumanism suggests a rejection of a belief that man works at perfecting himself and a belief that history is progressive. As antihumanists, postmodernists challenge a range of what they (arguably utterly mistakenly) take to be the modern concept of the subject: these include the sovereign subject, the rational intending self, and the unified conscious individual that preexists its own entry into the social and cultural order. Antihumanism was of particular importance for many of the leading French poststructuralists, such as Derrida and Foucault.

The theme of antihistoricism refers to a devaluation of historical causes and processes of development. Postmodernists challenge attempts to project a meaning onto historical events in order to establish some kind of progressive teleology. Postmodern antihistoricism rejects ideas of a linear or dialectical progression to history. Indeed, postmodernists tend to regard all grand narratives of historical development as power-saturated products of the unique moments at which they were articulated.

Ontological antiessentialism is the belief that being has no ultimate or true nature. Postmodernists generally hold that reality is not discovered as necessity, nature, or God by means of logic or experience. Rather, reality is produced through various contingencies and in various contexts. Some postmodernists even suggest that the categorization, classification, or analysis of reality into underlying parts is pointless or even misguided. Their ontological antiessentialism thus overlaps considerably with an antirealism that entails a denial of any authentic reality lying behind our representations or even behind modern consumer society and power.

Antiessentialism and antirealism open the way to an ethic (or aesthetic) of self-fashioning. Some postmodernists describe aestheticization as a practice of resistance to bourgeois society. Others describe it as a practice of resistance to codified gender relations. For Foucault, the notion of stylized self-fashioning, typically undertaken at the site of the body, was an attempt to break out of particular regimes of subjectivity and to refuse to be normalized into a well-regulated individual. Some postmodernists, following Foucault, appear to suggest that aesthetic self-fashioning involves a turn away from ethics and politics toward desire, pleasure, and play. Others appear, in contrast, to require any adequate self-fashioning to be a protest against prevailing social norms.

Linguistic antirepresentationalism is the belief that language, far from being a neutral medium through which consciousness is manifested, is that through which the world, our understanding of the world, and even we ourselves, are continually produced and reproduced. For most postmodernists, language is not a tool that we use to refer to objects that preexist it; language is not a transparent instrument with a referential relation to an objective world. Rather, objects (and we as subjects talking about them) cohere only in language and social discourses. Language is slippery and opaque, and it is constitutive of the world rather than descriptive of it.

The presence of a theme of irony among postmodernists is in large part a response to a bind that

arises from their linguistic antirepresentationalism. On one hand, linguistic antirepresentationalism entails a challenge to the use of concepts or words to refer to the world. On the other, we have to use language to convey thoughts, ideas, arguments, and the like. Hence, postmodernists face a bind: They deploy concepts that they do not accept (at least not at face value), and they cannot avoid doing so if they are to use language at all. Derrida responds to this bind when he places words under erasure; he crosses words out so as to alert his reader that although these words are being used they should not be taken literally. Likewise, Rorty defines irony as facing up to the contingency of one's most central beliefs and desires, and so allowing that they do not refer back to anything outside of time and chance. Critics of postmodernism can mistake such irony for frivolity, obfuscation, or irresponsibility. A more sympathetic view would recognize that it is a response to specific philosophical binds generated by some of the other themes that characterize postmodernism.

Finally, the theme of antipositivist utopianism is evident in the desire of many postmodernists to look ahead to a better set of cultural arrangements. Sometimes this theme sits awkwardly alongside the argument that all knowledge, representation, and ethics are partial, exclusionary, or even laden with power. The more postmodernists stress the latter argument, the more difficult it becomes for them to ascribe content to a utopian vision. Foucault expressed this difficulty when he suggested that to posit another system is to participate in our present system. Some postmodernists even imply that it is impossible to conceive of an alternative order let alone defend one. Hence, critics claim that postmodernism has an apolitical or cynical orientation. Yet a number of postmodernists—including Cornell, Derrida, and Rorty—convey a sincere, if conflicted, hopefulness that they express in diffuse futural terms.

Power

The notion of *power* is one of the fundamental conceptual elements of political theory, yet it remains rather elusive. A great variety of different conceptualizations of power have been suggested by political theorists, yet there is no general agreement on a definition, let alone on a conceptual framework for how to use the term. Although this fact sounds detrimental to political theory's ambition to scientific rigor, there might be something to be learned from it, namely that contested political keywords like power play different roles and have different functions in specific political theories. In the broadest sense and roughly in tune with the use of the term in many everyday contexts, power can be generally described as the capacity to bring about certain effects. This wide meaning of the term can be found in Aristotle's usage of the Greek term *dynamis*. In the narrower context of social action, the concept of power refers to the ability of an actor (i.e., an individual or a group) to make other actors do (or suffer) something. Speaking of actors as "powerful" or describing an action as an "exercise of power" refers to this attribution of causality: An actor is said to be able to produce a certain outcome and thereby to influence or determine the behavior of others.

Among modern social scientists, Max Weber gave this core idea, which might historically be traced back to Thomas Hobbes's use of the term, its classical formulation when he wrote that the concept of power refers to the probability that one actor within a social relationship will be in a position to carry out his or her will, even against

resistance. This formulation does not cover all aspects of power, but it covers many instances and cases in which the theoretical concept of power is employed. Using it as a guideline and elaborating its systematic implications can serve as a way to give an outline of what one might call the standard notion of power in modern political theory. It relies on an essential connection between power and domination and has undergone continual renewal and revisions over the last century. But it can also serve as a point of departure for introducing several alternative ways of using the concept of power that focus on power's constitutive or productive function. Finally, there remains the question about the very function of the concept of power in political theories.

Power and Domination

The Weberian idea that power refers to an actor's capacity to influence or determine another actor's behavior or to carry out his or her will, even against the other's resistance, has been the core of the traditional concept of power, and it has been reformulated in many ways. A famous restatement was suggested by Robert Dahl: An actor has power over another to the extent that he (or she) can get her (or him) to do something that she (or he) would not otherwise do. Several characteristics of this usage of the concept of power can be noted. First, it binds power to conscious actors and their intentionality. Second, it explains the efficacy of power on the basis of assumptions about a clear causal relation between two forms of action. Third, the counterfactual assumption treats power as something that gives an external motivation for action to the second actor that might even bring her (or him) to act against her (or his) own original free will. Objections have been raised against all of these assumptions. Why should power be effective only in cases of explicit intentions and expressed wills? Why should power depend on the always fallible knowledge about the effects of an action? Why should power always entail the agonistic moment of the suppression of one will? And finally, for many political theorists it was clear that all of these highly theoretical assumptions pose serious obstacles to an empirical study of power.

A number of revisions to the original schema were proposed, among which the most important were attempts to suggest a multidimensional vision of power. The first major revision was to include not only overt action but also nondecisions (or the avoidance of certain actions) as major instances of the exercise of social power. On the level of communal political decisions, for example, it was argued that the real power might indeed lie where efficient agenda setting is exercised, so that certain questions are not even posed. Power here is not only exercised through action but also, and maybe more importantly, through the structuring of the space of possible actions. In yet another influential step, a "third face" of power was detected in exactly those actions and mechanisms that influence and distort what people think to be their own interest and will. This is indeed a "radical view," as Steven Lukes has called it, that transforms the whole framework of the standard concept of power. Leaving open the possibility of radically manipulated wills and consciousness (i.e., of ideology in the strong sense) makes it impossible to rely on social actors' own expressed intentions and self-explanations. *Power* therefore ceases to be a term that can be dealt with in the framework of the theory of action alone and calls for a more sociological elaboration.

Power and Its Forms

This is where a multiplicity of theories comes in that try to account for structural power. In their view, power not only refers to individual actions but to networks of intersubjective and institutional relationships that crucially determine which actions can be taken by individual actors. Social power, as it were, is also the power of structuration, and it cannot be assessed on the level of individual behavior alone. Although this perspective gives priority to social institutions and material inequalities among social groups, others have argued that it is foremost on the level of discourse and meaning where power is generated and distributed. On this view, it is epistemic and symbolic patterns of knowledge and meaning that decisively shape social action. Such systems of discursive or symbolic power prove effective to the extent that they manage to neutralize conflicts between different social groups by discursively creating symbolic hierarchies between them. Differences in status and worth can therefore become naturalized and

almost invisible. In these cases, the most pervasive form of power is one that is not even observed by the social actors involved.

But all of these revisions leave the original idea intact that says that power is basically to be seen as an impediment to action or a suppression of freedom. It is therefore fair so say that the standard notion of power works from a concept of domination and envisions the paradigmatic scene of power as an asymmetric relation between single actors struggling for superiority. Of course, many of the different theories falling under the rubric of the standard notion allow for quite different forms of power, and for many of these theories it has become a key interest to draw distinctions between different forms of exercise of power. The dominant and most plausible view in this framework is to think in terms of a spectrum that reaches from actions almost totally determined by power on one extreme to actions almost fully autonomous on the other extreme. Near the first extreme, forms of "raw" power as physical violence, brute force, or coercion can be found. In the middle, there are various forms of repression, regulation, control, and sanction, but also milder cases of influence and guidance. Ideological manipulation and discursive framing might also be placed somewhere in the middle of the spectrum. Near the second extreme, there are forms of persuasion and seduction, various kinds of authority, and arguably even the power of rational argumentation. To draw clear-cut distinctions between these forms has proven difficult, but the mainstream of political theory has followed this general model in one form or another. Its core idea from Hobbes to Weber and Lukes is to think about power in terms of greater or lesser degrees of impediment to agency. It remains, therefore, ultimately a model that conceptualizes power in terms of domination.

Power and Constitution

Whereas the standard model of power, rooted in the theory of action but extending to more general versions of social theory, views power as essentially negative (i.e., detrimental to agency), alternative accounts have stressed another of its semantic connotations. The second sense of power clearly appears in the distinction between the two Latin terms for power, namely *potestas,* in the sense of command and domination, and *potentia,* in the general sense of capacity. This second sense (which is also present in the Italian *potenza,* the French *puissance,* and the German *Vermögen*) refers to power as a productive force that brings about rather than represses something. This meaning is sometimes referred to as "power to" in opposition to "power over" (in the sense of domination), but this side of power might be best termed "constitutive." Several theories of power have tried to articulate this side or function of power by focusing less on individual acts of power exercise between people and more on the very creation of social relationships or even social entities through power.

In these quite heterogeneous alternative frameworks, rather than referring to acts that repress or impede, power refers to the media or processes in which sociality, consensus, and communality are brought about and shaped (e.g., in the theories of Hannah Arendt or Talcott Parsons). This sets power in sharp contrast to domination and expresses the idea that power has to be created collectively and is not just there to be found. But it also shows that power is the very basis on which collective social action is possible and that it can never be fully substituted by the rule of force or violence. Power, as it were, manifests itself as empowerment, as the bringing about of new forms of agency.

Although this might seem too optimistic a view, power as constitutive has also been taken to refer to its capacity to bring about the very elements of the social, like systems of knowledge, patterns of conduct, and social institutions (e.g., in the work of Michel Foucault). To say that power not only acts on but even "produces" bodies and subjects requires speaking about power in terms of social ontology and the very constitution of the social. This does not mean that power as constitution is not bound up with systems of control, repression, and hierarchization. On the contrary, one can argue that the efficacy of certain systems of control and regulation exist only on the basis of their capacity to produce and shape the affects, mentalities, and self-conceptions of subjects. Although the alternative frameworks differ enormously on how to spell out (and how to evaluate) power's productive or constitutive function, they share a common criticism of the standard model. The latter remains too

fixated on the case of the power of existing social actors over others, and it neglects the constant reconfiguration of the social world through mechanisms of power.

Power and Critique

The relationship between the standard model and the alternative models is a complex one, and it seems clear that this is not a matter of theoretical preference. Several attempts have been made to integrate both sides or dimensions of power, domination and constitution respectively, into a single theoretical framework that could account for the entire realm of phenomena that can be described as instances of power. These integrated models, however, tend to become rather abstract because the gap between the theoretical perspectives of the theory of action and social ontology has proven difficult to bridge.

There also remains the question how the concept of power should function in a political theory. Some theorists insist on the neutrality and purely descriptive nature of the term, but for many others the concept of power refers to a web of concepts with normative implications. In the case of many political theories following the standard concept, the strong negative link between power, agency, and freedom suggests that a society should strive for the critical exposure and active struggle against all forms of power that cannot be given acceptable legitimacy. Such political theories will then need to give an account of the very criteria that decide on the legitimacy or illegitimacy of power in general and on the exercise of legitimate political power in particular. Theorists that work from the broader ontological understanding of constitutive power, however, hesitate to call for a critique of power as such. They tend to suggest more context-specific analysis and local resistance to specific forms of power, and they insist on the deep ambiguity of power. Most importantly, they refer to the fact that the very capacities to think critically about and turn against power may themselves be products of power. This demands a self-critical and reflexive stance toward one's own implication into and complicity with networks and practices of power.

Finally, the diversity of understandings and models of power in the history of political thought, as well as in contemporary political theory, suggests that power is less a "perennial problem" than a moving target of theoretical analysis and political critique. By giving priority to certain cases of power (e.g., armed violence, class struggle, symbolic violence) over others, by conceptualizing the basic mode of power differently (e.g., as conflict or consensus), and by envisioning the aim of politics in a particular way (e.g., as a balance of forces or the eradication of illegitimate violence), political theories themselves take side in a struggle about the adequate understanding and the preferable practice of politics.

Prisoner's Dilemma

The *prisoner's dilemma* is one of the most famous and important concepts in game theory. In the classic version of the two-person prisoner's dilemma, two agents—labeled A and B—each

have two actions available: "cooperate" or "defect" (abbreviated C and D), and each person chooses her action simultaneously without knowing the other person's choice. The situation can be represented by the following matrix:

Table 1 Payoff Matrix

	C	*D*
C	4, 4	0, 5
D	5, 0	1, 1

Source: Author.

Note: The payoffs correspond to the different possible combinations of actions.

The rows correspond to player A's actions, the columns to player B's actions, and the numbers in each box indicate the "payoffs" to the players if the corresponding combination of actions is chosen, with the first number referring to player A's payoff. For example, the upper-right box corresponds to the outcome in which A chooses C and B chooses D, and A receives a payoff of 0 and B receives a payoff of 5. These numbers are intended merely to represent the agents' preferences. For example, that A receives a higher payoff when C, C is played than when D, D is played simply means that A would prefer the outcome induced by C, C to the outcome induced by D, D.

The prisoner's dilemma derives its name from a common interpretation of the game used for pedagogical purposes, according to which the two players are suspected partners in crime being interrogated by a district attorney, who gives each the option of confessing to the crime (defecting) or keeping silent (cooperating with one's partner). Different amounts of prison time correspond to each combination of actions, with the prisoners' preferences over these outcomes being those represented by the payoff numbers mentioned earlier. The game has been used, however, to study many social interactions in economics and political science.

If both players choose D, then neither player has an incentive to change her choice of action, *given* the other player's choice of D. For example, if A were to choose C instead of D when B is choosing D, she would get a payoff of 1 instead of 2. Likewise, the payoff to B of choosing D is greater than the payoff of choosing C, when A is choosing D. Because each player is choosing a "best response" to the other player's strategy when they play (D, D), game theorists call this pair of strategies a Nash equilibrium. Yet, despite the fact that D, D constitutes a Nash equilibrium, each player would prefer the outcome resulting from C, C to the outcome resulting from D, D. Consequently, the Nash equilibrium to the prisoner's dilemma is said to be Pareto-suboptimal or Pareto-inefficient.

PROGRESSIVISM

Progressivism refers to the political and social reform movement that brought major changes to American politics and government during the first two decades of the twentieth century. Progressive reformers made the first comprehensive effort within the American context to address the problems that arose with the emergence of a modern urban and industrial society. The U.S. population doubled between 1870 and 1900. Urbanization and immigration increased at rapid rates and were accompanied by a shift from local, small-scale manufacturing and commerce to large-scale factory production and mammoth national corporations. Technological breakthroughs and frenzied searches for new markets and sources of capital caused unprecedented economic growth. From 1863 to 1899, manufacturing production rose by more than 700%. But this dynamic growth also generated profound economic and social ills that challenged the capacity of the decentralized republic that had dominated the United States during the nineteenth century. This entry describes the efforts of Progressives to address these changes and the long-range impact of the Progressive movement.

Goals of Progressivism

The Progressive movement accommodated a diverse array of reformers—insurgent Republican office holders, disaffected Democrats, crusading journalists, academics, social workers, and other activists—who formed new organizations and institutions with the common objective of strengthening the national government and making it more responsive to popular economic, social, and political demands. Viewing themselves as crusading reformers at a critical juncture of American history, Progressives were the rare practitioners of American politics whose writings and rhetoric verged on political philosophy.

Above all else, the Progressives sought to come to terms with the concentration of wealth, specifically the giant trusts, which they saw as uncontrolled and irresponsible units of power in American society. By the turn of the century, economic power had become highly concentrated, threatening the security of employees, suppliers, and customers. These industrial combinations created the perception that opportunities were not equally available in the United States, that growing corporate power threatened the freedom of individuals to earn a living. Reformers excoriated the economic conditions of the 1890s—dubbed the "Gilded Age"—as excessively opulent and holding little promise for industrial workers and small farmers. Moreover, many believed that the great business interests, represented by newly informed associations such as the National Civic Federation, had captured and corrupted the men and methods of government for their own profit. Party leaders—both Democrats and Republicans—were seen as irresponsible "bosses" who did the bidding of "special interests."

In their efforts to grapple with the challenges of industrialization, Progressives championed three principal causes. They promoted a new governing philosophy that placed less emphasis on rights, especially when invoked in defense of big business, and stressed collective responsibilities and duties. In line with these new principles, Progressives called for the reconstruction of American politics, hitherto dominated by localized parties, so that a more direct link was formed between government officials and public opinion. Similarly, reformers demanded a revamping of governing institutions, so that the power of state legislatures and Congress would be subordinated to an independent executive power—city managers, governors, and a modern presidency—that could truly represent the national interest and tackle the new tasks of government required by changing social and economic conditions. Progressive reformers differed dramatically over how the balance should be struck between these three somewhat competing objectives, as well as how the new national state they prescribed should address the domestic and international challenges of the new industrial order. But they tended to agree that these were the most important battles that had to be fought in order to bring about a democratic revival.

Above all, this commitment to remaking American democracy looked to the strengthening of the public sphere. Like the Populists, who flourished at the end of the nineteenth century, the Progressives invoked the Preamble to the Constitution to assert their purpose of making "We the People"—the *whole* people—effective in strengthening the federal government's authority to regulate the society and economy. But Progressives sought to hitch the will of the people to a strengthened national administrative power, which was anathema to the Populists. The Populists were animated by a radical agrarianism that celebrated the Jeffersonian and Jacksonian assault on monopolistic power; their concept of national democracy rested on the hope that the states and Congress might mount an assault on the centralizing unholy alliance between national parties and the trusts. In contrast, the Progressives championed a new national order that completely repudiated the localized democracy of the nineteenth century. In his influential book, *The Promise of American Life,* Herbert Croly challenged his fellow citizens to embrace a truly *national* form of democratic government. Only by doing so, he suggested, could they prove themselves worthy of the ideals of self-rule and responsible citizenship to which the republic had been dedicated.

In their quest for national community, many Progressives revisited the lessons of the Civil War. Edward Bellamy's admiration for the discipline and self-sacrifice of the Civil War armies was reflected in his enormously popular utopian novel *Looking Backward.* Men and women alike were drafted into the national service at the age of 21, on the completion of their education, where they remained

until the age of 45. Bellamy's reformed society had thus, as his protagonist Julian West notes with great satisfaction, "simply applied the principle of universal military service," as it was understood during the nineteenth century, "to the labor question" (Bellamy, 1888, p. 30). In Bellamy's utopian world there were no battlefields; but those who displayed exceptional valor in promoting the prosperity of society were honored for their service.

Bellamy's picture of a reformed society that celebrated military virtues without bloodshed resonated with a generation that feared the excessive individualism and vulgar commercialism of the Gilded Age would make it impossible for leaders to appeal, as Abraham Lincoln had, to the "better angels of our nature." His call to combine the spirit of patriotism demanded by war with peaceful civic duty probably helped to inspire the progressive thinker William James to write his widely read 1906 essay The Moral Equivalent of War. Just as military conscription provided basic economic security and instilled a sense of duty in men to confront a nation's enemies, so James called for the draft of the "whole youthful population to form for a certain number of years a part of the army enlisted against *Nature,*" which would do the rugged jobs required of a peaceful industrial society:

> To coal mines, to freight trains, to fishing fleets in December, to dishwashing, clotheswashing, and windowwashing, to road-building and tunnel building, to foundaries and stoke-holes, and to the frames of skyscrapers, would our gifted youths be drafted off, according to their choice, to get the childishness knocked out of them and to come back into society with healthier sympathies and soberer ideas. (pp. 556–557)

James's proposal for a national service was not as ambitious as the one found in Bellamy's utopian society; moreover, James called for an all-male draft, thus ignoring Bellamy's prescription for a society of greater gender equality that inspired progressive thinkers such as Charlotte Perkins Gilman. But both Bellamy and James expressed the core progressive commitment to moderate the American obsession with individual rights and private property, which they saw as sanctifying a dangerous commercial power inimical to individual freedom. Indeed, progressive presidents like Theodore Roosevelt and Woodrow Wilson, and even the more effete philosopher John Dewey, strongly supported America's entry into World War I, not only because they believed, with President Wilson, that the country had a duty to "make the world safe for democracy," but also because they acknowledged that there was no moral equivalent for the battlefield. Most progressive reformers held a common belief in civic duty and self-sacrifice; they differed significantly, however, over the meaning of the public interest and how a devotion to something higher than the self could be achieved.

Diversity and Disagreement Within Progressivism

The great diversity of Progressive reformers and the ambiguous meaning of Progressivism have led some to question whether the Progressive movement possessed any intellectual or political coherence. Although many leading political leaders and thinkers joined the Progressive Party, that organization's brief existence (from 1912 to 1916) underscores the movement's powerful centrifugal forces. The party was torn apart by fundamental disagreements among its supporters about the role of the national state in regulating the society and economy. For example, the Progressives' 1912 presidential campaign, with the celebrated former president Theodore Roosevelt as its standard bearer, was deeply divided over whether the reform movement should attack forced segregation in the South—the shame of Jim Crow. In the end, it did not, and accepted the right of states and localities to resolve the matter of race relations. Most Progressives, in fact, called for the "enlightenment," rather than the expansion, of popular sovereignty: Their idea of national community did not include, indeed, was threatened by, African Americans and immigrants. Moreover, because reformers held such divergent views on the meaning of patriotism, Progressives were irrevocably fractured by America's entry into World War I.

More generally, the very notion of progressive democracy is fraught with contradiction, presuming to combine reformers' celebration of "direct democracy" and their hope to achieve more disinterested government—their ambition to create a "modern" state—which would seem to demand a

more powerful and independent bureaucracy. As the acerbic social critic H. L. Mencken argued with respect to the 1912 Progressive Party campaign, Roosevelt only thought he believed in democracy. His "remedy for all the great pangs and longings of existence was not a dispersion of authority, but a hard concentration of authority" (1958, p. 58). Similarly, Bellamy's progressive utopia is governed by a highly centralized administrative state that restricts political participation to those over 45 who have labored for the state long enough to enjoy leisure and the right to vote (1888, xi–xii).

Without denying that the Progressive movement was weakened by a tension between reforms that diminished democracy and those that might make democracy more direct, its central thrust was an attack on the institutions and practices that sustained the decentralized republic of the nineteenth century and posed an obstacle to the creation of a more active, better equipped national state. For all their differences, Progressives shared the hope that democracy and administrative efficiency could be combined and that in this combination, Americans' obsession with self-interest and rights could be tempered by the development of a greater sense of national and international responsibility. For Progressives, public opinion would reach its fulfillment with the formation of a modern executive—famously celebrated by Theodore Roosevelt, as "the steward of the public welfare"—freed from the provincial, special, and corrupt influence of political parties and interest groups.

The Legacy of Progressivism

Although Progressives failed in many respects, it may be argued that "no other generation of Americans has done conspicuously better in addressing the political, economic, and social conditions which it faced" (Link & McCormick, 1983, p. 118). Indeed, no equally comprehensive body of reforms has ever been established in place of the Progressive measures adopted at the dawn of the twentieth century. Many of those features of contemporary politics that often are deemed so new—the distrust of politicians, aspirations for direct democracy, self-styled public interest groups, "culture wars," investigative reporting, and a messianic view of America's role in the world—had a critical start during the Progressive Era.

In the most fundamental sense, Progressivism gave rise to a reform tradition that forced Americans to grapple with the central question of the founding: Is it possible to achieve self-rule on a grand scale? This was the question that had divided the Federalists and Anti-Federalists at the time of the founding. The persistence of local self-government and decentralized political associations through the end of the nineteenth century postponed the question of whether the framers' concept of "We the People" was viable. But with the rise of industrial capitalism, constitutional government entered a new phase. It fell to Progressives to confront the question of whether it was possible to reconcile democracy with an economy of greatly enlarged institutions and a society of growing diversity. As John Dewey argued, the dignity of the democratic individual had to shift from the emotive grounds of local ties "to the cumulative and transmitted intellectual wealth of the community. . . . The Great Community, in the sense of free and full intercommunication," would do "its final work in ordering the relations and enriching the experience of local associations" (1927, p. 109).

To a point, the Progressive Era validated the Anti-Federalist's fears. Despite Progressivism's championing of mass democracy, the mix of attack on political parties and commitment to administrative management conspired to make American politics and government seem more removed from the everyday lives of citizens. Yet Progressive reformers invented institutions and associations that enabled citizens to confront, if not resolve, the new problems that arose during the Industrial Revolution. Many of the political organizations that are central to contemporary American democracy—labor unions, trade groups, professional, civic, and religious associations—were founded during the Progressive Era. Although the assumptions and techniques of Progressivism no longer command the confidence that early twentieth-century Americans had in them, the dilemmas of large-scale democracy with which the Progressives struggled so creatively have continued to challenge Americans since.

Property

Property is a general term for things such as land or other material resources and goods, the relations between people and those things, the relations between people with respect to those things, or the system of rules that governs these relations. Every society with an interest in avoiding conflict between people over things requires such a system; without it, a civilized common life is impossible. We may distinguish three ideal types of systems that could be used to organize property in a society. Under the first type of system, property is held in common, and all members of the society are free to use it as they choose without spoiling it for others. Under the second type of system, property is held collectively, and society collectively determines its use. Under the third type of system, property is held privately, and those who hold it are free to use it as they choose. Each of these types of systems has been proposed at some time as the best possible system for organizing property in society, and the proponents of each have thought their favored system works the best for many different reasons. Most serious political thinkers have an opinion about property. This entry describes some of the more influential discussions of property in the history of political thought.

The Ancient Greeks on Property: Aristotle and Plato

In his *Politics,* Aristotle asked, what are best arrangements to make about property if a political community is to be as well constituted as possible? Should its members have all things in common, or nothing in common, or some things in common and some not? The second arrangement he considered impossible because living together in a community presupposed having at least some things in common. Thus, the first and the third arrangements were the only practicable alternatives. Aristotle understood Plato to have proposed the first alternative in his *Republic*. *The Republic* was concerned in the first instance with justice as a condition of the human soul but, because Plato assumed that a political community was a replica of the human soul writ large, his conclusions about justice in the soul had some important implications for the character of a just political community. *The Republic* implied that, as a general rule, common or collective ownership should be the governing system of property among the rulers of the community because collective ownership was necessary to promote the common pursuit of the common good. Aristotle argued, against Plato, that collective ownership was injurious to the good of individuals and to the common good, and concluded that, as a rule, it were better that property were private than common, even though it should be used in common.

Aristotle adduced several considerations in support of this conclusion. One consideration was that collective ownership was inefficient: because everyone thought about their own interests more than the common interest, what was held in common was apt to be neglected as everyone left it to others to put it to good use. Another consideration was that conflict between people would increase rather than diminish if there were no clear distinctions in property. More positively, he suggested that individual well-being and virtue were advanced by private ownership. Private ownership encouraged happiness and generosity by enabling people to do services for their friends and companions. At the same time, it allowed people to be independent

of one another and, in that sense, free and equal. Free and equal people enjoyed the status of citizens, a status that stood in contradistinction to that of a slave. A slave was neither free nor equal, not a person but a thing, an item of property to be owned privately but shared freely with one's friends and companions like any other. If Aristotle could not imagine a system in which private ownership went with purely private use, it was because, to his mind, people were by nature political animals that lived together with others for the sake of their common good. Private property was in accordance with nature—as was slavery—and its abolition would be contrary to human nature.

Property in the Roman Law Tradition

A rather different view developed in the Roman law tradition. In this view, private property was not natural—nor was slavery—but a product of convention. In emphasizing the conventionality of private property, the Romans were led to consider, as Aristotle really had not, the modes by which it was acquired. They distinguished several, but all involved action under legal authorization. Earlier Roman writers such as Seneca had asserted that the conventions that established private property stood in contrast to an original dispensation of nature by which all things were made equally available to everyone. The Roman lawyers now suggested that this original freedom and equality existed by a right or law of nature (*jus naturale*), and they distinguished between this state of affairs and current arrangements that derived their authority from the positive law of a particular political community or from the law common to all nations (*lex positiva* and *jus gentium,* respectively). Most of their statements about property dwelled on the second and third of these laws—their interest in the first was slight in comparison. These statements indicated that individuals became entitled to things under the terms of one of these laws: Some things were theirs by natural law, some by civil law, some others by the law of nations. The Roman lawyers used the words *dominium* and, less often, *proprietas* to describe the sum of these legal entitlements to things, and typically ascribed them to the current possessor of the things in question. The recovery of Aristotle's works in the thirteenth century changed matters. Central to these changes was Thomas Aquinas.

Aquinas on Property

Aquinas followed Aristotle in arguing that private property was natural and good. He explained the naturalness of private property by reference to people's entitlement to it under natural law and the jus gentium (which he treated as an adumbration of natural law), and he established its goodness by linking its use to the development of virtue (much as Aristotle had done). But he emphatically subordinated private property to the common good, which trumped the claims of any one person. People had duties to others to use what they had to meet their needs, duties shared by the rulers of the political community. Accordingly, the idea of individual rights to private property figured in his writings, if at all, as entitlements that enabled people to do what was right, whether to develop their own potentialities and those of the community in which they lived, or to succor the needs of their fellow men. Aquinas underscored the moral element in proprietas, a word he used to mean not only possession but also rightfulness, or propriety.

Conceptions of Property in Modern Political Thought

Later commentators on Aquinas elucidated the idea of individual rights but introduced complications by arguing that the jus gentium simply represented an aspect of positive human law rather than natural law. Their arguments conflicted with the naturalness of private property and implied that property rights were merely privileges granted to the members of a political community by its laws, which could be withdrawn without impropriety. This suggested in turn that property, and private property in particular, should be referred to government, a suggestion taken up eagerly in the seventeenth century. The most influential explanation of private property in this period was by Hugo Grotius. Grotius assumed that mankind originally held all things in common and subsequently agreed to partition it, thus producing private property. Samuel von Pufendorf added some refinements but retained the fundamental theory. If this theory implied nothing specific about government, the two came together easily in the idea that only government could enforce a stable partition and so make private property viable. Thus, Thomas Hobbes could argue that

there could be no property, and no distinction between "mine" and "yours," without government. Private property was therefore a creation of government power.

Locke

This way of thinking about property was challenged by John Locke. Locke believed that God had given the world to mankind collectively. The question was how to move from that to private property. Locke explained this move by broadening the scope of property to include not only a person's things—the land or goods to which he was entitled—but also his person. Locke claimed that people had dominium over themselves and their powers of body and mind. These powers he used as the means to private property. By using the labor of their bodies, people could appropriate things from the world and make them their own, effectively extending the natural right they had over themselves into those things. Now, others before him, including Grotius and Pufendorf, had recognized that people could use their own powers to take things from the world, but they had not seen appropriation as an instrument for legitimately acquiring property. Indeed, as Jean-Jacques Rousseau would later observe, a person who takes a piece of the world and calls it his own may be a thief or an imposter.

Locke dealt with this problem by arguing that the world already belonged to God, who had given it to mankind for certain ends. The qualities of body and mind with which He had endowed people were means to be employed to further those ends. God's ends embraced the preservation and increase of the human race in a single great design. Thus, the person who labored in order to sustain life acquired property for himself because he did as God willed with God's creation. His unilateral action gave him a right to property without the need for government. Equally, someone who occupied land without laboring productively on it would have no claim to own it, whereas those in need had claims on the assistance of the propertied and wealthy. Thus with Locke, as with Aquinas, property was connected to virtue and the common good, though the precise character of those connections and their ramifications within his political theory remain moot. In any event, Locke was immensely proud of his account of private property, which proved extremely influential in at least two directions.

Kant and Hegel

In one direction, thinkers like Immanuel Kant and Georg Wilhelm Friedrich Hegel adopted Locke's view that property went together with personhood but rejected the theological presuppositions in which that view was implicated. Kant elevated human freedom to an end in itself and depicted individual human beings as striving to realize their own freedom on terms that registered the freedom of others. This implied the existence of a system of private property rights, and a political order that protected these rights against the intrusions of others, which enabled people to develop their own freedom, equality, and independence. On his view, people acquired property not by mixing their labor with things but by the transcendental operation of directing their wills on those things. This notion was further developed by Hegel and in time became the standard theory of property among idealist thinkers, from T. H. Green onward. The idealists saw the freedom embodied in property as one stage in human beings' growth toward perfect freedom, which culminated in their membership in a national state as citizens. The property rights they held as individuals were transcended by the claims made on them by the state, which meant in practice that, once the state was established, its positive laws determined property ownership.

Smith and Ricardo

In another direction, thinkers like Adam Smith and David Ricardo transformed Locke's theory of appropriation into a labor theory of value, which made labor alone the source of economic goods and the increase in value that privatization brought. The inference they drew from this theory was not, as Pierre-Joseph Proudhon would later insist, that individuals were entitled to the products of their own labor, but rather that they should be free to sell their labor to any employer they chose. If Smith occasionally acknowledged that in his thinking, it implied that government existed to protect the rich and propertied against the poor; he usually

offered a more optimistic picture in which it appeared that the property thus protected was the result of natural developments, and so just, and served a common interest, if not a common good. Later utilitarian thinkers from Jeremy Bentham to James Mill were more sanguine, contenting themselves with the claim that on balance there was more utility in allowing people to have rights to what they had produced than not (which again presupposed that rights were privileges granted by government).

Marx

Karl Marx disputed the conclusions of both of these lines of thinking. Against the first he argued that, insofar as conditioning private property, the state was conditioned by it. Against the second he argued that in laboring under the conditions hymned by Smith and Ricardo, people did not extend their rights over themselves into things, but imported the characteristics of what they labored on into themselves, becoming in effect servants of the property their own labor had created, a process he famously described as "the fetishism of commodities." Marx projected an image of a future society in which this process had been reversed. First, private property would be abolished and everyone would become an employee of society in a strict equality of wages. Then, people would be free to develop a new kind of appropriation in which they were no longer alienated from their own labor and no longer regarded the world as something there to be utilized. The world would be something to be enjoyed together, a world of potentialities to be realized and possibilities to be explored. These potentialities would be liberated once private ownership ceded to collective ownership and thence to common ownership, and the interests of abstract individuals ceded to the good of all.

Marx's vision of the common ownership of the goods of nature has exerted a persistent imaginative force. His idea that human beings are entitled to a just share of the opportunities open to them, and that society should be refashioned so that they could secure this share, inspired many socialist and egalitarian thinkers in the twentieth century. It continues to inspire today, notwithstanding the hideous failure to implement it in practice by regimes purporting to do so. By the same token, the idea that individuals have rights to the fruits of their labor that, other things equal, no other human being can gainsay, has its own moral force. Aristotle's question—what are the best arrangements to make about property if a state is to be as well constituted as possible—thus remains a central question in modern politics, for every society to confront, theoretically and practically, within a set of wider economic structures that no one society controls.

Protagoras (c. 490–420 BCE)

Protagoras of Abdera was the first and greatest of the Greek Sophists. His credited innovations include professing the title "Sophist," charging a fee, and teaching how to speak and win on either side of any question. He traveled widely and spent time at Athens, where Plutarch says he associated with Pericles. In 443 BCE, he wrote laws for Thurii, the new pan-Greek colony that attracted participation from noted intellectuals and experts. His interests were nearly universal but focused on speech and argument (including grammar and

literary interpretation). In his few surviving fragments, his modern interpreters have recognized "the earliest democratic theorist."

Protagoras's *Take-Down Arguments* (an analogy to wrestling) was likely his major and all-inclusive work, as rhetorical as it was philosophical. It famously began: "The human being is the measure of all things, of the things that are, that they are, and of the things that are not, that they are not." Plato and Aristotle criticize this claim extensively, earning it a special place in the history of epistemology. Scholars debate what kind of relativism it implies, and Protagoras's purposes may not have required developing its implications. The apparent emphasis is on bringing the believer and perceiver fundamentally into the equation whenever considering claims of truth: truth is ("democratically") accessible and identified with what seems the case to each individual, who is its "measure." This fits well with Protagoras's other challenges to the standing of expert knowledge (e.g., using perceptual observations to deny geometers' claims). Plato rejected the idea of truth as determined empirically rather than rationally, and philosophers have found the principle contradictory.

Nonetheless, Plato respected Protagoras's ideas and philosophical commitment, and the Sophist's great speech in *Protagoras* seems a sincere representation; used cautiously, it allows insight into his political thought. Protagoras tells a myth about human origins, in which we received, in compensation for our lack of other animal endowments, skill in the various arts, and then the respect and justice necessary to live together and survive in cities. Thus, our capacity for political virtue is original and (as participatory democracy presupposes) universal, and our communal institutions seek to develop it fully in citizens (e.g., by punishment, which in Protagoras's progressive view is educative, as vengeance is a motive more appropriate to beasts). Virtue is teachable, and we are all its teachers (though some, like Protagoras, are better teachers). It is dubious how the pursuit of virtue is reconcilable with the man-measure doctrine. Plato has Protagoras treat "good" and "bad" as appearances relative to the individual believer, yet insist that the wise man can use a (somehow more secure) understanding of what is "beneficial" and make this "seem just" to the citizens.

Later writers report that the Athenians convicted and banished the aged Protagoras for impiety, collecting and burning his books. This is questionable because Plato and Xenophon are silent about the parallel to Socrates' fate (indeed Socrates observes in *Meno* that, if Protagoras corrupted his associates, "all Greece has failed to notice it"). Protagoras's *On the Gods* began, "Concerning gods, I am able to know neither that they are, nor that they are not, nor what kind of form they have. For many are the things that prevent knowing, both the hiddenness from ken and the shortness of human life."

PSYCHOANALYSIS

In danger of extinction as a clinical practice, *psychoanalysis* thrives in a number of areas in academic life, almost all connected to political theory: critical literary theory, feminist theory, postcolonial theory, and of course political theory itself. The importance of psychoanalysis, the reason for its lasting influence, stems from the fact that it asks the same question asked by all the great political thinkers. What is the nature of the *psyche,* the Greek term that may be translated as soul or self? What is the best regime, given human nature as we

know it? In one way or another, the study of "psyche-ology" has been the leading concern of all great political theory from Plato to the present.

Sigmund Freud

Sigmund Freud (1856–1939), founder of modern psychoanalysis, said that civilization is built on the problem of controlling aggression. Not sex, even if that is the popular reading of Freud, but aggression is the key problem. "Man is the wolf to man," as the classic saying has it, and Freud saw almost all of the institutions of civilization as built to contain this aggression, which he came to call the *Todestrieb,* the drive toward death. In a controversial claim, Freud speculated that in the end, the individual seeks his or her own death, but not before inflicting death and destruction on others. Whether or not people seek their own death, Freud, who wrote most of his social theory in the shadow of World War I, believed that the drive toward destruction was supported by empirical observation alone.

Against the Todestrieb, Freud sets that other great force, *Eros,* the desire to create, build, and foster life, a desire that extends from families to civilization itself. Between these two forces, civilization itself hangs in the balance, which is why so much sexual repression is necessary. Eros, which would ordinarily be channeled into erotic relationships and pair bonding, needs to be repressed and rechanneled into the task of containing aggression. Assuming a hydraulic model of the mind, Freud believed that only a limited amount of psychic energy was available. If Eros was not busy containing *Thanatos* (the term Freud's student, Carl Jung later gave to the Todestrieb), then Thanatos would overpower the individual, and soon enough the world. For Freud, civilization itself was the endless struggle between Eros and death, working itself out in a struggle for the life of humanity. In the end, Freud was not certain which great force would prevail.

A permanent discontent with civilization, a malaise as Freud calls it, is the result of the situation humanity finds itself in. This discontent arises from the sense of guilt civilized men and women feel at the aggression they would unleash against their fellows. Add to this the constant sexual repression necessary to maintain civilization itself, and civilization is not a happy place. It is, however, better than the alternative—the barbarian sack of Rome, perpetual war, massacre, pogrom, and destruction on the one hand, or the totalitarian world as imagined in George Orwell's *1984* on the other.

Freud did not, of course, use all of these images, but the ideas are his: a world of perpetual war and aggression on the one hand, a totalitarian state that might contain it on the other. In *Civilization and Its Discontents* he imagined both. A third alternative he considered unlikely but possible. That some men and women might, through a process of rational self-control (a process he sometimes called sublimation), deny their passions in order to serve a greater cause to which they have devoted their lives. One imagines that Freud included himself in this third category.

Eros and Civilization

The most audacious reception of Freud was that of the cultural Marxists, whose various attempts to blend Marx and Freud would seem an unlikely enterprise. What strange bedfellows they make: Marx, the utopian, who envisioned the possibility of a new socialist man or woman, and Freud, the theorist of a permanently discontent civilization, one in which the abolition of private property would make virtually no difference in the amount of aggression that would have to be repressed. Humans, being who they are, would simply find other things to fight about, or so Freud believed. Evidently Freud's theory would have to be transformed in order to make it useful to the project of cultural revolution.

The greatest transformer of them all was Herbert Marcuse, whose *Eros and Civilization: A Philosophical Inquiry Into Freud* turns Freud into a utopian theorist by rethinking the origins of repression. For Freud, repression is a psychological category, necessitated by emerging aggression and sexuality. For Marcuse, repression is as much a social as it is a psychological category, designating not just psychological self-restraint, but the restraints on satisfaction imposed by an unjust economic system based on what he calls the "performance principle," the prevailing historical form of the reality principle. Instinct, in turn, Marcuse defines as the primary drives that are subject to historical modification.

If the instincts are subject to historical modification, then the door to utopia is open. Marcuse must demonstrate that repression is essential not to civilization itself, but only to a particularly repressive form of civilization, one based on the performance principle, in which people live to consume, and not the other way around. Marcuse is writing, of course, only about the world's most "advanced" industrial societies. And he was writing at a time (the mid-1950s) in which it seemed possible that the alienation of labor might soon become complete, as he once put it, by which he meant that machines might do the real work, so that humans would be free to play and display themselves. In such a world, repression as Freud wrote about it would become unnecessary; all repression would become surplus, necessitated by an obsolete economic system. In the place of repression, Eros might become self-sublimating, learning how to delay gratification for the sake of more sustained or more satisfying forms of gratification, just as we learn today to postpone some forms of pleasure in order to heighten them. Think, for example, about how waiting for a delicious meal can make it even tastier. But only, of course, if we don't have to wait too long.

Marcuse's argument has been subject to extensive criticism. Perhaps the most interesting is that of Jessica Benjamin, who argues that in other works of his that combine psychoanalysis and utopia, Marcuse seems to idealize the patriarchal bourgeois family—that is, the traditional family, where the father works and is the unchallenged authority figure, while the mother stays home with the children. Marcuse idealized the patriarchal bourgeois family because he believed that the conflict between father and son that was generated by such families often, or at least sometimes, produced unique children with strong identities. People like himself. The trouble with such an account, Benjamin argues, is that it ignores the crucial role of mother in forming the child's self. Freud too neglected the role of the mother in the child's earliest years, from birth to about age 5.

Melanie Klein and the British School

The shift to a focus on the mother came with Melanie Klein and the rise of the so-called British School in psychoanalysis, which flowered during and after World War II. Instead of seeing the three-way Oedipal conflict between father, mother, and son as the central psychological development, Klein and her students, such as D. W. Winnicott, focused on the child's relationship to the mother. For Klein, the father was of secondary importance, especially in the early years, the parent without breasts, as some Kleinians called him.

Both Freud and Klein make aggression central. Though Freud's famous Oedipal conflict is about the young boy's sexual attraction to his mother, it also assumes his desire to kill and replace his father, coupled with the boy's fear that his father will castrate him if he ever finds out. In order to assuage his fear, the young boy, according to Freud, internalizes the father's values, the values of society at large. Here is the origin of conscience, or the superego as Freud called it, in the child's fear of his own aggression, as well as the imagined aggression of his father.

Klein imagines a much earlier and more complex relationship between mother and child, a relationship that differs little depending on whether the child is a boy or a girl. At first, the young child feels terrible anger and aggression at its mother, because the mother must, of necessity, often frustrate the child. No matter how perfect the mother is, she cannot meet the child's every need. At times like these, the child would destroy his or her mother with every weapon at his or her command, from little fists to teeth that bite. At the same time, the child realizes from a young age (as young as 6 months) that the mother he or she hates is also the mother he or she loves. In order to protect mother, and him- or herself, the child psychologically splits the mother in two: the good mother and the bad mother, almost as if they were two separate mothers.

Splitting is a good way to protect those we love from our own hatred and aggression, but splitting has its limits. We see these limits in politics, particularly, where splitting occurs on a large scale. My country is good, your country is bad. My religion is good, your religion is bad. My skin color is good, yours is bad. My country fights for peace, your country fights for war. The most mentally primitive defense, splitting allows us to live safely with those who love us, or who are like us, but at the cost of directing all our hatred, our frustration, our aggression outward, on the "mature" version of the bad mother, such as another country or ethnic group.

The alternative to splitting is ambivalence, the recognition of complexity, above all the complexity of our own feelings. Klein called it the depressive position, because she believed that when the child first comes to recognize that the mother he or she hates is the same mother he or she loves, the result must be a certain depression, a sober recognition that much of the badness in the world resides not in others, but in ourselves. We have hated as well as loved, desired to destroy as much as we have desired to love, foster, and create with our loved ones.

Out of ambivalence and depression comes the desire to make reparation, to help heal the wounds of hatred: wounds that we have inflicted in phantasy (always spelled by Kleinians with a "ph," in order to connote its unconscious dimension), as well as reality, including the wounds others have inflicted. It is the desire to make reparation that leads boys and girls, men and women, to do most of the good things in this world: make peace, care for others, build institutions and societies that will give new opportunities to the next generation. If Freud saw the battle for civilization as a conflict between Eros and Thanatos, then Klein too sees civilization as a conflict between two desires: (1) to split the world into good and bad, cultivating our hatred, and so justifying our endless persecution of the bad; (2) the desire to make reparation for the badness that our own fear and hatred, as well as the fear and hatred of others, has helped create.

The French Connection

Probably the majority of academics, including political theorists, who use psychoanalysis in their work today draw not on Klein or the British School, and only indirectly on Freud, but on the work of Jacques Lacan and those influenced by him. Writing and holding seminars in the 1950s through 1981 in Paris, where he became renowned, Lacan held that the self does not exist, except as a symptom. One of his most influential insights remains his early work on the mirror stage of development, which runs from about 6 months to 2 years. At that time, the young self recognizes itself in the mirror. He or she is impressed by the wholeness of the image, the appearance of definite boundaries, form, and control seen in the mirror. Yet, this wholeness is an illusion. He or she is none of these things. Alienation, from which the child will never recover, stems from the growing realization that his or her reality lies in an imaginary space: the mirror or the mirroring response of other people. In reality, our selves are torn this way and that by our desires.

There is no cure. The best the analyst can do is help the patient organize his menu, by which Lacan means bring some order to one's desires. To do this, however, the patient must recognize that he or she does not exist as a subject, but lives in the position of the dead. One is reminded here of Freud's comment that a successful cure will consist of transforming the patient's hysterical misery into ordinary human unhappiness. Indeed, Lacan saw himself as returning to the original Freud.

While Lacan, and those who attended his seminars, such as Julia Kristeva, a psychoanalyst and literary theorist educated in France, and Luce Irigaray, have been enormously influential, their relevance to political theory is less obvious. Lacan generates a critical theory of reading in which the subject functions much as a sign (such as a word) that will always be out of reach, its meaning forever sliding under the signifier, as Lacan puts it. He means that just as we think we grasp the meaning of a sentence or text, it slips away from us, much as the self does. Like the self, meaning is never stable. The result has been some brilliant rereading of classical texts, showing how they undermine their own claims.

One must look for the political influence of Lacan's thought in untraditional places, such as Irigaray's argument that patriarchy has infiltrated our language so deeply that we do not even know how to think outside its categories, which she calls phallogocentrism. In constructing new ways of thinking about language, in creating a new disruptive form of feminist writing, Irigaray continues the tradition of transforming psychoanalysis into a critical theory of society.

Public Choice Theory

Public choice theory is a division of rational choice theory. Some authors do not distinguish between the two. Both import the methodology of economics to political science, and use formal, deductive modes of reasoning. Both assume that political agents are rational in the economist's conventional, thin definition of rationality. Those authors who view public choice theory as a distinct subset of rational choice do so because of its (actual or supposed) ideological bent toward a certain sort of libertarian conservatism, typified by the Chicago and Virginia Schools of economics. Social choice theory is analytically distinct from, but is often grouped with, public choice theory, and is therefore discussed in this entry.

The Toolkit of Rational Choice

Rational choice is analytical and deductive. It applies the tools of economics, especially microeconomics and to a lesser extent welfare and macroeconomics, to the subject matter of political science. Microeconomics is concerned with the activities of rational economic agents and, in particular, with their interactions. At its core lie the concepts of marginalism, expressed most conveniently and clearly using differential calculus. For instance, the elasticity of demand for any good is the rate of change in demand for it per unit change in its price.

Concepts such as elasticity depend on a deliberately thin theory of rationality of economic agents. (Neo)classical economists do not, as often wrongly asserted, assume that all economic agents are selfish. They have been attempting to rebut this misperception since Adam Smith, who wrote extensively about it. To derive predictions and models about the world it is necessary to make some assumptions about human agents, but to make the predictions and models as widely applicable as possible, the assumptions are as meager as possible. In the thinnest conception, rationality is a property (only) of transitivity and completeness of judgment. Transitivity requires that if I prefer a pound of apples to a pound of oranges and a pound of oranges to a pound of pears, then I prefer a pound of apples to a pound of pears. If this were not so, I would be impoverished every time I met a greengrocer. The greengrocer could sell me a pound of apples, then offer me a pound of oranges in exchange (providing that I pay him some more), then a pound of pears in exchange, on the same condition, and so on. Completeness requires that for any *a* and *b* I can say exactly one of three things: *I prefer a to b*; *I prefer b to a*; or *I am indifferent between a and b*.

A slightly thicker assumption is *diminishing marginal utility*. For any pair of goods, it assumes that I would rather have more than less; but for either one, the more of it I already have, the less I value a further increment of it compared to the other. Note that nothing, even in this thicker definition, need imply selfishness. The goods in question could be, for instance, charitable donations. The more I have already given to the volunteer lifeboat service, the less I am inclined to spend my marginal dollar on that and the more on cancer research.

The Virginia School

The Virginia School was founded by James Buchanan (b. 1919; Nobel laureate in economics 1986) and Gordon Tullock (b. 1922). They

observed that economists typically assumed that although economic agents would mostly act from self-interest, political agents, constitutional designers, and regulators would act from the public interest. Notably in public finance, theorists assumed that policy makers would set the optimal tax level that was just sufficient to pay for "the right" amount of public expenditure, while correcting distortions and market failures. Buchanan and Tullock vigorously argued that this was inconsistent, and that political agents should be regarded as selfish to the same extent as economic agents. A well-known Tullock aphorism, although not backed by empirical evidence, is "Everybody is altruistic, 5% of the time." Accordingly, their book, *The Calculus of Consent* (1962), proposes what they regard as the optimal institutions to counter the selfish aims of politicians, voters, and interest groups. They also founded the journal now known as *Public Choice,* which for many years (but less so now) reflected the Virginian ideology that most political agents use the concept of public interest as a cover for their special interests. In the Virginian view, the least plausible statement in politics is "I'm from the government, and I'm here to help you."

The most important Virginian contributions are to restore constitutional design to the central place in political science that it should never have lost and to introduce the concept of rent seeking (credited to Tullock but authored by Anne Krueger in a paper published in 1973).

Constitutional Design

The Calculus of Consent could be regarded as a remake of the Virginian James Madison's essays in *The Federalist* (1788), especially numbers 10 and 45 through 51. In Madison's view, "faction" cannot be suppressed, so it must be controlled. In one version (that of "Federalist 10"), an "extended republic" does most of the work, because it ensures that no local faction is likely to become a tyrannical majority oppressing the minority across the whole land. In the second version (seen especially in "Federalist 51"), the checks and balances of horizontal and vertical federalism do the work. "Ambition must be made to counter ambition," Madison argued (in "Federalist 51," p. 319).

Madison's insights were never forgotten, but their importance was not truly recognized until the 1950s. *The Calculus of Consent* argues that only a constitution unanimously agreed on would fully protect individuals from expropriation. This idea extends the welfare economist's conception of "Pareto-improvement." If a measure makes at least one person better off while making nobody worse off, it may be regarded unambiguously as an improvement. Measures that make some people better off and others worse off can not be so classified. The careful welfare economist says, "I cannot tell you whether or not they should be done; that is a value judgment"; A full-throated Virginian says, "They should not be done unless everyone agrees to them." This would in practice rule out most or all redistributive taxation, which is the basic reason to classify the Virginia School as libertarian conservative.

Two problems are that a constitution that had to be agreed to unanimously would never be agreed on (as Madison himself was well aware), and that Buchanan and Tullock's assumption that political actors are selfishly motivated most of the time leaves no room for altruistic constitution designers such as James Madison.

Rent Seeking

Rent seeking is the search for *economic rent,* by which economists mean the extra return a factor of production makes, compared to the next best available return. In a perfect free market, there are no economic rents because if any activity earns a higher return than others, scarce factors of production will flow to it until the return drops back to normal level. In the real world, there are lots of monopolies (natural and artificial) and information asymmetries that create rent. Tullock's insight was not just that special interests seek economic rent. That has been known since Adam Smith, who, in a prequel to public choice theory, said: "People of the same trade seldom meet together, even for merriment and diversion, but the conversation ends in conspiracy against the public, or in some contrivance to raise prices" (*Wealth of Nations,* 1981, I.X.C.27, p. 145). Public choice writers see conspiracies against the public everywhere. Tullock saw that it pays a lobbyist to use real resources, such as bribes and Washington

dinners, to secure monopolies or tax breaks—but that in aggregate bidders will spend up to the whole value of the monopoly and in some circumstances more in order to secure it. This is what the development economist Jagdish Bhagwati has labeled "directly unproductive activity."

Public Choice Theory in Stanford, Maryland, and Rochester

Not all followers of the Virginia School are Virginians. Among important public choice theorists who neither came from Virginia nor shared the Virginians' libertarian conservative ideology were Anthony Downs, Mancur Olson (1932–1998), and W. H. (Bill) Riker (1920–1993). Downs's *Economic Theory of Democracy* (1957) was his Stanford doctoral dissertation. He models politicians as sellers and electors as buyers in the market for policies. His best-known conclusions are (a) that in equilibrium, policy will converge on the issue position of the median voter (a result developed simultaneously by the Scottish economist Duncan Black); and (b, rather in tension with a) that as the probability that an individual voter is decisive is infinitesimal, a rational voter would almost never vote. Much of public choice theory since 1957 is an elaboration and reconciliation of these two results. The median voter theorem is now such a standard tool of empirical analysis that those who use it may not particularly associate it with public choice theory.

Olson and Riker both founded schools of public choice theory, at Maryland and Rochester (NY) respectively. Olson is best known for his first book, *The Logic of Collective Action* (1965), his Harvard dissertation. Potential lobbyists face a collective action problem. What they are seeking, even if it is a restrictive practice or tax break that would yield economic rent, is a public good from the point of view of the (potential) lobbyists. A public good is anything whose benefits are indivisible and nonexcludable, such as clean air, national defense, and an ethanol subsidy. If the group that would benefit from a public good is large, then (as with the Downsian act of voting) it is rational to take a free ride on others' actions and not contribute to the lobby. If the group is small, on the other hand, it is harder to get away with free riding. As there are fewer capitalists than proletarians, one implication is Marxist: Public policy will tend to favor the interests of capital over those of labor. Not all public choice theory has right-wing implications.

Riker had multiple interests, but the one most likely to survive is his program of "heresthetics." From the impossibility results of social choice theory discussed in that section later, he concluded that politics was in chronic disequilibrium. The median voter theorem fails whenever there are two or more dimensions in politics. This is a tragedy for some but an opportunity for those smart enough to practice "heresthetics"—the art and science of political manipulation. By structuring the options and controlling the voting order and the voting system, a heresthetician can get an unexpected outcome in multidimensional space. Riker and his followers have identified a few successful heresthetic ians, such as Gouverneur Morris and Abraham Lincoln in U.S. politics, Robert Peel and David Lloyd George in the United Kingdom, and David Lange and Roger Douglas in New Zealand.

The Chicago School

Where Virginians in their various ways see disequilibrium, the Chicago School sees equilibrium. Chicago economists also tend to be libertarian conservatives, but their distrust of government is typically more than Virginians'. Rather than search in a Madisonian (or Olsonian or Rikerian) way for optimal institutions to control rent seeking, they put a different gloss on the concept of Pareto-improvement. In an efficient political system, all trades and logrolls that make at least one party better off without making either (any) worse off will be done. Therefore, adapting a typical Chicago School title (by Donald Wittman), *Political Institutions Are Efficient* and *Democratic Failure Is a Myth*. Chicago School economists do not deny that politics is full of *economically* inefficient outcomes and institutions, such as tariff protection, which is ruinous to all except those whose output is directly protected. They assert rather that if the gains from moving to a free-trade regime were so great that the winners could bribe the losers to accept it, they would have done it. Therefore, the fact that they have not is used as evidence that a move to free trade would not be efficient. Followers of Olson may object that there

is something circular in this argument: certainly it is hard to test or to set up a counterargument.

Social Choice Theory

Social choice theory concerns the problems of aggregating individual choices (and orderings) to social choices (and orderings). The first known thinkers to understand some of the issues were Ramon Llull (c. 1232–1316) and Nicholas of Cusa (a.k.a. Cusanus; 1401–1464). The "first golden age of social choice" occurred in France between 1770 and 1804, when fundamental discoveries were made by the marquis de Condorcet (1743–1794) and J.-C. de Borda (1733–1799). Condorcet proved that when there are at least three voters and at least three options, it is always possible to have a cycle in majority rule such that no option wins a majority against each of the others. This has fundamental implications for democratic theory. Borda proposed the rank-order scoring rule. This was not in itself novel—unknown to Borda, Cusanus had proposed it 350 years earlier—but Borda was the first to axiomatize its properties. The Condorcet winner (the candidate who wins a majority against each of the others) and the Borda winner (the candidate who is on average the highest ranked) are not always the same, and the dispute as to which is the better criterion for majority rule is as open as it was in 1785.

However, all the writings of the golden age were lost and rediscovered only in the mid-twentieth century. The most important new work was Kenneth Arrow's general impossibility theorem of 1951. Arrow proved that no social welfare function could possibly satisfy a set of minimally demanding criteria of fairness and logicality. A social welfare function is a map from a set of individual orderings to a group, or social, ordering. The conditions may be stated, making the anagram "cupid," as:

1. Collective transitivity and completeness (if all individual orderings are transitive and complete, so should be the social ordering)
2. *U*niversal domain (the mapping function yields a unique answer for all possible combinations of individual inputs
3. The weak *P*areto-condition (if all individuals prefer some x to y, the social ordering does not rank y above x)
4. *I*ndependence of irrelevant alternatives (the social ordering of x and y to be a function only of individual orderings of x and y, regardless of individual orderings of other options)
5. Non*d*ictatorship (no individual's preference automatically becomes the group preference regardless of the preferences of other individuals)

The Condorcet rule fails condition *C* (or *U*). The Borda rule fails condition *I*. All conceivable rules, including nondemocratic ones such as "do what has always been done" and "do what the Oracle at Delphi says" must fail at least one of the conditions.

The implications of the Arrow result took some years to sink into political theory, but they now play enormous roles in democratic theory, in the design of electoral systems, and in the subdiscipline of social choice itself. In the 1970s and 1980s, social choice theorists tended to concentrate on the negative—proving that various things were impossible. The trend has now shifted to proving existence results—that things are possible given certain conditions.

Social choice theory carries no distinctive ideological baggage, unlike the Virginia or Chicago Schools of public choice theory. However, it is normatively important. For instance, it destroys the argument that politicians should implement the "will of the people" because the will of the people may be undefinable, and in a complex multidimensional context it almost certainly is.

Public Goods

A *public good* is a nonexcludable and nondepletable (or "nonrivalrous") good. A good is nonexcludable if one cannot exclude individuals from enjoying its benefits when the good is provided. A good is nondepletable if one individual's enjoyment of the good does not diminish the amount of the good available to others. For example, clean air is (for all practical purposes) a public good, because its use by one individual does not (for all practical purposes) deplete the stock available to other individuals, and there is no way to exclude an individual from consuming it, if it exists. Another common example is national defense, because it is assumed that a nation-state cannot choose to protect just some of its residents from foreign aggression while excluding others from this protection and providing one resident with national defense does not diminish the protection being provided to other residents. A *public bad* is similarly defined to be a "bad" that is nonexcludable and nondepletable. For example, polluted air is a public bad, for the same reasons that clean air is a public good.

Public goods contrast with private goods, which are both excludable and depletable. Food is a straightforward example of a private good: One person's consumption of a piece of food deprives others of consuming it (hence it is depletable), and it is possible to exclude some individuals from consuming it (by assigning enforceable private property rights to food items, for example). Some goods fit neatly into neither category because they are excludable but nondepletable (such as a music concert) or nonexcludable but depletable (such as a public beach, which may become less attractive, or "depleted," as more individuals make use of it).

Public goods (and bads) are textbook examples of goods that the market typically undersupplies (or oversupplies in the case of public bads), relative to Pareto-efficient levels. For example, profit-maximizing firms and self-interested individuals can be expected to choose levels of production and consumption such that the aggregate level of pollution resulting from their activities leaves everyone worse off (according to their own preferences) than if each were somehow prevented from producing or consuming as much as is individually optimal. Commonly suggested solutions to such "market failures" include taxes and subsidies or government intervention.

An important similarity exists between problems involving the provision of public goods and collective action problems, such as voting, public protest, or output restriction in the case of oligopolists, where an individual typically cannot be prevented from benefiting from the achievement of the goal of the collective action, if it is achieved. In such cases, the achievement of this goal can be thought of as a "nonexcludable good." Consequently, it is often thought that an individual may have little incentive to contribute to its achievement—by turning out to vote or participating in a protest—if he or she views the act of contribution as in itself costly and his or her contribution is unlikely to have a significant impact on whether the collective goal is achieved.

Public Reason

Public reason is a moral ideal requiring that political decisions be reasonably justifiable or acceptable from each individual's viewpoint. Given the plurality of moral, ethical, and religious doctrines that characterize liberal democratic societies, public reason represents an attempt to develop a shared framework for our political deliberations that each person can endorse. Some philosophers argue that political regimes or laws that do not meet the standards of public reason are illegitimate or unjust for that reason. Leading contemporary theorists of public reason include John Rawls, Jürgen Habermas, and Gerald F. Gaus. This entry will briefly discuss three aspects of public reason: constituency, scope, and content.

The *constituency* of public reason identifies the relevant set of people to whom we seek to justify a given decision. In one view, the constituency of public reason includes all those people who are governed or otherwise affected by a decision. But this *inclusive* conception poses difficulties—what about irrational, immoral, or otherwise unreasonable people? Some theorists respond to this worry by specifying an *idealized* constituency of people who meet certain epistemic and/or normative standards. A key debate is thus whether the demand for justification applies to people as we find them, or rather to people qua idealized rational and reasonable agents.

The *scope* of public reason delineates the set of issues to which the ideal applies. Some argue that all political power is ultimately coercive, and because it is wrong to coerce others on grounds they cannot reasonably accept, *all* our political decisions must be informed by public reason. Others claim public reason has a more limited scope and regulates only constitutional essentials or those decisions that affect the basic political framework of society. Democratic decisions that take place within that framework are then alleged to be free from the constraints of public reason. A related question is whether public reason should regulate the behavior of all citizens in the political arena, or whether it applies only to public officials, such as judges and legislators.

In considering *content,* theorists largely agree that public reason does not support decisions that can be justified only by appealing to some individual's or group's self-interest, or by appealing to controversial ethical, religious, or metaphysical beliefs. However, theorists disagree about *why* public reason has this content. Some claim public reason is a *procedural* ideal that regulates political discourse among citizens, whereas others insist public reason provides a *substantive* standard that ought to guide our political behavior. In the first view, public reason provides an ideal list of conditions that real political procedures would have to meet in order to ensure decisions are acceptable to each participant (e.g., conditions for inclusion, participation, and decision making). Those who favor the second view, however, argue the content of public reason is, at least in part, settled in advance of any actual discussion. The theorist determines which reasons or principles are publicly justifiable; real political deliberation is then regulated by this substantive standard.

Public Sphere

On November 4, 2008, Barack Obama was elected president of the United States. The election was notable for a number of reasons, not least for the fact that Obama was the first African American president. In addition, he was perceived by much of the American electorate and by many elsewhere

in the world as a liberal alternative to the 8 years of neoconservative policy making under his predecessor George W. Bush. But there is another reason why Obama's election is important, one that directly concerns what is explored in this entry. This election opened up public spheres in societies across the world through which individuals debated and discussed the consequences and wider meaning of his victory. These debates were numerous, and the issues discussed varied according to factors such as social class, gender, religion, race and ethnicity, country of origin, media outlet, and so on. Nonetheless, the crucial point is that many people in different ways engaged in dialogue and deliberation about Obama's electoral success. This relatively simple example suggests what is meant by the concept of "the public sphere." This entry elaborates on this initial meaning and looks at some of the debates around what constitutes a public sphere.

Habermas and the Public Sphere

Arguably, the most well-known theorist of the public sphere is the critical social theorist Jürgen Habermas. In his early work, *The Structural Transformation of the Public Sphere* (1989), Habermas outlines the rise in eighteenth-century Western Europe of the bourgeois public sphere to its eventual demise in the nineteenth and twentieth centuries. According to Habermas, the eighteenth century saw the convergence of several key developments that encouraged the emergence of this particular public sphere. The modern economy required the circulation of information between traders about such factors as the prices of commodities. Subsequently, the market economy also required a reading public who could think in "rational" terms about economic transactions across the globe.

At the same time, Habermas further suggests, the eighteenth century witnessed the rise of the modern patriarchal family. Within this particular social unit, individuals began to express their innermost emotional and personal feelings through the likes of letters, diaries, and novels. Private individuals now shared a platform of psychological intimacy of what was thought to be "human." Urban cities in Western Europe also flourished, and this brought together strangers who would mix in particular public spaces such as *salons* and coffee houses to discuss the issues of the day. "Professional" criticism likewise emerged through a growing national press, which helped to politicize debates in civil society. Indeed, as Habermas observes, it was soon apparent that a growing "public opinion" among the populations of Western Europe could be identified based on the power of the better argument and a morally equipped rationality bent on ascertaining what was just and right.

Habermas's delineation of the bourgeois public sphere is useful because it highlights some of the key attributes of the modern public sphere. However, on closer inspection, Habermas's early exposition of the public sphere is found wanting. First, Habermas argues that the bourgeois public sphere went into terminal decline from the nineteenth century onward due to such factors as the trivialization of debate through the rise of the mass media and the increasing way in which politicians and governments began to manipulate debate through, for example, public opinion polls. But if one accepts Habermas's historical narrative, it becomes difficult to see how the bourgeois public sphere as it existed in the eighteenth century can be productively used to analyze contemporary events if that very same public sphere flourished for only a short period of time.

Second, critics argue that Habermas says very little in *Structural Transformation* about how non-bourgeois public spheres, such as working-class public spheres, were more frequently than not excluded from being fully included in democratic debate and discussion. Such exclusion operated through factors such as government repression, wealth, inequality, power, and so on. A related point here is that Habermas's delineation of the bourgeois public sphere seems to capture the cultural lived experiences of a rather serious and scholarly type of public debate by white, middle-class, male individuals. Yet when we turn our attention either to eighteenth-century European societies or to a modern-day phenomenon like the election of President Obama, we immediately notice that the sort of "rational-critical" discussion evident in the bourgeois public sphere is just one type of debate in society among numerous other populist forms of debate. For example, many would no doubt have discussed Obama's election

campaign in everyday spaces such as a community club, a workplace, Internet discussion forums, local shops, public parks, the gym, a bar, and so on. And it goes without saying that these discussions would themselves be mediated by other factors, such as the region each participant lived in; their own individual, social, and cultural identity; local language styles such as "slang" words; and so on. These attributes convey types of discussion embedded in a popular culture at some distance from the sort of rational-critical bourgeois public sphere celebrated by Habermas.

A Procedural Approach to the Public Sphere

Habermas is of course aware of the criticisms directed at his early conception of the public sphere, and in his later work he consciously seeks to address these problems. Habermas no longer equates the public sphere with the bourgeoisie. Instead, he now seeks to theoretically reconstruct the broader *procedures* required for debate and discussion to be considered as rationally motivated. Accordingly, Habermas argues that there are three validity claims underpinning debates between at least two people: that the propositional content is true and is based on evidence; that the performative content is normatively correct and refers to questions of moral rightness about a subject matter being discussed; and that the intentions expressed are sincere. Such validity claims, Habermas further suggests, conjoin *all* individuals, and not just the bourgeoisie, to accept an argument based on the best reasons put forward by those concerned, rather than by imposing arguments on others through more coercive factors, such as wealth and power.

In *Between Facts and Norms,* Habermas argues that in our increasingly complex global world, it is the steering capacity of law that has the power to establish a robust and "valid" public sphere. For example, law for Habermas has both the power to create sanctions aiming to regulate the behavior of people and to enact laws that individuals have actively participated in creating. This viewpoint enables Habermas to sketch out the procedures that would need to exist for a healthy public sphere to flourish. In his ideal state of affairs, "strong" public spheres such as the state and government would make rules and regulations that a population must follow. "Weak" public spheres, such as those associated with social movements (e.g., environmental groups) or the voluntary sector, would form opinions through debate among their members. In other words, "weak" public spheres have the capacity to articulate their own validity claims based on the beliefs, desires, norms, and morals held by their members. In this way, law acts as a means by which strong public spheres communicate decisions to weak public spheres, while weak public spheres debate the validity of such legal rules in their own public forums and formulate their own validity claims on them. Once debated among their members, these opinions from weak public spheres are then passed back up to strong public spheres. By taking on board opinions from weak public spheres, strong public spheres can amend legal rules as is required.

A Deliberative Approach to the Public Sphere

One notable set of criticisms directed at Habermas's later work suggest that the sort of procedures Habermas maps out will not in themselves guarantee that some participants will engage in ongoing dialogue with others. As James Bohman argues, Habermas's procedural account will not by itself be able to judge the extent to which discussion in a particular context will be publicly acceptable to others. On balance, knowing that one's arguments are "valid" does not necessarily imply that the processes of deliberation will be acceptable to one or more of the parties involved in a respective debate. For example, there may very well be a procedure that stipulates that no public sphere can discriminate on the grounds of gender. However, in actual deliberations, a woman might not raise a question concerning, say, everyday experiences of sexual harassment, because she believes it to be a matter of less seriousness and importance than other issues under consideration in the public sphere at hand. In other words, the quality and public nature of debate cannot be resolved only through a set of procedures. Instead, people will tend to support agreements to the extent to which deliberations themselves, and not merely the procedures, are publicly accountable.

What this means is that procedural devices for the public sphere are a necessary though not sufficient mechanism for people to engage in debate

and discussion. Just as important, some suggest, is the quality of deliberation through which people argue about, and make justifications for, their reasons for adopting a particular standpoint. Accountability in deliberative encounters is therefore just as vital as the amount of consent people show toward procedural devices. After all, according to this deliberative perspective, when one gives an account of their arguments to others, they are forced to take careful note of the public setting in which the discussion is taking place and take note of the various people listening. While certain procedures must obviously be observed by all in such settings, participants are also required to carefully articulate, explain, and justify their reasons in a manner that will resonate with the lived experiences of others in the setting in question. In addition, a deliberative perspective does not merely highlight formal procedures of co-opting participant membership onto organizational forums, as one might expect in Habermas's schema. Rather, deliberative theorists pay closer attention to the inclusion of a variety of "ordinary" people on such forums so that a rich array of voices can be heard.

Although more deliberative approaches illustrate some of the problems evident in Habermas's procedural account, they are not without their own problems. One of the more pressing problems is that deliberative theorists want to restrict coercion to a minimum during the actual moment of deliberation in order to promote equality and mutual respect between participants. However, critics point out that although this is a laudable aim, it is nevertheless somewhat idealistic. For example, many social movements aiming for greater democratic rights obviously use various types of communicative rhetoric to win allies for their respective causes. Yet such movements also use strategic acts of resistance, such as demonstrations, marches, boycotts, disobedience, and so on. These more "coercive" strategies are often just as important for gaining greater rights as are "noncoercive" deliberative acts, but they are strategies that are frequently ignored by deliberative theorists.

A Postmodern Approach to the Public Sphere

It is the recognition that strategic coercion is often required in debate and discussion that has led others to reformulate the concept of the public sphere. In particular, some argue that contemporary societies comprise a plethora of competing voices in the public sphere. These competing voices are structured around diverse identity formations, such as gender, sexuality, race, and by diverse social and political issues, such as environmentalism, global poverty, stop-the-war campaigns, antiglobalization, and so on. In such circumstances, it makes little sense to map out a set of procedures or deliberative conditions that will satisfy all of these competing interests and issues. Rather, one should simply accept the permanency of conflict, or agonism, between different interests in society and encourage the formation of public outlets for these competing interests. In this more postmodern perspective, one does not therefore have to necessarily discover or reach a consensus between relevant participants in the public sphere. Rather, it is quite feasible and legitimate to allow and encourage spaces of agonism to develop and flourish.

This latter point is especially noticeable when one considers the impact of globalization. Recent technological advances in civil society, such as the Internet, have encouraged the formation of global communication networks across territories. As a result, different people from different countries, regions, and localities can engage in debate and discussion across a range of issues and use these discussions in conjunction with, or as a springboard for, other types of activist politics. Take the antiglobalization movements as an example. They were formed by a multitude of groups and alternative media outlets along with a vast array of issue-based politics. However, the various activist networks that feed into the antiglobalization movement are still nevertheless linked together by a critical and often antistatist stance toward the development of globalization. For example, many activists involved in the antiglobalization movement are critical of the policies of Western governments to tackle global poverty. This represents a unique public sphere in the age of global capitalism to the extent that debate and discussion are formed across social and global communicative networks. A particular local social struggle in one area of the world can thereby at the same time be communicated to other local struggles in another part of the world. Such struggles are thus simultaneously local and common, public and private.

Moreover, it is a type of communication in which debate is informed by other ongoing and often coercive strategies, such as demonstrations, protests, leafleting, petitions, computer hacking, and so on.

According to critics, however, a postmodern approach suffers from its own problems in relation to the public sphere. First, a postmodern approach is frequently hampered by lack of coherency. For example, the fact that a social movement such as antiglobalization is composed of so many different groups often leads to internal divisions and rifts between various movement activist networks that make up its core constituency. This in turn means that this movement is not as successful as it could be in presenting a coherent political program to those "ordinary" public spheres inhabited by "ordinary" voters in local communities. Such divisions also open up the opportunity for nation-states and global governance institutions to selectively co-opt social movements within formally sanctioned government public spheres and marginalize other social movements that prove too "antagonistic."

Second, many postmodern approaches are accused of lumping together qualitatively distinct types of protest under rather homogeneous descriptive terms, such as "social movements," "multitude," or "identity politics." The problem appears if we compare public spheres that emerge in working-class communities on local issues and public spheres that emerge in anarchist networks on global issues. Each respective public sphere here is substantially different in both form and content, and it makes little sense to simply relate them together under the same descriptive terms.

Third, many postmodern approaches overestimate the impact that globalization has had on the public sphere. Often preferring to conceptualize debate and discussion at a global level, postmodern approaches sometimes fail to explore in enough detail the role that the nation-state plays in framing issues spoken about in the public sphere. An obvious illustration in this respect is the way in which governments will use immigration as a subject matter to frame part of a nation's political landscape in order to deflect public scrutiny away from other more contentious political issues.

PUBLIUS

Publius—the pseudonymous voice of Alexander Hamilton, John Jay, and James Madison—is the author of 85 essays urging the ratification of the U.S. Constitution. These essays appeared several times a week in New York City newspapers between October 1787 and August 1788 and were later assembled in book form as *The Federalist*. Although the essays were initially written to defend the Constitution against Anti-Federalist opponents, they also provided a systematic explanation of American constitutionalism. *The Federalist* is, therefore, often considered America's most important work of political theory. A proper understanding of *The Federalist* requires attention to its status as a work both of political polemic and of theoretical reflection on

the principles and organization of republican government.

Publius argued against the decentralization of political authority under the Articles of Confederation, which had created a confederation of 13 sovereign states rather than a central government capable of acting in the national interest. Publius worried, for example, that national commercial interests suffered from intransigent economic conflicts between states, and that federal weakness undermined American diplomatic efforts abroad. Broadly, Publius argued that the government's impotence under the Articles of Confederation obstructed America's emergence as a powerful commercial empire.

Publius was also critical of the power assumed by state legislatures under the Articles of Confederation—and of the questionable character of the men serving in those assemblies. The farmers and artisans who rose to power in postrevolutionary America seemed too beholden to narrow economic and regional interests to serve the broader public good. Of particular concern to Publius were state legislatures passing pro-debtor legislation and paper money laws that threatened creditors' property rights. Although revolutionary Americans typically worried about the conspiracies of the elite few against the liberties of the people, Publius's concern was with tyrannical legislative majorities threatening the rights of propertied minorities. According to Publius, the Articles of Confederation had provided no safeguards against the vices of the people themselves. He argued that the American Revolution's enthusiasm for liberty had diminished popular appreciation for the need for governance. "Excesses of democracy" threatened to corrupt postrevolutionary republican governments and sink them into popular licentiousness and vice. Publius understood the 1786 insurrection of debtor farmers in western Massachusetts—Shays' Rebellion—as a symptom of this broader crisis.

Publius argued for an increase in the "energy" of the federal government to respond to this crisis. However, the national government's increased power would have to be based in republican principles and retain a federal distribution of power; there would be no return to monarchical rule or consolidation of central authority. The task, as Publius stated in Federalist 10, was to find a "republican remedy to the diseases most incident to republican government" (p. 65). *The Federalist*'s new science of politics sought to establish republican government on principles that departed from classical republicanism, to prevent the United States from falling into predicted cycles of decline and regeneration that afflicted past republics. The new federal Constitution promised to break these cycles of decline and establish a more durable and powerful *Novus ordo seclorum*.

There were two essential components of Publius's arguments on this issue: the American states' vast territory and an innovative theory of political representation. The baron de Montesquieu and other influential republican theorists had argued that republican government was possible over only a small territory because free republics depended on a virtuous citizenry that shared interests and values and whose loyalty was engendered through direct participation in public affairs; popular liberties were sustained only by a virtuous citizenry. A large republic's diversity, classical republicans feared, would lead to divisive factional politics that would undermine it. The loyalty of citizens in a large state, moreover, would be achieved by threat of force rather than virtuous commitment to the public good. Publius's Anti-Federalist opponents frequently invoked these theories in their arguments against the Constitution.

Publius rejected this prevailing theory of small republics and argued instead that the American republic's vastness was an advantage. Rather than relying wholly on the citizenry's virtues to prevent factionalism, Publius argued that institutions could be arranged so as to mitigate its harmful effects. Political representation, which Publius called "the great mechanical power in government," was the key. In a large republic, there would be so many different factions, Publius reasoned that no majority faction could win elections and tyrannize over minorities. Instead, these factions would cancel each other out and typically elect representatives capable of an enlarged, refined view of the public good. Although Publius argued that the people were the only legitimate foundation of public authority, *The Federalist* emphasizes that institutions should be organized to obstruct majorities and protect the people from the tyrannical tendencies of their own democratic will.

Publius's emphasis on how institutional organization might "ameliorate popular systems" exemplifies a broader shift in how he understood the strategy of republican governance. In earlier forms of republicanism—including the "Country" republicanism that profoundly influenced American revolutionaries—the power of government was directly opposed to the liberties of the people. Publius, by contrast, argued that the Constitution established an economy of governmental power and popular liberty: Government would rule not by directly limiting the liberties of the people, but would indirectly channel them to prevent harmful excesses.

This institutional strategy of indirect governance is also exemplified in Publius's famous arguments about checking governmental power. Popular accountability through elections was a crucial "external" check, and Publius also argued for the importance of "auxiliary precautions" in the internal organization of the government itself. The separation of powers between the three branches of government would create internal checks and balances within the government to prevent, first, one branch from dominating the others and, second, the general government from overreaching constitutional limits on its power. Whereas earlier republican theories of "mixed government" had associated the separate branches with different social classes, Publius's theory derived the authority of all branches from the people themselves. There was no constitutionally sanctioned division of social classes or estates.

Scholars have contested the place of *The Federalist* within the history of Western political thought. Some have identified it with the end of classical republican politics and with the birth of modern liberalism; others have emphasized the influence of Scottish Enlightenment thinkers like David Hume; and yet others have tried to establish the influence on Publius of ancient theories of the virtues. Most agree, however, that Publius offers profound insights into the nature of American politics and, doing so, allows readers to see the goals—and democratic limitations—of modern republicanism more clearly.

Pufendorf, Samuel von (1632–1694)

Samuel von Pufendorf is one of the most important intellectuals of the early German Enlightenment. During the seventeenth century, Pufendorf's works were widely read and translated into all major European languages. At least for his own century, his influence on the German and European developments on law and philosophy cannot be easily overrated. His writings have influenced the shaping of ideas formulated by Jean-Jacques Rousseau and Denis Diderot, as well as ideas in John Locke's and William Blackstone's works. His influence, however, is not limited to Europe. Pufendorf also had bearings on the ideas of the American founding fathers and on the formulation of a defense of the right of colonies. But by the end of the eighteenth century, he had become academically marginalized.

During the last two or three decades, Pufendorf's thought has regained scholars' interest. The recent scholarship can be broadly divided into two camps, reflecting the two different trends in the reception of his work during the seventeenth and early eighteenth century. Although Pufendorf was read in Europe primarily as a theorist of absolute and religious independent state power, in the New World he stands for a defender of the people's liberty and rights. These two different readings of Pufendorf are mirrored in recent scholarship in a "modern" and a "traditional" interpretation of his works.

Life

One reason for his marginalization can be accounted for in the eclectic nature of his writings. This eclecticism is also reflected in his life and career. Pufendorf was born in the Electorate of Saxony to a Lutheran pastor. Originally, he intended to follow his father's profession and began studying Lutheran theology in Leipzig, Germany. Soon thereafter he became interested in natural sciences and jurisprudence and switched to Jena University. There he studied natural law and moral philosophy. After leaving the university, he served as tutor for Peter Julius Coyet's family, the Swedish minister in Copenhagen. In 1660, he became professor of natural law and law of nations in the faculty of philosophy at Heidelberg University. This was the first chair of this kind in Europe. Later, he held a similar position in the faculty of law at Lund University. He was privy councilor, royal historian, and secretary of state to Charles XI of Sweden; thereafter, he served similar appointments with Frederick I and Frederick III of Prussia. A few months before his death, Charles XI of Sweden ennobled Pufendorf by granting him the title of baron (*Freiherr*). His different occupations and interests are reflected in his work: Although he primarily has a reputation as a natural law theorist, he was interested in the concepts of sovereignty, toleration, federalism, resistance, and theological questions.

Main Ideas

Despite the diversity of his work, most of his ideas are related to and center on the nature of the state and the primacy of the political. One of his major achievements can be located in freeing natural law, the state, and the political from religion. Unlike other theorists of his time, he integrates history into his theoretical analysis. This becomes particularly apparent in *On the Constitution of the German Empire* (1667), a work that is ranked among Pufendorf scholars as his most brilliant. Published under the pseudonym of Severinus de Monzambano, *On the Constitution of the German Empire* refutes the medieval ideology of the *translatio imperii,* an idea, Pufendorf believes, that is only for the papacy's benefit.

Pufendorf's refutation of papal power echoes a number of medieval voices, including Marsilius of Padua. However, it also reveals and highlights one of his main concerns: the struggle for an intellectually sound argument for the independent sphere of the political. His entire political theory is aimed at securing the religious neutrality of the state and the political neutralization of the church. These are the two essential features of his natural law theory. They are closely related to his concept of the state, which emerges out of a transformed Hobbesian original contract.

Although Pufendorf is heavily influenced by Thomas Hobbes's language and ideas, Pufendorf's understanding of the state of nature is not a permanent state of war. He considers it a state of freedom with a number of deficits that can be overcome only in a political community. To transfer from the state of nature to the political, two contracts are required. The first contract is among (future) citizens. They agree on forming a community and decide whether they want a monarchical, aristocratic, or democratic government. In the second contract, the citizens transfer their power to the government. The government and the state in its totality have then the same freedom as each individual in the state of nature. Although it was still common among his contemporaries to consider God as the primary cause for the state, Pufendorf considered God only the mediate cause of the state; natural law and law of nations are the immediate cause. Adopting a slightly transformed version of Jean Bodin's concept of sovereignty allows him to make a further argument for the state's autonomy from any religious authority over the political: Because sovereignty is indivisible and it resembles the original freedom, it possesses unlimited freedoms and can act and judge as it wishes. This concept gives power over religion to the state. In the case of a tyrannical ruler, Pufendorf grants the individual only the right to flee and to seek the protection of a third party that is not under obligation of the ruler. However, if the ruler tyrannizes the entire people, the contract between these two parties becomes invalid. The ruler is considered an enemy and the people have the right of self-defense.

Punishment

One of the central, and revealing, elements of every political system is how it punishes those who break the law. Many different variables provide insight into the working of a regime, including how systems of punishment are administered; which infractions are considered worthy of punishment; what sorts of punishments are demanded; whether punishment is conceived as serving justice, social order, or the combination thereof; and whether those accused of crimes are able to offer a defense. It is important to distinguish the ideas about punishment espoused by a regime from its actual practices, as both are relevant for understanding how punishment and political order are interrelated. Four lenses of analyses have predominated in the political theory of punishment: punishment and right, punishment in relationship to sovereignty, a sociological approach that focuses on how different groups in society are affected by punishment practices, and utilitarian and economic approaches that investigate the role of punishment as a political tool that complements larger social or economic systems.

The integral relationship of punishment to the concepts of rights in Western political thought can be traced back to the common Greek roots of *timê* and *poinê*: the words *honor* and *punish* have a common origin. It is an acknowledgment of human rationality and judgment that creates the need to punish. Today, those who are considered impaired in their judgment, for instance by youth or mental instability, are not held accountable for their actions the same way as those in full control of their faculties. Intentionality in agency is also important; a crime is punished differently depending on whether it is determined to have been premeditated or accidental. Therefore, the liberal tradition in political theory sees punishment as a necessary complement to individual rights. The belief in judgment that grounds individual rights also means that all individuals must be held accountable for the results of their actions. Although we may think of punishment as a way of limiting individual freedom, many thinkers have argued it is actually a recognition of individual freedom and responsibility.

Punishment is also integral to the dictates of sovereignty to deliver order, security, and justice. Social contract theory emphasizes the exclusive right to punish that resides with political authorities once a political order has been established. For Thomas Hobbes, the sovereign punishes in order to create security and justice and to train the subjects of the social contract; whereas for John Locke, the role of the state is to provide impartial adjudication of conflict. Locke argues that impartial judicial procedures and punishments are the best way for the state to limit the eruption of irrationality and anger—the state of war—into the context of a political society. Governments must use punishment in such a way that it promotes the end of political society as a whole: to enlarge the security and stability of individuals, and not to abuse them through the arbitrary exercise of the power of the state to punish. Therefore, punishment is the exclusive right of sovereigns, but also must be bound by larger ideals of law and justice.

The work of Michel Foucault on institutions of punishment, *Discipline and Punish,* argues that modes of punishment reveal what the state desires as a model citizen, and how it goes about reshaping the population according to these norms. He argues that the structure and intent of modern government can be understood through an examination of institutions, such as the prison. More recently, scholars such as David Garland have argued that governments have legitimated themselves and consolidated power by encouraging fear in citizens by replying with increasingly punitive practices. These lines of inquiry suggest that not only is the prerogative to punish exclusive to sovereign powers, it may also be used to both develop and justify the exercise of new forms of political administration.

These ideals reveal much about how individualism, rights, bounded sovereignty, and government accountability are conceived, and punishment practices also create and reveal social and political inequalities. First, those who disagree with a regime can be subject to exile, incarceration, torture, and/or death. Members of religious, ethnic, racial, and sexual minorities can also be subject to severe punishment within a regime. Disproportionate minority confinement, where minorities make up a larger percentage of the prison population than they do in the general population, is a phenomenon in many different countries. Economics has also influenced punitive practices throughout history. Vagrancy laws have penalized the homeless and/or jobless, and forced labor from prisoners known as galley slaves literally powered the early modern exploration of the globe. Later colonial settlement in North America, Africa, and the Pacific was accomplished in part by those convicted of crimes. Punishment has not infrequently been used to reinforce the status of already disenfranchised groups as well as to extract labor from the poor.

Finally, no account of punishment and political theory would be complete without a consideration of how many political prisoners, such as Nelson Mandela and Václav Havel, have become symbols of resistance against unjust regimes and played roles in regime transformation. Institutions such as the Bastille and the Soviet Gulag have invited actions of resistance and outrage from those subject to these regimes. If a sovereign power appears to abuse its exclusive authority to punish, it may become suspect and engender resistance. If the stated ideals of a polity concerning the rights of citizens and the bounded use of power are clearly compromised by its practices of punishment, the legitimacy of a regime can be threatened. Therefore, rather than the brute exercise of force, punishment needs to be understood as a complex negotiation of larger principles, the need for order, the institutional structures of governance, and the evolving relationship between a state and those subject to it.

PYTHAGOREANISM

A philosophical school, with characteristics of a mystical cult in its earlier stages, founded in the city of Croton in southern Italy by Pythagoras (c. 570–490 BCE), a seer and sage according to his followers. The flourishing of the school was violently terminated by a revolution against the Pythagoreans, allegedly by aristocrats that were denied admission, that led to Pythagoras's escape and the massacre of some of his followers. Pythagoreanism had a strong impact in classical political thought and contributed to the formulation and development of basic social and political ideals, like the political role of friendship, the meritocratic distribution of political power, and retributive justice.

Our knowledge about Pythagoras's actual teaching is speculative, due to it having been kept secret within the restricted confines of his fellowship. Some of the earlier Pythagorean reports on their political thinking have survived in the form of fragments attributed mainly to Archytas of Tarentum (fl 400–360 BCE), an influential politician and philosopher who held important political offices a couple of generations after Pythagoras. Archytas's friendship with Plato, however, is seen to cast doubt on the authentically Pythagorean nature of his writings, which in turn prompts the question of the degree to which the surviving version of

Pythagoreanism is in fact of Platonic inspiration. Pythagorean influence is evident in the political writing of both Plato and Aristotle, while a neo-Pythagorean tradition of the Hellenistic era combined the central philosophical ideas of that period by presenting them as the heirs of early Pythagoreanism. Several pseudo-Pythagorean political fragments of that time survived in later hagiographies of Pythagorean life, most notably those of Diogenes Laertius (c. 200 CE) and the neo-Platonists Porphyry (c. 234–305 CE) and Iamblichus (c. 245–325 CE). Regardless of its mystical element, Pythagoreanism has been claimed as the antecedent ideology of political classes and parties: Plato (*The Republic* 600A-B) alluded to the affinity to the Pythagorean fellowship of his communist elite of the guardians, and Iamblichus (*The Life of Pythagoras* 6.29) depicted Pythagoreans as coenobites, a distinctive social group that had revived in his time.

Friendship was the cornerstone of the Pythagorean sect, in theory as well as in practice. Allegedly, Pythagoras authored the term and regulated the concept by distinguishing between its different types (Iamblichus's *The Life of Pythagoras* 33.230, 16.70), while the Pythagorean fellowship was depicted as a symbiosis in which the fellow members were treated equally, regardless of their sex or social background, and property was shared among them. Plato (*Laws,* Book 6, 757A5-C6) bears witness to a qualified version of the Pythagorean claim that centers on the "truest and perfect equality" of proportional, instead of arithmetical, equality, which results in a meritocratic, rather than a radical egalitarian, scheme. Still, in all likelihood, the new meritocratic proposal did not have any historical political impact in the cities where Pythagoreans lived or held political power, and it was restricted only within their fellowship. As far as the politics of the city were concerned, the Pythagoreans' political alliances aimed at the preservation of the status quo and the maintenance of civic concord.

Their theoretical commitment to that concord is captured by one of Archytas's few authentic fragments (B3.7–9), which refers to the ability to calculate its social function in promoting concord in the city by equalizing differences. According to this fragment, because identifying the proportional distribution, which results to a concordant community, is the result of calculation, it is open to every rational being, and it is therefore solid ground for accordance. Such a political use of the rational capacity that human beings possess is groundbreaking, because it replaces the arbitrariness of tyrannical degrees with objective and accessible fairness. This proposal was based on the Pythagorean conviction that an underlying harmony unites the whole cosmos, and it was supported by their belief that "mathematization" should be employed to reveal this harmony in every of aspect of human life. By identifying cosmic justice with the proportionality that remains intact insofar as the ratio of its parts lasts, Pythagoreanism could similarly define social justice as a meritocratic allocation.

Pythagorean conservatism was also the basis for their conception of corrective justice. From the thesis that justice should be defined as harmony, they derived a conception of corrective justice that is viewed as the talionic ("eye for an eye") restoration of any violation of the status quo caused by an unjust action. Once more, calculation is crucial for the judge's verdict about the conviction, the compensation, and even the deterrent function of punishment. Although Aristotle (*Nicomachean Ethics,* Volumes 4–5) criticized what he understood as the monolithic nature of Pythagorean reciprocal justice for failing to take into account intentions and social utility, he could not help but acknowledge the importance of bipolarity between the unjust action and its restoration and to incorporate it in his influential theory of rectificatory justice.

Many of the later Pythagorean political pseudepigrapha are attempts to philosophize on Aristotelian themes in a Pythagorean fashion. Taking the famous Aristotelian thesis for distributive justice as his starting point, Pseudo-Archytas argued in favor of the meritocratic allocation of political offices. Other neo-Pythagoreans carried this idea to its extremes by suggesting that the raison d'être of hierarchical ruling is the emplacement of harmony on the social domain, which will have to be tuned and united with the harmony of the cosmos. Again, starting from another Aristotelian hypothesis for the superlatively virtuous kingship, they proposed a utopian account of the ideal monarch, akin to God, who is animated law and serves as a moral exemplar to his subjects. Neo-Pythagoreans also expanded on the Aristotelian classification of constitutions with reference to whose

interest it is promoted and also proposed a theory of mixed constitution with a notion of separation of powers.

QUEER

The term *queer* originates from the German *quer* meaning oblique, cross, adverse, perverse. It was first used in the sixteenth century to describe something generally regarded as strange, odd, or out of keeping with the commonplace. In the nineteenth century it began to be used as a verb, meaning to spoil, to ruin, to jeopardize, and in the early twentieth century it was used, for the first time, as a disparaging term for an effeminate man or a homosexual. In the late twentieth century, in the wake of Gay Pride and other such movements aimed at reclaiming identities previously constituted by mainstream society as aberrant, the term *queer* began to be deployed by gays, lesbians, bisexuals, and other sex- and gender-nonconformists as a positive form of self-identification. This reached its apotheosis in the 1990s with the emergence of direct-action activist groups such as Queer Nation, OutRage, PUSSY (Perverts Undermining State Scrutiny), Transsexual Menace, Lesbian Avengers, and Transgender Nation, to name but a few. Like the individuals who identified with the descriptor "queer," these groups aimed to both reinscribe and celebrate what was represented in the mainstream imaginary as strange, marginal, or aberrant, in particular as this applied to gender and sexuality. Consequently, groups such as Queer Nation envisaged the activist interventions with which they have since become synonymous as queering mainstream or heteronormative values, identities, institutions, and forms of social relations, and thus as constituting a direct attack on the hegemony.

At the same time that queer took on the mantle of an umbrella term applicable to all self-identified sex- or gender-nonconformists alike—and indeed, as some would have it, to anyone who positions themselves as at odds with the normal, the legitimate, the dominant—an academic deployment of the term emerged. Queer theory, as this has come to be known, shares with queer activism a political commitment to queer—that is to challenge and to undermine—heteronormative ideas and structures. However, unlike much queer activism, queer theory has its roots in poststructuralism and deconstruction. Despite their differences, queer theorists share a broad commitment to an epistemological shift in focus from the identity of the individual or group to discursive structures and their institutional settings; from the problem of oppression and liberation to the cultural politics of power/knowledge.

As a result, the challenge queer theory (in all its diversity) poses to heteronormativity includes a troubling of the fundamental tenets of identity politics, and in this, queer theory diverges from much queer activism in significant ways.

Broadly speaking, queer theory could be understood as a form of political intervention designed to queer heteronormative notions of identity rather than simply expanding or reversing their established meanings. This is because queer theory, as a critical response to the limits of identity-based politics, conceives gender, sexuality, and so on, as the historically and culturally specific

truth-effect of systems of power/knowledge, and moreover, sees these aspects of selfhood as necessarily existing in complex, ever-shifting relations with other identity variables and their specific histories. For queer theorists, then, sexuality is not an innate drive that has been repressed by oppressive social forces and is thus in need of liberation. Rather, drawing in particular on the work of Michel Foucault, queer theory offers accounts of the ways in which particular forms of knowledge engender specific modes of being. In other words, queer theory is less concerned with explaining the repression of a homosexual minority than with developing critical analyses of the binary figure of hetero-/homosexuality as the effect of systems of power/knowledge that shape desires, behaviors, social institutions, and social relations. In and through this deconstructive process, queer theory aims to expose the limits and instabilities of binary logic, to reveal that the hetero/homo presuppose each other, that each is elicited by the other, and thus haunted by the other which is integral to it.

On this model, then, the identities that are "reclaimed" and celebrated by some forms of queer activism are, in fact, integral to systems of power/knowledge, rather than simply opposed to them. These different ontologies—the former poststructuralist, the latter closer to what one might think of as liberal humanist—are informed by significantly different conceptions of power. In much queer-identity–based activism, as in liberationist politics more generally, power is presumed to be repressive, negative, and disabling: It is something that hegemonic culture has and that marginalized groups must exert or reclaim by force. Queer theory, on the other hand, queers this top-down model of power, arguing instead that power is, for the most part at least, productive, and that it consists of a vast, complex, constantly shifting network in which we are all enmeshed. Indeed, for queer theorists, there is no space outside of this network and thus no position that is simply counter to it. Given this, queer theorists argue that there can be no single or simple political response that would overturn or blow apart the existing social order.

As queer theory conceives it, resistance is inseparable from power rather than being opposed to it. And because resistance is not, and cannot be, external to systems of power/knowledge, then an oppositional politics that attempts to replace supposedly false, repressive ideologies with nonnormative truths is inherently contradictory. There can be no universally applicable political goals or strategies, only a plurality of heterogeneous and localized practices, the effects of which will never be entirely predictable in advance.

While *queer* continues to be used in both the senses outlined earlier—that is, as an identity and as a critique of identity—the last couple of years has seen the emergence of the term *post-queer*. Like the term *queer,* this term is also deployed in a range of competing and often contradictory ways. Some use it in order to foreground what they see as the spatiotemporal movement of the formation and transformation of subjectivities (as relational), of what is sometimes referred to as (un)becoming. Others have used it to suggest the arrival of a new political milieu in which the aims of queer (however they might be imagined) have been achieved. At the same time, the term *post-queer* has been deployed to signify a move away from the ambiguity, fluidity, open-endedness, and so on, associated with queer theory, and back toward more coherent identity categories such as gay and lesbian.

Race Theory

Race theory involves (a) the definition of race, (b) the determination of policies in response to the definitions at hand, and (c) the viability of thought and justifications for the reasoning dominating race definitions and policies. In more prosaic language, this involves answering the questions: What is race? What is the proper response or policies that should be set with regard to race? And, as Paul C. Taylor has characterized these matters in *Race: A Philosophical Introduction,* what is involved in and what is justifiable or not justifiable in and about race thinking? Echoing a turn in modern thought that focuses on conditions of possibility, this last question also takes the form: How is race possible? These three (and not exclusive) concerns of race theory connect with a variety of other theoretical concerns in modern thought, such as the articulation of human subjects, the directions to which human societies should aim or that for which human societies struggle, and the metatheoretical problem of reflective justification.

Definition of Race

The definition of race has a history that is prototypical and then a full-fledged history or what Taylor calls "self-conscious" race thinking. The prototypical history refers to theories of human difference from ancient to the end of medieval times. The ancient versions in Africa, Asia, and Europe were not explicitly *race* thinking because the concept was not yet developed, but familiar tropes of a centered group of human beings counting as truly human versus those who were not fully human were evident in ancient writings. These accounts of human difference were premised on teleological conceptions of nature, in which the centered group exemplified the direction or purpose of achieved humanness. Although there was variation in the models offered, the ancient Greeks generally thought in terms of a species-form of human achievement. For Plato, these concerns transcended the organic features of embodied human beings, but for Aristotle, the organic fusion of form and matter made concrete the manifestations of human potential in the centered group. This implied a natural limitation on the outside groups that, as he argued in his *Politics,* included barbarians, women, and slaves.

The emergence of Christendom transformed the centered group into one legitimated by a theological naturalism, which framed the outsiders at first as those who rejected the Christianity. In the Iberian Peninsula, this framework took the form of *raza,* which referred to breeds of dogs and horses, and, when referring to human populations, Moors and Jews. As Muslims from North Africa, the Moors, along with the Jews, represented a deviation from Christian normativity. The defeat of the Moors in Iberia was followed by the Inquisition to assess the authenticity of the remaining populations of Moors and Jews who had converted to Christianity, a process that led to demands for demonstrations of "purity of blood" (*limpieza de*

sangre), best exemplified by individuals whose origins were purely Christian. Because all that was natural emanated from the theological center, these groups stood as a prototypical formulation of the anthropology that took a path through *razza* (Italian) to the modern term *race,* as used by Francois Bernier in his 1684 account, *A New Division of the Earth*. The initial period of the expansion of Christendom in the late fifteenth century had led to Christian encounters with populations of people who were neither Moor nor Jew, although there were efforts to interpret them in such terms, as conquistadors had at first thought they were encountering strange mosques and synagogues (when the populations were presumed to have been lost Hebrew tribes) in the New World. The enslavement and near genocide of the native populations of the Americas led to Bartolomé de Las Casas's efforts to save them through appeals to the papal authority and his famous debate with Juan Gines de Sepúlveda on the status and suitability of the native populations for slavery. The Atlantic slave trade emerged in this context.

The emerging secular explanations that developed by the end of the sixteenth century were in no small terms a consequence of meeting people, animals, and fauna not accounted for in the Bible, in addition to the changing worldviews from the emerging new science inaugurated by Nicolaus Copernicus, Galileo Galilei, Johannes Kepler, and Francis Bacon, to name a few. As Ernst Cassirer observed in *An Essay on Man,* this new science demanded explanations without theological causality. The search for causation appealed to the human organism as part of a nexus rooted in nature itself. As David Hume observed in his *Treatise of Human Nature,* his goal was to articulate for man what Newton had achieved in his explanation of the physical world. Of interest in the history of naturalistic accounts of race in this regard was the work of Carolus Linnaeus and Johann Friedrich Blumenbach. Linnaeus's *Systema Naturae* (1735) offered a classificatory system, premised on hierarchies of being, sometimes referred to as "the great chain of Being," which serves as the basis of classifying living things to this day. Blumenbach devoted his classification interests to divisions within the human species, racial divisions that were correlated with the continents of Europe, Asia, Africa, and America, as they tend to be known today. He coined the term *Caucasians* to refer to Europeans. In the nineteenth century, the explanation that eclipsed all discussions up to that point, at least with regard to the understanding of the human being in nature and the development of human differences, was Charles Darwin's theory of natural selection. With regard to the human being and differences in the social world, the theoretical framework that set the stage for the eventual critique of Darwinism was the materialist sociology of Karl Marx. By the end of the nineteenth century, Sigmund Freud's psychoanalytical modes of explaining the psychic meaning behind ascriptions of human difference began to make their mark.

Race Theory as Race Policy

The policy aspects of race theory are connected to an important distinction between race theory and theories of racism. Racism involves the set of commitments and practices averring racial hierarchies. There, the notions of racial superiority and inferiority come to the fore. For some theorists, race and racism are sufficiently independent for the possibility of having the former without the latter. For others, the relationship is so strong that the assertion of the distinction between the two becomes negligible. And for others, the two are necessary consequences of each other: Where there is racism, there is race; where there is race, there is racism. And there are others who argue for different sets of criteria of assessing the legitimacy of either. For instance, one could argue that racism could be consistently rejected while accepting the existence of race, and even more radically understood, one could even reject racism while believing in the notion of racial inequality. The ethics of how to treat supposedly "undeveloped people," for instance, could require the rejection of many racist practices. For those who argue that certain notions cannot be separated, however, the racism may exist in the concepts themselves, in the very notion of undeveloped people, as Sylvia Wynter, among others, has argued. In the main, the definitional question of racism is such that it is possible to offer a theory of racism without defining race, because racism is fundamentally about what is done to races and how, in social terms, various races are perceived, interpreted, and judged.

Modern Meta-Race Theory

The metatheoretical problem brings race and racism together in the critical question of what is involved in race thinking and race theorizing. The origins of this aspect of race theory are in the work of Anton Wilhelm Amo, an African philosopher and professor at the University of Halle in the eighteenth century. Amo wrote critically on the inequality of the blacks in Europe, on Cartesian psychology, and on problems of proper reasoning. The last consideration included his engagement with the philosophy of Christian Wolff, who brought the possibility of reason into focus in his political thought. Amo's questioning of the conditions of reason was later taken up ironically by a critic who dismissed the legitimacy of his thought on the basis of his race: Immanuel Kant. Kant, who was also influenced by Wolff but who inaugurated his influential turn in philosophy through his response to David Hume, offered a comprehensive treatment of the conditions of possibility argument. He later referred to his form of transcendental argumentation as critical philosophy. For Kant, the crucial question to ask about the reasoning that supports theory regarded its conditions of possibility. Subsequent philosophers and theorists in the human sciences were critical of Kant's answers but became his genealogical descendants through in turn offering transcendental conditions of their own. Georg Wilhelm Friedrich Hegel, for instance, brought up the importance of history, as did Marx with the added element of materiality. Still others offered physical determinism, linguistic considerations, semiotic questions of signs and symbols of meaning and, more recently, those of culture. The legacy of this form of argumentation in race theory is found among those who ask: How is race possible?

The Foundational Works of Anténor Firmin and W. E. B. Du Bois

In the main, race theories examine how race is possible through discussion of *when* the concept emerged. As we have already seen, that period seems to have been in the transition from its prototypical religious beginnings to its modern naturalistic moorings in the sixteenth century. That period should, however, be understood more as the development of race and racist theory than the theory about that development. For the latter, Anténor Firmin and W. E. B. Du Bois, two intellectuals of the African diaspora, offered the foundational works, although it is their white successors who dominated that area of thought until the late twentieth century.

Firmin was a lawyer, anthropologist, historian, and philosopher from Haiti. While serving as ambassador to France, he became a member of the French Ethnological Society. Appalled at the influence of Joseph-Arthur, comte de Gobineau, the influential proponent of modern racist theory, Firmin responded by writing *The Equality of the Human Races* (1885), where he proceeded not only to present counterarguments to Gobineau's misrepresentations of African and Asian peoples but also to point out the methodological flaws in the work offered by the conceptions of anthropology in the thought of Gobineau, his supporters, and their predecessors. He argued, for instance, that Kant and Hegel offered geographical theories more than anthropological ones in their appeals to climates and continents for a determinism of physicality and cultural *value* and, anticipating some of the ideas of Du Bois and much later Michel Foucault, that the study of human beings must take seriously the normative and disciplinary presumptions behind the determinations of human difference. Explanations of racial difference were being formulated and then forced onto people instead of being generated from how people actually were. A republican in his political preferences, Firmin's efforts were designed to shift the civilization arguments from notions embedded in skin color and racial differences to the potential of each group or race of human beings to forge nonarbitrary laws. This latter demonstration required an understanding of history and culture based on actual study, which Firmin referred to as *positivism,* informed by theoretical models devoid of prejudice and circular reasoning. For instance, most notions of the inferiority of blacks at the time were supposedly "proved" by virtue of their not being white.

Firmin's work did not gain influence in European circles, where theoretical work on race for the most part took the form of seeing evidence for models of racial hierarchies of whites at the top with gradations of "yellow," "red," and "brown" in the middle to "black" at the bottom, or by then

presumed the most primitive level. His influence, however, grew among Francophone black intellectuals, and, with the translation of his work into English near the end of the twentieth century, his ideas have achieved renewed influence through contemporary African diasporic race theory.

The situation for Du Bois was markedly different from that of Firmin. Although there were many efforts to marginalize Du Bois, which included limiting his ability to teach in universities in various stages of his career and even incarcerating him as a threat to American national security during the mid–twentieth-century hysteria against Communism, Du Bois's prodigious body of works left a legacy that, among other areas of thought, arguably made him the father of American sociology and race theory. Many of his articles are canonical texts for the study of race. In "The Study of the Negro Problems" (1897), he outlined several major challenges in the study of race. There is at first the presumption that race functions as a descriptive anthropological classification. Du Bois showed, however, that there were normative presuppositions of white normality versus gradations of colored abnormality that dominated the field. Implicit in the study of "Negro problems" was the notion of "Negroes as problems" and, as a correlate, "problem Negroes," instead of "people facing problems." Research on such populations was thus affected in advance by a priori claims about them. Du Bois further argued that there was an absence of social scientific rigor because of the abandoning of basic social scientific practices of theorizing from a shared social world, on one hand, and a failure to interrogate the methodological presuppositions of applicability on the other. As the sociologist Paget Henry recently argued, the social scientific study of populations at the time presupposed the legitimacy of Herbert Spencer's social Darwinian biosociology, where human populations were placed on a hierarchy of "fitness" according to who dominated and who was dominated. In the European context, different schemas had emerged, such as the class analysis of Karl Marx, the typification models of social rationalization offered by Max Weber, and the examination of sacred symbols and social meaning in the work of Émile Durkheim. By way of methods, the expectation of positivism, from the thought of Auguste Comte and the general environment of the expected advancement of natural science, suggested that the scientific method offered much for the development of sociology and, as the followers of Spencer believed, the overall grounding of the study and classification of human populations according to the prevailing scientific models. After Darwin, as Ernst Cassirer observed in his "Essay on Man" (1994), the dominating scientific influence was biology. Among Du Bois's many contributions, Henry argues, was his recognition of how race was central for the formation of American sociology, even though the American scientific communities sought legitimacy through the European models. The result was one in which, although race was nearly a ubiquitous object of concern, its importance was denied in universalistic claims. To study race, in other words, was treated as indulgence in the particular at the expense of studying the universal "man." The prejudices, however, centered the categories of universal man in terms of particularities that excluded racialized people and related ethnic typographies with the result that a particular kind of man became the presumption of *man*. The continued relevance of Du Bois's sociological work, which has outlived the Spencerians of his day, is because of the centrality accorded to race, which is a continued sociological theme and "problem," not only of American social life but across much of the globe. Contemporary studies of global racism attest to the validity of his prophetic claim that the twentieth century was going to be governed by the problem of the color line. Finally, a crucial dimension of Du Bois's early reflections on sociological theory was his bringing the problem of formulating *social problems* to the fore. That task required understanding the role of social institutions, social concepts, and what later structural anthropologists would call "symbols" by which race is understood.

Du Bois's efforts crystallized into the three tropes found throughout race theory, as mentioned at the outset: (1) the meaning of racial concepts, (2) the policy considerations that can be drawn from them, and (3) the critical reflective theoretical tools by which the first two considerations can be assessed. It was clear to Du Bois that discussions of all three were infused with political significance. The policy concerns of Du Bois were resolutely devoted to expanding institutions by which freedom could be made

manifest. Because racial hierarchy also resulted in categories of people who went from a condition of being property to that of struggling for equality and respect as human beings, the political focus for Du Bois eventually took the form of examining the impact of political economy on human classification. In *Black Reconstruction* (1935), for instance, he argued that the thwarted potential of reconstruction after the U.S. Civil War resulted in new forms of servitude rationalized by a system of racial segregation.

Race Theory's Critique of Social Biology

Another pivotal moment in race theory emerged in the work of Franz Boas through an additional conflict with the misreading of Darwinism exemplified by the social Darwinists and sociobiological theories of Herbert Spencer. What the social Darwinians misunderstood about Darwin, Boas claimed, was that he was not arguing that human beings evolved out of chimpanzees, but that from the standpoint of natural selection both species were equally evolved. In other words, every species sharing a particular moment in history has evolved by virtue of the coordination with their environment that enables their survival. They can, in principle, be unsuitable for another environmental development. The misreading of Darwin presumed that there was an inherent progress to evolution, which meant that some groups within a species could be interpreted as living at an earlier stage of development, while another was at a later stage. Thus, the appeal to racial hierarchies took the form of asserting the primitiveness (earlier stage) of one group versus the more developed stage of another racial group. In addition, Boas argued that culture, which the social Darwinists treated as exemplifying an isomorphic relation to biology, was independent of biology. In other words, any human being could be raised in another cultural context in which he or she would acquire the language and other exemplars of the material conditions of that culture. Boas's work, in addition to those of other anthropologists, both physical and cultural, played a central role in the eventual development of the genetic disputation of race as expressed in the *UNESCO Statement on Race* authored by the famed geneticist and anthropologist Ashley Montagu. A revised and embellished version of the UNESCO document was adopted and published in 1996 as an official position of the American Association of Physical Anthropologists under the title "AAPA Statement on Biological Aspects of Race."

A result of the undermining of biological bases for the concept of race has been the domination of the social sciences and humanities as the main sites of work in race theory. This is not to say that research has not continued in the life sciences, such as medicine and genetics, nor is it to suggest that institutions of research closed down. However, it is to say that the main sites of debate, especially those affecting developments in political theory, have been in the more social-oriented and humanistic sciences.

Racial Sociogenesis and Social Structure

Frantz Fanon in 1952 outlined many of the contemporary issues of race theory in his classic short book, *Black Skin, White Masks*. There, he first challenged phylogenetic and ontogenetic positions in the study of human difference and pointed to the additional element of social reality that, he argued, as a generator of meaning also generates the identities by and through which people live. He articulated an important distinction between race and ethnic identities, whereby the latter could be chosen and transformed by individuals within a group, but racial identities are a function of an imposition *on* a group. In a later text, *Sociologie d'une révolution: l'an V de la révolution algérienne* (1959), he formulates the difference this way: Whites created the Negro, but it is the Negro who created Négritude. Fanon argued that social reality required human agency for its existence, which means that it could also be transformed by human agency. But transformation required the negotiation of symbolic and material structures of culture, ranging from language, the psychoanalytical organization of power, and constitutional organizations of psychic life. All these fail in the colonial context, which Fanon regarded as quintessential for the construction of racial ordering, in an asymmetrical semiosis of race: The white constructs the black, but the black does not construct the white. The white functions as agent in both accounts, and in similar kind to other categories of color. With

regard to blacks, however, the racial designation has an additional effect. The slide from racial difference to *racism* pushed the black into a nether realm of subhumanness that led to a disruption of self–other ethical dialectics. The result was a structural model of whites and some colored categories in a relationship of self and others. Below that schema, however, was another set who were neither the self nor others except in a unique set of differing relations in the subschema. The self–other dialectic functioned between each other from below, but the asymmetry of the relationship meant that those above stood as others in relation to the self from below. This structure is a semiotic rearticulation of Du Bois's double consciousness thesis. The blacks can see themselves as seen through the eyes of whites, which means the positing of the white perspective as a possibility. The realization that it is not a reciprocal relationship—the white does not see the self as conditioned by the black but as a point of reference looking onto the black looking back onto the white *as a white perspective*. In other words, the black, as a genuine point of view, is eliminated in the relationship. Fanon's conclusions were twofold. First, he insisted that the structures he analyzed were not *complete,* that there were exceptions to these rules by virtue of the contingency of human existence. Second, he argued that the elimination of these skewed relationships called for *political* instead of individual ethical intervention.

Fanon's analysis comes to the fore in a variety of subsequent approaches in race theory. There has been, for instance, the structuralist approach as formulated by Claude Lévi-Strauss in *Structuralist Anthropology* (1963), where the symbolic ordering of mythic life takes dualistic forms that reassert themselves, even at the metatheoretical levels. Race theory, from this point of view, attempts to make science or sciencelike thinking supervene over mythic race thinking, but fails to appreciate its own mythic practices. This insight is taken up by poststructuralists such as Michel Foucault and Jacques Derrida, whose work could be interpreted as bringing the mythic narratives of lawlike determinations into the human sciences, indeed even bringing the human sciences themselves into focus in terms of their investments. These considerations were taken up in literary theory, often through studying the symbolic manifestations of such interests through utilizing the resources of a variety of psychoanalytical approaches.

Race and Reason

Since the 1980s, however, race theory has burgeoned in philosophy and political theory. Although interest in race has been a current of philosophical thought since the dawn of the modern era, it was also often disavowed or denied its due importance at the disciplinary level. This was due in part to the expectation that philosophical work should pertain to universal and abstract phenomena. Kant, for instance, was careful to properly differentiate philosophical matters from anthropological ones. The kinds of arguments offered by Lévi-Strauss and ironically his rival, Jean-Paul Sartre, which focused on the mythic foundations of scientific rationalism in the case of the former and bad faith or self-deceiving conceptions of reason in the case of the latter, opened the door for the kinds of critical work on reason and theoretical work offered by Fanon, Foucault, Derrida, and even the sociological philosopher Pierre Bourdieu, all of whom brought to philosophy the kinds of critique levied against scientific completeness and absoluteness in the study of culture. By the 1970s, a group of philosophers began to write on race armed with the theoretical problematizing of methods offered by the work of Du Bois and Fanon and the metacritique of the human sciences offered by phenomenological, structural, and poststructural accounts of constructed social realities, including that of race.

Racial Eliminativism and Conservationism

The philosophical groups are generally divided into racial eliminativists and racial conservationists, although there is another camp that argues more for analyses of the meaning of racial concepts and practices than for their elimination or preservation. They diverge on the significance of the general scientific dismissal of race. The eliminativists, whose main proponents are K. Anthony Appiah and Naomi Zack, argue that the scientific invalidity of race calls for the rejection of the concept. In addition to its scientific invalidity, Zack also argues that the concept renders mixed race people raceless because of their supposed exclusion from racial binaries. While agreeing with some of

the problems posed by racial mixture, Appiah argues that there is sufficient social significance of the concept for it to be used in the effort to eliminate racism, but that the achievement of the latter would imply the elimination of the former. In sociological theory, Paul Gilroy has offered a more radical eliminativist position in *Against Race: Imagining Political Culture Beyond the Color Line* (2000), insisting on the invalidity of the concept even if it were to receive scientific support.

Although acknowledging the scientific invalidation of race, the conservationists argue, echoing Fanon, that race is a socially constructed reality whose logic should be understood in social terms. Social constructions, in other words, function according to their own reality. In other words, for biological science to be supervening would mean the subordination of sociology to the point of a positivistic reductionism. Even Marxian historical materialism recognized the materiality of social phenomena. Proponents here include Lucius T. Outlaw, Cornel West, David Theo Goldberg, as well as sociological theorists such as Michael Omi and Howard Winant, whose racial formation theory took political projects into account. The general argument here is that people live not only as individuals in a society but also as groups. Many facets of social life are organized through groups, without which even certain individual claims would cease to have contexts in which they could make sense. We see here a return of the conditions of possibility argument.

Phenomenological Race Theory

Constructivist arguments also find support in the phenomenological philosophical tradition, where there is not as radical a divide between the physical and biological on one hand and the social on the other. The phenomenological tradition of race theory takes the body as a site of signification and bodies as the basis of intersubjective social relations on which symbolic orders are built. Racial concepts are also treated as objects of consciousness, as intended constructions of symbolic life. In this regard, Du Bois's theory of double consciousness and lived understanding of race is phenomenological in character, although he was historically associated with pragmatism because of his relationship with William James during his years at Harvard. Such interpreters overlook his time in Germany, where the towering figure of Max Weber and the intellectual impact of Hegel and Marx were unavoidable.

Sartre and Fanon explicitly advanced the phenomenological approach to the study of racial constructions, as we have seen, and their influence was global. In Africa, their thought influenced Steve Bantu Biko, who brought that approach to his formulations of black consciousness in order to propose an explicitly *political* conception of race. Biko regarded black consciousness as emerging from opposition to a state premised on anti-black racism. Such a state, in order to maintain itself, depends on the repression of blacks as political agents. Thus, the assertion of blackness, by people who would not be regarded as such in other conceptions of race and other forms of race theory, such as the biological one, leads to the identity and identification of blackness not only as a chosen identity but, because of the subjugating efforts of the apartheid government, an imposed one. Biko's thought was most recently taken up by Mabogo Percy More in South Africa to argue for an understanding of black solidarity as a theory of constructive political engagement.

In the United States, Linda Martín Alcoff has also taken up the phenomenological account, which she conjoins with hermeneutics or interpretation theory, to explore the relationship between institutional imposition and biophysical visibility and difference, which she refers to as *visible identities*. She, along with other more phenomenologically oriented race theorists, regards the body as a site of multiple identities. Thus, unlike Naomi Zack, who regards mixed race as racelessness, a position criticized by other mixed-race theorists such as, for example, Rainier Spencer, Alcoff regards mixed race as one among other visible identities; many people, for instance, know what a mixed-race person generally looks like. Phenomenologically oriented race theorists have also offered novel approaches to the study of mixture through explorations of creolization. Alexis Nouss, for instance, has argued that algorithms of human identities do not function as those in the physical sciences because a human being can be 100% more than one thing. The negotiation of the relationship between the different identities manifested in a group or individual is a function of a

society's normative assumptions and asymmetrical semiotic structures: A mixed individual does not suffer from racelessness under this interpretation but from the fundamental asymmetry and teleological difference between her or his shared identities. Whiteness, for instance, stands as the normative standpoint by which other racial identities are compared. Finally, Sara Ahmed has explored problems of deviation from normative centers and phenomenological accounts in general as peculiarly *queer* efforts whose exemplars are precisely those people who have to be squeezed into the theoretical models at hand, as Du Bois argued, as problem people.

The account of philosophical race theory is not here an exhaustive one, and the eliminativist versus constructivist divide is not as neat as it appears. For instance, many constructivists are ultimately eliminativists because their arguments for the preservation of race usually appeal to its importance for the fight against racism. The question of what is to be done if and when racism disappears challenges the insistence of postracist conservation of race. Some scholars, such as Derrick Bell from the critical legal studies camp of race theory, respond by insisting on the permanence of racism, but such an appeal is an a priori assertion that begs for evidence that could not be supported by *social* criteria because those depend on human projects for their creation and maintenance. Others such as Ahmed appeal to the contingency of human communities: There will always be individuals and groups who are outliers simply because without such possibility, human beings would collapse into a preordained necessity or laws of being human. The objection to the adverb "always" as itself a preordained claim would not work because it would only emphasize the paradox of human existence: The necessity of an absence of necessity.

Race Theories of Civil Society

Theoretical reflection on race in political theory emerged on questions of the suitability of certain groups of people for governing and participation in politics; to that end, the concerns tend to take the form of assessing the membership of some groups in civil society and political life. The political theory branch of race theory thus focuses on the impact of race in and on political thought. The anthropological commitments behind political ones have an impact on how race configures in those approaches. For example, liberalism has had difficulty with race because of presumptions of the liberal subject as a color-blind one in search of ideal rules of governing. For republican approaches, the main focus is on nonarbitrary laws, which means that the particularities of the governed populations could be recognized without jeopardizing republican commitments. But for democratic political orders, the notion of self-government requires greater reflection on what participants are supposed to share instead of their differences. The expectation of sharing universal criteria often led to appeals to an ideal subject, which often meant ignoring race theory as a secondary or even tertiary matter. Conservatism, however, often involved taking traditions seriously as a basis of civic life. This often meant a head-on examination of racial difference. Yet liberalism and conservatism often had the same consequence of a normative centering of the dominating population: For conservatism, difference was articulated from a center that was deemed "traditional"; for liberalism, that center was simply the point of neutrality; in modern historic terms, they were invariably white.

Marxism, left-wing nationalisms, and anarchist movements took for granted that the traditions of conservatism and the ideal centrism of liberalism supported institutions of domination. Thus, they devoted considerable effort to identifying populations dominated by such institutions and the levels of failure implicit even in appeals to ideal, value-neutral models of political organization. This meant, for them, the specification of *inequalities* such as enslavement, class exploitation, racial hierarchies, and sexism. Implicit in these latter approaches is an anthropology of human possibility; that however human beings may be traditionally, that is not how human beings have to be. Although rejected when interpreted as a permanent nature of each group, race is reproduced in this model through identities *in the making,* as exemplified in the concluding line of the anthem "The Internationale": "the working class will be the human race."

Race in Ideal and Non-Ideal Political Theory

Recent race theory in political theory has also challenged ways in which political theory presumes the

subjects of theories of justice. The philosopher Charles Mills has argued, for instance, that this leads to a tension between ideal political theory and non-ideal political theory, which he correlates with contractarianism and contractualism. The former is a sober reflection on non-ideal situations that have led to the current, very non-ideal social and political orders. The latter explores the conditions of consent for a better social reality. A problem with the dominant models of American political theory, argues Mills, exemplified in its most influential form by the work of John Rawls, is that it focuses on ideal theory at the expense of being able to address real social injustices because they cannot be identified in the initial conditions that generate the ideal—in Rawls's case, the thought experiment generated by the veil of ignorance, with "ignorance" exemplifying Mills's point. Mills proposes taking contractualism outside of the framework of ideal theory and wedding it to non-ideal theory, in this case the problems raised by contractarianism, to generate non-ideal contractualism, or, simply put, contractualism in the interest of sexual and racial justice. In this regard, race theory in political theory becomes the lobbying for a fusion of non-ideal and ideal theory, or non-ideal contractualism.

Radical Democracy

Political theorists have used the term *radical democracy* in different ways. In general, the "radical" of radical democracy refers to a wish to address, and change, the fundamentals of democracy. This should come as no surprise, given the etymological origin of the word "radical," namely the Latin *radix*, meaning root. Thus, radical democrats challenge what is at the root of democracy as we know it. Among radical democrats there are different views of what the basis of democracy should be; indeed, contemporary radical democrats suggest that we should not think of democracy as being rooted in any ground.

Past Radical Democracy

Jean-Jacques Rousseau (1712–1778) was an early radical democrat. He criticized representative democracy and argued for direct and participatory democracy, something that was later taken up by participatory democrats in the late twentieth century. For Rousseau, the ideal is a political community without divisions and where the will of the people is reflected in the laws in an unmediated fashion. This ideal is summed up in the concept of the General Will, which is also why critics have pointed to the potential totalitarian consequences of Rousseauian democracy.

Karl Marx (1818–1883) is another philosopher who has been labeled a radical democrat. Marx thought liberal democracy was superficial because it did not address the root of the ills in capitalist society, namely the exploitation of one class by

another. The alternative communist society was, for Marx, a harmonious society without division. Paradoxically, the outcome of this sort of radical democracy is that there is no need for democratic institutions in the sense that we know them.

Radical Democracy Today

Today, the term *radical democracy* is associated with theorists such as William Connolly, Michael Hardt, Antonio Negri, Chantal Mouffe, and Ernesto Laclau. These theorists are all inspired by poststructuralism, broadly conceived, and the focus is on these contemporary theories of radical democracy in the following.

Poststructuralism and Radical Democracy

The poststructuralist conception of language, identity, and meaning leads radical democrats to emphasize the contestation of existing norms, institutions, and identities. They reject all forms of essentialism where things—for instance, democracy—have a universal and ahistorical essence. Thus, they are skeptical of Marx's notion of "species being," for instance. Likewise they are critical of Marx's teleological conception of history; instead, they argue, history is contingent and does not proceed according to a necessary logic. Next, radical democrats believe that it is impossible to transcend alienation and inequality, for instance through a revolution. This is not to say that they do not believe that a better world is possible, only that they reject the possibility of a harmonious society, whether Rousseau's society ruled by the General Will or Marx's communist society. Instead, poststructuralist radical democrats argue that there is always conflict. They add that this is not something to regret because it means that norms, institutions, and identities do not become fixed, and this is what distinguishes democracy from totalitarianism. In this context, Claude Lefort's argument about the difference between democracy and totalitarianism has been influential, among other things in the work of Laclau and Mouffe.

Finally, if Rousseau and Marx tried to get rid of alienation by refounding democracy, poststructuralist radical democrats reject foundations. To use Jean-François Lyotard's phrase, contemporary radical democrats are skeptical of grand narratives. For instance, they are skeptical of the Marxist grand narrative of emancipation and its links to essentialism and teleology; and they are skeptical of the Enlightenment's grand narrative of man, for instance, the way it is expressed in the notion of human rights based on human nature. Instead, they propose that we think of democracy without foundations. Thus, to go back to the etymological meaning of radical (*radix,* root), poststructuralist radical democrats aim at the root, or foundation, of democracy. However, they do so not in order to substitute it with an alternative root, as Rousseau and Marx did in their different ways. Rather, radical democrats aim at the root of democracy in order to do away with the attempt to root democracy, for instance in human essence.

Historical Context

Rousseau and Marx put forward their theories of radical democracy against the background of the upheavals of the modern age. Poststructuralist radical democracy is a thing of the late twentieth century. Poststructuralism is often seen as part of "postmodernism," with the latter's emphasis on antiessentialism and the pluralism and relative fluidity of identities.

Poststructuralist radical democracy must also be seen against the background of changes on the (Marxist) left. From the 1960s onward, new social movements and struggles over identity gained increasing importance within mainstream politics. These movements—for instance, the women's movement—all challenged the Marxist emphasis on class as the organizing principle of society and emancipation. Class gradually lost its empirical importance, as well as its theoretical centrality to the diagnosis of, and solution to, the problems of contemporary capitalism. Contemporary society is not a class society in a strict Marxist sense, and it seems unlikely that the working class will be a revolutionary agent. Thus, the question became how to think emancipation without tying it to class. Another problem faced by Marxists at the end of the twentieth century was the absence of the revolution despite the developed character of capitalism in the West. In fact, since the late 1970s, neoliberalism and liberal democracy have become

increasingly hegemonic. Given that the predictions of Marx proved wrong, radical democrats are faced with the question "what is to be done?" without being able to fall back on Marx's analysis of capitalism. On the whole, poststructuralist theories of radical democracy emerged as one response to the question of strategy in the face of neoliberal hegemony and the inadequacy of Marxist analyses and strategies.

Radical Democracy and Contemporary Political Theory

Radical democrats often distinguish their positions through a critique of contemporary alternatives.

Liberalism

Radical democrats criticize liberalism on a number of accounts. They are, first of all, critical of the liberal notion of the subject as an atomistic and rational individual. They criticize this disembedded and disembodied individual, a kind of abstract individual outside historical and socioeconomic context and without a (gendered, racial, etc.) body. And radical democrats argue that the liberal subject is not universal and is only one particular kind of subject, one that is associated with a particular kind of society, namely bourgeois society. The radical democratic critique of the liberal subject is mirrored in a critique of liberal citizenship and democracy. Radical democrats argue that democracy is more than rights and procedures, and that it must contain a democratic ethos too. This is not to say that radical democrats reject liberal rights and institutions, only that they want to extend and deepen these. As a consequence, they challenge the current forms of rights, citizenship, and so on. In short, they politicize them.

Communitarianism

Although radical democrats share the communitarian critique of the disembedded liberal subject, they disagree with communitarians on the nature of communities. For radical democrats, no community is harmonious. There is always conflict and disagreement, and identities are fluid and overlapping, a fact that radical democrats do not lament.

Deliberative Democracy

Finally, radical democrats share some things with deliberative democrats such as Jürgen Habermas. Both are critical of the liberal atomistic individual, and both see the identity and interests of the individual as formed through the political process rather than given prior to it. However, radical democrats disagree with deliberative democrats on a fundamental point, namely, the rationality of deliberative procedures. For radical democrats, no deliberation is completely devoid of power, inequality, or distortion, and it is the task of the theorist to highlight these things. Likewise, radical democrats are skeptical of the deliberative notion of a rational subject. Radical democrats argue that this view of the subject is biased against affect in politics, and that it comes at the expense of silencing certain voices within the deliberative procedures and within the public sphere more generally. Finally, radical democrats are critical of the deliberative emphasis on consensus. Given that conflict and disagreement are permanent, consensus is only possible by suppressing and excluding dissent.

Thus, in different ways, poststructuralist radical democrats seek to politicize rights and institutions, the identities of communities, procedures, and consensus. This goes to the heart of the radical democratic notion of politics as associated with contestation.

Divisions Within Radical Democracy

Having considered contemporary theories of radical democracy as a whole, we now look at two ways of mapping out the differences among radical democrats.

Immanence/Transcendence

Radical democrats can be divided according to whether they believe that a radical democratic alternative must emerge through immanence or through transcendence. Michael Hardt and Antonio Negri (drawing on Baruch Spinoza and Gilles Deleuze) represent the immanence side, and Laclau (drawing on Jacques Lacan) would represent the transcendence side.

The disagreement between Hardt and Negri and Laclau concerns whether an alternative to the

present liberal-capitalist order will emerge immanently or require a moment of transcendence. For Laclau, we need a moment of transcendence (albeit a "failed" transcendence) understood as hegemony. A particular element within society (a group, a party, etc.) comes to stand in for the whole (say, the emancipation of society as a whole). In this way, a hegemonic consensus is formed, a hegemonic consensus that can oppose and dissolve the current hegemony. Hardt and Negri, on the other hand, believe that countering one hegemony with another reproduces a form of politics historically associated with Lenin and the vanguard (the Communist Party, taking over—but ultimately leaving intact—the state, etc.). For them, change must arise from below, from what they call the multitude, and they find hope in, among other things, the alter globalization movement. Thus, the immanence/transcendence distinction is not merely philosophical, but has important implications for political strategy.

Abundance/Lack

The immanence/transcendence distinction is not unrelated to another division within radical democratic thought, one between abundance and lack. Hardt, Negri, and Connolly are representatives of abundance, while Laclau and Mouffe represent lack.

Inspired by Lacanian psychoanalysis, Laclau and Mouffe argue that any communal identity is marked by a lack, which it may try to project onto an external enemy (e.g., the figure of the Jew or the Islamic terrorist). More generally, any identity is marked by a lack, which sets in motion identifications with objects—a football club, a national symbol, and so on—that are supposed to fill the lack. Yet, although my identity is constituted through these identifications, the latter always fail. It follows that any identity is precarious and constantly renegotiated. This is also how Laclau thinks about hegemony. There is no natural or essential political community; instead, a particular sector of society takes up the task of forming a hegemonic consensus around certain key signifiers such as "freedom" or "solidarity."

For Laclau and Mouffe, radical democracy is one hegemonic project among others. In her work, Mouffe has focused on how a democratic "we" is established. For her, the democratic "we" is established hegemonically, for instance, as a radical democratic "we," but importantly the "we" is not a closed whole because it is marked by internal division and differences. It is, thus, a "we" that is always unstable and in the process of being renegotiated, even if it is also constituted through an antagonistic exclusion of "them."

Connolly, too, is interested in how the democratic "we" is constituted, but he has a different take on it. For Connolly, what is central is whether, and how, existing norms and institutions can be contested and thereby opened up. His focus is on excluded and marginalized constituencies and on how we can relate to these in new ways, thereby including them within the political space. In the process, our own identities and understandings are challenged. In other words, it is a matter of pluralization: contesting communal and individual selves and creating new selves. This is what Connolly has in mind when he talks about "agonistic respect," "critical responsiveness," and a "generous ethos of engagement": An agonistic relation to the other that engages with the identity of the other as well as one's own identity. Hence, for Connolly, we should avoid creating others as antagonistic others (as threats, enemies, etc.).

For Connolly, then, Laclau and Mouffe too readily accept that exclusion is constitutive. The risk is that they take particular exclusions as given and take the hegemonic way of organizing politics as given. Connolly's radical democracy is organized as a rhizome, as a network that connects and reconnects in new ways all the time. He gets this image from Deleuze, and he opposes it to a politics that takes the trunk as its model, for instance, a hegemonic politics where a "we" is established in the center. For Connolly, we should not think of identity in terms of lack, but in terms of abundance: flows of energy, networks of materiality, processes of becoming, and so forth.

Criticisms

Poststructuralist radical democrats have criticized earlier radical democrats like Rousseau and Marx for their essentialism as well as the potential totalitarian consequences of their ideas of society and emancipation.

The main criticism of poststructuralist radical democratic theory is that it does not make a difference. This criticism is leveled at radical democrats from different perspectives. First, at a general level, radical democratic theory is faulted for being just that: theory. That is, theorists of radical democracy have been criticized for not spelling out the practical and institutional consequences of their theories. Second, some deliberative democrats have charged that radical democracy is not that different from deliberative democracy, first because deliberative democracy is more radical than radical democrats allow, and second because radical democracy is only a radicalization of liberal and deliberative principles.

From a different perspective, theorists such as Slavoj Žižek have made a similar charge against radical democracy. Žižek, who is himself sometimes labeled a radical democrat, argues that radical democracy is not really radical. He believes that radical democrats such as Laclau stay within the liberal democratic imaginary and that they do not confront the fundamentals of contemporary justices. The latter are rooted in capitalism and, hence, in the economic sphere about which radical democrats are often silent. Laclau, on the other hand, retorts that Žižek remains trapped in essentialist and foundationalist categories such as class. Thus, we are back at the question of what it means to be radical, that is, what it means to go to the root of democracy.

Radical Enlightenment

The *radical Enlightenment* was an intellectual and cultural movement that swept across Europe from the mid-seventeenth to the mid-eighteenth century, challenging theologically anchored belief systems and hierarchical conceptions of society. Recent historical and historiographical studies of this movement complicate the standard view of the Enlightenment as an emancipatory project that was advanced by freethinking modernists against traditionalists. In the revised account, the Enlightenment was a three-way struggle among conservatives, moderates, and radicals over the beliefs that then informed an entire gamut of social practices. While the more renowned and moderate mainstream of the Enlightenment sought to reconcile a burgeoning *natural philosophy* with revealed religion and monarchical or aristocratic tradition, proponents of the radical current made stronger claims that reason was the decisive standard for both natural and social-political orders. The radicals in this tradition included, most prominently, Baruch Spinoza, Pierre Bayle, and Denis Diderot, as well as less familiar figures such as Bernard le Bovier de Fontenelle, Anton van Dale, Balthasar Bekker, Frederik van Leenhof, and others often decried as Spinozists. Their ideas were officially suppressed by authorities everywhere and denounced by dominant mainstream enlighteners and conservatives alike, forcing the radical Enlightenment to develop in large part as a clandestine network.

Research on the genealogy of Enlightenment radicalism has placed particular emphasis on three factors: (1) the importance of Spinoza's philosophy as the original systematic expression of radical thought, (2) the subsequent underground diffusion of Spinozist literature by an international coterie of writers and publicists, and (3) the culmination of this thought in the eighteenth-century works of French philosophes such as the Encyclopedist

Diderot. This historical revision has also prompted some scholars to reassess the political significance of the entire Enlightenment movement, and to cast it as the main cultural transformation responsible for the advent of modern conceptions of equality, democracy, toleration, freedom of expression, and revolution. In essence, the radicalism of the radical Enlightenment is said to reside in its expansive and profoundly secular understanding of philosophy and in its salience as the intellectual vanguard of the Enlightenment as a whole.

The Philosophy of the Radical Enlightenment

In the wake of the religious conflicts of the Thirty Years' War (1618–1648), philosophy began to reemerge as an autonomous enterprise, neither wholly subordinate to the traditionally superior disciplines of law and medicine nor altogether subject to the regulation of confessional theology. The new philosophy, which was largely inspired by the work of René Descartes, proposed a mechanistic worldview that held mathematical rationality as its sole criterion of truth. This approach sharply contrasted the theologically sanctioned scholastic Aristotelianism that was the prevailing philosophical orthodoxy. At the time, ideas about nature and its metaphysical properties were intimately linked to beliefs about moral and societal order. The radical Enlightenment's philosophical and political impact was intimately related to how it reworked the Cartesian vision of nature.

Until Cartesianism began to make inroads in the middle of the seventeenth century, philosophical explanations of natural phenomena typically followed scholastic Aristotelianism in assuming that all things were constituted of matter and form. Form was thought to be the peculiar nature, principle of development, or essence of any given thing. According to this cosmological framework, bodies acted in particular ways because of inherent or God-given qualities that they were meant to realize. By contrast, Cartesianism explained the movement of bodies in terms of physical properties or forces that were governed by mechanical laws and capable of mathematical measurement. Most advocates of the new mechanistic philosophy believed their accounts of the physical universe to be compatible with fundamental tenets of Christian faith, such as biblical prophecy and the authenticity of miracles. This meant that their philosophy would be capable of lending ideological support to existing institutions of authoritarian government. Descartes himself attempted to create such compatibility by positing an immaterial human mind or soul. His exemption of the mind from the laws of physics supported the claim that matter could be ordered and explained by the power of the human intellect, and it also safeguarded the assumption that the final source of universal motion was a providential God, external to matter.

Despite the Cartesians' intentions to synthesize mathematical reason and Christian belief, the new philosophy was soon employed in service of a more radical naturalism. This strain of philosophy denied the separations of God from nature, and mind from matter. As Spinoza articulated this radical view, the source of all life was internal to the totality of existence, a cause that was immanent in its effects. God and nature were just different names for the same substance, an infinite causal web of which human beings were a constituent but by no means privileged part. Similarly, the emerging Spinozist view held that mental activity could not be strictly separated from matter or the movement of bodies. Rather, thought and extension were different perspectives on the same reality and followed the same laws of cause and effect. This thoroughgoing naturalism thereby excluded from its explanations theological criteria or appeals to supernatural agencies, miracles, divine providence, or creation. An exclusion of such proportion was tantamount to a subversion of contemporary culture in its core beliefs.

The Historical Trajectory of the Radical Enlightenment

In addition to the evolution of mechanistic philosophy, several other developments in the seventeenth century helped to shape the new radical consciousness and to give it an international scope. The most formative political events spanned the continent and included the English Revolution, the French Fronde uprising, and the Neapolitan Massaniello insurrection. These revolutionary experiences created a growing awareness of the power of intellectual dissent and its association with fundamental social change. Meanwhile, a spate of technological and cultural innovations

enabled this nascent strain of radical thought to propagate as a relatively integrated movement. Particularly instrumental in this respect were the evolving media of learned journals, encyclopedias, newspapers, and magazines; new discussion forums such as salons and coffeehouses; and the proliferation of printing presses, publishing houses, and universal libraries.

The Netherlands of the late seventeenth century served as the chief incubator for radical intellectual ferment. Following the revolt against Spanish Habsburg rule, the new Dutch Republic rapidly developed into the leading urban and commercial society in Europe. It was also among the only countries with a republican rather than aristocratic or monarchical form of governance. The relatively fluid, tolerant, and open character of Dutch society encouraged many foreign scholars, intellectuals, and religious refugees to settle there. These included Jews, Catholics, Socinians, dissenting Protestant sects, as well as a large Huguenot population. The French-born Descartes chose to live and spend the bulk of his career in Holland. Another pivotal figure of the radical Enlightenment, the Huguenot Pierre Bayle, emigrated in 1681 to the Dutch Republic, where he spent the rest of his incredibly prolific and conflict-ridden life as a philosopher.

Although civil and ecclesiastical authorities banned or censured the work of Spinoza and Spinozists, radical ideas nonetheless propagated throughout Europe in such a way as to effectively challenge the positions of both the moderate Enlightenment and the conservative counterattack. The two main mechanisms for the penetration of the radical Enlightenment were, on the one hand, a series of pitched intellectual controversies that were widely publicized and reported across Europe, and on the other hand, the international circulation of forbidden manuscripts. The controversies ranged from the uproar that followed Bayle's claim that a society of atheists was possible to disputes over the meaning of Fontenelle and van Dale's treatment of oracles as political imposture; from the outcry over Bekker's immense tome against belief in the devil to the fracas that followed van Leenhof's postulation of a universal philosophical religion.

The dissemination of illicit clandestine manuscripts was the chief propaganda method of the radical Enlightenment. This practice particularly flourished in the salons and high society circles of early eighteenth-century France, though these tracts also made their way to farther flung regions, such as Scandinavia and Russia. The *Traité des Trois Imposteurs* ("The Treatise of the Three Impostors") was unparalleled as the definitive heretical manuscript. Its title referred to the three major figures of biblical religion—Moses, Jesus, and Muhammad. The text was eclectic in its philosophical borrowings and generally Spinozist in its thrust, arguing that religion was a political instrument used to dupe the credulous masses and hold them in thrall. In addition to debunking revelation and prophecy, it attacked the doctrines of free will, divinely ordained law, and the absolute nature of good and evil, implying that a revolution—at least initially in thinking—would enable individuals to escape from their servitude.

The philosophical mainstream and the conservative Counter-Enlightenment camps of the seventeenth and eighteenth centuries responded differently to the persistence of the radical current. Counter-Enlightenment traditionalists took a virulently antiphilosophical stance in order to defend the virtues of the Christian faith, as well as royal and aristocratic privilege, against reason. Spokesmen of the moderate mainstream Enlightenment frequently replied by portraying the radical ideas as a perversion of philosophy in its true form. Although there were significant differences in the orientation of the mainstream variants across Europe, they converged in the conviction that the radicals made excessive claims for the purview of reason. This influential camp of moderate enlighteners, which included such luminaries as John Locke, Isaac Newton, David Hume, the baron de Montesquieu, and Voltaire, garnered support from governments and liberal clergymen everywhere. It did this by attempting to limit the scope of scientific or philosophical reason so as to secure the integrity of inherited theological orthodoxy and established political orders.

The ascendancy of the mainstream was never assured, however, and the radicals' cause was periodically advanced by several circumstances. For one thing, the coherence of the moderate Enlightenment's synthesis of reason and faith was often hard to maintain when pressed from both sides by the more uncompromising positions of reactionaries and radicals. When compounded

with the mainstream's internal divisions, this sometimes created situations in which the Counter-Enlightenment unwittingly encouraged radical ideas by attacking the compatibility of reason and faith. This happened in France in the several decades following Louis XIV's reign, where a newly liberated society with a relative absence of moderates quickly polarized into extreme positions held by antiphilosophical Jansenists and radical materialist philosophers. Viewed historically, the Enlightenment Era was a complex record of advances and setbacks for these moderate, radical, and conservative ideological blocs.

The Political Legacy of the Radical Enlightenment

The radical Enlightenment was instrumental in shaping an entire menu of values that underpin the self-understanding, if not always the practice, of modern politics. Notions of equality, democracy, and freedom of expression have all been affected by radical Enlightenment thinkers. Just as this movement sought to extend the purview of philosophical reason so that it could scrutinize all aspects of the social and natural world, the radical Enlightenment correspondingly sought to extend the power of reasoning to all members of human society. This aim followed from the radicals' rejection of preordained moral law as a theological and political mystification. If the laws of political society ultimately rested on nothing else but the human capacity to create and sustain these institutions, then the common interest of everyone should serve as the basis for association. While the radicals did not believe that everyone in society wielded an equally effective power of reasoning, these thinkers nevertheless maintained that individuals shared the same basic motivation to preserve and assert themselves. From the perspective of nature, the radical Enlightenment claimed, everyone sought to judge what was good or bad for one's perseverance. The most legitimate basis for political society was that which secured and extended this capacity for all.

For Spinoza and other radical enlighteners, a democratic republic was the form of government that best met such a demand. In this institutional context, individuals submitted to collectively ordained laws while, crucially, maintaining the prerogative to publicly scrutinize legislation and communicate to others their ideas about what is just or good. Spinoza called this participatory exercise of public reason "the freedom to philosophize," and saw it as essential to the mutual development of individual and collective goods. By associating this conception of reasoning with the freedoms of publication, speech, and thought, rather than liberties of conscience and worship, Spinoza argued for a more comprehensive and secular form of political expression than did moderate mainstream pleas for toleration.

For students of political theory, then, the philosophy and historical trajectory of the radical Enlightenment raise important questions about the link between theory and practice, reason and political innovation. An array of evidence, from scholarly literature to popular pamphlets and spanning the late seventeenth to the mid-nineteenth century, reveals a broadly held view that a new way of doing philosophy, if not any particular set of doctrines, was revolutionizing human relations. When this cultural phenomenon is studied together with the conceptions of philosophizing that were furthered by the likes of Spinoza, Bayle, and Diderot, the likely result is a renewed appreciation of the impact of the Enlightenment on major political events, including such radical transformations as the French and American Revolutions.

Rational Choice Theory

Rational choice theory has become a paradigmatic way of analyzing behavior. Three relatively independent fields have evolved with rational choice theory at their core: game theory, social choice theory, and decision theory. Rational choice theory has deep roots in economics and has become the foil for the development of a cognitive theory of choice in psychology. It has made important inroads in political philosophy and in political science as a whole. In a nutshell, rational choice theory is three things at the same time: It is both a normative and an empirical theory of individual behavior, and also a formalized logical structure that serves as the foundation for much theorizing in political science and economics. Essentially, it ties individual choices to preferences, underscoring choice as teleological or purposeful behavior. It claims both that we *ought* to behave purposefully in accordance with our values, and that we *do* behave so, although not all rational choice theories encapsulate all three of these elements. As such, choice is explained by preferences forming an intuitively simple story with both explanatory and normative presumptions and implications.

The entry begins with a short history of rational choice theory and moves to its applications in political theory. A recurring theme throughout is how the status of rational choice theory has evolved as its traditional structure has been morphed by the analysis of data from experimental efforts to test its assumptions. These tests uncovered inherent problems in its assumptions and are leading to fundamental changes in the structure of the theory.

The role of rational choice theory in political theory is built on dual foundational presumptions that explaining individual behavior is the key to understanding the functioning of political institutions and that these behaviors can be aggregated to understand the behavior of the group and its institutions. These presumptions fit well with the ideological justification of democratic political systems and are usually referred to as *methodological individualism*.

A Brief History of Rational Choice

Although the origins of rational choice theory are a bit murky, its modern roots stem from the Age of Reason. Its pivotal intellectual position was secured in Thomas Hobbes's move to explain the foundation of political institutions via individuals' choices. He conjectured choices stemmed from universally held *appetites* and *aversions*. The effort was continued by such illustrious figures as Francis Hutcheson, David Hume, Adam Smith, and later such utilitarians as Jeremy Bentham and John Stuart Mill. Adam Smith emphasized the social functionality of Hobbes's assumption of self-interest, famously asserting that typically we benefit not from the benevolent but rather from the self-interested transactions that occur in the market. Utilitarians went on to formalize the link between individual choice and social welfare via a reduction of moral content to an interpersonally comparable utility *numéraire* seen as also motivating the individual. At this time, there was less of a divide between normative and positive claims in political economy.

The utilitarian program (often referred to as consequentialism) began to unravel when, by the end of the nineteenth century, preference was stripped of its presumptive interpersonal comparability. By disparaging the notions of interpersonal comparability of satisfaction, or utility, Vilfredo Pareto (followed by virtually everyone, at least in economics) reduced the power of the utilitarian framework in moral matters. Indeed, all that was left of the utilitarian program was Pareto-optimality: If one makes others better off, without hurting anyone, only then is there an indisputable improvement for the group. Disempowered in matters of distribution and redistribution, Pareto-optimality reflects criteria tightly related to both efficiency and unanimity. As such, Pareto-optimality became an almost universally accepted, yet weak, normative standard.

Alfred Marshall, and other economists such as Paul Samuelson, later reduced preferences to a generalized value structure that eventually was defined by its assumed logical properties. These formal properties came to serve as the deductive

engine of microeconomics and game theory, and they define classical preference theory. Rational choice theory (choosing in accordance with one's values or preferences) is that theory that was developed from classical preference theory.

Classical Preference Theory

In classical preference theory, theorems are derived from the assumed formal properties of preferences, and in the eyes of Milton Friedman and many other theorists, the realism of the structure is simply not relevant. Preferences are assumed to have the following properties:

1. *Pairwise*: peoples' preference judgments are made in pairwise comparisons.
2. *Complete*: all alternatives from which one chooses are comparable. And individuals (I refer to generic individuals as *i* and *j*) are capable of, and do form, judgments as to whether one item (I refer to generic items as *x* and *y*) is better than another (usually written *xPi y*) or whether the two are equally good (*xIi y*). When *i* judges two items to be equally good, one says that *i* is indifferent between them. Completeness implies that for any *x* and *y*, either *xPi y*, *yPi x,* or *xIi y*.
3. *Transitive*: allows two pairwise relations to be inherited by a third pair in the following fashion: If the relation is transitive, then if *x* relates to *y*, and *y* relates to *z*, then *x* relates to *z*. Hence both preference and indifference are presumed to be transitive: for example, *xPi y* and, *yPi z*, imply *xPi z*.
4. *Reflexive*: any alternative is as good as itself.

Together, these four properties imply that preferences are a relationship over things that individuals can order. In other words, one checks all alternatives against each other, and forms a complete ranking, rather than just selecting the best from the field. Each of these assumptions can be somewhat relaxed without creating enormous changes in the theoretical conclusions.

These formal properties are related to individual choice by adding three more assumptions:

5. *Maximized*: individuals are presumed to always choose their most preferred alternative.
6. *Stable*: the preference orders are stable over time and scenarios. Of course, if there is no sugar some might choose a cola drink rather than a coffee. Preference stability does not imply behavioral stability: It allows individuals to make variable tradeoffs between valued ends when the costs of those ends vary in differing scenarios.
7. *Unique*: individuals have but one set of preferences.

Together these seven properties imply that we can explain an individual's choice behavior in terms of his or her preferences and the alternative consequences of the choices from which the choice is being made. Nothing else is required. Because preferences of each individual are presumed to be ordered, they can be represented by numbers (although the numbers have only ordinal meaning). The axioms allow preference theory to perform some of the same roles as utility theory did for the utilitarians. But with utility no longer presumed to be interpersonally comparable, it is robbed of most of its moral power.

In the 1930s and 1940s, John von Neumann expanded these properties to cover choices of alternatives associated with probabilistic rewards. Calling such alternatives *gambles* or *lotteries,* he presumed people had preferences over gambles. He then argued that rational choice led to outcomes associated with the highest expected value. In other words, preferences regarding the outcomes plus the probabilities associated with the outcomes were all that was needed to evaluate gambles. To do this von Neumann assumed all the earlier properties and then some. We can best understand his developments as also requiring:

V1. *Reducibility*: the form of the lottery makes no difference: only the probabilities of receiving each of the possible outcomes matters. One would be indifferent between gambles that reduce to the same rewards via the calculus of probability.

V2. *Continuity*: consider a person who prefers *x* to *y* to *z*. Then a lottery can be constructed between *x* and *z* that the person will find of equal value to the sure bet of getting *y*.

V3. *Monotonicity*: a person faced with two gambles that involve the same two alternatives,

except that in one the person has a higher probability of getting the preferred outcome, always prefers the lottery with the higher chance of getting the more preferred outcome.

V4. *Substitutability*: a person is indifferent between any lottery and another that has elements of equal value to the individual were they but there, at the same probability.

Together, these four additional assumptions imply that individuals evaluate lotteries in terms of the expected value of the lottery. Taken together, the assumptions imply that all alternatives can be evaluated in terms of their value equivalent gambles. Further, these then can be ranked in terms of the probability of receiving the best alternative. In other words, people have preferences over outcomes and are risk neutral. They are indifferent to the form of the risks, only caring about the calculable probability of receiving each outcome. For example, were there no decreasing marginal valuation of money (i.e., every dollar is equally valued, regardless of how many dollars one has), a gamble of $100 with a probability of .01 and $0 with a chance of .99 will be found equally good.

These moves by von Neumann made a representation of preferences over all outcomes (sure bets and gambles) possible both in geometric and numeric terms. Geometrically, continuity and decreasing valuation lead to indifference contours and the like. Numerically, it permits one to interpret utility numbers in more than an ordinal fashion. Indeed, the presumptions that permit one to analyze the value of lotteries in terms of their expected value allow one to map utility numbers on an *interval scale* (i.e., scale differences between values are interpretable, but the zero point is fixed arbitrarily). Familiar examples of such scales are Fahrenheit and Celsius temperature scales: equal differences between scale scores, such as temperatures, correspond to equal differences in the attribute being measured, but a difference of 5° does not correspond to the temperature of 5°.

Still, without a positive element, classical utility theory is a bit vacuous. No universal values are left, no interpersonal comparability: leaving the power of the analysis to rest on a simple teleological presumption of maximization in human behavior. Unfortunately for economics as well as for political science and political theory, more was needed. To gain power, self-interest was raised in many theoretical contexts to the status of an axiom. Further, the behavior of a group of individuals was to be understood as the aggregate of the self-interested behaviors of the individuals choosing within the group.

Empirical Testing and New Theories of Rational Choice

As suggested, the classical theory had considerable success and considerable limitations. But its longevity was bound to its empirical accuracy. As the claims of theorists utilizing classical theory increased, its assumed properties were subjected to tests. These tests were often inspired by the failures of extensions of rational choice theory to nonmarket behavior. Tests that demonstrated failures were followed up with detailed examination of what could explain the erroneous predictions, and this has generated an entire field often referred to as *behavioral economics*. Although behavioral economics is a bit far afield for this entry, we must understand a bit about the contributions of experimental tests to understand the directions taken in the new theories of rational choice.

As indicated, classical rational choice theory began to falter, or at least evolve, when tests of behavior in nonmarket situations were examined. Certainly, Samuelson's suggestion that we understand preferences as what is revealed by behavior helped lead to the development of its empirical side. Early experimentalists showed first the smoke and then the fire. Kenneth May, for example, showed through a simple survey of students that a high proportion of people held intransitive preferences. But a whole field of experimental economics was born when Vernon Smith, a young assistant professor arriving at Purdue in 1955, found it useful to use experimental exercises in teaching economics. Subsequent experimental work explored the fit of classical rational choice models with the realities bared in the laboratory. And by the mid 1970s in the psychology laboratories of Daniel Kahneman, Amos Tversky, and a few others, a new cognitive theory called prospect theory was taking shape that showed that the problems with preference theory were much wider

than May suggested. The foundation for a broader understanding of rational choice was laid.

While the problems of transitive preferences were being studied, others ran experiments that showed the classic notion of self-interest was suspect and underdefined. And getting past self-interest meant considering what forms of other-regarding behavior could be developed to explain the observations. New forms of preference theory cropped up that involved other aspects of preferences that had been shown to violate the classical view, allowing for inconsistent choice over time, framing effects, probabilistic preferences, and more.

But the most fundamental alternative to the classical model of rational choice was developed by a couple of polymaths working in evolutionary biology and developing game theoretic models: John Maynard Smith and George Price. Worrying about biological outcomes understood as outcomes of a long repetition of a type of interaction, they conjectured that the interactions that were more successful would lead to more *rewards* and a higher probability of offspring survival, thereby generating an evolutionary model of strategic development in a population. For them, choice became probabilistic and adaptable. And the models that were developed, referred to as evolutionary game theory, changed in both form and foundation from what we earlier called classical rational choice theory to what has become the theory of evolutionary games. The introduction of this to political science was carried forward by Robert Axelrod. In his work, evolution took place in the choice of strategies in a repeating two-person prisoner's dilemma game.

Rational Choice and Political Theory

Although there have been interesting contributions of postclassical rational choice theory, most such work is still debating how to develop foundations and has not yet settled down to a consistent theory of political interaction. The classical view of rational choice has, by contrast, spurred numerous contributions to both positive and normative political theory. These have, in turn, led to both further empirical testing and further problems for the theory. In what follows we look at a few examples of seminal contributions of rational choice theory to normative and positive theories of politics. They include improved understandings of:

- Social cooperation through what is usually referred to as the logic of collective action
- The behavior of collective actors (e.g., unions and governments) through what is usually referred to as social choice theory and spatial modeling
- What might constitute a metric of social or collective well-being and hence a yardstick for political performance

Collective Action and the Political Contribution Problem

If shared interests are to be satisfied, and if satisfying them for one member of the group satisfies the others, then why would rational, self-interested individuals work to get their shared interests satisfied? This is a classical puzzle developed more than 200 years ago by Jean-Jacques Rousseau. In modern times, Mancur Olson set out to solve the puzzle. What emerged was a somewhat complex but sobering view of how humans solve what is called the collective action problem. Olson's first step was to identify the basic conflict between self-interest and any "natural coming together" of individuals to solve group problems. Russell Hardin then recast Olson's argument as a simple *n*-person prisoner's dilemma game. A prisoner's dilemma game involves a situation where each individual would individually be better off not cooperating, but everyone would be better off if they all did, and therefore even had to, cooperate. This moved the analysis along in two ways. First, it produced rich implications about what to expect in political behavior. Second, the implications permitted experimentalists to develop models they could test.

Key Implications of the Logic of Collective Action

As already pointed out, in a prisoner's dilemma, the individual has a dominant strategy to not contribute. The individual in an unorganized group will not contribute on the basis of the public good alone. This led Olson to note that the incentives that lead one to contribute to the supply of a public good must be both somewhat independent of the good and work in an individualized fashion.

How and why, then, do groups get organized? At least in some fashion, the aggregate value of a public good to its potential consumers is the sum of the values each consumer places on the good. The shortfall of the outcome that occurs in the unorganized or noncooperative group can hence be thought of as the difference in the aggregate values of the cooperative and noncooperative outcomes for the members of the group. This is the maximum gain that the group could get. Or, it is the maximum it could spend on organizing and still have a net benefit from the organizing effort. Or, this net gain is what the group's organizers can tap to improve the state of the group, and, at the same time, reward themselves for the effort.

If nothing else, our analysis to this point gives a solid justification for liberal political orders. Of course, there is no *ought* derived without a normative presumption. But *if* we agree that people should be able to meet their shared needs, then it follows that people ought to have such basic freedoms as press, speech, and assembly. The lessons of the logic of collective action literature imply that people must be given basic civil liberties, otherwise the demand for many valued public goods will neither be manifest nor factored into public decision making. Generally, individuals will not know that they share interests if they do not have the possibility of free communication. For groups to demonstrate the scale of their demands socially and politically, they must be capable of sharing the costs of the political efforts to change the public policies underlying their demands for public goods without undue costs being imposed on them because of their identity. Because a means of sharing the cost of a public good is organizationally difficult for groups of people to meet their shared needs over time, they must have the freedom to organize themselves politically.

The size of the group does not change the behavioral prediction in an *n*-person prisoner dilemma. But, if interests are shared, the value of their achievement increases: the larger the group of individuals who want a particular public good outcome, the bigger is its aggregate value. Hence, if collective action is to be roughly understood as an *n*-person prisoner dilemma, solving the shortfall of a larger group is more valued than that of a similarly situated but smaller group. Or as shown by Norman Frohlich and Joe Oppenheimer, organizing a larger group is more profitable than organizing a smaller group. And if political leaders are somewhat oriented toward the private rewards they can gain from such efforts, then politics is potentially more profitable in large groups and political competition will be stiffer in larger groups.

Along the same lines, we can note that the outcomes of elections are public goods, and that at least the instrumental value of voting is likely to be very small because the probability of any one vote making a difference is very small. This conclusion has led to two inferences: First, voters will tend to invest little in acquiring information about political outcomes and alternatives. In the words of Anthony Downs, they will tend to be "rationally ignorant." Second, citizens not given reasons to vote separable from the effect of their vote on the outcome of the elections are likely not to vote. The issue has been somewhat overdrawn in the literature, because many theorists argued as if there were no other reasons to vote. In any case, the fact that many voters do vote, referred to as the voting paradox, has led to both an interesting research frontier and an Achilles' heel in the rational choice theory program. It also helped spur investment in experimental research to discover the precise limitations of the theory.

Key Findings From Tests of the Theory of Collective Action

The findings of empirical tests did not fully confirm the predictions of the prisoner's dilemma games. Finding individuals contribute more than predicted to public good problems, researchers such as Elinor Ostrom and Charles Plott began to explore institutional structures that contributed to success in sustaining common property assets. In a series of experiments, Plott showed that the incentives generated by institutional design determine a great deal about the obtaining of group outcomes. Working on common property problems that Garrett Hardin believed required privatization of publicly possessed assets, Ostrom similarly found that informational and institutional details made all the difference in environmental sustainability. When deviant behaviors were easily monitored, and punishment for noncooperative behavior was possible, groups solved their public good problems.

From these discoveries grew a vast prescriptive literature that has had an enormous impact on institutional and policy design. It has led governments to design policies that use such market institutions as trading and auctions in such diverse problem areas as environmental, transportation, communication, and other policy matters.

Collective Actors, Social Choice, Social Welfare, and the Arrow Problem

The contributions of rational choice theory to institutional design did not begin, or end, with the study of collective action. These contributions began more than 50 years ago with the negative findings of Kenneth Arrow, who wondered which normatively attractive properties one could guarantee by properly crafting a constitution. Arrow's initial answer was astounding: If groups and group behavior are the aggregation of individual choices, and if individuals behave in accordance with rational choice theory, then democratic constitutions cannot be designed to generate rational group choices. Arrow's work also made clear a huge hole in our understanding of social welfare as the aggregate of individual welfare when we are bereft of interpersonal comparability. The problems stem from the difficulty of using a rule to combine reasonable individual choices (or welfare indicators) in a manner that can ensure a reasonable group choice.

We can identify some of the implications of Arrow's work using the problem of group voting cycles. Such cycles undercut any simple assertion that group choice reflects the will of the group or that it is somehow better for the group than alternatives that were rejected. To illustrate a voting cycle, we construct an example: some voters with preferences over a set of alternatives and a defined voting procedure to identify the winner. In this case, the rule is simple majority rule structured so that voters consider their options two at a time. The winner of each contest (the one that gets a majority) survives to compete against the next undefeated option until only one option is left. To show the problem of instability, assume:

> A group of three voters (i, j, and k) considering four options (w, x, y, z) with preferences of the following sort: two of the three, i and k, prefer x to y; two others, k and j, prefer z to x; and finally two (i and j) prefer y to z. Further, let all three voters find z preferable to w. Finally, we presume that w is preferred to x by j and k.

In such a case:

1. The outcomes would cycle: Start with y: x beats y, but w beats x; then z can beat w, but y beats z, and we are back with the initial defeated alternative.
2. There is no stable outcome.
3. Without further information, winning or losing in such a situation carries no normative weight.

With these preferences, each option can lose because there is a majority that prefers some other outcome. And each option can win, including w (even though the voters unanimously prefer z to w) depending on the order of the contest. So the winning motion could be anything. It is determined by which of the possible majorities form a winning coalition in which order. What is chosen would thus be determined by something beyond preference, perhaps the order of the vote or the structure of the agenda: In a legislature this is usually a strategic choice controlled in part by a committee chairperson or a party leader.

Arrow and Impossibility

What Arrow shows is that majority rule is not the problem. Cycles can be avoided only by rules that permit other things we will not like. For example, a dictator can be expected to choose in a manner that does not show this sort of instability, but a dictator has other negative normative qualities. Also, a rule of unanimity does not permit cycles (there being only one winning coalition). More specifically, Arrow shows there are deep conflicts between designing a social choice rule to achieve some minimal normative qualities that also requires avoiding a dictator. So if we insist that (labels for the properties are in parentheses):

1. Any pattern of preferences that the voters have can be aggregated into a decision by the rule (U-universalism).
2. Any side can win if it gets enough support (positive association). And certainly, this means

that if the group is unanimous in preferring *x* over *y,* the group choices *x* (P-Pareto).

3. The choice between any two alternatives should only reflect the preferences of group members over those alternatives (I-independence).
4. The results of the contests should be transitive (which forbids the voting cycle problem previously identified) (O-ordering).

These qualities conflict. The first requirement permits us to choose any set of preferences (such as, for example, the ones specified in the previous example). And the last two then can conflict directly, because, for example, if the group chooses *x* over *y,* and *y* over *z,* then we can imply that with transitivity it should choose *x* over *z*. But as we saw, this can violate the choice that would come from the consideration of only the preferences of group members over the final pair of options (*x, z*). Which of these properties one would want to sacrifice is unclear.

For example, relaxing the ordering requirement does not come cheaply. This is because there is a connection between any notion of good and transitivity. Amartya Sen has shown that virtually any conceivable notion of best, or better, implies some sort of ordering principle, such as transitivity. So when we say that one outcome is better for society than another, and that yet a third is worst, we are implicitly requiring some degree of ranking. Sen considers precisely what such normative terms might minimally require, and no simple solution allows for even loose rankings and independence (property I). Others have shown that if we give up a strict interpretation of I, we gain wiggle room as to what we can get from a choice rule. All this has underlined that we have to think carefully about the normative properties we hope to obtain from constitutions. Further, we must note that the precise designs of political institutions will impact how the preferences of the people are aggregated and how privileged the status quo will be.

Challenging the Noncomparability of Utility and Social Choice

Not all combined preference patterns lead to cycles with any particular rule. And not all decision rules (e.g., unanimity) lead to them either. But those preference aggregation procedures that do not lead to cycles implicitly involve some violation of another of the properties Arrow stipulated. And if we want there to be a connection between the aggregation of individual preferences and some notion of aggregate social welfare, we need some basis of comparison between the preferences of individuals and the aggregate social welfare.

Consider, for example, a comparison of majority rule with another rule: the Borda count. The difference here is the amount of information the voter gives in her vote. Majority rule asks for very little information from the voter: What is your first choice? The link to social welfare with majority rule must come from an assumption that the social welfare value of each person's first choice (in any contest) is the same. With a Borda ballot, the voter is asked to rank all the candidates. A higher rank is worth more points. If there are, say, four candidates, the top rank is given three points, and each subsequent ranked alternative is given one less: a third place vote gives the candidate only one point. The winner is determined by adding up the total points that are given to any candidate. With Borda, the preferences that determine the outcome between any pair will be preferences held over the entire set of alternatives. Borda can perhaps be said to do a better job than majority rule: after all, the voters are giving more information about how the outcomes affect them. But there is still a need to consider how the votes being aggregated relate to aggregate welfare. Now one voter's second place counts equally with that of another's. And so on. This requires distinctive assumptions regarding what interpersonal comparisons must be made to treat the aggregate Borda vote count as a legitimate indicator of social welfare: It does not let us avoid the need for direct comparison.

Spatial Models and Institutional Analysis

Another approach to the problem is to relax Arrow's first assumption (U) and assume that individual preferences have certain commonalities. Specifically, Duncan Black showed that if all voters agree on an underlying ordering of the possible outcomes (e.g., from left to right, or regarding

allocating a fixed budget to, say, either guns or butter) and each voter has an ideal point in that ordering and prefers an outcome closer to her ideal than one farther away, then there is no possibility of a cycle, or Arrow problem. With most forms of simple majority rule, the social choice will turn out to be in agreement with the voter who is in the median position in the set of voters.

But Plott proved that when the dimensionality of political conflict goes beyond 1, the median voter equilibrium breaks down. In more than one dimension, the ideal point of the median voter remains the equilibrium for the group only if that voter's ideal point is a median in all directions. Without that, Richard McKelvey derived a "wildness theorem" demonstrating that, with cycles, the outcome might lead anywhere. This led to considerable interest because as Gordon Tullock noted, democracies do not seem to generate radical instabilities, nor do they seem to lead to randomly selected, inefficient outcomes. Tullock conjectured that there must be some logic to the attraction of the center of the distribution of ideal points, perhaps via the positioning of the intersections of all the median lines (i.e., lines that have a majority of ideal points on both sides of the line when we include those points that are on the line).

Surprisingly, although there may be many issues dividing voters, measuring citizens' preferences often shows that these preferences can be mapped onto only one or two dimensions. So, for example, when there are but two contesting parties for office, voters are often motivated by which of the parties' composite positions they feel closest to. Hence Black's findings have relevance even in some substantially complicated electoral situations. But this was not totally satisfactory because the dimensionality of voters' preferences is not necessarily reflected in the legislatures and cabinets where laws are written.

Three major building blocks have been developed to justify Tullock's conclusion. First, it was shown by Thomas Romer and Howard Rosenthal that many institutional structures can bring equilibrium to an otherwise chaotic state. For example, many of the checks and balances of the American political system privilege the status quo so that it becomes less likely to be caught in a cycle. But less elaborate arrangements can also generate stability. Second, developments have expanded the notion of commonalities of preferences that preclude cycles. Peter Coughlin and Melvin Hinich established that if the relationship between individual preferences and choices is probabilistic rather than certain, electoral political competitions can lead to centralistic outcomes that are stable and conform to utilitarian conceptions. Frohlich and Oppenheimer show that a consensus on a conception of justice can obviate problems of majoritarian cycles.

But clearly, one of the great advances has been the development of tools to analyze the political dynamics of elections and legislatures when cycles do exist. Here the most important insight was that of George Tsebelis. He argued that we can think of political systems as having veto players (e.g., in the United States, the president, the Congress, and the Supreme Court). Only if all veto players agree, do we move beyond the status quo. Obviously, this entails a notion of unanimity, and hence, within that set of actors, we do not have to worry about Arrow problems. But some of these veto players might be institutional and collective actors, as is, for example, the Senate. For these we must get some solution to the problems of social choice raised by Arrow. Here Tsebelis turned to the work of Nicholas Miller and Richard McKelvey. Miller invented the notion of an uncovered set as the set of points that can be quickly recaptured (via a short cycle). McKelvey proved that its location has been established to be within the yolk: an area 4 radii of the smallest circle that intersects all median lines. This allowed Tsebelis to develop a more generalized understanding of institutional equilibriums. Others such as Norman Schofield made similar advances to deal with such problems as stability in multiple party cabinet formation and multidimensional party conflict situations. The upshot of all these pieces is that Tullock's conjecture is approximately right: There is considerable stability, centrality, and predictability to most democratic procedures. And this has led to increasingly successful modeling of specific political institutions and situations.

Social Welfare and the Evaluation of Governmental Performance

The problem posed by Arrow was so big that it spurred attempts to reconsider the link between

rational choice and aggregate welfare. Indeed, much of the effort of behavioral economists has been to investigate the link between "utility" (traditionally understood as welfare or happiness) and preferences. Rationalist branches of democratic political theory, led by John Rawls, embraced such a substitution (referring to the goods that satisfied such needs as primary goods) even earlier than behavioral economists and social choice theorists. One of the ways that first John Harsanyi and then Rawls moved beyond the consideration of preference was by reinstituting the notion of impartial reasoning in the exploration of individual and social welfare. This deliberate decontextualizing of choice forced its ties to something more basic than preferences. Rethinking the problem of utility and its relation to preferences has led others (David Braybrooke, Gillian Brock, Norman Frohlich, Joe Oppenheimer, and Amartya Sen) to focus on more concrete aspects of preference satisfaction, such as the satisfaction of basic needs.

These shifts from preference to more basic indicators of welfare changed both the presumptions of interpersonal comparability and the properties that one might expect of the individual welfare measures being aggregated into conceptions of social welfare. Shifting to such needs as nutrition, for example, invites the obvious comparison of the welfare of those who are hungry to those who are not. Interpersonal comparability is reintroduced precisely where Pareto denied its possibility.

As Sen conjectured in his Nobel acceptance speech, the difficulty with social welfare identified by Arrow is partially based on the emaciated noncomparability derived from considering preference satisfaction the be-all of individual welfare. Reformulating the epistemology of welfare reopens possibilities for tackling the old problems the utilitarians and others explored. But now, we do so with a fuller understanding of how to consider what ought to be aggregated and what can and cannot be obtained.

The tools of social choice have kept up with these expanded horizons of moral reasoning. And the tools of experimental economics permit the testing of the conjectures as to what are the contours and contents of impartial reasoning. Although there has not been a wholesale rejection of Pareto-optimality as the criterion for governmental performance, there has been a resurgence of an investigation of the link between rational individual choice and social justice.

RATIONALITY

Rationality means the capacity to exercise reason, to think, infer, and reach conclusions logically. The word *rationality* derives from the Latin noun *ratio,* meaning not only calculation but also method, reason, and order. Some of the most basic questions asked about rationality include how and why we become rational and whether nonhuman animals or artificial intelligences can be rational as well. In addition to these epistemological questions, the human capacity for rationality has prompted questions that bear on political life. Some of the most important of these include: Is rationality a capacity nearly all human beings develop, or something only a few exhibit fully? Must we be rational to be moral, or to be free? How different thinkers answer these questions bears on how they assess the political implications of human rationality.

Claims about who ought to be accorded political rights or exercise political power are often grounded in beliefs about the human capacity for rationality. That is, the claim that certain people are entitled to political rights or should exercise political power is often supported by the claim that these people are rational. Conversely, many arguments to deny certain people political rights and power rely on the claim that those people are not or cannot become rational. Many have based their hopes for a better political life on the further development of our rational capacities. Others have warned against such optimism, whether because they believe that traditional or sacred knowledge withers away in a society that prizes rationality or because they believe that current dominant conceptions of rationality are oppressive. This entry reviews ancient, modern, and contemporary conceptions of rationality and its relevance to political life, concluding with a look at feminist and poststructuralist critiques of rationality.

Ancient Ideas

Though ancient Greek philosophers saw rationality as an essential prerequisite to the exercise of political power, many believed it was not fully developed in most human beings. Though *rationality* is no better than a rough translation of the terms used by Aristotle and Plato, both considered questions similar to those being addressed here.

Of all the well-known ancient Greek philosophers, Plato's Socrates (the figure of Socrates as he appears in the earlier philosophical dialogues of Plato) regards rationality as a nearly universal human capacity. When noting craftsmen's ability to give a clear account of what they know, or demonstrating an illiterate slave boy's ability to understand and apply the principles of geometry, or praising the philosophical instruction he received from a woman, Plato's Socrates asserts that he believes the rational capacity to be more widely distributed than do his fellow male citizens in classical Athens.

By contrast, Plato presents rationality as a much rarer capacity among human beings in his later writings. Unlike contemporary understandings of the term, however, Plato's rationality is part of a complex set of intellectual attainments he believed only a few human beings could master. What we would call rationality is for Plato so closely linked to the capacity for creativity and a facility for mathematical or other forms of abstract thought that it cannot be meaningfully separated from them. Plato argued that only people capable of such thought could design a sound political community; only they could rule it well.

Aristotle also maintains that what he calls the deliberative faculty of the soul reaches its full development in only a small number of human beings. In women, boys, and those Aristotle called slaves by nature, rationality (meaning here the capacity to direct one's own life according to ethical standards) is not fully developed; such people therefore should not be allowed to direct their own lives but must be cared for and ruled by free men. Full participation in political decision making, Aristotle concludes, ought to be granted only to those who are not ruled by others. Only such men who can fully realize their deliberative faculties should be entitled to participate in political rule, rather than being subject to others.

Modern Ideas

The British empiricist John Locke argued that God made human beings capable of rationality and of

moral behavior; people display these capacities when they understand and act in accordance with the laws of nature, the laws God has woven into his creation. Once people become capable of understanding these laws (by means of education and maturation), they enter into a moral community of equals in which all members possess the natural right to property (broadly understood as life, liberty, and material goods). Because Locke believes human rationality is awakened by education and maturation, the subjection of children to adults is justifiable because children are not yet fully rational beings. But if this is the case, then most adults cannot be subject to other adults on the same grounds. Yet Locke does qualify the general presumption that rational adults should not be subject to other rational adults in several important ways.

First, Locke regards marriage and parent–child relations as prepolitical human associations. That is, Locke believes that although political communities may make laws governing some aspects of these associations, marriage and parent–child relations must obey some central natural laws in order to fulfill their purposes. In the case of marriage, one such precept amounts to a decision rule: Because marriage is an association of two people, there must be some rule for making decisions when the two people disagree. Locke's rule gives preference to men based on their greater abilities and physical strength. Therefore, even though Locke does not argue that women are not fully rational, his insistence that they be subject to men in the prepolitical association of marriage denies them full membership in the moral community of equals and, hence, political rights.

Second, Locke considers what should happen to those capable of understanding the laws of nature who nevertheless violate them by initiating an attack on the lives, liberties, and property of others. Because Locke sees such people as deliberately casting aside their ability to act rationally, he insists they should be stripped of all natural and political rights. And because such people have by their actions forfeited their right to their own lives and liberties, they may be justifiably killed or enslaved by others. Though Locke assumes most adults can develop their capacity for rationality fully, he regards the exercise of that capacity as a moral duty and those who neglect it as morally culpable.

Another distinctly modern conception of rationality was developed by the Swiss philosopher Jean-Jacques Rousseau. Like Locke, Rousseau sees rationality as a potential or capacity realized only under certain conditions. But unlike Locke, Rousseau does not believe that rationality and morality are inextricably linked. Rousseau maintains that people are naturally averse to seeing other sentient beings suffer and that this aversion will most of the time steer people away from harming others. But once the rational capacity awakens, it not only allows people to meet their needs more efficiently but may also spark a potentially poisonous self-regard. This dark side of rationality can overwhelm natural moral impulses, so that people whose rational capacities have come to fruition in a corrupt, hierarchical society are likely to enjoy besting others and to remain unmoved by suffering.

For as pessimistic as Rousseau can be about how rationality is exercised in most social settings, he makes a strong connection between the sound exercise of rationality and human freedom in his later work. Rationality, Rousseau concludes, need not inevitably trigger narrow self-regard; it has the potential to bring about self-awareness too. And rational, self-aware people aspire to direct their own lives according to rules they themselves fashion. When Rousseau defines freedom as living in accordance with the rules one has made for oneself, he does so on the basis of a more optimistic view of rationality. In this view, rationality is the capacity most crucial to realizing human freedom. The connection Rousseau makes between rationality and freedom sparked the German philosopher Immanuel Kant's much more extensive examination of the relation between human rationality and autonomy.

Twentieth-Century and Contemporary Ideas

One of the most influential contemporary conceptions of rationality may be found in rational choice theory (also called public choice, social choice, or decision theory). Rational choice theorists focus on how people use their rational capacities to achieve their goals rather than on whether the goals themselves meet standards for rationality. This conception of rationality applies to the means selected to achieve goals rather than the goals

themselves; it is therefore often referred to as instrumental or purposive rationality. As part of their focus on the means people choose to achieve their ends, rational choice theorists also consider a variety of constraints on human choices: imperfect information, risk and uncertainty, rules and sanctions, and the simultaneous choices of others. For many rational choice theorists, the accounts people give of their own actions are not definitive for how their actions should be analyzed. That is, even if people give other kinds of reasons for their actions, many rational choice theorists maintain that their actions can still be explained as if they were instrumentally rational and self-interested.

An important source for these ideas may be found in late eighteenth and early nineteenth-century utilitarian theory; according to utilitarians, actions are rational when they can be understood as attempts to maximize benefits or utility to the actor. But rather than treat instrumental rationality primarily as a powerful analytical tool, many utilitarians stressed the prescriptive implications of their views. For example, the utilitarians Jeremy Bentham and John Stuart Mill argued that both government policy and social practices ought to be judged according to whether they maximized collective utility or happiness and that any that fell short of doing so ought to be at least reformed or even discarded. While they were not revolutionaries, the first utilitarians justified their commitment to widespread social and political reform by referring to their conception of rationality.

By contrast, most contemporary rational choice theorists do not draw reformist political conclusions from their conception of rationality. Instead, some of the most influential works by rational choice theorists in the United States raise serious questions about ideas central to modern democratic theory, such as the will of the people, collective action, and popular participation. Rational choice theorists have argued that especially in large, stable political communities, it is much more rarely instrumentally rational for a person to participate politically or take part in collective action than democratic theorists have assumed. They have also shown how difficult it is to identify a rational political choice preferred by a majority of voters (i.e., a choice that satisfies a few basic logical criteria, like consistency, transitivity, etc.). Although rational choice theory is regarded by many social scientists today as primarily an analytical tool rather than a normative theory, most of the political conclusions drawn from it have been skeptical of democratic aspirations.

A more optimistic contemporary conception of rationality emphasizes that democratic political values can be rationally justified. John Rawls and Jürgen Habermas are some of its best known advocates. Rawls argues that people who rationally engage in a thought experiment in which they know nothing of their own talents or limitations or of what others in their society value will conclude that several basic principles of justice emphasizing the priority of liberty and equality are rationally warranted. (Rawls calls the situation presented in the thought experiment the original position; the wide-ranging constraints on what parties to the original position know, the veil of ignorance.) In his later work, Rawls portrays these principles of justice as outgrowths of modern Anglo-American ideas about religious toleration, rather than as abstractly valid conclusions. Still, rationality remains central to Rawls's political theory as one of the capacities liberal democratic public officials employ to justify their decisions publicly. Like Rawls, Habermas considers rationality crucial to the human capacity for morality. Habermas argues that human communication depends on certain rationally discernible rules; under ideal conditions, these rules promote agreement and consensus without the need for coercion.

While Rawls and Habermas ground the possibility of a better political community in the human capacity for rationality, the German sociologist Max Weber holds a more cautious view. On the one hand, Weber notes that many human groups before and beyond the modern West display purposive rationality, and that, as an analytical starting point, social scientists should assume that actions they seek to understand are purposively rational. Weber also employs the concept of value rationality to understand what people do to fulfill their commitments to a cause, a religion, or an ideal. On the other hand, Weber believes that as purposive rationality takes deeper root in a society, its members lose access to nonrational ways of knowing, like those based in tradition or religion. Weber regards these as real losses for which the further development of rationality cannot compensate. Though Weber

acknowledges that a society that prizes rational action develops capabilities traditional societies cannot, he insists that the power of traditional or religious knowledge to make the human world meaningful also be recognized.

More recently, a number of theorists have advanced more fundamental critiques of the conceptions of rationality previously summarized. Poststructuralists and feminists are some of the most important of these critics, questioning some claims central to the defense of rationality. Feminist critics focus on the supposed universality of the rational capacity. They argue that current conceptions of rationality should be understood as the historical products of male-dominated social and political orders; as a consequence, conceptions of rationality that purport to be universal should be critically analyzed to uncover the illegitimate generalizations of Western ideals of masculinity they contain. Poststructuralist critics focus on the claim that the exercise of rationality need not depend on the exercise of power. Instead, they argue that power relations are so pervasive that even those ideas that deny their presence must be examined to find their traces. From this perspective, concepts of rationality have important disciplinary functions: They not only present standards for what it means to be rational but also define what it means to be irrational or nonrational, how human communities should enforce these standards, and how they should treat those who fail to meet them.

Rawls, John (1921–2002)

John Rawls was an American philosopher who had a significant impact on postwar political philosophy. He is credited with reviving a form of normative theorizing that had gone into decline in the course of the twentieth century and, more specifically, resuscitating the social contract tradition of John Locke, Jean-Jacques Rousseau, and Immanuel Kant. The focus of his work is justice—more specifically, distributive justice. Accepting that human beings can benefit from coercively enforced social cooperation, he is concerned with the fair distribution of the costs and benefits of such cooperation. Although his most famous book—*A Theory of Justice* (first published in 1971)—is primarily a discussion of justice between individuals under a state, he does address justice between states or people in his last substantively new work, *The Law of Peoples* (1999). Rawls reformulated his project and arguments in response to criticism, and the discussion will follow the development of his work from the publication of *A Theory of Justice,* in which he sets out the method for determining what is a just distribution and defends his "two principles of justice," to his revisions of the theory in *Political Liberalism* (1993) and, finally, to his theory of international justice.

A Theory of Justice

Although he locates himself in the contract tradition, Rawls is not primarily concerned with the legitimacy of the state. He takes for granted that social cooperation must be backed up by sanctions if human beings are to solve the prisoner's dilemma. Rather, his work focuses on the distribution of the benefits and burdens of such coercively enforced social cooperation. A society is just insofar as it is

governed by principles that ensure a fair distribution of those benefits and burdens. This reorientation of the role of the contract away from state authority has, however, generated interpretational problems. While he stresses that he is offering a political conception of justice, rather than a moral one, Rawls's version of the "state of nature"—the original position—owes more to Kant's moral theory than to his political theory. For Kant, an act is moral insofar as it is motivated by a good will, but a "society of devils" can create a state just so long as they get the constitution right. It should be possible for a good person to live under that state, but you do not need good people to create and sustain it. In short, the legitimacy of political institutions is not grounded in human motivation. In contrast, for Rawls the stability of political institutions does appear to depend on human beings having or developing motivations conducive to justice. While this problem recurs in his work, it is clear that Rawls intends his theory to be specifically political in character. The theory applies to the basic structure of society and not to all social relations.

The basic structure consists of those social and political institutions that fundamentally affect a person's life chances, and restricting concern to this area of life has important implications. Rawls draws a distinction between the justice *of* the basic structure, and justice *within* the basic structure. The family illustrates this distinction. Household labor and child-rearing responsibilities, as well as income, are distributed within families as well as between families, and the dynamics of family relations are different from wider social relations, for while families can be dysfunctional, at their best they are held together by ties of affection rather than mutual advantage or civic duty. This difference is significant in at least two ways: It may not be possible to redistribute affection in the same manner as income or freedom is redistributed, and even if it were possible, it would not be desirable to attempt a redistribution.

Although political, the theory is not intended to be applied directly to everyday political questions, but assumes that agents live in a well-ordered society. We are asked hypothetically to choose principles of justice in the knowledge that all will comply fully with the chosen principles. In reality, there exists at best partial compliance, so we need answers to problems created by instances of noncompliance. For example, how do we deal with law breaking? We need a theory of punishment. What is the morally correct response to human rights violations? We require a theory of humanitarian intervention. Rawls does not deny the importance of these issues, and indeed accepts they are at the heart of everyday politics, but argues that a systematic grasp of ideal theory is necessary as a preliminary to dealing with the more urgent problems of nonideal theory.

The Original Position

There are two aspects to Rawls's theory of justice: method and substance. The method by which we determine what is just is a reformulation of the social contract, while what is chosen consists of two principles of justice, the first guaranteeing an equal set of basic liberties, and the second equal opportunity and a minimum of material resources. The original position is the equivalent of the traditional state of nature, although it differs in important ways from the state of nature: It is not a description of an imaginary historical situation, but a thought experiment that can be undertaken by an individual at any time. Furthermore, Rawls takes the existence of the state as a background condition and not the object of hypothetical deliberation. Indeed, he rejects the idea of general political obligation, arguing instead that we have a moral obligation to create and sustain just institutions, rather than a moral obligation to a specific state.

The most important feature of the original position is the denial of knowledge of your identity—you choose principles of justice without knowing what position you occupy in society. Indeed, you do not even know your particular society. While this "veil of ignorance" is its most memorable aspect, the original position has two other important components: primary goods and motivational assumptions. If you are denied knowledge of your ends—that is, those things that you seek to protect or advance or achieve, such as a particular career, relationships with identifiable family and friends, or a set of beliefs about the world—then you need some substitute ends. Given that agents do not know their identities, these ends must be shared by all agents in the original position, and they must be of fundamental importance. Rawls argues that each person desires to maximize his or her share of

the (social) primary goods, which are rights and liberties, powers and opportunities, income and wealth, and the "bases of self-respect." These goods are all-purpose means to the realization of a multiplicity of different ends. There is an objection to this argument: The primary goods are not equally valued by all people. A hedonist will require a higher share of the goods than an ascetic. To deal with this problem, the primary goods must not be of purely instrumental value: Although the ascetic may require fewer primary goods than the hedonist, both must be capable of imagining being the other, such that while they may not *use* the same amount of primary goods, they recognize it is rational to *have available* the same amount.

The third important aspect of the original position is a set of motivational assumptions. These assumptions are advanced for the purposes of generating principles of justice and are not a description of how real people behave. As well as seeking to maximize his or her share of the primary goods, an agent is nonenvious, disinterested, and willing to live by the chosen principles. To understand the role of motivation in Rawls's theory, it is necessary to distinguish rationality and reasonableness. Rationality entails the successful pursuit of your own interests, whereas reasonableness involves a willingness to see the world from the perspective of another person and act accordingly. Agents in the original position are directly rational and only indirectly reasonable: They are rational insofar as they seek to maximize their own share of the primary goods, but reasonable in that they are willing, and know that other agents are willing, to live by whatever principles are chosen. Critics of Rawls argue that his theory combines the contradictory impulses of self-interest and morality, but this is a misunderstanding, for he makes an analytical distinction between self-interest and morality precisely to motivate people to act morally. Agents in the original position have a formal sense of justice, meaning that they are willing to live by whatever principles of justice are chosen. This contrasts with a substantive moral sense that certain principles are valid. To be motivated, people must see principles of justice as a product of their choice, but to give substance to principles, they need some idea of what interests people have.

At the core of the theory is the idea that procedures validate outcomes, and consequently choice plays a fundamental role in explaining why we are morally bound to a set of political principles. The theory is constructivist. Constructivism has the advantage over alternative methods of justification that the chosen principles can be recognized by agents as (at least, hypothetically) the product of their own actions (choice), and therefore they are more likely to be motivated to respect them.

Principles of Justice

Agents in the original position are free to propose any principles they wish, although, of course, they must achieve unanimous agreement. Given they are identically situated, the unanimity requirement is not onerous. However, determining what they would, in fact, choose is more challenging. Rawls claims they would choose the two principles of justice, but concedes that they might select different principles, hence the distinction between method and substance. To simplify matters, he suggests the following menu of possible principles: free riding; first-person dictatorship; general egoism; classical utilitarianism and average utilitarianism (with or without a guaranteed minimum); perfectionism; intuitionism; and, the democratic conception (the "two principles").

The first three options are excluded by the way the original position is set up: We are all prepared to comply with principles rather than free ride; given ignorance of our identities, it would be irrational to identify a dictator; and egoism would be unstable. The credible alternatives are average utilitarianism with a guaranteed minimum of resources, intuitionism, and Rawls's preferred democratic conception, which consists of two principles:

1. Each person has the same indefeasible claim to a fully adequate scheme of equal basic liberties, which scheme is compatible with the same scheme of liberties for all; and

2. Social and economic inequalities are to satisfy two conditions: first, they are to be attached to offices and positions open to all under conditions of fair equality of opportunity; and second, they are to be to the greatest benefit of the least-advantaged members of society (the difference principle) (Rawls, 2001, pp. 42–43).

There is a lexical relationship between the principles of justice, meaning the first principle must be fully satisfied before the second principle can be applied, and within the second principle equality of opportunity must be respected before the difference principle can become operative. Lexical ordering is intended to avoid problems with the two main philosophical rival theories: intuitionism and utilitarianism. Intuitionists have to make judgments regarding the trade-off between values, such as freedom and equality, without determinate ordering principles to fall back on. Utilitarians settle disputes by appeal to a single principle—that utility be maximized—at the expense of the plurality of values. Lexicality entails the recognition of the plurality of values but gives some precision to their ordering. The danger, however, is that the value that is given the highest priority—in this case, liberty—will, unless defined in a relatively narrow way, trump other values. Rawls acknowledges the need for a "limited application" of higher ranked principles if lower ranked principles are ever going to come into play.

Although the first principle has been criticized, and the above version of the two principles is a late formulation intended to clarify the importance of specific liberties rather than liberty in general, it is the second principle that has generated the most debate. In fact, the second principle has the appearance of two separate principles: equal opportunity and the difference principle. Equal opportunity requires that advantageous positions, such as college places and good jobs, are open to all and that each person has a reasonable chance of acquiring such a position. The difference principle entails maximizing the position of the worst-off representative person.

Rawls argues that rational agents in the original position, recognizing the seriousness of the choice to be made in the original position, will ensure that should they end up in the lowest socioeconomic class, they will be as well-off as possible. The reasoning behind this is termed maximin: *maximum minimorum,* or the maximization of the minimum position. Although he avoids committing himself to any particular view on agents' attitude to risk, only highly risk-averse agents would select the difference principle over average utility, although a further argument is that the justification for average utility relies too much on the empirical claim that given the fact of diminishing marginal utility, extreme inequality will be avoided. Rawls claims to offer a more direct argument for limiting material inequality.

In addition to risk aversion, the motivational assumptions of mutual disinterest and nonenvy are important in the derivation of the difference principle. Mutual disinterest leads individuals narrowly to seek their own advantage and not the advantage of identifiable others, and the fact that agents are not envious of other people renders the pursuit of equality for its own sake irrational. The conclusion of Rawls's argument is that material inequality, in the shape of the difference principle, can be justified from a standpoint of equality—that is, from the original position.

Civil Disobedience

Most of *A Theory of Justice* is concerned with ideal theory; that is, he assumes for the purposes of his argument that people comply strictly with the principles to which they have agreed. He departs from this assumption in one relatively short, but very influential, section of the book—the discussion of civil disobedience. It is only in a society where there is partial, rather than strict, compliance with the principles of justice that civil disobedience has a role. This is because civil disobedience is an appeal to the majority—to its "sense of justice." The majority is being asked to respect principles that it implicitly accepts. In a (fully) just society, there would be no need for civil disobedience; and in an unjust society, there is no sense of justice to which you can appeal. The concepts of majority and minority are central. Although unanimity is required in the original position, once the principles have been selected they need to be institutionalized, and this is possible only through the creation of majoritarian political institutions. But majorities are liable on occasion to disregard the rights of minorities.

The leading idea behind Rawls's theory of civil disobedience is that in breaking the law, the civilly disobedient are addressing, or appealing to, the sense of justice of the majority. All the other points that Rawls makes, including an important distinction between civil disobedience and conscientious refusal, lead back to this idea. He sets out the following conditions for an act to be one of civil

disobedience: The injustice that is the object of civilly disobedient action must be clear. Civil disobedience involves breaking the law, rather than simply testing it, and must be a public act, nonviolent in character, and not threatening. The civilly disobedient must accept the penalties for law breaking. And even if laws are seriously unjust, civil disobedience must not threaten the stability of the political system.

Rawls distinguishes civil disobedience and conscientious refusal. His aim in *A Theory of Justice* was to articulate a morality—a theory of justice—appropriate to the political sphere. That political morality leaves open many other areas of morality. Conscientious refusal may be grounded in that political morality, but it need not be; it may be based on religious or other principles that extend beyond the political. The clearest modern example of conscientious refusal is objection to military service, either for general pacifist reasons or because of opposition to a particular war. Rawls argues that such objections cannot be automatically accepted, for justice requires on occasion that people be prepared to defend—by force of arms—the political system. The danger with conscientious refusal is that it undermines the political order by substituting individual moral judgment for the collective judgment of society.

A significant strand in conscientious refusal is the striving for moral integrity, that is, a feeling that regardless of the consequences, you cannot support a law or policy. Insofar as conscientious refusal is a form of moral purity, it is in tension with civil disobedience, which looks "outward" toward the majority, and appeals to it to change. The idea of moral purity is central to Mohandas Gandhi's *satyagraha,* which means an "insistence on truth," and Rawls's account of civil disobedience is often contrasted with Gandhian civil disobedience.

Political Liberalism

In the 1980s, Rawls began to revise the account of justice that he had presented in his earlier work. Largely unchanged were the substantive principles, but in a series of articles, culminating in the book *Political Liberalism,* he appeared to revise quite significantly the justificatory basis of the theory. He had assumed that in a well-ordered society there was a widely, and deeply, shared moral code. But this belief does not, he now suggests, address the fact of reasonable pluralism: the existence of conflicting, yet reasonably held, conceptions of the good. Rawls does not abandon the idea of the original position, but his interpretation of it undergoes a significant change. It is important to stress that denial of knowledge of one's identity (the veil of ignorance) entails not knowing one's conception of the good—that is, one's conception of what is ultimately valuable. This means that the resulting principles of justice must be compatible with a plurality of such conceptions. Expressed more concretely, Christians, Jews, Muslims, and atheists must all be capable of respecting the principles.

A theory of justice must be political, meaning that its motivational force must derive from a particular, circumscribed sphere of life, and not from a comprehensive moral standpoint, such as Kantian or Millian liberalism. This is not a restatement of the standard liberal argument for the distinction between public and private, whereby individuals enjoy a sphere of freedom in which they can act in ways that others might reasonably disapprove of; rather, the claim is that the basis of justification is itself limited to the political. The distinction between a political and a comprehensive conception of the good in turn affects the motivational basis of the theory. It is important that this distinction is not defined in terms of the political as opposed to the moral, for the political conception is itself a moral conception, but a special one. Somehow, the agent must accept the principles of justice but for the "right reasons," and that means as principles with independent moral force.

Rawls lists a number of features of human interaction that explain why reasonable people can disagree: Evidence is conflicting and complex; different weights can be attached to different considerations; concepts are vague; there are conflicts between different moral considerations, such as duties to family and duties to strangers; no society can contain a full range of values. He then goes on to define a reasonable conception of the good as encompassing both theoretical and practical reasoning, and although a reasonable comprehensive view is not necessarily fixed and unchanging, it normally draws on a tradition of thought and doctrine. It is not subject to sudden and unexplained changes.

From the idea of reasonable pluralism Rawls offers an explanation of how citizens, from a variety of different reasonable comprehensive conceptions of the good, can come to respect liberal political institutions. There develops an overlapping consensus: It is for citizens as part of their liberty of conscience individually to work out how liberal values relate to their own comprehensive conceptions, where a "comprehensive conception" could be a religion or a secular philosophy. Each reasonable comprehensive doctrine endorses the political conception from its own standpoint, and individuals work toward liberal principles from what are, at a basic level, mutually incompatible comprehensive perspectives, and respect for those principles is built on the overlap between them.

Rawls does not give concrete examples of how such an overlapping consensus can be achieved, but the position of Muslims in a Western society can be used to illustrate the argument. Various features of Islamic thought that might appear threatening to the liberal democratic order can be reformulated in a way consistent with political liberalism: a long history of toleration of Jews and Christians based on a shared monotheism; adherence to secular law so long as it respects Muslims' right to worship; an interpretation of *jihad* as a spiritual struggle; and submission as a voluntary act. A Muslim cannot endorse comprehensive liberalism but can respect political liberalism. Other citizens—people of different faiths and none—may have other reasons for respecting the principles of justice, but they can, along with Muslims, nonetheless converge on those principles.

The Law of Peoples

Liberal and Nonliberal Societies

In his last substantively new work—*The Law of Peoples*—Rawls turned his attention to international relations. The underlying aim is to outline the just foreign policy of a liberal society: When is intervention in the affairs of another state justified? And what duties do liberal societies have to nonliberal ones? Although that aim is quite narrow, in the course of the book, Rawls does present an argument intended to show that nonliberal, non-Western societies can be stable and thus should be tolerated by liberal ones. Although he does not use these terms with great precision, he makes a distinction between four types of society or people:

1. *Liberal societies,* such as those that (largely) respect human rights conventions and the conventions of war
2. *Decent nonliberal societies,* of which there can be several variants, but the one type Rawls discusses possesses a decent consultation hierarchy
3. *Outlaw states,* which that violate the law of people, by, for example, waging aggressive wars or engaging in serious violations of human rights
4. *Burdened societies,* where poor socioeconomic conditions make respect for international law difficult

Rawls applies the idea of the original position and the veil of ignorance developed in his theory of domestic justice to international law, but there are some significant differences between how these devices are used in Rawls's theory of domestic justice, and in his theory of international justice. Liberal societies agree among themselves on a "law of peoples," and then decent societies endorse those same principles. (Rawls argues that liberal democratic societies, by their nature, will tend to respect the human rights of their own people and the sovereignty of other people.) The law of peoples consists of eight principles:

1. Mutual recognition of each people's independence
2. Honoring of agreements
3. Legal equality of peoples
4. Duty of nonintervention (except in the case of dealing with outlaw states and grave violations of human rights)
5. Right to self-defense
6. Respect for human rights
7. Respect for the rules of war
8. Duty to assist people living under conditions that prevent them from becoming just (liberal) or decent societies

The law requires of liberal societies that they do not seek to change the fundamental character of a decent society.

To understand how a decent society could endorse the law of peoples, and consequently why a liberal society should *tolerate* a decent society, it is necessary to identify the characteristics of the latter. Rawls argues that a decent society is peaceful in that it pursues its interests through trade and diplomacy. The domestic laws of such a society are guided by a "common good conception of justice," meaning that while it may not grant the freedoms to individuals enjoyed in a liberal society, in a fundamental sense all citizens are treated equally. There should exist a "decent consultation hierarchy," which permits the possibility of dissent (the Arab–Islamic concept of *shura* would be one example of a consultation hierarchy). Importantly, the common good conception of justice entails respect for human rights, including the right to life, liberty (freedom from slavery and forced labor), personal property, and equality before the law. Although a decent society may not permit apostasy and proselytization, it must accord a degree of religious freedom to minorities, and because that right is limited, it must also allow citizens the possibility of emigration. Human rights do not depend on a particular conception of the human agent as autonomous, but rather they set a standard for the decency of domestic political institutions. Human rights fulfill three roles: they are a necessary condition of a regime's legitimacy; they determine the limits of sovereignty—the law of peoples prohibits intervention in the affairs of another state except when that state is violating human rights; and, they set a limit on the pluralism among peoples.

Just War

People, Rawls argues, have a right to go to war in self-defense but not, as in traditional accounts of state sovereignty, simply in the rational pursuit of a state's interests. And in a liberal society, conscription into the armed forces is justified only when just institutions are under attack—the need to defend liberty justifies a short-term, but transparent and proportional, interference in an individual's liberty. Because decent hierarchical societies do not share the same conception of domestic justice, they may make further demands on their citizens; however, because both decent and liberal societies fight only defensive wars, they will have no reason to amass armed forces beyond what is necessary to deter aggression.

A war is just if the reasons for waging it are just by reference to the law of peoples, and—importantly—if it is conducted in conformity with certain rules of combat. Well-ordered (decent and liberal) people must carefully distinguish three groups: an outlaw state's leaders and officials, its soldiers, and its civilian population. Because the population is not a *people* in Rawls's sense—it is not consulted in matters of public policy—it cannot be held responsible for the instigation of an aggressive war. For this reason Rawls argues that the fire bombing of Tokyo and other Japanese cities in the spring of 1945 and the atomic bombing of Hiroshima and Nagasaki were unjustified. Enemy combatants must also be treated with respect because they have human rights and because the possibility of long-term peace—which is one of the aims of a just war—is assisted if the armed forces of an outlaw state are treated with a respect that they themselves may not accord to forces of the well-ordered society.

Global Distributive Justice

Relatively well-ordered societies have a duty to bring burdened societies, along with outlaw societies, into the society of peoples. It does not follow that they must transfer resources to burdened societies in order to achieve this goal. Part of the reasoning is that transfers are indeterminate—we do not know at what point transfers must cease. A second, and more substantial, argument against transfers is that a society with few resources can be well ordered if its political traditions, law, social structure, and culture are capable of sustaining a liberal or decent society. Furthermore, the culture of a society is a significant determinant of the wealth of that society. Following the work of Amartya Sen on international development, Rawls argues that a society's population policy is extremely important and that failure in food distribution, due to a collapse in entitlements, such as wages, rather than food decline, is the cause of most famines.

Rawls rejects the extension of the difference principle to international relations, arguing that the target of distribution is the achievement of a society's political autonomy and consequent on it joining the society of peoples. This argument fits with his rejection of the extension of domestic liberal justice to the international sphere: Peoples are represented in the society of peoples, not individual human beings. A practical result of Rawls's position is that while he has a relatively egalitarian theory of domestic justice, he has a view of international justice that is significantly inegalitarian.

Realism

Realism as a way of interpreting international relations is as old as the conduct of international relations itself, but over the millennia it has taken several forms. Its self-chosen appellation reflects the rhetorical advantage that realists derive from describing themselves as dispassionate observers of the "realities" of international life—as opposed to the unreal hopes of their intellectual opponents, whom they designate "idealists." The premise of this positioning is the belief that there is a "reality" that limits humanity's ability to reform international politics. Constraints on realizing peace and international justice arise not out of failures of imagination or the malign influence of particular ill-intentioned actors, but out of conditioning realities inherent to international relations. Realism counsels recognizing these as limiting conditions, which human beings did not consciously create and which they cannot abolish, and it therefore prescribes a foreign policy that pursues its aims with a respect for these restraining aspects of international politics, rather than seeking to overcome them. Realism is thus both a theory and a policy of accommodation to a harsh, even tragic, side of reality.

Varieties of Realism

Realists discern unchangeable realities of international politics in either of two starting points: the self-aggrandizing nature of human psychology, or the peculiar organization of international politics deriving from the lack of any effective mechanism controlling the competition among sovereign states. One form of realism is thus a universal account of politics as it must be practiced as long as human beings remain what they are; the other is a depiction of a particular kind of politics sharply distinguished from political life as it reveals itself in other institutional settings.

The realism of human nature derives its propositions from a conviction that there is an essence to human beings in their relations to one another in any social setting: It is the desire for power—for control, for mastery of one's fellows. Reinhold Niebuhr, the eminent twentieth-century student of religion and politics, following the example of

Augustine, found the explanation for this desire in original sin. Implanted within each person since the Fall is an insatiable and ineradicable will to make oneself into a kind of god, dictating to others and bending them to one's own purposes. The possession of power allows one (call him or her *A*) to achieve this objective to some extent, while also helping to prevent others from similarly becoming dominant over *A*; and the more power (understood as the means to bring others to do what *A* wishes them to do) possessed, the greater the degree to which both the expansionist goal of dictating to others and the defensive goal of avoiding being dictated to can be realized. Niebuhr's contemporary, Hans Morgenthau, and Augustine's intellectual foe Niccolò Machiavelli reach much the same conclusion without recourse to explicitly religious language, for they too discern in human psychology an *animus dominandi* that makes politics a striving for power, with no limits to the power sought that can be derived from the power-seeking urge itself.

If the basic reality of politics is contestation for power, then international politics is the purest example of politics—what is more or less successfully hidden in the political art as practiced in other arenas of social life (hidden by institutional structures or systems of social norms and beliefs) is in international politics unadorned. Whether because social conventions render the hypocritical claim that one is acting morally less necessary in international affairs than in domestic ones, or because diversity among peoples (due to differences of language, race, and culture, for example) diminishes the effectiveness of those social bonds that mitigate the contest for power in more intimate relationships, international politics come closest to being "pure" politics. Seeking after power is a ubiquitous feature of human life, but politics practiced on the largest scale provides the clearest picture of what this universal drive looks like in practice.

The implication of this standpoint is that the desire for more power cannot be quenched or suppressed by any proposals for international reform. Thus, for example, international organizations such as the United Nations will be turned to the purposes of those who can gain control over them. Seemingly neutral and universally agreed-on principles will likewise be used by those who have the power to do so to harass their enemies and give an aura of disinterestedness to their own lust to gain or retain power, as realists assert that Adolf Hitler did with the slogan of national self-determination in the interwar period and the superpowers with the policy of nuclear nonproliferation in the cold war.

The more far-reaching charge by the realists against idealist opponents, however, is not that they foolishly endanger their nation's power position by failing to see that their well-meaning plans for reform will be turned against them by malevolent, power-hungry governments. Rather, it is that they naively do not recognize that their own actions, even when they claim to be most selfless, usually serve their own nation's interests. That is, human-nature realists attribute so much strength to the innate quest for power that they believe that it subtly prompts international actors who believe themselves to be wholly beneficent to interpret morality in ways that work to their own advantage. Reform projects are taken up, in all sincerity, when they advance the power position of their sponsors, and are discarded when they no longer serve that purpose: Such is the extent of the inescapability of "power politics," even for those who have convinced themselves that they are most free from its influence.

By contrast, a second group of realists locate the most important reality of international politics not at the microlevel of individual human nature, but the macrolevel of the international system. Specifically, the trait of the international system that most impresses these realists is its anarchy, by which they mean not that international politics is marked by constant disorder, but that it contains no authority possessing a monopoly on the legitimate use of force. This monopoly, which is held at least in theory within each state by the government of that state, constitutes sovereignty. The sovereignty of states has two aspects: Internally, each state, employing in the last resort its instruments of force, exercises control over other actors (such as local governments or corporations) on its territory; externally, states grant no authority to any international or transnational body to exercise control over them. If a world government did exist, international politics would cease to be anarchical and become instead "hierarchical," and in so doing it would lose its specifically "international" character.

The absence of any global counterpart to national police forces that can enforce national laws means that states, having no superior authority to protect them, must take measures to protect themselves. International relations is a "self-help" system, and states maintain and employ all the instruments of power, including both military force and all the diplomatic arts, to protect what they see as necessary to their well-being. Given that they are responsible for seeing to their own safety, they decline to delegate to any other actor the power to define the means required for their safety—their national interests. Knowing that all other states find themselves under the same pressure of self-reliance, each state exposes itself to the vulnerabilities created by cooperating with others (and therefore becoming to some extent reliant on actors that, in the final analysis, will be guided by their own rather than its interests) only when it believes it will gain more than it will lose by the transaction, creating a constant brake on international collaboration.

International-anarchy realists insist that understanding international rivalry and distrust does not require attributing to all human beings (and indirectly to states, as organizations made up of and controlled by human beings) a universal desire for power. Indeed, they contend that only a few humans, and therefore only a few states, may behave in this aggressive way. Rather, what is decisive is the inability of any state to know for certain what the objectives of any other state may be, or what they may become in the future. In this condition of uncertainty, the self-reliance of each state pushes it to assume the worst of its counterparts and to accumulate as much power as it can to protect itself against potential threats, and there is no logical limit to the amount of power that it might need in some unknown crisis. Without relying on any assumption about what human nature is like, other than granting human beings a rational desire to survive, this group of realists arrives at the same point as the first: a picture of the international system marked by conflict, suspicion, and fear.

Thomas Hobbes, with his picture of the solitary individual trapped in a war of all against all in the state of nature, and his assertion that international politics constitutes the clearest example in actual practice of this intellectual construct, stands as a forebear of the realism of international anarchy. Indeed, Hobbes specifically states that human beings are governed by different motives, including the simple desire to be left alone, but that the structure of any setting in which no government exists and self-help must be practiced drives those within it to assume the worst about their counterparts and to be guided only by what serves their own interests. What Niebuhr and Morgenthau did for Augustine, the French sociologist and political observer Raymond Aron did for Hobbes: restate in the twentieth century the interpretation of international politics set down by an earlier political thinker—in this case, by insisting that what makes international politics "international" is the central role of international anarchy.

Realists who base their picture of international relations on their understanding of human nature advance claims about what is universal, found in all politics and indeed all social relationships (aside perhaps from the most personal ones) at all times and places. Realists who base their portrait of international relations on insights into international anarchy begin with what is particular—with what distinguishes international politics from politics as it is practiced in other settings, and makes it unique in lacking a single ultimate sovereign. The two forms of realism are at one, however, in believing that this foundational reality is not susceptible to conscious control exercised by those who wish to reform or revolutionize international relations. Those who attempt to act as if reality, understood either as human nature or international anarchy, were other than what it is will only penalize their own state, and perhaps endanger its existence.

In both varieties, the currency of international relations is power, pursued either for its own sake or as a means to another end, such as security. It is assumed that those who direct states will be self-regarding rather than other-regarding, and the dominant note of international life competitive. Cooperation, where it exists, will serve, not compromise, vital interests, and it will rest on a deeper competition—as, for example, the cooperation of alliances presupposes conflict with a shared adversary. Because they can never be certain that current allies will not become future opponents, states will be sensitive to falling behind even friendly states in the contest for power, and they will therefore prefer relative gains in the objectives that contribute to overall power, such as wealth, even if they could

make larger absolute gains at the cost of seeing other states gain even more. Intensely conscious of their potential vulnerability in an environment in which, in the end, they have only themselves to rely on, they are willing to compromise their freedom of action and delegate to others power over them only on issues that are marginal and few. On the other hand, precisely because of their intense consciousness of the limits within which even the most powerful states must live, realists of all stripes counsel reliance on diplomacy whenever possible and constant awareness of the risk entailed in rolling the iron dice of war. Neither camp of realists holds out the hope that even a successful war will free statesmen from constraints, and their emphasis is instead on clear-eyed bargaining and accommodation as, most often, the preferred route to international stability and the protection of national interests.

The Evolution of Realism

Although one can find in Thucydides elements that blend the version of realism that begins with human nature and the version of realism that starts from international anarchy, most of those over the succeeding centuries who have been described as progenitors of realism can be placed in one of two categories. First, there are canonical political thinkers who have in scattered writings applied their more general understanding of politics to the particular realm of international politics. International relations in these contexts has frequently been used to illustrate a concept not limited to international life (such as Hobbes's state of nature) or as one of several reasons why political leaders have to make power their lodestar if they wish to survive, politically or even physically (as in Machiavelli's advice to the prince not to be good). But by and large political theorists have not made international affairs their primary subject of concern, and so they have not systematically developed the tenets of an approach to foreign policy and the international system that could be described as a full-blown realist theory.

Second, there are political leaders themselves, in their actions, their state papers, and their memoirs, who have displayed a kind of realism, understood as a pragmatic approach to formulating policy by those who believe themselves to be looking the facts of life in the face. These sources and examples of realism are even more disparate and widely separated than are the writings of the theorists; and from the point of view of the historian of political thought, they carry the additional difficulty of being after the fact and self-justificatory. They have nevertheless supplied evidence for the conviction, held by realists and nonrealists alike, that over the course of history, more practitioners of the political art have been guided by realist assumptions than by any other set of ideas.

Where these two manifestations of realism came together was in the European tradition of raison d'état or Realpolitik, which grew up alongside the sovereign state, first in Italy and later beyond the Alps, as the influence of the supranational church decayed and the figure of the absolutist prince appeared. Both as a way to understand international events of the day, such as patterns of alignment and realignment among princes, and to excuse the moral shortcomings in the actions of those princes, Realpolitik propounded a frank moral dualism: Whatever moral virtues might be appropriate to practitioners of the political art in their private lives, when acting in their public capacity, they ought to be guided by the well-being of the state for which they were responsible. The survival of the state was the highest concern of the statesman, and securing whatever means were necessary to that end was his or her primary duty. Neither personal scruples nor abstract moral principles had a place in the arena of competition for power that was coming to be conceptualized as a separate international sphere of politics. Realism in this guise was consequently associated from the beginning with the state, the states system, and policies that preserved the states system.

Although it contended that conflict was inherent in the interactions of princes, Realpolitik did suggest a set of measures that might produce at least a temporary and tentative peace. These were the policy prescriptions of the balance of power, which held that, while rulers were not selfless, they were rational. A stable balance of power relied on two assumptions: first, that through the use of unemotional reason, leaders could calculate, roughly but accurately enough, the relative power held by each state in the system; and, second, that any leader considering attacking another state would be deterred from doing so if the relative

power of the prospective object of the attack and its allies was so great as to render the likelihood of success too slender to make the action worthwhile. Ideological affinities or ethical hesitations would interfere with the unbiased calculation or the smooth transfer of affiliation among allies; these were matters that should be decided solely according to the rule that alliances ought to be directed against the strongest state, which was, because of its greater power, the player in the system most likely to attempt expansion at the expense of others. Although states naturally rose and fell over time in their relative power, if statesmen were alive to these changes and accurate and agile in identifying and diplomatically isolating the greatest power, general peace might be indefinitely preserved. This Realpolitik analysis gave no assurance, however, that smaller, local wars fought for reasons other than the general systemic balance would not take place. Moreover, it recognized that if a general war was necessary to prevent or undo an excessive concentration of power in the hands of one state or alliance—that is, if a choice had to be made between peace and the international balance—then the rational policy would be to employ war to preserve the balance that underpinned the entire system of independent states and prevented its replacement by a "universal empire."

In its reliance on rational calculation of power and its distrust of overscrupulousness and sentiment, Realpolitik presumed a cadre of diplomatic and strategic professionals who would determine and implement policy free from the influence of a broader public that lacked the expertise and the temperament to make rational decisions. There was, then, an almost automatic tension between Realpolitik and the ideological struggles that convulsed international politics at the end of the eighteenth and beginning of the nineteenth centuries, and again through most of the twentieth century, as well as the increasing democratic control over foreign policy. It was in reaction against these forces and the policies they generated that realism first developed as a self-conscious academic school, as opposed to a set of assumptions, drawn from experience, which in a general way guided the actions of those in positions of power.

Although theorizing about international relations in the first four decades of the twentieth century had contained many elements, including some that could be described as realist, those who, in the 1930s and 1940s, adopted the name and set out the tenets of realism argued that a gulf had opened between what they saw as a naive concentration on international law and organization in the universities (largely Anglo-American) in which they worked, and an increasingly dangerous world in which the distribution of power was tilting against those same countries. These realists intended to look behind the formal institutions of international life to reveal the power realities that would either drive these rules and organizations or destroy them. The formulators of mid-twentieth-century realism wished to awaken their societies to the peril in which they found themselves because of their neglect of the factor of power, but they also hoped to tear away what they believed to be the hypocrisy that prevented these societies from seeing the power urges that lay beneath their own actions—to argue, for example, that a seemingly disinterested advocacy of international law and peace could mask the preservation of the international status quo by satisfied powers. In both its polemical and its scholarly sides, then, this realism disputed the tendency to see Realpolitik as a relic of the past that was being replaced by institutionalized and cooperative international action for the common good. On the other hand, the American realists also rejected the insistence of Realpolitik that a successful foreign policy was necessarily amoral. The argument of these realists was instead that only by accepting the existence of the contest for power could any international actor confront and mitigate the self-seeking aims behind its own actions, and only by pursuing policies that protected national interests while also advancing broader international interests could progress toward greater global justice be made. One mark of this camp of realists was its moral anguish at the realities that constrained, though they did not eliminate, ethical action in international relations. It was precisely because they differed from the exponents of Realpolitik in seeing the possibility and obligation of some realization of justice that they painfully delineated the gap between what was ideal and what could practically be accomplished given the characteristics of human nature as they understood them.

This form of "traditional" or "classical" realism became influential and indeed dominant in the

study of international relations, though it was never unchallenged by adherents of various forms of "idealism" in the three decades following World War II. In the 1970s, however, it was confronted by an alternative form of realism. Criticizing traditional realism for its failure to meet the standards of social science, and taking economics as a better model, Kenneth Waltz and others sought to supplant human-nature realism with international-anarchy realism. Their argument was that human nature, being almost impossible to study directly with precision, could be accepted as a constant, while attention focused on the "structure" of international relations: its anarchical lack of a global sovereign, which made the distribution of power among its independent units the determining factor in relations among them. These "structural" realists, or neorealists, contended that hypotheses could be advanced, tested, and confirmed or disconfirmed if one adopted the parsimonious abstraction of international reality that they offered in the place of the philosophical-historical approach of the traditional realists. The debate between traditional and structural realists therefore proceeded on two fronts, one being the fundamental starting point of any interpretation of international politics and the other being the degree to which the study of international relations could be modeled on the natural sciences and those social sciences that had been transformed by the behavioral revolution.

Because they avoided reference to any inherent desire for power found in human nature, neorealists could posit that the common goal of states was not power but security. In a world in which all actors are driven by an unquenchable thirst for more power, the amount that any one of them holds at a given moment can never be considered sufficient, because it could be overtaken in the future by a competitor accumulating yet more power. By contrast, the neorealists argued, the desire for security—only so much power as needed to protect oneself in an anarchical setting in which other actors want no more than the same thing—could be satisfied, and any number of actors could enjoy this degree of security simultaneously. Systemic stability and peace were more likely under the assumption that the goal of most states was simply to defend themselves, and the first neorealists became known as advocates for "defensive realism." A later form of neorealism returned to the assumption of ever more power rather than security as the objective attributed at least to all great powers, bringing it the label "offensive realism."

Meanwhile, the evolution of the "English School" suggested replacing the realist–idealist dichotomy with a more complex tripartite scheme. Beginning with the British scholar Martin Wight and his Australian colleague Hedley Bull, adherents of the English School argued that the theory and practice of international relations should be understood as a centuries-long conversation among three interpretations of international life, those being the rationalists (or Grotians), who saw the most important reality in cooperation and mutually beneficial interchange among states; the revolutionists (or Kantians), who saw relations among states as epiphenomena, shifting above the underlying community among all human beings; and the realists (or Hobbesians). These realists had more in common with exponents of Realpolitik than twentieth-century American realists, some of whom were described as incorporating large elements of rationalism into their thought. Realism, as characterized by the English School, emphasizes conflict among states, based on isolation, fear, insecurity, and contestation for limited resources. A second generation of English School analysts sought to find the true contribution of their school in the development of rationalism, or the elucidation of a synthesis between rationalism and revolutionism, and have thus tended to shunt realism to one side as an element in international life that can be overcome, much in the manner of the American idealists. Whatever their differences, however, all subscribers to the English School have tended to reject both the "scientism" of the neorealists and the single view of human nature held by classical realists, arguing instead that the conversation among realism, rationalism, and revolutionism is propelled precisely by differing interpretations of human sociability and competitiveness.

Realism and International Change

Beginning with the peaceful end of the cold war and continuing through the contemporary process of globalization, critics of realism have questioned the relevance of a body of thought stressing competition and conflict among sovereign states. Exponents of realism have described its insights as

"timeless," but if systemic change is occurring, realism must account for it.

The issue arises most clearly in the current role of the state, and here the two varieties of realism diverge. Realism based on human nature sees the lust for power expressing itself in all—or at least in all collective—realms of human life, as it has done throughout human history, including the great bulk of history that passed before the rise of the sovereign state. Therefore, humans would continue to behave in this way in the future, even after the disappearance of states, which are only the latest in a series of institutions developed by humans to govern themselves. Realists of this stripe would thus expect the contest for power to continue among whatever organizational arrangements might replace territorially defined independent states. For the structural realists who begin with international anarchy, the problem is a different one, for their depiction of the forces governing international politics rests precisely on the existence of a system that in its major elements looks somewhat like the Westphalian ordering of multiple centers of power that ultimately are answerable to no authority beyond themselves, and are hence protected by no one other than themselves. If this anarchical system was replaced by a hierarchical one, structural realism, by its own terms, would cease to describe the incentives operating on the players within it.

While international-anarchy realism is more vulnerable than human-nature realism to the contention that globalization has invalidated its premises, both forms tend to be skeptical of claims that international relations has indeed been transformed in some fundamental way. Both perceive in such claims, not a clear-eyed recognition of radical alteration, but an attempt to escape the uncomfortable lessons of realism—that, in the end, human beings are not especially trustworthy or unselfish, and that the institutional setting of interstate politics tends to exacerbate the conflict into which humans fall when they deal with one another. Both would ask whether accounts of globalization describing it as extensive or unprecedented are correct, and whether, even if they are accurate, such changes will have the effects attributed to them. International-anarchy realism suggests that states have no interest in allowing their effective core of power to be taken from them, and that they will therefore not allow it to happen, whatever role subnational or supranational actors might appear to play; human-nature realism asserts that contest for power is always intrinsic to politics, even a globalized politics. Both types of realism thus continue to see international relations as realism has always seen it: marked more by continuity than by rupture, more by limits than by opportunities.

Reason of State

Reason of state (*ratio status,* raison d'état) denotes a way of thinking about government that emerges at the end of the fifteenth century and remains prevalent until the eighteenth century. It refers to the right of rulers to act in ways that go counter to the dictates of both natural and positive law with the aim of acquiring, preserving, and augmenting the dominion of the state. Reason of state presents politics as a sphere that has rules of its own

that are not reducible to moral principles. These rules concern what must be done when a state of necessity or exception puts at risk the safety of the state. For the doctrine of reason of state, the particular nation-state becomes the main historical actor and the final purpose of all political action.

The term *reason of state* was first coined in 1589 by Giovanni Botero, an Italian Catholic priest active in the Counter-Reformation. But its roots can be traced to late medieval political thought when the kingly estate (*status regis*) begins to claim prerogatives with respect to the other estates composing the commonwealth (*status regni*). At the time, it was argued that the kingly estate had the superior right against the rights of the other estates by reason of its capacity to confront the external or internal threats to the commonwealth posed by foreign invasions or internal rebellions. Machiavelli would later argue that the estate of the prince is always under threat, and it is therefore necessary for rulers to learn how not to be moral in order to maintain their estate, that is, their control over a territory and its population.

Although Machiavelli did not employ the phrase *reason of state,* there is a general consensus that his political thought provides the decisive influence on the development of the doctrine for two main reasons. First, Machiavelli shows that politics is amenable to rules, but these rules are not the same as the rules of everyday morality. Second, he argued that rulers are constantly living in a state of exception or emergency, which necessitates them to engage in actions that would not be condoned if performed by civilians. Reason of state adopts the concepts of necessity and violence as the hallmarks of state action. Necessity and violence come together in a central idea of the doctrine of reason of state, namely, the idea of a coup d'état, first theorized by Gabriel Naudé (see *Considérations politiques sur les coups d'État,* 1639).

But the thinkers of reason of state also tend to distance themselves from Machiavelli. Some argue that Machiavelli is simply concerned with the violent acquisition of power by a prince, rather than with the wise conservation of the state over time. Reason of state focuses more on the preservation of the state than on the person of the prince: It presupposes an impersonal conception of the state that Machiavelli had not as yet recognized. The need to conserve the state requires, according to the doctrine, constant attention on the part of government to matters of economy (mercantilism) and to the manipulation of public opinion by means of keeping secrets of state (*arcana imperii*). Additionally, theorists of reason of state during the Counter-Reformation do not uphold Machiavelli's belief that religion has merely instrumental value to politics. Many of them, like Justus Lipsius, argue that a religion always lies at the foundation of the state. Reason of state may at times excuse rulers from engaging in actions that contravene their religious beliefs, but only if they do so for the sake of preserving the state in its confession.

With the end of the period of religious wars and the new world order established by the Treaty of Westphalia, the doctrine of reason of state focuses on the idea of maintaining an equilibrium of forces between national states. This doctrine of a balance of power allows states to use war as a continuation of diplomacy (Carl von Clausewitz). With regard to internal politics, the requirement to maintain an equilibrium of power gives rise to a science of police (*Polizeiwissenschaft*), whose greatest exponent is Johann H. G. von Justi (see *Grundsätze der Polizeywissenschaft,* 1756). The function of the police is neither to acquire the state nor to conserve it, but rather to increase its power by providing for the felicity of its population. Reason of state becomes a matter of policing: making sure that the numbers of the population increase by providing for the necessities of life, the health of the inhabitants, their productive occupation, and lastly by providing for safety in the circulation and commerce of things and people.

As a way of thinking about government, reason of state begins to enter into crisis with the emergence of civil society as a separate sphere from the state in the eighteenth and nineteenth century. The idea of civil society entails the existence of social systems that have "natural" laws of their own and that respond negatively to arbitrary state intervention and regulation. These social systems are those of political economy and of the rule of law (*Rechtsstaat*). In order to govern civil society, a new rationality of government emerges whose formula is that of laissez-faire and that establishes limits to the action of the state on society as a whole. Insofar as liberalism understands good government to acknowledge the limits imposed by law and economics on the state, it can be said that the

advent of liberalism spells the end of the hegemony of reason of state.

Rebellion (Medieval)

Medieval European societies were marked by gross socioeconomic inequalities, legitimated through ideologies of hierarchy, and were subject to periods of considerable economic hardship. It has long been argued that, as a consequence, popular rebellions were a natural and recurrent symptom; but also that, as such, they lacked any coherent purpose, were driven only by the harshness of circumstances, and tended toward either millennial fantasies or naive monarchism—the desire, in both cases, for some radical intervention from "on high" to rectify their wrongs. However, historians have more recently demonstrated that some rebellions did have coherent (and potentially achievable) goals, deployed recognizable strategies in their pursuit, and that they were more usually spurred by political aspiration than simply the goad of hunger. In popular uprisings, there is thus the tantalizing possibility of glimpsing some political ideology and praxis at a plebeian level.

Not, of course, that only ordinary people revolted. Various medieval kings experienced rebellions from among their noble classes, something notable particularly in France and England, which, from the twelfth century onward, had the necessary mixture of monarchies that were theoretically central and politically transcendent, but that in practice depended heavily on the support of earls, barons, and the higher nobility for maneuver. When barons revolted, they invariably presented the claim that the king, being led astray by "evil counselors," was in need of rescue by those whose loyalty and responsibilities lay with the wider realm and commonwealth. Sometimes, as with the baronial movement led by Simon de Montfort against Henry III of England in the years 1258 to 1265, the role of those who considered it their duty forcibly to assist the king might formalize themselves via oaths into a communal council. On rare occasion, the established voice of counsel (the parliament in England, most obviously) might judge the king himself as *rex inutilis*—unfit for the job, and hence in need of replacement (as with Richard II, deposed in 1399). Tyranny was, some political theorists argued, another legitimate reason for deposition; though within a monarchical context, this was a claim more rarely sustained.

A form of monarchism thus lay at the heart of baronial revolt. This was sometimes the case also with popular rebellions, though with a rather important different inflection. Large-scale rebellions that sought to appeal to the king have often been seen as politically naive. But such appeals are found most frequently in places where monarchs had long laid claim to strong legal powers of intervention in all disputes; and they can thus be seen as calling on an established political channel, indicating that the underpinning idea was royal law, as a greater force that could override local jurisdictions. It is notable that in the English Rising of 1381, the rhetoric of rebellion played in part with the erasure of all social strata between the king and the people; but the practical measures sought by the rebels were written royal charters of manumission, a rather less abstract goal. Elsewhere, rebels might appeal to kings, princes, or other powers not necessarily in a naive desire for intercession, but as political players who might be tempted into allegiance against a common foe.

Spiritual ideas are also found within some revolts, most recurrently the idea of Christ's liberation of the world from sin, implying the amelioration or erasure of social order. Social hierarchy, and the unequal demands of labor, were explicitly glossed within medieval theology as the price of the expulsion from the Garden of Eden. It is perhaps

then unsurprising that those in rebellion might see Christ's redemption as implying the reversal of this situation—"Christ redeemed and bought us with His precious blood," as the peasants of Swabia declared in 1525. Recurrent also was the idea that the world, being in sin (marked by harsh social inequality and the greed of the higher classes), needed correction; as Paul Freedman has noted, peasants' anger could be presented as God's anger. Religious imagery and religious practice—particularly pilgrimage and collective festal culture—provided both logistical vehicles and a means of legitimation for collective action. Medieval people were practiced at operating collectively, particularly around religious festivals; such activities could be redirected. And confronted with a religious ideology that claimed that social inequality was God-given and immutable, finding a spiritual counterclaim could be a key factor in finding legitimacy and a motivating call to arms. On occasion, issues of religion in themselves constituted a part of the motive for revolt, as perhaps with the radical Taborite fringe of the fifteenth-century Hussites. More usually, though, religion provided a means through which revolt could be framed, expressed, and communicated.

However, as Sam Cohn has demonstrated, it is far from the case that every medieval revolt had a religious element. Contrary to some previous perceptions, almost none of the local or national uprisings were led by, or even had involvement from, priests or other religious figures; John Ball in 1381 is very much the exception rather than the rule. The occasion and ideology for many uprisings was resolutely secular: perhaps most frequently, the resistance of taxation or other impositions, the loss of collective political liberties, and the call for freedom from political oppression. Nor were the participants necessarily those at the very bottom of society: A more typical rebel might be the village or parish office-holding, law-worthy man, who already had a vested interest in the workings of the state (being not infrequently the state's embodiment at a local level), and whose sense of political engagement perhaps always exceeded that expected by his superiors. The most recurrent ideologies here were those of the "common good" and commonwealth, emphasizing again the shared cultural importance of "good government" across all levels of society. In plenty of civic rebellions against external taxation, we find evidence also that revolt was preceded not by a crescendoing wail of incoherent suffering, but by collective debate, widespread communication (including through writing), and organization for action. The predominant sources of medieval history—the chroniclers and commentators—present us with a vision of popular protest as incoherent, undirected, and meaningless. But the reality—found by reading those sources against the grain for what they unwittingly reveal and by supplementing them with other documents like prosecutions and royal pardons—shows something much more complex and more truly political.

Reformation

The sixteenth century's tumultuous period of church reform known as the *Reformation* had major

implications for European society, Christianity, and early modern politics and political theory. From Martin Luther (1483–1546) onward, one major question preoccupied Reformation political thought: What should be the nature and extent of the authority of a magistrate over the affairs of the church and the promotion of the faith? This prevalent question was predicated on a long and complex history of the intertwining of secular and church authorities in the middle ages. Reformation political thought was not merely an afterthought to theology; on the contrary, most reformers believed that without their political theories, their efforts to reform the church would quickly fail. But the support of secular authorities became a crucial and often deciding factor whether church reform would gain a foothold in a given territory. Thus, a major effect of the Reformation was the consolidation of secular power and the establishment of territorial and national churches.

Late Medieval Influences

Among the important factors influencing the political theory of the Reformation was the structure of political authority. Though strong monarchies existed, most sovereigns were dependent on the cooperation of subordinate local princes who possessed a considerable degree of autonomy. This relationship was especially true in the Holy Roman Empire, where the Reformation first began; soon thereafter, the reformers relied on the patronage of German princes, who hitherto had a longstanding control over clergy and church property. The medieval debate over ecclesial authority was also a major influence. The church hierarchy jealously guarded secular incursion into what it considered properly ecclesial, such as the appointment of offices; where that line was drawn, however, was contested since the age of Charlemagne. Moreover, since the fourteenth century and the Avignon Papacy, a contentious debate over authority raged within the medieval Western church over authority. The papalists held that the pope had supreme authority, whereas the conciliarists argued that it resided only in a general church council. In the Reformation period, this debate continued in the Roman Catholic Church. Many of the opponents of Martin Luther and the German Reformation were papalists.

Major intellectual currents from the Middle Ages also affected Reformation political thought. Nominalism, a movement against universal categories in late-medieval scholasticism, inspired a contentious debate about the status of human action (including political action) vis-à-vis the grace of God. Because this debate was still alive in the German universities of the sixteenth century, it helped prepare the foundational theological ideas of Luther and the German Reformation. Humanism, here defined as an intellectual movement toward classical liberal studies and education, also influenced the theology and political thought of the reformers. The humanist revival of Hebrew and Greek alone exerted an enormous influence on the political ideas of the Reformation through a renewed emphasis on ancient sources and philological criticism.

Because the focal question of Reformation political thought was about the duties and limits of the secular magistracy, each "confession" from the Reformation period developed answers, though the Lutheran one was seminal. Yet even though these confessional boundaries were distinct and often hostile to one another, one must not assume that this signaled major foundational differences in political theory. Mutual influences and common causes often blurred confessional distinctions in political thought; moreover, battles over political ideas *within* a confession could sometimes be as contentious as any battle between them.

Luther and Lutheranism

Just as the starting point for the Reformation period in general was Martin Luther and the German Reformation, so too was it the starting point of Reformation political thought. Because of the intense opposition from the church hierarchy, Luther and the German reformers discovered that reform was impossible without the committed help of secular authorities. Soon thereafter it also became clear that both the papal hierarchy *and* radical reformers rejected this role for secular authorities; thus German reformers had to theorize over the role of the secular magistracy in the Reformation.

Luther argued that there were *Zwei-Reiche-Lehre* or "Two Kingdoms," each given by God, to which all Christians were subject. The spiritual

realm was ruled by Jesus Christ through his Word; however, the temporal or secular realm was ruled by kings and magistrates through law and coercion. Its proper responsibilities were peace, order, and the protection of life and property. For Luther, secular government was not intrinsically Christian (he would in midcareer praise the political thought of the ancients); but he did argue that the two realms were not only divinely ordered but also biblical. His conception of the two realms came directly from the fact that neither the advice of Paul to submit to secular authority nor the commands of Christ to turn the other cheek could be disregarded. The two realms were two complementary divine gifts through which God directed humanity. In the temporal realm, God ruled indirectly through law and worldly authority and thus demanded obedience to secular power. Luther argued for a strict separation of the kingdoms: Just as popes and priests had no business with human law, secular authorities had no authority in the affairs of the church. However, for Luther exceptions to the limits of secular authority could be made in emergencies, particularly when caused by the recalcitrance of the papal hierarchy. In such times, a secular magistrate could conduct affairs in the spiritual realm as a *Notbischöfe* or "emergency bishop." Due to a magistrate's prominent position as a leader within the priesthood of all believers, he could, in some limited circumstances, direct the church.

Distinguishing their political thought from their leader's, Luther's fellow German reformers generally argued (along with many of the secular rulers themselves) that the secular realm had a duty to ensure that the true religion was established and maintained in a given territory. At the same time, however, they held to some version of Luther's "two kingdoms" and argued that this was not a transgression of their separation. For many of these reformers, the church was seen as an institution that existed in both the spiritual and secular realms; while the Word and the sacraments were part of the spiritual realm, the secular realm included any external measures to ensure good morals, discipline, and the practice of the true faith, including a general oversight of the clergy.

Foremost among the German reformers was Philipp Melanchthon (1497–1560), whose theory about the secular magistrate became the definitive Lutheran doctrine for generations. In Melanchthon's view, the magistrate was the *praecipuum membrum* of the church and had an obligation, through external discipline, to preserve and maintain a Christian society in all its public observances. Johannes Brenz (1499–1570), a Lutheran reformer in Schwäbisch Hall and Southern Germany, was also a foundational thinker who agreed with Melanchthon that secular government included the obligation to provide and maintain the religion of their territories.

With the positions of Melanchthon and Brenz prevailing, political thought in the German Reformation moved away from Luther's idea that secular government was not necessarily Christian toward the understanding that in its truest form, the duties of secular authorities necessarily demanded maintenance of the true religion in their jurisdictions. However, many problems arose in subsequent generations over the limits of secular authority, particularly since the Peace of Augsburg (1555) gave the German princes the right to determine the religion of their subjects.

Zwingli and Calvin

Humanist, Swiss patriot, and Zurich reformer Huldrych Zwingli's (1484–1531) political thought was more sharply distinguishable from Luther's "two kingdoms" and the *Notbischöfe*. A Christian for Zwingli was not a believer in the spiritual regiment and a subject in the secular one; rather, citizenship and faith were parts of an integrated Christian commonwealth that ought to imitate the ancient covenantal state of Judah. Unlike Luther, Zwingli greatly distrusted monarchy and believed that Zurich would be best served by an aristocracy. Zwingli had no objection to the magistrates' controlling ecclesial affairs (though magisterial control over Swiss dioceses had been established prior to the Reformation), and as *Leutpriester* in Zurich, he actively integrated church and civil affairs in the town council. Zwingli's defense of armed resistance to imperial and Catholic forces also contrasted with Luther's reticence; in fact, his personal willingness to take the battlefield in defense of the reforming cantons cost him his life in 1531.

John Calvin (1509–1564) became one of the sixteenth century's most influential Protestant

theologians, and Geneva, the city he helped form (though not as a citizen), became one of the most revered Reformed centers. However, Calvin was a second-generation reformer; by his rise to leadership in the early 1540s, confessional lines were largely drawn and even entrenched, and many of the theological and political controversies had been refined by the German reformers. Essentially, Calvin's political thought, as seen in his definitive work *Institutes of the Christian Religion,* at least on the question of the role of the magistrate over spiritual affairs, resembled Melanchthon's; Calvin envisioned magistrates who would work in tandem with church elders for the common cause of governing a thoroughly Christian society. The separation of church and secular authority was for Calvin a matter chiefly of tools and resources for the sake of the common end. Therefore for Calvin (against the Anabaptists), church discipline was a matter of political concern. The governing institutions of Geneva reflected Calvin's political thought: the consistory, the council of church elders that policed orthodoxy, would in cases of punishing transgressors have to rely on the authority and assent of the civil magistrates. Like Zwingli, Calvin and his followers were also suspicious of monarchy, despite the (unsuccessful) appeals for support to the French monarchy. Calvinism and the Reformed movement subsequently came to be identified with republicanism, and had an enormous impact on political thought in France, the Low Countries, England, Scotland, and the American colonies.

Anglicanism

After Henry VIII's (r. 1509–1547) establishment of royal supremacy over the Church of England, English political thought revolved around the structure of the state church, while royal supremacy was generally left unchallenged. Yet the role of bishops, who were largely royal agents, was hotly debated. Presbyterians and Congregationalists both sought to dissolve the English episcopacy in the name of Reformed theology and replace it with either national or local governance. During the Tudor dynasty, the shape of the state church depended somewhat on the attitudes of each monarch. Thus, under the young Protestant Edward VI (r. 1547–1553), reformers such as Thomas Cranmer (1489–1556) and continental exiles Martin Bucer (1491–1551) and Peter Martyr Vermigli (1499–1562), pushed for reformation through royal supremacy. But even his Catholic successor Mary (r. 1553–1558) ruled in a Henrician supremacist style through the papal legate Reginald Pole (1500–1558). Protestant exiles from Mary's rule went to Geneva and adopted Calvinist ideas on both church and secular authority. John Knox (c. 1510–1572), one exile who would influence Scottish reform, opposed female rule; thus when Elizabeth (r. 1558–1603) succeeded Mary, he and many former Marian exiles lost their political influence. Tensions arising from Presbyterians, Congregationalists, royal supremacists, parliamentarians, radicals, and Catholics were deftly negotiated under Elizabeth. Her "settlement" found its most intriguing apologist in the Aristotelian and conformist theologian Richard Hooker (1554–1600). But in the seventeenth century, this Elizabethan settlement proved untenable.

The Radical Reformation

Many of Zwingli's original followers split with him over infant baptism; the "Anabaptists," or re-baptizers, as the Swiss Brethren came to be called, were the first of many loosely related radical movements. In general, the radical Reformation strongly objected to the magisterial side of Protestant reform (a notable exception was Balthasar Hubmaier, c. 1480–1528); most radicals envisioned a pure church completely separated from secular power. Many early radical reformers argued that swearing oaths, the use of coercion, and secular authority in general were Satanic. Other radicals counseled rebellion against secular authority in the name of the Gospel, as in the Peasants' War of 1525, or formed a millenarian regime as in the city of Münster (1534–1535). Such experiments were crushed by Protestants and Catholics alike, and the radical Reformation was thereafter considered both politically and theologically subversive. However, Anabaptists like Menno Simons (1496–1561) maintained a renunciation of political aspirations alongside an ethic of nonviolence and strict separation of the church from secular power; this point of view prevailed among radicals in the aftermath of Münster.

Roman Catholicism

Political thought in the Roman Church during the Reformation was extremely diverse, for despite the growth of Protestantism, the remaining church was still a large tent. In fact, Catholic political theories were at least as much continuations of medieval and Renaissance intellectual disputes as they were reactions to Protestantism.

Catholic humanism had its celebrity in Desiderius Erasmus (c. 1469–1536). His influence on Protestantism and the revival of patristic and biblical studies was unrivalled. His political thought was most famously expressed in *The Education of the Christian Prince,* a treatise that sought to prepare the hereditary prince for good rule in a Christian commonwealth. Thomas More (1478–1535) was another such Catholic humanist known for not only his intellectual output (such as the classic work *Utopia*) but also for his political service and martyrdom under Henry VIII for opposing the Act of Supremacy.

During the Reformation, conciliarism and papalism clashed. Partisans of this debate often found major roles in the Reformation; for example, Cardinal Cajetan (c. 1468–1534) became Luther's early foe but was also an authoritative papal theorist and Thomist (follower of Thomism, the belief in the philosophical and theological views of Thomas Aquinas, 1225–1274). Thomism enjoyed a sixteenth-century revival, and thinkers such as Domingo de Soto (1494–1560) were instrumental in Counter-Reformation theology and political thought. When the Society of Jesus (Jesuits) was formed in 1540, papalism and monarchism generally prevailed in their political theories. On the conciliar side, John Mair (1467–1550) was considered a forerunner of "constitutionalism," or theories of limited monarchy that would later grow in and outside the Roman Church.

Conclusion

Reformation political theory was generally occupied with the role and limits of the magistrate in religious affairs. Most thinkers agreed that territories divided by religion could not be governed, and that the magisterial promotion of the true religion benefited peace and order. Hence a major political effect of the Reformation was the consolidation of secular power (particularly in the rule of law) alongside the consolidation of the territorial church. Yet these consolidations had boundaries; for example, justifiable regicide became a common Protestant notion. Finally, all Reformation political thought (radicals excepted) considered secular government a necessary and precious gift of God.

Regulation Theory

Regulation theory is a Marxist approach to political economy. It examines how particular forms of capitalism achieve a temporary stability. Karl Marx famously argued that capitalism was inherently unstable: It was unstable, first, because it led to capital overaccumulation and so periodic crises, and, second, because it generated an unstable set of social relations that resulted in a class struggle. For Marx, these instabilities would result in a working-class revolution to establish a communist society. *Regulation theory* focuses on the ways in

which material, institutional, policy-driven, and discursive supports allow capitalism to "regulate" its instabilities and thus ward off revolution.

Marx himself had taken different views of the prospects for revolution at different times in his life. Up until the end of World War I, however, Marxists commonly believed that the workers revolution would come soon. By the 1920s, the prospects for revolution looked far bleaker. The call to war had found the workers not uniting to overthrow capitalism but rallying to nationalist causes. Even the Russian Revolution had failed to spark similar uprisings in the more advanced economies of Western Europe.

Much twentieth-century Marxism can be read as an attempt to explain the absence of revolution and the persistence of capitalism. One well-known explanation came from Antonio Gramsci, an Italian Marxist imprisoned under Benito Mussolini. Gramsci argued that the bourgeoisie had established an ideological hegemony; the bourgeoisie had propagated an ideology that dominated throughout society and that lent a spurious legitimacy to the capitalist social order. Although the concept of hegemony certainly offered one way of explaining the persistence of capitalism, it did so by emphasizing the role of culture and ideas in a way that broke somewhat with the more orthodox, economic strands of Marxist thought. Regulation theory tried to explain the persistence of capitalism in terms closer to Marx's economic writings.

The earliest exponents of regulation theory are called the New French School or more commonly the Parisian School. They explained the temporary stability of various types of capitalism primarily in terms of economic institutions. Their emphasis on such institutions explains why their work is often described in relation to other institutionalist challenges to neoclassical economics. Yet, their institutionalism remained firmly located within a Marxist theory according to which capitalism inherently suffered from unstable development (crises of overaccumulation) and social relations (class struggle). Hence, they concentrated on the ways in which institutional arrangements managed to persist in spite of such instabilities.

The main institutional arrangements studied by the Parisian School were regimes of accumulation and regimes of regulation. As a rough rule—but one that oversimplifies—we might say that regimes of accumulation do most to mask the instabilities associated with the overaccumulation of capital, while regimes of regulation do most to mask the instabilities associated with the class struggle. The regime of accumulation refers to the institutions or regularities that facilitate a stable and proportional distribution of capital across departments of production. It includes norms for the organization of work and production, the relationship between branches of the economy, modes of industrial and commercial management, and the norms that govern the division of income between wages, profits, and taxation. The regime of regulation refers to the legal and political institutions that enable capitalist societies, and thus regimes of accumulation, to persist over time. It includes laws, industrial codes, styles of negotiation, state policies, political practices, and patterns of consumption.

Regulation theorists have applied their view most consistently to the broad shift from a Fordist form of capitalism to a post-Fordist or neoliberal one. Fordism refers to the methods of mass production and the rules of management pioneered by Henry Ford in his car factories during the 1920s and 1930s. Regulation theorists use Fordism to refer to the combination of an intensive regime of accumulation with a monopolistic mode of regulation. This combination lies behind the temporary stability of Western capitalism, with its Keynesian welfare state, up until the mid- to late 1970s. The intensive regime of accumulation comprised mass production, the intensification of work, semiskilled labor, a detailed division of tasks, and increasing mechanization. The monopolistic regulation embraced the separation of ownership and control, monopoly pricing, recognition of trade unions, wages being indexed to growth in productivity, the use of Keynesian policies to secure aggregate demand, and standardized consumption of mass-produced commodities. Regulation theorists argue that intensive accumulation and monopolistic regulation created something akin to a virtuous circle. Mass production brought economies of scale and thus rising productivity and increased wages. Rising wages led to increased demand and a fuller utilization of capacity and greater profits. Rising profits then led to the new investment in technologies of mass production that was needed to start the cycle again.

According to regulation theorists, neoliberalism arose as the inherent instabilities of capitalism finally disrupted the temporary stability created by Fordism. They offer several different, if compatible, explanations for the end of Fordism. Some regulation theorists argue that productivity gains declined because of both social limits (e.g., worker resistance) and technical limits (e.g., the difficulties of balancing ever-longer lines of production). Others argue that the expansion of production led to increased global economic flows and thereby undermined the ability of the state to regulate its national economy. Yet others argue that Fordism relied on ever-greater state expenditure, which led to inflation and overload. The demise of Fordism, whatever its cause, entailed a whole social formation; it was the end of mass production, large industrial complexes, blue-collar work, full employment, mass markets for standardized goods, mass political parties, the nation-state, and, crucially for our purposes, centralized and bureaucratic management systems.

Regulation theorists were often reluctant to engage in futurology. They did not claim to be able to predict what regimes of accumulation and regulation would arise in the post-Fordist era. In recent years, however, several regulation theorists have begun to suggest that neoliberalism itself has developed a kind of temporary stability. In this view, a new governance of markets and networks enables the state and other actors collectively to manage capital overaccumulation and the class struggle.

Renan, Ernest (1823–1892)

Ernest Renan was one of the most widely read French authors of the nineteenth century, which is remarkable given that he was committed to the life of the research scholar. When he did choose to comment on current affairs, his sometimes ambiguous political positions made him an author particularly prone to misinterpretation. Yet it is these very ambiguities that make Renan a significant figure. His interpretation of Christianity, his views on democracy and on the nation-state, among others, give us an important insight into the contradictions of political life in late nineteenth-century France.

Renan and Catholicism

Renan was born in 1823 in Tréguier in Brittany. The most significant event in his early years was his break with Catholicism at age 22. As a successful schoolboy, he had followed the traditional path to priesthood, entering the famous Parisian seminary of Saint-Sulpice in 1843. However, by the end of 1845 he had left, "never again to climb the steps of Saint Sulpice in cassocks," as he put it in his widely read *Souvenirs d'enfance et de jeunesse* (*Recollections of Childhood and Youth*) (1883). From then on, he was committed to the life of academia: He completed his doctoral thesis on Averroes in 1852 in Paris, participated in state-sponsored archaeological expeditions to the Holy Land in 1860 to 1861, and was eventually appointed Professor of Hebraic, Chaldean, and Syrian Languages at the Collège de France in 1862.

But the story of Renan's conversion away from Catholicism remains significant. Outside the seminary, Renan had been introduced to Romantic authors such as Victor Hugo and the great French historian Jules Michelet. He had also become increasingly interested in the historical study of language, under the influence of Abbé Le Hir and, later, the noted Orientalist Eugène Burnouf. Finally, he was deeply impressed with German philosophy—especially that of Johann Gottfried von Herder and Georg Wilhelm Friedrich Hegel. Renan's letters throughout the early 1840s testify to his growing skepticism toward the Christian faith. This and his dedication to science—understood in the

mid-nineteenth-century French sense as a commitment to the philosophical principles of empiricism—fatally undermined his faith.

Nevertheless, the influence of religion was to cast a long shadow over Renan's professional life. By far his most famous work was *La Vie de Jésus* (*Life of Jesus*) (1864), a book that attempted to historicize and humanize Jesus. It caused immediate uproar. It went through over 100 printings in 5 years and was translated into over 14 different languages. Renan's text was branded as blasphemous, and he was the target of bitter recriminations: For many orthodox Catholics, the book represented the pernicious creep of anticlericalism.

Renan himself was surprised at the violent responses to his work. Nevertheless, he continued to tackle religious themes in his academic life. *La Vie de Jésus* was only one of seven volumes in his monumental and carefully researched work *Les Origines du Christianisme* (*Origins of Christianity*) (1864–1882), in which he explored the roots of the Christian faith. By the time he finished, he had been elected to the Académie Française (1878) and he extended his project with the *Histoire du peuple d'Israel* (*History of the People of Israel*) (1882–1892), a further five volumes devoted to the history of the Jewish people. Even if Renan had left Catholicism behind in his early twenties, it continued to fascinate him until his death.

Rebuilding France: 1870 and Beyond

Today, Renan is perhaps better remembered for his political texts, in particular his short lecture *Qu'est ce que la nation?* (*What Is a Nation?*) (1882). A member of the "generation of 1848"—that is, those who came of age during the Revolution of 1848—he belonged to the political and intellectual world of contemporaries such as Gustave Flaubert and Hippolyte Taine. Their worldview was defined by France's second, short-lived, republic (1848–1851) and, significantly, the first attempt to implement universal male suffrage. The majority of "the generation of 1848" also lived to see in 1870 to 1871 another traumatic upheaval in French politics: the violent crushing of the Paris Commune and the tragedy of the Franco-Prussian War, in which French forces were roundly defeated. Both events prompted national soul-searching, as French thinkers grappled with the country's perceived decline.

Despite Renan's academic interests, he remained a regular commentator on current affairs. Broadly speaking, we can identify three strands in his political thought. The first is a skepticism toward universal suffrage and democracy on the grounds that the rule of the masses is, at best, problematic and, at worst, dangerous. The second is a consistent belief in science, progress, and the pursuit of wisdom, which led Renan to support the creation and development of an educated, rational elite with liberal inclination. Finally, he believed in the importance of the nation-state, not as an ethnic or territorial category, but as a shared community of historical and cultural values—or what he famously called "an everyday plebiscite."

There is ample (and not always consistent) evidence for these positions in such youthful work as his *L'Avenir de la Science* (*The Future of Science*) (1848, published 1890) or in later and more polemical pamphlets, such as *La réforme intellectuelle et morale de la France* (*The Intellectual and Moral Reform of France*) (1871). Only twice did Renan actually participate actively in politics, standing for election in 1869 and 1878. Both attempts were unsuccessful, but the political programs he proposed highlighted his liberal credentials. In 1869, for instance, he fought on a platform that condemned war as a solution to the Prussian threat and advocated a stable constitutional monarchy or parliamentary democracy.

Nevertheless, the interpretation of Renan's legacy has been hotly contested. For some, Renan was a liberal—in short, an elitist, who was critical of France's violent political history. Others—particularly the leading political figures of the Third Republic (1875–1944)—saw him as a champion of the republican values of anticlericalism and rational enlightenment. Yet others have seen in his thought the harbinger of French fascism; they cite especially Renan's direct influence on right-wing political thinkers of the early twentieth century, such as Maurice Barrès. While contemporary commentators now broadly agree that Renan was a member of France's nineteenth-century liberal elite, his complex legacy shows that he belonged to a France that, like him, was still far from having resolved its contradictions.

Representation

Representation is often taken to mean the making present of something that is in fact absent. Or to use slightly different terms, one thing is taken to stand for or symbolize another thing. This approach to defining representation is problematic in certain ways, but it provides a suitable baseline for comparing a number of different conceptions. Both the idea and the practice of political representation have been crucial, and often controversial, topics for political theorists, practitioners, and activists throughout the early modern and modern periods at least.

The most familiar type of political representation is where a person stands for a geographically defined constituency (or district) in a parliament, council, or other legislative body by virtue of winning an election. In this example, the elected member makes present, in some sense, the absent citizens of his or her constituency in the relevant legislative (or representative) body. He or she may be seen as representing the substantive interests of those absent citizens or standing for them in a more symbolic sense (or indeed both).

The Developing Meanings of Representation

In the early twenty-first century, more countries in the world than at any previous time in history are governed according to the principles of *representative government*. The phrase indicates that governments are drawn from (the votes of) the people and are responsible or accountable to the people. In cases where free and fair elections have become more or less established constitutional practice, the phrase *representative democracy* is also in common use. The latter phrase in particular indicates that representation has become the crucial source of legitimacy or acceptability for modern governments. Indeed, the development of the principles of representation, especially because the crucial innovations in ideas and practices forged in the French and American Revolutions over 220 years ago, can be seen as analogous with the definition, rise, and dominance of the modern idea of democracy.

These seemingly straightforward and factual meanings, however, only scratch the surface of the richness and complexity of the idea of representation. This richness and complexity is evident in contemporary political debates and controversies surrounding representation. But it is also evident in the historical development of the concept. Long before its appearance in the English language (most likely via Old French) in the fourteenth century, the Latin word *repraesentare* meant to make one thing stand for another, but generally in an aesthetic or symbolic sense and mostly involving only inanimate objects. Although the Roman Empire contained institutions and practices that we might think of as representative in today's terms, contemporaries did not use the term in that sense. In English from around the fourteenth century, the term representation meant to symbolize, or even to embody in some mystical manner. Thus, for example, a monarch could be said to represent his realm, but only in the powerful sense that in his divinely sanctioned authority he embodied or symbolized his subjects and his realm.

In Western political thought, the debates around the English Civil War concerning who and what the king or parliament could stand for or represent gave rise to the beginnings of a more modern political sense of the term. From that time, the idea that a leader might claim a legitimate right to represent a body of people became more tightly entwined with the notion of pursuing the interests of the people, and in some sense being answerable or responsive to the people. Thomas Hobbes's *Leviathan* and John Locke's *Second Treatise of Government,* for example, were crucial classic works defining staging posts in the contentious evolution of the political meanings of representation.

One key aspect of this development is that the modern idea of political representation evolved prior to the modern idea of democracy. For example, at the time of the American and French Revolutions, democracy largely meant what today we could call direct democracy—a system in which the people rule directly, without formal mediation or representation, as in the ancient Athenian democracy that operated through a face-to-face assembly of resident male citizens. In his influential writings, James Madison advocated a republic, or a representative government, *as opposed to* a democracy for the United States of America. It was only over the course of the nineteenth and twentieth centuries, to simplify greatly, that the ideas of representative government and democracy came together to make up what we call representative democracy today.

The latter part of the twentieth century cemented the idea that one cannot have representative government without democracy, nor democracy without a system of elective (parliamentary or legislative) representation. In political theory, the work of Joseph Schumpeter writing in the 1940s was influential in defining democracy as a competitive system in which teams of would-be representatives (parties, for the most part) competed with each other for the popular vote, with the winner gaining a limited right to rule. Schumpeter's theory dominated postwar American political science thinking about representation and representative democracy—and American thinking in this realm was itself dominant, not least in the cold war context. Postwar American political science for the most part analyzed representation in terms of responsiveness, focusing on the extent to which elected legislators were responsive to the wishes of their constituents. In focusing on responsiveness, they were picking up on one key thread in the most celebrated contemporary work on the theory of representation, Hanna Fenichel Pitkin's *The Concept of Representation,* published in 1967.

It is important to note that aesthetic and cultural tenses of the concept of representation are not wholly separate from this mainstream contemporary political sense of the word. Aesthetic or artistic representation, for example, can refer to representational art, where a landscape painting is taken to be a depiction of a real place, or a portrait of a person is taken to be a reasonable likeness of the actual subject's appearance. But this very same sense of representation is quite political. Consider, for example, increasingly sophisticated photography and film representations of U.S. presidents and the ways in which they are often portrayed as embodying the nation's values. Similarly, cultural representations of members of minority groups in Western media have quite often given rise to accusations that they reinforce stereotypical images of (say) black men or Asian women, in a manner that it is accurate to describe as political.

The Revival of Representation in Political Theory

The topic of representation was not prominent in political theory for most of the postwar period. Pitkin's work in the late 1960s was, rightly or wrongly, perceived to have offered a standard and widely accepted account of the concept. However, since around the turn of the century there has been renewed interest. Real world factors such as globalization encouraged new claims to be representative by actors and bodies that were not elected legislators or governments at the national level. These include, for example, international nongovernmental organizations (such as Greenpeace or Amnesty International), transnational corporations, and international governance bodies (such as the World Trade Organization or the International Atomic Energy Authority). As the environmental agenda has become more prominent, issues such as who, if anyone, can rightly claim to speak for nonhuman nature (e.g., endangered species), or indeed for future human generations, have increased in profile among theorists and practitioners.

Further, there has been growing and widespread disillusion with elective institutions in a number of Western democracies at least, raising questions about the quality of political representation. From a different angle, debates among theorists of democracy over the past 20 to 25 years have centered on deliberative democracy, highlighting questions about the quality of deliberation over issues and policies rather than more formal or quantitative (some would say aggregative) aspects of democracy, such as majority rule or proportional representation. Because inclusion in deliberative forums—from parliaments to new institutions like

citizens' juries—is available to only a small minority of citizens, theorists have renewed their attention to issues such as who gets to participate in deliberative forums, and what sorts of claims can they make to speak for, or represent, those who are not included.

Controversies and Challenges

This renewed wave of political theory interest in representation has involved discussion of a number of challenging issues. Some of these issues have been subject to debate for decades, or even centuries; others are relatively new. All of them are of both theoretical interest and of practical political importance. These issues are all connected in some way to the relation between a thing or person who represents (X), and a thing or person who is represented (Y)—or, to use the basic definition we started with, the way in which some X can make some other Y present in some sense, despite Y's factual absence. In the political sphere, we can ask, for example: Who or what can represent another? What does representing mean—what roles or practices are included within the idea and which ones are not? Where does, and where should, representation happen? And how can we know whether an alleged case of representation really is representation?

Who or what can represent something or someone, in a broadly political sense? As we saw in the earlier discussion, the conventional answer is elected representatives. But this might include indirectly elected as well as directly elected actors or groups—the prime minister of the United Kingdom, for example, is not voted for directly by all voters in the country (only those in his or her specific constituency). Civil servants and other appointed officials, along with guardians of public interest such as ombudsmen, may also be regarded as representatives, speaking or standing for the interests of the public in some sense. A range of unelected actors or groups that may influence government but are formally outside it often claim to be representatives. Amid the Make Poverty History campaign in 2004, the U2 singer and political activist Bono said, "I represent a lot of people [in Africa] who have no voice at all . . . They haven't asked me to represent them. It's cheeky but I hope they're glad I do." In all societies, not least in established democracies, people who are not elected—from interest group leaders and activists to spiritual figures—often claim to be political representatives. Finally, consider the claims of United Nations (UN) bodies, such as the role of the UN High Commissioner for Refugees. If representing means to speak for the interests of some larger group—to make that group's interests "present" in some sense—then potentially the range of political representatives begins but does not end with elected representatives to parliaments or councils.

What counts as representation? Hanna Pitkin made an influential distinction between four types of political representation:

1. *Formal representation,* where a representative is either authorized to act or to speak for another, or is accountable to the represented (in both cases, normally via elections or voting), for example a duly elected U.S. president.
2. *Symbolic representation,* where one thing embodies or stands for certain values, for example, the way a monarch might represent a people or how a national flag might stand for a country.
3. *Descriptive representation,* where one person might be said to represent another by virtue of similarity, for example, a black woman might be said to be the best sort of representative of black women generally.
4. *Substantive representation,* where it is the actual interests of the represented that are spoken for by the representative.

One might also ask where representation occurs, or can occur. That a member of parliament represents his or her constituency is a familiar idea. But does a father represent a family—perhaps in substantive, perhaps also in symbolic terms? Can the secretary-general of the United Nations represent all of humanity, in some substantive or symbolic sense?

And how can, or how should, representation be carried out? There is a longstanding debate in political theory between advocates of the view that representatives ought to be *delegates*—they should follow the wishes of their constituents, even if they themselves disagree with those wishes—or *trustees,* who look after the best interests of their

constituents, even if that sometimes means taking a different view from that of the constituents themselves. Sometimes the issues in the delegate versus trustee debate come to revolve around the issue of responsiveness—just how responsive to the actual wishes of his or her constituents should a parliamentary or local representative be?

Underlying a number of those debates is a fundamental difference over how we ought to understand representation. On the one hand, it can be defined as a fact—representation is something that exists in the political world, for example, when a member of parliament is elected in a free and fair vote. On the other hand, it can be viewed as a claim—the elected member claims to be the representative by virtue of the vote, but some minority, perhaps nonvoters, might dispute that claim. Or, Bono might claim to represent certain interests in Africa, but a variety of African governments or other agencies might dispute the claim. In short, there is a debate as to whether representation is best viewed as a set of institutional facts or as a set of dynamic practices and events centered on claim making.

Throughout the modern period, representative democracy was often contrasted with direct democracy—with the latter seen as the more democratic type. Increasingly, today, the distinction is seen to be false. Democracies need representation to promote deliberation and judgment about the public good. But this shift in the status of political representation has also been accompanied by new critical debate about the nature, place, and limits of representation.

Representative Democracy

Representative democracy is a form of government in which the citizens of the state exercise their popular sovereignty through legitimately elected representatives. In a representative democracy, the citizens choose their representatives by voting in elections. Typically, the chosen representatives then congregate in a legislative assembly in which they debate policy and determine legislation. Representative democracy is often contrasted with more participatory forms of democracy in which citizens play an active role in the decision-making process.

The classical theory of representative democracy suggests that the representatives should act in accord with the will or interests of the citizens. Yet, the representatives do not simply act as a proxy for the relevant citizens; rather, they have considerable discretion, and so can adopt the positions that they believe will most benefit their constituents or even the population as a whole. Besides, representative democracies often include political parties, with citizens voting for particular representatives in large part because of the party to which they

belong in a way that arguably requires the representative to adopt the positions to which his or her party was committed at the time of the election.

Because the role of the representatives is, at least in part, to act on behalf of their constituents, it is important that the voters have a way of holding the representatives accountable. Accountability has generally been linked here to both transparency and periodic elections on the grounds that transparency enables citizens to keep track of the actions of their representatives, while periodic elections enable citizens to replace their representatives if they are unhappy with their representatives' actions.

As we have seen, the classical theory of representative democracy broadly supposed that elected politicians would act in accord with the will or interests of their constituents. This supposition is challenged by several themes that have become increasingly prominent in political thought since the early twentieth century, including: the dominance of some policy networks by vested interests, the complexity of modern governance, and declining levels of trust and political participation.

Political scientists now often emphasize how business groups become involved with the political process and even come to dominate areas of it. Corporate interests have used their extensive resources to become powerful lobbyists, financiers, and advisors for politicians and, at times, public officials. The worry is that their involvement can lead to political representatives, perhaps intentionally or perhaps unintentionally, acting as the voice of these kinds of elite interests rather than their constituents.

Classical accounts of representative democracy are also threatened by the sheer complexity of modern politics, and especially the rise of nongovernmental nodes of collective decision making. The classic theory of representative democracy suggested that laws (and perhaps public policy) were made by elected representatives in a transparent manner and within a national context. Not much of that account remains. For a start, many nonelected officials clearly make policy and law within administrative agencies, judicial settings, and other such domains. Although the legislature creates statutes, these statutes are generally vague, so typically their interpretation, application, and enforcement all fall to administrative and judicial bodies that have the relevant technical expertise. Much collective decision making thus occurs in contexts where neither citizens nor their elected representatives have much of a presence. In addition, the complexity of the technical issues that are involved in defining, applying, and enforcing laws and policies inevitably entails a certain loss of transparency. Few citizens can grasp the legal language, let alone the scientific knowledge, on which many policies are based. Finally, the growing complexity of intergovernmental and transnational ties means that lives of people within a specific nation-state are increasingly being governed by laws and policies decided on not by their own government, but by transnational decision-making bodies. For example, while rules on environmental regulation, trade treaties, and migration all affect people living inside national borders, they are often made by international organizations that are certainly not directly accountable to the affected constituents in specific countries.

The declining rates of trust and political participation also challenge the classical theory of representative democracy. A representative democracy depends on the regular political participation of citizens: voting is, after all, the way citizens select their representatives. Falling rates of voter turnout undermine the claim that elected politicians adequately represent the voice of their constituents. Much of the public voice remains silent and unheard.

The challenges to representative democracy have lead many of its advocates to worry that their ideal is increasingly out of touch with political realities. Some of them still hope to transform society and politics in accord with the ideal. Others appear to be more interested in redefining the ideal so as to make it less demanding. Perhaps, they suggest, the number of citizens who vote does not matter as long as we have elections. Perhaps, they continue, the complexity of collective decision making does not matter as long as elected representatives are involved at some point. And perhaps, they conclude, policy networks can be seen less as dangerous clusters of vested interests and more as beneficial ways of bringing voices into the decision-making process.

There are also debates about the desirability of representative democracy. Radical, participatory, and deliberative democrats all believe that we should renounce or at least supplement the

representative ideal with other forms of citizen involvement. For some, representative democracy is not very democratic at all. Democracy literally means rule of the people, and radical democrats want the people, not the people's representatives, to rule. Some radical democrats point mainly to worries about self-interest and corruption within representative bodies: The representatives might not act in good faith. Others argue that political freedom consists in active participation within the process of ruling: Much of the value of democracy lies in the experience it affords citizens of collective deliberation and wielding power.

Advocates of representative democracy often counter more radical schemes by arguing that they could not work in the modern world. Radical schemes will not work, they tell us, because of the size of modern states and the complexity of the problems they confront. In this view, direct democracy might have worked in ancient Athens, but Athens was just a single city: If every eligible voter participated directly in a modern democracy, the political process would more or less grind to a halt. Likewise, in this view, modern politics deals with complex issues, including macroeconomics, the environment, and health and safety—issues about which the ordinary voter lacks the technical expertise necessary to make informed decisions. Some advocates of representative democracy have also defended it on the grounds that it might check some illiberal tendencies found in more radical proposals. They argue that radical democratic schemes encourage a tyranny of the majority: The power given to majority choices is liable to lead to repression of minorities. In their view, representative democracy provides a bulwark against such tyranny insofar as representatives are more moderate than the average citizen.

Repressive Tolerance

The concept of *repressive tolerance* was first spelled out by Herbert Marcuse, a critical theorist and an important organic intellectual of the social movements of the 1960s. Marcuse coined the term to differentiate it from its converse, *liberating tolerance*—a form of tolerance that truly houses perspectives that have an added value to social justice. Instead, under the social space of repressive tolerance, multiple views are seemingly embraced. This superficial accommodation of different ideas begets the opposite of genuine tolerance, so that repressive tolerance becomes an effective instrument of repression. Consequently, the essentials of the dominant politico-economic paradigm are reinforced, while at the same time the force of alternative perspectives is effectively enfeebled. In the end, change *of* the system is contained; only inconsequential changes *in* the system are promoted.

Although their ultimate upshots are similar, repressive tolerance and authoritarian politics are not analogous. Under repressive tolerance, resistance against the dominant order is not rejected in toto. Rather, alternatives that do not challenge, to use Antonio Gramsci's term, the essentials of the system are tolerated. By doing so, a system of domination gives the impression that there is freedom of expression and action. People are made to believe that they live in an open society. Yet alternatives that are considered to have sweeping consequences are systematically neutralized. This is in part accomplished through the process of creating conditions that make the genuinely different look outlandish. Groundbreaking alternatives consequently are perceived as eccentric perspectives that, if pursued, bring about chaos or, at least, imbalance in the arrangements of the existing social order. In the end, in the midst of a world of multiplicities in which authentic social change is

discouraged, the qualitatively distinct become one out of many without a significant bearing.

Repressive tolerance, then, is a system of conditions that makes creative collective reactions against the established order difficult by promoting the universalization of false consciousness. The populace, through the cultivation of a "democratic" habitus, is encouraged to see the familiar as legitimate and the unfamiliar as too radical to be taken seriously. To the extent that discourse is flattened, all views are given the same weight: The "pure tolerance of sense and nonsense" takes precedence over opting for a better argument. In this ideological obfuscation, the media play a critical role. By predefining the criteria for what is true or false, or what is right or wrong, or what is beautiful or ugly, those that are considered to be different are excluded from public transcript from the outset. However, subjective factors alone are not responsible for the unhindered reproduction of the dominant social order in spite of its rapport to a state of unfreedom. At the core of repressive tolerance are objective conditions that reinforce institutionalized inequality.

Republicanism

The word *republic* derives from the Latin, *res publica* (literally "public thing" or "public matter"), and denotes a state that is filled by a government composed of citizens; the branches of the government—executive, legislative, and judicial—exhaust its store of power and exist independently of one another. Historically, then, republicans are those who opposed unchecked discretionary power of kings by proposing alternative constitutions based on institutionally divided power, each accessible to all.

Civic virtue, understood as a citizen's assiduous cultivation of respect and reverence for the spirit and letter of the republic's law, animates the archetypal patriot who is willing to defend the republic against moral corruption and military invasion. Republicans, looking to encourage civic virtue and explain its cause, commonly harangue political life's intrinsic worth. A human, it is said, is a political animal who needs to participate in politics in order to reach her highest end. Formal equality before the law is thus a necessary presupposition of a republican argument. Republicanism is at once an abstract theory of human flourishing through a particular form of active politics based on legal equality and a politically engaged, reforming doctrine.

Politically engaged not only with contemporaries, republicans are self-conscious of their Roman roots, and the politicized historiography of its republic. Any republican must orient her theory to Roman republican practice and its symbols. Thus, Renaissance-era Florentines sought to rewrite the history of Julius Caesar and Brutus; Niccolò Machiavelli deliberately associated himself with Livy, the chronicler of the republic's glorious freedom; the English Commonwealthmen used Roman legal definitions of freedom; and the American founders suffused their arguments with Roman references and christened their institutions with the nomenclature of Rome's own.

Rome

An aestheticized memory of republican Rome was an important philosophical inspiration and plangent rhetorical device for which the works of the Roman and Greek historians, Sallust, Livy, Tacitus, Cicero, Polybius, and Plutarch, were crucial documents. Roman history, as it was written, was theater at its best. Tarquinius Superbus, Rome's last king, was exiled to Cumae for acts of tyranny whose wickedness was forever symbolized by his son Sextus's infamous rape of Lucretia. The imagery of kingly excess as gluttonous, lascivious, and self-serving could easily be contrasted with the republic's virtue and its justly earned communal bounty.

The Republic's constitution was highly conventional and protean, thus history provides essential documentation of its complex constitutional

odysseys. An important addition to this historical record is the *Corpus Juris Civilis* of 529–534 CE, a compendium of law and legal opinion compiled under the Byzantine Emperor Justinian I. For republicans this is a crucial document of Roman law. The so-called *Pandectae* (Greek), or *Digesta* (Latin), form part of it and include the Roman definition of slavery: A state in which one person is subject to the complete dominion of his master. Because Roman law conceptually divided the population in two, the free and the slaves, freedom was the condition of being under no one's absolute and arbitrary dominion. Contemporary republicans hoping to prove the unbroken history of republican freedom as being fundamentally about nondomination, frequently cite this piece of law from the quintessential republic. This view of freedom, which contrasts with one that emphasizes life lived without interference as freedom's essence, is anathema to any extralegal institution of monarchy, and is thus, strikingly republican.

The historians themselves are also the first philosophers of Roman freedom. Livy, for example, wrote that after the expulsion of Tarquinius Superbus, Rome was free because laws were more powerful than men. This identifies a pillar of republican constitutionalism, Aristotelian rule of law, and associates its presence with freedom, thus establishing republican argument on the force of this principle.

Florence

The Venetian Republic was known as the Most Serene Republic, but it is Florence of the fifteenth and sixteenth centuries that was the site of influential republican thought. Republican themes were common in the works of political writers (Ptolemy of Lucca, Lorenzo de Monaci, and Giovanni Cavalcanti) of the *Quattrocento*. They identified the sovereign's subjection to the law as the definition of republic and suggested that leaders ought to be chosen by the people. Nor was the shift to republicanism confined to political writers. In Dante's *Inferno* (1321), Brutus, the assassin of Caesar, suffers in the most punitive ninth circle of hell. Dante saw Brutus as a traitor against the glorious Caesar, father of Italy. By the fifteenth century, Renaissance Florentines had crowned Brutus as a hero and Caesar as traitor.

In 1494, the ruling Medici was deposed, and a republic was again established at Florence. Girolamo Savonarola, a Dominican friar and brief leader of the Florentine Republic, influenced the republican constitution of Florence, under which Machiavelli worked. It was Machiavelli, however, whose *Discourses on Livy,* published posthumously in 1531, would become the most influential early modern republican. Interestingly, Machiavelli's writings actually constituted a departure from previous republican thought. His originality lies not just in his shrewd analysis of power and its preservation, but also in his challenging thesis that the frequent civil clashes among Romans, which had always been seen as the cause of the decline of the Roman Republic, were actually signs and sources of its strength. The conflicts between the plebeians and the Roman Senate, for example, served as a check on power, led to compromise, and both exhibited and encouraged civic virtue.

Much of the renewed interest in republicanism resulted in analysis of the curious stability of the Republic of Venice. Machiavelli, the iconoclast, stands apart from the mainstream of this laudatory literature that highlighted Venetian isolation and small size as essential parts of republican functioning. In Venice, Machiavelli thought, political stability was achieved by restricting political rights, and this could buy stability only at the cost of civic virtue and military dynamism. Large republics, with a citizen army, become more secure and honorable as they manifest and foment the growth of civic virtue. Equal liberty to participate in public deliberations under conditions of free speech, the liberty to hold public office, and to attain highest honors, these are the surest ways to the heights of collective achievement and the preservation of liberty.

England

At the end of the sixteenth century, directly preceding the rise of parliamentary discontent with royal prerogative, the works of Tacitus, Livy, and Sallust began to be translated into English. By the opening decades of the seventeenth century, a group of English parliamentarians opposed to the prerogative power of the crown had begun a century-long battle over the essence of liberty and the institutional arrangement of English power. Roughly a century after republican ideas had

changed Florence, the recurring sentiment of freedom as nondomination unseated and beheaded the King of England, Charles I.

In 1628, Charles used the royal prerogative, the epitome of discretionary will, to decree an extra-parliamentary law of taxation. This was opposed by, among others, Sir Edward Coke, a prominent legal scholar and parliamentarian, who drafted the censorious *Petition of Right*. The *Petition* affirmed legislating taxation as the exclusive right of parliament and proposed to limit the royal powers of arbitrary imprisonment. Coke and his colleagues were clear that it was the mere presence of unchecked prerogative powers, and not just their practice, that stripped liberty, and that this was both immoral and unconstitutional. If the crown had the right to arbitrary power, Englishmen have their liberty not by right, but by the king's grace. Such liberty is not worth the name. In the 1770s, John Adams and Patrick Henry used arguments from Coke, whose works were carried to America on the Mayflower, to urge Congress to adopt the Declaration of Independence.

A decade after the *Petition,* neo-Roman arguments again resurfaced in the wake of Charles I's extension of ship money, a tax paid by residents of coastal towns in times of war, into general levy. And this neo-Romanism pervaded the arguments defending the parliament's decision to take up arms in the civil war of the fall of 1642. The charge against Charles I, at his trial, was tyranny, the rule by his will, and the enslavement of England.

The ascendancy of republican ideology and the depredations of civil war urged on Thomas Hobbes, whose antipathy to republicanism was deep and principled. Henry de Bracton's thirteenth-century, republican-tinged, legal work, conspicuously reproduced in 1640, rehearses the Roman *Digesta*'s definition of slavery and freedom, an account that was a crucial piece of the contemporary republican rhetoric to which Hobbes was so opposed. It was this, and the work of James Harrington, John Milton, and Algernon Sidney, the so-called Commonwealthmen, and those whom they succeeded, that established a republican whetstone against which Hobbes sharpened his theory. It was to be against this new blade that republicanism would now have to fight.

Hobbes's freedom as noninterference slowly became the dominant standard of freedom. This powerful philosophy ended up complementing and lending ethical justification to the increasingly commercial society of Europe. Quietly growing in salience and militating against classical republicanism was something later (1819) famously identified by the Swiss-born Benjamin Constant: Commercial society and population diversity and quantity steadily made Roman republicanism impractical, and thus morally impotent.

The Eighteenth Century

The century of enlightenment witnessed the ascendancy of a new version of freedom, and it was Hobbes of Malmesbury's. Hobbes and Locke had brought into currency the concept of a social contract that, among other things, fired the imaginations of eighteenth-century philosophes looking for clinching arguments in favor of radical constitutions. It was this which in short decades would clash with insights from the baron de Montesquieu's *Spirit of the Laws* (1748) and split republican theory in two.

Montesquieu distinguished forms of government in the way Aristotle had, but for him, the salient difference among regimes was not the virtue of the sovereign, but whether or not the sovereign governed by fixed and exhaustive laws. He formalized the scattered practice of the separation of powers into a discernible theory: Each branch is subject to the rule of law, and the power of each checks the power of any. Though these ideas bear some mark of republican freedom, and American republicans were much influenced by them, Montesquieu actually viewed republics as practically inoperable in an age of large commercial society. The tendency to eschew luxury and cultivate virtue in isolated republics was neither practicable nor desirable given the great benefits, moral and practical, that could be attained from commerce. James Madison addressed this difficulty that republican thought was forced to overcome and resolved it in a way far different from Jean-Jacques Rousseau's resolution of the same.

In the summer of 1787, Madison had formed clear intentions for the alteration to the system governing America's 13 colonies, which had been established by the Articles of Confederation (1777). At the Philadelphia Convention, Edmund Randolph presented Madison's Virginia Plan, which embodies

much of the republicanism Madison would come to defend: bicameralism, an independent judiciary, and representative democracy over a large population who were divided into coordinate subunits. In September and October of 1787, letters opposing the new constitution appeared in the *New York Journal* written under the pen names Brutus and Cato, believed to be Robert Yates and George Clinton, respectively. Here was Brutus, risen again to defend republicanism.

Madison was keen to defend this new proposal on republican grounds, thus when Alexander Hamilton asked him, along with John Jay, to write what would become *The Federalist,* Madison was happy to write under the name of Publius Valerius Publicola, a Roman consul in the first year of Rome's Republic. "Federalist 10" addressed the then-prevalent republican quandary: Large republics will succumb to faction, small ones can no longer come to be. Madison granted that faction and internecine conflict could be prevented only by restricting liberty in all ways, or by creating a unanimity of opinions, interests, and passions. The former preventative was worse than the disease, and the latter disregarded the fact that in commercial society a diversity of interests and inequality of faculties of body and mind is the source of its strength and attractiveness. What is needed is simply to dampen the conflict of interest for reasons of both morality and efficiency.

As Madison saw it, the danger in a small democracy was the possibility of legitimizing minatory interests of a majority. The larger and more diverse the *demos* is, the less likely will a tyranny of the majority be. America thus was uniquely poised to apply that maxim. The population was diverse, and its political structures and fortuitous economic development had increased the variety of interest. Madison and the framers proposed to maintain much of the diversity of America through federalism. It was an ingenious combination of careful evolutionary constitutionalism with the eighteenth century's obsession with a constitution based in pure reason. It was also still recognizably republican: antimonarchist, rule of law, and a separation of powers. Interestingly, Immanuel Kant argued that a direct democracy could never be a republic but must always be a despotism because there is no check; there, in a conceptual sense, is only one agent with power. In fact, aristocracies or monarchies are the only possible forms of sovereignty under which a republic is possible, because only there can power be divided and be, thus, law governed. This idea was utterly rejected by the French and American revolutionaries.

In 1749, Rousseau read a question posed by the Academy of Dijon for its essay competition that raised in him the familiar dilemma of commercial society, morality, and republicanism. Over the subsequent decades, Rousseau developed his influential theory of nature and freedom that culminated in a republican political philosophy advocating small agrarian republics. Rousseau emphatically chose the second horn of Madison's dilemma: The people of a republic must have a common interest, shared civil religion, and similar manners and morality. Rousseau believed that commercial society and social stratification necessarily turned human nature against itself. It did not matter whether this could be made stable or secure. For Rousseau, the question for a designer of a constitution was not how to harness the dynamism of competition through delimited freedom under a just republican state, but how to establish a timeless, natural morality under the artifice of a state while allowing each person to remain as free as one ought.

His republic is a radical version of democracy, where the will of the sovereign is not merely the will of the people, determinable by the expression of a voice or the counting of votes, but a will whose existence is knowable simply because it is the necessary product of a life lived under his republic. The legitimacy of the democratic will is guaranteed not by the ethic of majority rule but by the conditions under which the demos live. Rousseau was the first to admit that his was a nearly impossible republic. When he was approached by Count Wielhorski to write constitutional proposals for Poland, he urged caution and the preservation, to the degree possible, of what institutions of government existed.

In France, Rousseau's legacy is closely tied to the revolution and its extreme measures aimed at conditioning a more perfect republic. This is another example of how republicanism's history, that is, its applications, is clearly part of the definition of the ideology itself. It is a highly political ideology whose principles shift relative to its circumstances. Thus, it is best to think of republicanism as its historical

incarnations, as a bundle of concepts whose emphasis and accents change, but always surround the core principle of freedom from arbitrary rule.

REVOLUTION

For the political theorist, it is difficult to be objective in the face of revolutionary phenomena, and this may explain why—to paraphrase Hannah Arendt—the subject has been largely left to the technicians, whose sociological approaches have tended to be largely diagnostic, the objective being to determine scientifically what causes or prevents revolutionary transformation. More often than not, those political theorists who have engaged the subject have been more explicit in their loyalties, but not at the expense of more sociological questions. Rather, the normative questions swirling around the concept of revolution have been placed in dialogue with the frequently paradoxical descriptive issues regarding revolutions and their effect on the institutions of the state.

Conflict and Containment

While many would no doubt consider Plato, author of *The Republic,* a revolutionary of sorts, it is clear that he was deeply preoccupied by political change, or the *metabolē* that marked the shift between political systems or constitutions. In fact, the very notion of *revolution*—derived from astronomy but applied to radical social change—did not emerge until the seventeenth century. Instead, what concerned Plato and Aristotle was the *stasis,* or factional conflict, that led to metabolē, and whose etymological root makes it something of the opposite of our modern notion of revolution.

While Italian theorist Niccolò Machiavelli's emphasis in *The Prince* on regime preservation and stability and his advocacy of mixed government in *The Discourses* certainly have ancient overtones, his work lacks the determinism of Plato's (and Aristotle's) sixfold analysis of regimes and the linear path of their breakdown, and hence their pessimism toward metabolē. Further, if Aristotle's stasis, or violent strife, was perceived as the fundamental cause of regime change, this same assumption did not hold for Machiavelli, as it was precisely the institutionalization of class conflict in the Roman Republic, albeit without factions, that led to its historic greatness.

States and Revolutions

If Machiavelli's radicalism was a result of his incorporation of class conflict within the bounds of institutionality, then Karl Marx's radicalism grows from his insistence that such conflict inevitably surpasses those same bounds, gaining the status of the motor of history itself. However, for Marx, the study of current and past revolutions plays a significant part in determining the direction of the class struggle. Hence, Marx's own experience of the 1848 June Days informed his understanding of the working-class seizure of the bourgeois state, while the 1871 Paris Commune inspired him to correct his earlier analyses in *The Communist Manifesto,* laying greater emphasis on the need to not only seize but also to fundamentally transform the state if revolution is to be more than mere restoration.

The question of the state remained at the center of the revolutionary Marxist tradition well into the twentieth century, but its importance was obscured by the vicissitudes of state power in the Soviet Union. While Vladimir Lenin is often credited as the supreme proponent of a vanguardist understanding of revolution—whereby an intellectual elite bestows on the masses the consciousness

necessary to overthrow the old order—such a view is too often mobilized as a retrospective explanation of the errors of Soviet Communism. Whereas Lenin had formulated his vanguardist thesis in *What Is to Be Done?* (1902), he too was compelled to modify his theory in response to popular rebellion and revolutionary ferment in both 1905 and 1917 Russia. Returning to Marx's own discussion of the commune in his 1917 *State and Revolution,* Lenin formulated the dictatorship of the proletariat as a transitional state prefacing the disintegration of the state entirely, thereby arriving at a more substantive view of revolution than the one with which he is generally credited.

But if Lenin's focus remained on the state, later Marxists would see the need to transform revolutionary theory in order to take into account the broader spheres of social life, whose impact on political life could no longer be ignored. Italian Marxist Antonio Gramsci, for example, emphasized the strategic importance of the realm of civil society, the conquest of which he considered almost a precondition for the conquest of the state. If the state, as the realm of pure domination, was taken through force, Gramsci argued that civil society was taken through hegemonic struggle, an organized deployment of ideas for which the role of the intellectual—understood broadly as a social organizer—would be paramount.

Revolutionary Restoration

If the progression from Marx to Gramsci represents a growing concern for the question of the state and the danger that revolutionaries might—unwittingly or not—reproduce the very structures they had previously opposed, this concern was of primary concern for another group of thinkers for whom modern revolutions rarely surpassed the conditions from which they emerged. That modern revolutions should stimulate this anxiety, moreover, was far from coincidental, because according to Arendt, modern revolutions differed qualitatively from ancient stasis or metabolē in their aspiration to total change.

As with Edmund Burke, much of this tradition was characterized by the conflict between a positive view of the American Revolution and a critical view of the French Revolution. Alexis de Tocqueville, for example, wrote his seminal *Democracy in America* in an effort to determine both the causes for the success of republicanism in the United States and for what he perceived as a failure in France. Whereas the French Revolution nominally sought to oppose the centralizing despotism of the old regime, Tocqueville attempted to show how the revolutionary process had the paradoxical effect of strengthening the state. This view would find theoretical sustenance in Max Weber's pessimistic view of the paradox of the revolutionary process. For Weber, who distinguished traditional, charismatic, and legal-bureaucratic forms of domination, revolutions are more likely to result from charismatic intervention, but the inherent demands for their eventual institutionalization would lead them to strengthen the "iron cage" of state bureaucracy.

If Tocqueville critiqued the traditional Marxist account of revolution as the result of immiseration—arguing instead that radical transformation was as likely in times of improvement in the lives of the masses—Arendt's response to the French Revolution was slightly different. For Arendt, while Marx's account bore some truth, its economism embodied nevertheless all that went wrong in the French Revolution. Whereas the revolution made explicitly political promises, creating the potential for new institutions of deliberation and political action, this political impetus gave way to social demands, and as a consequence the revolution was doomed. In contrast to the French case, Arendt saw some success in the American Revolution but, like Tocqueville, she saw such successes as self-limiting, both guaranteed and stifled by the constitutional arrangements. Ironically, Arendt appealed instead to a council structure like that of the Soviets, a structure that—as Lenin was quick to point out—rarely if ever existed without reference to the social question.

RIGHTS

Etymologically connected to *the right,* which is concerned with correct action, the plural concept of *rights* developed in the modern period, primarily as the assertion of the individual's right to private property. But the connection between rights (plural) and right (singular) is not simply etymological but also conceptual, for a particular right must necessarily be located in a wider scheme of rights. The focus of this entry is on the concept of rights rather on justifying particular schemes of rights. After analyzing different kinds of rights—claims, privileges, powers, and immunities—the conceptual unity of those four forms is discussed. Two theories of what holds rights together dominate the conceptual debate: will theory and interest theory. In will theory, to have a right is to be in a position to change your legal position vis-à-vis other rights holders, while benefit theorists hold that having a right involves benefiting from other people acting in certain ways toward you. Although advanced as purely conceptual, the two theories do have normative implications. For will theorists it is difficult to attribute rights to fetuses, animals, or very young children, although they may be protected in other ways. Benefit theorists are better able to accommodate such entities as right holders, but at the price of conceptual clarity.

Hohfeld's Analytical Scheme

In his book, *Fundamental Legal Conceptions as Applied in Judicial Reasoning* (first published 1923), American jurist Wesley Hohfeld argued that there are four forms of right (or rights), but eight fundamental legal conceptions. This is so because rights are relations, and there are two types of relationship: correlation and opposition. The jural opposite of a right is the legal position that is necessarily excluded by having a right, so one cannot, for example, have both a privilege and a duty with regard to the same action. The jural correlative is the legal position that is necessarily imposed on another, such that if, for example, a person has a claim right, then somebody else—an individual or a group—must have a duty. Although Hohfeld talked of eight conceptions, it is easier to think in terms of four rights—claims, privileges, powers, and immunities—each bearing two kinds of relationship, opposition and correlation.

Claims

The jural opposite of a claim is a no claim, and the jural correlative is a duty. To possess a claim is to stand in a position legitimately to demand something from another person (or people). The other person is under a duty to perform the demanded action, and the clearest example is the creation of a claim right as the result of a contract (in a contract we exercise powers in order to create claims). If, for example, you buy an airline ticket, then you have entered into an agreement with the airline company that they will supply you with a seat on a specified flight, and you have a claim against them, such that were they to deny you that seat they will suffer a penalty. However, claims need not be the result of a contract—benefit theorists argue that children, for example, have claims even if they lack powers.

Privileges

The jural opposite of a privilege is a duty, and the jural correlative is a no claim. Privileges are sometimes referred to as liberties (and the correlative *a duty not to interfere*). But this is wrong. If you have a liberty to do X, all that this means is that you are under no obligation not to do X, meaning you could be forced to do X. A world in which only liberties existed would be one of pure conflict: a Hobbesian state of nature. A privilege, however, implies an area of life in which you are free to do something that is generally prohibited.

The freedom to engage in sexual acts in private would be an example of privilege rights, for these things are normally prohibited in public.

Powers

The jural opposite of a power is a disability, and the jural correlative is a liability. A power is one's affirmative control over a given legal relation to another. To be that other is to stand in such a way as to be liable to have your legal position changed. The act of marriage, as a civil legal procedure, involves the (mutual) exercise of powers. The contracting parties, through their actions, alter their legal relationship to one another and also their relationship to those outside the contract. Nobody else can marry one of the parties unless powers of annulment are first used, and the parties gain taxation benefits and so alter their relationship to the state. Although Hohfeld did not make this clear, a power operates on a different level from a claim—this is because it is through the exercise of powers that many claim rights are created and extinguished.

Immunities

The jural opposite of an immunity is a liability, and the jural correlative is a disability. To possess an immunity is to be in a position to resist the powers of others. Immunities exist, most often, where there are different levels of legal authority, such as a legislative authority, which creates and destroys rights, and a judicial authority, which upholds a constitution. The immunities created in a constitution exist to insulate the individual from the powers of the legislature: An immunity disables the legislature from exercising powers. Immunities are often misleadingly referred to as *fundamental liberties,* but must, in fact, be immunities, because liberties are not intrinsically resistant to alteration as a result of legislative action.

Conflicts of Rights

Hohfeld's scheme was analytical, meaning that his aim was to break rights down into specific forms rather than provide a theory of how rights relate to one another. The latter is the focus of *theories of rights,* which will be discussed in the next section. As a preliminary to that discussion, a few further concepts must be explored; these relate specifically to how rights are held and how conflicts between rights can be resolved.

Although claims correlate to duties, it does not follow that all duties correlate to rights. It is possible to have a *duty-based system*—that is, one in which stress is laid on the performance of a duty. For example, it is difficult to couch the right to preserve natural resources in terms of rights. We may have duties to future—that is, not-yet-existing—generations, but those duties cannot correlate to the rights of future individuals because our actions will determine who actually exists in the future. Many ecologists argue that the earth (Gaia) is of ultimate moral significance, but it is problematic to conceptualize the earth as a right holder and human beings as correlate duty bearers.

Rights often presuppose conflict, because to have a right is to be advantaged in relation to another person; but they are also the means by which conflicts are resolved. A system of rights should therefore be *compossible*—that is, there should be rules whereby conflicts of rights are settled. For example, if person A has a right to property x, then person B cannot have a right to the same property. If both A and B have legal title to the same property, then as each exercises the property right, so each violates the right of the other. Although compossibility is easy to grasp in relation to rights to physical space, it is more problematic when less-tangible goods are involved, such as speech or assembly. Certainly, speech requires apportioning time, for not everybody can speak at once, and assembly is possible only if people do not assemble in the same place at the same time. However, the media's right to report on the activities of a politician and that politician's right to have his or her reputation protected generates a conflict that is not easily resolved through the idea of compossibility. There is a conflict between different kinds of rights, rather than between the exercise of the same right by different individuals.

To resolve the conflict between different kinds of rights and also between rights and other political principles, rights may need to be *overridden.* To override a right is not to *violate* it. The former is a justified setting aside of a right, whereas the latter is a failure to fulfill the correlative act. In popular debate it is often said that "no rights are absolute." The assertion that the right to free

speech is absolute is often met with the retort that nobody should be allowed to shout "fire!" in a crowded theater. The implication being that the right to free speech can be overridden by considerations of security. However, while correct, too often this is a rhetorical move, rather than a reasoned response. To resolve the conflict between free speech and security requires moving to another level (or second order), whereby the value of free speech is weighed against other considerations. It is significant that while Article 19 of the Universal Declaration of Human Rights asserts without qualification that everyone has a right to freedom of opinion and expression, the corresponding Article 10 of the European Convention on Human Rights sets out a range of limitations on free speech. Although the convention draws its inspiration from the declaration, it is a legally enforceable code and thus requires recourse to mechanisms for overriding particular rights.

An *absolute right* is a right that can never be overridden. It is often asserted that torture should be absolutely prohibited, and it is significant that Article 3 of the European Convention does indeed prohibit torture without qualification. Absoluteness should not be confused with *universality:* A right can be universal but not absolute. There is a logical sense of universal that roughly equates to the claim that like cases should be treated alike: If two people are identical in all relevant respects, they should be treated in the same way. The more colloquial sense of universal in relation to rights is that all humans have attributes that make them equally worthy of respect, regardless of citizenship. It is possible to assert that there are universal rights—human rights—but none of the rights are absolute, meaning that every right can be overridden. What universality would demand is that any overriding of a right is applied consistently. Finally, a right may be *inalienable*. A right is inalienable if the right holder cannot extinguish—make alien—the right. Selling yourself into slavery would be a case of alienation.

Theories of Rights

Hohfeld's study was analytical: He wanted to lay out the different forms of rights. He was not interested in explaining the underlying connections between them (he thought claims were rights proper, but did not justify this). But political theorists are keen to go beyond analysis and explain how the forms come to be bundled together. Take the right to private property: Everybody possesses a power to acquire property, and in exercising that power, a person comes to acquire a claim in a particular piece of property, while in excluding others from the use of that property one enjoys a privilege. If the right to private property is enshrined in a constitution, then you also have an immunity. So the right to private property is in fact a bundle of different kinds of Hohfeldian rights.

A theory of rights attempts to reconstruct rights into a system by finding some core concept that can unify the four Hohfeldian rights. The traditional candidates for this core concept are benefit and will, the former associated with Jeremy Bentham and the latter with H. L. A. Hart (Hart is credited with identifying Bentham as the progenitor of benefit theory). Benefit theory states that to have a right is to benefit from the performance of an enforced duty, or on revised versions, to be intended to benefit. Will theory states that having a right involves being in a position to control the performance of a duty. Expressed in a less dry way, benefit theory takes rights to be the way interests are protected, which is why some theorists prefer the term interest theory. The right holder need not be in a position to assert his or her or its rights. This suggests that nonhuman animals, fetuses, and very young children could have rights, because while they have interests, they need not exercise the rights that are intended to protect those interests. The rights could be exercised on their behalf by their parents or the state; in situations where the parents are the potential violators of their children's rights, the state will exercise those rights against the parents. Will theory, on the other hand, stresses agency: Rights are things we use to control our lives. Consequently, a will theorist would be much more restrictive about who can have rights. It would be too simplistic to associate benefit/interest theory with the political left, and will theory with the political right, but it is the case that those on the left who want to express egalitarian principles in the language of rights will tend to stress interests rather than agency.

Will theory is criticized on the grounds that its conception of what it means to exercise a right is implausible: The theory seems to require that to

have a right, one must be in a position to release the correlative duty holder from the performance of his or her duty. But even mature adults have rights over which they do not have this kind of control vis-à-vis the duty bearer. This may, however, rest on a faulty interpretation of the theory. In will theory, some Hohfeldian rights are first order and others second order: People exercise second-order *powers* in order to create first-order *claims*. For example, in most liberal democracies, all adults, with some exceptions, have the power to marry, and they cannot alienate that right. In getting married, two people mutually exercise their powers to enter into a contract and in the process create claims. People who choose not marry retain their powers but create no claims. What, according to will theory, excludes animals and fetuses from this scheme is their inability to exercise powers. This does not mean that we lack duties toward animals and fetuses, but simply that those duties do not correlate to rights.

Even if the distinction between first-order claims and second-order powers is accepted, it may be argued that there are many claim rights that are not created through the exercise of powers and that cannot be conceptualized as powers. The right to free speech is neither a power nor a product of the exercise of powers, and this is likewise the case with many of the rights set out in the American Bill of Rights, the Universal Declaration of Human Rights, and the European Convention on Human Rights. One way around this problem is to distinguish between benefiting from powers and exercising powers. Hillel Steiner suggests that citizens are the third-party beneficiaries of criminal law duties, and the right bearers (more accurately, power bearers) are state officials. The difficulty with this argument is that it does not explain the reality of a constitutional state in which the state is—in Hohfeldian language—disabled, meaning that citizens are immune from have their legal position changed.

Will theory has received sharper criticism than benefit theory in part because it is an easier target. By narrowing the scope of rights—who can have rights and how they are exercised—the theory opens itself up to challenge by reference to intuitively plausible counterexamples of the holding and exercising of rights that do not fit the model of power-created claims. But benefit theory suffers from the converse weakness that it is too broad. Defining rights too widely empties them of any interest. It is likely that any mature legal and political system will be constituted by a plurality of types of principle, and we need to delineate these different principles and show where they conflict or how they might operate together.

Collective Rights, Welfare Rights, and Future Generations

Although there are important normative debates about collective rights (state sovereignty, the right to national self-determination, cultural rights), welfare rights (right to development), and the rights of future generations (intergenerational justice, preservation of resources), there are also some conceptual issues common to all three. Specifically, there are difficulties involved in identifying the appropriate right bearer and the good to which the right holder has an entitlement; and the duty that supposedly correlates to the right is frequently indeterminate. Indeterminacy is a problem because ought implies can: If you ought to act in a certain way—whether that *ought* is legal or moral—then it must be possible so to act. If you do not know what is required of you, then you cannot have a duty.

Collective Rights

Rights can be attributed to collective entities, such as firms or states, as well as individual human beings. In principle, there is no conceptual problem involved in the idea of collective rights. If the right holder and that to which it has a right can be identified, then collectives can have rights. In domestic law there are publicly limited companies, and these are termed *artificial persons,* and in international law there exist states. Difficulties arise when the right holder or the good that the right protects cannot be identified. The demand for national self-determination is often problematic because the precise territory of the putative state is unclear and there are competing groups claiming to speak for that state.

It is also difficult to claim a right to goods that cannot be individuated. If we assume the truth of man-made global warming, then all humanity (all states) will benefit from reductions in carbon

emissions—call this good a *clean environment*—but those who continue to emit will still benefit, such that a clean environment cannot be individuated. A clean environment is therefore a public good, in the sense of a good the enjoyment of which cannot be restricted to those who pay for it. What is possible is to create an internationally enforceable system of permits held by states to emit carbon; such a *right to pollute* implies that a state also has an individuated share in a clean environment.

The requirements for a collective right to exist—identifiable right holder and individuated good—have implications for debates over multiculturalism. Against the charge that a commitment to cultural diversity implies that cultures have rights over their members Will Kymlicka maintains that *rights to cultural membership* are held by individual human beings against the majority culture. Muslims should not be forced by Muslim authorities to observe religious practices, but rather individual Muslims have rights against the non-Muslim majority to practice their religion and for society to be organized in a way that such practice is facilitated so long as it does not carry an unreasonable cost to the majority. But this implies that cultural goods—analogously to a clean environment—can be individuated in the appropriate way. Maybe individual Muslims benefit from the maintenance of Muslim practice even when they choose not to be observant, such that they are free riding on the observance of others. This suggests that the Muslim community, rather than individual Muslims, is the bearer of a right to cultural membership. It should be stressed that this is not an argument for multiculturalism, but purely a conceptual point about the nature of rights.

Welfare Rights

The idea of a right to welfare raises conceptual problems parallel to collective rights: It must be possible to identify the appropriate right holder and for the duty bearer to know when the duty has been fulfilled. In 1969, the United Nations proclaimed the Declaration on Social Progress and Development, which sets out principles and objectives for international development. Defenders of the right to development maintain that there are socioeconomic conditions to the traditional so-called negative rights, such as the right to free speech, freedom of religion, association, marriage, and so on. To assess the conceptual coherence of this claim, we need to locate the holder of the right to development and the correlative duty bearer. It could be that a *state,* or a *community,* possesses the right to a certain level of resources, or that an *individual* has the right. If the individual holds the right (in Hohfeld's language: claim), then who has the corresponding duty: that individual's own state, or rich states, or the international community? If states have the right to development, then that would imply that the only relevant issue of wealth distribution is between states; whereas if individuals have the right, then the distribution of wealth within a particular state is morally relevant. The 1969 UN declaration is opaque on these points. It defines development as a comprehensive economic, social, cultural, and political process aimed at the constant improvement of the well-being of the entire population, which would imply that the right holder is the state, but it also asserts that individuals should benefit: Development requires the active, free, and meaningful participation of the citizens of a particular community.

The right to development raises a number of further conceptual problems. First, a set of rights must constitute a coherent scheme. The requirements of development may well result in the setting aside of certain fundamental negative rights; for example, a society that wishes to control urban growth may seek to control freedom of movement, choice of occupation, and the decision to have children. This may appear to be a normative question about the relative weighting of rights, but it is conceptual in that no mechanisms are suggested for resolving conflicts of rights. Second, a right to development must be actionable, meaning that a remedy can be obtained when a person complains that his or her rights have been violated, and the duty bearer must be able to determine when the duty has been fulfilled. Although in principle it is possible to draw up a set of material needs, is not easy to conceive of development as an individuated good. Development may be a good, but it is not one best advanced by use of the language of rights. It is significant that many societies have ratified laws on asylum, and largely respect those laws, but those same societies make it clear that they do not accept economic migrants.

Rights of Future Generations

By *future generations* is meant not-yet-existing people. Although some ecologists argue that the case for preserving resources and avoiding further degradation of the planet is a duty owed to posterity that cannot be correlated to any rights, many environmentalists would maintain that we have duties correlating to the rights of future generations. This argument raises similar conceptual problems to welfare rights but in a more radical form. What we do today will affect not only the life prospects of future generations but whether they exist at all.

There is a consensus that population growth is a threat to the quality of life of future generations, and the present generation has a duty to see to it that such growth is checked. But it is difficult to establish to whom that duty is owed. Imagine we have a fixed level of resources, and in future World 1 there are 5 billion people, while in future World 2 there are 20 billion people. Average (per capita) resources will be higher in World 1 and its inhabitants are, therefore, better off than the inhabitants of World 2. Does the present generation have a rights-correlated duty to bring about World 1? The problem is that one consequence of bringing about World 1 is that a large number of people will not exist. The duties of the present generation could correlate to the rights of the 5 billion people in World 1 and the duty is fulfilled by not bringing into existence the extra 15 billion people of World 2, but it is impossible to identify those 5 billion. The alternative is to say that the 15 billion have a right not to be brought into existence, presumably because life in World 2 would be intolerable. This suggests that nonexisting (never-to-exist) people can have rights. Certainly, there have been legal cases involving children who have taken legal action for having been born, thus implying that one can have a right not to be brought into existence. However, these actions have been motivated by parents acting on behalf of severely disabled children against medical authorities who are alleged to have been negligent, with the aim of winning damages.

Right and Rights

It was argued at the beginning of this entry that there is an etymological connection between the singular right and the plural rights. Etymology does not settle conceptual issues because of the genetic fallacy. However, the discussion of compossibility, with the attendant need on occasion to balance and limit rights, suggest that rights form a system, such that there is a connection of right and rights. The relationship between right and rights is important because it may not be possible to express all ethical-political relationships in the language of rights. The problem of defining a right to development or the rights of future generations was illustrative of the limitations of *rights talk*. To do the right thing is not identical to respecting a person's rights.

Natural law theorist John Finnis has argued for an intimate connection between right and rights. The plural rights, he argues, results from asserting the requirements of justice from the point of view of the person or people who benefit from that relationship. Surveying the development of the concept of right from its classical antecedent *jus,* Finnis notes that for Thomas Aquinas jus meant fair or fairness. Relationships of justice—who is owed what—are secondary. By 1610, the Spanish Jesuit writer Francisco Suárez reversed the priority and defined jus in terms of a moral power that each person possesses, and this way of thinking about justice is developed later by Hugo Grotius: *Jus* is essentially something a person has—it is a power. There is a development of rights from right. For Finnis, this takes what he regards as a damaging turn in the work of Hobbes, who argues that a person has rights in the state of nature—that is, a situation in which there is no state, or political authority: Because nobody is compelled to do anything, each is free. The state for Hobbes is the rational outcome of the exercise of these natural rights. But because nobody has any duties in the state of nature—for example, nobody is under a duty not to kill you—then we could, Finnis suggests, just as well say that there are no rights outside the state.

While Finnis accepts the post-Thomist pluralization of rights, he argues that the Hobbesian tradition loses sight of the connection between right and rights. The justification of *human* rights depends on understanding that connection. The limitations on the rights contained in the European Convention on Human Rights are significant: They demonstrate that rights derive their validity from an underlying structure of right. But for

Finnis, others' rights do not constitute the only limits: There is also reference in the convention to morality, public morality, public health, and public order. These considerations cannot be reduced to the effects on *identifiable* individuals, but are diffuse common benefits. A scheme of human rights, such as the convention, is a way of sketching a common good, which is a umbrella term for the various aspects of individual well-being in a community. What the reference to rights contributes to this sketch is simply a pointed expression of what is implicit in the term *common good,* namely that *each* and everyone's well-being, in each of its basic aspects, must be considered and favored at all times by those responsible for coordinating the common life.

Finnis's argument has implications for human rights. The catalog of rights set out in the universal declaration makes sense only within a specific cultural and legal context. This is not a rejection of universal human rights, for states can choose to bind themselves to such rights and in so doing can acquire or maintain membership in the international community of states. For Finnis, human rights are the name we give to the legal protection of goods that he maintains all cultures (implicitly) value: life, knowledge, play, aesthetic experience, practical reasonableness, sociability, religion (or equivalent secular beliefs about the meaning of life). We do not have to accept this aspect of Finnis's theory to recognize the significance of his broader conceptual point about the connection between right and rights: Rights form a system, such that alongside a catalog of rights we need secondary rules for settling conflicts between rights. Furthermore, the package of rights is just one principle among several, and doing right incorporates more than respecting another person's rights.

Robespierre, Maximilien (1758–1794)

Maximilien Robespierre was one of the principal political figures of the French Revolution. Today he is known primarily as the instigator of the Jacobin Terror (also known as the Reign of Terror) and the leader of the Committee of Public Safety. His political thought, dispersed in academic essays, pamphlets, newspaper articles, and over 500 speeches delivered in the National Assembly and at the Jacobin Club, represents one of the revolution's most influential intellectual streams.

Life

Robespierre was born in Arras to a family of lawyers. His mother died when he was 6, and his father abandoned him and his siblings, who were raised by their maternal grandparents. Maximilien attended the *collège* Louis-le-grand in Paris, where he distinguished himself in philosophy and law. After graduation he returned to Arras to work as a lawyer, soon becoming known for his altruism and for his defense of the poor and oppressed.

When the revolution broke out in 1789, Robespierre was elected to represent Artois in the National Assembly. From this time until 1793, his

political thought evolved from monarchism toward a natural republicanism that preached establishing republics on the laws of nature. The opinions of the "Incorruptible," as he was nicknamed for his austerity, accordingly changed through time: He at first defended the constitution and later contributed to its suspension, advocated religious tolerance and then sought to unify France under a single cult, began by opposing violence against the revolution's enemies and ended by articulating the ideology of the Reign of Terror. Throughout, however, Robespierre displayed an unflagging commitment to defending the cause of the people—whom he saw as inherently good, patient, and generous—against political players, whose injustice and corruption he considered to be proportional to the people's goodness.

Political Theory

The two principles central to Robespierre's political theory—regeneration and civic religion—derive from Jean-Jacques Rousseau's philosophy. Like Rousseau, Robespierre believes that virtue is not a matter of knowledge, but of sentiment, and that the true republic is made not by law, but with the character of its citizens. *Regeneration* hence implies not only replacing oppressive institutions with freedom-endowing ones, but also purging citizens' passions so that natural virtue may take root in their hearts. The sentiments proper to republican virtue, in turn, are those that the baron de Montesquieu describes as love of the polity and love of equality. Among the people, who extend themselves naturally through virtue, these loves are effortless. Revolutionary France, however, is politically republican but remains morally monarchical because the republic has innumerable counterrevolutionary enemies bent on thwarting national regeneration. For them, Robespierre prescribes terror, because in revolutionary times—by contrast with peaceable times, when virtue suffices—it is only through fear that love can be consistently elicited. Terror is therefore an emanation of virtue. Robespierre allows that this makes the French Republic tyrannical, because fear is the principle of despotic governments, according to Montesquieu. But the despotism of liberty, he argues, must struggle against the despotism of tyranny—Robespierre's twist on Rousseau's famous recommendation that citizens be "forced to be free" in the good republic.

Also like Rousseau, Robespierre believed that society could not be regenerated without religion's succor. He denounced atheism as the accomplice of royalism and the enemy of philosophy, and as a systematic form of selfishness that stripped citizens of everything apt to lift up their hearts. Hence his condemnation of the Hébertists' Cult of Reason as atheism's scandalous apotheosis, and his call for their execution. In lieu of such secular religions, Robespierre preached the Cult of the Supreme Being, based, like Rousseau's civic religion, on belief in the immortality of the soul and in a benevolent God of nature concerned with human affairs. It was Robespierre's hope that this natural religion would stimulate truth to silence the passions, and enable the stifled voice of conscience to finally speak within all. To this end, he urged his colleagues in the National Convention to internalize the divine gaze. Robespierre likewise desired that the Cult of the Supreme Being remove from each citizen everything distinguishing him from the public body—including, eventually, traditional religious beliefs. Thus, while he denounced the dechristianization campaign and aimed to spare religious opinions consecrated by time, he also thought that the Supreme Being, as sole Legislator, wrote only in hearts, and that his code was voiced most faithfully by the individual conscience.

In all, Robespierre's attempt to regenerate France through terror and religion expressed his own personal and political experience. He was sincerely convinced that he himself had achieved freedom from the passions, that he had become entirely available to virtue, and that, in consequence, his cause was one with the people's cause. His speeches intimate that he wished every French citizen to follow his example and deposit himself in society completely, thereby effacing the boundary between the private and the public, the individual will and the general will, in an absolutist consummation of Rousseau's political sentimentalism. The fact that the Festival of the Supreme Being, held on June 8, 1794, at once suspended the Reign of Terror and preceded its unmatched intensification also suggests that Robespierre viewed his new religion both as a justification and as a motor of the method of national regeneration whose excesses would soon bring about his own

downfall. For besides purifying citizens' hearts and uniting France in virtuous self-cleansing, the Cult of the Supreme Being was projected to supply to the executioners and the revolutionary tribunals the moral strength and discernment they needed to implement that "severe, prompt, inflexible justice" that Robespierre defined terror as being.

Roman Commonwealth

> *The form of our government is superior to that of all other states (civitates), because while the latter's commonwealth (res publica) was generally established by individual lawgivers through statutes and institutions, . . . ours was produced not by one, but by many talents, not over one's lifespan, but over several centuries and epochs.*

So allegedly spoke Cato the Elder (died in 149 BCE), as quoted by Scipio Aemilianus (died 129 BCE) and reported by Cicero (died 44 BCE), all three senior politicians and figureheads of the Roman senatorial order. The *Roman commonwealth*—like the Latin *res publica* and Greek *politeia/politeuma,* which it translates, a rather ambiguous term—was a major topic of debate among statesmen and philosophers in the late Republican period and beyond, until modern times. It is a concept drawing from Greek political theory (Plato and Aristotle) and designed to fit the historical development of Roman political institutions from the foundation of Rome to late antiquity. Embodying typical Roman values, the notion of res publica served as an identity marker, a rallying point, and an ideal model to be pursued and defended by the ruling elite during all of Roman history, independently from the nature of the regime in power. Roman civilization dissolved when this notion came to be regarded as no longer relevant, as its essence had been absorbed by different, separate entities, such as the Catholic Church and barbarian kingdoms. The real question is whether the Roman commonwealth had actually ceased to exist before the final dismantlement of the imperial government in the West (476 CE), as many in the fourth or fifth century would have concurred.

Treading in Plato's footsteps (*Republic, Laws, Politicus*), Cicero authored a whole treatise *On the Commonwealth* (*De Republica,* 51 BCE), which survived only fragmentarily, but is supplemented by his later treatises *On Laws* (*De Legibus,* early 40s BCE), also partly preserved, and *On Duties* (*De Officiis,* 44 BCE). Focusing on the good citizen in the best conceivable city, Cicero's definition of the notion of commonwealth can and must be reconstructed from all his writings, but the most relevant text, cited and discussed by later Christian writers such as Lactantius and Augustine, is the following: "The commonwealth is the 'thing' of the people (*res populi*), understood not as any gathering of human beings, but as the willing association of the many based on agreement over the law (*jus*) and a shared vision of the public interest (*utilitas*)." The bonding of individuals is the result of a natural disposition—Aristotle viewed man as a social and political animal—rather than necessity (*imbecillitas*). The "multitude" involved in the commonwealth is instrumental in defining what is beneficial to all, but does not imply a democratic form of government. Participation in the political process can be limited, but the benefit of the commonwealth is universal. The people (*populus*) own and/or control, directly or by delegation, the "thing" (*res*), which includes, in the context of the ancient city-state: a territory; public buildings,

including fortifications and temples; a citizen army; property of all kinds; a population composed of people of various legal, social, and economic conditions; authorities whose legitimacy was based on a "constitution" (not necessarily in a written form); and, last but not least, a purpose, the well-being of all. The purpose of the commonwealth is achieved through appropriate lawgiving, the sound interpretation of the law, the fair administration of justice, the conduct of war, the making of peace, and the protection of the rights and status of individuals. Without the common bond of law, an agreement on justice, and a social union defining the people, there can be no commonwealth because there would be no liberty. Laws and political institutions are meant to secure the happy and honorable life that constitutes the end of social life. The ultimate point of the commonwealth is its endurance, based on stability and a balanced government. It is warranted by the respect owed to those in charge of it, as long as this respect is deserved.

Theoretically, the government of the commonwealth can take several forms, as long as it is representative of the people. This is the case in a monarchy, aristocracy, democracy, or a mix of these regimes. However, each form of government presents, and inevitably develops into, a perverted variety of itself, be it tyranny, oligarchy, or ochlocracy (i.e., mob rule), in which the people lose control of political life and its centrality. Government, whatever its form, must be guided by justice, which is defined by laws, customs, and political institutions, and ultimately derives from the gift of reason and speech granted by nature. The Roman commonwealth is grounded on the principle that "each should be given what he (or she) is entitled to." The government of the commonwealth is comparable to that of a household, where the head (*paterfamilias*/*dominus*) supports and protects family members and maintains and increases its property through the proper management of human and material resources. This idea will be taken over and further developed by Seneca (died in 65 CE) in a famous letter about slavery and the relationship between master and slaves.

While Cicero offers a Roman's view of the commonwealth, combining a philosophical approach with a conventional knowledge of early Roman history, the Greek historian Polybius (wrote in the 150s BCE) looks at the concept from the outside and uses it to explain why the Roman state was able to grow from a regional power to world domination, conquering most of the Mediterranean area, over a little more than half a century, from the time of the Second Punic War (218–201 BCE) to the Roman victory over the Macedonian kingdom in 168 BCE and the destruction of Carthage and Corinth in 146 BCE. His answer points at the specificity of the Roman Constitution. Polybius regards any form of government as an organic being going through the normal life pattern of birth, rise, peak, decline, and death, the latter resulting in the replacement of one form of government by another. The history of Greek city-states provides plenty of evidence for monarchy degenerating into tyranny, aristocracy into oligarchy, and democracy into mob rule. This phenomenon is inevitable and cyclical (*anacyclosis*), leading from initial lawlessness (*anomia*) to periods of stability interrupted by transitional crises. States are thus flourishing at the time of the maturity of the regime and vulnerable at any other times. Polybius finds a solution to such a predicament in the Roman so-called mixed constitution, whereby monarchic, aristocratic, and democratic elements are active simultaneously. These various elements are embodied by the king—to be replaced by magistrates, and eventually by a *princeps*—the Senate, and the popular assemblies (*comitia*). Though each element is subjected to the natural degenerative process, it follows a different schedule, thus allowing the stability and prosperity of some to compensate for the perversion and decline of others. The complementarity and interdependence of these various elements are intentional, as illustrated by the fable of the stomach and the body limbs, supposedly told by Menenius Agrippa in a time of crisis (the secession of 494 BC) to rekindle and strengthen solidarity between the people (*plebs*) and the government (*patres*).

The history of the Roman commonwealth shows that this combination had existed right from the foundation (753 BCE). For two and a half centuries, the kings established the commonwealth by building its political and religious institutions, with the help of the Council of the Elders (Senate) who acted as their *consilium* and the popular assemblies who bestowed legitimacy on newly appointed kings. When kingship was finally perverted by the tyrannical rule of Tarquinius

Superbus, the regime was toppled by private individuals who restored the commonwealth by introducing a new form of government (509 BCE). The so-called republican constitution deviates from kingship on three major points: the king's powers are transferred to elected magistrates (consuls) and become collegial, limited in time (annual), and nonrenewable, at least not right away. This threefold adjustment was supposed to protect the commonwealth against the corrupting effects of absolute power. A system of checks and balances was established over the next century, whereby the consuls' powers over military affairs, diplomacy, expenditures, and the legislative process were diluted by the appointment of other (censors), mostly minor magistrates (praetors, aediles, quaestors, etc.), some of whom (tribunes) enjoyed veto power over the decisions of even senior magistrates. Meanwhile, an aristocratic Senate composed of former magistrates and representatives of leading families had the final say over war and peace, arbitration between states, and financial matters, and held wide-ranging judicial powers, limited only in capital cases, the preserve of popular assemblies (through *provocatio ad populum*) generally entitled to apportion honors and punishment, besides electing officials, voting statutes, and ratifying treatises. According to Polybius, Rome was not the only state to experiment with a mixed constitution, because Crete, Sparta, and Carthage had trodden the same path before. Three factors explain Rome's success in adjusting its political institutions to the changing landscape and framework brought along by imperialism: the Senate's prominence (*auctoritas*) in deliberations, the legal regulations regarding the acquisition of wealth (bribery), and the adherence to ancestral values, especially religious ones, for the sake of social cohesion. Religion remains part of politics throughout Roman history, as political and legal acts can be performed only on particular days and need prior validation from the gods, who expressed themselves through *auspicia,* or signs to be interpreted by priests, traditionally originating from the upper classes (patricians). The commonwealth rests on the unflinching respect of rulers, laws, institutions, oaths, and good faith (*fides/pistis*), in both public and private matters.

There is no doubt that despite the unifying project underlying the idea of commonwealth, the Roman Constitution, however mixed, did not promote equality before the law. The Servian "constitution" (sixth century BCE) that defined the role of popular assemblies introduced or perpetuated a system whereby the rich carried more political weight than the poor, the country folks, and the city masses. If the commonwealth was the property of its citizens, it can be suggested that the shares were uneven. Besides, a large part of the population had no political or even legal existence: slaves, foreigners, women, minors, and dependents. But the commonwealth had an early history of inclusiveness, repeated later on with the extension of political rights to plebeians, allies, provincial elites, army auxiliary troops, and eventually the whole population of the empire (*Constitutio Antoniniana* of 212 CE). There is little doubt, however, that this apparent generosity and open-mindedness was concealing an urgent need to extend the pool of taxpayers and liturgists. Freedmen on the other hand, who acceded to full citizenship on manumission in earlier times, saw their condition worsen in the Augustan period (*lex Aelia Sentia*, 4 CE), as they were then usually granted only second-class citizen status (*Latini*) or worse (*dediticii*), with some exceptions.

The successful initiators of the change from kingship to republic (509 BCE) and from republic to empire (31 BCE) claimed to have restored the commonwealth, thus underlining its independence from the form of government. During the early imperial period (31 BCE–285 CE), the commonwealth, like one body commanded by one mind, in the words of Tacitus, was represented by a first citizen (*princeps inter pares*), who embodied the law (*nomos empsychos/lex animata*) and who acted as the moderator of the state, warranting civil peace through the concord of the orders, providing for the safety and integrity of the empire, and protecting the dignity (*dignitas*), liberty (*libertas*), and greatness (*maiestas*) of the Roman people. The emperor's powers rested as much on a formal delegation from the people (*imperium proconsulare* and *tribunicia potestas*) as on his own commanding personal aura (*auctoritas*). Imperial succession turned out to be a recurrent problem because no agreement existed on how to decide between competing claims to the latter, whether it was expressed by the dying emperor, his entourage, the Senate, the army, or any other influential

political group. Chosen emperors could subsequently enhance their auctoritas by working on their *clementia, benignitas, beneficentia,* and *humanitas*. On several occasions, the commonwealth was put at risk, and it nearly melted down in the third century CE because the rapid turnover did not allow this to happen. This political problem was compounded by the fact that the religious unity of the commonwealth was constantly challenged by the introduction of foreign religions. The assimilation of some of them, combined with the development of the imperial cult, proved an unsatisfactory response to the appeal of Christianity. While distancing itself from the exclusiveness of Judaism—a commonwealth of its own (*politeuma*) uniquely described as a theocracy by Josephus in the late first century CE, but more akin to a hierocracy—from which it derives, Christianity shared the universalism of cynic and stoic doctrines, and promoted the idea of an all-encompassing commonwealth, within, without, or even, if necessary, against the traditional framework of the Roman state. The latter reacted first with an attempt at repression or suppression (with the large-scale persecutions of the mid-third and early fourth centuries) and finally realized that the survival of the Roman commonwealth had to go through its integration within the church. The latter history of the Roman commonwealth (fourth and fifth centuries CE) is concerned with the question of which entity, the state or the church, represented the people. The eventual victory of the church spelled the demise of the state. The process was facilitated by the political division of the empire into two parts, broadly along language lines, tentative during the Tetrachic period (293–305 BCE), and permanent after 395 BCE. In the early fifth century, one major Latin political thinker, Augustine of Hippo (died in 430 BCE) produced a wide-ranging work *On the City of God,* in which he proposes a powerful alternative model to the traditional one, in which no commonwealth can exist without justice, and no justice without God. The subsequent generations may have missed the implementation of the former, but certainly witnessed the obsolescence of the latter.

Roman Law

The legal history of the Roman Empire is commonly divided into the following five periods: archaic period (753–250 BCE), preclassical period (250–27 BCE), classical period (27 BCE–284 CE), postclassical period (284–527 CE) and Justinianic period (527–565 CE). These periodizations cut across conventional historical classifications of Roman history, such as republic and empire, but are nonetheless useful in describing changes to Roman law.

Little is known about archaic Roman law. According to Greek and Roman historiographers, the city-state of Rome was ruled by seven kings from its mythical founding in 753 BCE by Romulus and Remus until 510 BCE when the last king, Tarquin the Proud, was expelled by the populace. Almost nothing is known about the law of the monarchy. Pomponius, a jurist of the classical period who wrote a treatise on the origins of law, hypothesized that the seven kings of Rome produced statutes (*leges regiae*) from which the most revered of Rome's political institutions, such as the

Senate, drew their authority. Modern scholars have questioned the historical accuracy of this account and it is widely accepted that Roman law, in as much as it existed during this early period, must have been largely customary and unwritten. It is also generally assumed that the law was not strictly separated from religion. Tarquin the Proud was said to have been expelled on account of his savage treatment of the populace and his moral corruption. Following this popular revolt, the Roman people collectively decided to replace the monarchy with a republic. The power of the king would be divided into two equal parts to be shared by two elected officials, the consuls, who each had the right of veto over the decisions of the other. The consulship, an annually elected office, would be supported in its decision making by the Senate, a council of elders drawn from the foremost citizens in the republic.

The early years of the republic were turbulent. The Roman people were divided into two distinct classes, plebeians and patricians. A common complaint raised by the plebeians during this period was that too much political and religious power resided with the patricians. At the same time, Rome was engaged in many skirmishes with its rivals on the Italian peninsula and the military burden often fell on the plebeians. The plebeians expressed their frustration with this state of affairs through threats to secede from the fledgling Roman state. Matters finally came to a head in the first part of the fifth century BCE when the plebeians demanded that the unwritten law be redacted and publicly displayed. According to the Roman historiographer Livy, a commission of 10 men was chosen to travel to Athens to investigate the Laws of Solon with a view to creating a similar collection for Rome. On their return, the constitution was suspended and these men were given supreme authority to draft the laws. They succeeded in drafting 10 tables of laws before their governance descended into anarchy. The commission was replaced and the task was completed. It is said that the final text of this law, later known as the Twelve Tables, was publicly displayed in the forum for all to see. The text of this law has not been preserved, but many Roman writers of later periods quote passages from it. Modern scholars have therefore been able to reconstruct it, though certain lacunae remain. This reconstruction has led scholars to speculate that the Twelve Tables was not a codification in the sense that it completely replaced all existing customary law. Rather, it was merely a collection of the more controversial areas with a view to provide greater clarity. Much of Roman law continued to be customary. Although (some of) the law was now known to the populace, much of it remained in the hands of the college of pontiffs (priests and custodians of the state religion), one of whom was elected to provide citizens with legal assistance.

It was not until about 150 years after the publication of the Twelve Tables that the monopoly of the pontiffs over legal interpretation was effectively destroyed when a scribe to one of the pontiffs stole information about the different legal processes available to litigants and the days on which the courts were open for business and published this. Within 4 years thereafter (and perhaps as a result of this) an act was passed, the *Lex Ogulnia,* that enabled plebeians to be elected to the college of the pontiffs. This triggered the development of what would in time become known as a class of jurists—a key factor in the development of Roman law. Roughly 26 years before, in the year 326 BCE, an important change in the administration of Roman justice had occurred. According to the traditional account, it was agreed that the administration of justice would be removed from the office of the consul to permit it to deal with larger matters of state. To that end, the office of the praetor was created. Initially, this office had limited effect on legal change, as the system of procedure used in Roman courts did not permit much adaptation. At the same time, following the successful conclusion of the Punic Wars, foreigners started to settle in Roman territories, thereby necessitating the creation of a second praetorship to deal with legal disputes involving foreigners. In time, the streamlined process used in the court of the peregrine praetor became attractive to Roman citizens who still had to use the highly formalistic system of procedure in the court of the urban praetor. This presumably led to forum shopping and eventually led to the enactment of the *Lex Aebutia* in about 150 BCE, which permitted this new form of legal process, the formulary process, to be used by Roman citizens.

During the same period, a class of jurists emerged. At first, the jurists were mostly patricians

who felt it part of their civic duty to provide citizens with legal advice, but toward the end of the republic jurists came from all classes. Another important emerging theme in legal development during the latter part of the republican period is the extent to which the legal activities of the praetor began to shape the law. By virtue of his edict, in a statement of legal principle produced at the start of his term in office, drafted on advice from jurists, the praetor set out rules and formulae that could be used by parties in legal disputes. This had a profound impact on the development of Roman civil law and his edict continued to be the dominant force of legal change until the advent of the principate under Augustus. Before this can be explored, a few words about the end of the republic are required. One of the most personal and intimate accounts of this period may be found in the various works of the great orator, Cicero, whose entanglement in the cut-throat politics of the day eventually cost him his life. Cicero's letters, philosophical works, and written accounts of his most important court appearances also provide modern scholars with a mine of information concerning legal practice in the late republic and the relationship between the professions of the jurist and that of the orator.

The constitutional change brought about by the collapse of the republic does not seem to have had much of an effect on Roman law in the short term, though in two important respects the Roman system of justice came under imperial control. First, Augustus introduced a system of regulation on the profession of the jurists. Certain eminent jurists were granted the right to give public responses (*jus publice respondendi*), which rendered them more authoritative than responses by ordinary jurists and which could be used as persuasive authority in a court of law, especially where the majority concurred. This system of granting licenses continued at least until the reign of Hadrian, after which it seemingly fell into disuse. At the same time, Augustus also introduced tribunal hearings for some of the offices of state endowed with jurisdiction in private law matters. These hearings (*cognitiones*) would in time revolutionize the system of procedure used in Roman civil courts.

The classical period of Roman law, from the reign of Augustus to that of Constantine, is characterized by a number of important legal developments. First, it was the golden age of the jurists, who became the major driving force for legal development. The reasons for this are twofold. On the one hand, the authority of the praetor to change the law through his edict was slowly eroded by the sheer size of the document brought about by the practice of incorporating the bulk of the predecessor's provisions into the next edict. On the other hand, it is clear that very few new measures were introduced into the praetorian edict by the first century CE. It was eventually enacted as a finite statutory text in 132 CE. Another defining feature of classical Roman law is the level of intellectual abstraction achieved by the jurists. This period witnessed a substantial growth in the quantity and type of juristic writing. By the middle of the classical period, the system of procedure had been replaced by the *cognitio* process. This affected the activities of the jurists and the role of the praetor. Toward the end of the classical period, a recognizable change in the relationship between jurists and the state is visible. It is conventionally agreed that the last of the named classical jurists, Modestinus, flourished during the latter part of the third century CE. This does not mean that the profession of the jurists had ceased to exist by this time. Rather, as the principate transformed into the dominate, jurists increasingly came under imperial control and operated as bureaucrats.

The period between the death of Constantine and the division of the empire into East and West under Diocletian in the fourth century CE is conventionally described in terms of decline. Strict imperial control of the administration of justice combined with an unstable political period led to legal decline. Not much is known about the state of Roman law during this period, apart from references to a number of unofficial "codes" of imperial law. Much of Roman private law must have remained as described in the works of the jurists of the classical period. The final official code of imperial law produced in the Western Empire before its collapse in 476 CE was the Theodosian Code (429–437 CE). This code contains a wealth of information about the legal preoccupations of the ailing Western Empire. Given that Theodosius was planning to produce a separate code of private law (a project that never came to fruition), the Theodosian Code contains surprisingly little about Roman private law apart from the Citations Act,

an imperial rescript setting out the use of the works of the five great classical jurists as authority in a court of law.

The next major event in the development of Roman law occurred after the Western Empire had disbanded into the protomedieval kingdoms of Western Europe. In 527 CE, Justinian became the emperor of the Eastern Roman Empire. He was an ambitious figure who had been, for some time before the death of his uncle Justin I, in effective control of the empire. Justinian formulated two great aims for his reign. The first was to recover the western part of the empire from the "barbarians" and, most notably, to reconquer Italy. Second, he wished to transform the masses of confused Roman law into a system that could be used both for the academic teaching of law and for legal practice. To that end, Justinian instructed a commission to begin reviewing all of the imperial rescripts produced from the time of Emperor Hadrian. These were arranged by subject into titles, and within each title the various applicable rescripts were to be arranged from earliest to latest. The various titles were collected together in 12 books and published as the *Codex*. Justinian thereafter turned his attention to juristic law.

As an important source of legal doctrine, Justinian gave priority to the clarification of juristic law. The commission of 17 men, headed by the minister of justice, Tribonian, was instructed to work through roughly 2,000 books written by 38 prominent jurists of the classical period (first–third centuries CE), all of whom had been awarded the right to give public responses. The content of these books had to be examined and redacted into titles on specific subjects. In each title, snippets from these works were included to form a coherent account of the law on that subject. Each snippet was numbered and the original author and work from which it was taken were included. Titles were arranged into books following the order of the codified praetorian edict and the entire work, consisting of 50 books, was named the *Digesta*/*Pandecta*. The aim of this work was to be an anthology of intellectual thought on Roman law that could be used by both academics and legal practitioners. Although this project was expected to take at least 10 years to complete, the commission completed it in 3 years. Many reasons for this have been proposed, ranging from the existence of a pre-Digest to the use of subcommittees staffed by bureaucrats. The most plausible reason may be that the original works were divided into three groups, and members of the committee dealt with specific groups.

Although Justinian had originally intended the Digest to be used both for legal practice and for academic teaching, it soon became apparent that it was too voluminous and intellectually too advanced for first-year law students. Thus, another commission was instructed to create a textbook of first principles, the Institutes, which could be used for the teaching of law in conjunction with the Digest and the Code. The commission chose to base this textbook on an existing textbook compiled during the mid-second century BCE by a relatively unknown jurist called Gaius. The reasons for this choice remain unclear, but Gaius's textbook had a number of unique selling points. First, Gaius was clearly interested in history, and therefore included in his textbook a great deal of information about the historical development of Roman law. Second, this book, though physically divided into four (unnamed books), was intellectually based on a soon to be famous trichotomy of private law, namely, that all of private law may be divided into people, things, and actions. This taxonomy, known to history as the Institutional Scheme, would in time have a significant impact on the development of law in Western Europe. On its completion, this textbook was given the singular honor of being enacted in law as the official textbook for teaching Roman law at the law schools of the empire. By this time, the *Codex* had become outdated and a commission was instructed to update it. This project was completed within a few years, and the product was officially called the *Codex* (the earlier version was from then on referred to as the old *Codex*). Modern critical editions of Justinian's project of legal reform also include the Novels. These were additional imperial rescripts collected after Justinian's death.

Roman law has had an enduring influence on many aspects of law and society in Western Europe. In the field of law, the significance of Roman law brought about by the rediscovery of Justinian's *Corpus Juris Civilis* in Italy in the eleventh century cannot be denied—first, when all the world was Rome at the height of the Roman Empire, and thereafter, when it provided the building blocks for

the legal systems of Western Europe in the late medieval period.

ROMANTICISM

Romanticism was a rich and complex body of philosophy, literature, and art that originated in Europe in the late eighteenth century. Some of its central figures included the English poets and literary theorists, William Wordsworth (1770–1850) and Samuel Taylor Coleridge (1772–1834), the French philosopher Jean-Jacques Rousseau (1712–1778), and the German poets and philosophers, Friedrich Hölderlin (1770–1843), Friedrich Schlegel (1772–1829), Novalis (1772–1801), and Friedrich von Schiller (1759–1805), among others. Romantic thought had an impact not only on nineteenth-century English and European culture, but also on nineteenth-century American thought through the work of Henry David Thoreau (1817–1862) and especially Ralph Waldo Emerson (1803–1882).

Two of the most influential texts of romanticism were William Wordsworth's "Preface to *Lyrical Ballads*" (1801) and Immanuel Kant's *Critique of Judgment* (1790). Although Kant was not a romantic in the strict sense but rather the leading philosophical voice of the Enlightenment, this particular text had an enormous influence on romantic thought. It became the basis for thinking about and overcoming, one way or another, various philosophical dichotomies: for example, the dichotomy between subject and object, fact and value, freedom and nature, self and other. Wordsworth's "Preface" to the collection of poems published by himself and Coleridge, *Lyrical Ballads* (1798), took up these same concerns, but cast them as challenges to romantic writing, especially literature, which, when successfully met, would envision a form of expressive freedom that could be realized under conditions of modern life, and through which the limitations of modern life could be overcome.

Resurgent Romanticism?

For most of the recent century, romanticism has been an often maligned and just as often misunderstood philosophical, artistic, and political phenomenon. It has been variously identified with repressive forms of communitarianism and nationalism, with kitsch and cultural conservatism, and with the aestheticization of politics and the depoliticization of art. Antimodern, antidemocratic, quietistic, narcissistic, masculinity—the list of romanticism's various sins can be long indeed. Given its many egregious sins, what can explain the resurgent interest in German and American romanticism today? The complex picture of romanticism (and its unrealized possibilities) that one finds in the work of Stanley Cavell, Charles Taylor, Richard Rory, Dieter Enrich, Manfred Frank, Richard Eldridge, and a number of other important contemporary scholars does not easily conform to the received view of romanticism as an exhausted and suspect set of responses to the modern world.

Perhaps, this resurgent interest in romanticism can be viewed as just another passing academic fashion, in today, out tomorrow. More generously, the resurgent interest in romanticism might signal something else—the decline of confidence in "modernist" modernity, and so indicative of an interest in retrieving long neglected or misunderstood possibilities for living modernity's form of life—living it less rigidly, less destructively. This, of course, was the original impetus of early romanticism when it was channeling the intellectual energies of Rousseau and Kant, and the political energies of the French Revolution and the Enlightenment.

Surely, one could object, we are not now living in a "romantic" age. Whatever might be percolating in the minds of scholars, we are not living in

the 1790s, when even the horrors of the French Revolution could not dampen the radical hopes of the young romantics.

The future, too, is different, dramatically less capable of bearing radical hopes, were any to be articulated convincingly. Is romanticism even possible in a skeptical, doubt-ridden age such as ours? Why not accept that the time for romanticism, for better and for worse, has passed? Why not just let it fade into the sunset, and deal realistically with the world *we* face, making the most of the possibilities *our* historical circumstances allow? What need could romanticism answer today?

As Cavell, Taylor, and others have suggested, a *reinserted* romanticism might provide us with a richer evaluative vocabulary than we now have, one that might make it possible for us to say yes or no to modernity, to the present, to the future, in more complex and nuanced ways. And so the resurgence of interest in romanticism could be construed as part of a growing realization that it may be unwise as well as self-contradictory to live modernity's cultural and political forms of life unromantically. We might also find that we are not so far removed from romanticism as we tend to believe.

Reinserting Romanticism

It can be said that a doubt-ridden, skeptical age such as ours finds it especially difficult to imagine a future different from the past, a future we might wish somehow to realize, to see as responsive to our genuine needs. To imagine the future in this way is, however, to hold on to the possibility of certain forms of cultural and political change that are simply inconceivable apart from our romantic understanding of such change and our romantic need of it. So long as one aspires to a kind of change in which one sees oneself differently, sees the problems one confronts differently, and sees the world differently, then one is bound and answerable to the demands of romanticism. What is demanded, in spite of all the obstacles and constraints, in spite of the improbability and possible futility of it all, is to find and found new ways of looking at things, new ways of speaking and acting, new kinds of practices, and new kinds of institutions. Anyone who thinks such change is as necessary as it is improbable, whatever their view of "romanticism," is undoubtedly a romantic.

A critical vocabulary that thinks it must renounce romantic notions of change and transfiguration will find itself hugely incapacitated, existentially, not just theoretically. Romantics have given us good reason to doubt that justice without transfiguration is possible. Neither justice nor transfiguration can be achieved merely by providing "good arguments," by designing the right normative procedures, or by reforming existing legal and political institutions. Conventional arguments, however "good" they might be, cannot cast our problems in a new light, nor can they adjust the light so that we can see ourselves and the things that matter to us in a new way. By lending themselves to the creation of these necessarily new ways of speaking and acting, political theorists and not just artists and writers respond to, and occasionally meet, the demands of romanticism.

So what *is* romanticism if it is not what we have thought it was? We should see romanticism as a distinctive tradition of thought that originates in, and continues to be informed by, German romanticism and German idealism. But it is broader and more heterogeneous than either of these, encompassing a wider range of concerns and positions, the nature of which makes it difficult to prevent from becoming entangled with one another the questions of political philosophy, aesthetics, ethics, language, and epistemology. It is a tradition that, in the course of its transmission from one generation to the next, is not even passed on as or in the name of romanticism. This is understandable, given what romanticism came to mean. Nonetheless, there are certain defining romantic concerns and preoccupations that link early German romanticism with Emerson and Friedrich Nietzsche, with Martin Heidegger and John Dewey, with Ludwig Wittgenstein and Hans-Georg Gaudier, with Michel Foucault, Cavell, and Taylor, to mention only a few of the prominent voices of a distinctive "philosophical romanticism" that belongs to and informs a conception of political theory as practical philosophy.

A Response to Enlightenment Modernity

Most obviously, romanticism is a critical response to the Enlightenment interpretation of modernity, not just by making that interpretation problematic, but also by making modernity itself a

central, if not *the* central, philosophical problem of the age. This means looking at "philosophical" problems as both responding to the problems of modernity and as implicated in them—as responding to and implicated in living modernity's form of life. Under what conditions, and in what form, can the modern ideals of autonomy, reason, critique, and expressive subjectivity be lived successfully–lived, that is, without reproducing the standard list of self-defeating consequences (e.g., fragmentation, anomie, the leveling of meaning, loss of freedom, self-crippling forms of skepticism, etc.)?

In conformity with the concerns of early German romanticism, Stanley Cavell has tried to reformulate these problems as the "aesthetic problems of philosophy. The "unity" of these problems is not to be found in specific theoretical positions or formal procedures, but in the family resemblance each bears to the others. From the other direction, J. M. Bernstein has proposed treating the aesthetic problems of philosophy as the aesthetic problems of modern society. In doing so, we find that what we are ultimately dealing with is philosophy's *and* modernity's suspicious and anxious relation *to* the aesthetic. From the perspective of the latter, calling the problems of modern philosophy and modern society "aesthetic" problems typically provokes the suspicion that romantics are in the grip of some aesthetic ideology that cannot but misrepresent and thereby distort problems whose modernity is such that they cannot possibly be captured in aesthetic categories. This was precisely Georg Wilhelm Friedrich Hegel's point in his lectures on aesthetics: The problems of the modern world were sui generis, and certainly too complex to be grasped in aesthetic categories. Modern social life and modern political institutions simply exceeded the conceptual grasp of aesthetic categories, be they of modern or classical provenance.

Nonetheless, romantics emboldened by Kant's compelling articulation of the aesthetic problems of philosophy in the *Critique of Judgment* took them also to reveal the aesthetic problems of modern society, problems that had to be grasped in aesthetic categories, for there were no other categories in which they could be grasped. To grasp them in this way was also to see how the aesthetic has become an urgent but repressed problem for philosophy and modern society.

The Nature of Philosophy

Insofar as it understands itself as responding to the conditions of modernity, romanticism takes the question of what philosophy is or what it should be as a question defined and shaped by those very conditions. So the met philosophical question of what philosophy is or should be is inseparable from what it means to be modern, from the question of what constitutes the modernity of philosophy. In being responsive to the conditions of modernity, philosophy would be seeking to make sense of the conditions of its own possibility. To make sense of those conditions is to make sense of its own calling, and so the obligation to make sense of its own time is internal to the possibility of philosophy. Political theory insofar as it understands itself as a part of political philosophy cannot evade the force of this question, and of its own relation to modernity.

As a protean form of life, open to abrupt, incessant, and apparently uncontrollable processes of change, modernity is also a disorienting form of life. The more responsive political philosophy is to the conditions of its own modernity, the more unsettled its identity will be. The more unsettled its identity, the more pressing the question of the *form* in and through which political philosophy should express itself. Although this kind of self-questioning is seen as one of the preoccupations of "continental" political theory, it is not something that the "analytic" side of the discipline can simply offload to its "continental" cousin, because it must take certain features of Enlightenment modernity uncritically for granted, not least of which is the form of writing and expression appropriate to political theory. Thus, the question of voice, or the search for voice, becomes a central concern.

Once the search for a voice of its own is regarded as internal to the activity of philosophy, it becomes both more difficult and less necessary to defend some pure form of philosophical argument as the proper (and only) "voice" of philosophy. So the line between "narrative" and "apodictic" forms of argument, and between argumentative speech and "world disclosing" speech will be happily and necessarily blurred, allowing the emergence of nonstandard and pluralistic forms of arguments. Transcendental, dialectical, hermeneutic, deconstructive, genealogical, and narrative forms of argument all take the form they

do because what needs saying or showing cannot be said or shown any other way. That is why Emerson, Heidegger, Wittgenstein, among others, "argued" as they did. Ultimately, the purpose of such arguments is to get us to see things in a different light, and that light can shine only when a new perspective is made available to us.

This in turn redefines the task of political theory romantically understood: Its job is not primarily to offer normative justifications for an idealized social order, but to enlarge the cultural conditions of intelligibility and possibility and thereby open the horizon of the future. Because it is especially sensitive to the tendency of the life forms of modernity to become rigid and inflexible, to become unresponsive to the need for new ways of thinking and acting, romanticism thinks philosophy can play a role, albeit a necessarily modest role, in facilitating normative and cultural change. In this sense, to "romanticize" the world is to make room for the new, to make room for new possibilities that would otherwise be foreclosed.

Receptivity

Romanticism's emphasis on the new might provoke the ever-present worry that politics will become indistinguishable from aesthetics, but if one accepts that politics is "aesthetic in principle," then one comes to see the possibilities of political life in a new and richer way. In any case, the new is not something we will, something we can make happen; it is something that we "let" happen. Receptivity, as Emerson, Heidegger, and Cavell have tried to show, is essential to "making" the new possible—receptivity to the present, to the difference between today and yesterday, receptivity to as-yet-undisclosed possibilities.

For philosophical romantics, thinking about receptivity in this way also invites a reconsideration of our inherited conceptions of agency. The more we emphasize the positive role of receptivity, the more we stress the embodied nature of human agency and its historical and cultural dependencies, the less likely are we to make mistake mastery for agency. We will come to see agency as a matter of what we reflectively let ourselves be affected by rather than a matter of exercising control over what we encounter.

Romanticism and the Everyday

Contrary to the popular but erroneous view, romanticism does not take flight from the everyday into some extraordinary dimension; it seeks to reclaim the everyday as the site where the ordinary and extraordinary are at home together, where they animate one another. Romanticism has a special interest in the everyday, not just as it now is, but as it might one day be. Because the everyday is where all that has gone wrong with modernity is most deeply felt, and where its effects are most devastating, the everyday is where the recovery must begin. For such a new world to arise as a world that we can realize, it must first be prefigured in "every-day appearances," attentively perceived and made visible, as William Wordsworth put it in *The Prelude:*

> *Not in Utopia . . .*
> *Or some secreted island, Heaven knows where!*
> *But in the very world, which is the world*
> *Of all of us,—the place where, in the end,*
> *We find our happiness, or not at all!*

That is why romantics from Wordsworth to Heidegger, Wittgenstein, and Cavell worry about the threatened state of everyday language and the leveling tendencies of everyday life. And that is why they regarded their tasks as writers as requiring them to bring about a recovery of the everyday by regaining contact with the semantic sources of everyday language and life. Once a writer makes this task her own, she becomes vulnerable to the worry that the semantic sources on which this recovery depends will become depleted before it can even take place. That worry is fueled, of course, by conditions of (capitalist) modernity that promote a flight from the everyday into the "extraordinary," and an experience of the "extraordinary" that is made possible by the narcotic stimulants of consumer culture.

Recovering Nature

As with early romanticism, contemporary romanticism continues to be preoccupied with the problem of how to recover nature as a source of meaning and orientation. That romantic idea, more

than any other perhaps, seems to be completely out of place in a disenchanted universe, governed by physical laws, and devoid of any intrinsic meaning. However, given the now widely recognized threats to the natural world that human intervention has raised to near-catastrophic proportions, a renewed concern with transforming our relation to the natural world and the "nature" within us would bring this long-standing romantic concern back into its proper place within the modern world.

Freedom

While all of these concerns help to individuate romanticism and distinguish it from its more "vulgar" forms, there is one overarching concern that distinguishes this "tradition" from all other traditions of modern thought, and that is the concern with realizing a form of *freedom* that conditions of modernity make possible and thwart at the same time. Reducible neither to negative nor positive freedom, it is not an individualistic form of freedom that aspires to a state in which one is able to recognize one's words and actions as one's own, as *spontaneously* originating from oneself. A lot hangs on how we understand "one's own" and "spontaneously originating from oneself," which is why so much of this philosophical tradition is equally preoccupied with the corresponding and complementary relations of dependence that would make it possible to recognize one's words and actions as one's own (relations of dependence to which the normative ideal of receptivity is closely tied). What kinds of social and political relationships, call them positive dependencies, allow one to recognize one's words and actions as one's own? Can we lead lives that are "self-determining" without being "self-alienating"?

But because this form of freedom must also be spontaneous, capable of initiating a self-determining new beginning, the need for which will be ineliminable, romanticism is just as much preoccupied with the question of what it means to begin anew. In what sense can a new beginning be an expression of freedom and agency? Because the freedom of new beginnings will always be in productive tension with the social relations, cultural practices, and political institutions from which we derive our identities and sense of ourselves as agents, the degree to which we are able to recognize our words and actions as our own will be provisional at best, and the forms of recognition on which we rely are permanently subject to new normative challenges. And that is why romanticism is also sensitive to time and makes attunement to time a prerequisite of understanding freedom and politics.

No matter how carefully attuned we are to the historical conditions under which we think, judge, and act, the fact that such attunement is fleeting and partial means that all our judgments are inescapably time bound and time imprinted. This does not mean that we have to accept Paul de Man's stoic skepticism about the very possibility of historical knowledge, which skepticism must dogmatically presuppose not that history has come to an end, but that it never began. It does mean, however, that we have to temper our urge to speak in the voice of authority about that over which we cannot claim authority. As Emerson wrote in his 1841 essay "Circles" (Essay 9 in *Essays,* first series), "Our life is an apprenticeship to the truth that around this circle another can be drawn."

Emerson's words are meant to temper our desire to speak with authority about that over which we cannot claim authority. They were meant to outline a possible way of life—a way of life in which criticism is compatible with critical uncertainty, with the romantic consciousness of multiple and "infinite" perspectives.

The Critique of Romanticism

Certainly the view of romanticism presented here is not the view of romanticism held by influential political thinkers such as Hegel (1770–1831), Carl Schmitt (1888–1985), and Jürgen Habermas, who, in spite of the differences that divide them philosophically and politically, have made romanticism the object of remarkably similar, vehemently expressed criticisms; criticisms that seek to portray romanticism as something that is incompatible with modern politics, neither with conservative nor liberal-democratic politics. Indeed, they have gone out of their way to do so. Why?

For the controversial German legal scholar and political theorist Carl Schmitt, romanticism is essentially and unavoidably an apolitical phenomenon. It succeeds only in exposing the shallow and rootless subjectivism that is at the basis of modern liberalism. Its only value to the political theorist is

in the perspicuous contrast it provides to what real politics requires, which is precisely what romanticism seeks to avoid and defer at all costs: decisions and actions. For Schmitt, to "romanticize" is to aestheticize, in the most pejorative sense of the term; to turn the whole of culture and the entire sphere of human relationships into an occasion for thrill seeking self-experimentation and vacuous self-creation. The romantic takes pleasure only in the play of surfaces, and leaves social reality just as it is. He or she prefers to remain a detached, ironic observer of the social world, from which he or she withholds any normative commitments and to which he or she denies any binding obligations. Romantic freedom is nothing more than an aestheticized form of negative freedom that exalts the visionary and creative powers of the (typically male) subject.

This critical view of romanticism was first articulated in Hegel's critique of romanticism in the *Phenomenology of Spirit* (1807), especially in the discussion of the "beautiful soul," and in the critique of romantic irony in his lectures on aesthetics from the 1820s. In *Political Romanticism*, first published in German in 1919, Carl Schmitt restates this criticism (without any mention of Hegel), in order to say that the romantic subject treats all objects (people, things, circumstances) he encounters as mere "occasions" for expressing his constrained imagination.

Hegel's critique of romantic irony is elaborated vividly and powerfully in Søren Kierkegaard's (1813–1855) depiction of the commitment-averse romantic aesthete in part one of *Either/Or* (1843) who refuses as a matter of principle to acknowledge any demands that arise outside the self. Schmitt argues that romantic aestheticism should be seen for what it truly is: the apotheosis of modern liberalism. Thus for Schmitt, it is a mistake to identify romanticism with conservatism. Rather, its intrinsically apolitical character should be regarded as a symptom of the decay of liberal political culture in general. Romanticism is essentially passive in orientation, refusing commitments, decisions, and constraints of any kind, which therefore makes it politically useless and ineffectual, the antithesis of the political and a threat to it, as well.

In *The Philosophical Discourse of Modernity* (1987), Habermas produces yet one more iteration of this two-centuries-old critique of romanticism, updating it to encompass its most recent manifestations: poststructuralism and neo-Heideggerianism, as articulated in the work of Jacques Derrida, Cornelius Castoriadis, Foucault, Taylor, and others. Both Schmitt and Habermas believe that the two great errors of romanticism are: (1) the absolutization of the aesthetic sphere, violating the autonomy of the political, and (2) the valorization of the extraordinary at the expense of the everyday. Habermas, for his part, tries not so much to detach romanticism from liberalism as to contain it in its proper sphere—the sphere of autonomous art. Art and politics constitute two independent and autonomous spheres of culture (in Weber's sense), whose integrity depends on respecting each other's independence and autonomy. Thus, Habermas's strategy is intended to secure the proper limits of the aesthetic sphere at the same time as securing the autonomous domain of politics.

In recent years, the limitations of this approach to making sense of modern political life have been exposed by various theorists. For example, Jacques Rancière has suggested that it is a mistake to separate the aesthetic from the political, as though the former is incommensurable with the latter. Moreover, argues Rancière, politics is "aesthetic in principle." The idea that there is a form of speech, call it argument, that is distinctive to politics, and a form of speech, call it "poetic" or "world-disclosing" speech, that is distinctive to aesthetic modes of making and acting, and that these two types of speech define and delimit autonomous domains of action, involves a failure to recognize the interdependence of these forms of speech, on whose interdependence the political depends. For there to be a political dispute about some object, for there to be an argument over its status and its claims, both the object and the "world" in which that object finds or seeks to find a place must be disclosed—that is, opened up as a disputable object, and that requires a form of speech that is prior to the arguments made for or against that object. It requires, "poetic" or "world-disclosing" speech through which, as Hannah Arendt stated in "What Is Freedom?" something is called into being, "which did not exist before, which was not given, not even as an object of cognition or imagination, and which therefore, strictly speaking, could not be known."

Rousseau, Jean-Jacques (1712–1778)

Jean-Jacques Rousseau was the author of several major works in political philosophy, including the *Discourse on the Sciences and Arts; The Discourse on the Origin and Foundations of Inequality; On the Social Contract,* and *Émile, or On Education.* His gifts, however, were many, and his achievements were not limited to philosophy: Rousseau's opera, *The Village Soothsayer,* delighted the royal court and the public; his romantic novel, *Julie, or the New Héloise,* became an instant and enduring bestseller; and his autobiographical works, particularly the *Confessions and Reveries of the Solitary Walker,* pioneered an entirely new approach to self-revelatory writing. Rousseau's contemporaries regarded him as a man of paradoxes, as he was: a son of the Enlightenment who denied the possibility of moral progress and celebrated the republican heroes of classical antiquity, a playwright and composer who denounced the theater, a lover of virtue who could not live up to the severe moral principles he professed, and a citizen estranged from his city. Nevertheless, he insisted that there was an underlying unity to all his works, and though this claim has been doubted, the preponderance of recent scholarship accepts Rousseau's contention and seeks to demonstrate the intellectual coherence of his social thought.

Early Life and Education

Jean-Jacques Rousseau was born on June 28, 1712, in the city of Geneva, which was then an independent, self-governing republic and the bastion of John Calvin's austere Protestantism. Both of his parents were citizens, a status held by roughly one fifth of the population. Though Rousseau spent most of his life away from Geneva, he took pride in his citizenship and affixed the epithet, "Citizen of Geneva" to the title pages of his major publications. His father, Isaac, was a watchmaker, while his mother, Suzanne Bernard, came from a wealthier family with a fine house in the upper town. Rousseau never knew her, however, because she died from complications related to childbirth.

In his earliest years, Rousseau lived with his father. They read voraciously and indiscriminately, delighting in novels and taking inspiration from Plutarch's lives of noble Greeks and Romans. When Rousseau was 10, his father fled Geneva to avoid punishment in the wake of an altercation with a French captain. Rousseau was entrusted to

the care of his uncle, who apprenticed him first with a notary, who dismissed him, and then to an engraver, from whom he ran away. Leaving Geneva at the age of 15, Rousseau made his way to Annecy in what was then the duchy of Savoy. There he met a Catholic convert named François-Marie de la Tour, baronne de Warens, who induced him to convert to Roman Catholicism and with whom he lived, with interruptions, until 1742.

Although she and Rousseau subsequently became lovers, Madame (Mme) de Warens was much more than a mistress to Rousseau: he called her "*Maman,*" and she called him, "*petit.*" In the *Reveries of the Solitary Walker,* Rousseau claims that his soul was formless until she gave it shape; to her influence he attributes the romantic sensibility, love of solitude, the country, and of contemplation that feature so prominently in his writings. During this period, Rousseau also cultivated his mind, reading widely in history and philosophy, dabbling in experimental chemistry, making some not very successful efforts to learn Latin, and beginning to write poetry and music.

When he was not living in Mme de Warens's household, the youthful Rousseau tried to support himself in a variety of employments, working at times as a valet, music teacher, and household tutor. Even when he found employers who recognized his genius and showed eagerness to advance his career, Rousseau's pride, his extreme love of independence, and a romantic sense of adventure made it impossible for him to serve for any period of time as a responsible employee. His experiences at the bottom of the social order, however, reinforced his democratic sympathies for the poor and humble and sharpened his bitterness against wickedness and incompetence in the powerful.

Rousseau Among the Philosophes in Paris

Displaced in the affections of Mme de Warens and determined to make his fortune, Rousseau moved to Paris in August of 1742. He hoped to win acclaim with a new method of musical notation. The scheme received a respectful hearing, and Rousseau succeeded in getting it published, but it was not adopted. Rousseau devoted himself principally to music and literature, composing an opera, *The Gallant Muses,* and a play, *Narcissus*. During this period, too, he first became intimate with Therese Levasseur, an illiterate washing woman, to whom he remained attached for the rest of his life, though did not marry her until 1768.

At this stage, he shared the belief in science and progress of the philosophes, and he established friendships with such leading lights of the French Enlightenment as Denis Diderot, the abbé Condillac, and Jean Le Rond d'Alembert. When Diderot conceived the project of publishing a comprehensive work to make knowledge of the sciences broadly accessible, Rousseau found himself sufficiently sympathetic to this great Enlightenment project that he contributed several articles to the *Encyclopédie,* primarily on musical subjects.

On a late summer's day in 1749, however, Rousseau experienced a moral and intellectual revolution. Walking from Paris to visit Diderot, then imprisoned at Vincennes, Rousseau read that the Dijon Academy had offered a prize for the best essay in answer to the question: *Has the restoration of the sciences and arts contributed to the purification of morals?* In a flash, the answer came to him: *No!* The insights he attained at that moment stand at the core of all of Rousseau's major works. Stated simply, he perceived that civilization and enlightenment do not necessarily make us happier or morally better; on the contrary, man is naturally good but has been made evil and unhappy by the contradictory influences of society's ill-ordered institutions. In his two *Discourses,* Rousseau deploys these ideas to formulate an incisive critique of the bourgeois social order then emerging within the bosom of the decaying *ancien régime*. In his three great constructive works: *Julie, Émile,* and *The Social Contract,* Rousseau explores alternative ways of remedying or avoiding the ills he had diagnosed in the two *Discourses*.

The Two *Discourses:* Rousseau's Critique of the Bourgeois Social Order

In the *Discourse on the Sciences and Arts,* his first submission for the Dijon Academy's prize, Rousseau maintains that the cultivation of the sciences and arts corrupts morals, subverts republican governments, and paves the way for the emergence of despotism. He concedes that the refined manners of his contemporaries present a pleasing spectacle but argues that they only hide the reality of pervasive depravity. Because it only

masks vice, conventional politeness is no substitute for virtue, which, to Rousseau, means the steadfast determination always to do what one knows, in conscience, to be right. His contemporaries take no heed of their inner moral compass, but are instead slaves of opinion. Publicly, they do what is expected of them by the canons of propriety, but secretly they are willing to do whatever might be necessary to gain wealth, fame, or power, and so triumph in society. Thus, their souls are divided between the morality they profess and the secret ambitions they dare not avow but that truly motivate them.

The highly civilized French are not alone in their corruption, Rousseau argues. On the contrary, all people in their infancy enjoyed a state of rustic simplicity, virtue, and freedom, and all people, in becoming more civilized, have become artificial, corrupt, and servile. Consider the Romans: Under the republic, their virtue conquered the world, but they built no fine buildings and produced no great art or literature. Under the empire, their capital became a city of marble; they could read Ovid and Virgil, but there was no longer public freedom, and the lamentable state of their politics and morals can be read in the histories of Tacitus.

Rousseau's *Discourse* won the Dijon Academy's prize for 1750, and it made an immediate sensation in Paris when it was published during the winter of 1750 to 1751. Rousseau became famous, and his ideas were extensively discussed in the press and in the fashionable salons. Rousseau embraced his rediscovered republican and became to his contemporaries, "the Citizen"; he abjured his youthful ambition to win wealth and fame, vowing instead to dedicate himself only to truth and virtue. Although Rousseau never fully lived up to these lofty ideals, they inspired him to make some real sacrifices. When *The Village Soothsayer* was performed for the royal court in October of 1752, the king was so delighted with Rousseau's opera that he decided to reward him with a pension. Rousseau refused the pension, lest his financial dependence compromise his independence of thought.

Rousseau's next submission to the Dijon Academy's competition did not win the prize, but he did not expect it to. Instead, the *Discourse on Inequality* became a landmark in the history of political philosophy, the first great critical analysis of the bourgeois culture of commercial society. Rousseau began by reframing the Academy's question: *What is the origin of inequality among men, and is it authorized by the law of nature?* The law of nature he dismisses as an oxymoron: A law must be a dictate of reason, directed to the will, but nature speaks to us only in our passions and instincts. What troubles Rousseau is not the *authorization,* but the *foundation* of such forms of social inequality as wealth and poverty, power and powerlessness, nobility and vulgarity. He takes it to be obvious that the distribution of wealth and power in his world are unjustifiable according to any reasonable criterion of morality. The mystery is why people accept it, when the rich, mighty, and titled are always a small minority.

Rousseau's answer begins with a demonstration that nature makes men free and equal. To show this, Rousseau presents the portrait of a man according to nature, whom he envisions as a creature biologically like us, but deprived of all learning or education. Such men are but animals, moved only by the innate passions of self-love and pity. The first inclines them to seek their own well-being; the second is a modest disinclination to witness suffering in others of one's kind. Moved by these passions and having only the simple needs of food, rest, and the occasional mate, Rousseau's solitary and mindless natural men would have had few occasions for conflict and no motive to intend harm to another of their own kind. Hence, Rousseau concludes that man is good by nature and that social inequality is artificial.

Unlike the other animals, however, human beings have a faculty Rousseau calls "perfectibility," the capacity to develop our intellectual powers, and it is to the development of mind that Rousseau attributes the origin and foundations of inequality. To make his case, Rousseau offers a schematic, six-part history of human civilization to identify the key steps in man's mental development and moral decay. The first age of animal ignorance ended when, confronted by obstacles to their survival, our most distant ancestors invented languages, tools, and came to establish settled homes and enduring family relationships. These developments mark the dawn of the second period of Rousseau's history, the state of the "savages" encountered by European explorers.

This second age also marked the birth of a new form of self-love, which Rousseau calls

amour-propre and which is the desire to be esteemed by others for what we value in ourselves. The introduction of amour-propre into his understanding of human nature is one of Rousseau's great innovations, and it distinguishes him both from the philosophes, who viewed men as basically self-interested and rational, and the ancient philosophers, whose understanding of human nature added to reason and self-interest a third passion, *thumos,* or spiritedness, which, in their view, gives rise to pride and anger. As Rousseau conceives it, amour-propre is malleable, and thus accounts for the very different sorts of dominant character produced in different political and social milieus. In societies of marked inequalities of wealth and power, such as eighteenth-century Paris, amour-propre appears as the desire for power and status, which corrupts Rousseau's bourgeois contemporaries. However, in conditions of rough equality and self-sufficiency, such as the savages know, amour-propre manifests itself as the demand for respect as an equal and the desire for the affection of one's beloved, and in the homogeneous, honor-loving ancient city-state such as Rome and Sparta, amour-propre appeared as civic virtue.

In Rousseau's view, the savage stage represents the happiest and best era of human history, because the savages know life's greatest pleasure, love, but do not suffer from the worst evils of civilization: tyranny, exploitation, and war. Rousseau never calls his savages noble, because they have not attained knowledge, wisdom, or virtue. Nevertheless, he expects his readers to see the savage state as superior to their own because the savages are not divided against themselves as modern bourgeois souls are. They may occasionally be violent, but they are not vicious, because they do not find their interests systematically at odds with the interests of others.

With the introduction of the division of labor ends the rough self-sufficiency that characterized the savage state. Exchange and commerce become necessary, and while the clever and fortunate grow rich, others become destitute. But because they are no longer able to provide for their own needs, the poor have no real alternative but to acquire resources in whatever way they can. The rich claim ownership of what they have, the strong claim ownership of what they can seize, and the poor claim ownership of what they need. All desiring power and property, the third era is a war of all against all. Unlike Hobbes, however, Rousseau sees this war not as the natural state of man, but as the product of antecedent intellectual and social developments.

The first political societies emerged, and the fourth age dawned, when men reciprocally agreed to regard ownership as rightful possession. In these first political societies, laws are only the general will of the community that the rights of each person be protected, and there are no specialized magistrates responsible for enforcement. Thus, Rousseau sees the legislative power as both temporally and conceptually prior to the executive; the existence of fundamental laws, grounded in the general will of the members, defines the civil state. The appointment of officials to enforce the laws marks the emergence of government and the beginning of the fifth epoch in Rousseau's history. In his entry "Political Economy" in Diderot's *Encyclopédie,* Rousseau makes clear that legitimate government can endure only so long as the people exhibit civic virtue, which is the determination to follow the general will and respect the rights of others, rather than to follow one's own interest, which typically opposes the interests of others.

Inevitably, however, social inequalities undermine civic virtue, and the people's leaders become its oppressors. The conclusion to the *Discourse on Inequality* is grim: Rousseau teaches that his readers, the "bourgeois" subjects of unequal and oppressive social arrangements, are enchained by a combination of artificial needs and reason-dependent passions, permanently divided against themselves and locked tightly into inegalitarian social and political systems inimical to freedom and destructive of happiness and virtue. Nor does he see any hope for the future. Modern men can no more revive the civic virtue that once animated the Roman Republic than they can return to live among the savages. Even Geneva no longer truly embodied Rousseau's political ideals, if it ever truly had. He dedicated the work to his native town, but to an idealized Geneva that scarcely resembled the oligarchic, bourgeois city it had become. In the summer of 1754, after the completion of the *Discourse* but before its publication, Rousseau traveled to Geneva, where he reaffirmed his Protestant faith and reclaimed his citizenship.

Rousseau's "Solutions": *Julie, Émile,* and the *Social Contract*

Rousseau returned to France, but left Paris in the spring of 1756 to live in the countryside near the forest of Montmorency. The following years were a time of emotional turmoil in Rousseau's life, leading ultimately to the rupture of his friendship with Diderot and most of the philosophes, but they were also his most productive, culminating in the publication of his three great, constructive works: *Julie, Émile,* and *On the Social Contract,* each of which explores a possible alternative to the corrupt, bourgeois social order condemned in the two *Discourses*.

Julie, or the New Héloise

Rousseau's romantic novel, *Julie, or the New Héloise,* was first. Its publication was eagerly anticipated, particularly as it appeared not long after Rousseau had published his *Letter to d'Alembert on the Theater,* denouncing the project of opening a theater in Geneva. He objected that a theater would undermine the traces of civic virtue that still remained among his fellow citizens by importing the manners and values of Paris's glittering upper class. Defending himself against the charge of inconsistency, Rousseau argued that novels, read in the privacy of one's home, do not inflame amour-propre as attendance at the theater does. Besides, Paris is already so corrupt that a novel cannot do any harm, and it might, by inspiring its readers with the love of virtue and the desire to imitate the simple, rustic, and domestic life its protagonists lead, even do some good. Certainly the novel explores the possibility that happiness and wholeness may be found by withdrawing from the whirl of urban life into a private domain of love and friendship, sustained by an optimistic faith in a tolerant and loving God. Its tragic conclusion, however, suggests that so long as human society continues to confront us with duties opposed to our desires, earthly happiness cannot be easily attained or long sustained.

Émile, or On Education

Émile appeared in Paris in May of 1762. It is the work Rousseau himself judged to have been his best and most important, and it presents his most complete and systematic effort to find a cure for, or at least a sort of inoculation against, the corrupting effects of ill-constituted social institutions. In the form of a novel, it is the story of an ordinary boy's extraordinary education. It details its eponymous hero's development from infancy to adulthood, under the care of his governor, Rousseau, who is an idealized version of Rousseau himself.

Rousseau starts from the premise that man is naturally good but corrupted by society. Accordingly, he proposes to tailor Émile's education to match the course of the natural development of his body and soul, making use of the child's innate desire to learn. For the infant, he recommends breast feeding and forbids swaddling clothes, which impede the infant's natural urge to move his limbs. The young child must learn the careful use of his senses and develop his growing body; hence, Rousseau advises games and outdoor activity. In the later years of childhood, from the ages of roughly 12 to 15 (Rousseau supposes adolescence to begin around 16), Émile learns a trade and the rudiments of science. Only at this stage does he read his first book, *Robinson Crusoe*. Imagining himself as Robinson on his island, Émile's favorite game is to discover how he can use his strength and wits to survive.

Émile's early moral education is negative; Rousseau aims only to prevent his charge from contracting any vices. He issues no commands, lest he teach the child to disobey and to lie. Nor does he reason with Émile, because children cannot perceive the human bonds that underpin moral obligation. Because Rousseau maintains that no one rebels against necessity but only against what one views as the intentional actions of another, Émile is confronted only by limitations he perceives as natural rather than willfully imposed. To this end, the tutor totally, but imperceptibly, controls Émile's environment, so that it presents no opportunities for him to do anything wicked. If Émile should do anything wrong, he will not experience punishment as the willful infliction of harm for harm, which would only provoke rebellion; he must, rather, feel any punishment as the natural consequence of his behavior. Such training preserves Émile's natural goodness from the corruption of society.

The onset of adolescence marks a decisive turning point, because it is when amour-propre begins

to be felt. If Émile is to be saved from the corruption of bourgeois society, he must be preserved from learning to ground his self-esteem on wealth, fame, or status. To that end, his tutor guides him to spend his days among the unfortunate, which will make him compassionate. Doing good works for those in need, Émile learns to take pleasure in beneficence. Learning about society by seeking to right wrongs suffered by the oppressed, Émile acquires a sense of justice. In Rousseau's judgment, Émile at this stage is good, because he has no inclination to wrong anyone, but he is not yet virtuous because he has not yet acquired the strength of soul required to resist temptation.

When the potentially disruptive force of sexual desire can no longer be denied, Rousseau reveals to Émile the nature of sexuality, describing for him the joys of marriage and the dangers of libertinage. At the same time, he disclaims all authority, insisting that Émile is old enough to be his own master. Émile responds by begging Rousseau to guide him and promises obedience to his commands; Rousseau accepts. Rather than forbid Émile from tasting the pleasures of sex, he makes Émile want to remain chaste by making him fall in love with the image of an ideal woman, whom he names Sophie. In the fifth and final book of *Émile,* the young man and his tutor seek this Sophie, whose own education Rousseau describes as the preparation for a life of dependence as a wife and mother.

When Émile finds Sophie, he falls immediately in love with her, but she remains wary until he demonstrates to her his wholehearted dedication to the rights of humanity. Once she has agreed to marry, however, the tutor intervenes; he commands Émile to leave Sophie for a time, to travel and learn about politics. Now, for the first time in his life, confronted by a disjunction between his desires and his duty, Émile demonstrates his virtue and proves that he is truly worthy of Sophie's love. Subordinating his immediate pleasure to the just demand that he keep his word, he complies willingly with this first demand ever placed on him. On his travels, he learns to judge governments according to the principles of *The Social Contract* and finds that all fall short. Believing that a man of virtue can live happily wherever he resides, Émile opts to live on a small farm in the countryside of the land where he was born, far from the corrupting influence of Paris. Émile's love of his ideal Sophie takes the place in his soul that philosophy would occupy in that of a wise man, and, as the novel concludes, it appears that Rousseau has succeeded in showing that it is possible for any man, of ordinary intellectual and moral gifts, to lead a life of virtue, happiness, and wholeness.

Scarcely a week after it had been permitted to be sold in Paris, *Émile* was confiscated by the police, condemned, and burned. The authorities in Geneva quickly followed suit. Orders for Rousseau's arrest were issued, and Rousseau fled into exile. What particularly provoked the authorities was the heterodox religious teaching of *Émile,* which Rousseau presents as the profession of faith of a Catholic priest from Savoy. The priest articulates a religion according to nature, and he seeks to demonstrate the basic elements of his faith—the existence of God, freedom of the will, the immortality of the soul, and the happiness of the just—by appealing to sentiment and the inner light of his own soul. The priest dismisses as irrelevant metaphysical and theological speculations, such as those about the nature of the communion sacrament, over which Protestants and Catholics had bitterly quarreled. He holds instead that God loves equally all religions that teach men to love their neighbors and to do justice. Nor do external forms and ritual matter: God heeds only the inner worship of the loving heart.

The Social Contract

Published contemporaneously with *Émile, On the Social Contract,* subtitled *Principles of Political Right,* offers Rousseau's account of a legitimate state, in which the subjects are morally obliged to obey the law and are motivated to comply with its demands. *The Social Contract* begins from the premise that man is born free, that all political communities are, therefore, artificial and grounded in consent. As he had argued earlier, Rousseau teaches in *The Social Contract* that the state comes into being when an aggregation of individuals becomes citizens by agreeing to be directed, not by their individual desires, but by the general will of the community, which aims at the common good of all. In the general will, Rousseau finds a means of reconciling obedience and freedom, which had remained opposed in the teaching of Hobbes and

Locke. They had argued that the establishment of political authority requires the subjects to alienate a portion of their freedom to the commonwealth. By contrast, Rousseau conceives the establishment of a legitimate state as effecting the transformation of man's natural freedom to do whatever pleases him into civil freedom. As subjects, the people of Rousseau's legitimate state are free because they obey only the laws they have, as citizens, prescribed for themselves.

The natural freedom and equality of men implies that no individual can have any right to tell the citizens what they should will for themselves as their law, but, though the people can judge whether or not they are happy, Rousseau believes they lack the wisdom to frame the laws that would make them so. To bring the legitimate state into being, an extraordinary legislator is required to draft the laws, which he must induce the people to embrace without their really understanding why. The legislator will have succeeded in his task only if the people, after living for a time under the laws, willingly and wholeheartedly embrace them. This will only happen, Rousseau supposes, if the laws and customs established by the legislator fundamentally transform the character of the people, so that instead of regarding themselves primarily as independent actors with private and conflicting aims, they see themselves first as citizens, dedicated above all to the common project of their collective welfare. In the republics of antiquity, religion served the state, endowing political obligations with an additional, supernatural sanction. To the displeasure of the orthodox, Rousseau complained that pure Christianity weakens the political bond by teaching that one's true home lies not on this earth but in heaven; to the displeasure of the philosophes, he suggested that a modified Christianity could be made into a civil religion that would serve civic ends.

In the legitimate state, the people are sovereign: Their general will is the law. Rousseau advises that the people must assemble in person at least annually to give or withhold their assent to laws and to elect their own magistrates. The magistrates and the government they constitute are not sovereign but are only its agent, tasked with the responsibility of applying the general will to particular cases. The best form of government, Rousseau argues, is elective aristocracy, where those most capable of faithfully carrying out the general will are entrusted with office. Although he recognizes its oligarchic features, Rousseau nevertheless asserts that the Roman Republic substantially met the conditions specified in his theory: Every citizen was a member of the sovereign assembly, having the right to vote in the *comitia centuriata;* this sovereign body assembled at least annually, and it had the right to enact the laws and the right to select its own magistrates.

Persecution and Exile, Introspection and Self-Justification

Warned of his impending arrest, Rousseau fled and sought refuge in Môtiers, under the sovereignty of Prussia's King Frederick the Great. For a time, Rousseau hoped that his name and his works would be vindicated in Geneva, where a number of citizens supported his cause. The controversy grew heated and threatened to spill over into civil violence. At the height of the conflict, Rousseau's adversaries struck and anonymously published a pamphlet written by Voltaire that made public the details of Rousseau's illicit sexual relationship with Levasseur and accused him of having abandoned the five children he had fathered with her. Though Rousseau's actions were not especially uncommon in eighteenth-century Paris, the revelations were acutely damaging because the reality of Rousseau's conduct contrasted so sharply with the idealizations of romantic love, domestic happiness, and wise paternal guidance depicted in his novels. By February of 1765, it had become clear that Rousseau's cause in Geneva was lost, and he turned his back on his native city, renouncing all further interest in its affairs.

The attacks on his personal character prompted Rousseau to begin composing his *Confessions,* in which he proposes to show himself to the world, faults and all, in the expectation that his readers would recognize the essential goodness of his nature, despite his obvious failure to live with anything like the virtue exhibited by his exemplary characters, Julie and Émile. Driven from his refuge in Môtiers by the stoning of his house, Rousseau stopped for a time on the Isle de Saint Pierre, in the territory of Berne. While there, he amused himself by making botanical observations—a pastime to which he would devote ever more of

his time as he grew older—and sometimes allowing himself simply to fall into sweet daydreams. The Bernese, however, expelled him, and in January of 1766, Rousseau made his way to England, accepting David Hume's offer to help him find refuge there. Rousseau's relationship with Hume deteriorated rapidly, as Rousseau came to suspect Hume of plotting against him.

Returning to France the following year, Rousseau was compelled to live away from the capital and under a pseudonym, Renou. In 1770, he moved back to Parris, where he was permitted to live under his own name, and where he made a meager living as a music copyist. His last years were principally devoted to the composition of autobiographical works, the forensic and self-justificatory *Rousseau Judges Jean-Jacques* and the elegiac *Reveries of a Solitary Walker,* both of which were published posthumously, as was the *Confessions*.

In May of 1778, he accepted the hospitality of marquis Rene de Girardin, and came to live on his beautiful estate in Ermenonville, where the marquis had laid out a garden in the English style, such as Rousseau had celebrated in Julie. But Rousseau did not have long to enjoy this retreat; he died on July 2 and on July 4 was buried on the Isle of Poplars at Ermenonville. Rousseau's tomb became a sort of shrine for his admiring readers, and such luminaries as the ill-fated Marie Antoinette paid their respects to him there.

Rousseau's influence was far reaching and as diverse as his range of intellectual interests. In philosophy, Immanuel Kant proclaimed him "the Newton of the moral world" and confessed that Rousseau had decisively transformed his intellectual outlook, teaching him the unconditional value of humanity and so inspiring him to develop a practical philosophy justifying the rights of man. The central element of Kant's practical philosophy, the idea that autonomy is found in compliance with the categorical imperative, in effect translated into the moral sphere of Rousseau's political idea that citizens can realize freedom through obedience to the general will. In literature, Rousseau's *Julie* and his autobiographical writings contributed to the emergence of Romanticism, with its celebration of feeling and enthusiasm for nature. Rousseau's educational philosophy subsequently inspired the pedagogical reforms of Maria Montessori. In religion, the "Profession of Faith of the Savoyard Vicar" articulates the doctrines of a mild and tolerant Christianity that have come to define mainline Protestantism today. And, in politics, such leading figures of the French Revolution as Louis de Saint-Just and Maximilien Robespierre claimed to be acting in his name, though because they mistook their own will for the general will of the French people, their actions did not accord well with the actual content of Rousseau's thought. Nevertheless, the French revolutionary government had his remains transferred, in a theatrically staged procession, to the Pantheon, in Paris.

Rule of Law

The *rule of law* refers to a mechanism, process, institution, practice, or norm that secures a particular type of governance. The relevant type of governance is usually defined in opposition to arbitrariness. Arbitrariness is typical of various forms of despotism, absolutism, authoritarianism, and totalitarianism, which are widely thought to be evils that the rule of law is supposed to curb. These include even highly institutionalized forms of rule where atop the apex of a power structure sits some sovereign entity (a king, a junta, a party committee) that can make decisions unconstrained by law when it deems necessary. Ideas about the rule of law have long been central to political and legal thought since at least as early as when Aristotle distinguished "the rule of law" from "that of any individual." In the eighteenth century, the baron de Montesquieu elaborated a doctrine of the rule of law that contrasted the authority of monarchs with the caprice of despots, which underpinned his notion of an independent judiciary (rightly or wrongly with regard to England) and has since profoundly influenced Western liberal thought.

In all, the rule of law implies that the creation of laws, their enforcement, and the relationships among legal rules are themselves legally regulated so that no one—including the most highly placed official—is above the law. The legal constraint on rulers means that the government is subject to existing laws as much as its citizens are. Thus, a closely related notion is the idea of equality before the law, which holds that no "legal" person shall enjoy privileges that are not extended to all and none in particular shall be immune from legal sanctions. In addition, the application and adjudication of legal rules by various governing officials are to be impartial and consistent across equivalent cases, made blindly without taking into consideration the class, status, or relative possession of power among disputants. In order for these ideas to have any real purchase, moreover, there should be in place some legal apparatuses for challenging officials to submit to the law.

Not only does the rule of law entail such basic requirements about how the law should be enacted in society, but it also implies certain qualities about the characteristics and content of the laws themselves. In particular, laws should be open and clear, general in form, universal in application, and knowable to all. Moreover, legal requirements must be such that people are able to be guided by them; they must not place undue cognitive or behavioral demands on people to follow. Thus, the law should be relatively stable, comprised of determinate requirements that people can consult *before* acting, and legal obligations should not be retrospectively established. Furthermore, the law should remain internally consistent, and failing that, should provide for legal ways to resolve contradictions that can be expected to arise.

Despite these basic features, however, the rule of law has not always had a particularly established or even systematic formulation (not for lack of attempts by jurists and political philosophers). The idea that the law should contribute to beneficial ways of channeling and constraining the exercise of public power is a matter of interpretation; that is especially so over time and across different polities. One reason why its meaning continues to be widely contested is that any of the strictly legal or philosophical aspects of the concept points beyond itself also to political and social conditions that are historically and culturally contingent. Another reason for the inherent complexity of the idea is that for whatever empirical particulars are said to fall within the purview of the concept, there is always some larger normative vision about the nature or purpose of law and the legitimate aims and limits of political power that support it that stand to enjoy even less agreement.

Institutional Arrangements and Legal Culture

For these reasons, the rule of law is best seen not as a blueprint for institutional design, but as a value, or cluster of values, that might inform such design, and that can therefore be pursued in a variety of ways. Nonetheless, several rather simple and generalizable institutional insights follow from the idea that those who judge the legality of exercises of power should not be the same as those who exercise it. For instance, a typical rule-of-law state will institutionalize some means of shielding legal officials from interference, political or otherwise, that threaten their independence. Accordingly, the institutional separation of the judiciary from other

branches of government is commonly thought to be an important feature of rule-of-law states. Other measures to ensure fair access to legal institutions may also be important for rule-of-law regimes. In addition, a binding written constitution is an American innovation that is widely believed to aid the rule of law, and has thus been mimicked in other parts of the world.

While certain institutional traditions and conventions as well as written laws may be important to ensure that judicial decisions are grounded within plausible interpretations of existing laws, no single institutional character of a state should be seen as necessary or sufficient to the rule-of-law ideal. The rule of law is tied neither to any one national experience nor to any set of institutions in particular, although it may be thought to be better served in certain nations and more by some institutions than by others. Institutional variety and possibilities are likely to be too rich and complex to identify precise institutional arrangements of the rule of law that could be automatically duplicated or transplanted. Different polities embody their own judgments about how to implement specific rule-of-law ideals given their particular legal and cultural traditions that influence the character of their institutions. Furthermore, the initial sociological condition of the rule of law is simply that most people in a society, including those whose profession it is to administer the law, believe that the law does and should count in the first place. In this regard, political and legal institutions are but one factor among many variables that comprise cultural supports for and means of socialization into the rule of law as a value.

Negative and Positive Forms of the Ideal

The basic idea that the rule of law is at odds with arbitrariness has led most legal theorists to view the rule of law as a purely negative ideal whose value lies mainly in what it shields against. Those who take the view that the rule of law is devoted primarily to "damage control" concentrate especially on the various kinds of damage that might be done at the hands of government. The point of institutionalizing the consolidation of power, then, is to be able to curb it and thereby buttress the citizenry against the potentially intrusive claims of the state. Yet the constant fear that the threat of violence and actual cruelty of those holding a monopoly of power can engender in citizens is not the only perilous alternative to the rule of law. Without the rule of law's promise of fixed and knowable points in the vast field of human interactions that constitute the basis for legitimate expectations and the means of social coordination, the alternative may well be widespread chaos if not paralysis. Hence, many theorists have derived the value of the rule of law by focusing on the disastrous state of affairs that would ensue from the absence of information, security, and legally enforceable obligations that the rule of law provides for ordering and regularizing social relations.

As a solution either to the problem of an all-too-powerful state or the need for order and predictability within modern societies, the rule of law's assurance of constraint by clear legal rules and the establishment of well-defined legal processes is of central importance to a purely negative ideal of the rule of law. As a negative ideal, the rule of law sets out principles of legal efficacy but remains silent on the moral quality or purpose of the law. While it may appear empirically inconsistent for horrific acts to occur under the rule of law, mere formal regularity and procedural justice are quite consistent, in principle, with iniquity in the law's content. Thus, many writers have offered a more affirmative, morally ambitious account of what is required to govern according to the rule of law. A more positive understanding of the rule of law includes some underlying principles of substantive justice and purpose in legal systems in relation to society. In this tradition, formal regularity and attention to process is likewise valued, but they are seen as valuable not merely for their own sake but insofar as they help to secure further goods—such as greater equality and fairness, respect for the dignity and integrity of people or groups. A particular theory about the proper respect for individual rights or a preferred conception of political community and communal goods usually lies at the heart of a more substantive rule-of-law ideal that seeks not only to protect but also to realize specific social goods and human values through the law.

Challenges to the Rule of Law

Anyone who holds that what matters most in politics is having the *right* people in power and not

how power should be constrained will be unconvinced of the value of the rule of law. Neither will anyone who believes that institutions of public power are merely instruments of the ruling class that need more than to be constrained but dismantled. For the majority of modern democratic societies, however, the rule of law's requirement that both rulers and the ruled be accountable to the law is of unquestionable value. To be sure, in the modern world, it is the liberal tradition that values the rule of law most highly. Liberals who are concerned with ways of protecting (and realizing) liberty in some form and averting threats to it view the rule of law as an overarching source of security and value. Be that as it may, there is substantial disagreement even among liberals over what exactly counts as a faithful application of the term and, even when that is pinned down, how it is to be accomplished.

In and of itself, the rule of law is not a faithful description of any state of affairs, but a complex ideal that is even more complex to realize. Thus, we have reason to be skeptical about whether societies necessarily benefit from all that might be invoked under the term. The independence of the judiciary, for instance, is a murky value at best, and clearly a problem if the independence is misused to foster the sectoral privileges of judicial personnel or to allow unchallenged interpretations of the law. Heavy emphasis on the negative aspects of the rule of law, for example, on formal regularity and procedural justice, may distract from the content and consequences of those laws. Critics of a strictly negative conception of the rule-of-law ideal argue that too much attention to legal process generates significant vices of its own in the form of exaggerated legalism and excessive juridification. The price of excessive veneration of the law and legal procedures may be too high if doing so inhibits independent social assessments of the merits of a given policy proposal or if the official mandate of "blindness" gives legitimacy to actions performed "according to the law," even when most people would oppose such acts. Some writers have charged, moreover, that the increasing domain of judges and lawyers, indeed, their encroachment into areas previously left to politicians and the electorate, entails the loss of much that is politically and democratically valuable.

In short, too much emphasis on procedures for preventing arbitrariness can lead to subverting the doing of justice according to what might otherwise find support in the rule of law, and the legal strictures then become themselves a form of arbitrariness that is no more legitimate. On the other hand, those who defend the negative value of the rule of law object to more substantive understandings of the ideal on the grounds that morally ambitious aspirations about the rule of law threaten to purge the concept of its specificity and usefulness. They argue that to open the concept to a whole host of extralegal considerations about substantive justice and wider societal goals is to conflate ideas about "the rule of law" with notions about "the rule of good law," such that any distinction between the two is reduced to nothing. As a consequence, no separate or practical discussion of the rule of law can take place short of propounding a whole rival social philosophies.

To address further challenges to the ideal, a matter of continuing controversy is whether contemporary law associated with the welfare state is compatible with the rule of law. The regulatory activities of modern governments are frequently neither general nor abstract, but are targeted, detailed, and specific. A matter of even longer dispute is whether such formal equalization counts for much if it merely leaves substantive social and economic inequalities to play themselves out with greater effect. Liberals commonly believe that the existence of social inequalities does not necessarily cancel out the worth of the rule of law, for they maintain that inequalities should not confer advantages before the law even if they do so in the world. Those on the political left disagree and argue that real differences in the world render the blindness or neutrality of the law false, inconsequential, or pernicious.

Therefore, despite widespread consensus in different parts of the world that the rule of law is a good thing, it is neither automatically nor self-evidently so. Like any social value, the rule of law can be a mixed blessing when it conflicts with commitments to other social ideals or because different interpretations of the same ideal or attempts to realize different ideals can require different institutional logics. Where the governing powers of a polity are unconstrained, the negative conception of the rule of law will undoubtedly

hold much salutary promise. Where power is already substantially constrained by law, however, the rule of law might not only tolerate but require that some space be made for wisdom, judgment, particularity, and substantive justice.

S

Schiller, Friedrich (1759–1805)

Friedrich Schiller was a key figure of the late Enlightenment; he made significant contributions to philosophy, poetry, drama, and the study of history. This entry considers three major aspects of Schiller's works—history, philosophy, and drama—as they relate to the politics and political ideas of his time.

Schiller's first historical works focus on the Dutch rebellion against Spain in the sixteenth century and reveal a strong sympathy toward the Netherlands' battle for emancipation from the despotism of Philip II. While, on the one hand, Schiller heralds the victory of freedom over oppression as a product of the people and not of individual heroic leaders, on the other hand, he suggests that there was a lack of unity of purpose among the people that, in part, contributed to their defeat. One of the main topics of these early histories is the question and problem of middle-class freedom. It is an indication of Schiller's desire to be more actively involved in public-political life.

On the basis of both Schiller's literary work and his writings on history, Johann Wolfgang Goethe recommended to Duke Carl August (of Weimar) that Schiller be appointed to a professorship at the university in Jena, Germany (today, the Friedrich Schiller University). Schiller held his inaugural lecture on May 26, 1789, the very week in which the French revolutionary estates were gathering in Versailles to form a National Assembly. The topic of his lecture stemmed from his study of the philosophy of history, "What Is, and to What End Does One Study Universal History?" ("*Was heißt und zu welchem Ende studiert man Universalgeschichte?*"). In this important essay, Schiller sought to mediate between two approaches to the writing of history, the first of which focused on facts and occurrences of the past, while the second considered the interrelationships between phases of history. With the aid of the philosophy of history, he hoped to establish more universal truths that had arisen out of a close study of the particulars of history. At the same time, he believed that, in consideration of universal history, the individual human being is liberated from the limitations of one's situatedness in the present. The work thus marks a turning point in Schiller's view of history and politics. Along with his later historical works, these formative texts powerfully shaped the conceptions of philosophical history that would dominate the later Hegelian tradition.

Like many of his contemporaries, Schiller focused his attention in the area of philosophy on the work of Immanuel Kant. Schiller's study of the Königsberg philosopher intensified in Jena, where the leading expert on Kant of his time was one of his colleagues, Carl Reinhold. Through a critical engagement with Kant's works, Schiller developed a classical aesthetics of moral autonomy. For Schiller, neither the nature state (*Naturstaat*) nor the state of reason (*Vernunftstaat*) can address the needs of human beings because they are nonmoral, human constructs. It follows that because it is made by human beings, the state must respect the individual and the

leader must not legislate arbitrarily but out of respect for the will of the people.

While Schiller might have been excited about the historical realization of republican democracy with the French Revolution, the aftermath of the revolution and the actions of the Jacobins, in particular Maximilien Robespierre and Georges Danton, led him to the conclusion that only a program of aesthetic education could overcome the potential violence of reason. Although retaining a strong Kantian impetus, Schiller's program of aesthetic education transcended Kant's own conception. Schiller held that only through the attainment of a balance between reason and emotion could a truly efficacious social-political environment of freedom and mutual responsibility be actualized—the sole facilitator of which is art.

As an artist himself, Schiller had considerable interest in Kant's discussions of beauty and the sublime. In his essay "Concerning the Sublime" (1801), Schiller declared that, as an object of history, the world is, at bottom, nothing other than the conflict of the powers of nature both between themselves and with human freedom, the outcome of which is manifest in history. Again, Schiller pins his hope for improvement in the political sphere on the refinement of the sensations through an appreciation of art. While in the process of reforming the individual through art and culture, a socially efficacious state can be established that serves rather than coerces its citizens, for it is culture that enables individuals to assert their freedom and will. This idea would reach an even broader audience in his drama, *Wilhelm Tell.*

Many of Schiller's dramas explore political problems, often in the light of the course of history. His first political drama, *Don Carlos,* a compilation of five manuscripts written between 1785 and 1787, explores the phenomenon of despotism within the family and the political and religious orders. Schiller created one of his most intriguing dramatic characters in the marquis de Posa, who stands not so much for a republic as a constitutional monarchy, or even universal monarchy, in which basic human rights and social well-being are guaranteed. Posa's tragic fall illuminates how autocratic, arbitrary state's governance debilitates human beings, even when they serve the cause of humanity. In fact, in the end, Carlos's father, the king, turns his own son over to the Grand Inquisitor. In *Don Carlos,* the alliance between state and church stands in the way of the realization of a better, humane political order.

Schiller's experience of the French Revolution and its aftermath shaped his later literary-dramatic representations, all of which are political in nature and effect. In the trilogy *Wallenstein,* the hero is defeated not by opposing troops, but by the very government he is supposed to be serving. The plot illuminates the need for a new political order of freedom and justice and implicitly endorses the right of citizens to resist their state, if necessary by force, an issue to which Schiller returned in *Wilhelm Tell* (1803). The hero, Wilhelm Tell, who became a mythical hero for the Swiss, kills a tyrannical, inhumane representative of the state (*Geßler*). In this, Schiller's most revolutionary drama, murder appears as a morally justified act that has positive consequences in the political sphere.

In conclusion, although Schiller was not himself a revolutionary activist, numerous of his ideas and historical, poetic, and dramatic representations were profoundly political. Through his writings, Schiller propounded the cultivation of a moral imperative for the improvement of society that is of political consequence.

Schmitt, Carl (1888–1985)

Carl Schmitt was a renowned conservative jurist and political theorist in Germany's Weimar Republic who ultimately incurred infamy as an enthusiastic supporter of Hitler's Third Reich. From "exile" in his provincial hometown, Plettenberg, Schmitt exerted a shadowy but extensive influence over postwar social and political philosophy, as well as constitutional and international law. Each of his short and forceful Weimar era books accentuated some deficiency of Enlightenment thought and/or liberal political practice. *Political Theology* (1922) argued that liberal jurisprudence's inattention to legal gaps highlighted the Enlightenment's more general inability to account for "the exception," Schmitt's word for phenomena that cannot be circumscribed or predicted by rationalist systems of thought. This work, along with *Roman Catholicism and Political Form* (1923), insisted that transcendental, extrarational, and supramaterial sources are necessary to ground moral-political authority; and, furthermore, that the revolt against authority, as such, posed by Russian anarchism and communism would destroy Europe and irrevocably degrade humanity. Schmitt's *Crisis of Parliamentarism* (1923) exposed liberal parliamentary government as a sham: Interest-based political parties feign protection of the national good while they actually pursue advantage for their own particularist agendas. Contemporary parliaments, Schmitt averred, were incapable of reconciling democracy, which presupposed political unity, with liberalism, a fundamentally individualist or pluralist doctrine.

Moving out of the ambit of Catholic political thinking in the mid-1920s, Schmitt composed his most influential and impressive works. His magnum opus, *Constitutional Theory* (1927), offered a painstaking analysis of the Weimar Constitution, as well as an astounding account of the principles underlying any "democratic" constitution. In *The Concept of the Political,* composed in 1927 and fully elaborated in 1932, Schmitt defined "the political" as the eternal propensity of human collectivities to identify each other as "enemies"; that is, as concrete embodiments of "different and alien" ways of life, with whom mortal combat is a constant possibility and frequent reality. Schmitt assumed that the zeal of group members to kill and die on the basis of a nonrational faith in the substance binding their collectivities together refutes basic Enlightenment and liberal tenets. Willingness to die for a substantive way of life negates both the pursuit of self-preservation undergirding modern natural rights and the liberal motivation to neutralize deadly conflict that was, in his view, driving modern European history from the sixteenth to the twentieth century.

Schmitt offered several striking interventions, most notably *Legality and Legitimacy* (1932), during Weimar's final, crisis years. In the midst of economic collapse and social conflict bordering on civil war, Schmitt argued that the democratic legitimacy of the republic's president outweighed any limits on his authority legally articulated in the Weimar Constitution. Schmitt advised members of President Hindenburg's circle to bypass the parliament and rule by presidential decree for the duration of the crisis, and potentially beyond it. Once these conservatives were outmaneuvered by Hitler, Schmitt helped legally coordinate the Nazi seizure of power, and, in 1933, he joined the party and was rewarded with the highest judicial post in the new Reich. Despite wholeheartedly endorsing Hitler's liquidation of political adversaries and his promulgation of anti-Jewish policies, Schmitt found himself on the outs with the regime by 1936. He subsequently occupied himself with purportedly academic studies like *The Leviathan in the State Theory of Thomas Hobbes* (1936), and international law-based legitimations for an expanding German Empire or "Grossraum." Refusing to be de-Nazified by the Allies (because he insisted that he had never been "Nazified"), Schmitt was banned from teaching after the war, but continued to produce intriguing but often self-exculpating

scholarly works, such as *Ex Captivitate Salus,* and his dazzling philosophical-historical study of international law, *Nomos of the Earth,* both published in 1950.

SCHOLASTICISM

Scholasticism refers to an intellectual and cultural movement in the Western European Middle Ages characterized by an influx of new knowledge, by the emergence of new institutions of learning, and by new methods of study. This knowledge was transmitted mostly from the Islamic world and included material on many philosophical and scientific areas but not, in any significant way, on politics or political theory.

The "two swords" understanding of religious and secular authority that was developed in the early Middle Ages continued to dominate political thought in Western Europe up to the middle of the thirteenth century. The position of the pope remained central, although Byzantium represented an alternative arrangement of the relationship between bishop and emperor. The roles of emperor and of local kings vis-à-vis the church were developed and expressed through legal instruments, jurisprudence, political actions, and coronation rites.

The tensions inherent in this arrangement were always clear: witness the investiture controversy of the eleventh and twelfth centuries and the ongoing struggles between Frederick II and the papacy in the first half of the thirteenth century. Muslim occupation of the Christian holy places provided an external challenge to unite an otherwise fragmented Europe, a unity seen in the crusades that came to serve other political purposes.

Although in early scholasticism (1100–1250) there is not much political philosophy, the study and practice of canon and civil law ensured the transmission of political values and ideas. Notions such as *right, justice,* and *sovereignty* were enshrined in, and came down from, Roman law. These traditions were collected and codified in the *Corpus juris civilis* (Body of civil law) at the behest of the sixth-century Emperor Justinian. In the twelfth century, collections of canonical legislation begin to be referred to as *Corpus juris canonici* (Body of canon law). The need for lawyers in the developing towns is one of the factors that stimulated the emergence of universities in cities such as Ravenna and Bologna.

Earlier Christian theological controversies contributed to the development of a distinctive understanding of the human person that had great

importance for later political understanding and valuing of the individual. The notion of *person* was given new depth through these controversies, and the call of humanity to eternal life with God founded an understanding of human dignity as inherent rather than originating externally.

John of Salisbury's *Policraticus* may be taken as summarizing the political thought of early scholasticism. John worked at Canterbury, Rheims, and Chartres, and was acquainted with Thomas Becket, Peter Abelard, Bernard of Clairvaux, and other notable contemporaries. *Policraticus* seeks to gather all knowledge and wisdom about ethics and politics. It considers first virtue and happiness, summarizing the wisdom of the ancient and early medieval worlds about where human happiness is found: supremely in the worship of God and life with God in eternity, in a lesser sense in a practical and active life of charity toward one's neighbor.

John develops the metaphor of the body politic, familiar from ancient sources as well as from its application by Saint Paul to the church. Just as the individual human body is made up of parts that depend on each other, and is healthy and well functioning when these parts know their place and perform their function, so, says John, a political society is made up of parts that depend on each other for the community's flourishing. There are three levels to this body, those who hold authority to govern, those who perform some of the functions of governing, and those who are governed without any involvement in governing. John spells this out: the prince is the head, the senate is the heart, and the church is the soul of this body. Judges and other senior officials are the eyes and mouth, while soldiers and other junior officials are the hands, internal organs, and sides of the body. Those who are governed without governing are the feet of the body.

Although the church is concerned with the higher happiness of eternal life, and the secular power is subordinate to it because its concern is the happiness of this life, still the prince has his power from God and not from the church. Kings tended to be more independent of the papacy than emperors were, and hence the sharper conflicts between pope and emperor in the Middle Ages. Sacred and secular powers ought to work together for the common good, John says, as body and soul do for the good of the individual. The first duty of a prince is to love God, then to love his subjects, be virtuous in his own life, and educate those who govern with him. Senior officials too ought to be virtuous, although John reckons they will need more promise of reward and threat of punishment if they are to remain so. He speaks bitterly, probably from experience, of the role of the flanks of the body, the courtiers (or lobbyists) who control access to those in authority. These are the parts most susceptible to corruption.

The prince himself might become corrupt, and there has been much debate about John's understanding of tyrannicide. It seems that he cautions patience in the first place, allowing time for God to act to remove a tyrant, but accepts that God's action may sometimes be through human hands.

Aristotle is important for twelfth-century thought, and John's other major work, *Metalogicon,* applies Aristotle's logic across the liberal arts curriculum. But access to Aristotle's *Ethics* and *Politics* provided scholastics of the following century, notably Thomas Aquinas, with radically new resources that made possible the development of a political philosophy properly so called.

SCHOPENHAUER, ARTHUR (1788–1860)

Arthur Schopenhauer, whose writings established pessimism as a distinct and important philosophical

position, was one of the most influential moral theorists of the nineteenth century. He was born into a wealthy Danzig trading family, and his father intended for him to continue the family business. As a youth, he traveled widely and learned several languages, but his education was oriented largely toward business. After his father's early death, however, Arthur was released to scholarly pursuits and his inheritance ensured that he could live comfortably. He studied at Göttingen and Berlin and received his doctorate from Jena. In 1818, he published *The World as Will and Representation,* which contained the essence of his pessimistic philosophy and which was universally ignored. In 1820, he lectured on philosophy at the University of Berlin and pointedly chose for the time of his class the exact hour at which Georg Wilhelm Friedrich Hegel, then at the height of his fame, also spoke. Virtually no one attended and Schopenhauer soon returned permanently to private life. He became well-known only with the publication of *Parerga and Paralipomena* in 1851 and with the appearance of a long appreciation of his works in the English *Westminster Review* in 1853. Thereafter, he enjoyed the literary fame that he had always felt he merited.

Schopenhauer considered himself a metaphysician in the tradition of Immanuel Kant, but he also rejected the optimism found in the most eminent post-Kantians of his day, especially Hegel. To appreciate his moral views, it is necessary to understand their metaphysical presuppositions. Schopenhauer accepted that Kant had refuted brute forms of empiricism according to which our experiences give us direct knowledge of "things-in-themselves"—objects as they are apart from the observing mind. Kant thus denied that we acquire knowledge simply by passively receiving information from the world. He proposed instead that our minds actively organize our perceptions according to certain a priori categories and that genuine knowledge is impossible without this active mental engagement with the world. Kant had identified these a priori categories as the concepts of space, time, and causality. While Schopenhauer never disputed this formulation, he laid greatest stress on the idea that our conception of time does not directly reflect the world as it is but, rather, is a mental fiction.

For Schopenhauer, this assumption of linear temporality had enormous costs for our species—chiefly the anticipation of death and the general experience of the transience and instability of the world—that were not sufficiently compensated for by the benefits of consciousness. Like Rousseau, he contrasted the happiness of animals, which were unaware of past and future, with the unhappiness of modern humans. Temporality created the possibility of hope, anxiety, striving, loss, and disappointment, among other emotions, without any compensatory increase in physical or mental satisfaction.

Moreover, and more importantly, the a priori of time created illusions from which it is nearly impossible to liberate the mind: first, the illusion that we are highly distinctive as individuals and that this distinctiveness is centered in our consciousness; second, the idea that our desires are fueled by material needs and could therefore be satisfied by the achievement of our goals. In fact, Schopenhauer claimed, vain striving is an inherent property of the will in general. When any particular objective is accomplished, it loses its value to the desirer, who inevitably moves on to another object.

Schopenhauer's pessimism, then, did not consist in the idea of a downward historical trajectory, but rather in the idea that the account of human reason as inherently beneficial, cumulative, or progressive was false. The human condition was, instead, essentially static and marked by irremediable suffering. His ideas thus directly challenged the optimistic Hegelian thesis that world history is necessarily rational and progressive.

According to Schopenhauer, the only appropriate response to the predicament created by Kantian a priori is to cultivate an extreme self-denial that limits unhappiness by containing, to the extent possible, the striving that generated it. An attitude of resignation before the vanity of human aspiration might also make room for moments of transcendence, chiefly through contemplation of art and beauty. These provide at least a partial escape from the bonds of temporality and allow a limited encounter with unchanging things-in-themselves. In spite of the ubiquity of unhappiness, however, Schopenhauer opposed suicide as an act of futility.

Schopenhauer's position was largely laid out in his early work, but *Parerga and Paralipomena* (which means roughly "supplements and omissions") recast a complicated metaphysical argument in a brisk aphoristic style, which contrasted

markedly with the academic prose of more prominent German philosophers. Moreover, in his later work, Schopenhauer included sharp observations on a whole range of activities that were not, strictly speaking, required by his philosophy. Despite the overall posture of pessimism, these aphorisms—on, for example, boredom, romance, literature, and religion—are frequently funny and often inspirational.

Both in his own time and since, Schopenhauer's ideas have often been compared with those of Buddhism. Although he claimed to have developed his position independently, he welcomed the comparison; and his later texts are filled with references to Buddhist works and concepts. His ascetic approach to life is also clearly indebted to the Stoicism of late antiquity. Although he considered himself an atheist, he believed that the moral insights of pessimism could also be extracted from the New Testament if one ignored its theology and metaphysics.

Schopenhauer's influence was vast, especially in the late nineteenth and early twentieth century. His pessimism found inheritors as varied as Friedrich Nietzsche, Sigmund Freud, Martin Heidegger, Albert Camus, Ludwig Wittgenstein, and Theodor Adorno. His aphoristic writing style, however, set a standard for German prose that far exceeded the reach of his philosophy.

SCHUMPETER, JOSEPH (1883–1950)

Often hailed as one of the great economists of the twentieth century, Joseph Schumpeter has exercised considerable influence on political scientists through his *Capitalism, Socialism, and Democracy* (1942). In political theory, he is considered an exponent of a type of democracy variously dubbed competitive, elitist, minimalist, and realist.

Schumpeter was born a subject of the Austro-Hungarian Empire in 1883 (the same year as John Maynard Keynes) and a member of the dominant German minority in a Czech town in Moravia. His mother's second marriage thrust him into the aristocratic circles of the imperial capital, where he received an elite education culminating in a degree in law and economics at the University of Vienna. After practicing law in Cairo and holding university posts at Czernowitz and Graz, he spent several years in Vienna making abortive ventures into politics and business during and after World War I. An appointment at the University of Bonn in 1925 was followed by his move to the department of economics at Harvard University in 1932, where he stayed until his death in 1950.

The Vienna of Schumpeter's early adulthood was a vibrant place for social research, and he cut a distinctively hybrid figure among historians and mathematicians, Marxists and liberals. He was known as an early advocate of the use of theory and mathematics in economic analysis (and later helped to found the Econometric Society in the United States), yet he remained deeply committed to Weberian historical sociology throughout his career. He embodied what has since come to be known as "interdisciplinary research" and "methodological pluralism."

At this time, a professor was not considered above (or beneath) engaging in political intrigue. During World War I, Schumpeter wrote confidential memoranda for the emperor and members of his court that urged the organization of a conservative political party. Its aims were to preserve the empire by staving off absorption into a German-dominated *Mitteleuropa* ("Middle Europe"), and to align with Western powers whose financial aid would be needed for postwar economic reconstruction. Schumpeter called his politics "tory

democracy" in homage to the British system, which he saw as a model for how the bourgeoisie and progressive elements of the aristocracy should cooperate in managing public opinion in support of enlightened policy. These proposals made little practical impact, but after the defeat and dissolution of the empire, Schumpeter was appointed minister of finance for the new Republic of Austria. He lasted less than a year in the job because he was perceived as an obstruction to the government's policy of socializing major industries and seeking closer ties with Germany, and he vowed never to reenter politics.

Instead Schumpeter returned to his academic research on the history of economic thought, the theory of business cycles, and other topics in economic theory. He always stressed the dynamic nature of capitalist development and the pivotal role of innovation. While his early work emphasized the importance of unleashing the individual entrepreneur, his later work viewed "trustified," monopolistic firms as better able to make the massive investments in research and development that spur innovation. These features of his economic thought were crystallized and carried over into political theory in *Capitalism, Socialism, and Democracy*.

The book's main argument was that capitalism would soon be replaced by socialism, but that socialism could in principle serve economic efficiency and political democracy. As ever, Schumpeter distinguished himself as a man without a party: Marxists were wrong about how and when capitalism would fall, and liberals were wrong about what socialism would mean for prosperity and freedom. This was not, as some early readers supposed, a full-throated endorsement of socialism, but rather a basically conservative effort to accommodate unwelcome trends. Schumpeter has remained, for some, a model of a pragmatic counterpoint to Friedrich Hayek's conservatism untethered to a doctrinaire faith in free markets.

Schumpeter's famous critique of democratic theory was part of his case for the compatibility of democracy and socialism. Here he targeted the "classical doctrine" of democracy, an amalgam of nostrums about popular sovereignty and the common good that Schumpeter attributed to no particular author but presumably derived from the likes of Jean-Jacques Rousseau and Jeremy Bentham. To replace this doctrine, Schumpeter defined democracy as nothing more than a method for authorizing decision makers through periodic elections. The essential but often overlooked corollary of this famous formulation is that governments must be allowed to rule with absolute discretion between elections; in turn, elected politicians must be allowed as little interference as possible with the technocrats who manage the economy.

Schumpeter's political theory, then, reflected key elements of his economic thought: The individual economic entrepreneur and the great political leader of his early work gave way to the monopolistic economic firms and the oligopolistic political parties of his later work. What remained constant was an essential elitism: A few superiors should rule and the many inferiors ("subnormals," as he called them later in life) should obey. In other words, his democratic theory was built on classically antidemocratic foundations.

Schumpeter's influence on political science, especially in North America, flows from the elitist assumptions and economic models of *Capitalism, Socialism, and Democracy*. The behavioral school openly embraced his vision of electoral competition among elites as the primary (and almost only) criterion of democratic politics, and the rational choice school openly embraced his modeling of political behavior by analogy with the production, consumption, and advertising of markets. Though his value-free pose has provided a large target for deliberative, developmental, and participatory theories of democracy, his characterization of the centrality of electoral politics has gone largely unquestioned on all sides, even if slightly misunderstood. The paradox is that conventional assumptions about democracy today are still Schumpeter's institutionally but not interpretively: many embrace electoral competition but pass over his denial that elites are (or should be) thereby made accountable to the people, and others embrace electoral competition but decry the absence of other channels for popular expression, but few recognize Schumpeter's basic analytic point that elections are a mechanism purely of selection (popular consent) and not of accountability (popular control).

Science of Politics

Attempts to develop a *science of politics* in the broadest sense of the term can be traced back to Aristotle. His thought on politics combines an emphasis on empirical analysis of systems of government with a teleological ontology and ethical considerations. While Aristotle's thought regains influence after the recovery of key texts in the Middle Ages and the incorporation of certain aspects of his philosophy into Thomistic cosmology, the predominant Christian worldview is at odds with both the feasibility and the desirability of a science of politics. It is only with the onset of the scientific revolution in the sixteenth century that the project of a science of politics is reenvisioned. However, for most important thinkers of the time from Francis Bacon to Thomas Hobbes, a scientific understanding of the world presupposes a break with the assumptions of Thomistic cosmology and Aristotelian science, both of which view reality as purpose driven, either by divine providence or a telos inherent in things. In contrast, Hobbes's attempt of a scientific treatment of politics in *Leviathan* and other works is deeply influenced by the new empirical sciences. Among these, particularly Newtonian physics, which assumes that the universe is made up of matter in motion to be calculated according to general laws that are derived from experiments, leaves a mark on Hobbes's understanding of politics that relies on a materialist ontology, definitional and conceptual rigor, as well as an emphasis on analytical reasoning over normative judgments.

The notion of a science of politics finds considerable support in many varieties of Enlightenment thought, albeit with differing emphases. This is exemplified by David Hume's hope that "politics may be reduced to science" on the basis of eternal political truths, as well as the belief in the possibility of generalizations regarding political matters found in many passages of *The Federalist* and Jeremy Bentham's meticulous "felicific calculus" that is to guide policy making with scientific precision according to utilitarian principles.

At the end of the nineteenth century, the project regains momentum through the growing institutionalization of the various social sciences. From the very beginning, the budding discipline of political science is traversed by conflicts over its identity as a social science. On the one hand, proponents of a nomothetic understanding of science aspire to develop social sciences like sociology or political science into quasi-natural sciences that would yield lawlike generalizations. Influential exemplars of this naturalist view include Auguste Comte, Herbert Spencer, and, more controversially, Karl Marx. On the other hand, defenders of an ideographic science point to the ontological divide between the respective object domains of natural and social sciences. Given that humans enjoy free will and attribute meaning to their own actions and those of others, the social sciences should not attempt to *explain* occurrences like the natural sciences because they cannot hope to generate equivalents to their lawlike generalizations. Instead, they have to aim at an *understanding* and interpretation of meaning (*Verstehen*). Proponents of this view, originating in Germany, are Wilhelm Dilthey and, with important qualifications, Max Weber, whose agenda of a *Verstehende Soziologie* is located somewhere in the middle of this divide.

While there are sustained attempts to develop a science of politics through a better understanding of history or a refinement of the comparative method to be found throughout the beginning of the twentieth century, World War I, economic depression, the rise of fascism and bolshevism, and the Holocaust eclipse the optimism about science, its achievements, and its promises of progress—particularly in the social sciences. Respective critiques of the (social) sciences are developed from various perspectives ranging from the critical theory of the Frankfurt School to the Heideggerian critiques of modernity developed by Hannah Arendt or Leo Strauss.

It is against this background of reservations and skepticism that the protagonists of the *Behavioral Revolution* of the 1950s try to revive the notion of an ambitious quasi-natural science of politics. Influential scholars like David Easton, Roy Macridis, and David Truman chide the political scientists of the first half of the century alternatively for their legal formalism, parochialism, lack of methodological rigor, or thinly veiled normative biases.

Most, if not all, proponents of a behavioral science of politics subscribe to a positivist ontology and epistemology, that is, that there is an intelligible (social) reality that exhibits regularities, which can be known through methodologically rigorous and, if possible, quantitative research relying on observable actions (i.e., facts). The behavioral revolution thus ushered in a new attempt to develop a nomothetic science of politics. Lasting until the end of the 1960s, the behavioralist era is distinguished by an almost unprecedented confidence and determination with regard to the pursuit of a true science of politics that would simultaneously demarcate political science from other disciplines and establish its authority as science vis-à-vis nonacademic political actors.

The challenge to behavioralism arises from critics both inside and outside the movement engendering a constellation that structures the debate about a science of politics to the present day. Building and expanding on similar approaches developed in economics by Gordon Tullock, James Buchanan (of the Virginia School), and Anthony Downs, the so-called Rochester School, under its leading scholar James Riker, pursues their ideal of science through formal modeling with the help of rigorous deductive reasoning and sophisticated mathematics. These rational/public choice and game theoretical models do not constitute a wholesale departure from behavioralism but rather an internal critique of some of its aspects (e.g., inductive reasoning). In contrast, (post-)structuralist critics like Michel Foucault challenge the fundamental claims of the (social) sciences to truth and objectivity by reexamining their history and stressing the power effects of the "scientific" knowledge generated. In a similar way, these notions are questioned by scholars of feminism, postcolonialism, and neo-Marxism, who expose the particularistic biases of the seemingly universal and impartial claims of science.

Today, despite numerous criticisms, the two dominant approaches of the discipline, formal modeling and quantitative statistical analysis, espouse the desirability and feasibility of a scientific understanding of politics.

Scientific Realism

There are, as the philosopher Hilary Putnam has suggested, many "faces" of realism, but most philosophers who subscribe to the label of *scientific realism* argue that scientific theories, including statements about unobservable entities, are basic reality claims and are true or false by virtue of the extent to which they correspond to a mind-independent world, which, they maintain, is more than a regulative ideal. The manner in which realism, in recent years, has found its way into the discourse of political theory and political science is exemplary of a long history of the involvement of these fields with the philosophy of science. This entry examines the impact of logical positivism and logical empiricism on the philosophy of science, the subsequent evolution of scientific realism, and the application of positivist principles to the social sciences.

Logical Positivism and Logical Empiricism

Whether social scientists have wished to embrace or distance themselves from the methods of natural

science, they have characteristically turned to the philosophy of science for an account of the nature of scientific explanation. During the nineteenth and early twentieth century, images of science were porously depicted in the literature of both philosophy and social science. By the middle of the twentieth century, however, logical positivism and logical empiricism (LP/E), represented by philosophers such as Carl Hempel and Herbert Feigl, had been transplanted from Europe to the United States, where this school of thought not only contributed to the institutionalization of the philosophy of science as a distinct field of study, but also established a dominant reconstruction of the logic and epistemology of science that became authoritative for disciplines such as political science.

The program of LP/E, formulated in the Vienna Circle during the early part of the twentieth century, was in part a philosophical challenge, in the name of science, to both metaphysics and traditional social and intellectual authority, but it was also a reaction to the decline of Newtonian theory as a definitive description of the world. Nineteenth-century philosophy and science were already wary of speculative thought, and the subsequent crisis in physics contributed to idea that theories were ephemeral and transient. Although LP/E stressed the nomological and deductive character of explanation, it posited factual observation as the foundation of science and as the basis for verifying or falsifying empirical generalizations. Theories were largely construed as somewhat heuristic cognitive instruments for generating descriptive and predictive statements about observable phenomena rather than as claims about the world that could, themselves, be judged as true or false. The exact nature of what was taken to be the "given" and immediately perceivable observational domain was, however, contested and elusive.

At the apex of its influence, the basic tenets of LP/E were challenged by individuals as diverse in some respects as W. V. O. Quine, Karl Popper, Thomas Kuhn, and Paul Feyerabend. These criticisms, which focused on the character of scientific theory and its relationship to facts and which called into question the "dogmas of empiricism," were deployed by opponents of the behavioral program in mainstream political science. Although the residue of LP/E remained embedded in much of the language of social science, it had, by the last part of the twentieth century, been largely discredited in philosophy, and social scientists, who had taken their cues from the philosophy of science, suffered something of an identity crisis. Questions were raised not only about the unity of scientific method, but about the extent to which the philosophy of science could, in principle, be a resource for the judging and prescribing of the practice of either natural or social science. The collapse of the hegemony of LP/E in philosophy has not been followed by the emergence of another clearly dominant school of thought, but scientific realism is one of the principal contenders in philosophy. Although empiricism, because of its emphasis on observable facts, has sometimes been equated with realism, contemporary scientific realism is defined in part by its rejection of the empiricist account of scientific theory. The LP/E depreciation of the status of theory was, early on, criticized by Vladimir Lenin, who also argued that the focus on sensory experience, as the interface between observers and observed, threatened to devolve into a form of idealism. Realists sometimes claim that their rendition of the logic of science is itself a kind of empirical hypothesis that is supported by the practical success, and progress, of science in explaining, predicting, and controlling natural *events*.

Realism and Antirealism

Philosophical realism is opposed by versions of antirealism that, while also unsympathetic to traditional empiricism, are skeptical of the metaphysical premises of realism as well as the epistemological claim that the truth of scientific theories, and the doctrine of realism itself, is demonstrated by the history and practice of science. Although realists often claim that their account reflects the assumptions embodied in the actual practice of science, antirealists, such as Michael Dummett, argue that much of the conduct of natural science is based on antirealist premises. Antirealists do not revert to the idea that theories are merely tools for economically organizing observable facts, and, like realists, they maintain that theories are often actually about unobservable entities. They claim, however, that the truth value of theories is relative to what is considered to be justified belief in a particular context or, like the "constructive empiricism" of Bas van Fraassen,

that good theories are not necessarily true or at least not literally true.

Kuhn is sometimes categorized, and criticized, as an antirealist because of his argument that factual statements are theoretically constituted, but his position, as well as that of individuals such as Richard Rorty and Nelson Goodman, might be best described as theoretical realism. Kuhn rejected theoretical instrumentalism and maintained that what we mean by the "world" inheres in the theories and paradigms of science, and that it makes little sense to speak of an unrepresented world to which scientific concepts ultimately correspond. While most forms of realism remain tied to the basic premises of representational philosophy that pivoted on the problem of how thought and language make contact with an external world, philosophers as diverse in many ways as Ludwig Wittgenstein and Donald Davidson have rejected such a bifurcation of language and the world.

Although LP/E is now obsolescent, it is difficult to assess exactly where the current weight of opinion resides in the philosophy of science and where the lines are to be drawn as far as parsing the arguments within and between versions of realism and antirealism. The decline of LP/E has, however, prompted a search within the social sciences for a new metatheory. This may be somewhat ironic in view of the fact that, apart from the arguments of Popper, little of the literature in the philosophy of science has been advanced as a metatheoretical foundation for scientific practice. The normative tone of the literature of LP/E may have belied the claim of individuals such as Hempel that their goal was neither to judge nor instruct scientific practice, but, today, most philosophers of science do not present their work as a model for informing practice. In some instances, the advocacy of realism in social science has been in the service of a critique of the residual influence of LP/E, but one of the principal goals has been to establish the explanatory and normative cognitive authority of social science with respect to claims about its subject matter. At the same time, it has been concerned with countering what some believe are the inhibiting relativistic or "constructivist" implications of arguments such as that of Kuhn, which are viewed as undercutting the foundations of metapractical criteria of truth.

Philosophy of Social Sciences

Part of the challenge to positivism in social science emanated from the work of individuals such as Peter Winch, who challenged claims about the unity of science and argued for the logical autonomy of both social phenomena and social scientific inquiry. These arguments, however, like that of Kuhn, called into question, at least implicitly, the epistemic privilege of metapractices such as philosophy and social science. As a response to this contest between what is sometimes referred to as *rationalism* and *relativism,* philosophical realism has been invoked in a number of fields, including social science, ethics, literature, and legal theory. The arguments of the philosopher John Searle are typical of these concerns. Although Searle has advanced a detailed account of the unique character of what he designates as mind-dependent social facts, he has insisted that such facts are constructed on the foundation of a mind-independent reality in terms of which they can be both explained and judged. Two principal, and related, examples of the turn to realism in political inquiry are the work of those who endorse what is often referred to as *critical realism* and those who wish to adopt realism as a metatheory of *international relations*.

Critical Realism

Critical realism arose in opposition to various intellectual currents that seemed to threaten the idea of reality as transcendental datum. So, for example, the term *critical realism* was coined in the early twentieth century by the American philosopher Roy Wood Sellars, whose naturalistic image of science was formulated in opposition to nineteenth-century idealism. The phrase is still used to refer to a general contemporary philosophical argument, but in social theory, "critical realism," in its various incarnations, involves the search for a metatheory devoted to explaining and evaluating social phenomena in terms of the existence of unobservable structures, generative mechanisms, and underlying causal relations. In some cases, this approach builds on the Marxist tradition of structural explanation that, as in the case of Lenin, invoked a realist philosophy of science to underwrite the truth of dialectical materialism, as well as entailed claims about exposing ideological

false consciousness. Although critical realism often seeks support from the literature of scientific realism, much of contemporary critical realism is philosophically eclectic. It is often less a one-dimensional defense of ontological realism than an attempt to reconcile contending postpositivist epistemologies to account for both agency and structure, and yet retains a critical perspective that many believe has been undermined by trends such as postmodernism. Commentators such as Christopher Norris have been adamant in defending realism and the authority of social theory.

One prominent and influential version of critical realism, which has developed into an institutional academic movement, is closely associated with the work of Roy Bhaskar. Stressing the need to take account of both the epistemological and ontological dimensions of social inquiry, he insisted on the ontological independence and reality of the objects of science and their knowability, but also emphasized the contingent and socially situated nature of knowledge. This explanatory project was linked with and informed by a critical and normative goal. Bhaskar has drawn on a wide range of metatheoretical claims, ranging from the philosophy of science to hermeneutics, in order to formulate a program of critical inquiry devoted to a general project of "human emancipation." Although Bhaskar acknowledges the contribution of arguments such as that of Kuhn, which stress the inseparability of scientific concepts and the "world," he criticizes what he claims are its subjectivist and idealist implications and the inability of this approach to adequately explain transformations in science. He defends a form of "metaphysical realism" as a transcendental assumption that would sustain particular claims to knowledge and provide a basis for critical social inquiry.

In political science, and particularly in the study of international relations, the concept of realism often evokes a reference to the work of individuals such as Hans Morgenthau and Kenneth Waltz, who have advanced substantive arguments about the nature of politics that have emphasized power, the pursuit of self-interest, the role of the state, and the anarchical character of the international political system. This, however, should not be confused with contemporary efforts to bring the philosophy of scientific realism and critical realism to bear as a metatheory for the study of international politics.

The Study of International Relations

The application of scientific realism to the study of international relations is, in part, devoted to a critique of instrumentalist accounts of theory. Instrumentalist premises informed the common assumption that social scientific theories were basically somewhat arbitrary conceptual frameworks that were, in themselves, neither true or false nor incompatible, but rather tools to be judged by their utility for generating empirical generalizations that could be tested by reference to observational data. In the case of international relations, as in the case of other aspects of political science, instrumentalist assumptions had become deeply embedded in the field and its various research strategies. Proponents of realism argue for assigning an ontological status to political phenomena and stress explanation in terms of theoretically posited structural causes. Some scholars, such as Alexander Wendt, who have attempted to adapt scientific realism to the study of international relations, treat structure and agency as mutually constitutive rather than insisting on the irreducibility and primacy of structure in the production of social relations. Realist arguments, however, are often coupled with an attack on alternative philosophies of science and especially the current popularity of constructivist approaches to the study of politics that are often associated with assumptions related to the work of Kuhn and various forms of postmodernism and poststructuralism. *Constructivism*, however, much like realism itself, whether self-ascribed or pejoratively deployed, is less the name of a definite philosophical position than a categorical designation encompassing claims to the effect that reality is less a given datum than a function of interpretive frames deployed by both social actors and social scientists.

Much of the discussion about the adoption of philosophical realism in the study of international relations distinctly manifests some persistent problems in the relationship between political inquiry and the philosophy of science. There is typically an intellectual lag between what is happening in philosophy and the echo of philosophical debates that reverberates in the discourse of social science. At the very point, for example, at which realism might be construed as reaching its peak in social theory, its popularity is arguably on the wane in philosophy. Even Putnam, formerly a hard-core

realist and representationalist, has, in the course of a generation, gravitated to internal realism, which closely resembled antirealism, and finally to an embrace of Wittgenstein and what Putnam refers to as "natural" or "pragmatic" realism that entails a rejection of the assumption that it is meaningful to speak of a transcendent reality that both constrains and supports the formulations of science. There are also difficulties revolving around the extent to which social scientists adequately interpret the content and purpose of the literature in the philosophy of science and sufficiently discriminate among various positions. Finally, there is the persistent issue of the general relationship between philosophy and scientific practice, as well as that of the application of the philosophy of natural science to social scientific inquiry.

Scottish Enlightenment

Although authors in the eighteenth century never referred to a *Scottish Enlightenment,* this term has been used since at least 1900 to refer to the significant intellectual flourishing that occurred in Scotland from the union with England in 1707 through the end of the eighteenth century. Having given up its independence and remaining among the poorest nations in Western Europe, eighteenth-century Scotland nonetheless produced such important thinkers as David Hume, Adam Smith, Adam Ferguson, Thomas Reid, Francis Hutcheson, John Millar, Henry Home (Lord Kames), William Robertson, James Boswell, Robert Burns, James Watt, Joseph Black, and James Hutton. The achievements of natural scientists such as Hutton and Black, engineers such as Watt, and literary figures such as Boswell and Burns are among the most important of the Scottish Enlightenment. Political theory today owes most to the groundbreaking work of eighteenth-century Scottish authors in the broad field then known as "moral philosophy." Smith, Hume, Ferguson, and their contemporaries profoundly shaped not only what is now known as moral philosophy, but also much of what is now known as the social sciences and humanities.

The authors of the Scottish Enlightenment were generally personally acquainted with one another, and often united by ties of friendship. Friendship, however, does not imply intellectual agreement. To the contrary, even close friends such as Hume and Smith had serious divergences, and their disagreements with other Scottish luminaries of their time were even more pronounced. Rather than being identified with a set of substantive conclusions, the moral philosophy of the Scottish Enlightenment is better understood as a set of debates on issues of common interest utilizing common methods of inquiry. Universities, gentlemen's clubs, intellectual societies, the Presbyterian Kirk, the legal system, and a vibrant press provided the institutional setting for this intellectual exchange. While related to larger discussions taking place throughout the rest of Britain, continental Europe, and North America, the key moral-philosophical debates of the Scottish Enlightenment retained a number of distinctive characteristics.

The Empirical Method

Sharp disciplinary divisions were unknown in the Scottish Enlightenment, whose leading authors instead took a holistic approach to the broad questions of the day. In order to understand Scottish Enlightenment debates on the topic of moral philosophy, it is therefore necessary to understand Scottish Enlightenment attitudes toward "natural philosophy," or what we would now call natural science. The Scottish moral philosophers explicitly modeled their methods on those of recent natural scientists, most prominently Isaac Newton. They saw their own topics of inquiry as continuous with those of Newton, because broadly moral (i.e., social) phenomena are as much a part of the natural world as physical phenomena and can be examined through analogous empirical methods. The extension of naturalist empiricism to the humanities and social sciences has often been described as the hallmark of the Scottish Enlightenment and contrasted with the aprioristic rationalism that is seen as characteristic of the French and German Enlightenments.

On the title page of his *Treatise of Human Nature* (1739–1740), Hume introduces his work as "an attempt to introduce the experimental method of reasoning into moral subjects." It is important, however, to avoid two misunderstandings that might arise from this subtitle. First, despite his claim to be "introducing" a new method into moral subjects, Hume makes clear that his approach is not to be understood as wholly original. Instead, he credits John Locke, Anthony Ashley Cooper (Lord Shaftesbury), Bernard Mandeville, and the Reverend Joseph Butler, as well as his Scottish mentor Hutcheson, as the "late philosophers in England who have begun to put the science of man on a new footing" (Hume, 2000, p. 5). Second, it is important not to misunderstand Hume's description of his method as "experimental" because neither Hume nor his predecessors were experimental scientists in a contemporary sense. Rather than thinking of the controlled tests of today's laboratories, Hume instead associates "careful and exact experiments" with the "observation of those particular effects that result from . . . different circumstances and situations" (Hume, p. 5). Because experimentation in general is equated with careful observation, in the case of "moral subjects," experimentation will involve close observation of the broadly moral realm—of the social, psychological, political, economic, as well as narrowly ethical phenomena that make up human life.

Observations of such moral phenomena were often drawn from examination of contemporary societies and introspection into the author's own psyche. Equally, however, they could also be drawn from the full record of human events. Scottish Enlightenment authors thus had a keen interest in historiography as a branch of moral philosophy, producing such monuments of historical scholarship as Hume's *History of England* (1754–1762) and Robertson's *History of Scotland* (1759). On the basis of their observations of social phenomena past and present, Scottish authors generally agreed that one could inductively derive a universally applicable theory of human nature, although the precise contours of this nature were a subject of considerable dispute. Once in possession of an accurate, universally applicable theory of human nature, Enlightenment philosophers believed that they could then move beyond the empirical record to deduce what might have occurred in times and places left undocumented, producing works of what Dugald Stewart called "conjectural history." Examples of such conjectural history included Hume's *Natural History of Religion* (1757) and Smith's "Considerations Concerning the First Formation of Languages" (published with the third edition of his *Theory of Moral Sentiments* in 1767). Some, such as Ferguson, questioned the reliability of much of this conjectural history, but even Ferguson himself included considerable conjectural material alongside the empirical elements of his *Essay on the History of Civil Society* (1767).

Despite their emphasis on the importance of empirical observation and what may be justifiably conjectured on the basis of this observation, no author of the Scottish Enlightenment limited himself to mere description of social phenomena in the manner of later, value-neutral social scientists. Even Hume—now famous for his sharp distinction between "is" statements and "ought" statements—argued that accurate empirical description must be put in the service of informing normative evaluation and ultimately improving the conditions of society. While their opposition to revolutionary social change has led many to see the Enlightenment Scots as politically conservative when compared to their more radical French contemporaries, few

deny that the Scottish Enlightenment was infused with a commitment to practical reform.

Metaethics and the Moral Sentiments

Despite the broad scope of what was then known as "moral philosophy," many of the authors of the Scottish Enlightenment had a central interest in ethics in the narrower sense as well. Most of the moral philosophers of the Scottish Enlightenment were united in their opposition to Thomas Hobbes and Bernard Mandeville's position that morality is the self-interested invention of atomized individuals. Despite their common belief in the natural sociability of humanity, however, the authors of the era were divided on what might now be called questions of metaethics. In keeping with the general empiricist spirit of the Scottish Enlightenment, metaethics was not treated as a branch of a priori metaphysics or the philosophy of language, but primarily as a matter of empirical moral psychology. Rather than seeking a transcendental authority for morality or analyzing the nature of moral language, Scottish Enlightenment philosophers instead sought to determine what power or faculty of the human mind is responsible for our natural sociability and the ethical judgments that this sociability requires. The central metaethical debate of the time revolved around whether moral judgment is an activity of the faculty of reason or whether it is instead the work of some form of moral sense or sentiment.

Given the prominence of moral sentimentalists such as Hutcheson, Hume, and Smith, the Scottish Enlightenment as a whole is often associated with the rejection of moral rationalism. Although they differed among themselves as to how precisely the moral sense or sentiments operate, all three of the most prominent moral philosophers of the Scottish Enlightenment agreed that pure reason alone is powerless to discern moral distinctions or motivate moral conduct. Instead, Hutcheson argued that moral judgment is the work of a special sense akin to sight or hearing. Hume and Smith argued that morality is the product of sentiments that draw on the powers of the human mind as a whole—including not just reason, but also imagination, emotion, and, most importantly, the imaginative sharing of emotion that they call *sympathy*. Hume argues that our sympathetic participation in the welfare of our fellows leads us to approve of character traits that are useful or agreeable as virtues, while disapproving of their opposites. In Smith's variation of this view, it is our sympathetic participation in the warranted feelings of others that leads us to approve of these feelings as virtuous and proper, while our failure to share sympathetically in others' unwarranted feelings leads us to disapprove of them. Hutcheson, Hume, and Smith remain the inspiration for sentimentalist positions in moral philosophy and political theory to this day.

Moral sentimentalism, however, was always a minority view during the Scottish Enlightenment. More popular were forms of moral rationalism, often drawing on the earlier rationalist ethics of English philosophers such as the Cambridge Platonists (most prominently Ralph Cudworth), Samuel Clarke, and William Wollaston. In the wake of the sentimentalist critique of these forms of moral rationalism, Scottish philosophers of the "common sense" school sought to defend the doctrine in a more modest form. Foremost among them was Thomas Reid, who argued that the feelings of moral sentiment are a product of moral judgment rather than an integral element of moral judgment itself. As with his responses to Hume in the fields of metaphysics and epistemology, there are considerable parallels between Reid's responses to moral sentimentalism and the even more influential views of Immanuel Kant.

Normative Political Theory and Natural Jurisprudence

The normative political theories developed in the Scottish Enlightenment represented a sharp break with many of the intellectual traditions that had previously dominated European thought on the topic. Hume's adamant rejection of the concept of a social contract represents one of the few times that the controversial philosopher succeeded in convincing the majority of his contemporaries to join him in his views and remains highly influential to this day. Most authors of the Scottish Enlightenment also joined Hume in rejecting civic republicanism in the Machiavellian mold, seeing neo-Roman politics as incompatible with modern commercial society. Andrew Fletcher of Saltoun had earlier attempted to apply the civic republican tradition to the modern Scottish context in his

Discourse of Government with Relation to Militias (1698), but Fletcher's heated opposition to union with England led him to be marginalized by the pro-union philosophers who followed. Although some civic republican themes remain throughout the normative political theory of the Scottish Enlightenment, perhaps most prominently in Ferguson's work, the greatest influence on Scottish political theory at the time was the modern theory of natural law earlier developed on the continent by Hugo Grotius and Samuel von Pufendorf. The central political debate of the Scottish Enlightenment thus focused on the question of whether natural jurisprudence in Grotius's sense might yield a naturally authoritative theory of political justice, or whether justice must instead be understood as inherently "artificial."

The debate over whether justice is natural or artificial interacted in complicated ways with the debate as to whether morality is a product of reason or sentiment. The majority who believed reason capable of providing authoritative personal morality generally also believed that reason could legislate universally valid natural laws. The moral sentimentalists, however, were more divided. Hutcheson and Smith, in their different ways, both saw justice as a natural outgrowth of human nature. Hutcheson equated justice with benevolence, which is naturally approved of by our moral sense, while Smith saw our commitment to justice as a natural outgrowth of our sympathy with the warranted resentment felt by victims of injustice. Both then went on to outline distinctively sentimentalist versions of natural jurisprudence. Hume, by contrast, argued that justice could not be the direct product of our moral sentiments, because strict justice often requires behavior that these sentiments are naturally prone to condemn. Justice, in his view, instead involves obedience to artificial social conventions. Yet in contrast to later "social constructivists," who sometimes argue that the artificiality of our practices is reason to doubt their authority, Hume argued that the conventions of justice are to be treated as morally obligatory by virtue of their indispensable utility.

Political Science and Political Economy

Although Hume devoted an influential essay to the question of whether "politics may be reduced to a science," the authors of the Scottish Enlightenment devoted surprisingly few works exclusively to what we would now recognize as descriptive political science. This is not to say that authors of the period were uninterested in the topic. To the contrary, under the influence of the baron de Montesquieu's *Spirit of the Laws* (1748), Scottish authors devoted ever-increasing energy to descriptive political questions. In keeping with the interdisciplinary tenor of the period, however, the empirically observed regularities of political life were woven into larger works on history, ethics, jurisprudence, and, most importantly, political economy. Adam Smith is famous for his centrality to the emergence of the last of these disciplines, but other Scottish Enlightenment authors, such as Hume and Sir James Steuart, played important roles as well.

In contrast to many economists today, the political economists of the Scottish Enlightenment paid considerable attention to the way that markets are embedded within larger sociopolitical structures. Smith and his contemporaries emphasized how the modern commercial economy was the contingent product of broader historical developments, in which universal psychological principles guided human beings through an evolving series of social contexts. Smith influentially argued that there are four primary stages in the development of human societies, each determined by the dominant form of economic activity: first the age of hunters, second the age of shepherds, third the age of agriculture, and fourth the age of commerce. Variations on this stadial theory of development are then found in the works of Ferguson, Millar, and Kames, among many others. Although none of these authors departed from the Scottish Enlightenment consensus that the fundamental psychological principles of human nature are basically constant, all argued that the social, political, and economic generalizations that accurately capture the reality of one stage of human development cannot be applied directly to other, different stages. This aspect of the political economy of the Scottish Enlightenment was to have more influence in the later development of sociology, anthropology, and political science than on that of economics. Yet one would be hard-pressed to find a field across any of the humanities or social sciences today that does

not bear some traces of ideas first developed in eighteenth-century Scotland.

Secession

The term *secession* is normally employed to refer to a situation where a community breaks away from its present state and founds its own independent state that then has jurisdiction over the territory that is said to belong to the seceding community. There have been numerous instances of secession. The early 1990s, for example, saw the break-up of the USSR and Yugoslavia as many national communities seceded to form their own states. Other minority groups in other parts of the world (including some Basques, some Quebecois, and some Scots) continue to make the case for secession. South Ossetia has sought to secede from Georgia, but this has not been recognized by many other states. Of course, further back in history, 11 southern states in the United States attempted to secede from the Union, leading to the American Civil War.

These cases raise the question of whether secession is justified and, if so, when. A number of different arguments have been made for secession.

Some have provided individualist arguments for secession. Harry Beran, for example, starts from a commitment to individual liberty. On his view, people have rights over themselves and it follows from this that they can choose to secede and form a new state. Some find this argument unpersuasive. They agree that liberty is a fundamental value, but they deny that this entails that people may secede. Rather, they hold, it entails that the existing state has a duty to uphold people's individual rights and hence is legitimate insofar as it entrenches liberal rights.

A second type of argument for secession appeals to the ideal of national self-determination. Why should we value national self-determination? The fullest modern defense comes from David Miller in *On Nationality* (1995). Miller argues that for many people, membership of their nation is an important good and hence enabling national self-determination furthers their well-being. He further argues that people value group freedom, and so for this reason they may also value national self-determination. In addition to these two arguments, Miller also argues that political institutions function better where their members have a sense of solidarity with one another and that because nationality provides this sense of solidarity, it is better to have nation-states than multinational states. Now if these arguments are persuasive, then one might argue that the good of national self-determination provides a case for secession.

The first two types of argument have maintained that a community is entitled to secede even if its current state is not treating it an unjust way. A third type of argument for secession takes a different tack and argues that secession can be justified because, and to the extent that, it is the best way of protecting the fundamental rights of a persecuted minority. Some argue, for example, that East Pakistan's secession from Pakistan in 1971 to form Bangladesh can be justified on the grounds that it was needed to protect the rights of those in East Pakistan.

A strong version of this third approach is defended by Allen Buchanan in his important

work on secession and, in particular, in his *Justice, Legitimacy, and Self-Determination* (2004). Buchanan's approach has two distinctive and interesting features. First, he argues that secession is justified only if it is needed to prevent one state treating a group within it unjustly. If a state treats its members fairly, then they do not, in Buchanan's view, have a right to secede. Buchanan terms this a "Remedial Right-Only Theory" (2004, p. 350 and following). Buchanan terms the earlier individualist and nationalist arguments "Primary Right Theories" (2004, p. 350 and following) because they, unlike the Remedial Right-Only Theory, affirm a basic right to secede even where there is no current injustice. Second, Buchanan argues that our focus should not be on whether states are morally entitled to secede but rather on whether international law should be constructed so as to allow groups to secede or not.

Many resist the case for secession. A number of different objections are made. First, some object that secession may lead to the unjust treatment of minorities within the newly created state. Nationalist movements that secede, it is argued, often wish to create a strong sense of national unity within their state and this can lead to the unfair or illiberal treatment of new minorities. Second, some object that to allow groups to secede is problematic because it is often hard to define the members of the group in question. Furthermore, they argue, it is hard to specify who should and who should not be included in any democratic decision determining who is entitled to secede. Third, and related to this last point, many argue that allowing secession results in instability and can fuel conflict.

Proponents of secession often respond that while these are forceful concerns, they do not entail a complete repudiation of secession because there will be some secessions that will result in neither injustice nor instability. On this view, the concerns raised are relevant not because they refute the case for secession, but because they should inform our understanding of when secession is justified.

Drawing on this, some argue that secessions can be justified only if they do not lead to persecution and injustice and only if they do not destabilize other legitimate states. Some might add to this that secessions may be permissible only if they do not lead to greater injustice within the original state. Finally, many would add that secession can be permissible only if there is an equitable distribution of resources between the new state and the state from which it is seceding. This raises some thorny questions: Who owns the natural resources contained within the territory of the seceding group? What principles of justice should govern the distribution of the benefits created by their association in the past? Such issues cannot be avoided, and an adequate theory of secession must address them, along with the other conditions.

Sen, Amartya (1933–)

Amartya Sen is one of the most influential contemporary economists. His work spans a range of disciplines, including political and moral philosophy, social choice theory, development studies, and welfare economics. Sen has written on famines, theories of justice, democracy, freedom and liberties,

classical and neoclassical economics, development, identity and conflict, the history of ideas, and many more topics. In 1998, he was awarded the Nobel memorial prize in economics. Outside academia, his ideas have greatly shaped the human development approach, a development paradigm that advocates a shift from a narrow economic definition of development to a focus on all constitutive dimensions of the well-being of human beings.

Sen was born in Santiniketan, India, on November 3, 1933. He spent much of his first formative years at the progressive school of Rabindranath Tagore, the 1913 Nobel Laureate in Literature. As a child, Sen witnessed a deadly case of communal violence, which has had a formative influence on him. He saw how a Muslim daily laborer, who had come to a predominantly Hindu area to look for work, was murdered. This childhood experience has made him aware of the dangers of narrowly defined identities, but also of how extreme poverty can make a person vulnerable in other areas of human freedom, such as those of moving around safely. Although in the first decade of his academic career he would focus more on technical subjects, especially social choice theory, his later work would be devoted primarily to issues of poverty, inequality, development, democratic pluralism, and related topics.

Sen studied economics at Cambridge University. His doctoral dissertation was published in 1960 under the title *Choice of Techniques*. Sen has stayed all his life in academia, and worked at Trinity College in Cambridge, MIT, the Delhi School of Economics, the London School of Economics, Oxford University, and Harvard University, where he currently has appointments in both the economics and the philosophy departments.

The publication of Kenneth Arrow's famous impossibility theorem prompted his interest in social choice theory. Arrow had shown that all possible voting systems will violate some elementary norms of democracy. Sen considered social choice theory to be concerned with fundamental political-philosophical questions, because it tried to answer how, in a society with a wide diversity of views and preferences, collective decision making could be done in a justified and legitimate way. Put slightly more technically, Sen was intrigued by the question how individual preferences could be aggregated into a collective decision, without creating paradoxes or inconsistencies, and thus leading to what social choice theorists call impossibility results. His classical book *Collective Choice and Social Welfare* builds on Arrow's pioneering work and includes an analysis of the conditions under which the majority rule does not lead to indecisive outcomes. For his work in welfare economics, and social choice theory in particular, Sen was awarded the Nobel memorial prize in economics in 1998.

Another important area of Sen's work is the analysis of justice, poverty, and inequality. In this field, Sen has contributed both to the advancement of measurement problems, to philosophical issues, and to empirical research. He proposed a new poverty measure, which was not only taking into account the number of people living below the poverty line, but also how deeply they are living in poverty and the distribution of poverty in the population. He also contributed to the technical literature in welfare economics that is concerned with inequality measures. While most economists limited their poverty and inequality measurement to one-dimensional metrics (like income or expenditures), Sen emphasized the need to rethink the implicit normative assumptions behind these mainstream methods. He argued against the equation of economic inequality with material or income inequality, arguing instead that our focus should be on what people are genuinely able to do and be, which he labeled their "capabilities." In the area of theories of justice, Sen argued that capabilities provide a better metric of justice than the social primary goods that John Rawls proposed. By now Sen's work on the capability approach has become popular among academics across the humanities and social sciences as a framework for inequality, justice, development, and poverty analyses.

In his book *Development as Freedom,* Sen used the capability approach as the general framework to argue for a complex, multidimensional, and noneconomistic approach to development. That view has also been taken up by the United Nations Development Reports, which annually conduct an analysis of the progress made by countries in the world in terms of people's capabilities, rather than just a country's economic growth. The capability approach thus had a major practical impact, through its translation in the human development

approach and the policy research done by the United Nations offices throughout the world.

Already in the 1970s, Sen was a famous and respected economist. He has used his status both within and outside academia to draw attention to causes that he cared much about. One such cause was women's position in society, especially in societies where their position is extremely bad. He estimated that in Asia more than 100 million women are "missing," in the sense that there are at least 100 million fewer females alive than there would be if there were no human bias against women, girls, and female fetuses. Sen has also written about the importance of democracy for development, and has argued against the alleged tension between democracy and economic development. More recently he has written on the politics of identities, whereby he argues for the recognition of the multiple identities that people can have, and for the view that people have considerable choice over their identities. Sen has stated that he knew from early on in his life that he did not believe in the existence of God, and has strongly defended religious tolerance, especially in societies where the government tries to establish one religion in a dominant position.

Justice, human diversity, democratic debates, helping the most vulnerable, and respect for people's liberties and freedoms are just some of the major themes in Sen's work. While he started out as an economist, Sen gradually transformed into a truly all-around scholar whose work stretches across the social sciences and the humanities. At the end of 2008, he celebrated his 75th birthday, announcing that in 2009 he would publish a new book, *The Idea of Justice*.

Separation of Powers

The *separation of powers* is the principle of political philosophy and constitutionalism that distributes governmental power among branches to limit power and secure liberty, and to promote good government through a division of labor. Its familiar form distinguishes legislative, executive, and judicial branches in liberal democracies. It is related to other Western constitutional principles, including the mixed regime, balanced constitution, and checks and balances. Separation of powers defines *presidential* more than *parliamentary* systems, because the former separate legislative and executive powers while the latter fuse them. However, separation is important even in parliamentary constitutions, which typically include a judiciary and agencies or civil service bodies independent of parliament and cabinet. The view that justice requires prevention of the concentration of power, security for individual and communal liberty, and competence through distributing distinct functions to distinct branches is now basic to many forms of constitutional democracy and free politics. However, the principle faces challenges from the rise of mass democracy, modern parties, and the administrative or bureaucratic state.

The principle of dividing power for both negative reasons (to prevent concentration and abuse) and positive ones (to achieve balance in a complex order and a division of labor) stems from classical and medieval philosophy. Aristotle's *Politics* (fourth century BCE) praises functional separation into the deliberative body (legislative), offices (magistrates), and courts. Polybius, in his *Universal History* (second century BCE), praises Rome's republican constitution for mixing monarchy, aristocracy, and democracy in its array of consuls and magistrates, the senate, and tribunes of the people and popular assemblies. In the medieval era, Thomas Aquinas (thirteenth century CE) endorses a mixed constitution, with a monarch balanced by aristocratic offices and courts but with the people

electing all. English common law jurists such as Sir John Fortescue (fifteenth century CE) advocated a royal-and-political constitution in which the monarch rules under law and shares power with other bodies to secure justice and prevent tyranny. During the English Civil War and constitutional conflicts of the seventeenth century, the critics of royal absolutism developed the common law tradition and earlier models by advocating a clear separation of legislature (the commons and lords) and monarch, while some characterized these three bodies as a proper balance of democracy, aristocracy, and monarchy.

The modern liberal philosophers John Locke and the baron de Montesquieu drew on these ideas when affirming the rule of law, and a constitution organizing distinct offices, as indispensable conditions of a just and limited government. However, their new versions of a distribution of powers emphasize the securing of rights or liberty. Locke's *Second Treatise* (1690) formulates a mostly negative theory that the legislative and executive powers (the latter coupled with a "federative" power for foreign affairs and war) must be separate to prevent concentration of power and threats to individual rights. Locke prescribes a leading role for a unicameral legislature given its root in popular consent, but also emphasizes executive prerogative to address domestic or foreign contingencies outside of stated rules. The inevitable conflict between two such powers, coupled with Locke's principle of a popular right of revolution, does not prize stability and balance as had the ancient, medieval, and common law models.

Montesquieu, in *The Spirit of Laws* (1748), draws on Locke but also earlier Western principles to develop a complex separation of powers that seeks liberty and moderation. This guided the framers of America's constitution and provides the tripartite form familiar today. One of Montesquieu's innovations is an independent judiciary that protects individual liberty by preventing legislative or executive violations of rights. Generally, he argues that if any power exercises another—the legislative by executing its laws or judging cases at law, the executive by making laws or adjudicating them, or judges either making laws or enforcing them—then liberty is threatened, because interest and power would overwhelm rule by law. Human nature is such that even virtue needs limits and even the most qualified must share power. Thus, Montesquieu also introduces legislative bicameralism and federalism to the theory—the latter a vertical separation to complement the horizontal one within a government—and also the partial sharing of powers now called checks and balances (e.g., executive veto of legislation). He nonetheless retains something of the traditional, positive view that distinct functions are better performed if separated, particularly executive and judicial power. He also analyzed parties and factional thinking as consequences of a complex constitution, describing the benefits and perils for both individuals and society of such a system of liberty.

Montesquieu's conception influenced American thought both directly and through the jurist Sir William Blackstone. The latter's *Commentaries* (1765–1769) was the basic authority on law in America through the nineteenth century and cites Montesquieu when declaring liberty the first principle of a just constitutional order, with a complex form its indispensable means. However, the debate over the 1787 Constitution pushed its advocates to develop a fuller theory of separating powers, functions, and office holders. Alexander Hamilton and James Madison, in *The Federalist* (1788), elucidate the principle itself ("Federalist 47"–"Federalist 51") by explaining how separation paradoxically requires some sharing of powers (to check and balance), and how separation complements both freedom for factional interests and federalism to produce a complex, contentious system of liberty. Subsequent essays on the senate ("Federalist 62"–"Federalist 66"), executive ("Federalist 67"–"Federalist 77"), and judiciary ("Federalist 78"–"Federalist 83") expound the need for constitutional spaces to foster sober legislating, statesmanlike execution, and professional adjudication. Publius includes the innovation of judicial review in this positive conception, and generally defends the not-so-democratic elements that moderate majority tyranny and short-range, populist policies.

Critics since the late nineteenth century (e.g., Walter Bagehot and Woodrow Wilson) argue that separation of powers produces gridlock and disunity, is unresponsive to democratic opinion and progress, and resists the efficiencies of modern administration. Many political scientists praise the fusion of powers in parliamentary party governments or bureaucracies, or argue

that America's Constitution has been pragmatically but not formally amended to adopt fusions that promote equality and progress. However, Alexis de Tocqueville's *Democracy in America* (1835) is widely admired today for its insights into the strengths and pitfalls of modern democracy, and he praises a separated constitution for fostering citizen participation and liberty, a thriving civil society, and protection of individual rights, while he warns against a centralized, efficient state responsive to democratic pressures for equality and progress. Tocqueville does diagnose maladies of the modern liberty promoted by a separated constitutionalism, but recommends moderating these rather than adopting a new order.

Shari'a

In literal terms, *Shari'a* translated from the Arabic means "the path to water." In common usage, it is used to denote Islamic jurisprudence or law. However, as recent scholars like Professor Khaled Abou El Fadl have pointed out, there are some central conflations surrounding the definition of the term and its symbolic versus jurisprudential connotations. This entry examines the meaning of Shari'a, its historical development, and current issues in Islamic jurisprudence.

In representative terms, Shari'a is the symbol for the collective effort of Muslims to understand what God wants from human beings. It is this symbolic aspect of Shari'a that is operative in the idea of the Muslim community, or *ummah,* and is envisioned as the glue that draws the faith community together despite its ethnic and national diversity. In jurisprudential terms, Shari'a points to the use of a particular science of jurisprudence *(fiqh)* to arrive at the discernment of Divine Will. Distinguishing between these two aspects of Shari'a is crucial in evading a conflation that has been exploited politically throughout Islamic history in an effort to lend legitimacy to various legal or political systems. The first symbolic aspect of Shari'a requires a consensus in the belief by all Muslims. The second aspect, however, the particular application of the *fiqh* and the determination of matters using both human and divine sources, has always been a point of contention among Muslims and is reflected in the plurality of jurisprudential methods and opinion.

In jurisprudential terms, Shari'a differs from Western systems of law in that pronouncements made through the application of Islamic jurisprudential method have both a transcendent and an empirical significance. While there are disagreements on the specifics of rulings, Islamic legal scholars agree that the edicts of Shari'a are generally believed to be binding on all Muslims. In this sense, the pronouncements of the Muslim jurist represent the interface between the eternal and the temporal.

Within the framework of Islamic law, the divine sources of Shari'a are the Qur'an and the Sunnah, the latter being the traditions of the Prophet Muhammad. *Ijma,* or scholarly consensus regarding these sources, was a corollary to these divine sources. Human sources of Shari'a include *qiyas,* or analogical reasoning, and *ijtihad,* or individual intellectual effort. In addition to these human sources, the role of local custom, or *urf,* is varyingly acknowledged by various Islamic scholars as a basis of legal decision making when it does not contravene principles available through the other sources.

History of Islamic Jurisprudence

Records of the development of Islamic legal history have not generally been developed in tandem with

the social and political contexts in which they developed, owing perhaps to the conceptualization of Shari'a as an amorphous metaphysical ideal existing independently of the historical context. In the early Medinite Caliphate, most disputes were resolved by the Prophet Muhammad himself. Following his death, in the time of Caliphs Abu-Bakr, Umar, Usman, and Ali, most disputes were again resolved by the ruler, a task that was made possible both by the proximity of the Caliphs to the revelations of the Qur'an and to the Prophet and the small size of the Muslim community itself. During this time, if Qur'anic injunctions on a matter did not exist, customary law was used to fill in the chasm. In some cases, even when Qur'anic injunctions did exist, principles of equity were applied by the caliph when he felt the contextual rules specified in the Qur'an did not apply. The Umayyad Caliphate (661–750 CE) was the first to establish actual administrators or Qazis for dispute resolution as the expanding Islamic Empire, including Persian and other non-Arab subjects, required greater administrative governance. The Abbasid Caliphate (750–1258 CE) saw even more territorial expansion, resulting in the systematization of Islamic law in response to the growing needs of a global empire and the diversity of its subjects. The four Sunni schools of thought, Maliki, Hanafi, Shafii, and Hanbali, were named after the four eminent jurists around whose work they developed. Also emerging during this time were the Shi'a schools of jurisprudence and the Jafari and Zaidi schools, which achieved the most prominence.

During the Abbasid Caliphate and extending later into the Ottoman Empire, Islamic jurisprudence saw the development of an independent jurist class that both legitimized and served as a check on executive power. However, with the official end of the caliphate in 1924 and the arrival of colonial powers in most Muslim lands, the power and intellectual vibrancy of this class was severely eroded. Over the years that followed, many Muslim countries opted for secular, Western-style legal systems leading to the stagnation of Islamic law and the devolution of the jurist class as an independent cadre to check executive power.

Contemporary Developments

In recent history, many postcolonial states such as Pakistan, Sudan, and Somalia declared themselves to be Islamic states. Islamic jurisprudence or Shari'a was thus put to the service of a variety of nationalistic and political causes. The use of Shari'a as a means of legitimizing political power with an emaciated jurist class led in turn to the subordination of jurisprudence to political power. Of particular note have been efforts of fundamentalist groups to present Shari'a as an antimodern system, devoid of method and plurality and based only on literal application of Qur'anic injunctions. These efforts have been challenged by emerging Islamic scholars who recognize the need for reinvigorating the intellectual diversity and methodological acuity of Islamic jurisprudence.

Muslim communities around the world are currently engaged in varied debate regarding the role of Shari'a within the state and its implications for democratic systems of governance. Of particular interest to theorists are intersections where ideas and theories of multiculturalism meet with claims for accommodation of Shari'a tribunals in the United Kingdom and Canada. The work of Muslim female scholars to interpret Shari'a in a way that retains the legitimizing methodology of tradition while renouncing the patriarchal influences of culture is another area worthy of further study for political theorists.

Sidgwick, Henry (1838–1900)

Henry Sidgwick was a Victorian-era British philosopher, political economist, parapsychologist, and educational reformer who played a seminal role in both the academic organization of Cambridge University and the growth of modern academic ethical and political theory, particularly utilitarian ethical and political theory. He has been widely credited with enhancing the professionalism of academic higher education and with opening up educational opportunities for women. He has also been widely credited with providing the philosophy of classical utilitarianism—the ethical and political philosophy of Jeremy Bentham, James Mill, and John Stuart Mill, which made the normative bottom line the greatest happiness of the greatest number—with a sophisticated, comprehensive, and academically satisfying statement, especially in his major work, *The Methods of Ethics* (1974). Highly influential political philosophers of recent decades, notably John Rawls and Peter Singer, have, for all their disagreements, agreed on taking Sidgwick's classic work as a touchstone for their own projects, which can often be helpfully classified by how they either continue or oppose the positions set out in Sidgwick's *Methods*.

Foundational Questions

Sidgwick was clearly a brilliant, skeptical, and ethically scrupulous individual, and these traits are evident in his major works and many essays and reviews. He had a markedly successful education at Rugby and Trinity College in Cambridge, where he excelled in both classics and mathematics, joined the famous discussion society known as the "Apostles" and early on became a Fellow and Lecturer, though his career trajectory suffered a certain temporary inconvenience when he resigned his Fellowship in protest over the requirement that he take an oath accepting the Thirty-Nine Articles of the Church of England. By the early 1860s, he had grown profoundly skeptical of the orthodox Christianity that he had imbibed from his first mentor (and brother-in-law), E. W. Benson, who would become Archbishop of Canterbury. Cambridge University devised ways to harbor Sidgwick while he harbored his doubts, and in due course, as the times caught up with him, he was made Knightbridge Professor of Moral Philosophy.

Still, Sidgwick's religious skepticism would prove to be painful to him in the extreme, and most of his deepest intellectual and scholarly commitments were at least in part attempts to address such skepticism and the future decline in religious culture that it suggested.

Thus, the *Methods,* although cast as an impartial, dispassionate, scholarly inquiry into the comparative merits of the leading ethical approaches, or "methods," by which people reason about how they ought to act (common-sense or intuitional morality, egoism, and utilitarianism), was also, to Sidgwick's mind, an important effort to discover compelling secular rational grounds for morality, acceptable to reason independently of religious orientation. Deeply impressed with the successes of science from Isaac Newton to Charles Darwin, Sidgwick hoped that philosophical inquiry might adopt something more akin to the scientific outlook, with a greater commitment to impartial search, as opposed to the promulgation of standing moral and religious positions—something that he rightly regarded as hampering the growth of philosophy as an academic discipline. But he also hoped that such impartial inquiry would produce some compelling results, foundations to replace the crumbling religious ones. In this he was disappointed.

It is in fact one of the great paradoxes of Sidgwick's *Methods* that, although he personally identified himself as a utilitarian, and although the description of utilitarianism in Book 4 of that work is commonly taken as the best statement of the position ever, Sidgwick did not think or claim that he had succeeded in providing his favored view with the needed epistemological or rational defense. To his satisfaction, his impartial inquiry had demonstrated how the utilitarian position could absorb and explain the precepts of common-sense or intuitional morality: such familiar prohibitions as "don't steal," "don't lie," and "don't murder" obviously have great utilitarian value. The way to realize the greatest happiness in society would often be indirect, with the bulk of the people in most circumstances deploying decision procedures involving the common-sense precepts, rather than trying to calculate the consequences in each case for the greatest happiness. The more fundamental

utilitarian principle was needed for—and its deeper justification made evident by—problem cases or dilemmas involving conflicts between such precepts, conflicts that, to Sidgwick's mind, pointed to how most people are unconscious utilitarians, ready to adopt that principle at the more fundamental level. But, to his consternation, he could not persuade himself that any of his arguments could defeat the rational egoist. After all, why is it always and only rational to promote, directly or indirectly, the greatest happiness of all, instead of one's own greatest happiness? Why take "the point of view of the Universe," in which one is just one source of value in addition to all the others with equal claim?

The *Methods* is a work that details the most basic principles or candidate axioms for all of these seemingly rival views with remarkable care. Unlike Bentham or the Mills, Sidgwick adopted the epistemology of utilitarianism's common-sense or intuitional rivals, seeking to find the key axioms embedded in each "method" that, by virtue of being clear and distinct, coherent with other justified axioms, and capable of producing consensus among rational inquirers, might make a plausible claim to self-evidence, or at least apparent self-evidence. Sidgwick's epistemological intuitionism is somewhat unusual in finding a place for the type of fallibilism more characteristic of empiricist approaches, allowing that even claims to self-evident truth for an ethical axiom needed to be regarded as tentative and subject to revision. His complex and original views on moral epistemology have proved to be fertile ground for conflicting interpretations of his work, with some commentators playing up the foundationalism of his rational intuitionism and others, notably John Rawls and J. B. Schneewind, emphasizing the similarity to a search for "reflective equilibrium," an ongoing critical effort to balance general principles and particular cases in a satisfactory way.

However, many other sides of the *Methods* have also yielded rich harvests of controversy. Sidgwick's detailed account of utilitarianism provided most of the material for future philosophical debates over the meaning and viability of any such view, articulating such key topics as total versus average utility (made conspicuous by the problem of calculating the happiness of future generations and optimal population growth), direct versus indirect approaches (or the utility of acts versus rules versus decision procedures versus attitudes, etc.), and hedonistic versus nonhedonistic value theory. Like Jeremy Bentham, Sidgwick favored a form of hedonism as the best interpretation of the "good" or "welfare," arguing that the best account of ultimate value, the thing utilitarianism should be maximizing, is pleasure or pleasurable/desirable states of consciousness. But unlike Bentham, Sidgwick recognized the force of the criticisms of hedonism coming from ideal or "objective" accounts of the good or welfare, from views such as those of his friend T. H. Green, an early British idealist deeply influenced by German philosophy from Immanuel Kant to Georg Wilhelm Friedrich Hegel. If Sidgwick was doubtful about how secure the foundations of utilitarianism in general were, with its call to maximize good, he was even more doubtful about how secure the foundations of its value theory were, with its claim that the good was pleasure. And, again unlike Bentham, these doubts were heightened by an acute awareness of the falsity of psychological egoism, or the view that people just did, as a matter of fact, seek to maximize their own pleasure, and of the inadequacies of either invisible or visible hand mechanisms, the market or government, for happily reconciling the conflicts between individual and general happiness. One could say that Sidgwick succeeded in laying bare the fundamental and inescapable normative conflict between pursuing one's own happiness and pursuing the happiness of all, and the confusions swirling around the whole notion of happiness or ultimate value in the first place. He was not happy with his achievement.

Parapsychology

Sidgwick dealt with his most fundamental ethical and religious doubts in a rich array of ingenious ways. He hoped to use the forces of science against science itself, or at least against the more materialistic, antireligious side of science that became prominent in the Darwinian era. Thus, believing that there were grounds for thinking that scientific methods of inquiry might vindicate the reality of telepathy and personal survival of bodily death, he devoted an extraordinary amount of time and energy to parapsychology, or "psychical research,"

in due course becoming a cofounder and founding president of the British Society for Psychical Research. But, despite endless hours spent investigating claims about ghosts, premonitions, and other paranormal phenomena, his skeptical intellect ended up concluding, after many ups and downs, that the evidence was not yet there and that this possible route for reconciling the individual and collective good in the happy hereafter was not as promising as he had at first thought. But historically speaking, it can justifiably be said that whatever intellectual respectability parapsychology has ever had is in significant measure due to Sidgwick and his wife, Eleanor Mildred Balfour (the sister of the future prime minister, Arthur Balfour).

Educational Reform

The Sidgwicks, especially as a couple, were rather more successful with efforts at educational reform. Although Henry did a great deal on his own to improve the Cambridge curriculum, reorganize its structure, and professionalize the academic/professorial role, his crowning achievement as a reformer was the result of his collaboration with his wife in the cause of higher education for women. Continuing the work of one of their great heroes, John Stuart Mill, in challenging the "subjection of women," the Sidgwicks ultimately succeeded in becoming cofounders of Newnham College Cambridge, one of the earliest institutions of higher education for women in England. They devoted time, energy, and their own funds and resources to this institution, which continues to flourish today. With Sidgwick, however, educational reform, like parapsychology, was always done with an eye on the deepest problems that troubled him. Education, after all, might afford another vehicle for independently supporting the ethical life in the future, when the influence of religion declined. Like their friend, George Eliot, the Sidgwicks sought to make the cultivated forms of happiness marking the ethical life attractive in their own right. Significantly, Newnham College was built without a chapel.

Politics and Economics

Sidgwick's secular educational reformism, if not his parapsychology, linked him to his classical utilitarian predecessors, who were also ardent reformers. Moreover, like Bentham and the Mills, but unlike his own students Bertrand Russell and G. E. Moore, Sidgwick was an ethical and political theorist who was also a first-rate political economist and political scientist, with Alfred Marshall a cofounder of the Cambridge School of Economics. His other major works, which have always been overshadowed by the *Methods,* were *The Principles of Political Economy* (1883) and *The Elements of Politics* (1891), though he also published a concise little primer on the *Outlines of the History of Ethics for English Readers* (1886) and a collection of essays on *Practical Ethics* (1898), featuring some of his contributions to the ethical culture movement. He also published many essays and reviews, and a number of his works appeared posthumously.

Given his foundational doubts about the meaning and defense of utilitarianism, combined with his own personal commitment to that view, it is perhaps not surprising that the normative side of the *Principles* and the *Elements* does not address such matters but rather simply assumes the utilitarian position from the start. Sidgwick's aim in these works, especially the *Elements,* is mainly to spell out the implications of the utilitarian view for the evaluation and design of political and economic institutions. He does not seriously address these issues from the perspective of the committed rational egoist, though he is keenly aware of the conflicts between individual and general happiness and sharply critical of overly sanguine attempts to ignore the potential for such conflict, even in the best of institutional arrangements. After all, no market society or any other has ever contrived to eliminate, for example, the need for individual sacrifice in time of war. Welfare economics, in the form given it by Edgeworth and Pigou, was very much a reflection of Sidgwick's influence.

Both works in fact share a certain intellectual structure, taking the principle of laissez-faire or free market/individual liberty as an intermediate principle needing a utilitarian defense. But the defense invariably ends up qualifying this form of antipaternalistic individual liberty in a host of ways. Sidgwick appears to have been intimately familiar with the many (now familiar) forms of market failure, from monopoly and oligopoly to negative externalities to collective action problems.

But he was also articulate on the deeper failures of such programs—their failure to recognize their limited applicability to educational and socialization processes or other cases where individuals are scarcely in a position to recognize or pursue their good, their failure to protect vulnerable populations like children, animals, or future generations, and their failure to appreciate the attractions of "ethical socialism," which would have one motivated to work out of a concern to do one's bit for the common good, as part of a cooperative enterprise. He took a high-minded approach to the educative functions of liberal democratic society, thinking that the state could helpfully promote morality via certain educational programs.

Although Sidgwick, in his major works, invariably took great care to distinguish his normative from his descriptive claims, he also made it abundantly clear that the "facts" about human nature and society did not, contrary to ideologues of both left and right, go very far to limit the options for humanity, especially in the future. He was highly skeptical of the generalizations being promoted by the new discipline of sociology, which was spawning wildly ambitious accounts of the laws of human evolution and history. He did think, however, that there was some evidence for a continuing evolution toward greater federation and parliamentary or constitutional democracy, and strongly favored the growth of a cosmopolitan international morality with appropriate standards and institutions for reducing the risk of war. For Sidgwick, utilitarianism meant opposition to Machiavellianism in any form, whether in personal relations or international relations. If he worried intensely about a future bereft of religious comfort and motivation, he also labored assiduously to shape human nature in a way that would maximize the potential for happiness under such circumstances. The leading champions of utilitarianism today continue to invoke his example in defense of everything from animal liberation to economic redistribution to global justice to justice for future generations.

Sidgwick's economic and political work has been subject to widely varying interpretations. He has been called a conservative or Tory elitist, an early part of the progressive media that produced pragmatism, an architect of British imperialism, a champion of classical liberalism, a critic of classical liberalism who helped usher in the welfare state, and more. But the diversity of interpretation surely reflects the complexity of argument. Sidgwick was the type of philosopher and intellectual whose critical intellect was so insistent on seeing all possible sides of every argument that his heart scarcely ever had the opportunity to override his head.

Sieyès, Emmanuel Joseph (1748–1836)

Emmanuel Joseph Sieyès, known as Abbé Sieyès, was one of the leading propagandists and constitutional theorists of the French Revolution.

Life and Work

Born in southern France in 1748, he was placed by his father (a government official) in a religious career. He enrolled in the Sorbonne in Paris in 1765, where he would remain for the next decade. In 1772, he was ordained a priest and in 1775 was attached as a secretary to a bishop in Brittany. In the 1780s, though lacking a true religious calling, Sieyès made his way up the administrative ladder, becoming a vicar-general in Chartres, a canon of its cathedral (1783), a councilor in the sovereign church chamber (1786), representative of the clergy in the Provincial Assembly of Orléans (1787), and a chancellor in the cathedral chapter of Chartres (1788).

Until he was 40, Sieyès published nothing but read widely and left voluminous manuscripts that have only recently been studied by scholars. Then,

with the country near bankruptcy and the first Estates-General in nearly two centuries looming, he suddenly burst on the scene with three important pamphlets. His anonymous *Essay on Privileges* (August 1788) attacked the French system of statutory privilege and especially the position of the nobility within it. His *Views of the Executive Means Available to the Representatives of France in 1789* (January 1789, most likely), also anonymous, offered a far-reaching argument for the legislative, as opposed to merely consultative, power of the upcoming Estates-General. But it was *What Is the Third Estate?* (January 1789) that made his reputation. Sometimes compared with Thomas Paine's *Common Sense* for its galvanizing effect on the course of events, *What Is the Third Estate?* is both a call to action and a work of theory. It opened a career for Sieyès as a revolutionary constitutional theorist.

Sieyès was elected a member of the Third Estate for the city of Paris in January 1789. In May and June, he presented motions that successfully sought to rename the Estates-General the National Assembly, symbolizing the transformation in the conception of sovereignty that he had done so much to bring about in the first days of the revolution. Also in those early days, he was instrumental in the process of drafting a constitution, in articulating a Declaration of the Rights of Man and of the Citizen (especially Article 7 on arbitrary arrests), and in replacing the ancient system of provinces and regions with a streamlined territorial division of France.

As the revolution grew more radical, Sieyès took his distance (1791). But in September 1792, he was elected to the National Convention and voted the death penalty for the deposed King Louis XVI in January 1793. With the ascendancy of Maximilien Robespierre and the Reign of Terror (1793–1794), Sieyès retired in dismay from revolutionary activity. After the fall of Robespierre, he returned to government as a member of the Council of 500 under the Directory in 1795, surviving an attempt on his life in 1796. In June 1799, he was made the President of the Directory. But he then collaborated with Napoleon in a coup that overthrew the Directory a few months later, though he was quickly outmaneuvered and became a generally inactive member of the new Senate; Napoleon made him a count under his new hierarchical system in 1808, but by then his career as a constitutional expert was mainly over. Sieyès lived on until 1836 but was not active throughout most of his later years.

Political Theory

What Is the Third Estate? was a robust and frontal attack on the functionalistic theory of the social and political order that had prevailed in most European countries in one form or another from the Middle Ages up to 1789. According to the French version of that theory, society was divided into three groups: those who pray, those who fight, and those who work. These functions defined the social categories that were represented in the national assemblies called "estates general" that the kings convoked from time to time in order to levy taxes and secure support for the wars that were among the principal activities of premodern governments. Those who pray were the clergy or first "estate," those who fight were the nobility or second estate, and those who work were the third estate, more numerous but with less status and dignity than the other two. That theory had seemed increasingly threadbare to commentators throughout the eighteenth century, with the growth in size and complexity of an increasingly commercial and industrial society. Reform proposals of the period had come to focus on more utilitarian and egalitarian considerations of property ownership, rather than on the discharging of these traditional functions, as the proper basis for distributing political power and representation.

But Sieyès took this standard eighteenth-century argument much further. For him, the key fault line in contemporary society was between idle privilege and unprivileged labor. He argued provocatively that the third estate was "everything," and that the privileged orders were entitled to no representation at all. He depicted the nobility as an *imperium in imperii* (a state within a state), and famously invited them to return to the Franconian forests whence they had come. He made an exception for the first estate, to which he belonged, and has accordingly been accused, in his own time and since, of special pleading and hypocrisy on that account. His answer was that there were four legitimate public functions—army, church, law, and government—and that because the clergy fulfilled one of these, their status should be considered

different from that of the nobility. By arguing that the private laws adopted by nobles had effectively removed them from the social contract altogether, his pamphlet was an inspiration for some of the later revolutionary legislation excluding the nobility from the possibility of citizenship. Some commentators have thus blamed him in part for a later revolutionary tradition of "totalitarian democracy," resting on the systematic purging of "social parasites" or "class enemies." Other commentators, however, see Sieyès as the proponent of a kind of "rational liberalism" that is different from both totalitarian democracy and the Anglo-Saxon tradition of cautiously empirical liberalism.

For Sieyès, the nation was rightfully the constituting power, and the Estates-General, called by the king for May 1789, was an opportunity for it to reclaim the role played by an original contract in Sieyès's theory. He envisioned a two-stage process. Individuals come together and agree to create a nation. Then they separately create a political order. Against Hobbesianism, Sieyès asserts that the people do not contract with their government. They contract with each other and vest their united powers in the government they create. Conversely, Sieyès rejected the baron de Montesquieu's notion of the constitution as a description of the inherited rights and duties of a complex and historically evolving polity, preferring something closer to Rousseau's notion of the will of the people. It is for this reason that one of his highest priorities in 1789 was to turn the Estates-General from a representative of inherited interests, whose members were solemnly bound to vote according to the specific instructions of an "imperative mandate," into a new and assertive body that would represent all the French people as individuals—the National Assembly.

It was also Sieyès, more than anyone, who was responsible for replacing the historical legacy of ancient provinces, regions, and communities—each with its unique array of special privileges and agreements with the sovereign power in Versailles—with a streamlined territorial division of France into the system of departments (83, at present) that still exist today. During the turbulent decade of revolution, in fact, he offered a number of different plans on territorial division. Sometimes his emphasis was on achieving electoral balance from the most local level up to the most national, by which each elector would have a uniform share of power relative to the local, regional, and national levels of authority. Sometimes the emphasis was on administrative uniformity, especially in times of upheaval such as the summer of 1789, when the old municipal institutions were breaking down. But always the concern was to provide equal individuals with moderate-sized intermediary bodies between themselves and the government of the nation as a whole. Thus, Sieyès was no Jacobin; he drew a sharp contrast between an excessive concern to unify the country—such as the Jacobins would promote when they came to power in 1793—and his more carefully calibrated attempt at adunation (a term meaning union whose French equivalent he coined).

Relatedly, one of the key ideas associated with the name of Sieyès was the distinction between active and passive citizens. Active citizens were those resident adult males who paid taxes and an annual civic contribution, as a guarantee of their adequate public engagement. This property qualification, though controversial in his time and since, was similar to many reform proposals in the eighteenth century and was not dissimilar to much of liberal theory and practice, chastened as it was by the experience of revolutionary democracy under Robespierre, in the nineteenth century. In addition, Sieyès envisioned liberalizing changes to these requirements with the advance of education and civic experience—especially for suffrage, somewhat less so for eligibility to office.

Perhaps the key novelty in Sieyès's political theory lay in his concept of representation. Here he applied the market-based economic theory of the physiocrats and Adam Smith, whom he had read closely, to a political setting where it had not previously been employed so forcefully. As society grows more complex through time, he argued, men's basic needs come to be met increasingly by a division of labor. That division of labor is only able to develop through exchange. It was Sieyès's novel idea that exchange itself involved a kind of representation, in which the grower of wheat, for example, pays the maker of shoes to represent him in the provision of shoes. Government in an advanced commercial society, on this account, then becomes merely another activity calling for specialized skills, for which there are customers willing to pay to be represented.

In his July 1791 debate with Tom Paine over the latter's claim that republicanism was the only legitimate form of government, he took issue with Paine's definition of republicanism as simply "Government by Representation." Instead, he insisted on his broader conception of representation, asserting that "every social constitution of which representation is not the essence, is a false constitution." His dichotomy was between "representatives and masters, between despotism and a legitimate Government" (Sonenscher, 2003, pp. 165, 168). In his contribution to the drafting of the Constitution of 1791, too, he made clear that the assembly and the king alike perform a representative function under the French system.

By emphasizing in this way the role of exchange, and by seeing liberty itself largely as the capacity to apply means to needs, Sieyès offered a view of the transition from the natural to the civil state that was quite different from that of Locke. Where Locke saw an original contract among men as a sacrifice of some portion of natural liberty in exchange for the more secure enjoyment of the remainder of that liberty, with the state fulfilling the minimal function of ensuring the latter, Sieyès saw the state in more positive terms. For him, the fulfillment of needs can only flourish in society, and both man's rights and his capacity to fulfill his needs are greatly augmented by conditions in which exchange can occur peacefully and efficiently, conditions that can only be guaranteed by the state. Thus, human rights are not abstracted from and set against the powers of the state, but are only brought to fruition within the framework of the rule of law that the state makes possible.

Later in the revolution, during the Reign of Terror in particular, Sieyès became more emphatic about the defense of individual liberty. The purpose of public institutions, he said in one 1794 speech, is individual liberty. For unlike Jean-Jacques Rousseau, there was never in Sieyès a full alienation of individual rights into the hands of the political community. His final major effort, the constitutional proposal of 1799, returned to his earlier preoccupation with the balance of liberty and sovereignty through careful constitutional machinery, as it attempted to put an end to the revolutionary upheavals once and for all. The sovereign people would choose those eligible for selection to the various assemblies. A Grand Elector, named for life, would choose two consuls from a national list, who would themselves choose the government ministers from lists of notables to form the executive branch. As for the legislative branch, it would consist of a Tribunate (with one deputy per department) that would initiate and debate the laws but not vote on them, as well as a legislative body that would vote on the laws but not debate them. A third body, the College of Conservators, would watch over the constitution and name the tribunes, legislators, and Grand Elector. Some scholars see this five-stage arrangement as an unacknowledged adaptation of ideas that appeared in Baruch Spinoza's *Political Tractate*. This plan was adopted with minor revisions, but was fairly quickly rendered moot by the maneuvers of Napoleon.

Simmel, Georg (1858–1918)

Georg Simmel was one of the founding figures of sociology. He received his doctorate from the University of Berlin and lectured there, without a full-time academic appointment, for most of his career. Simmel produced an array of publications devoted primarily to understanding (a) the essence, origin, and future of cultural forms (e.g., music, painting, religion); (b) the origins and structures of various social forms (e.g., exchange, conflict, sociability); and (c) the central features of realized personalities (in studies, e.g., of Goethe, Michelangelo, and Rembrandt). Though Simmel did not write a treatise on politics, his seminal *Sociology* (1908) contains a long discussion of domination as a form of association, offering many critical insights to political theorists.

Like exchange, conflict, sociability, and urbanity, domination as a form of interaction possesses for Simmel certain features that can be abstracted from any of its contents. Wherever and whenever domination occurs, similar forms of interaction emerge. These forms vary depending on whether domination involves subordination to an individual, to a plurality, or to a principle.

Simmel argues that groups subordinated under a single individual tend to become tightly unified, though dissociation is possible as well. Unification may occur in two forms: On the one hand, a superordinate (god, ruler, etc.) can provide a unitary expression for a group's will. This unity can express preexisting commonalities rooted in kinship or territory or be created through common service to a deity or leader. On the other hand, a group may become unified in opposition to its leader. Subordination under a single individual provides a common enemy against which all aspects of society may combine or a common reference point for internal conflict.

Subordination under a plurality generates a variety of interactional forms. Plural superordinates, such as councils or triumvirates, tend to downplay individual subjectivity in favor of legality, impartiality, and objectivity. Subordinates to pluralities may expect less tenderness, altruism, and special favors attuned to unique situations. Nevertheless, plural rulers may undertake extremely violent actions, as no single individual can be held accountable. Special forms of domination also arise when groups are subordinated under mutually opposed or stratified superordinates.

Subordination under a principle, as in the rule of law, depersonalizes domination. Spontaneity between ruler and ruled declines, though new forms of liberty emerge. Family cooks, for example, Simmel notes, are subordinated in all aspects of their personalities; contracted cooks are subordinated to legal principles, and so retain a sphere of personal dignity apart from their employer's will.

Students of political theory may find other aspects of Simmel's work of interest as well. In *Sociology*, for example, Simmel analyzes the social development of voting, from unanimity requirements to majoritarian principles, first as proxies for intragroup conflict and later as expressions of the general will. And in his later work, Simmel identifies key points of tension within modern culture, stressing the modern tendency to restlessly undermine any determinate social and cultural forms and the challenges moderns face in rendering personally meaningful the masses of cultural objects available to them.

Singularity

Singularity is a concept usually identified with postmodern, poststructural, early Frankfurt School, or vaguely continental approaches to philosophy and political theory. It is difficult to identify any core meaning of the concept, or even a family resemblance among its meanings, as the term has been used by such a wide range of thinkers, drawing on different traditions, in different contexts, to address distinct dilemmas. The term is used quite loosely, often interchangeably with

terms like particularity, the Other, alterity, difference, finitude, plurality, and contingency. In extreme cases, the range of use is so wide that the term can take on mutually exclusive or contradictory meanings. Given the indeterminacy of the concept, it is perhaps best understood as a *negative* concept, an idea most often used in *opposition* or resistance to other concepts, such as universality, generality, totality, the Absolute, identity, and the Same. As a negative concept, singularity usually stands in for the unrepresentable, the unsubsumable, the irreducible, the indomitable, the inexplicable, the discontinuous, or the irreplaceable. Singularity can be thought of as that aspect of reality or a situation that eludes, exceeds, or disrupts traditional philosophical attempts to grasp reality by means of conceptual, categorical, representational, or logical thinking. Conventional forms of thinking operate with *general or abstract* concepts and categories that are inadequate for grasping the unique singularities of reality. The idea of singularity has many implications for both ethics and political theory. In ethics, the idea functions critically against predominant Kantian rule-based approaches to moral reasoning and as a basis for alternative forms of ethics. In political theory, the idea of singularity has both been appropriated by mainstream approaches to political theory and has provided resources for a radical critique and rethinking of prevailing forms of political theory.

Historical Contexts and Traditions

The term singularity can be partially understood by situating it in the historical context(s) from which it emerged, and the traditions within which the concept is used. Without too much violence, we can identify two relevant historical contexts that gave rise to thinking about singularity. In response to the various horrors of national socialism, totalitarianism, fascism, and Stalinist communism, beginning in the 1940s, a group of thinkers known as Western Marxists deployed notions of singularity. Similarly, French intellectuals beginning in the mid-1960s, but especially after 1968, made widespread use of the concept. In both contexts, the idea of singularity was introduced to criticize prevailing forms of social relations and modes of thought, but proceeded mostly by way of appropriating existing traditions and works of canonical authors. Thus, singularity should also be situated within the traditions that the concept was deployed.

Singularity is a term used within the Marxist tradition to oppose the concept of totality. Many earlier Marxists thought that there was a total perspective from which the whole of historical reality could be known, and that one could speak for, or represent, the whole of a society from that perspective. In opposition to scientistic, deterministic, and structuralist varieties of Marxism that were committed to the idea of totality, a group of Western Marxists after World War II (early Frankfurt School, Theodor Adorno) deployed the idea of singularity. Marxist proponents of singularity argued that history cannot be subsumed under an all-encompassing materialist logic, that the revolution was not inevitable, and that Marxist analysis had to be more sensitive to historical particularities. In so doing, they resurrected notions of contingency, agency, and an open-ended account of history.

Within a Hegelian tradition, singularity was used, often by the same group of Western Marxists, in opposition to the concept of the Absolute. Many Hegelians held the belief that history had a dialectical or development logic to it that proceeded automatically behind the back of historical agents, culminating in an absolute perspective from which the total movement could be grasped as rational. By contrast, some Hegelians deployed the concept of singularity to argue that aspects of reality eluded the historical movement of reason, that the historical movement was contingent, and that the attempts to make history conform to reductivist forms of reason resulted in the totalitarian, fascist, and communist horrors of the twentieth century.

The second historical context in which thinking about singularity emerged was among French intellectuals of the late 1960s (until present). Thinkers as diverse as Gilles Deleuze, Jacques Derrida, Michel Foucault, Alain Badiou, Emmanuel Lévinas, and Jean-Luc Nancy all made use of the concept of singularity. These thinkers all shared the belief that conceptual, representational, and logical forms of thought were inadequate to grasping reality and that such thinking was a danger to be resisted. Unfortunately in this French context, the idea of singularity gets run together with

related ideas, such as difference, alterity, and the Other, making it difficult to discern a stable meaning for the concept. Much French philosophy from this period on can be understood as competing attempts to conceive of, and valorize, the idea of singularity or difference. These French thinkers incorporate many of the Frankfurt School reworkings of Georg Wilhelm Friedrich Hegel and Karl Marx, but mostly deploy singularity in ways that can be understood as appropriations of ideas from the German philosophers Martin Heidegger and Friedrich Nietzsche.

Heidegger and Singularity

The work of the German philosopher Martin Heidegger is one of the two primary sources for the French thinkers who resurrected notions of singularity. Heidegger's thought points to at least three different sorts of singularity, all of which have been taken up in the French context. First, Heidegger developed an ontology, and an idea known as ontological difference, which was hugely influential. Much of Heidegger's work is an attempt to show that "what is" cannot be reduced to the entities that are grasped by conceptual or categorical thought. There is an ontological difference; "What is" exceeds, eludes, and disrupts conceptual or representational thought. Second, Heidegger developed a concept of authenticity, or a way of being, in which an individual might become a singular somebody, as opposed to a generic nobody. He grounded this notion of authenticity in the singularity of our death. Finally, later Heidegger introduced the idea that being has a history, that how things show up to conceptual, representational, and logical thinking depends on the singular historical epoch within which such thinking operates. Heidegger thought that this history of being was one of radical discontinuity, in which singular events, *happenings,* or works of art constituted entirely new worlds and ways of conceptualizing, categorizing, and representing that historical world. Conventional forms of thinking were appropriate to, and relative to, historically discontinuous singular worlds. All three of these notions of singularity have been widely influential in the works of recent French thinkers. For example, Derrida has taken up the idea of ontological difference, Foucault the history of being, Badiou the notion of the singular event, and Lévinas the singularity of death.

Nietzsche and Singularity

The other major source for French thinkers of singularity was Friedrich Nietzsche. At least three aspects of Nietzsche's thought point toward something like singularity. First, Nietzsche's ontology was one that rejected the existence of stable discrete entities graspable by conceptual, categorical, or representational thought. Nietzsche was either a nominalist of sorts, believing that everything that exists is a unique singular particular, or he held the view that being is always becoming, that there are no stable entities for conceptual thought to grasp. In either case, Nietzsche held the view that conceptual thought, language, and logic are never adequate to reality. Second, Nietzsche rejected all attempts to grasp reality from a total all-encompassing perspective. Instead, he defended a form of perspectivalism in which there are multiplicities of singular perspectives on the world, but no all-encompassing perspective. Finally, Nietzsche too seemed to embrace a heroic ethic of authenticity, glorifying the singular individual with a strong will and the courage for honest thinking. All three senses of singularity were influential in the twentieth-century French context. Thinkers descending from both the Western Marxist and post-1968 French traditions have brought the concept of singularity to bear on contemporary issues in moral philosophy and political theory.

Singularity and Ethics

In ethics, the idea of singularity has functioned to undermine predominant neo-Kantian, rule-based approaches to ethics, and to open up alternative approaches to ethics. Kantian rule-based forms of ethics tend to conceive of ethical judgment and ethical action as a matter of subsuming a particular case under a universalizable rule. Ethics becomes a matter of having justified principles and applying them consistently and appropriately to the particular case at hand. The idea of singularity has been used to undermine this approach to ethics by showing that ethical rules are always abstractions from irreducibly singular cases, and that the application of rules to particular cases always requires

a form of judgment that is irreducible to rule following. According to some proponents of singularity, ethics is more a matter of relating to radically particular singular situations without recourse to rules. This critique of prevailing Kantian ethics has opened up space for exploring alternative ethics based on different conceptions of singularity.

Some liberals have appropriated singularity, namely the singularity of each individual, as the basis of a rights-based ethics. Others committed to singularity have proposed an ethics of tolerance, responsiveness, and openness to the unique singularity, or difference, of the Other (individual or society). Still others have advocated for an ethics of authenticity, based on the capacity for individuals to take responsibility for themselves, to potentially become singular individuals. Some have returned to Aristotelian notions of phronesis and practical judgment in singular contexts. Kantians themselves have taken up the idea of singularity and returned to Kant of the critique of judgment, and his notion of reflective aesthetic judgment, as a basis for a form of practical reasoning sensitive to contexts and particularity.

Singularity and Politics

The concept of singularity has also been taken up in political theory. We might distinguish at least four conceptions of singularity, and four corresponding uses of singularity in political theory. First, we might conceive of singularity as the given, or already existing, irreplaceability of an individual or a community. We might then ask: What would a politics responsive to existing singularities look like? Conventional forms of liberalism and communitarianism have appropriated this idea of singularity. Liberals use the singularity of individuals as a new basis for the dignity of human rights and social orders dedicated to securing such rights. Communitarians appropriate the idea of the singular historical community as a basis for protecting and promoting existing historical communities. Second, but closely related, we might think of singularity as the irreplaceability of an individual or community, but understand such singularity as a project or process to be achieved. Thus, we might ask what a politics that attempts to achieve the singularity of individuals or the singularity of a historical community would look like? Cornelius Castoriadis has approached this problematic and frames the issue as one of thinking the relationship of the singular individual to the singular community, both understood as processes and projects. Third, we might conceive of singularity as that which eludes the grasp of existing forms of thought and social ordering. We might then ask what a politics responsive to this elusive unrepresentable dimension would look like. Jacques Derrida has pursued this question, elaborating a form of democracy "to come," a social order always open to difference and alterity. Similarly, Hannah Arendt's conception of a politics open to natality, birth, and newness could be read in this context as well. Finally, we might conceive of singularity as an openness to the singular world transformative *event, happening,* or *revolution.* The work of Alain Badiou and his notion of a politics of truth, and fidelity to an event, is representative of this approach.

Most generally, the idea of singularity confronts political theorists with the problem of thinking through how and which forms of social relations could be responsive to singularity, however conceived. As one thinker asks, how can we be singular plural? The problem is exacerbated under conditions of modern social organization. How can individuals or communities respect or achieve singularity when the means of organizing social relations are the impersonal mechanisms of positive law, the administrative bureaucratic state, and the market economy?

Slavery in Greek and Early Christian Thought

Ancient Greeks and Romans depended on slavery as a principle of social and economic organization. Theoretical discussions of slavery are found in works on politics, ethics, agriculture, law, and religion. Within a broader range of archaeological, historical, and literary source material, analyses of ancient slavery must be temporally and geographically specific—fourth-century Athens differs greatly from first-century Rome, for instance. Yet in the theoretical realm, the following observations may be useful to distinguish slavery in the classical world from other slave systems: the structures of classical slavery are rooted in and bound up with other social structures; a binary distinction between free and unfree cannot be applied to the complex hierarchies of status in the ancient world; the relationship between master and slave is negotiated in moral and personal terms just as much as (if not more than) it is in legal and economic ones. Few primary sources are devoted exclusively to issues of slavery. We may survey various philosophers—Plato, Aristotle, the Stoics, Paul, Augustine—but even within this limited group, the moral and metaphorical slavery of individuals is more urgent than the practices and problems of legal slavery. It is not surprising, then, that Aristotle's theory of natural slavery in *The Politics* is so prominent in the theoretical evaluation of ancient slavery.

To contextualize such philosophical discussions, we must sift through texts in which slavery is mentioned briefly, often as example or analogy. In spite of Aristotle, ancient writers seem troubled by the idea of natural slavery. All Mediterranean societies had some experience of slavery; the historical enslavements of one population by another (such as the Messenians by the Spartans) could support the idea of ethnic superiority while also exposing the fortuitous nature of slavery. Slavery was an institution sanctioned by the law of nations (*jus gentium*). Legally, slaves are categorized not as people but as property. Aristotle's definition of a slave as an animate (or ensouled) tool (*empsychon organon*) is echoed by the Roman agricultural writer Varro, who classifies slaves as articulate instruments. Despite these and numerous other assimilations of slaves to animals or objects, the fact of their humanity persists in practical situations. Various writers discourage both indulgent and heavy-handed treatment of slaves, arguing that a system of proper discipline and punishment serves the moral and practical needs of the master and slave alike. The management of domestic slaves serves the common analogy between household and state. Ancient writers regularly juxtapose discussions of slavery with familial, political, or human–divine relationships, envisioning an ideal that meets the interests of all, but there is no perfect analogy for the master–slave relationship. Such comparisons instead enable a focus on moral and metaphorical slavery, often without questioning the existence and practice of legal slavery. Advice for the benefit of masters is a common feature of all the following philosophical schools. Consideration of the slaves themselves is rare.

Plato

There is nothing like a comprehensive theory of slavery to be found in Plato's works, but slavery's importance as a social institution among different people is acknowledged, particularly in *The Laws*. *The Laws* assigns a number of slaves to each citizen but draws attention to the unique problems of slaves among other kinds of property. Different masters will treat their slaves differently, but neither extreme cruelty nor jovial indulgence is desirable. Slaves themselves can be so useful and devoted as to be preferable to blood relations, yet ultimately their souls are corrupt and thus they cannot be trusted. Several solutions for the common problem of controlling of slaves are proposed: A master should avoid having slaves with common origins and common language, because they are more likely to band together and revolt. Furthermore, mere admonishment is counterproductive; masters should not speak or joke with slaves in the same way they do with free people. The scant mention of slaves in *The Republic* has prompted much debate. It has been argued that

Plato's ideal city does not include slaves and that his tripartite soul admits of no slavish quantity. It is contrariwise possible that Plato envisions no radical changes from the status quo regarding slaves: In the ideal city Kallipolis, they continue to do hard labor as in Plato's own society, lacking the tripartite soul of free citizens.

Aristotle

In Book 1 of *The Politics,* Aristotle attempts to justify the enslavement of certain people on moral grounds. Aristotle's theory of natural slavery has a long and knotty afterlife in political philosophy. The conclusion runs as follows: "it is clear, then, that in some cases some are free by nature and others slaves, for whom slavery is both beneficial and just" (*The Politics,* 1255a1–3). Aristotle distinguishes slaves from other domestic subordinates, women and children, by claiming that slaves lack the faculty of deliberation, that they are able to perceive and have a share in reason (*logos*) without fully possessing it. This formulation is notoriously problematic.

Aristotle posits the master–slave relationship as one of the three fundamental relationships—along with husband–wife and father–children—in a self-sufficient household, the essential unit comprising his city. Aristotle identifies two schools of thought: those who believe that the mastery of running a household and controlling slaves is a kind of political science, and those who believe that slavery is contrary to nature (*physis*), and only a matter of convention (*nomos*). Because slavery depends on violence, it cannot be just. (We have little external evidence of the larger debate Aristotle represents here, so it is difficult to evaluate Aristotle's position among others.) Aristotle argues that slaves are animate tools and property, belonging fully to their masters, almost as an extension of them, and assisting their activities. Like domestic animals, they are primarily fit for physical labor, and it is as instruments that they best fulfill their function. They are capable of productivity (*poiēsis*) but not true activity (*praxis*). While acknowledging that not all legal slaves are natural slaves, Aristotle argues that some are fit to rule and others fit to be ruled, and that the good of both depends on the proper fulfillment of these roles. It is not clear how non-natural slaves would function in Aristotle's household.

The virtues of slaves are limited to those that enable them to fulfill their instrumental function; they cannot participate in the moral virtues of citizens. There could not be a *polis* of slaves, but in Aristotle's ideal city, their labor—particularly in agricultural tasks—is essential. A treatise attributed to Aristotle's school divides slaves into supervisors and laborers. Supervisory slaves should be educated and treated with respect; laboring slaves should be fed well. The best slaves are ones who are neither too courageous nor too cowardly. Importantly, the treatise advocates the hope of freedom, in clear and definite terms, as an essential motivator in getting slaves to work.

Objections to Aristotle's arguments on moral and logical grounds are numerous. Aristotle himself offers ample evidence against his charge that slaves lack reason. There is no great skill in managing slaves, Aristotle says, and a rich man will leave such a task to a slave steward in order to pursue philosophy or politics. This statement shows not only how the pursuit of Aristotle's goals of autarky and the contemplative life depend on the labor of others, but also the impossibility of wholly denying to slaves the capabilities of reason and deliberation. Aristotle prefers to frame dependence in moral, not economic terms; the slave depends on the master as the body depends on the soul.

Further inconsistencies have been observed. For example, in *The Nicomachean Ethics,* Aristotle compares the master-slave relationship to a kind of tyranny and disallows the possibility of friendship between a slave and a master, because they have nothing in common. In *The Politics,* by contrast, Aristotle states that the master and slave do share a community of interest and friendship. Attempts to resolve such issues and to disentangle Aristotle's theory from its troubling afterlife result in a more circumspect understanding of Aristotle's logic and rhetoric, but even the most charitable analyses fail to make Aristotle's theory of natural slavery fully palatable. It is noteworthy that few subsequent philosophers until Aquinas engage with Aristotle on these points.

Stoicism

Stoic philosophers seem indifferent to conventional slavery. (The picture might be different were more Stoic political writings extant.) Diogenes, a

forerunner to the Stoics and a self-declared citizen of the cosmos, was captured by pirates and sold into slavery. On the auction block, Diogenes advertised himself as a master in search of a slave. The reversal in this anecdote exemplifies the Stoic attitude toward slavery: Diogenes proclaimed his inalienable moral freedom against the slavery of his legal master to his passions. The Stoics address slavery as the moral quality of an individual more than as a legal institution; the former is within a person's control, the latter is not. "Only the wise man is free, but the bad are slaves" summarizes this concern with individual morality; this Stoic paradox is explicated in detail by Cicero and by Philo of Alexandria. The yoke of slavery for the Stoics is comprised of the passions: desire, fear, pleasure, and grief. Epictetus, a former slave, makes surprisingly few arguments explicitly concerned with conventional slavery. He values a slave above an ox or dog but below a citizen or magistrate. Epictetus argues for the impossibility of physical autonomy and advocates treating the body like a poor overladen donkey, a fitting metaphor for a slave. The Stoic belief in human capacity for virtue may be cited against Aristotle's theory of natural slavery, though the Stoic belief in the natural separation of things into superior and inferior may support it. The Roman philosopher Seneca, who had plenty of practical experience with slaves, encourages masters to be fair by appealing to their common humanity; slaves have the capacity to be moral agents regardless of their status.

A lecture by Dio Chrysostom representing a debate between a slave and a citizen addresses the question of natural slavery with examples from history and literature. Whereas reversals of fortune—the idea that anyone could be a slave is also found in Seneca—complicate the semantic applications of *slave,* the speech affirms the Stoic concern with moral slavery, concluding that *slave* is most applicable to the common and base man regardless of social status.

Paul

Philo of Alexandria and the Apostle Paul inherited from the Stoics the concern with the enslavement of the soul to the passions. Philo disassociates himself from conventional slavery, dismissing quibbles over different categories of slaves in favor of the truly free man, much like the Stoics and Diogenes. This is Paul's primary concern as well. Legal slaves, however, are addressed in Paul's letters, but in a conservative way. Those who endure slavery in this world should accept it without resentment or resistance. Service to earthly masters substitutes for service to Christ, the master of all; and both masters and slaves will find just rewards in the next life. Thus, Paul's eschatology introduces a specific motivation for slaves to obey. Slaves and masters alike are encouraged to be slaves of God, not slaves to sin. In early letters, Paul collapses various status distinctions in order to emphasize the unity of the community, but in later letters he retreats to a more modest and pragmatic position in which Christian norms can be implemented without threatening existing social structures.

Augustine

The fourth-century Christian apologist Lactantius produced a vision of equality in heaven: Divine justice makes all people equal. Yet this radical justice does not affect existing human institutions: Lactantius reiterates the division of body and spirit and stresses the importance of the latter. This dichotomy is also found in Augustine, who both defends legal slavery as sanctioned by divine authority and produces a new formulation of slavery in a theological context.

Like Paul, Augustine advocates the acceptance of conventional slavery. The master-slave power relationship is a household commonplace to which Augustine frequently refers. The structures of Augustine's City of God reproduce those of the household. Stability depends on a harmonious relationship between the master and his subordinates. The duty of the former is to guide, that of the latter, to obey. There are good and bad masters, good and bad slaves. But slavery to sin is by far more damaging than legal slavery.

According to Augustine, in God's creation no man is a slave to another or to sin. But through the righteous judgment of God, one man may be enslaved to another. This is an unprecedented explanation that accounts for both spiritual and bodily slavery. The fall of Adam renders all humans inherently sinful and deserving of God's punishment, and slavery is one form that this punishment can take. Individual sins may result in

enslavement; it is the sin on one side or the other that leads to the enslavement of war captives. But even slavery that may seem unjust in every way can be explained by sin.

Ancient Greek and Roman philosophy is completely devoid of ideas that might be called abolitionist. Utopian fantasies do away with slaves by envisioning responsive and animate objects and food items, eliminating the anxieties of slave dependence without sacrificing the benefits of service. Very few thinkers felt compelled even to touch on the moral legitimacy of slavery as Aristotle did. Instead, they took slavery for granted as an essential component of real and imaginary *poleis* or empires, and further capitalized on the ubiquity of the rhetoric regarding slavery to examine moral slavery in the individual soul.

Slavery in the United States

John Locke and Jean-Jacques Rousseau confronted slavery as an intellectual problem; Thomas Jefferson, John C. Calhoun, and Frederick Douglass lived it. This is what led C. L. R. James to say that what Europeans faced as a philosophical question, the Americans faced as an empirical one. Slavery was the defining issue of American politics in the nineteenth century. Its legacies—segregation, civil rights, and racial discrimination—have profoundly shaped its twentieth and twenty-first centuries.

Slavery's influence on American political thought has been no less profound, though not always recognized. Louis Hartz (1955) famously argued that slavery had little impact on American political thought due to the pervasiveness of liberal and egalitarian views. The ubiquity of liberal ideas and the absence of feudal institutions reduced class conflict and produced a common, almost unconscious, political philosophy among Americans that emphasizes moral and political equality, individual liberty, and private property. Given this climate, the elitist views of the slaveholders could have no lasting influence. Hartz was right to an extent: The early United States was indeed distinguished by a relative lack of social differentiation, which produced a common American spirit defined by "freedom, initiative, adventure, [and] self-expression, in pursuit of trade and industry" (James, 1993, p. 44). Yet the absence of sharp class stratification in the United States was largely due to slavery. The enslavement of Africans helped to entrench liberal egalitarian views among whites across social classes. While earlier scholars such as Hartz believed that slavery had little to do with American democracy, most scholars today argue that slavery, race, and freedom were intimately connected in American history. This paradoxical relationship has profoundly shaped American political theory.

Slavery and the Racial Order

American slavery was a struggle between masters' attempts to impose "social death" on the slave and slaves' efforts to seek freedom and build a community. Orlando Patterson (1982) argues that slavery is a system in which the master seeks to strip the slave of all kinship ties and social standing so that the slave is physically alive (and therefore able to labor for the master) but socially dead, belonging to no recognized community and possessing no legitimate genealogy. Slaves resisted this social death in three ways. First, they sought freedom, by purchasing it, suing for it, running away, or rebelling. Second, they sought to make the terms of labor more favorable, through work slowdowns, attempts to shorten the working day, subterfuge, sabotage, maintaining their own livestock or garden plots, participating in markets, or hiring out their labor and keeping a portion of their wages (Berlin, 1998). Third, they created

their own families and their own culture. While masters sought to impose their rule from sunup to sundown, from sundown to sunup slaves created a community that denied the authority of the master and defied social death. Slaves shaped their own customs, religion, dialect, music, economy, and political perspectives, merging African, indigenous, and European practices into a uniquely and truly American culture. This conflict between "sunup to sundown" and "sundown to sunup," or between social death and the resistance of the black community, is one of the fundamental experiences of the American political tradition.

It also produced the racial order. Europeans sat at the top and Africans the bottom of the social hierarchy throughout the Americas. Further, African slavery was the dominant form of labor exploitation in the hemisphere because it was economically cheaper than importing European indentured servants or enslaving the indigenous population, since African slaves were plentiful, cheap, and politically powerless, possessing no "rights of Englishmen" or membership in indigenous communities to appeal to for protection. But slavery in the United States differed from the rest of the hemisphere in the form of social control involved. In the West Indies and Brazil, for example, slaves were controlled by an intermediate "buffer control stratum" of creoles that stood between them and the planters (Allen, 1994, 1997). (Members of this group were generally referred to as mulatto or colored.) But in the 13 colonies, poor European colonists were the buffer between master and slave. Their interests and those of the planters converged as poor Europeans demanded—and received—sundry economic, political, and psychological advantages, such as the right to own property (including human property), immunity from enslavement, access to public accommodations, and the right to participate in public affairs. In exchange, poor whites gave their tacit or active acceptance to the slave system (Du Bois, 1992; Roediger, 1991). This cross-class alliance created a "white" racial category, a group distinguished from slaves and those eligible for slavery (generally referred to as Negroes) and that enjoyed a remarkable degree of freedom and equality while enduring relatively little class conflict (Olson, 2004). The paradox of American history is that the ideals of liberty, equality, and democracy were built on racial slavery. The subordination of some provided the foundation for the freedom of others. The symbiosis of race and democracy forged by slavery has shaped the American political experience to this day.

Slavery in the New Republic

Slavery dominated the political debates of its era. The revolutionary generation's relation to slavery was complex and conflicted regarding its morality and necessity. The struggle for independence made many patriots aware of a contradiction between their demand for liberty and their ownership of slaves. After the revolution, George Washington privately expressed support for the gradual abolition of slavery and freed some of his slaves on his death. Thomas Jefferson had moral objections to slavery as well, though he was also one of the first people to suggest that black people are by nature inferior to whites. James Madison, like Jefferson, favored gradual abolition followed by colonization of black people to Africa.

Despite their moral qualms, the revolutionary generation built slavery into the founding documents. Jefferson's original draft of the Declaration of Independence contained a paragraph condemning the slave trade, decrying King George for waging a "cruel war against human nature itself, violating its most sacred rights of life & liberty in the persons of a distant people who never offended him," but Southern delegates excised it from the final version. The 1787 Constitution is careful to never mention slavery by name but it clearly protects it in several clauses, including the infamous "three-fifths clause" in Article I.2, which stipulates that the population of a state shall be determined by counting all "free persons" in addition to three-fifths of "all other Persons." This clause augmented the South's representation in Congress and their apportionment of taxes and implicitly sanctioned slavery. Other clauses protected the slave trade until 1808 (Article I.8), guaranteed federal support to masters in capturing fugitive slaves (Article IV.2), and guaranteed federal protection against slave insurrections (Article IV.4). Debates between Federalists and Anti-Federalists over the Constitution barely touched on slavery, suggesting that both sides took its existence for granted.

The invention of the cotton gin in 1793 wiped out any moral objections masters had regarding

slavery. In 1800, 11% of the slave labor force worked on the cotton crop. By 1850, two thirds of them did, as Southern plantations supplied the raw material devoured by the hungry machines of the Industrial Revolution. By 1860, over 90% of Britain's cotton came from the U.S. South. The rise of "king cotton" transformed slaveholders' ambivalence about slavery into an obdurate defense. Whereas many planters in the revolutionary generation lamented slavery as a necessary evil, antebellum slaveholders argued that it was a positive social good. James Henry Hammond (1858), for example, argued that all civilizations require a "mudsill" class to perform its menial labor. The genius of Southern civilization is that it has found an "inferior race" to do this work. By compelling one race to perform labor "naturally" fitted to it, slavery eliminates class conflict within the other race and thereby produces free political institutions.

Slavery not only sustains republicanism, John C. Calhoun insisted; it also civilizes Africans. Africans are savages who practice cannibalism, worship satanic spirits, and are sexually licentious. Slavery, Calhoun argued, has saved the black race from this barbaric origin. "Never before has the black race of Central Africa . . . attained a condition so civilized and so improved, not only physically, but morally and intellectually . . . This . . . is conclusive proof of the general happiness of the race, in spite of all the exaggerated tales to the contrary" (McKitrick, 1963, pp. 12–13).

Scientific Racism

The emergence of scientific racism arose in tandem with the intensification of slavery. In the eighteenth century, whites tended to view African Americans as alien and unassimilable but believed that the natural and social environment was the cause of black inferiority. But with the rise of king cotton, theories of Africans' innate, biological inferiority began to hold sway (Fredrickson, 1971). The eighteenth-century notion of slaves as childlike (thus implying the ability to "mature") gave way to the notion of Africans as subhuman. Scientists conducted various experiments and measurements, such as measuring skull size, evaluating the quality of earwax, and measuring the angle of facial profiles, to determine the biological capabilities of the various races. Unsurprisingly, nearly all of these experiments concluded that Caucausoids were intellectually and physically superior to Negroids, Mongoloids, and other supposed racial categories. Some of the theorists of scientific racism in this era, most notably Joseph-Arthur, comte de Gobineau (1915), would influence Nazi philosophy.

The Antislavery Movement

Prior to the 1830s, most antislavery organizations urged a slow, gradual end to slavery, and many of them supported the colonization of freed slaves to Africa. But in 1831, a slave rebellion led by Nat Turner struck fear into the heart of the South, weakening much of that sort of antislavery sentiment. And earlier that year, William Lloyd Garrison began publishing *The Liberator,* which would become the leading newspaper for a new brand of abolitionism. Turner and Garrison led the shift from a Southern-based, white, conciliatory and gradualist abolitionism to a Northern-based, biracial, militant movement. Many of the leaders of this new movement were upper-class whites, but its support (financial and political) came from the grass roots, particularly free black communities and white communities in New England and in then Western states like Ohio. Considered alongside the efforts of slaves themselves, this new abolitionism was a black freedom movement with biracial participation.

Garrison provided much of the intellectual framework for this movement. He argued that slavery was a sin and that slaves should be freed immediately and unconditionally, without compensation to slaveholders. *Immediatism* became the touchstone of the modern abolitionist movement. Garrison and his followers employed a strategy of "moral suasion" to end slavery. They believed that slavery had so corrupted the entire political system that seeking to overthrow it through electoral politics would only end up compromising abolitionism. Slavery was a sin that damned the nation and required repentance. Moral suasion, or the transformation of public opinion, was the means by which abolitionists would persuade their fellow citizens of the evils of slavery and the need to abolish it.

The Garrisonians also railed against racial prejudice. The constitution of the New England Anti-Slavery Society (founded by Garrison in 1832), for

example, declared that "a mere difference of complexion is no reason why any man should be deprived of any of his natural rights, or subjected to any political disability" (Ruchames, 1963). Garrisonians argued that eradicating racial prejudice was essential to creating an egalitarian society freed of sin. This principle, however, was held unevenly among white abolitionists. Indeed, antislavery sentiment in the North was often also violently anti-black. "Death to Slavery! / Down with the Slaveholders! / Away with the Negroes!" went one popular slogan in 1861 (quoted in Fredrickson, 1971, p. 189). Even as they opposed the slave power, many whites feared that racial equality would threaten their privileged standing. And even Garrison occasionally acted paternally toward black people (who were nevertheless fervently devoted to him). Regardless, racial equality was a central tenet of radical abolitionist political thought from Garrison to Frederick Douglass to John Brown.

American abolitionists quickly embraced immediatism, but the strategy of moral suasion sat uncomfortably with some of them, and in 1840 the movement split. The catalyst for the split was a debate over the participation of women in the movement: The Garrisonians welcomed anyone's participation so long as one shared a commitment to immediate, unconditional emancipation. Reformist abolitionists, however, insisted on following norms of decorum in political deliberation—such as prohibitions on women's participation in public affairs—so as not to offend public sentiment and distract attention from the antislavery cause. Unlike the Garrisonians, who argued that slavery was but the worst of many sins in the United States, reformist abolitionists held that American society was fundamentally moral and just, except for slavery, and advocated an electoral strategy for abolition. After the split, they formed their own party, the Liberty Party, which pulled some support away from Democrats and Whigs but fared poorly overall and folded into the Free Soil Party in 1848. Meanwhile, abolitionists such as Gerrit Smith, James McCune Smith, and the later Frederick Douglass shared the radicalism of the Garrisonians but also supported the Constitution and electoral participation. In the 1850s, several of them would support John Brown's raid on a federal arsenal in Harpers Ferry, Virginia, in a plan to free and arm slaves throughout the South.

The Garrisonians became even more radical after the split. They urged disunion, calling for the North to secede from the South because, they argued, slavery depended on federal support; the removal of such support would lead to slavery's collapse. Garrison attacked the Constitution as "a covenant with death, and an agreement with hell" for protecting the slaveholders' interests, while Wendell Phillips called for Northerners to break up "the whole merciless conspiracy of 1787." Stephen Foster and Parker Pillsbury disrupted church services in congregations that refused to oppose slavery. Garrisonians' speeches, newspapers, and the slave narratives they published aroused opposition to slavery through shame, anger, guilt, and pity, as well as rational argument. The Garrisonians explicitly distinguished their more zealous approach to antislavery from those of politicians such as Abraham Lincoln, who was personally opposed to slavery but at first did little to abolish it because for him preserving the Union came before all else. Garrisonians castigated this perspective. It perpetuates slavery, they maintained, because placing priority on preserving the Union requires making compromises with slaveholders, which ultimately strengthens their power. The Garrisonians adamantly rejected any sort of compromise or moderation regarding slavery.

This fanatical, uncompromising dedication to freedom and equality is the radical abolitionists' distinctive contribution to American political thought. Their focus on individualism, inalienable rights, political equality, and self-reliance have led some to see them as the highest expression of bourgeois liberalism in an emerging industrialized nation (e.g., Hartz, 1955). Yet there was a deeply radical character to the abolitionists that spilled over the boundaries of liberalism. The Garrisonians, in particular, were not afraid to follow their principles to their radical conclusions. Their belief in individual liberty led them to struggle for free speech and a radical democracy in which all people have the right to participate in public affairs. As Martin Delany put it, "No people can be free who themselves do not constitute an essential part of the *ruling element* of the country in which they live" (Foner, 1998, p. 88). Their belief that all people are created equal led them to fight racial prejudice, advocate women's emancipation, and support the labor movement. Their demand for

immediate emancipation led them to attack the church for its complicity with slavery, condemn the Constitution as a proslavery document, call for the breakup of the United States, and welcome civil war. Their openness to new ideas led many of them to radical social and personal experimentation, including vegetarianism, alternative medicine, and nudism. They challenged patriarchal relations in the private and public spheres, and they crafted new forms of religious worship. In short, the abolitionists' radical views regarding slavery and racial equality led them to reimagine the American ideals of freedom, equality, and democracy.

Indeed, the radical abolitionists were revolutionaries, for their politics threatened the stability of the nation. Unlike trade unionism, prison reform, temperance, or other reform movements of the time, abolitionists' demand for unconditional emancipation with no compensation to slaveholders threatened the entire structure of the American political economy. As James argues, immediatism meant "to tear up by the roots the foundation of the Southern economy and society, wreck Northern commerce, and disrupt the union irretrievably" (1993, p. 89). By attacking slavery, abolitionists undid the arrangements that kept the Union together. As the brief but suggestive history of radical reconstruction indicates, this unraveling made possible not just a liberal society, but perhaps also a radically democratic one (Du Bois, 1992).

Slavery and Contemporary Political Thought

Hartz wrote that the curious thing about slaveholder thought is that it had virtually no impact on American political thought. Equally curious is the uneven impact slavery has had on mainstream contemporary political theory. Slavery is in the background of nearly all black political thought in the United States, influencing its work on power, identity, solidarity, political strategy, gender, and more (e.g., Dawson, 2001). Yet outside this field there is surprisingly little on slavery in the study of eighteenth- and nineteenth-century political thought. (Exceptions include Charles Mills's [1997] analysis of race and the social contract tradition and a cottage industry on Alexis de Tocqueville's views on race.) Slavery and abolition are even less contemplated in contemporary political theory. Few democratic theorists, for example, read the abolitionists (or the slaveholders) to think through debates in the discipline such as between recognition and redistribution, liberalism and communitarianism, deliberative and agonistic democracy, the nature of power, or the role and value of postmodernism. The uneven influence of slavery in contemporary political thought—and the continued contortions of a democratic nation that has not completely let go of its past—suggest that there is much work to be done on slavery in the United States and its relation to political theory.

Smith, Adam (1723–1790)

Adam Smith was a Scottish moral philosopher and political economist and a participant in a movement of intellectual flourishing in eighteenth-century Scotland known as the Scottish Enlightenment, which included such figures as Frances Hutcheson (1694–1746), David Hume (1711–1776), Thomas Reid (1710–1796), and Adam Ferguson (1723–1816). Smith was also the author of two influential books: one on moral theory, *The Theory of Moral Sentiments* (1759) and one on political economy, *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776). The first book brought Smith immediate fame as a man of letters, inside and outside of Scotland, but the second book was largely responsible for Smith's lasting international influence, launching his renown as the father of classical political economy, a school that over centuries included such thinkers as David Ricardo (1772–1823), Thomas Malthus (1776–1834), John Stuart Mill (1806–1873), Karl Marx (1818–1883), John Maynard Keynes (1887–1982), and Milton Friedman (1912–2006).

Smith was born in Kirkcaldy, Scotland, the only child of Margaret Douglas and Adam Smith, a civil servant who died shortly before his birth. He was educated at the Burgh School of Kirkcaldy, then the University of Glasgow under the guidance of Francis Hutcheson, whose views on Newtonian natural philosophy impressed him deeply, and whose theory of "moral sense" would set a standard against which he would come to define his own contribution to moral philosophy; and later as a Snell exhibitioner at Balliol College, Oxford, an educational experience he found deeply disappointing. He reported later that "in the university of Oxford, the greater part of the publick [*sic.*] professors have, for these many years, given up altogether even the pretence of teaching" (Smith, 1981–1987, p. 761). Nevertheless, quite independently, Smith immersed himself in the study of the natural sciences, and English, French, Greek, and Latin languages and literatures, and in 1748, after 6 years in Oxford, was invited to Edinburgh by Lord Kames (1696–1782) to deliver a series of lectures on rhetoric and literature, published posthumously as *Lectures on Rhetoric and Belles Lettres*. In Edinburgh, Smith met the philosopher and historian David Hume, 10 years his senior, who would become his closest friend and intellectual companion until Hume's death in 1776, though he would never fully digest Hume's utilitarianism, his skepticism, or his atheism. Smith thrived in Edinburgh, and in 1750 was appointed to the chair of logic and then to the prestigious chair of moral philosophy at the University of Glasgow, delivering lectures over the next 14 years on natural religion, ethics, jurisprudence, and political economy.

Smith left Glasgow in 1764 to serve as personal tutor to Henry Scott, the third Duke of Buccleuch, which paid well and enabled him to travel to the continent with his charge and meet many of the most influential philosophes of the French Enlightenment, including Voltaire (1694–1778), Denis Diderot (1713–1784), and Jean-Jacques Rousseau (1712–1778). Smith's encounters with François Quesnay (1694–1774), Jacques Turgot (1727–1781), and the so-called *physiocrats* corroborated some of his earliest thoughts on political economy, stimulated some new ones, and ultimately influenced the evolution of his free market arguments in *The Wealth of Nations* against the mercantile system, the early modern variant of protectionism in which governments use tariffs to manipulate trade. Smith returned to Kirkcaldy in 1767 to complete work on *The Wealth of Nations,* which was published in 1776.

During this period, Smith spent considerable time in London and participated in various intellectual clubs and societies with such friends and acquaintances as Edmund Burke (1729–1797), Dr. Samuel Johnson (1709–1784), Edward Gibbon (1737–1794), William Pitt, the younger (1759–1806), Lord North (1732–1792), and Benjamin Franklin (1706–1790), who spent several years in London before he returned to revolutionary America to serve on the Continental Congress. Smith became something of a hero to the American founders for his devastating critique of European imperialism, and particularly of British conquest in

North America. In *The Wealth of Nations,* Smith argued that colonial conquest was a disastrous enterprise for both conqueror and conquered, in political, economic, and moral terms, challenging a popular perception encouraged by monopolist companies that profited most from European exploits that empire was central to British power and wealth, and that it was the main vehicle for spreading modern liberty rather than imposing tyranny. *The Wealth of Nations* and its free market challenge to the mercantilist protection of monopolies was receiving wide acclaim, hailed as the coming of a new economic dawn, and had a profound influence on the political economy of the American founders. Franklin, George Washington (1732–1799), Thomas Jefferson (1743–1826), Thomas Paine (1737–1809), and many other Americans read *The Wealth of Nations* with great interest.

On the reputation of his economic treatise, Smith was appointed commissioner of customs and moved to Edinburgh in 1777, charged somewhat ironically with enforcing the very sort of tariffs he railed against in theory. At this time, Smith was also at work on an extensive new "account of the general principles of law and government" (Smith, 1981–1987, p. 342), which he never lived to complete. His last public appointment was as rector of the University of Glasgow in 1787. Smith died in 1790, at the age of 67, one week after having consigned 16 volumes of his unpublished manuscripts to the flames, among them, surely, his manuscript on law and government.

Smith is closely associated today with the idea of laissez-faire individualism, though he never used that formulation to describe his own project. There has been a tendency among libertarians and advocates of free markets, as well as Marxists and other left critics of capitalism, to caricature Smith's thought as an extreme defense of free market capitalism and supply-side economic principles, in which self-interest is the essence of human motivation, and in which the public good emerges as if by an "invisible hand"—that is, spontaneously from the unfettered pursuit of individual self-interest in an environment of free market competition where government has little positive function beyond maintaining a stable understructure. Surely there is much in Smith's thought to substantiate such a caricature, as we shall see. And critics are not altogether inaccurate when they observe that Smith had largely transformed classical political discourse into the terms of economics and sociology. But this story about "economic man" and the cold, utilitarian society in which he prospers is a distortion of Smith's overall philosophical project, a product of ideology and selective reading, and sorely anachronistic from the perspective of intellectual history. The words *economist* and *capitalism* were not even in English usage in Smith's day, let alone the ideas of "supply-side" and "trickle-down," which are regularly attributed to him. Smith understood himself primarily as a moral philosopher, and like all eighteenth-century Scottish moral philosophers, tended to situate his thoughts about economics and politics within a much broader framework of ethics and jurisprudence.

The Wealth of Nations

One of Smith's earliest essays, published posthumously in 1795 among other miscellaneous essays on philosophical subjects as "History of Astronomy," initiated his life-long fascination with Newtonian physics. Much of Smith's later work on ethics and economics demonstrates a propensity to apply methods in the natural and physical sciences to moral and social phenomena. Indeed, Smith would eventually argue in *The Wealth of Nations* (1776) that the economic sphere was governed by a natural order, an "invisible hand," whose autonomous, self-regulating qualities greatly resembled the natural order of the physical world. Accordingly, the economic system understood in free market terms was not chaotic, as traditionalist critics feared, but tended to order itself and bring about both wealth and social cohesiveness without human intervention. This way of thinking is diffused throughout Smith's description of the market. Self-interest was not a vice like greed or gluttony, to be condemned for dissolving our sense of moral and political responsibility toward our fellows. On the contrary, Smith argued that self-interest would contain its own excesses in a free market system and promote the public good without intending to do so. Additionally, the division of labor would dramatically increase productivity and generate a better standard of living for all; even the poor would be clothed and fed without planned redistribution. The prices of goods and services would be regulated by supply and demand; trade would balance

itself while opening new markets for surplus goods and supplying cheaper goods from abroad. Ultimately the world would become a freer, less bellicose, more prosperous place.

The Wealth of Nations (1776) is a 900-page assault on mercantilism, which Smith condemned for its faulty assumptions about the nature and causes of national wealth. While mercantilists believed that national wealth consisted in the accumulation of precious metals, achieved by manipulating the balance of trade through protectionist policies and punitive tariffs, Smith located national wealth in the annual flow of goods and services, which was stimulated most effectively under conditions of free trade. He described this as a "system of natural liberty and perfect justice" in which the proper function of government was to stabilize market conditions, primarily by maintaining a standing army to defend the society from invasion and by maintaining a system of justice, understood commutatively as the protection of property, rather than distributively and beneficently as the provision of goods and services. For this reason, Smith has often been described as a champion of small states.

Smith's arguments in *The Wealth of Nations* were substantiated by robust historical examples, which he deployed to great rhetorical effect. Smith's historical sensibility is perhaps best illustrated in his *Lectures on Jurisprudence,* a series of lectures he delivered in Glasgow, published posthumously from student lecture notes by Edwin Cannan in 1896. There Smith employed a historical technique that his biographer Dugald Stewart (1753–1828) called "conjectural" history, a method of thinking about history when one does not have solid empirical evidence, that was initiated by David Hume and became increasingly common among Scottish thinkers. In the *Lectures,* Smith reflected on law and government in anthropological terms as unfolding progressively through four general stages, each determined by its mode of subsistence. Humans began as hunters, Smith conjectured, with little sociality among them and no permanent settlement, gathering subsistence through chance encounters with animals. This evolved into pastoral society, in which men were a bit more social and cooperative, gathering what they needed as they wandered together in groups in search of subsistence. In the agricultural stage, humans began settling down to cultivate crops. During this stage, simple ideas of property developed; humans began to bond into permanent communal groups with shared moralities and feelings of communal responsibility. Honor was a primary value in this stage, provoking the natural evolution of armies to protect the group and its property from foreign invasion. The fourth and final stage is commercial society, or what Smith sometimes called civil society, in which human relations are regulated through commercial exchange in the marketplace, and where subsistence is provided through the money that one makes engaging in labor. Smith argued that commercial society best provides the conditions necessary for human liberty, which he conceived in negative terms that resonate with classical liberal thought today: The ability to pursue one's ends without impediment or injury under the rule of law.

Smith celebrated civilization, refinement, and the triumph of the arts and sciences, moral equality, autonomy, tolerance, and self-sufficiency; and he believed that a neutral state with a standing army was the best guarantee for modern freedom and general well-being. Insofar as we might characterize the Enlightenment as a unified movement, Smith seems to have supported every one of its aims. And yet he never claimed that civilizational progress was an unqualified good. For one thing, he never embraced the pursuit of wealth uncritically. Despite what history has made of him, Smith was never a flat-footed optimist about the effects of commercialism on the texture of human life. He did believe that a free market economy, supplemented by appropriate political and social institutions and policies, was modernity's best hope for general well-being. He was committed to reducing human poverty and misery and promoting human equality, and had great faith in the trajectory of history in this sense, leaving him justly susceptible to charges of woeful shortsightedness, well-intentioned as it may have been. But he also elaborated on the dangers of commercial culture in detail and intensity rivaled only by Karl Marx himself. In this sense, Jean-Jacques Rousseau had a profound influence on Smith's thought. As early as 1756, Smith was reading Rousseau's work, and was sufficiently prompted to compose a letter to the *Edinburgh Review* engaging Rousseau's *Discourse on the Origin of Inequality Among Men* (1755). Though

they disagreed rather dramatically in terms of political vision, and in their ultimate views of modernity in general, Rousseau and Smith shared a keen sense of the corrupting moral effects of commercial life on modern individuals. Echoing Rousseau's Counter-Enlightenment themes about the hypocrisies of modern happiness, Smith agreed that modern commercial life rested on a pervasive self-deception about our needs and our happiness and that it tended to corrupt our moral sentiments by promoting vanity and conspicuous greed. Smith encouraged commercial people to cultivate habits of personal thrift and to resist emulating the superfluities of the rich, which would lead to perpetual disappointment at best, failure and poverty at worst. Moreover, even at the dawn of the Industrial Revolution, he observed that the division of labor dehumanized its participants through "mental mutilation," rendering them dependent, enervated, and stupid. To combat the mental and spiritual by-products of commercial productivity, Smith charged the government with the duty of public education.

Indeed, Smith understood that the government had affirmative duties, what he called "expenses," in a free market system to perform functions necessary to the public good that private institutions were ill-suited to perform, such as the building and maintenance of public works and institutions, like roads, bridges and communications; institutions necessary to protect trade routes from piracy and freebooting; the public education of children; the containment of public disease (he singled out leprosy); and the dignified upkeep of the sovereign's expenses that were to be supported by public revenue through taxation and the collection of customs. He also observed that the expenses of government would become more substantial as a government becomes more opulent. He remained ever wary of proposals that rested too heavily on taxation, but he insisted that government was the only body capable of harnessing many of the most harmful tendencies of commercial society. Another essential component of sovereignty, what Smith called "the science of the legislator," is to stimulate a sense of magnanimity and public spiritedness within modern commercial populations susceptible to becoming too narrowly focused on private interest, or atomized by their specialized functions in the division of labor. Here Smith gave voice to classical republican themes that still dwelled more or less overtly in Scottish Enlightenment thought, despite the diminished appeal of republican sentiment for moderns elsewhere. Though he was fully committed to commerce as the engine of historical progress, something of the Scottish highlanders remained in him. Their emphasis on stoic austerity, independence, and civic virtue resonated in Smith's sensibility. In this sense, among others surely, Smith's modernity was articulated in a distinctively Scottish key.

Smith never wrote a text devoted explicitly to the subject of politics, and he was a notorious critic of "men of system," who attempt to work out in advance the details of ideal political arrangements. His allergy to political idealism intensified in his later writings, as events in France and America escalated and revolutionary violence seemed inevitable. Smith tended to associate ambitious political projects with the fomentation of fanaticism and faction, the great destabilizers of prosperity. Yet it would be a mistake to underestimate Smith's contributions to modern political thought, which are obscured when his ethics and politics are marginalized and his overall project is articulated in the narrow key of economics.

George Stigler, the 1982 Nobel Laureate in Economics, gave voice to a dominant perception about Smith's thought when he suggested that *The Wealth of Nations* is a "stupendous palace erected upon the granite of self-interest" (1971, p. 265). Clearly self-interest is the engine of commercial prosperity for Smith, and a central dimension of human motivation. But self-interest takes its place within a far richer motivational complex, marked as much by passion and imagination as by interest and reason. As we shall see in the next section, Smith rejected the utilitarian, rational-choice, "economic man" assumptions that posterity has attributed to him. He insisted that we impoverish our understanding of human nature when we reduce human motivation to selfishness.

The Theory of Moral Sentiments

From Smith's pupil, John Millar (1735–1801), we know that Smith's Glasgow lectures on moral philosophy were divided into four tracks: natural religion, ethics, jurisprudence, and political economy. The second track later provided the basis for Smith's first book, *The Theory of Moral Sentiments,*

published in 1759; the third was published posthumously as *Lectures on Jurisprudence;* and the fourth became the core of *The Wealth of Nations*. From a mere outline of Smith's lectures, one observes that political economy takes its place within a far broader philosophical project. This sense of a richer, more textured outlook on human morals and motivations is confirmed when one beholds the famous opening sentence of *The Theory of Moral Sentiments:*

> How selfish so ever man may be supposed, there are evidently some principles in his nature, which interest him in the fortune of others, and render their happiness necessary to him, though he derives nothing from it except the pleasure of seeing it. (Smith, 1981–1987, p. 9)

The Theory of Moral Sentiments was deployed as a challenge to more individualistic accounts of society and politics, which Smith identified with Thomas Hobbes (1588–1689) and his disciples, Samuel Pufendorf (1632–1694) and Bernard Mandeville (1670–1733). In this well-known passage, Smith rejected not only the claim that men were purely selfish beings without social impulses and needs, but also the corollary Mandevillean claim, embraced by many of his eighteenth-century contemporaries, and still frequently attributed to Smith's economic thought today, that any society or good will to be found among them was the by-product of enlightened selfishness. In *The Theory of Moral Sentiments,* Smith focused instead on the natural principle of "sympathy." For this reason, *The Moral Sentiments* is often casually mistaken as a normative treatise about morality, as if Smith was advocating benevolent action over selfishness, rather than providing a rich description of human nature and society, typical of Scottish moral philosophy. Such misinterpretations are responsible for fueling a long-standing debate, which began in Germany in the second half of the nineteenth century, about deep tensions between the conceptions of human nature offered in Smith's two central texts. The so-called *Das Adam Smith Problem,* coined by German economist August Oncken (1844–1911), turned on whether one can reconcile Smith's emphasis on "self-interest" in *The Wealth of Nations* (1776) with his ethical emphasis on "sympathy" in *The Theory of Moral Sentiments* (1759). Economists long resolved the "problem" in the direction of self-interest, with *The Wealth of Nations* rising triumphant as the motivating center of Smith's thought, and *The Moral Sentiments* set aside as puerile and academic. Others equally faulty have argued that sympathy triumphed. But the contours of this debate are putatively artificial. While Smith rejected moral pessimism, however it presented itself, and was eager to condemn the egoistic assumptions of Hobbesism so prominent in his day, he did not posit the idea of sympathy as a straightforward counter-principle to selfishness. He never believed the two were incompatible or worked in a zero-sum fashion.

On Smith's account, sympathy was not an innate benevolent disposition that discharges mindlessly and spontaneously like the "pitie" of Rousseau or the *moral sense* of Hutcheson; nor was it a rational end like the natural law of John Locke (1632–1704) or the categorical imperative of Immanuel Kant (1724–1804). For Smith, sympathy was a principle of moral judgment to be valued by moderns for its unifying function in complex commercial societies freed from feudal certainties. According to Smith, we all naturally desire sympathetic concord with our fellows. He observed that this leads us to speculate how others will judge us, and that we learn to adjust our actions to a pitch, a "point of propriety," that will obtain the sympathy we desire. Sympathy, in this sense, brings about an affective moderation in the individual and a "concord" of sentiments in society. Central to Smith's theory of moral development, however, is his claim that moral maturity consists of cultivating independence in one's judgments, in weaning oneself from the childish need for social praise. As a moral agent matures over time, she comes to need society's actual judgments less and less to motivate propriety in her actions. The repetition of sympathetic interactions with others over time cultivates in the breast of every individual a higher standard of judgment that Smith calls "conscience," or the "impartial spectator," which the individual comes to consult more frequently when judging herself and others. In this sense, there are significant similarities between Smith's "impartial spectator" and Sigmund Freud's idea of a "superego" a century later.

But sympathy amounts to more than an account of how selves are socialized for Smith. It is also a

highly original anthropological account of how moral cultures arise and are perpetuated. For Smith, society is like a vast mirror into which we all gaze, from earliest childhood, to discover who we are and what we value. As Smith described it, sympathy is the process through which we learn to "accommodate and to assimilate, as much as we can, our own sentiments, principles, and feelings, to those which we see fixed and rooted in the persons who we are obliged to live and converse a great deal with" (Smith, 1981–1987, p. 224). When compounded over time, sympathetic experiences with others near us progressively constrain our understanding of ourselves, of others, and of the world, and condition the criteria that we draw on when we judge ourselves and others. In other words, sympathy is the very process through which the self learns the etiquette, tastes, and values of the people with whom it interacts, becomes a member of that particular moral culture, and then passes that culture on to others. Moral culture is thus passed from each generation to the next through the infinite repetition of sympathetic contacts.

An important political implication of the sympathy mechanism, thus, is its capacity to socialize modern individuals into the group, to marginalize or sublimate difference, without traditional forms of coercion. By focusing on the unifying power of sympathy, Smith had posed a serious challenge to preachy critics of progress and modernity who insisted that wealth and virtue were incompatible ends, and that properly functioning societies require that men be perpetually subjected to traditional moral prohibitions enforced by absolute rulers, a punitive clergy and a vengeful God. In *The Moral Sentiments,* Smith described a lighter, freer, self-regulating method of social coordination that would operate in modern commercial societies without kings, priests, and teachers. Another interesting insight from the perspective of political theory is that Smith's system also functioned without transcendent truths supplied by religion or philosophy, which were always deeply contentious, and responsible for the intractable and bloody wars that moderns sought to bequeath to a barbarous history. Smith frequently invoked "God" as the "Author of Nature" who had arranged things to maximize human happiness, which complemented his Newtonian description of spontaneous social order as an "invisible hand," but there is broad consensus among scholars that Smith's God was deistic, and did not ground or determine man's moral faculties. In *The Moral Sentiments* Smith located the source of man's moral faculties in human nature as it unfolds in society. He described the actual practices through which modern people in their daily encounters and conversations learn to live together and achieve consensus spontaneously, and without ideological foundations, on a wide range of issues.

Smith agreed with David Hume about many things. But in his view of the social origins of morality, he believed he had departed from Hume's well-known claim that "utility" is the "foundation of the chief part of morals" (Hume, 1998, 5.4) Smith argued that considerations of utility might contribute to the beauty or deformity of a thing, but he resisted the idea that utility should be conflated with virtue, or that it should be seen as the primary reason why we tend to approve or disapprove of something. There has been much debate among scholars on the extent to which Hume's utilitarianism is ultimately incompatible with Smith's claims about the social nature of morality.

The Moral Sentiments earned praise as a profound work in moral philosophy from such venerable contemporaries as Edmund Burke and Immanuel Kant. Sophie de Grouchy (1764–1822), wife of the marquis de Condorcet (1743–1794), translated the treatise into French in 1798, along with Smith's 1761 essay "Considerations Concerning the First Formation of Languages." Smith revised *The Moral Sentiments* five times between 1759 and 1790, the second and the sixth editions substantially. In the final edition in 1790, Smith added an entirely new part in which he attempted a comprehensive history of moral philosophy.

Smith's methodological and disciplinary commitments elude simple categorization. As was common among members of the Scottish literati, Smith was broadly educated in the arts and sciences, a genuine polymath, and felt no hesitation crossing methodological and substantive barriers into the natural and physical sciences, philosophy, religion, history, politics, law, economics, anthropology, sociology, psychology, literature, and linguistics. He is most commonly categorized as a political economist, but his rightful place as a moral philosopher of canonical stature has been reestablished in

recent decades among philosophers and intellectual historians. And yet, Smith did not use his texts to advance strong normative ethical or economic positions. Surely there are moments throughout his work when he advocated certain actions and policies over others for their utility or their intrinsic moral worth; but in the empirical tradition of Scottish moral philosophy, Smith was engaged primarily in a far more descriptive activity: He wanted to describe the origin of morals, and the origin of national wealth. For the most part, *The Moral Sentiments* reads like a rich investigation into human nature, presented by an individual exquisitely attuned to the social phenomena he observed in the world around him. And *The Wealth of Nations* reads like an institutional description of the origins of national wealth, grounded in a trenchant sense of history. Indeed, those today who draw sharp lines between facts and values, between what is and what ought to be, may be inclined to characterize Smith's empirical investigations in both books as thoroughly scientific and not philosophical at all. The point to remember is that so rigid a division of intellectual labor did not yet exist in Smith's day. Smith moved rather freely between fact and value, between the actual and the ideal, and was inescapably guided by a variety of normative impulses, acknowledged or not. The positive/normative distinction that drives contemporary social science is inappropriate for characterizing a "theory" like Smith's that sought to provide an empirical account of morals in the nebulous terms of "human nature," and that sought to provide an empirical and historical account of wealth in the nebulous terms of "natural liberty."

SOCIABILITY

Distinct from an altruistic other-regardingness, *sociability* may be best and most generally understood as a natural and rational desire for human community and fellowship that has played an ontological and foundational role in accounts of political society. It is often depicted as a feature of human nature, a normative command of god or of reason and as a corollary of self-love. In general, sociability may be understood as the desire of individuals to live peacefully in society with one another and to take a general interest in the well-being of others As such, sociability played an important role in discussions of human nature

and the nature and constitution of political communities in both stoicism and modern natural jurisprudence.

Sociability in Greek and Roman Thought

The concept emerged originally among the Greek and Roman stoics (for example, by Epictetus, Marcus Aurelius, and Porphyry, among many others), who sought to bring the Aristotelian category of the *politikon zoon* to bear on a world in which empire had come to replace the polis. The concept of *oikeiosis* or *appetitus socialitas* was part of the apparatus used by the stoic philosophers to ground the notion of the universal community of mankind. The stoics saw sociability or fellowship as an integral element of human nature that was intimately connected to the rational life and the fulfillment of the human telos. The rational man observes his own desire for human fellowship and pursues this connection with other people as an expression of his rational and sociable nature. The end result of this conception of sociability is the acknowledgment of the universal community of mankind and a subsequent moral relationship with all other human beings.

Further, sociability provided the stoics with an alternate basis for political life than necessity or force. Rather than grounding political community and obligation in material necessity or coercion, the stoics used sociability as a way of describing these entanglements as voluntary expressions of a rational and universal human appetite. Cicero, for instance, in his *De Officio,* explicitly uses sociability as a way of distinguishing the political from the necessary, while at the same time using sociability as a justification for property (justice). In this usage, sociability is the feature of human nature that allows political life to be informed by a moral or ethical dimension: It becomes possible for justice and obligation to be grounded in natural human sociability rather than expedience or force.

Sociability in the Modern Natural Law Tradition

This latter conception of sociability regained popularity in the early modern tradition of natural law and natural rights. In the seventeenth and eighteenth centuries, natural lawyers turned to the stoic language of sociability in order to provide a foundation for their natural jurisprudence. The uses of sociability as a constitutive category are quite diverse but, generally, sociability comes to stand less as the prepolitical impetus for human society and more as the precondition for rights and moral equality. More particularly, the claim that human nature is characterized by a kind of sociability enabled the natural lawyers to argue that individuals possess reciprocal rights and obligations in the state of nature that retain their force even in political society.

For example, Hugo Grotius, in the *Prolegomena* to his *Rights of War and Peace,* draws explicitly on the stoic notion of oikeiosis to undermine the skeptical claim that justice and right are based solely on expedience and force. Rather, he argues that there is a sociable dimension of human nature, connected to reason, that makes individuals capable of recognizing natural law and natural justice and desirous of living in society with one another. This is an explicitly stoic rendering of sociability that comes to play an important constitutive role in Grotius's theory of natural law and natural right. By contrast, in the natural law writing of Samuel von Pufendorf, sociableness becomes the chief law of nature, divinely mandated to make human social life possible. In both cases, sociability is deployed in order to moderate the aggressiveness and solipsism of self-love and self-interest.

Despite its importance for thinkers like Grotius, Pufendorf, Jean Barbeyrac, and others, natural law sociability was contested from the outset. Hobbes, for instance, explicitly rejects the idea of any kind of sociable other-regardingness as a dimension of the human psychology and precondition for politics. Generally, however, in the early modern era, sociability works as the category through which political theorists and natural lawyers are able to conceive of individuals as capable and desirous of assuming rights and duties toward others. This means that sociability plays an important role, at least rhetorically, in the movement from a state of nature to political society. In the effort to explain why rights-bearing individuals would move into civil society, sociability becomes a way of explaining the desire to move into political society and a way of characterizing the restraints on individual rights and freedoms—again without having to

limit political obligations to necessity or coercion. In its early modern usage, sociability comes to occupy a gray space in descriptions of human nature; sociability works, generally speaking, as a category that moderates, informs, and restrains self-love in order to make political society and political obligations possible.

While Rousseau's notion of natural pity can be seen as a way of decoupling human sentiment from a sociable drive toward political society, the greater challenge to sociability came from its gradual merger with egoism and self-love. In the Scottish Enlightenment, sociability retained significance as *sentiment* or *benevolence*—a natural moral inclination toward shared goods. However, whereas thinkers like Grotius and Pufendorf saw sociability as a facet of human nature distinct from self-love, thinkers like Hutcheson, Smith, and Ferguson, among others, began to blur this distinction. In this tradition, sociability ultimately comes to be an organic feature of human psychology that is difficult to distinguish from a well-regulated self-love. The tension between sociability and self-interest can be said to have reached its apex with Kant's "asocial sociability"—a concept that merged the two historically antagonistic concepts and thereby effectively undermined the possibility of designing political institutions to encourage sociability at the expense of pathological self-love.

The role of sociability in early modern natural law theories has been the subject of much debate in recent years. Scholars argue about the degree to which this sociability was a genuinely constitutive ingredient of political and social obligation and to what extent sociability is merely a rhetorical device for making liberal political authority possible. In any case, despite its importance to the foundations of early modern natural law theory, after the eighteenth century, the language of sociability all but completely disappears from political theory. As natural law theory declined in importance and as philosophers sought to establish firmer secular bases for political obligation, depictions of human nature came to be overwhelmingly focused on self-love and self-interest. Consequently, institutional rather than ontological constraints on this egoism came to characterize the concerns of political theory and natural rights.

Social Capital

Social capital is defined by the conjunction of its two terms. *Social* refers to institutions, organizations and networks through which individuals interact to achieve common goals. *Capital* refers to the aspects of these interactions that can be used to achieve common goals and political gains. Hence, *social capital* includes all interactions that develop bonds and trust between community members and that thereby increase the capacity of citizens to influence the political process.

Social capital can grow out of almost any everyday human interaction. Yet, while all kinds of interactions are important, some feed more directly into governance than do others. Again, while all kinds of governing institutions might foster trust, social scientists often suggest that local governing groups, such as city councils and school boards, are of particular value to the creation of a cohesive society.

To simplify matters, we might think of the institutions that foster social capital as being either private or state ones. Private groups, such as nonprofits and local networks, can help to develop social capital outside of the state. Even when social capital develops outside of the state, it often helps

to give people access to particular state resources, such as funding for schools or the repair of local roads. Here social capital fosters trust and communication within local communities, thereby enabling people to cooperate so as to interact more effectively with government. Equally, of course, such social capital can enable people to act collectively to pursue interests and concerns in ways that simply bypass the state. One example would be a local voluntary group that protects and cleans a park or other zone.

Social capital can arise, secondly, from government institutions. State agencies can stimulate communication, trust, and understanding between community members. A dramatic recent example of governmental interest in stimulating social capital is the White Paper on European Governance published by the Commission of the European Communities in 2001. The White Paper explicitly aimed to develop means to connect the European Union more closely to its citizens and to increase participation in governmental affairs. These aims are unpacked in terms of five principles: openness, participation, accountability, effectiveness, and coherence. These principles then inspire proposals for change under four headings: better involvement in shaping and implementing policy, better policies and better delivery of policies, contributions to global governance, and refocused institutions and policies. The big idea is to expand democratic participation by opening up the policy-making process through a shift in the role of governing institutions from command and control in hierarchies to facilitation and negotiation in networks. Governance in and through networks thus gets invoked as a means of building social capital.

The European Union and other governments might be increasingly convinced of the importance of building social capital, but by no means does everyone agree with them. Some social scientists think that the concept of social capital is sheer nonsense. Others debate about how to define it, or its role in society, governance, and democracies.

Consider the definition of social capital. Some people define it as an omnipresent resource arising out of each and every interaction. Others associate it more narrowly with only those social interactions that produce norms of trust and reciprocity. While these definitions overlap, they often lead to different analyses of the relationship between social capital to society and to governance.

Do high levels of social capital sustain communities in a way that leads to a strong and inclusive civil society? On the one hand, we might suggest that some forms of social capital actually hinder wider trust and cooperation. Close-knit social groups often exclude other members of society with different identities or concerns: Wealthy gated neighborhoods might express the common concerns of their residents for privacy and security, but they also physically remove their residents from the greater community. What is more, close-knit groups can restrict the effective freedom of their members by imposing draconian rules or norms. Yet, on the other hand, some social scientists strongly argue that even exclusive or repressive groups entail interactions that generate social capital. In this view, even if such groups make it harder to develop broader forms of trust and cooperation, they nonetheless increase the capacity of their members to engage in governance and influence the state.

The effect of social capital on the state is, however, also a matter of debate. The dominant view is that social capital stimulates the state to respond to its citizens. When citizens develop trust and cooperation, they are better able to get the state to respond to their demands. Yet, we might suggest that social capital sometimes encourages the state to divest from communities. Perhaps, for example, if local community groups and nonprofits tackle problems, state actors will come to believe that they need not do so. In the absence of successful community cooperation, the state itself might address the relevant issues.

Another debate concerns the relationship between social capital and democracy. Social capital is, it seems, weak in authoritarian states. Some political scientists thus argue that democracy depends on the presence of certain levels of social capital within civil society and independent of the state. Social capital in civil society serves to check abuses of power and prevents government corruption. However, other political scientists argue that democracy does not presuppose social capital as much as create it. Democracy encourages the state to pay more attention to public opinion, thereby giving social actors more reason to interact and organize themselves. Authoritarian

states, in contrast, often restrict free speech and free organization, thereby undermining the growth of social capital.

Social Constructivism

Constructivists argue that social reality is constructed out of human knowledge, beliefs, or meanings. Typically, they add that human knowledge too is constructed. Such constructivism stands in stark contrast to accounts of our knowledge as resting directly on the facts of the matter. It denies that our knowledge can derive from pure experiences of an independent reality. To the contrary, it emphasizes the positive role played by social traditions and cultural conventions in determining the content of our experiences. Hence, constructivism often acts as a form of critique. It suggests that ideas that might appear to be inherently rational or natural are in fact the artifacts of particular traditions or cultures. Likewise, it implies that our social and political practices are not the result of natural or social laws; they are the product of choices informed by contingent meanings and beliefs.

Social constructivism has been applied to a range of concepts. Perhaps the most controversial in philosophical terms are concepts such as truth and reality. The most controversial in social terms have perhaps been race, sexuality, and gender, all of which might be thought to have a basis in given facts about our bodies. Constructivism has also been applied to social and political institutions, including nations, corporations, agencies, and governments. This constructivist view of institutions challenges many of the leading approaches to social science and also related approaches to public policy. Constructivist theories of politics stress the role of tradition, discourse, and culture in constructing patterns of rule. They thereby highlight the contingency and contestability of political life in contrast to those who see it as inevitable, rational, or explicable by reference to natural or social processes. They suggest that political life is a social construction. It arises out of particular traditions or particular regimes of knowledge.

Varieties of Constructivism

All forms of social constructivism emphasize the constructed nature of the social world. However, there are different ways of unpacking constructivism, and we should distinguish between them. Although it is tempting to think of each type of constructivism as an account of society as a whole, each of them might apply to some (but not all) of our concepts.

A general version of constructivism insists that we make parts of the social world by our intentional actions. People act for reasons that they adopt in the light of beliefs and tacit knowledge that they acquire in part through processes of socialization. For example, when shopkeepers price goods, they make an aspect of the social world in accord with their beliefs about how to make a profit, and their perhaps tacit concepts of market economics and fair exchange. Other aspects of the social world then arise as the unintended consequences of such intentional actions. For example, if a shopkeeper prices her goods higher than her competitors, and if potential customers buy goods at the lower prices available elsewhere, she will go broke irrespective of whether or not anybody intended or foresaw that outcome.

All kinds of social scientists allow that we make the world through our intentional actions. Often they seek to explain actions in terms of allegedly social or natural facts about, say, institutions, social class, gender, or a universal human rationality. In contrast, constructivists usually argue that the intentions of actors derive in part from traditions, discourses, or systems of knowledge that are also social constructs. This linguistic social constructivism implies not only that we make the social world by acting on certain beliefs and meanings, but also that we make the very beliefs and meanings on which we act. In this view, our concepts are contingent products of particular discourses and practices; they are not natural or inevitable ways of conceiving and classifying objects. Again, our concepts are the artificial inventions of a particular language, culture, and society; they are not a universal vocabulary that picks out natural kinds in the world. Constructivism thus implies that varied traditions or cultures can categorize objects differently. For example, it is a commonplace that Eskimos have many words for different types of "snow," or that the people of the Kalahari Desert have words that pick out various shades of "red." Linguistic social constructivism consists, therefore, of what is called "anti-essentialism." It asserts that our concepts do not refer to essences: Our concepts do not pick out core, intrinsic properties that are common to all the things to which we might apply them and that also explain the other facets and behavior of those things. It is certainly possible that none of our social concepts refer to essences, especially if we define a social concept as one that cannot be unpacked solely in terms of our bodies, their movements, and their reactions. However, to say that our social concepts do not refer to essences is not to say that they do not refer to anything at all. We should distinguish here between pragmatic, critical, and antirealist forms of constructivism.

Linguistic social constructivism implies an anti-essentialism according to which concepts do not have objective boundaries but rather are determined by social factors. Sometimes this anti-essentialism inspires a pragmatic account of social concepts. In this view, social concepts are vague; they capture family resemblances; they are conventional ways of dividing up continuums, rather than terms for discrete chunks of experience. But although pragmatic concepts do not refer to essences, they do refer to groups of objects, properties, or events—often groups that have vague boundaries. Social factors determine pragmatic concepts because there are innumerable ways in which we can classify things, and because it is our purposes and our histories that lead us to adopt some classifications and not others. Nonetheless, the role of social factors in determining pragmatic concepts does not mean that these concepts have no basis in the world. To the contrary, we might justify adopting the particular pragmatic concepts we do by arguing that they best serve our purposes, whether these purposes are descriptive, explanatory, or normative. We might justify a pragmatic concept such as the "new public management" on the grounds that its content derives from family resemblances between recent public sector reforms. We also might defend ascribing particular content to concepts such as neoliberalism on the grounds that doing so best explains the resemblances between public sector reforms. And we might adopt a particular concept of democratic accountability on the grounds that it best captures those patterns of rule that we should regard as legitimate given our normative commitments.

Critical constructivism arises when we want to suggest a concept is invalid. In such cases, we might argue that the concept is determined by social factors and that it fails to capture even a group. For example, we might reject the concept "new public management" as unfounded, especially if it is meant to refer to a global trend. We might argue that different states introduced different reforms with widely varying results. And we might add that the reforms drew on, and resembled, each state's traditions of administration far more than they did a common neoliberal blueprint. In such cases, we dismiss concepts as unfounded by arguing that there is no fact of the matter—neither an essence nor a group—that they accurately pick out.

Some antirealists have adopted a kind of global critical constructivism, applying it to all of our concepts. Typically, these antirealists argue that the role of prior theories and traditions in constructing our experiences precludes our taking these experiences to be accurate of a world independent of us. They argue that we only have access to our world (things as we experience them),

rather than some world as it is independent of us (things in themselves). And they then conclude that this means that we have no basis on which to treat our concepts as true to the world. In their view, there is no outside the text, and so no world outside our linguistic constructions.

Constructivist Approaches to Politics

Different types of social constructivism might inspire different approaches to politics. Whatever the merits of antirealism as a global theory, it is important to say that there is nothing incoherent about an antirealist or critical account of any particular aspect of politics. Consider, for example, the idea that there is a new governance defined in terms of the hollowing out of the state: The state is said to have lost the ability to impose its will, and to have come to rely instead on negotiations with other organizations with which it forms networks and partnerships. In contrast, we might suggest that the state never had the ability to impose its will; the state always had to operate with and through organizations in civil society; it always has been plural and dispersed. Hence, we might conclude that there is no fact of the matter that can be accurately picked out by the concept "the new governance."

Even if we took an antirealist stance toward "the new governance," we still might be interested in abstract questions about governance or politics conceived as an account of features of all patterns of rule. The general and pragmatic versions of social constructivism are most relevant to these abstract questions. Because constructivists argue that we make the social world by acting on contingent sets of meanings, they generally analyze changing patterns of rule in terms of competing traditions and bodies of knowledge. They favor the interpretive approaches to politics that concentrate on elucidating the meanings that make possible any particular pattern of rule. Similarly, because constructivists emphasize the contingency of traditions, they sometimes highlight the diversity of traditions at play within a pattern of rule and the contests between these traditions. They favor bottom-up approaches to the study of politics that explore how meanings are created, sustained, contested, and transformed by human activity within practices saturated with relations of power. Finally, when constructivists emphasize the contingent and diverse nature of traditions, they offer critical genealogies of alternative accounts of patterns of rule. They reject any suggestion that a natural or social logic determines the content or the development of any given political system. They argue that political scientists efface the contingency of social life when they attempt to ground their theories in apparently given facts about human rationality, the path dependence of institutions, or the inexorability of social developments.

Although constructivists typically favor interpretive, bottom-up, and critical approaches to the study of politics, they disagree among themselves about the details of such approaches. The main disagreements seem to distinguish governmentality and decentered theory. These two forms of constructivism appear to embody different views of meaning. Governmentality theorists often imply that meanings exist as quasi-structures in that their content derives from their relationship to one another within discourses: individuals are just the passive supports or constructs of such discourses. In contrast, decentered theorists take meanings to arise from the use individuals make of language to express their beliefs; discourses are just clusters of intersubjective beliefs adopted against the background of similar traditions.

Constructivists adopt different views of meaning largely because they hold different views of the individual. Governmentality and decentered theory alike reject the idea of an autonomous individual. They insist that individuals are inherently located within social contexts that influence them. Governmentality theorists appear also to want to reject the very idea of human agency. Many of them concentrate exclusively on the ways in which social contexts or discourses give individuals their intentions and beliefs—their very identities. Decentered theorists want to defend the idea of situated agency even as they reject that of autonomy. They argue that individuals can reason and act in novel ways, albeit that they can do so only against the background of inherited traditions that influence them. Although people always set out against the background of a discourse or tradition, they are agents who can act and reason in novel ways so as to modify this background. Hence, they conclude that although a linguistic context forms the background to people's statements, and a

social context forms the background to their actions and practices, the content of statements and actions does not come directly from these contexts, but rather from the ways in which people replicate, use, or respond to these contexts in accord with their intentions.

Social Contract Theory

Social contract theory is an approach to questions of political legitimacy and obligation that seeks to ground claims to sovereignty on an agreement among people to form a political community. Social contract theory was the dominant approach to such questions in early modern Europe, and numbered among its proponents many of the major political theorists of the seventeenth and eighteenth centuries, including Hugo Grotius, Thomas Hobbes, Samuel von Pufendorf, John Locke, Jean-Jacques Rousseau, and Immanuel Kant. As it is a theory of popular sovereignty, social contract theory was originally in opposition to theories such as that of the divine right of kings that grounded political authority on a putative mandate from God. In the late eighteenth and early nineteenth centuries, social contract theory came under sustained attack from Edmund Burke, David Hume, Georg Wilhelm Friedrich Hegel, and utilitarians such as Jeremy Bentham and James Mill. As a result of these attacks, it fell out of favor in both the Anglophone and the continental European traditions of political theory until, in 1971, John Rawls sought to revive it. Since then, important contemporary variants on social contract theory have been developed by Rawls and by such figures as Robert Nozick, T. M. Scanlon, Charles Beitz, and Ronald Dworkin. This entry focuses on the social contract theory of early modern Europe. Its contemporary revival is discussed in the entry on Contractualism and other related entries in this encyclopedia.

Although all social contract theorists share an appeal to an original covenant that is the foundation of political society, and hence all ground sovereign authority on popular agreement, each major figure in the tradition developed a distinctive variant of the social contract. For example, Hobbes's social contract ushers in an absolute sovereign that, in its powers, is more similar to the figure envisaged by divine right theorists such as Robert Filmer than to the limited government of Locke's theory. This entry thus begins with an overview of the versions of the social contract offered by the figures previously listed, before turning to an account of the major themes that unite social contract theorists—such as their individualistic premises, the positing of a state of nature, and the appeal to natural law—and of the criticisms that beset contract theory after the Enlightenment. It concludes with a comparison with contemporary contractualism.

Hugo Grotius

Hugo Grotius (1583–1645) is not strictly speaking a social contract theorist, because he does not posit political society as arising out of an original agreement, or social contract. However, in developing a political theory based on the natural rights of individual human beings, he is an important precursor of later natural law theorists who would go on to develop the idea of a social contract. In *De Indis,* (*On the Indies*) Grotius based his argument that his country—the Netherlands—was justified in capturing Spanish and Portuguese merchant ships during war on natural principles of justice. He later developed this position in *Mare Liberum*

(*The Free Sea*) by arguing that the sea belonged to no nation and could be used by any. The idea that something that is the property of no one can be used by anyone was to be a significant theme in the writings of later contract theorists. Finally, in *De Jure Belli ac Pacis* (*The Rights of War and Peace*), his magnum opus, Grotius systematized a set of purportedly natural laws that applied to all nations, arguing that nations were bound by a common law both in times of peace and when at war. In arguing that certain laws might be natural, Grotius laid the foundation for social contract theory, with its use of the trope of the state of nature. Furthermore, Grotius also defended a notion of natural rights, thus developing a consent-based theory. In his view, people have the right to govern themselves unless they divest themselves of this right. Given the subsequent writings of Hobbes and others, this argument was, to say the least, a pregnant one.

Thomas Hobbes

It is in the writings of Thomas Hobbes (1588–1679) that the notion of the social contract—or as Hobbes frequently calls it, the social compact—is fully developed for the first time. Hobbes uses the notion of the state of nature to justify sovereign authority. In his argument, as developed most famously in *Leviathan,* but also in *De Cive* (*On the Citizen*) and in *The Elements of Law,* human beings existing outside of political society would have to rely on themselves to ensure their preservation, as they could not rely on anyone else to protect them. Postulating that our primary desire is to avoid violent death, Hobbes ascribes to human beings a right of nature, which is to do whatever they must to preserve themselves. As, outside of political society, there is no arbiter of what is necessary for someone's preservation, Hobbes argues that it follows that, in such a state, each person has a right to whatever he or she deems necessary. As each person has this right, he concludes that in a state of nature everyone has a right to all things.

In what is probably Hobbes's most famous argument, he advances the claim that life in a state of nature will be "solitary, poore, nasty, brutish, and short" (Hobbes, part 1, chap. 13 of *Leviathan*). That is not, as is commonly believed, because human nature is necessarily aggressive, but because we are compelled by fear, by competition, or by vainglory to seek to enhance our power at all times. Even if our neighbors do not actually wish us ill, we cannot know this, and so our desire for self-preservation means that we must assume the worst and take steps to protect ourselves from them. The result is a war of all against all, which does not mean constant fighting but the constant threat of fighting. Not only will our lives by lonely and brief, but we will have little scientific or artistic development and few of the commodities of modern life, because development of such things requires a level of trust that is, in Hobbes's view, absent from the state of nature. As a result of the inconveniences of the state of nature, we will sign a social contract that will establish a leviathan, an absolute sovereign authority, over us and protect us from the constant threat of violent death. Hobbes also postulates laws of nature that ensure that we sign the social contract, the most important of which are that we should do whatever we can to establish peace and that, when necessary for procuring of peace, we be willing to lay down our right to all things and transfer it to a sovereign.

So, in Hobbes, as in later writers, the social contract is a means of escaping the state of nature. Hobbes is in many respects an unusual social contract theorist, however, for he defends a form of political absolutism. The Hobbesian Leviathan is not a signatory to the compact, which is signed only by the subjects, and gains almost unlimited power over the signatories to the contract. For example, Hobbes holds that one of the most pernicious things that can happen in a social state is for the sovereign to lose control over the expression of public doctrines or religious expression. From the contemporary perspective, contract theories seem to be a branch of liberal political theory, but it is always worth remembering that the original proponent of the social contract was in many ways far from being a political liberal, despite his individualistic premises. Subsequent contract theorists were to defend things such as the separation of powers that were a long way from the thought of Thomas Hobbes.

Samuel von Pufendorf

One of the earliest commentators on Hobbes was Samuel von Pufendorf (1632–1694), a German in

the service of the Swedish crown. In *De Jure Naturae et Gentium* (The Law of Nature and Nations) and in *De Officio Hominis et Civis* (On the Duty of Man and Citizen), Pufendorf offered a critique of Hobbes's conception of the state of nature, while retaining the basic structure of Hobbes's theory, namely, its basis in natural law and its adherence to a notion of popular sovereignty. In Pufendorf's view, Hobbes seriously underestimates the extent to which human nature is marked by a sense of sociality and not just by diffidence. As a result, he concludes that the Hobbesian account of the state of nature is far too pessimistic. Pufendorf argues that the state of nature might for long periods be peaceful and that social organization would develop within it prior to the establishment of a political state. However, Pufendorf claims that the instability of the state of nature would lead its inhabitants to sign a social contract and, in doing so, to form a political society. In this respect, Pufendorf is a precursor of the similar arguments of his contemporary, John Locke, who also objected to Hobbes's account of the state of nature and sought to distinguish between it and a state of war.

For much of the eighteenth century, Pufendorf was one of the most influential figures in European political thought, thanks to the commentary on his work of Jean Barbeyrac. In his notion of state will, Pufendorf can also be seen as an influence on Jean-Jacques Rousseau. For Pufendorf, positive law was a creation of the will of the legislators and the will of the state was simply the will of all those who made it up.

John Locke

Although John Locke (1632–1704) is now most famous for his revision of Hobbes's theory of the social contract, it is important to remember that he saw himself responding at least as much to Sir Robert Filmer as to Hobbes, and devoted the first of his *Two Treatises of Government* to a critique of Filmer's account of the origins of political sovereignty as being in divine mandate. Locke followed Hobbes and Pufendorf in insisting that sovereignty could only originate in an agreement made by the people to whom it was to apply. However, he sided with Pufendorf and against Hobbes on the question of the nature of that contract, and his disagreement with Hobbes stemmed in large part from a different conception of the state of nature.

According to Locke, the state of nature need by no means be warlike. In many ways, the picture of primitive communism that Locke draws seems idyllic. In his view, the state of nature is one of liberty to do as one pleases, but is not one of license. Rather, the state of nature is governed by a law of nature that can be applied by anyone in cases of breaches of it. Anyone who breaches the law of nature places himself or herself into a state of war with the victims of their transgression and may rightly be punished. The upshot is that, for all its promise, the state of nature depicted by Locke is ultimately unstable in much the same way as is that of Pufendorf. One of the reasons that Locke provides for inhabitants of a state of nature to sign a social contract taking them out of that state is to avoid the danger of slipping into a state of war.

Locke also differs from Hobbes on the question of the right to own property in the state of nature. As previously noted, Hobbes argued that everyone in the state of nature has a right to all things; as a result, it does not make sense to talk of prepolitical property rights. Nobody would be prepared to cede perpetual possession of an object to someone else, in case that object might later be needed in her or his defense. For Locke, on the other hand, property is a feature of the state of nature. The world was left to human beings in common and each person has a right to take out of the common stock whatever is needed to ensure that person's survival, to mix their labor with it, and to call it their own. In Locke's view, the natural resources of the earth are sufficiently abundant that people can claim as possessions whatever they need without endangering anyone else's supply of such resources, so long as people do not take more than they need and allow things to go to waste. With the advent of money, however, hoarding became possible. People could have an infinite amount of money without the threat of waste, as money, unlike natural resources, is durable. The emergence of non-natural forms of property, such as money, brought a new source of insecurity to the state of nature. When people's possessions include only food and the like, there is less incentive to steal what other people have than there is once money has been introduced. So, the second reason why the social

contract is signed, according to Locke, is to protect property.

These differences in the conceptions of the state of nature and the consequent differences in the reasons behind the signing of the social contract lead Locke to develop a theory of government that differs markedly from that of Hobbes. As the contract has been signed to protect preexisting property rights, signatories to the contract do not wish merely to gain security but to maintain what they already have. Hobbes had argued that there could be no absolute property rights held against the sovereign, but Locke argued that government could not simply dispose of people's property as it saw fit. Likewise, the more benevolent account of the state of nature led Locke to grant greater scope for resistance to governmental power—and, on certain interpretations of his theory, even for revolution—than does Hobbes. As the state of nature is not necessarily one of war, avoiding slipping back into it is not as crucial as it was for Hobbes, who argued that the contract required obedience until the sovereign was no longer capable of protecting the subjects (although he did allow a subject to resist if the sovereign were to try to put him or her to death). According to Locke, tyrannical or usurping governments were illegitimate and could be resisted.

In short, the reasons for which the social contract was signed play a significant role in the account of the nature of government and the rights of the governed in the theories of Hobbes and Locke. Many of the differences between the two theories stem from the rationale for the social contract, which itself stems from the conceptions of the state of nature of the two men.

Jean-Jacques Rousseau

Writing in the century after the previous theorists, Jean-Jacques Rousseau (1712–1778) insisted in his *Discourse on Inequality* that no previous writer had drawn an accurate picture of the state of nature, because they had imputed to natural human beings character traits that were in reality the product of society. As a result, their "natural man" was in fact not natural, and their states of nature represented what would happen if modern Europeans were taken out of civil society rather than what human beings would have been like before the creation of political commonwealths. Drawing on the arguments of, inter alia, the baron de Montesquieu, Rousseau developed a conception of the state of nature in which human beings originally had little contact with each other, then lived in harmonious "primitive" villages, and only later became enmeshed in a state of war after the development of agriculture and metallurgy led to inequalities that were hitherto impossible. Rousseau concludes that contemporary civil society is not in accord with the laws of nature because it is characterized by a degree of inequality vastly at odds with that which human nature would mandate.

As a result of his radical redrawing of the state of nature, Rousseau was led in *The Social Contract* to undertake an equally radical revision of the agreement by which polities can legitimately be founded. So influential has his argument been that the task that Rousseau sets himself in *The Social Contract* is often seen as setting the research agenda for much of contemporary political theory, at least in the liberal tradition. *The Social Contract* famously starts with the sentence, "Man is born free, and he is everywhere in chains" (Rousseau, 1997b, p. 41). Although in the *Discourse on Inequality,* Rousseau had provided a conjectural account of the process by which natural freedom gave way to social enslavement, in *The Social Contract* he admits that he does not know how that might have happened and turns instead to the question of how that change, which is presumably irreversible, might be made legitimate. For earlier contract theorists, the social contract was a heuristic device by which the transition from prepolitical to political society was explained and justified. For Rousseau, and for many contemporary contractualists, the question of whether political authority is legitimate is held radically in question. Only a social contract of a particular kind—namely, one in which the parties to the contract continue to obey only themselves—is justifiable.

Rousseau is a famously paradoxical writer, and his argument as to how members of a political society can be seen as obeying only themselves has always been controversial, as it involves the notion of the general will. Rousseau argued that sovereignty resided in the people as a whole and was to be expressed by the general will, which was determined by a collective decision of all members of the commonwealth. Each citizen was to vote in accordance with what they felt to be the general

interest. In this way, Rousseau was able to distinguish between the general will and the will of all, the latter being what emerged through an agglomeration of self-interested wills on the part of the citizens. So, Rousseau claims, if the general will is followed then, insofar as she is a member of the sovereign body, each individual is free and follows only her own voice, but qua subject of that body, everyone must subordinate his will to that of the sovereign. We escape our chains only by seeing ourselves as inseparable from the community of which we are a part; so long as there is not this identification, then civil society cannot avoid becoming tyrannical. So it is that the extreme solipsism of Rousseau's depiction of the state of nature is transformed into the strongest sense of communal identification found among any of the major social contract theorists. When laws are made in accordance with the general will, each citizen can see himself or herself as the author of the law and thus as autonomous.

On Rousseau's account, the social contract must also draw a sharp differentiation between the sovereign and the government. The sovereign, which serves to express the general will, must deal only with general laws and not execute particular actions, which are to be the preserve of the government. As a result, Rousseau's version of the contract differs from that of both Hobbes and Locke in important ways. While, with Hobbes, he argues that sovereignty must be indivisible and inalienable, he departs from both theorists in his critique of representative democracy, most succinctly expressed in his famous remarks about the English people being mistaken in thinking that they are free at any time other than during an election campaign. Rousseau advocated an assembly of all the citizens as the appropriate law-making arena and thus expressed a marked preference for smaller bodies politic.

Immanuel Kant

Immanuel Kant (1724–1804) is better known as a moral philosopher than as a political theorist, although in the last 15 years of his life he did produce such works as *Perpetual Peace,* which advocated grounding the law of nations on a confederation among free, republican states. In both that work and in *Groundwork of the Metaphysics of Morals* and his *Critique of Practical Reason,* Kant was strongly influenced by Rousseau's quest to find a way in which people can see themselves as self-governing beings, even when bound by the laws of political society over which they may not have had much say. Through his response to these questions, Kant has in turn been a major influence on such contemporary contractualists as Rawls and Scanlon.

On Kant's account, we are free so long as we act independently of both external coercion and pure sensuous impulse. When fully worked out, this was to resolve into the argument that freedom meant acting in accordance with the Categorical Imperative, through which our actions should be able to form the basis of universal laws and should treat other people as means in themselves rather than as means to our—or any other person's—ends. Thus, Kantian ethics has a similar structure to Rousseau's version of social contract theory in that it defines free, and right, action as that which applies generally rather than to specific individuals.

Social Contract Theory and Its Critics

For all their differences, there are certain unifying features in the thought of the major contract theorists previously reviewed. First, each of them posits the notion of a state of nature. In some cases, the state of nature is supposed to be purely conjectural: this is so, certainly, for the early stages in Rousseau's account in the *Discourse on Inequality.* In others, it is part conjecture and part history, as when Hobbes and Locke refer to American Indians as living in something akin to a state of nature. At any event, the state of nature is a heuristic device that demonstrates the purpose that the social contract is supposed to serve, namely, to legitimate political authority. In the arguments of Hobbes, Locke, and Pufendorf, the fact that inhabitants of a state of nature would choose to make a social contract so as to escape the inconveniences of their state suggests that sovereigns are legitimate so long as they serve the purpose of avoiding those inconveniences. In the case of Rousseau, the social contract is supposed to ensure each citizen a share in the sovereign power and avoid the illegitimate inequality of the Europe of his day.

Hand-in-hand with the state of nature goes the appeal to natural law. In each version of his

political theory, Hobbes sets out a list of natural laws of which there are nearly 20, depending on the book in question. The most important are the first three: namely, that everyone should endeavor peace, that they should give up their right to all things in order to achieve peace, and that justice is nothing but the keeping of contracts. These laws are not binding until the creation of a civil state, but for Locke the state of nature itself is governed by a natural law that makes attacks on the person of another unjust and legitimates the punishment of transgressors. Grotius, Pufendorf, and Rousseau also rely on the concept of natural law at various points in their theories, as for example in Rousseau's claim that inequality is manifestly against the law of nature unless it is in correspondence with natural inequalities between people. The appeal to natural law is closely linked to the argument in favor of the existence of natural rights, be it, as in Hobbes's case, the right to all things, or, as in Locke's, the right to remove what is needed from the common stock of humanity so long as enough is left over for others. The result of the reliance on the notion of natural law is that social contract theorists tended to be prepared to advocate political systems vastly different from those under which they lived and in accord with a more or less universal set of criteria.

As the eighteenth century progressed, the notion of the social contract came under heavy attack from writers in both England and continental Europe. David Hume and Edmund Burke both argued that radical change of a political constitution was misguided because it involved a departure from custom, which was the appropriate guide to the allocation of sovereign power. Hume also pointed out the artificiality of notions of justice and the fact that they are reliant on convention. Hobbes had also argued that justice has no place outside of civil society, but nonetheless claimed that certain laws were natural. It is worth noting that Hume was not a thoroughgoing critic of social contract theory and in fact offered an account of the development of human society that could be seen as contractarian, namely that justice arose out of a need to remedy the inconveniences of a lawless society.

The rise of utilitarian political theory in the work of Jeremy Bentham and James Mill provided a more radical critique of contract theory. Bentham famously likened the notion of a natural right to nonsense on stilts and argued that legitimacy must depend on the promotion of happiness and not the hypothetical consent of the governed in the form of a contract that never actually took place. Meanwhile, philosophers in the Hegelian tradition emphasized the individualism of contract theory with its appeal to presocial bearers of rights and its failure to recognize the ways in which human nature could not be separated from the state or society of the human in question. Bentham and Burke made similar arguments when claiming that rights emerge only through, respectively, either positive law or tradition. In the nineteenth century, social contract theory came to be seen as neglecting the historicity of human beings even if, as in the work of Pufendorf, it respected their sociality. Rather than appealing to a state of nature for the account of the creation and legitimacy of sovereign power, the thought was that we should look back to the traditions of the society governed by that particular sovereign. The universalism that Rousseau and Kant, in particular, had emphasized thus fell out of fashion.

Social Contract Theory Today

Although few contemporary political theorists make use of the heuristic device of the state of nature, there can be no doubt that many contemporary liberals deploy a set of assumptions that are rightly seen as social contract theory's answer to utilitarianism and its other critics. This is made manifest by the rise of contemporary contractualism. In particular, John Rawls's notion of the veil of ignorance is a clear descendant of the state of nature, and Rawls acknowledges as much when he claims at the start of his *A Theory of Justice* that he intends to revive the contract theory of Locke, Rousseau, and Kant by carrying it to a higher level of abstraction. That level is reached by the use of the veil of ignorance, behind which people decide on the principles of justice that are to govern their society. The veil of ignorance shields the parties to what Rawls calls the original position from knowledge of their particular interests and abilities and seeks to ensure that the generality and impartiality advocated by Rousseau and Kant can be achieved.

Since Rawls published his book in 1971, contractualists have worked hard in seeking to

determine a set of constitutional principles that would fulfill the objective of Rousseau's social contract: namely, to ensure that citizens can be regarded as autonomous even though they are compelled to obey state law. As mentioned earlier, Rawls, Scanlon, and others often see themselves as working on the question posed by Rousseau as to how to justify the chains that we are in everywhere. Locke is also a major influence on many contemporary political theorists, in particular on libertarians such as Robert Nozick. Nozick's *Anarchy, State, and Utopia* argues, against anarchists, that government is legitimate, and against those who advocate redistribution by following Locke in claiming that the purpose of government is to ensure life, liberty, and property. To be sure, not all social contract theorists see the defense of private property as a key governmental responsibility; indeed, Hobbes argued that there could be no absolute property rights held against the sovereign, and Rousseau claimed that the advent of property was what led to the unjust societies of his day. Nonetheless, in following Locke by seeing defense of property as the raison d'être of government, Nozick develops a distinctly contractarian argument.

For much of the nineteenth and twentieth centuries, social contract theory was out of fashion. Although it no longer has the status afforded it in early modern Europe, it would be a mistake to think that we have seen the last of contractarian arguments.

Social Darwinism

Social Darwinism is most simply described as the application of Charles Darwin's evolutionary ideas to society and politics. There have been a myriad of such applications, largely based on concepts of competition, struggle, and "survival of the fittest," key elements in Darwin's theory of natural selection. The most common historical usage is probably the identification of social Darwinism as a justifying doctrine for a ruthlessly competitive

capitalism. Thinkers cited in this tradition include William Graham Sumner and Herbert Spencer (although closer analysis of their writings reveals greater complexity than often suggested).

Darwin broke down older religious and humanist assumptions by locating humanity in the animal world and subject to the same laws of nature. Violent, bloody, and cruel mechanisms brought about evolution by means of natural selection. Harsh economic doctrines based on unregulated economic individualism, and harsh social doctrines celebrating war, expansionist empires and the superiority of dominant white races flowed from such biology. Humans were seen as motivated by innate primal instincts that were pugnacious and territorial, and the genetic improvement of humans seemed to rely on incessant travail. Welfarism was decried as one of the causes of late nineteenth century "degeneration." A eugenics movement, founded at the time by Francis Galton, warned that human interference was thwarting natural selection, and advocated systematic control of human reproduction to improve "the human stock." This culminated in draconian policies, such as sexual sterilization of "unfit" types (like mental defectives) and "unfit" races (such as Jews and Gypsies), taken to monstrous extremes in the genocidal Nazi race hygiene project but also evident in the United States in assaults against the disadvantaged and blacks.

However, there was another side of Darwin's theory that encouraged more optimistic spin-offs. In the *Origin of Species* (1859), Darwin spoke of "the web of life" in describing the natural world, and he emphasized the interdependence of animals. In the *Descent of Man* (1871), he argued that cooperation between individuals and groups and altruistic behavior in humans had contributed to their successful evolution, and he predicted a human future in which we would live in a more peaceful, compassionate, and ethical world. This message was taken up by leftist and "reform" Darwinists. Peter Kropotkin expanded Darwin's cooperative ideas to justify anarchism in his book *Mutual Aid* (1902). Social Darwinism came to encompass socialism, liberal reformism, pacifism, anti-imperialism, and anti-racism, as well as more belligerent and racist social doctrines. People in fact used Darwinian ideas to support a spectacular galaxy of causes and agendas.

Conservatives could take heart from the fact that evolution had taken place over eons of time and largely as the result of selective pressures acting on a multitude of small variations, rather than in great leaps or "revolutionary" changes. This could be used to justify "gradualist" rather than systematically planned or violent politics. The "radical right" focused on hereditary factors as a barrier to reform, arguing that the innate inferiority of poorer groups would undermine all efforts at improvement. However, social reformers held that human capacities were the product of complex interactions between genes and environment; and they fastened on Darwin's theory of cultural evolution to envisage humans using their "exalted powers" of reason and ethicality to make a better future. Racists placed the yellow and black races lower on the evolutionary ladder than whites, supposedly representing earlier stages of evolution. Anti-racists cited Darwin's classification of *Homo sapiens* as a single species and drew the conclusion from his work that racial success depended more on cultural efficiency than physical factors. Eugenics was more variegated than its popular image suggests. It had its idealistic dimension, appealed historically across political lines (there were leftist and reform eugenists as well as "mainline" or reactionary eugenists), and has continued to be surprisingly resilient, for example in Scandinavia, Latin America, and Asia. Following the Human Genome Project, critics allege, it has been resurrected in bioengineering.

Historians have often exaggerated the influence of social Darwinism. It was in reality essentially marginal to serious theoretical debate in major discourses, being deployed as lightweight rhetoric to bolster other positions. Apologetics for capitalism were much more reliant on classical laissez-faire theory than on any naturalistic survivor ethics taken from Darwinism. Militarism, even in Germany prior to World War I, depended more on nationalistic and Realpolitik reasoning and emotions than on biological justifications. Similarly, rationales for imperial expansionism depended mainly on geopolitical, strategic, economic, and nationalistic factors. In liberal cultures, and even beyond them, there was great resistance to starkly survivalist doctrines. They were condemned on the basis of traditional mores, theodicies, and ideals of social obligation.

It is possible to discern two major interpretive traditions regarding social Darwinism. One takes a macro approach, emphasizing the rich variety of concepts that Darwin used and the kaleidoscope of social and ideological implications that could flow from them. It is a vital and inclusive approach but has the disadvantage that it can draw in notions that are problematically Darwinian, or classify as social Darwinists anybody who uses phrases and slogans like "survival of the fittest." The second tradition restricts the usage to social theory that systematically employs central Darwinian concepts, such as natural selection or differential reproduction. Recent work (such as that of Mike Hawkins) has taken a middle approach, accepting the multivalent nature of social Darwinism, but seeing it as a network of interlinked ideas and assumptions about nature, time, humanity, and selective pressures.

Socialism

Socialism as an organized political movement began in earnest in Europe in the 1870s, and reached its zenith in the social democratic Second International. World War I exposed the weakness of these movements, when most European parties—though not every individual socialist, Russian, or Italian party—supported the state. During the war, these parties lost much of their oppositional character, and the rise of Soviet Russia further mythologized socialism as a philosophy for oppressive regimes in the minds of most Westerners. With the rise of Fascism, socialism was dealt another crippling blow. Social Democracy rebounded after World War II, with parties in Germany, England, and Sweden all enjoying periods of exclusive rule and rule in coalition in France and Italy. Despite the fall of the Soviet Union, moreover, variants of socialism remain a major force in the third world.

Historical and Philosophical Influences

Socialism is not an entirely modern concept. Early Christianity, for example, required egalitarian conduct and a united social existence. Early Christians living in Rome, indeed, existed in a pseudo-communistic state of cooperation. Utopian visions stretch as far back in political philosophy as Plato's *Republic*. Modern socialism is a distinct evolution beyond these older ideas. Socialism is secular and claims to be based squarely on human rationality and not empty idealism. Socialism is now understood as a political force primarily concerned with liberation and comes from the belief that humans are in a state of unfulfilled potential restrained by the historical context in which they exist. Socialism's followers have historically come from the working class, where collective interests were gradually uncovered, strength was found in sociopolitical solidarity, and it was demonstrated that only collective action could mitigate or topple oppressive orders.

Socialist ideas are anticipated as far back as antiquity and can be discerned especially in Aristotle's political thought, but it was during the Enlightenment that the socialist tradition came into its own. Above all, the Enlightenment contributed a belief in science and progress necessary to the development of socialism. Heavily influenced by the thought of Jean-Jacques Rousseau especially, socialists framed the past as an irrational, though necessary, stage to be overcome. Rousseau's *Discourse on the Origin and Basis of Inequality Among Men* (1754), held that social ills were tied to private property, and his position—expressed in *The Social Contract* (1762) that men must sometimes be forced to be free—foreshadowed the view, popular among later socialists, that capitalist, commercial society must be overthrown because it is toxic for all humans, members of the bourgeoisie included. His rebellion against much of Enlightenment thought provided an early model for the socialist thinkers, including many in the Romantic tradition.

In the late eighteenth century, several bourgeois-democratic revolutions broke out in European countries. These revolutions radicalized large numbers of people and popularized the idea of a right to revolt against social, political, and economic injustices. The French Revolution was of particular significance in this regard. The revolution produced genuinely protosocialist radicalism on the part of peasants who burned deeds and declared land the property of all. By 1793, revolutionary agitators known as *les Enragés* were preaching class warfare and the use of violence to attain social justice. These agitators were not workers and simply called for the fair distribution of property.

The Industrial Revolution, the birth and rapid expansion of modern factory systems and technologies, displaced peasants who were driven into cities as part of an expanding working class. These workers often faced crippling poverty and appalling living conditions. Their grievances fueled the socialist critique of capitalism as a systematic obstacle to the realization of human freedom.

Early and Utopian Socialism

Gabriel Bonnot de Mably, François Noel Babeuf in France, and William Godwin in England were among several influential forerunners of later socialist thought and practice. Both Mably and Babeuf emphasized the need to abolish private property. Babeuf attempted to put some of these ideas into practice and formed the Conspiracy of Equals during the reign of the Directory in France, with the aim of forcing a return to the Constitution of 1793. He deployed tactics adopted by future socialists, including the use of leaflets and agitators in lower-class areas. The conspiracy was discovered, and Babeuf was executed on May 27, 1797, thus becoming the first martyr to the cause of socialist revolution. Godwin's thought influenced socialism in a different direction, emphasizing not so much the mechanics of revolutionary change as a vision of anarchical liberation from the shackles of law, morality, and religion.

By the first three decades of the nineteenth century, a clear tradition of socialist thought is clearly discernible, especially in the work of a group of writers often described as the *utopian socialists*. These thinkers looked backward to a pretechnological era of simplicity even as they looked forward to a better future. Charles Fourier, for example, rejected industrialism and emphasized that genuine fulfillment could only occur in an organized society bound together by emotional solidarity. He was an advocate of sexual liberation and a radical feminist who proposed that women's emancipation is the true measure of overall emancipation. His theory looks back to agrarian society in which the community sees to all needs, but Fourier concretely inspired only several failed utopian communities. He was not an egalitarian, but was committed to the abolition of exploitation. His critique of existing society contributed to socialism by exposing the moral corruption of bourgeois society.

Robert Owen was an English entrepreneur and philanthropist. He managed a textile factory at New Lanark, Scotland, where he instituted shorter hours, safer conditions, education, recreations, improved housing, health insurance, and the end of child labor while still turning a profit. He rejected Christianity and established custom, and this led to his exile from polite society. Despite his reforms, he still felt conditions at any factory remained essentially exploitative. In 1824, he set out for America, where he established New Harmony, Indiana, as a village of cooperation based on his view that rational planning and harmonious social engagement were capable of bringing about happiness. By 1828, the experiment failed and he returned to Britain where he continued his transition from conscientious capitalist to full-fledged socialist. By the 1830s, Owenism was the dominant form of socialism in Britain. Owen adopted the teaching of the materialists and held that man's character is largely the product of the sociopolitical environment in which he lives—thus, he felt that character could be reshaped by healthier social conditions.

Claude Henri de Saint-Simon was not himself a socialist but influenced many later socialist writers. An accomplished and astute businessman, Saint-Simon welcomed growth, but worried about the evils of unfettered individualism. He celebrated productivity, efficiency, and organization, but lamented free markets and envisioned a social order led by *les industriels*. Saint-Simon encouraged the equality of opportunity, but not equality of outcome. By the 1830s, some of his followers turned to socialism, emphasizing mutual dependence and his rejection of selfishness. They called

for the end of the exploitation of man by man, and the redistribution of wealth according to contribution. They began to question the institution of private property via inheritance, and eventually advocated that the state should hold all inheritances in a common pool to be distributed to citizens. He moved socialism away from the utopian idealism of Fourier and toward a focus on the just distribution of income and opportunity.

The Emergence of Socialist Movements

Socialism calls for a dual economic and political revolution. After the period of utopian socialism, socialist thinkers, organizers, and agitators turned toward dynamic means of garnering the popular support of the masses and thus sowed the first seeds of socialism as an international movement.

Etienne Cabet rose to fame with his utopian novel *The Voyage to Icaria* (1840), which envisioned an ideal state of basic but equal subsistence. Cabet assembled a mass "communist" movement with 100,000–200,000 followers in the 1840s. He used the press to communicate his claims and expand his following. His articles were designed to speak to proletarians through clear wording and uncomplicated arguments. His basic position of private property as source of woes and communism as the simple and sufficient solution, however, made workers feel as if quick answers existed for complicated problems.

Auguste Blanqui was active in every major French revolutionary effort in his adult lifetime. He saw violence as unavoidable in class conflict. He was not an egalitarian and denied that the oppressed could easily recognize their own interests in the class struggle. He therefore insisted on the need for an elite revolutionary leadership and concentrated on techniques for seizing power. He never turned his attention to building a revolutionary consciousness in the minds of the people. As a result, Blanquism has ever since been associated with revolutionary movements that lack mass support. This seeming oversight was corrected in the thought of Louis Blanc and William Weitling, both of whom understood that revolutionary socialism required a transformation in the attitudes of the popular classes, not merely astute tactics deployed by revolutionary elites. Not all socialists of the period believed that revolutionary change must be violent, however. For example, Pierre-Joseph Proudhon, the first thinker to call himself an anarchist, accepted many socialist goals, but denied that violence was required to achieve them.

British Chartism was the first large-scale, working-class movement and began in 1838 as a reaction against unfavorable reform legislation that disadvantaged the lower classes. The movement demanded universal suffrage of all men over 21, fairly drawn electoral districts, confidential voting, the abolition of the property qualification for parliament, and annual parliamentary elections. Despite gathering millions of signatures on their petition for a new social charter, the staging of mass demonstrations and threats of a general strike, the movement died out without success in 1848.

The Emergence of Marxism

Karl Marx created a new vision of socialism as a science based on the synthesis of German idealist philosophy, romanticism, English political economy, and French socialist theory. Friedrich Engels, who would support and collaborate with Marx, had already produced his classic *Conditions of the Working Class in England* (1845), which investigated the shocking conditions endured by proletarians, and was active in socialist circles. The pair soon became involved in the covert League of the Just, and founded a workers union in London. Marx soon became known as a genius in socialist circles, and came to have a measure of influence. It was thus that when the more democratic Communist League was formed out of the League of the Just in 1848, Marx and Engels were called on to compose the group's manifesto. They thereby produced the *Communist Manifesto* and reshaped socialism forever. The *Manifesto* begins with the claim that all history is the history of class struggle. In so doing, they articulated a definitive socialist statement that pegged the roots of the exploitative nature of capitalism in the mode of production supported by the bourgeoisie. They were thus able to issue a clear revolutionary demand for the demolition of the capitalist mode of production and the fulfillment of human potential through socialism. Marx and Engels dismissed utopian socialism as unsophisticated and urged workers to unite as communists and the revolutionary class capable of producing a just state. They enhanced this demand by claiming

that capitalism alienates worker from nature, labor, product, skill, family, class, and humanity for the gain of the few and in the service of capital. As Marx's thought developed, it turned increasingly toward economic analysis, as laid out in *A Contribution to the Critique of Political Economy* (1859) and *Capital* (1867), which is Marx's fullest exposition of scientific socialism. The *Manifesto* brought workers into revolution, but it is *Capital* that provided the rationale for Marxist movements. However, while both Marx and Engels continued to advocate violent revolution, they left the specification of appropriate political tactics dangerously vague and failed to provide a clear picture of the ideal socialist order at which the revolution aims.

First International

The First International, or International Workingmen's Association, was formed in 1864 and was fraught by disagreement from the start. The tension between socialists and anarchists, in particular, was central to its eventual failure. Still, the International spawned a large movement with intense solidarity, locally and internationally. During the brief life of the International, workers sent mutual aid to foreign proletarians in need and, in England, bravely refused to unload Southern cotton during the American Civil War. Marx was not very successful in weaning others in the International away from their respective doctrines, but did gain political influence. The Franco-Prussian War (1870) and Paris Commune (1871) accelerated the decline of the International by putting a strain on internationalism. Marx dissolved the organization in 1872.

The International was hard hit by the crisis emerging during and after the Paris Commune. When forces under Adolphe Thiers retook the capital, Paris lost 20,000 radicals to execution and many more to prison and exile. Marx was one of few within the International to support, although not unequivocally, the Communards. To Marx, the Commune was the first example of a dictatorship of the proletariat. But its failure led him to conclude that a movement must not only seize state power, but must completely smash it.

Mikhail Bakunin advocated collectivist anarchism, and was Marx's great rival within the International. The rivalry with Marx developed primarily over the desirability of socialist involvement with the capitalist state. Marx argued for parliamentary participation and held that the exercise of democratic rights was a necessity, but Bakunin, who rejected all government, argued against the plan. Marx's inability to manage his rivalry with Bakunin led to the collapse of the International.

The Second International

The Second International, formed in Paris on July 14, 1889, also quickly ran into trouble as a result of internal disagreement. This time, the disagreements were sharpened by the success of socialist parties within the separate countries involved. By 1914, many national parties had large parliamentary delegations, influential daily newspapers, and strong trade unions. As a result, socialists found themselves disagreeing over two issues: first, whether socialism should aim for gradual political reform or continue to demand revolution; and second, whether socialist parties should be authoritarian, vanguard organizations, or whether they should aspire to be mass parties, acting from below.

The history of the social democratic party in Germany (SPD) exemplifies this trend away from revolutionary action and toward more gradualist political reform through the institutions of representative democracy. Ferdinand Lassalle organized the first workers' party on the European continent, the General German Workers' Party (ADAV), in 1863. Lassalle was no Marxist and retained an admiration for the Prussian State, envisioning a role for it once it had been democratically won over to the worker's cause. The direct goal was to gain direct suffrage for the workers. August Bebel and Wilhelm Liebknecht formed a rival Marxist party called the Social Democratic Labor Party at Eisenach in 1869. In 1875, the two parties united under the Gotha Program, which retained a Lassallean influence, much to Marx's frustration. The new party, the SPD, was banned from 1878 to 1890, after which the party adopted a broadly Marxist program at Erfurt in 1891.

Major Theorists

Karl Kautsky was the chief theorist of the Second International. His contribution was to

adapt Marxism to fit a new time without rendering it irrelevant. For Kautsky, revolution is the conquest of power by the working class *as a political party*. Kautsky consistently advanced his conception of a state dictatorship of the proletariat to be established by free elections, with respect for liberties and the use of parliament for socialist ends, but maintained that the SPD must not substitute itself for people. The party's function was to take advantage of revolution, not to make it: before the revolution, the party is simply a democratic means of gaining power for the proletariat. For Kautsky, the irresistible force of social democracy could make peaceable revolution possible by democratic means. Parliament was indispensable as an instrument of government for Kautsky, who argued that proletarian presence can fundamentally alter the institution. His insistence on progress toward a parliamentary majority always maintained parliament as a tool and not an end. He put party organization above spontaneous mass action, because he held that until a revolutionary situation was reached, proletarian consciousness could not match party design. By exercising democratic rights, however, proletarians become more capable of bearing the great political responsibilities of revolution and freedom.

Eduard Bernstein was the chief advocate of revisionism and reform in the Second International. His work *The Preconditions of Socialism* (1899) is often regarded as the revisionist manifesto. He argued that for social democracy to succeed, it was necessary to abandon the idea that if capitalism survived, all prospects for socialism were doomed. Only in a democratic republic, Bernstein argued, can workers make actual progress, as he felt Marx's predictions were flawed and workers could not count on an impending revolution. He revised Marx's materialist assumptions, claiming that materialism binds the worker to a revolutionary cause in a kind of predestination, and that the way to socialism is the improvement, and not the immiseration, of the proletariat. Bernstein sought to show that the resilience of capital had spawned new conditions and needed new responses. Bernstein thus had a higher regard for parliamentary process and legislative ends and for, collaboration with nonsocialist parties, and believed that the modern proletariat must dispense with utopias. Bernstein's socialism accepts a much larger role for ethical ideals (notions of justice and equality) than Marx could have countenanced (Marx regarded all such moralized notions as suspect artifacts of capitalist ideology). Bernstein also emphasized the ongoing political education of workers, as a political education is necessary in democratic action. Bernstein's views were repudiated by the SPD, but still became quite influential in the right wing of the socialist movement.

Rosa Luxemburg was the most articulate defender of the revolutionary alternative in the Second International. Her vision was of a mass oppositional party, seeking to expose, agitate, and use revolutionary and, if necessary, violent means against the capitalist state until a worker's government was achieved. She maintained that the theorists and organizers in the party should have a backstage role, thus enabling workers to forge class consciousness through spontaneous revolutionary action. She regarded the mass strike as a critical weapon in the socialist arsenal. She had no fear of police repression and was jailed several times before being assassinated in 1919. She distrusted the use of parliamentary means and emphasized that only a revolution could enable meaningful change. She opposed Bernstein's revisionism: In her work "Socialism or Reform?" she accuses Bernstein of abandoning worker power for scanty protections from capitalist exploitation and degrading workers by offering them meaningless palliatives.

Historical Challenges

The Second International faced great challenges in the early twentieth century with the growing arms race of European powers, labor struggles, the rise of imperialism, and several ominous challenges to peace. The 1905 Russian Revolution sparked a great debate across Europe. Although the revolution was universally hailed as a sign of progress, it was questioned whether the lessons of that revolution should be imposed on Western parties. Kautsky expected a revolution in Germany, and wanted to keep the mass strike as option—but argued the military must be weakened first. Luxemburg wanted to put the lessons of Russia into practice and immediately begin the use of the mass strike. This debate is axiomatic: The question of the mass strike exacerbated the existing elite-mass tensions in Western socialist parties. In 1907, these tensions

were again heightened when the SPD suffered an overwhelming defeat at the polls after running on a platform of democratic reforms and anticolonialism. Even Kautsky was forced to admit the "spellbinding" forces of colonialism and nationalism. This setback restructured socialist parties across Europe, as they increasingly saw the need to make concessions to nationalist consciousness.

The damage done by the qualifications placed on the mass strike and the need to bow before nationalism became evident with the outbreak of World War I. Resistance to any war other than one of national defense was the official policy of the Second International. Vladimir Lenin and Luxemburg had twice passed statements pledging socialists to strive to prevent war and to attempt to end any war that did break out. Luxemburg argued that workers should respond with a general mass strike and attempt to end the war at all costs. Centrists, like Kautsky, felt that socialists must oppose, but could not stop, the war and should utilize it to hasten the coming revolution. The assassination of the French antiwar leader Jean Jaures on July 31, 1914, in Paris symbolized the death of resistance in the Second International and foretold the coming abdication of international socialism. Although major theorists like Kautsky, Luxemburg, Bernstein, and Lenin all lined up against the war, national parties—following the lead of the SPD, which voted for war credits on August 4, 1914—almost all raced to support their nation in an imperialist war. The failure to oppose the war marked the death of both internationalism and the Second International.

The Soviet Revolution

In March 1917, mass spontaneous food riots broke out in Petrograd, and the tsar was forced to abdicate when his armed forces refused to take action against the rioters. A provisional government was established, and socialists began to cooperate in rule. Lenin refused compromise with other factions—even socialist factions—from the moment he arrived in Petrograd. He quickly issued his "April Theses," which urged Soviets to take power over the provisional government, end the war, and end the toleration of moderates. Leon Trotsky, joining the Bolshevik faction, was made chairman of the Petrograd Soviet, which he radicalized and developed as an armed base for the Bolshevik Party. The November 7th Soviet Revolution succeeded with little opposition.

Lenin immediately faced serious challenges, and did not think Russian socialism could survive without aid and industrial support from other socialist states. For Lenin, therefore, revolution must be international. In Lenin's view only a union of the peasantry and proletariat could oversee the arduous task of effective bourgeois revolution. With Western aid, proletarians and peasants could telescope the bourgeois stage of economic development and begin to develop the infrastructure to support a socialist mode of production. Lenin drew on Trotsky's notion of *permanent revolution.* Trotsky argued there was no correlation between the number of proletarians and the revolutionary potential of the class, and that that potential was properly measured by class consciousness and existence of opportunities for power. In 1918, despite Luxemburg's fear that the Bolsheviks would come to dominate any association, Lenin founded the Third International. His predictions of international revolutions, however, failed. Germany—which seemed the ripest for revolution—saw only a failed uprising by the Sparticist group that led to the murders of Luxemburg and her associate Karl Liebknecht. As other revolutionary efforts similarly petered out, Lenin came to assert—as Luxemburg had feared—that the Bolsheviks should be studied as the model of revolution, and that the party was the only reliable interpreter of revolutionary principles. Parties were hence to be set up everywhere following the Soviet model. By March 1921, with the repression of the Kronstadt uprising and the proclamation of the New Economic Policy (which restored some aspects of capitalism), the Soviet Revolution had reached its Thermidor.

Twentieth-Century Fragmentation

After World War II, the socialist project was pursued in several sharply contrasting forms. The Soviet Union and its satellite states in Eastern Europe continued to adopt a state-centered and strongly authoritarian approach. In this it was followed in 1949 by the People's Republic of China, led initially by Mao Zedong and with increasing fervor during the cultural revolution in the decade after 1966. In the West, socialism assumed a more

moderate form under the banner of social democracy. The horrors of World War II, and memories of the economic depression that preceded it, propelled parties with (often radical) socialist platforms into the seat of power. The British Labour Party—under the leadership of Willy Brandt—and the Swedish SDP and SPD all became ruling parties for significant periods. The French Socialist Party and PSI both gained limited ruling experience in coalitions. In Western Europe, the model of a mixed economy, which emphasizes social reform through the nationalization of selected means of production and the transfer of wealth through taxation and state programs meant to narrow inequality, has worked efficiently to create successful social democratic welfare states. This was particularly true in Britain and Scandinavia. Not only did management by social democratic parties and the diffusion of socialist ideas enable the achievement of effective welfare distribution, it also served to strengthen democratic processes. In Britain, for example, the Labour Party came to power under Clement Attlee in 1945 and shortly provided free health care to the population through the National Health Service, nationalized the Bank of England and most natural resource–based industries, improved infrastructure, and provided many education programs, from funding elementary school programs to college grants.

Only in the United States—where socialism had reached its low high tide under Eugene Debs in the first decade of the twentieth century—did socialists and communists remain out of power, restricted to fringes of movements. The American Socialist Party, indeed, died after the war, leaving only isolated individuals like Michael Harrington and Norman Thomas to continue to advocate social democracy in the American context. In the 1960s, antiwar movements sparked the New Left, but the movement had diverse adherents without little cohesion and mass appeal. With the rise of conservatism and the spread of neoliberalism in the 1980s, most dramatically seen in the election of Margaret Thatcher and Ronald Reagan, welfare states faced intense internal attacks and were frequently dismantled piece by piece. The social democratic parties that emerged from this period of conservative ascendancy have generally been more committed to free market principles than their forebears. For many commentators, this crisis in moderate Western forms of social democracy was of a piece with the more dramatic collapse of command socialism in the Eastern Bloc during the late 1980s and in the Soviet Union in 1991. Although the Chinese Communist Party has remained in power, and is still officially committed to socialism, many would see its dramatic recent concessions to capitalist arrangements as part of the same repudiation of socialist ideas. Certainly, many earlier socialist thinkers would be extremely uncomfortable with recent trends in Chinese economic policy. Socialist ideas retain much appeal in large parts of the third world, thanks in part to the influence of Frantz Fanon, whose *The Wretched of the Earth* (1961) powerfully linked the socialist agenda with resistance to colonial domination by the capitalist West. Even here, however, the socialist agenda faces increasing pressure from the forces of global capitalism. These developments have led many to speculate that the present period represents the end of the socialist experiment; but the ethical impetus behind the socialist movement will doubtless endure.

Social Movements

Social movements are collective, sustained challenges to state and nonstate systems of political, economic, or cultural governance. Prominent examples include the civil rights, peace, environmental, and antiglobalization movements. Social movement scholars examine why individuals join social movements; under which conditions movements emerge, flourish, and dissolve; how movements mobilize and use material, organizational, symbolic, and tactical resources; and what impact movements have on participants, public policies, and society at large. Although most social movement studies have focused on domestic struggles in Western Europe and North America, analyses of transnational movements and movements in developing and transition countries are increasingly common.

The study of social movements bears relevance for political theory because social movements around the world have influenced political developments in important ways for several centuries. Recent local-to-global political transformations and the emergence of new modes of governance have wide-ranging consequences for the ways social movements operate. In response to global economic integration, for instance, social movements have successfully adopted transnational participants and practices during the last 15 years. At the same time, social movements play an increasingly influential role in shaping today's political dynamics. Recent phenomena, such as corporate social responsibility, have in large part emerged as a result of pressure from social movements.

Until the 1960s, social movement studies largely focused on extremism and violence. From their examination of communism, fascism, and other mass movements, early social movement scholars concluded that contentious, collective behavior of crowds was irregular and irrational, the result of individual frustration and aggression. Later collective behavior theorists, including Neil Smelser and Ted Gurr, advanced a more structural perspective and explained the emergence of movements as a normal response to social strain and relative deprivation associated with socioeconomic transformations, rather than individual psychological factors.

The advent of the 1960s student, peace, and civil rights movements, combined with a new theoretical understanding of collective action, fundamentally transformed prevailing hypotheses about social movements. Two distinct schools emerged as a result. First, the growing importance of economics and its view of humans as rational individuals gave rise to resource mobilization theory. Drawing on Mancur Olson, scholars such as John McCarthy and Mayer Zald argued that a movement's principal challenge was to mobilize financial and organizational resources in order to attract participants and sustain collective action. Their analyses thus sought to associate the degree of movement success with variation in the distribution of resources, strategic capabilities, and organizational sophistication.

The second variant to emerge from the 1960s movements did not reject the rational outlook of movement organizers and participants but instead emphasized the historical and political environment in which mobilization takes place. The resulting political process perspective centered on political opportunities, including access to decision-making processes, political realignment among key actors, appearance of influential allies, emerging splits among the elite, and decline in state repression. In contrast to resource mobilization, which primarily flourished in North America, political process views of social movements have incorporated European traditions of social thought, particularly in reference to the importance of broad social, demographic, economic, and political processes, such as industrialization, urbanization, and bureaucratization. Promoted by Charles Tilly, Sidney Tarrow, and Doug McAdam, the political process

model of social movement behavior remains the dominant perspective today.

As successful as political process approaches have been, they have also attracted criticism. European scholars examining the 1970s environmental, women's, and peace movements, for instance, have rejected their rationalist and state-centered emphasis. Alberto Melucci and others have noted that affluence, postmaterial values, and the intrusion of the welfare state into new domains of public interest have led to a politicization of private spheres. In response, new social movements mobilize collective identities around the defense of cultural codes and practices.

The emphasis on culture in the new social movements literature echoes a larger, cross-cutting concern with the marginalization of culture in social movement research. Critics of resource mobilization and political process perspectives have long pointed out that a rationalist view of movement organizers and participants fails to explain how such concepts as interests, resources, and identities can vary across cultural contexts. Some scholars, including David Snow and Robert Benford, have accounted for cultural dimensions by focusing on framing (that is, the conscious packaging of movement messages) in ways that best resonate with audience views of a social problem's origins, causal dynamics, and locus of responsibility. Others, like Francesca Polletta, have found that framing itself needs to be viewed in terms of the cultural environment in which framing is pursued. Drawing on new institutionalist theory, they argue that different arenas of mobilization are governed by different logics. These logics influence the legitimacy of actors, claims, and strategies, but are in turn shaped by the mutual interactions between challengers and their targets.

The recent emergence of nonstate modes of governance has had a significant influence on social movement theorizing. Most prominently, views of the state as the primary target of social movement challenges have given way to more differentiated perspectives on movement targets, tactics, and goals. As a result, political process theories have increasingly been criticized for their limited scope of real world movement phenomena. An emerging view of social movements thus emphasizes the multi-institutional nature of modern societies. In this model, Elizabeth Clemens and Mary Bernstein argue, movements may target a wide variety of institutions, which are considered dialectical outcomes of material and symbolic meaning systems and practices.

The study of social movements has been characterized by significant theoretical developments as well as methodological innovations. In the same way that social movement actors have embraced modern information and communications technologies, social movement scholars have increasingly used computer-assisted methods for data collection, manipulation, and analysis. Although the in-depth case study remains the dominant method in social movement research, an increasing number of studies draws on large-scale event data sets that are sometimes automatically generated from electronically available sources. These types of studies are providing systematic insights into the nature of, and relationships between, movement actors, claims, strategies, targets, and impacts. The results confirm the emerging view of social movement dynamics as contextual, historically contingent phenomena.

Sophists

The term *sophist* is most commonly used in the history of ancient philosophy to designate a group

of practitioners of wisdom in the mid-fifth to early fourth century BCE Greece; they are also referred to as the Old or Early Sophists. They feature in many of Plato's dialogues, where they engage in a range of philosophical discussions with Socrates. The Greek word for sophist, *sophistês,* was originally used to describe people distinguished for wisdom (*sophia*), such as lawgivers, poets, religious experts, and early philosophers. It is in Plato's writings that the word is first restricted to a specific type of sage. Outside of Plato, however, the word sophistês continued to be used to refer to a wide variety of practitioners of wisdom. It is questionable how apt the category of sophist is to describe a specific set of individuals, given how dependent this grouping and its characterization are on the influential testimony of Plato. For the sake of comprehensibility, this entry will follow the traditional grouping.

The most well-known of the Sophists were Protagoras, Gorgias, Hippias, Prodicus, and Antiphon, though some 25 others are known to us by name. Many scholars would also include Socrates among the Sophists, but his inclusion in this group is controversial. On the one hand, Plato goes out of his way to distinguish Socrates from the Sophists, yet on the other hand, the comic playwright Aristophanes clearly portrays Socrates as a Sophist in his play of 423 BCE the *Clouds*. The term *sophist* can also be used to refer to members of the so-called Second Sophistic, an intellectual current in Greek-speaking parts of the Roman empire from circa 60 to 230 CE—a movement chronicled by Philostratus in his *Lives of the Sophists*. This entry deals only with the Old Sophists.

The Sophists are traditionally celebrated for their contribution to rhetoric—exemplified by their notorious claim of being able to make the weaker argument the stronger, as well as for their popularization of relativism as a viable intellectual position: Protagoras' dictum "Man is the measure of all things." But this description is too narrow and fails to take into account the variety of the Sophists' intellectual pursuits. It also incorrectly assumes that the Sophists shared a unified intellectual outlook and pursued similar intellectual activities. Though there certainly were intellectual overlaps among the Sophists, they need to be treated individually. Today, sophist, sophistic, and sophistry are used almost exclusively as pejorative terms and imply a person or argument that is logically inconsistent, often for the sake of deception.

Almost no writings of the Sophists have been preserved, so we have to base our judgment of them and their intellectual contributions on two sets of secondary sources: Plato's characterization of them in his dialogues, and short paraphrases or quotations from their works in later ancient authors. In addition to this scarcity of primary sources, Plato, our most detailed source, is a hostile witness who offers an unflattering portrait of the Sophists as philosophical lightweights and as Socrates' intellectual inferiors. This characterization was later followed by Aristotle.

Possibly because of this critical treatment, the Sophists elicited little scholarly interest in antiquity. Although the fragmentary state of the evidence regarding the pre-Socratic philosophers (the Sophists' predecessors and contemporaries) such as Heraclitus is slightly better than that of the Sophists, we are still better equipped to understand their works because of a vivid scholarly interest in them in antiquity. This interest led to commentaries and attempts at explaining their writings, as well as the history and development of their thought. But no such tradition developed in regard to the Sophists. Owing to the dearth of primary sources and the problematic nature of the secondary accounts, any treatment of them will be necessarily tentative.

Many modern scholars have been inclined to accept Plato's negative verdict of the Sophists, especially his assertion they should not be considered philosophers, on the grounds that he was in a better position to evaluate their ideas than are modern interpreters. But others believe that Plato's polemical portrait of them is inevitably distorted. Today, the trend is to see the Sophists in a more positive light and to situate them firmly in the Greek philosophical tradition.

The Sophists were not an intellectually homogenous group, nor did they all subscribe to relativism and teach rhetoric. What, then, makes them distinct as a group? Plato suggests that, in sharp distinction to his own mentor Socrates, they taught for money and traveled the Greek world in pursuit of potential customers. Many practitioners of wisdom traveled extensively in ancient Greece, such as Xenophanes, Solon, Pythagoras, and Empedocles, to mention just a few. The Sophists' itinerant lifestyle thus seems more in line with the practices of

their predecessors and contemporaries in Greek intellectual life generally, than a trait unique to them. As for the familiar criticism that they charged fees for their services, it is difficult to interpret the language of monetary transactions in antiquity, especially because Plato, who is so critical of the Sophists, is our main witness. Plato is not interested in what moderns would recognize as economic life. It is certainly possible that the Sophists were first to teach for pay and that they introduced this habit to Greece. But it is also possible that the charge of teaching for pay is an accusation levied against the Sophists in an attempt to undermine their position as authorities in wisdom by implying that their motivations were driven by greed. Given our lack of knowledge about the historical realities regarding this issue, it is impossible to know for certain what the Sophists' actual practices and attitudes to teaching for pay were.

One area in which many of them shared a strong intellectual interest is the workings of language, an interest that ranged from rhetoric, philosophy of language, and linguistic theory to literary criticism. Gorgias, for example, in his *Encomium of Helen,* one of the few preserved Sophistic texts, raises questions about the persuasive nature of speech (*logos*) and asserts that persuasion can take the form of necessity, and that the effect of speech on the soul is comparable to that of drugs on the body. In the hands of a skillful speaker, Gorgias argues, persuasion can even overturn truth. He posits a stark discrepancy between language and reality and questions the relationship between the two. Given the limitations of human knowledge of the world, men often rely on opinion (*doxa*), which is particularly vulnerable to the power of speech and persuasion. Language, then, far from describing an objective reality, is at best a slippery medium, and its application and proper use is of the utmost importance. Similar concerns about the relationship between language and reality are raised in Gorgias' treaty *On Not Being,* where he argues three theses: (1) nothing exists; (2) even if it did, we human beings could not grasp or understand it; and (3) even if we could, we would not be able to communicate it to anyone else. Here, too, language has become a problem, and its ability to convey an accurate description of reality is put in doubt.

Protagoras is credited with stating for the first time that on every question there are two opposing arguments, and he wrote a work called *Contradictory Arguments* (*Antilogiai*). This work is lost, but an anonymous treatise called *Twofold Arguments* (*Dissoi Logoi*) has survived, which seems to be representative of Protagoras's way of arguing. This treatise begins with the sentence: "Twofold arguments are spoken in Greece by those who philosophize regarding the good and the bad." It goes on to present antithetical arguments regarding the nature of such issues as the just and the unjust, and the true and the false. Another example of opposed speeches is found in Antiphon's *Tetralogies,* which are rhetorical showpieces that argue both sides on imaginary legal cases. The presentation of opposing arguments was a practice particularly affiliated with the Sophists and was ridiculed as such in Aristophanes' *Clouds*.

The distinction between "convention" or "norm" (*nomos*) and "nature" (*physis*) is also common in Sophistic works. This was a productive dichotomy used in a variety of contexts to explore different intellectual positions, especially in the areas of ethics, justice, and the nature of society. Antiphon, for example, states that the most advantageous application of justice involves obeying the laws not only when witnesses are present, but obeying nature when they are absent. For the laws, he explains, are imposed, but nature is necessary. He uses the same dichotomy, as does Hippias, to argue that the distinctions between Greeks and barbarians are not based on nature, but convention. For we all breathe air, cry when sad, and laugh when happy. The anonymous Sophistic treatise *Anonymus Iamblichi,* on the other hand, espouses the view that human beings are not self-sufficient by nature but require sustained training and education to live up to our potential. As can be seen from these examples, the *nomos-physis* antithesis does not entail a consistent philosophical position but, just like opposed speeches, offers a productive contrast that can be used for different intellectual purposes.

Other areas of Sophistic interest in language focused on its correct application. Protagoras and Prodicus are said to have written treatises on "correct diction" (*orthoepeia*). Prodicus also wrote a work on the "correctness of words" (*orthotês onomatôn*), and Hippias on the "correctness of letters" (*orthotês grammatôn*). We are not sure what

the scope of these works was, but much of the subject matter should probably fall under the heading of grammar. Protagoras, for example, is said to have divided words into three genders: masculine, feminine, and neuter; and Aristotle mentions that he disputed the gender of the Greek words for "wrath" and "helmet," which are feminine, arguing instead that they ought to be masculine. He is also said to have differentiated discourse into separate modes, such as wish, question, answer, and command. Prodicus, on the other hand, is frequently portrayed in Plato as an expert in defining and differentiating the meaning of synonyms and in establishing the unique linguistic range of each word. As for literary criticism, in Plato's dialogue *Protagoras,* Socrates, Protagoras, Prodicus, and Hippias engage in interpreting a poem by the Greek poet Simonides. In the same dialogue, Protagoras also claims that any educated person should have the ability to assess the quality of poetry.

Why, we might ask, do we find this intense focus on language among the Sophists, and how new to Greek thought was it? Though many of them exhibited a strong interest in this area, it was by no means limited to their number. Both Parmenides and Heraclitus had been concerned with the relationship between the world of appearances and being, and the extent and limits of language's ability to convey reality. Democritus is credited with writing a work on correct diction, and Plato devoted the dialogue *Cratylus* to the exploration of the correctness of names. The practice of presenting opposing speeches was as old as Homer, and this feature also abounds in the Greek historian Thucydides and Greek tragedy. Still, despite these traditional elements, it is undeniable that the focus on language intensified in the fifth century BCE. Some scholars attribute this trend to the political development—mainly in Athens—of democracy and its emphasis on the participation of the citizens in public life. According to this explanation, it was the demands of the two fundamental institutions of democracy—the assembly and the law courts—that provided the impetus for the development of instruction in rhetoric, to enable individuals to participate in an effective way in these new political venues.

Other scholars emphasize the importance of understanding the new intellectual developments against the backdrop of the philosophical expressions of earlier practitioners of wisdom. From this point of view, the new Sophistic interest in language is to be seen as a logical and organic development arising out of the intellectual accomplishments of the pre-Socratic philosophers and as a process primarily internal to the philosophical field. This explanation tends to put less stress on the political developments associated with democracy.

Another way of looking at the new intellectual focus on language is to note that it coincided with important cultural transformations in fifth-century Greek society, such as the gradual shift away from poetry to prose as the dominant medium for intellectual communication. We see this shift especially in the fields of philosophy, history, and medical writing. Greek society was also moving away from a traditional oral culture to the eventual adoption of literacy. It is important to note that these transformations were gradual, and that there continued to exist significant overlaps; neither poetry and prose nor orality and literacy should be seen as absolute dichotomies. But they might be used as interpretive vehicles through which to understand the higher degree of reflection on language that occurred in the fifth century. Perhaps the best way to account for this new centrality of language in the works of the Sophists is to draw on elements from each of the three explanations previously presented.

We should be mindful, however, that the Sophists had many other interests besides language. This is perhaps best exemplified in the figure of Hippias, who is said to have expertise in, among other things, music, geometry, astronomy, mathematics, sculpture, genealogy, and history. Hippias was also the first systematic historian of philosophy, and both Plato and Aristotle drew on his work in their accounts of the beginning and development of Greek philosophy. We also have good evidence that some of the other Sophists showed a strong interest in physical matters and mathematics: Gorgias, Prodicus, and Antiphon are all reported to have actively pursued work in natural philosophy, while Antiphon is attested to have been an accomplished mathematician.

Sorel, Georges (1847–1922)

An oft-maligned figure in French political thought, George Sorel would find himself dismissed as a "notorious muddle-head" by Vladimir Lenin and a "fascist" by Jean-Paul Sartre. Nevertheless, his theories of class warfare and the creative effects of violence have come to have a lasting, if subtle, impact on later thinkers.

Origins

Born in Normandy, trained in Paris, and dispatched to the provinces, Sorel was not a traditional philosopher by any means. While well-educated in a technical sense—Sorel was trained as a civil engineer—as a philosopher he was for the most part an autodidact and actively sought to erase all traces of his prior education. Sorel's early conservatism would mark his later development of a nonorthodox, Proudhonian Marxism, and this was especially true of his anti-Jacobinism. From Sorel's earliest works like *The Trial of Socrates* (1889), the thinker's antipathy to revolutions as rationalist, intellectually driven enterprises seeking to impose their views on the blank slate of human material would lead him to oppose what he saw as the "cult of the state" in the French Revolution.

Dreyfus and Revisionism

No single event was of greater impact on Sorel's development—both negative and positive—than France's Dreyfus Affair. The rabid anti-Semitism of the anti-Dreyfusards would initially drive Sorel into the arms of the various social-democratic forces aligned under the Dreyfusard banner. However, when the Dreyfusards came to power, Sorel would see their policies—and especially their retributive attacks on the church and military—as exhibiting the worst elements of Jacobin excess.

This disillusion with the Dreyfusards coincided with the intra-Marxist debate over revisionism, in which Sorel would adopt a characteristically peculiar position. Rather than siding clearly with either the reformist revisionism of Eduard Bernstein or the catastrophist orthodoxy of Karl Kautsky, Sorel took what was ostensibly a revisionist position but turned it toward more radical ends, asserting the centrality of working-class identity and struggle.

Reflections on Violence

Sorel is best known for his *Reflections on Violence* (1908), which first appeared as a series of articles during the upswing of French syndicalism of the 1906 strikes. In *Reflections,* Sorel further concretized his theory of the productive and generative character of working-class violence. Sorel argued that, given the importance of ideology, the capitalist simplification of society into two opposing classes was far from inevitable, and that only

proletarian "violence" could ensure that division, thereby restoring objectivity to the Marxist framework. For Sorel, this violence was categorically distinct from the "force" of the bourgeoisie: where force strengthened the bourgeois state as a structure of inequality and minority rule, violence worked toward the destruction of that same state.

Influence and Controversy

Perhaps the most noteworthy fact regarding Sorel's reception and eventual influence is that his own France seemed to be the least receptive to his theories. Throughout Sorel's life and after his death, his greatest degree of influence would come in Italy (through his close association with Antonio Labriola and Bendetto Croce and influence on Antonio Gramsci), Latin America (through mystical-spiritual Peruvian Marxist José Carlos Mariátegui), and in the anticolonial thought of Frantz Fanon.

Sorel's posthumous critics have sought above all to associate him with the later development of fascism, a claim that has been developed most extensively by Zeev Sternhell. Others, like Hannah Arendt, dismiss Sorel's violence as the antithesis of political speech and action. Both claims, however, run into difficulty when faced with Sorel's opposition to all notions of unity (including the national) and the generative and political nature of violence as Sorel defines it.

SOVEREIGNTY

The concept of *sovereignty* is conventionally used to connote supreme authority within a given polity. In practice, however, sovereignty is one of the most contested concepts in political theory. The meanings of sovereignty vary widely depending on the context in which this concept is used, as well as on its inferential connections to other political concepts. Although crucial to modern political science and international relations, the concept of sovereignty is notoriously ambiguous and thus hard to define with any precision.

Issues of Definition

The proper *source, locus,* and *scope* of political authority have been subjected to constant debate in the history of political thought. From where does such authority derive its legitimacy? With whom should it reside? What are the proper limits of its exercise? While these are some of the questions that any account of political authority must confront, most modern definitions of sovereignty imply that such authority—quite irrespective of the sources of its legitimacy and its exact locus—must be both *indivisible* and *absolute* in order to qualify as properly sovereign and nothing else. While being indivisible implies that it must—at least in theory—reside with a single agent in a given polity, being absolute entails that this agent either is sovereign or not, but nothing in between. These formal characteristics distinguish sovereignty from related concepts, such as autonomy and independence, both of which are thought to be matters of degree. Insofar as sovereignty is defined in terms of authority, it is also thereby distinguished from mere power, because this latter concept does not normally carry the same connotations of acceptance, obligation, or obedience among subjects and citizens as does authority. Taken together, these defining characteristics have raised the question of whether sovereignty is best understood as a *rule* or *principle,* or as an empirical fact. In an analogy with grammatical rules, we could say that the concept of sovereignty contains both descriptive and prescriptive elements. Sovereignty thus not only refers to a state of affairs, but also implies that this state of affairs constitutes a norm

to which political life should conform in order to be intelligible. Finally, there is a performative dimension to the concept of sovereignty, insofar as it is frequently used by various agents to raise claims to possess supreme authority in different contexts. Hence, sovereignty is very much what you make of it through practices of definition and its actual usage in political discourse.

Modern theories of sovereignty frequently distinguish between the *internal* and *external* aspects of sovereignty. In modern times, internal sovereignty is attributed to the governmental institutions of a state by virtue of fulfilling some or all of the previous criteria, while external sovereignty is attributed to the state as a whole by virtue of being recognized as such by other states. Because the terms of recognition are dependent on the internal features of sovereignty, the requirements of external sovereignty have varied considerably over time, and have also proven negotiable during each historical period. Such recognition has been granted on different grounds throughout history, from principles of dynastic succession, via national self-determination and territorial integrity, to requirements that stipulate that a state has to be governed according to democratic principles to merit international recognition.

An important corollary of state sovereignty is international *anarchy,* because sovereignty implies a denial of any authority over and above that of the individual state. When three or more states raise and mutually recognize their claims to sovereignty, they thereby form an international society or system devoid of overarching authority. Hence, by constituting the domestic and the international realm as two contrasting but mutually implicating spheres of political activity, sovereignty is the main organizing principle of modern political order.

Historical Evolution

Although quintessentially a modern concept, the history of sovereignty can be traced back at least to the political theology and feudal practices of the late Middle Ages. At that point in time, supreme authority was vested in the person of the prince, who derived his authority both from liturgical sources as well as from his relative ability to protect his subjects from internal and external enemies. The subsequent articulation of modern conceptions of sovereignty followed several cumulative steps, catering to problems of political order peculiar to different periods in European history.

A first important step toward the articulation of a recognizably modern conception of sovereignty was taken when claims to supreme authority were *territorialized,* that is, delimited to a bounded territory. This took place in sharp contrast to prevailing views of imperial authority, which emphasized its universal and boundless character. While the idea of imperial authority implied no restriction on the scope of temporal power, rulers who contested such imperial claims during the thirteenth century did so by asserting that individual kings ought to enjoy the same political and legal status within their inherited domain as did the emperor within the Holy Roman Empire. Hence, during a formative episode, the rulers of the medieval kingdoms of France and Naples refused to recognize the authority of the Emperor Henry VII over matters considered internal. In support of their claims, they could draw on the doctrines of jurists such as Andreas de Isernia and Bartolus of Sassoferrato, who argued that temporal authority ought to be territorially delimited. Summarized into the widespread dictum *rex in regno suo est imperator,* this legal doctrine legitimized a territorial subdivision of political authority, and therefore also brought a gradual disintegration of the Holy Roman Empire.

A second and largely simultaneous step toward a modern conception of sovereignty came with the gradual *depersonalization* of political authority in medieval political theology. During the Middle Ages, authority had often been conferred to the physical person of the prince through anointment and other acts of liturgy that established his divine right to rule. While this practice had the advantage of endowing medieval kingship with religious legitimacy, it posed severe problems of spatiotemporal continuity in cases of death or absence. Depersonalization meant that supreme authority first was relocated to the fictitious person of the crown, and then symbolically transferred to the royal domain or to the body politic as a whole. This transition culminated in the invention of an abstract conception of the state—presumably existing independently of rulers as well as of those ruled—during the seventeenth century, to which sovereignty now could be attributed independently

of the physical person of the prince. Rather than being a mystical property embodied in the person of the king, sovereignty thereby became associated with the political institutions of the early modern state.

A third and decisive step toward a modern understanding of sovereignty was taken when the sovereign authority of the state was defined in terms of *indivisibility* and *absoluteness*. In response to the widespread and lasting religious warfare in Europe, legal theorists like Jean Bodin, Hugo Grotius, and Thomas Hobbes argued that sovereign authority ought not to be divided within one and the same polity, and that it should be understood as absolute in the sense that it is either attributable to a given agent or not. The cumulative consequence of these conceptual mutations was that the concept of sovereignty came to connote supreme, indivisible, and absolute authority within a given territory, while the questions of its proper locus and scope within each state were left to succeeding generations to handle. This implied that the very identity and integrity of the early modern state, along with that of an emergent international society or system of states in Europe, became dependent on the existence of such sovereign authority and its recognition by others.

The fourth and final step toward a fully modern conception of sovereignty was taken when sovereignty was *popularized,* by being relocated from kings to the people. From Jean-Jacques Rousseau and the French Revolutionaries onward, the will of the people was turned into the source of legitimate authority in the polity. Yet the rise of popular sovereignty did little to challenge the underlying requirements of territorial boundedness, which left modern political theory with the problem of accounting how the sovereignty of the people could be justified in democratic terms. The solution was to introduce the concept of the nation as the ultimate source of legitimacy. The final outcome of this transition was the modern nation-state, governed according to the principles of popular sovereignty. Toward the end of the nineteenth century, that peculiar construct came to constitute the main object of inquiry for modern historiography and political science.

During the twentieth century, the concept of sovereignty became increasingly controversial within political science. Whereas many *pluralists* argued that the concept of sovereignty was theoretically redundant and empirically obsolete in order to understand how modern democratic societies are governed, *Marxists* argued that sovereignty was but a fiction designed to justify and divert attention from the uneven distribution of power and wealth between classes in capitalist societies. Still others argued that the concept of sovereignty should be banished from the vocabulary of the social sciences because of its inherent opacity and ambiguity.

The Contemporary Debate

More recently, the usefulness of the concept of sovereignty has been contested on other grounds, however. At the heart of this debate we find the question whether sovereignty is a permanent or necessary condition of political order, or whether it is likely to be replaced by other organizing principles in the near future. The recent contestation of sovereignty is inspired partly by the belief that the political world has changed, partly by changes in philosophical outlook within the social sciences themselves.

Thus, many political scientists today dispute whether it is meaningful to speak of political authority as being absolute and indivisible any longer, because the processes of European integration and globalization have brought relocations of political authority to levels below as well as above that of the state. Authority appears both relative and divisible. As a consequence, many political scientists argue that the concept of sovereignty either has to be stripped of some of its traditional connotations and redefined to fit present conditions better, or, more radically, abandoned altogether in favor of other concepts such as autonomy and power. Others have contested sovereignty on more philosophical grounds, questioning the ontological status of this concept along with its ideological functions in justifying domestic abuses of power and international warfare. Many of these critics have argued that sovereignty has been unduly reified by modern political science and international relations theory, to the point that sovereignty has become taken for granted. Rather than simply referring to a legal norm or an empirical fact, *constructivists* and *poststructuralists* have argued that the concept of sovereignty instead is

constitutive of modern political order through its usage in academic and political discourse. By implication, sovereignty is believed to be historically contingent and profoundly mutable, rather than a necessary condition of domestic and international political order.

Such a diagnosis of course begs the question of alternative principles of order. But like many earlier attempts to contest sovereignty, the recent criticism of sovereignty tends to presuppose exactly what it sets out to criticize, namely, that there is, or at least has been, something like indivisible and absolute political authority out there in the first place. Thus, the concept of sovereignty, along with all its traditional core connotations of supremacy, territoriality, indivisibility, and absoluteness, nevertheless continues to exercise a powerful influence on contemporary political imagination, to the point that alternatives either seem totally out of reach, or, when inspected more closely, carry features similar to that of the good old sovereign state.

As some recent scholarship has suggested, much of the endurance of sovereignty as an organizing principle of modern political life depends as much on claims to sovereignty being raised by various agents as it does on such claims being perpetually contested by others. From this point of view, the concept of sovereignty derives its meaning from being used to legitimize claims to supreme authority in various contexts. But even if we accept that the meaning of sovereignty is a matter of usage, this implies that its normative import depends on the acceptance of those conventions governing its usage by those audiences recognizing or rejecting such sovereignty claims.

Something similar goes for attempts to relocate sovereignty to the global level, which despite their aspirations often remain premised on the notion that political authority needs to be both bounded and centralized in order for a political community to be possible. Hence, and symptomatically, the present contestation of sovereignty seems to be exactly what keeps this concept very much alive within political science and international relations theory. But by focusing squarely on sovereignty and the question of its endurance, recent critics have left some more basic questions of political authority—questions that the concept of sovereignty once was invented to address—unanswered. To be able to answer these questions without presupposing that political authority needs to be territorial, or that communities have to be bounded, remains one of the main challenges to political science and academic international relations today.

Sparta

The ancient Greek city-state (*polis*) of Sparta has been regarded by many thinkers since antiquity as an ideal state, embodying both political and social virtues. In antiquity writers suggested Sparta was an exceptional polis, ascribing its political supremacy to its social order. This image proved influential in the Renaissance, and especially the Enlightenment, when Sparta repeatedly emerged as a sociopolitical model.

François Ollier coined the term *mirage spartiate* (Spartan mirage) to describe the semimythical aura surrounding Sparta, actively promoted by the Spartans themselves, which continues to hamper historical studies of the city. The political and social arrangements of Sparta were attributed to the semilegendary lawgiver Lycurgus, although even ancient authorities were skeptical about his existence.

General opinion places the reforms that underlie the Spartan system in the period of expansion in the sixth century BCE, which established Sparta as the dominant polis in the Peloponnese, and one of the leading powers in Greece. During this expansion, the Spartans enslaved conquered peoples as *helots,* or forced them into dependent communities, known as *perioikoi,* literally dwellers-around. The existence of these groups allowed the Spartan citizens freedom from agriculture and skilled labor, as the helots worked land on behalf of the citizens, and the perioikic communities supplied craftsmen. Thus, they were free to dedicate their lives to the community, engendering a lifestyle eulogized by ancient observers, most notably Xenophon and Plutarch.

Key to the Lycurgan system was the balance of political and social measures, designed to promote equality among the citizen body and thereby prevent the civil strife engulfing most *poleis* in the sixth century. Lycurgus reputedly identified inequalities of wealth as the greatest threat to social harmony, and thus outlawed gold and silver money. Most radical, however, was his alleged redistribution of land into 9,000 equal plots. The ancient evidence is problematic; but the principle of such equality was integral to the Spartan system. This egalitarianism was reinforced by education and lifestyle. Spartan male citizens underwent a rigorous program of public education, sometimes known as the *agoge,* from the ages of 7 to 18; thereafter, until the age of 30, they would live and dine in a *syssition.* The barrack lifestyle fostered an intense community spirit and allowed the development of an unrivaled military. The precise balance between civic and military concerns in Sparta remains a matter of great debate among modern scholars, with it recently being suggested that the Spartans were professional citizens, rather than merely professional soldiers.

The political arrangements attributed to Lycurgus attempted to promote stability while allowing close participation by the citizen body. A dual kingship, probably a relic from a fusion of earlier communities, continued throughout the classical period. Yet the two kings—one from the Agiad royal house, and one from the Eurypontid house—ruled concurrently but were greatly restricted in their powers, performing religious functions and serving as generals on campaign. Power centered in the several different institutions that formed the Spartan Constitution: the *gerousia,* a council of elders, consisted of the 2 kings and a further 28 citizens over the age of 60, elected by the whole citizen body, but drawn from a limited circle of aristocratic families; the *apella,* an assembly consisting of the entire citizen body, which voted on, but could not debate, laws and public policy; and the *ephors,* 5 annually elected magistrates, drawn from the entire community. These various elements formed what admirers considered a perfectly balanced constitution, combining the "simple" constitutional forms identified by Aristotle, thereby enjoying the virtues and negating the vices of each.

To ancient admirers, the Spartan system exhibited a perfect balance, the citizens enjoying *eunomia,* the good life. Integral to this was the belief that the Spartan *eunomia* created citizens and soldiers—which were essentially inextricable roles—second to none. The Spartan *mirage* was deliberately fostered by the Spartans themselves, enforced by a strict secrecy, and involving periodic expulsions of foreigners, in order to maintain their status in Greek intercity relations. Thus, many aspects of Spartan life, such as the exposure of unhealthy infants, the encouragement of theft among youths, and the notorious *krypteia*—select groups of young men sent out to the countryside kill helots—remain obscure to ancient and modern observers alike.

Even during its period of supremacy in Greek affairs, Sparta provided an appealing model to Greeks of other states, usually aristocratic, who were disenchanted with their own cities. The decline of Sparta after the defeat by Thebes in 371 BCE only served to foster the legend of a golden age of Spartan excellence; and for much of antiquity, Sparta was imagined as an ideal polity. Ancient writers maintained and developed the mirage the Spartans themselves had strived to create. The contributions of Plato and Aristotle, while both limited in their praise and aware of her deficiencies, were best remembered for their positive remarks. Xenophon, who knew Sparta well, gave substance to the legends. Polybius suggested the comparison with Rome, and in his model of mixed government enshrined Lycurgus as a lawgiver without peer. Finally, Plutarch, drawing on a range of material, combined myth with history to present the most fully formed legend of Sparta.

While Latin writers did not share the Greek enthusiasm for Sparta, it remained a significant topic for discussion and comparison. With the decline of classical learning, interest in Sparta also inevitably waned; but in the Middle Ages Sparta continued to attract interest, its heroes mentioned in various medieval chronicles, and by the fifteenth century, the political system of Lycurgus was relevant enough for Laurent de Premierfait to insist that his laws could not compare with those of Jesus. The Renaissance saw a sudden growth of interest, republican thinkers seeing much to discuss, and even admire, in Sparta's political arrangements, with the thought of Niccolò Machiavelli and Thomas More heavily influenced by Plato, Xenophon, and Plutarch. Yet it was in the Enlightenment that Sparta would come most to the fore. James Harrington's choice of Sparta as one of his models for his idealized commonwealth helped to generate a growing interest in and admiration of Spartan institutions. The emergence of the first narrative histories of Greece in the late seventeenth and eighteenth centuries, and the growing presence of antiquity in a series of contemporary philosophical and political debates, served to foster these interests. Thus, the eighteenth century saw a string of thinkers, including Gabriel Bonnot de Mably, Jean-Jacques Rousseau, Adam Ferguson, and Claude-Adrien Helvétius, use Sparta in various ways, and many prominent protagonists in both the American and French Revolutions used Sparta as a model rhetorically, and perhaps even literally. The associations of Sparta were essentially radical, with some considering Sparta to be democratic and the most effective realization of the general will, and a potentially subversive assault on the notion of property. For these thinkers, Sparta emerged as a model for radical change, the ultimate challenge to the status quo. More moderate thinkers interpreted Sparta as the model of the mixed constitution, embodying virtues such as a separation of powers. In all these debates, the history of Sparta—imagined or not—served to make it a powerful model, and it was usually considered comparatively—be it with Rome, Athens, the New World, or modern Europe. While many were highly critical, Sparta was not seriously discredited as a political model until its supposed association with the Jacobins was highlighted by François-René de Chateaubriand and Benjamin Constant.

In the nineteenth century, interest in Sparta declined as liberals turned increasingly to Athens, and Sparta became the antithesis to modern liberalism. Although some radicals continued to see Sparta as a prototype of egalitarian socialism, Karl Marx expressed little interest in Sparta, and with the rise of nationalistic philosophies, Sparta became a model of militaristic patriotism. While Sparta would not again attain the levels of interest of the eighteenth century, it proved a point of reference for Nazism. The later twentieth century tended to reject the Spartan model, following the nineteenth-century notion of Sparta as a purely militaristic state, and the antithesis to modernity. However increasingly sympathetic analyses in scholarship, and a surge of popular interest, has made Sparta once again a relevant topic in twenty-first century political discourse.

Spencer, Herbert (1820–1903)

Herbert Spencer's name is associated with a general theory of evolutionary change that covered moral beliefs and social and political institutions, winning him a worldwide reputation in the second half of the nineteenth century, a reputation that waned, however, in the twentieth century, but is now undergoing a reappraisal.

Spencer was born in Derby, England, on April 27, 1820. His father was a noted teacher and secretary of the town's science-minded philosophical society. His parents shared nonconformism in religion; his mother's impact on his childhood was dwarfed by his father's passion for the causes of things and radical questioning of authority.

In 1833, responsibility for Spencer's education passed to his evangelical uncle Thomas, a Cambridge graduate and perpetual curate of Hinton Charterhouse, Somerset. Spencer initially absconded, but an enduring bond developed with his uncle while at Hinton. Mathematics and science appealed more than languages and history. He assisted with his uncle's pamphlets on religion and the *Report on the Poor Law of 1834*. These fused political economics and natural theology, yielding pathways to material and moral advance for individuals. In his parish, and as chairman of the Bath board of guardians, Thomas curtailed outdoor relief to the able-bodied in the interests of rewarding virtue and punishing vice. Spencer joined in with his own early article in the *Bath and West of England Magazine* of 1836.

Formal education completed, family contacts helped Spencer launch two related careers. He worked on railway engineering tasks and the negotiation of parliamentary approval for lines, and he undertook radical political journalism, notably in association with Charles Miall and the Complete Suffrage Union. A series of letters to *The Nonconformist,* "very good remedies for Tyranny and Toryism" he described them, were reissued in 1843 as *The Proper Sphere of Government.* Governments should protect people and property, and prevent the aggressions of the rich on the weak; in other words, administer *justice.* Given justice, the self-adjusting *laws of society* keep elements in equilibrium. Wider legislative provisions produce effects the opposite of those desired and distract governments from their proper duty, the prompt and free administration of justice for citizens.

Fame and fortune unforthcoming, a letter from Thomas secured appointment in 1848 as a subeditor with *The Economist* in London. *Social Statics,* dated 1851, went beyond *The Proper Sphere* by adopting the Lamarckian mechanism of adaptation to circumstances together with the inheritance of acquired characteristics as the key to *all* organic change, and argued that it ensured progressive *social* change. Under social, cooperative conditions, *justice* evolved as a master principle: "Every man has freedom to do all that he wills, provided he infringes not the equal freedom of any other man." Other government intervention compromised beneficial adaptation. Private property contravened the necessary *co-heirship* of men to the soil, and women were entitled to equal rights.

In London, his cultural experience expanded rapidly. G. H. Lewes, Marion Evans (later George Eliot), T. H. Huxley, and John Stuart Mill were new friends. Later, election to the Athenaeum made the group a focus. Thomas's death in 1853 brought the resources to concentrate on writing. The next decade was Spencer's intellectual zenith. Prospects of marriage, however, receded: Evans, who had formed a rather one-sided attachment to Spencer, he found deficient in beauty. Essays appeared on the implications of adaptation as an explanation of various facets of progressive development. His *Principles of Psychology* (1855) presented a dynamic version of associationism in which physical and psychical phenomena adaptively developed in parallel through all life up to human life at its most social. He rejected freedom of the will, attracting criticism from St. George Jackson Mivart and John Elliott Cairnes, and, later, idealists. No scope remained for eliciting a direct change of heart in an agent; exhortations belonged to an *environment* to which adaptations slowly and naturally arise.

Although often in poor health, by 1857 he had an all-embracing theory of (directional) evolution, a movement to heterogeneity caused by physical principles and, in organic life, by the compatible Lamarckian mechanism. *First Principles* (1862) and subsequent volumes on biology, psychology (reworking the 1855 study), sociology (including "Political Institutions" as a part), and ethics

elaborated the theory. This 10-volume "System of Synthetic Philosophy" was finished in 1896. Separate was his critique of contemporary politics, *The Man versus the State* (1884).

Spencer became well known and widely translated. His American visit in 1882 cemented his reputation there beyond his admirers, E. L. Youmans and Andrew Carnegie. To the philosopher of evolution was attributed a scientific basis for liberalism that censured law-making that infringed justice. In "Political Institutions" he contrasted peaceful and voluntaristic industrial social forms with aggressive and coerced militant forms. He also promoted the Anti-Aggression League, and opposed both Governor Eyre's brutalism in Jamaica and the Boer War.

In 1859, Charles Darwin had argued for *natural selection* as a major factor in biological change, whereby out of (genetic) variations only some were *selected* to survive in an inevitable struggle for existence. Spencer accepted natural selection, renaming it the "survival of the fittest" (in 1864), but also retained his Lamarckianism. Spencer's pre-Darwinian approach, often described as orthogenetic and epigenetic, led to misunderstandings over how Darwin's distinctive, nondirectional theory might relate to social life. By the 1890s, evidence told against the inheritance of acquired characteristics, and there was a decline in Spencer's reputation. Spencer's advocacy of altruism—the free administration of justice, beneficence, and small-scale, nonbureaucratic charities—represented a pluralistic vision of *social welfare,* but his depiction of social legislation as interfering with nature was arbitrary and contrary to the competing conceptualization of the state as enabling people to achieve their aims, not merely protecting them from injustice. Spencer viewed these developments as illiberal, and regressive rather than evolutionary, though they became the core of *new liberalism*. Poignantly, they lured Beatrice Webb, whom Spencer knew well as a close friend's daughter.

Society, conceptualized as an emergent reality rather than a collection of individuals, was central to idealist social thought (and to the sociology of Ferdinand Tönnies and Émile Durkheim). For Bernard Bosanquet, for example, the *social organism* was taken to be a spiritual whole that a wise state advanced, by tapping into the general will. Spencer judged this a dangerous misunderstanding of his social organism analogy, which construed individuals as fundamentally autonomous though social, moral governance was coercive and antiprogressive. However, Spencer's political thought remained appealing to liberals such as John Morley and Auberon Herbert, and to libertarian pressure groups.

Today there is renewed interest in Spencer's place in intellectual history, accompanied by reappraisal of the structure of his theory of evolution and constructive reworkings of his objections to government action in direct pursuit of *positive freedom.*

Spencer died on December 8, 1903. At his cremation the former Liberal Member of Parliament, Leonard Courtney gave the oration, in place of Morley, who was abroad. His ashes are in Highgate cemetery.

Spinoza, Baruch (1632–1677)

Baruch Spinoza scandalized the Western European world and his own Jewish community as his naturalist metaphysics drew accusations of heresy and atheism. His two political treatises and his *magnum opus,* the *Ethics,* comprise a rich treatment of politics grounded in his naturalism. Just as he insisted that one ought to investigate scripture like any other thing in nature, he examines human psychology, social relations, the state, and civil organization as natural forces that operate according to necessary relationships of cause and effect.

Spinoza was born into a time replete with religious and political strife. Of Portuguese Sephardic descent, Spinoza's ancestors were forced to flee their homeland during the inquisition. They found relative shelter in Holland, where Baruch Spinoza was born and spent the entirety of his brief life. He was an exceptionally bright yeshiva student, but was banished from the Jewish community (the *cherem*) in 1656, perhaps for his views on God and for questioning of the divine origin of the

Pentateuch. He changed his name to its Latin equivalent, Benedict, and dedicated the remainder of his life to philosophy and lens grinding. He enjoyed some reputation as a philosopher during his lifetime and was offered a position as a professor in Heidelberg. He refused on the grounds that it would undermine his freedom to philosophize. His rejection of institutions that would constrain his thought and action reflects the basic principles of his political theory. Whether one can think and live well is not a matter of volition or self-discipline. Rather, one's abilities depend on the quality of the institutions and relationships one enjoys.

Natural Right

Some scholars have argued that Spinoza's metaphysics is indistinguishable from a political philosophy, because he conceives of the entirety of existence in terms of power. To exist is to have power and, therefore, God (nature) names the infinite power to be and to act. The things we perceive in the world, including human beings, are different ways in which this infinite power of nature exists. Spinoza's naturalism entails the following: God is an impersonal, vital force rather than a king or legislator who commands obedience; nothing transcends or violates the natural order of cause and effect; and, existence itself is a complex web of power relationships, where power names the forces that enable and constrain actions. This metaphysical basis underlies Spinoza's doctrine of natural right, in which he insists that everything follows necessarily from nature's right to exist, where right is coextensive with power.

Spinoza's notion of natural right engenders both a theological and a political heresy. Just as God has no existence outside of nature, right neither precedes nor measures particular acts. Spinoza's view undermines the basis for natural law, according to which there is a standard inscribed in the cosmic order that dictates how things ought to be, independent of human convention. Right here does not designate a normative standard by which to judge either human behavior or the legitimacy of regimes. Our actions simply reflect the concrete, natural limits of our power. Thus, fools and madmen act according to the order of nature no less than the wise and virtuous. A sovereign republic whose only guide is the welfare of the people as a whole acts according to the same right as a brutal tyrant.

Spinoza's doctrine of natural right is often paraphrased as the notion that "might makes right." This is a misunderstanding. Spinoza's treatment of natural right does not function to justify or constrain any form of authority or behavior. For Thomas Hobbes, in contrast, natural right corresponds to acting in accordance with "right reason," and thus does not extend to anything that someone might do. Right simply names the power to exist and act of any natural being and is thereby purely descriptive rather than normative. It functions (a) to affirm that there is no transcendent standard that reason might discover to guide human action and (b) to assess regimes and actors in terms of the concrete practices and ways of life they make possible. Right does not designate any formal set of entitlements that citizens may or may not be able to exercise.

Although Spinoza does not condemn tyranny on the basis that it violates the natural order of things, or the given dignity of human life, he does argue that tyrannical governments exercise less right insofar as they give their constituents cause for resentment and revolt. Similarly, ignorance and enmity follow naturally from the tendencies of human psychology, but rationality and friendship reflect more enabling relationships and engender greater right. Nevertheless, as he notes in the *Political Treatise,* doing something by right is not equivalent to doing something in the best way. Spinoza distinguishes himself from other philosophers by examining the character of regimes and social organization only in terms of natural right without reference to an ideal regime. According to Spinoza, even Hobbes, famous for his realism, abandoned the perspective of natural right by imagining that individuals can formally and irrevocably transfer their power to the sovereign. State power is always a matter of the practical dynamic among the many, rather than any formal agreement.

The *Theological-Political Treatise*

Spinoza's *Theological-Political Treatise* is considered a founding document of modern democratic theory. It promotes democracy as the most natural (i.e., most powerful) form of commonwealth and outlines a kind of social contract as the basis of the

state. This treatise served as a direct intervention into theological-political controversies occurring in the United Provinces during Spinoza's day. The text includes his notorious treatment of scripture and miracles as thoroughly natural phenomena, governed by knowable relationships of cause and effect. Much of the book ascertains the origin and decline of the Hebrew state as an example of a democratic agreement between Jews and God, mediated by the earthly sovereignty of Moses. He published the *Theological-Political Treatise* anonymously in 1670, and was met with horror and threats to his life. The remainder of his work would have to be guarded by his friends and published after his death.

Among the several arguments in this complicated text, Spinoza contends that there is no conflict between religious and civil authority, because "true religion" commands only that one should love God and one's neighbors and obey the law of one's earthly sovereign. Similarly, theology does not conflict with philosophy, because its essential teachings inspire obedience and charity rather than knowledge. Spinoza's arguments aimed, at the same time, to carve out an autonomous space for philosophy to treat speculative questions and to mitigate disputes over whether the church or the state has greater authority over public life. Spinoza achieves his aim, to the dissatisfaction of many, only by proscribing the domain of religion to moral cultivation. For Spinoza, the state has the right, understood as effective power, to determine the role and scope of ecclesiastical power. Moreover, the argument that speculation about the ultimate character of reality remains in a separate domain from either religion or politics undermines the ability of either institution to claim that piety and law reflect the cosmic order rather than particular conventions and needs.

Without an eternal standard of right and wrong, justice becomes an expression of particular institutions of authority and ways of life. In the *Theological-Political Treatise,* Spinoza represents the local, conventional character of justice with the device of a "pact," or what has come to be called a "social contract." Spinoza shares with Hobbes the notion that justice reflects an agreement and has no existence prior to a pact. Yet Spinoza's portrait of the civil pact is somewhat different from typical social contract theories. While the contract usually functions to represent how a state's legitimacy and authority can be grounded in the volition of the people, Spinoza's rejection of free will in the *Ethics* and his treatment of natural right and the passions in his political writings alter how one should understand the basis of any pact.

First, Spinoza's rigorous naturalism makes it inappropriate to think of the commonwealth as an artifice erected over and against the natural tendencies of man, as Hobbes suggests. Rather, collective life and its forms of authority are entirely natural phenomena that issue from our basic psychological tendencies and physical needs. Second, a civil pact expresses the psychological fact that a group of humans apprehend a given arrangement of power as conducive to their self-preservation and well-being. While obedience may not genuinely be in the interest of most individuals, the right (power) of the state is entirely contingent on the perception that one will benefit by conforming to the state's demands. Obedience thereby issues from the majority's desire to preserve and enhance their lives, rather than from the unconditioned will of rational subjects. Third, rather than being a formal transfer of rights, obligation rests on perceived utility alone. Political authority endures only as long as the passionate dynamic persists in which the majority find that their well-being is furthered by yielding to the law.

Spinoza does not base his argument for democracy on its superior ability to formally recognize each individual's claim to liberty and dignity. Rather, democracy is the best way to coordinate the mutual striving toward self-preservation of the state and its constituents. As natural beings, individuals as well as institutions aim to preserve and enhance their existence. A democracy with large deliberative assemblies and ample opportunity for participation (at least for propertied males) is the best means to unify the power of many diverse individuals and, in so doing, to solidify the state. Thus, Spinoza claims in the *Theological-Political Treatise* that the purpose of the state is nothing other than freedom. Given that Spinoza rejects free will, freedom should be understood as the power by which one exists and enhances one's life. Humans strive not only for longevity, but also to be able to think and to communicate our capabilities to others. Democratic institutions support our efforts to express our views and publicize our activities, even as they inevitably come into dangerous conflict with one another. Spinoza contends that establishing various outlets

for the expression of our differences leads to more enabling social relations than trying to suppress them. Efforts to render human passions, tastes, and opinions uniform are, as Spinoza affirms in the *Political Treatise,* tantamount to trying to force a table to eat grass.

The *Political Treatise*

Whereas the *Theological-Political Treatise* entered into the debates of its time and place, Spinoza's *Political Treatise* comprises a general theoretical outline of the foundations of political power. Missing from the *Political Treatise* is a theory of the contract, any significant discussion of religion or theocracy, and a rhetorical emphasis on freedom. While the *Political Treatise* remains consistent with Spinoza's naturalism in the *Ethics* and the *Theological-Political Treatise,* it presents itself as a general account of how each form of state—be it monarchy, aristocracy, or democracy—might be organized so as to be as *absolute* as possible. The notion of *absoluteness* seems to replace freedom as the organizing principle and raison d'être of the commonwealth. While this may appear to be a retreat from his democratic commitments and even a turn toward authoritarianism, one should understand that, being a natural thing, a commonwealth aims to be absolute in the same sense that nature, or God, is absolute. To be absolute is to be self-determined, in control of one's right or power, rather than given shape by external forces. In the terms of Niccolò Machiavelli, to whom Spinoza pays homage in the *Political Treatise,* to be absolute is to rely exclusively on one's own forces.

One can therefore read the *Political Treatise* as a translation of the republican language of freedom into a more naturalistic, philosophical idiom of power and its limits. Moreover, Spinoza's continued commitment to democracy is visible (even though he died after composing only three paragraphs of the chapter on democracy) in his affirmation of democracy as the "completely absolute" state. Democracy continues to name the most self-determined, most powerful, and thus the freest form of government.

Spinoza begins the *Political Treatise* with an outline of his naturalist principles and refers his reader to the *Ethics* for further elaboration. He declares his aim to produce a political theory that will be useful in practice, avoiding the philosophical tendency to idealize either the role of the state or the character of men. He describes human beings, whether they be merchants, statesmen, or members of the crowd, as governed primarily by their passions and motivated by their idiosyncratic perception of their interest. Because most of us are led by passions rather than reason, social life invariably involves a great deal of conflict. Spinoza thus proposes institutions that take for granted the passionate and nonharmonious motivations of human beings, but which aim to channel such passions toward the general welfare and maintenance of peace. Given an optimum organization of institutions, statesmen can be induced to act in support of the common good, regardless of whether they subjectively recognize it.

Spinoza defines *peace* not as an absence of conflict or compelled obedience to the law, but as a union, or harmony, of minds. Whether the state is monarchical, aristocratic, or democratic, its foundation is best secured, and its right approaches absoluteness, to the extent that its institutions conduce toward a mental unity among the state's constituents. Many of his recommendations highlight the importance of large deliberative assemblies that include representatives from as many different interest groups as possible. He likewise advocates transparency on the part of the state, suggesting that, whereas secrecy vulgarizes the masses, a political education has a rationalizing effect on the population as a whole. He makes recommendations for decentralizing power, rendering political posts available to as many as possible given the state form, and for encouraging mercantile relationships among the people. Giving our passions public, institutional outlets provides a kind of theater of interaction in which we might find ways to collaborate, link our strivings for self-preservation and well-being, and thereby generate complementary interests. Regardless of the state form, Spinoza suggests that democratizing tendencies fortify any organization of power. Peace names the psychophysical harmony at which state organization aims, which is also, for Spinoza, the foundation of reason.

Spinoza's political theory can be discovered throughout his philosophy. It focuses on the concrete means of producing peace and reason (still other names for freedom) among a passionate body

of men. Spinoza's political theory has particular resonance today for several reasons. Most obviously, it directly addresses persistent conflicts between competing values and theological worldviews. Perhaps less obviously, Spinoza's solutions do not lie in greater formal recognition of abstract rights and duties. Rather, his philosophy provides the tools for a political analysis of the particular relations of power that operate between institutions and individuals. He highlights the force of the passions that circulate throughout the social body and animate or undermine the practical exercise of right, or power. Spinoza's political theory examines not what laws and institutions declare, but rather what they do.

Standing Armies

Standing armies are permanent, professional militaries maintained both in war and in peacetime. There is considerable debate over how and why large standing armies emerged in Europe in the sixteenth and seventeenth centuries. Some have pointed to the gradual pacification of significant areas of society underwritten by the monopolization of military power by sovereign states after 1648. Proponents of the military revolution thesis point toward technological, tactical, and strategic developments in Western Europe during the 1500s. Others suggest that new forms of finance and administration led to the development of a fiscal-military state supporting ever-larger standing armies.

The advent of standing armies prompted a series of debates in British political thought, mirrored to some extent in the American colonies, in the late seventeenth and eighteenth centuries. One of these debates originated in King William III's desire to maintain a standing army in Britain following the Peace of Ryswick (1697). Opponents of this scheme were animated by memories of the large parliamentary standing army of the 1640s and 1650s, and also feared that William's use of nebulous sources of credit managed by the new Bank of England would become an instrument of arbitrary power exercised against the traditional liberties of the landed elite. According to J. G. A. Pocock, the specter of new finance and a standing army fuelled fears of military government prompting some to argue for a balanced constitution incorporating a citizen's militia. In doing so, they revived the Machiavellian and republican insistence on the need for citizen soldiers schooled in virtue, while asserting the military strengths of the long established English militia. Critics of such arguments maintained that the nature and scale of modern warfare made militias obsolete.

This debate was revived by Prime Minister Pitt's Militia Bill (1757), which excluded a Scots militia due to fears that it would become an instrument of Jacobite rebellion. Adam Ferguson (1723–1816), however, saw a militia as a desirable means of national defense, and an indispensable bulwark of public virtue. Adam Smith (1723–1790) disagreed, maintaining that the division of labor made professional, standing armies necessary because war had become a science. The Jacobite risings of 1715 and 1745 and the brutally efficient suppression of the latter by professional troops at Culloden (April 16, 1746) reinforced the obsolescence of the militia.

STATE

A *state* is a particular form of political organization of a society, one where power is highly concentrated and where government is intolerant of rivals to its rule. It is often said that states possess or claim an exclusive right to control the use of coercion or force. How exactly to characterize the state is a matter of some controversy. The state is obviously central to the concerns of most modern and contemporary political theorists; some have even said that it is the subject matter of political theory. There are different ways of characterizing the notion, some narrower than others, and there are many controversies associated with the analysis of the concept.

Broad and Narrow Accounts

The general characterization previously offered is a good starting point, but it is insufficiently detailed for many purposes. We should first distinguish between broad and narrow characterizations of the state. For some purposes—for instance, the investigations of anthropologists and archeologists—broad characterizations are appropriate. States here contrast with decentralized anarchic communities (e.g., tribes without rulers). Early humans lived in comparatively egalitarian communities that were segmentary or acephalous (without rulers). Kinship relations determined obligations between members. The emergence of chiefdoms, with rulers who possessed a right to command and to tribute, is a significant development. Power is concentrated and political hierarchy introduced. To investigate these transitions, we need only a general or broad characterization of the state, something like that previously expressed. Most political theorists, however, are interested in questions about the conditions of contemporary political societies and focus their attention on modern times. To understand our world requires understanding the state, that is, the modern state. For this, a narrower and more detailed characterization is needed.

Our world is a world of states. The state is being challenged from many directions, and our world may be changing. Still, it is a remarkable fact that virtually every piece of land on the globe today is the territory of a state. That was not the case 100 years ago, though even then most European polities were states (at least after 1918). Equally remarkable is that the state dominates our political imagination. We worry whether the United Nations (UN) or the European Union (EU) will become a giant state (as opposed to something different); we categorize the Vatican as a state (rather than the seat of a once-powerful Christian Empire) and do not know what to do with other remnants of a world left-behind—for instance, Monaco (a principality), San Marino (a republic), or Andorra (under the joint suzerainty of the President of France and the Bishop of Urgel, Spain). Secessionists want a state of their own. Our world is one of states, and few can think of alternative ways of organizing political societies. And the questions that preoccupy political theorists—questions about justice, obligation to obey the law, the scope or limits of government, or citizenship, nationality, and multiculturalism—take this context for granted, though this is starting to change.

The modern state emerged first in Western Europe. There the victory of kings and other political actors over their rivals—the church and the Holy Roman Empire on the one side, the nobility and the independent towns on the other—led to the development of institutions and practices that give us our states. The political organization of medieval Europe was quite different from that of our world. Medieval Europe consisted of complex, crosscutting jurisdictions of towns, lords, kings, emperors, popes, and bishops, without clear hierarchies of political authority or unitary systems of law. Governance tended to be indirect or mediated. No single person or agency had power to

control most people outside of a small area. In fact, no agency even knew how many people there were in a realm, much less where exactly the borders were. Without statistics or maps, or the bureaucracies necessary, rulers could not do very much. Equally important, political rule was characteristically personal, consisting in relations between individual kings, princes, lords, vassals, and others. There was no clear distinction between a ruler's realm and his property. Rule over subjects and land could be acquired by purchase, conquest, marriage, or inheritance. People's rights and obligations depended on their place in complex relations with others, and not on their location in a particular territory. What is distinctive about the modern state is most apparent when one concentrates on the features of late medieval and early modern Europe from which it emerges. Thus it is worth highlighting some of these.

Medieval Europe, of course, bore some traces of the political institutions of classical Greece and of Rome. But it is primarily the contrasting features of political life in the Middle Ages that need to be recalled. Simplifying considerably, there are several important features of medieval political organization that must be noted. First, most people were governed by rulers whose practices and institutions were not likely to survive their deaths or that of their sons. The realms governed by these rulers would not have precise boundaries, and the lands in their possession often would not be contiguous. The general contours of their realms would change quite frequently, often with marriage or death. Second, their rule was largely personal; the allegiance of their subjects was owed to their person, not to them qua holder of an office. Thus, with their demise, some of their subjects might have to take new oaths to a new ruler. Some of these rulers might have attendants who assisted them in the little activity of governance that they performed, but their departure would leave behind no officials or institutions to speak of. The church and some of the self-governing towns were exceptions here. Third, in addition to being personal, rule was largely indirect or mediated. A lord might have specific obligations of allegiance to a king—for instance, to provide a specific number of knights in the event of a conflict with a neighboring monarch or prince—which might be fulfilled by parties unknown to the king. And a king's rule over peasants would be mediated by several classes of individuals. Rule for the most part would be light, compared to the centuries that follow, even if the burdens of the peasantry were heavy.

Fourth, people might find themselves the subject of several different rulers or systems of rule. The authority of kings competed with that of lords and princes, independent towns, popes and bishops, and emperor. And one could not easily make the distinction familiar in our world between the "internal" and "external affairs" of a realm or rule. Last, a person's allegiance or loyalty to a ruler would not exclude similar allegiance to others. And there might be no settled view as to whose word would take precedence in a conflict. These are some of the most important distinguishing features of the world from which the modern state emerged.

By contrast, governance in the modern state is relatively centralized, unified, uniform, hierarchical, direct, impersonal, and territorial. The state is distinct from the government, and the former becomes a corporate agent, distinct from the rulers, with a legally recognized personality. The modern state is a relatively new and complex form of political organization. We may think of the state in terms of a number of interrelated features:

1. *Continuity in time and space.* (a) The modern state is a form of political organization whose institutions endure over time; in particular, they survive changes in leadership or government. (b) It is the form of political organization of a definite and distinct *territory,* normally contiguous.

2. *Transcendence.* The modern state is a particular form of political organization that constitutes a unitary public order distinct from and superior to both ruled and rulers; one capable of agency. It is a corporate being, and its rule is impersonal. The institutions that are associated with modern states—in particular, the government, the judiciary, the bureaucracy, standing armies—do not themselves constitute the state; they are its agents.

3. *Political organization.* The institutions through which the state acts—in particular, the government, the judiciary, the bureaucracy, the police—are differentiated from other political

organizations and associations; they are formally coordinated one with another, and they are relatively centralized. Relations of authority are hierarchical. Rule is *territorial;* that is, the state's directives apply primarily to all people who find themselves in its territory. Rule is *direct;* and it is relatively pervasive and penetrates society legally and administratively.

4. *Authority.* The state is *sovereign,* that is, the ultimate source of political authority in its territory; and it claims a monopoly on the use of legitimate force within its territory. The jurisdiction of its institutions extends directly to all members of the state or residents of its territory. In its relations to other public orders, the state is autonomous.

5. *Allegiance.* The state expects and receives the loyalty of its members and of the permanent inhabitants of its territory. The loyalty that it typically expects and receives assumes precedence over that loyalty formerly owed to family, clan, commune, lord, bishop, pope, or emperor. Members of a state are the primary subjects of its laws and have a general obligation to obey by virtue of their membership.

Modern states, then, are distinctive territorial forms of political organization that claim sovereignty over their realms and independence from other states.

Coercion and Force

It is widely believed and often said that the state is necessarily coercive, and that its distinguishing feature is its claimed monopoly on the legitimate use of coercion and force. Unless we want a broad characterization of states, a monopoly of the use of coercion cannot be sufficient for something to be a state. If it were, the Mafia and other criminal gangs would be deemed states. There are reasons to want a broad characterization when studying the development of early human communities, but it is peculiar when studying modern forms of political organization not to want to distinguish between criminal organizations and states. The more interesting questions are whether the state is necessarily coercive or whether coercion is in some ways distinctive of the state.

States certainly are quite coercive. They also use force as well as violence, especially in war but also "internally." There is little controversy here (even if critics often do not carefully distinguish between coercion, force, and violence). However, *must* they be coercive? It is possible to imagine a state that is not. Suppose that a particular state is as just as we could hope for, and that its subjects (genuinely) consent to its rule and support it. Suppose, in addition, that they are virtually always motivated to obey the laws. Then it may be that such a state would not have to use coercion, much less force, on any of its subjects. If so, states would not *necessarily* be coercive. States like this one exist only in our imaginations. In our world, states are quite coercive and use force with some frequency. But a political society might not cease being a state by ceasing to be coercive.

Are coercion and force in some ways distinctive or characteristic of states? Modern states have emerged from war and conquest. At different times in their development, all states came to develop institutions and personnel for the control of their subject populations (e.g., police, intelligence services, prisons). These were made necessary by the increasing size of their populations, their urbanization, and by the increasing demands states placed on their members (especially taxation and military conscription). Coercion and force are part of these activities of states, and one would have to say that they are quite characteristic of them. It may be expected, however, that states need less coercion and force to the extent that they are just and their rule is legitimate, or to the extent that their behavior elicits the voluntary support of their subjects.

Do states claim a monopoly on the legitimate use of coercion and force? They seem to. They may not possess a complete monopoly; for instance, we may threaten our young children with deprivations if they do not do as they are told (coercion), and we may well be acting permissibly if we use force to defend ourselves, even if not authorized by the state. There is some controversy here. But it seems clear that states at least do *claim* a monopoly on the legitimate use of coercion.

Authority

The emphasis on the state's coerciveness can lead one not to notice a more significant characteristic,

namely the authority that it claims. States claim to be able to *authorize* other people and institutions to carry out certain tasks. This is a power that states claim, a power that enables them to give others permission and a right to act in certain ways. But authority is something different, even if related. Authority in the relevant sense is the power to direct agents to act in certain ways. If the authority is genuine, then the recipient of an authoritative directive (or law) is required to conform. Authorities can make certain courses of action, once optional, required. Now the nature of this power is controversial. One analysis, which seems to be that of some of the early theorists of the modern state, as well as of many jurists, is that an authoritative directive *obligates* its recipient to conform and is a *reason* to conform. Authoritative directives are thus meant to be *action-guiding*. So if one disregards a genuine authoritative directive that applies to one, one is making a mistake. Theorists who think that laws always have sanctions attached to them will often not notice this feature of states. Not all laws do have sanctions attached to them (e.g., the obligation of high officials to fulfill their duties to the best of their abilities, laws establishing powers), even if most do. Sanctions, however, are penalties applied for doing something one should not have done; they are meant to be supplementary motivation for those who fail to do as they are required. Many who are skeptical of the authority claimed by states may fail to see the point. The thought is that the authority claimed by states is intended to guide our behavior by obligating us and giving us reasons for action and that this fact is important.

The state's claim to authority is striking in two respects. The first is its claimed power to create obligations and reasons at will, by making law. The second is the fact that it is remarkably sweeping. No medieval authority and virtually no earlier authority claimed the sweeping authority sought by modern states, namely sovereignty. Sovereignty here is a particular form of political authority. Something is sovereign (in this sense) if it is the ultimate source of political authority within a realm. This is the power that early modern monarchs claimed in their quarrels with popes and princes. Not only were their realms theirs, to be shared with no one else, their rule was not to be challenged or constrained. They were *sovereign*. The key to the notion lies in the idea of ultimate authority. Imagine a political society with multiple political authorities. If one could rank them and the result were a strict ordering, then the last one would be the highest authority. It would have authority over all the others, exactly the authority claimed by the state (or the law). Not only does the state claim to be able to establish the law for all in its territory, to determine what they are required to do, but it claims the power to regulate all other authorities (e.g., church, conscience, clan). Early modern statements of this extraordinary power said that the state's sovereignty was indivisible and unlimited. Later many theorists, jurists, and statesmen came to think that the sovereignty of states could be divided (e.g., the divided government of most constitutional democracies) and limited (e.g., by bills of rights or international law). But even limited states are reluctant to delegate the power to interpret the limits on their authority and to adjudicate disputes about these.

Attention focused on the coerciveness of states often distracts our attention from the remarkable authority that they claim. It may be argued that states are forms of political organization that *necessarily* claim sovereignty. It is hard to imagine a state that claimed authority but admitted that other institutions also had authority, and that when the two conflicted, its own authority did not have precedence.

Legitimacy

States claim legitimacy. There is considerable controversy as to what this might entail. The law is the principal mode of action for states. In virtually all states now, laws in principle constrain both ruled and rulers, even if in practice there are many exceptions to the generalization. Acts or procedures that are in conformity with the laws of a state are usually deemed "legitimate." Legality eliminates one kind of injustice, but it does not exhaust what we mean when we ascribe legitimacy to a state.

In international circles, it is sometimes thought that legitimacy is conferred by recognition by other states. For instance, if a region breaks away from a state to form a state of its own and manages to secure the recognition of many other states, then it is often considered a legitimate state. This

is puzzling, as it is not clear how recognition could confer legitimacy. Recognition might convey that the new state has been accepted as a member of the club of states, and membership may confer some rights and powers (and duties). This would be a natural way for international lawyers to understand legitimacy. But even if a state is recognized by other states, we might still be reluctant to attribute it legitimacy in other, more important, senses.

What might be called *sociological* accounts of legitimacy are quite popular. These will ascribe legitimacy to states to the extent that their subjects think them legitimate. That formulation is unfortunate as it is circular, and the view is better expressed differently. A state is legitimate to the extent that its subjects find it acceptable, just, or something of the kind. On this view, to say that a state is legitimate is to say something about the supportive attitudes of its subjects. States losing their legitimacy in this sense are less stable. But nasty states may be legitimate in this sense. If subjects are ill-informed and manipulated, their state may have considerable "legitimacy." This may mean that it is relatively stable (until people are better informed). But often when we ask about legitimacy, our interests are in something else.

Claims to legitimacy often seem to be normative in intent. A legitimate state is one that has a certain status, one that rules by right. At the least it does no wrong by existing or even has a right to exist. Some states are denied this by their enemies (e.g., Israel). In addition, states claim they have a specific right to rule. It is not mere power that enables them to make law and to require their subjects to act in certain ways; they have a right to govern. That is, they have a right to make laws, to adjudicate disputes, to enforce their decisions, to institute programs of various kinds (e.g., education, transportation, public health). The right to rule is traditionally interpreted as entailing an obligation on the part of the governed to obey the law. Trivially, one always has an obligation to obey the law. What is usually meant here is more substantive: if a state has the right to rule, then subjects have a genuine obligation to obey. For some theorists, this means a moral obligation, for others, an obligation that is a serious reason for action. There are considerable controversies here, some spilling over into moral philosophy and the theory of practical reason. The main idea is that the right to rule entails serious obligations to obey.

There are lots of examples of laws where we might reasonably think we do not have a serious obligation to obey. At the least, we often disregard parking laws (when we think we are unlikely to be apprehended), and we may not obey traffic laws scrupulously when driving in the deserted countryside. We often disobey stupid laws and, more importantly, unjust laws. In these cases, we seem to believe we lack a serious obligation to obey. Agents of the state—judges and other officers of the law in particular—will remind us that it is not our position to question the wisdom of laws, and that we have an obligation to obey them even when we think they are in error (even when we are correct in thinking them mistaken).

Suppose legitimacy confers a right to rule, in addition to a right to exist, and that the subjects of a legitimate state have a serious obligation to obey each and every law that applies to them, except when the state permits them not to. What is necessary for legitimacy in this sense? It is widely believed that "the consent of the governed" would confer legitimacy on a state. This view is not universally accepted, but it is plausible at first glance. It is also clear what the implications of this position would be: virtually no state is legitimate. Consent of the kind that could bind one as extensively as seems to be the case here would normally have to be free (or noncoerced), informed, actual (as opposed to hypothetical), and explicit (as opposed to implicit or tacit). Just as we would not count two people as agreeing to marriage or to a business contract merely by waving at one another, so walking on a public street or voting in an election does not constitute the requisite kind of consent. Very few people have given their free, informed, actual, and explicit consent to their state. Most officials may have, and many naturalized citizens have as well. But certainly the bulk of the population has not. Thus, most states can claim legitimacy from the consent of the governed.

Consent in this sense is to be distinguished from consensus or agreement. The latter consists in agreement in belief or other attitudes. Thinking that consensus in this sense contributes to legitimacy may yield an account similar to the sociological theories previously discussed. And the

question there was why mere agreement in belief could confer anything more than stability.

There are other accounts of legitimacy that do not rely on consent. There is a large family of accounts that would have legitimacy follow from the provision of certain goods and services. Suppose a state provides security for its subjects, secures justice, provides those public goods that we think are important, and the like. Then we may think that it is thereby legitimate. But there will invariably be occasions where conscientious obedience to law will not be necessary to secure the goods of good government. Perhaps by refraining to pay one's share of the costs for public schooling and by contributing the money saved to education reform or to a neglected school district one may help the cause more. If so, it is not clear that this account will show that we have an obligation to obey every valid law, and thus that reasonably just and efficient states will have the right to rule as previously characterized.

The conclusion may well be that states do not have the legitimacy they claim. This is the view held by many contemporary political philosophers who accept "philosophical anarchism." This is the position that states are not legitimate in the sense that they entail the right to rule and correlate obligation to obey. By contrast, political anarchists think that we ought to dismantle our states and that most of us would fare better in their absence—there would be fewer wars, especially major ones; we would be more prosperous. These matters are quite controversial. Many people think that reasonably just states are legitimate (in the relevant sense), and there are many puzzles here.

Society and Nation

States are forms of political organization of societies. They are often called nation-states or even nations. The world organization of states—only states can be members—is called the United Nations. The term *nation* can be used to refer to societies (or states), such as the United States or France. And it can also be used to refer to large social groups, the members of which share certain properties (e.g., language, history, customs, ethnicity, religion) and are relatively conscious of this shared condition. National groups in this sense are cultural. Modern states as they have been treated here are sometimes called nation-states. If we think of nations as cultural groups, this term would be a misnomer. While Japan and Germany to some extent may be thought of as nation-states—as states of a single nation—the United States, Canada, the United Kingdom, Belgium, Switzerland, Spain, and the People's Republic of China are all multinational states, as they are each made up of several different nationalities.

There are many interesting questions about the nature of nations and nationalism, about whether national groups are entitled to a state of their own, or about whether it is desirable that states and nations be congruent. Clearly it is not necessary for a state to be a nation-state, that is, the state of a single nation. Most states today are multinational. But there are tremendous advantages in raising the national consciousness of a large national group or in making the members of a state believe that they are a single national group. Early in the nineteenth century, heads of state saw the power that could come from rallying their populations. Napoleon's armies impressed the world and changed the way wars were fought. In addition to building large and ferocious armies, national solidarity could also supplement motivations to obey the law.

It is worth noting in this context the distinct tendency of many multinational states to develop *national cultures* that underpin the patriotic allegiances of members. The cases of France and the United States are especially interesting in this regard, both multinational states. Both share an Enlightenment tradition hostile to nationalism and were shaped by eighteenth-century revolutions fought in the name of universal principles. Yet both have national cultures, easily recognizable to outsiders, and their members identify for the most part with their country.

The Decline of the State?

Several features of modern states are striking: their great power, their territoriality, and the large number of tasks and functions they take on. But increasingly these features are under significant pressure. The tasks and functions of states are in many ways being scaled down. Since the end of World War II, states everywhere have shed public corporations, nowhere so strikingly as in the formerly communist world. Most of the welfare state

services provided by government, especially after World War II, have been scaled back, in no small part due to expense and shrinking budgets. In many states, the military and police are supplemented by private services, paid for by the state or by private parties. A variety of nonstate judicial services are increasingly used by businesses. Especially in countries like the United States, private educational institutions are important, and an increasing part of the budget of American institutions of higher education is coming from nonstate sources. Compared with a century or two ago, our states are very active; compared to the postwar period, they have cut back extensively.

In the middle of the last century most mid-size or large states could set their own economic policies, regulate their currencies, and impose much of the control on trade with other countries. Those powers have largely been diminished, even for the strongest states. A variety of organizations, many nongovernmental, now besiege all states, pressuring them to reduce some activity or increase others (e.g., imprisonment or execution of political dissidents, environmental protection, restructuring of institutions, free trade). Some private organizations or individuals, wealthier than many countries, can initiate development or aid programs that few governments would think of undertaking. A variety of new players, neither states nor agents of states, are increasingly challenging the traditional competencies of governments. They are also threatening the state's dominance.

In one respect, these nonstate entities are like states: They are corporate beings, with lives that extend beyond those of their members or employees. In another respect, they are quite different: Unlike territorial states, these agencies are not linked to territories and usually have no jurisdiction and make no law. They pressure and facilitate, and they sustain larger movements of individual people. They are often more nimble and effective than state agents. Especially noteworthy here are those organizations that are able to support and organize guerilla wars and terrorist attacks on major states.

Add to these developments increasing bodies of international law, still in its infancy, and myriad treaties and multinational and international organizations, such as the EU, NATO, the World Bank, the International Monetary Fund, and the world of states is undergoing important transformations. It is hard for philosophers and political theorists to predict the shape of things to come. But it seems that the modern state is being transformed. War has built the state, and the conflicts of the start of the twenty-first century may reinforce the state, especially the large ones. But in the long term, it seems that the dominant form of political organization of our time, created in early modern Europe, may be transformed.

State of Nature

The *state of nature* refers to a hypothesized natural human condition, before or outside political community. It is a standard feature of social contract theories, used in order to illustrate that which is distinctive and created about the state. The differences among conceptions of the state of nature correspond to important differences among social contract theories. While *nature* and *naturalness* are among the oldest categories in political theory, the idea of the state of nature is ordinarily associated with the distinctively early modern development of social contract theory. The state of nature is humanity's prepolitical state, the condition in

which relations of political and legal authority and obedience have not yet been established. Rejecting the Aristotelian doctrine that man is naturally political, contractarians treated nature as a *contrast* to political and civil society. The state of nature was sometimes understood as a real moment in the past; sometimes as the condition of being outside the law whenever that might be located in time; often as the condition of much of the non-European world and the condition of international society, so long as there is no global state; and sometimes as a hypothetical condition or thought experiment, the unreality of which didn't interfere with its heuristic usefulness as a way to understand political and legal obligations.

The idea had obvious echoes of the Eden story, and Christian political thinkers before early modernity did sometimes analyze the Edenic state of innocence in ways analytically similar to the state of nature in social contract theory. In general, however, the idea of the state of nature is understood as an early modern break with the main ideas of medieval political thought. In the sixteenth and seventeenth centuries, the traditional Aristotelian and Thomist understanding of natural politics came under pressure from a number of different directions. One was the general move away from Aristotelian teleology as an account of nature in the sciences. The scientific revolution of Nicolaus Copernicus, Galileo Galilei, Francis Bacon, and René Descartes encouraged investigation into *efficient causes,* causes that push from behind like one domino falling into another, rather than *final causes,* purposes that are fulfilled as things or people develop toward their goals. In other words, the idea of what was "natural" shifted away from the idea of what was purposive and in the future: It is natural for humans to live in political societies because they are well-suited for it. Discussions of naturalness moved toward the idea of that which was original and, in some sense, in the past. A second was the crystallization of the state system during the Wars of Religion, and the emerging idea that international politics was perpetually (not just anomalously) made up of equal self-governing bodies that had no juristic superior. Neither the Holy Roman Empire nor the pope could any longer purport to represent a legal order that underlay all of Europe; and the idea of an anarchistic and lawless condition as politically foundational took form. And a third was the European encounter with the world beyond Europe and the Middle East during the sixteenth century. The forms of social organization found in the Americas and Africa—sometimes without agriculture, sometimes without territorial forms of government, and so on—seemed to contradict the idea that the political life as Europeans knew it was inevitable. These encounters encouraged speculation that the Americas and Africa represented something more natural, in the sense of being more primitive or closer to mere physical nature, and that Eurasia represented societies that had been *made* by human will, reason, or decision.

The idea of the state of nature was often closely tied to the ideas of natural law and natural rights. The state of nature is the condition in which humanity is governed only by natural law, not by positive law; it is the condition in which the only rights are natural rights. It thus offers a baseline against which the civil or political condition of life in a state or society may be judged.

The States of Nature in Social Contract Theories

While there are interesting variations in the theories developed by other contractarians, including Hugo Grotius and Samuel von Pufendorf, by far the most prominent discussions of the state of nature were offered by Thomas Hobbes, John Locke, and Jean-Jacques Rousseau.

Hobbes's natural condition of mankind, without positive laws or a sovereign that could keep the peace, was famously a condition of perpetual violent conflict, in which the life of man is "solitary, poore, nasty, brutish, and short," with no possibility for agriculture, science, commerce, or any of the other arts through which humans improve their existence. Conflict is generated through three mechanisms: competition over material goods; the imperative to strike preemptively given uncertainty about others' intentions and "diffidence" about one's ability to defend against an attack; and vainglory, the drive of each of us to be acknowledged as superior by the others. The state of nature is thus a state of war; even if there is a moment without violence, the violence is a permanent possibility.

The conflictual character of the state of nature both stems from and highlights humans' natural

equality, another rejection of the Aristotelian conception of nature. Where Aristotle emphasized humans' inequality in their ability to reach the highest purposes of reasoning and excellence, Hobbes emphasized the equality of mortality: each of us can die, and among normally functioning healthy adults, each of us can kill any other, even if only in the other's sleep. This equality denies us any natural hierarchy that might be agreed on by consensus, and so those who wish to be thought better than others must fight for the status. And it denies us any certainty of our ability to defend ourselves or our possessions, driving us into violent conflict over goods and safety. While humans are governed by a kind of natural law in the state of nature, it is a natural law the first command of which is to preserve oneself. Only by exiting the state of nature and creating the artificial bonds of sovereignty and law can humans hope to live in peace.

Locke's state of nature is only sometimes a state of war. He holds that there is a moral natural law that binds even in the absence of government, and that it is (imperfectly) knowable and enforceable even in the state of nature. Natural law commands respect for the lives, liberty, and property of other people; and offenders against that law may be justly punished. Whereas Hobbes holds that in the state of nature everyone has a right to every thing in the world (including other people!), because mutually exclusive rights must wait for the creation of the state, Locke maintains that the natural law ordains rights over person and property such that my right excludes yours.

A rights violator initiates a (temporary, local) state of war. Following restitution and just punishment, the state of war is exited. This does not necessarily put him at descriptive odds with Hobbes; Hobbes does not think that violence is constant in the state of nature, and Locke makes no particular claim about its frequency. Rather, the two differ on how to morally characterize the default condition in the state of nature. For Hobbes, it is a state of war even without actual combat, for there is no guarantee of peace, and each person may legitimately strike at any other at any time, for fear of the other's future actions. For Locke, it is a state of peace that may be disrupted but then may also be restored, when all are in possession of what is rightfully theirs. There are inconveniences associated with the state of nature that drive people out of it and into a civil condition; but the state of nature is not so catastrophic a condition that it is unthinkable to return to it. So, quite unlike Hobbes, Locke countenances a people reclaiming its natural liberty from a government that has come to violate natural rights.

Rousseau, in his *Second Discourse,* criticizes past social contractarians for populating their states of nature with people as they are in civil society. (The criticism is rhetorically effective but perhaps not well-founded, as will be discussed in the next section.) His depiction of natural man begins with a prelinguistic, presocial, radically solitary creature, living freely in primordial woods. While this account earned Rousseau a reputation as a theorist of the "noble savage," it is not his primary interest. Rather, his moral account centers on early social man, before the advent of agriculture, metallurgy, the division of labor, or private property. Humanity in that condition was honest and authentic, characterized by natural inequalities of strength, skill, and beauty, but not the inequalities of power and wealth we see in corrupt modern societies. Throughout the rest of the *Second Discourse* and the later *Social Contract,* it is from this happy condition that Rousseau thinks departures need to be justified and typically aren't. Unlike Locke's state of nature, it lacks law, property rights, and ideas of justice, rights, or punishment. Unlike Hobbes's state, it is a peaceful world, unmarred by the *desires* for goods or physical power possessed by modern Europeans.

When and Where

Rousseau places the state of nature in the unimaginably distant past. He maintains that it is a hypothetical past (apparently in an attempt to avoid direct conflict with the story of the creation in Genesis), but he offers an account of what we would now recognize as a kind of evolution. Moreover, he defends it through empirical claims about the anthropology of ostensibly primitive non-European people; the state of nature is distant from modern Europeans either by time (it is far in the past) or by space (it is far across the ocean). And once lost, it cannot be regained.

Hobbes portrays a state of nature that is always just around the corner. While the narrative of *Leviathan* proceeds from the state of nature to the

state, the work is centrally concerned with the possibility of state breakdown *into* the state of nature in the future. When sovereignty ceases to be unified and effective, a civil war breaks out, and the juridical state of nature is restored, because there is no sovereign who can definitively establish relations of justice. Hobbes's claim that the international order is a state of nature also suggests that the condition is pervasively present; potential war is always with us. The state of nature is nearby in both time and space; it is either always with us, in the international order, or always potentially with us, in the event that politics within our society goes badly. He thus would likely have found Rousseau's charge of anachronism beside the point.

Locke's sense of when and where to locate the state of nature sits sometimes uncomfortably between the other two. Like Hobbes, he is interested in the state of nature that might arrive in the future, when a government creates a state of war against its citizens by violating their rights, or when the people reclaim their natural liberty. Like Rousseau, however, Locke builds a state of nature that has an evolution and history within it, one that goes from ownership of hunted and gathered food to ownership of land to the creation of money. He moreover makes use of ideas of primitive non-Europeanness; "in the beginning," he writes, "all the world was America," (*Second Treatise on Government,* chap. 5, section 49,) that is, the America of indigenous Americans who ostensibly failed to cultivate land and establish ownership of it.

The Scottish Enlightenment theorist Adam Ferguson argued that there was no binary division between a static natural condition and an artificial legal and social condition; it is natural for humanity to be social, and even art and artifice themselves are natural. Ferguson analyzed a multistage development of human social, economic, and political organization, but that required doing away with the one-time transition between nature and society. "Of all the terms that we employ in human affairs," he wrote, "*natural* and *unnatural* are the least determinate in their meaning;" and:

> If we ask, therefore, where the state of nature is to be found? we may answer, It is here; and it matters not whether we are understood to speak in the island of Great Britain, at the Cape of Good Hope, or the Straits of Magellan. (*An Essay on the History of Civil Society,* part 1, section 1)

The state of nature is everywhere and always, and so not usefully contrasted with political society. At about the same time, David Hume offered a withering critique of the whig social contract theory typical in post-Lockean Britain, a critique that was afterward taken as devastating to social contractarianism as a whole.

State of nature analysis was not abandoned entirely; Lockean models figure prominently in the writings of American revolutionary figures including Thomas Paine, and the Hobbesian idea of international society as a state of nature remains in use even today. Nonetheless, by the late eighteenth century they faded from view. The last major social contract theorist of early modernity, Immanuel Kant, treated the state of nature as a wholly moral and legal condition, not a historical one. It was the lawlessness of international politics and the hypothetical lawlessness that contrasts with the everywhere real civil condition. Neither anthropology nor history was relevant to its analysis, and there was no pretense of equating the idea of the state of nature with empirically natural (i.e., primitive) man. By the time Jeremy Bentham famously derided Lockean natural rights as "nonsense upon stilts," the construct of the state of nature was in little use. The growth of knowledge of anthropology undermined any idea that humans who did not live in European-style territorial states necessarily lived in a condition of anarchy; and the economic, technological, and political changes in Europe since the seventeenth century undermined the idea that there was some uniform civil condition entered into once and for all by deliberate choice. The idea of a series of stages of development introduced by Ferguson and Adam Smith was built into new systems of thought by Georg Wilhelm Friedrich Hegel and Karl Marx, and the bifurcation between a natural and a civil condition was used less and less often.

When, in the twentieth century, John Rawls sought to resurrect social contract theory, he substituted the openly imaginary "original position" for the traditional state of nature, to emphasize its hypothetical character. The decision structure in the original position is a deliberately artificial one, and Rawls did not treat it as either original in fact

or as a desirable fulfilling of basic human purposes. Robert Nozick's resuscitation of the Lockean state of nature was likewise hypothetical, a heuristic device to show how the state could be legitimate.

Strauss, Leo (1899–1973)

Leo Strauss was an influential political theorist often associated with neoconservative ideas and their impact on U.S. politics. His parents were fairly conservative Jews, and his father ran a farming and livestock business. Strauss served in the German army at the end of World War I, before pursuing a doctorate at the University of Hamburg under the supervision of Ernst Cassirer. In 1932, he obtained a Rockefeller Fellowship that took him to Paris, where he married Miriam Bernshoh. With the rise of the Nazis, Strauss and his wife decided not to return to Germany, but to travel instead to Britain and then in 1937 on to the United States. Strauss worked at the New School for a decade. Then, in 1948, he took up a post as a professor of political science at the University of Chicago, where he remained until just before his retirement.

Today, Strauss is often discussed in terms of his alleged influence on American neoconservatism, notably the foreign policy of George W. Bush's administration. Yet, political theorists increasingly recognize Strauss as a far more sophisticated and original philosopher than hostile assessments of his influence are wont to suggest. To understand Strauss's political philosophy, we need to grasp his account of modernity within the history of philosophy.

Critique of Modernity

Strauss's critique of modernity revolves around the quarrel between ancients and moderns. Ancient philosophy reflects a necessary conflict between the city (or state) and philosophy. The city has to rely on people accepting whatever opinions peacefully unite them; it requires acceptance of conventional morality and religion. Philosophy, in contrast, studies universal truths as they are given by an impersonal nature; it requires the questioning of all ancestral conventions and local pieties. The conflict between the city and philosophy led the ancients to defend a teleological order and natural right. Natural right required that philosophy be kept apart from social life because its truths would undermine the local idols on which civic life depends. Strauss even argues that the ancients tried to keep philosophy apart from the city by writing esoterically, thus hiding their philosophical beliefs beneath a superficial surface.

Modern philosophers neglect the wisdom of natural right. In Strauss's view, the moderns foolishly believe that if we come to know ourselves as we are, and if we make this knowledge public, we still can construct a city. They think that knowledge enables us to conquer fortune, make nature serve human ends, and even coordinate private interests for the public good.

Strauss generally points to Thomas Hobbes as inaugurating modernity. Hobbes tried to reconcile philosophy and the city by appealing to an unprincipled political hedonism. He openly argued that individual virtue is irrelevant: people can be immoral—they can concentrate on the pursuit of personal pleasure—and still sustain a good and stable society. The first wave of modernity gave rise to the idea that the city could be based on a modern ideal of enlightened self-interest, rather than the ancient ideal of public virtue. Although Strauss acknowledges that there were hedonists before Hobbes, he argues that it was Hobbes who turned hedonism into a political doctrine. Hobbes first gave voice to the quintessentially modern doctrine that political order can arise out of mastery of nature as opposed to mastery of self. Strauss

added here that Hobbes's political hedonism led to political atheism. Because Hobbes denied that individual virtue is necessary for the city, he saw no need for religion to sustain individual virtue. Hobbes was thus the first to make atheism a political doctrine, for no earlier atheist had doubted that social life required worship of gods.

According to Strauss, political hedonism is bound to fail. It has to recommend antisocial behavior when there is little chance of being caught. And it cannot cope, in a philosophical sense, with threats to one's life or with war.

The inevitable failure of political hedonism gave rise to a second wave of modernity. The second wave of modernity, which Strauss associates with Jean-Jacques Rousseau, attempted to reconcile philosophy and the city by appealing to self-rule. Rousseau rejected Hobbes's unprincipled hedonism: He recognized that only public virtue and religion (not enlightened self-interest) can sustain the city. But, Rousseau did not return to the ancient wisdom. Rather, he adopted an even more radical version of the modern project. He argued that public virtue could arise out of individual freedom in a democratic community. Rousseau believed that philosophy should be made public so that individuals can become free by ruling themselves for the common good in accord with knowledge.

According to Strauss, however, Rousseau's vision failed just as inevitably as did Hobbes's. It was too broad a guide to apply to practical action. And, much more importantly, if we try to base morality on self-legislation, we are led inexorably to historicism, positivism, and nihilism.

For Strauss, the third wave of modernity consists of the working out of this inexorable path to nihilism. Historicism and relativism arose because the collapse of natural right, along with the failings of Hobbes and Rousseau, leaves us without any absolute concepts. When Hobbes and Rousseau rejected classic natural right with its basis in a natural order, once they turned to the human ability to manipulate nature according to will, there was no longer any reason to ascribe to morality any kind of foundation beyond human life. Again, once morality is thought to be a purely human construct, it soon comes to be seen as relative to time and to place. Hence, Strauss concludes, the modern project leads inexorably to historicism (as in Edmund Burke and Georg Wilhelm Friedrich Hegel) and positivist relativism (as in Max Weber and social science). Historicism and relativism give up on absolute concepts of right in a way that implies we have no grounds for selecting one morality over another. They leave us with only the study of different values that have been adopted by different societies.

Yet, Strauss continues, historicism and positivism remain authentic—and unsustainable—forms of nihilism. They try to deny the relativism that they entail by pretending that their own perspective is true, not relative. Friedrich Nietzsche, it is true, reveals the nihilism that lies at the heart of modernity. Nonetheless, for Strauss, our times are characterized by the inauthentic nihilism of historicism and positivism. We are no longer convinced of our own views. We are unsure of our purpose. We have lost faith in ourselves. Above all, we think our values and purposes are relative to us.

Is there any way out of such inauthentic relativism? Strauss seems to think that the role of political philosophy is to resolve the crisis of our times by devising a new and usable version of the ancient wisdom. Equally, however, he sometimes seems to acknowledge that modem natural science has rendered impossible the old teleological view of the universe in a way that precludes a simple return to ancient philosophy. Perhaps Strauss wanted philosophers indirectly to recover the ancient wisdom by first making possible something akin to a teleological view of humanity and then defending a form of natural right.

STRUCTURALISM

Structuralism names, in the first instance, a movement of thought briefly dominant in Europe, especially France, in the mid-twentieth century. It traced its origins in part to the work of the Swiss linguist Ferdinand de Saussure (1857–1913), who, in his *Course in General Linguistics,* put forward a view of language as a synchronic structure—that is, a set of relations between signifying sounds (or marks) on the one hand, and signified concepts on the other, and between the signs thus defined, holding simultaneously for a population of speakers and hearers (or writers and readers) at a given moment in time. Saussure's basic insight, on which his importance to the structuralist movement rested, is that the differential relations that distinguish one sign from another and thus make language possible are *constitutive*. He already saw that while the concept of difference generally assumes previously existing positive terms, basic linguistic differences do not—the positive terms are a function of the differences, not the other way around. A sign is not a sign at all until it is differentiated from another sign.

Saussure does not in fact use the term *structure* in what came to be its structuralist sense; he has been called "the structuralist without knowing it." The term is obviously embedded in ordinary discourse, as referring to any complex object whose parts stand in defined relations to one another. Buildings are often called "structures" in this sense, having foundations that support walls, with windows cut into them. But we also say that a building *has* a structure, putting the emphasis not on the material object and its parts but on their relatedness. The same relations could be realized in different materials—wood, stone, glass, and so on. The structure can, as it were, be detached from the object whose structure it is. We may then say that the structure is characteristic of a *kind* of object. In this informal way, the term is frequently used in political science, as referring to formal arrangements in one or another political unit, without any suggestion of structuralist doctrine.

Building on Saussure's insights, a number of prominent workers in other fields—Claude Lévi-Strauss (1908–2009) in anthropology, Jacques Lacan (1901–1961) in psychoanalysis, Roland Barthes (1915–1980) in literary criticism, Michel Foucault (1926–1984) in the history of ideas, and Louis Althusser (1918–1990) in Marxist studies—extended the reach of structuralism to mythology, kinship systems, mental states, works of literature, intellectual disciplines, and political institutions. The appeal of structuralism in these contexts was as a methodology. It suggested a search for relations (binary oppositions, negations, etc.) that could be discerned in the objects or situations being studied so as to show similarities of structure across diverse cases and throw light on some of them as structural parallels or transforms of others. The material content might change, or the signs or tropes be inverted or distorted, while revealing a constant underlying structure. Lévi-Strauss, for example, claimed to have identified the basic structural unit out of which higher-order kinship structures are built in the triad of mother / son / maternal uncle. He did something of the same sort for myth, arguing that the cycle of myths in a given culture constitutes a set of structural transforms in which male / female, human / animal, raw / cooked operate as variables that generate a body of lore that is practically limitless. He sometimes suggested that such basic similarities of structure detected in different social or discursive contexts reflected the structure of the human mind.

Structuralism and the Philosophy of the Human and Social Sciences

The theoretical discourses to which structuralism are most philosophically appropriate are commonly called the "human sciences." The objects of the human sciences are just those that have been introduced into the world by human intention (in the ordinary-language sense of purpose) and intentionality (in the more technical phenomenological sense of apprehending what is before the mind), as contrasted with objects that are found in the world having no human intentions among their causal antecedents, which are therefore properly objects for the natural sciences. The concepts of *structure,*

construction, instruction, and *deconstruction* define the preoccupations of structuralism, and while the first two terms also have applicability to objects in the natural world, structuralism in that setting does no work of its own. All physical objects with parts can be said to have structure, but that is a derivative fact about them that throws no light on particular cases; the objects of the human sciences, on the other hand, have structure constitutively.

Knowing subjects "have" the structures of the objects they know. They internalize the relations that constitute the structures and make use of them to work out inferences, convey information to others, and so on. But the basis for the acquisition of these structures, by a process of instruction (*instruction,* the structuring of the inner) is different, in principle, though not always in practice, in the case of the objects of the natural sciences on the one hand, and objects of the human sciences on the other: through perception and experiment, in the first case, but through language and cultural example, in the second. Broadly speaking, we can distinguish between the physical or perceptual objects of the natural sciences and the intentional objects of the human sciences. What have traditionally been called the "social sciences" straddle this gap—their empirical and behavioral content allies them with the natural sciences, while their theoretical and intentional content allies them with the human sciences.

The intentional character of the objects under study is frequently left unclear in a variety of discourses in the humanities and social sciences, which often casually assume the existence of a domain of social and intellectual objects whose properties and interrelations form the *dramatis personae* of their narratives or explanations: genres, prices, political parties, communities, races, currencies, exchange rates, hierarchies, offices, treaties, families, genders, religions, styles, nations, borders, institutions, languages themselves, and so on. Some of these things do take on an apparently entrenched solidity that rivals the objectivity of concrete entities in a physical world. What tends to be overlooked—because of their long histories and the very large numbers of people who sustain the relevant practices and disciplines—is their essential and continuing dependence on the mental activities of individual knowers and agents. The conflation of physical with cultural objects (or cointentional objects) in the minds of most unsuspecting people arises in part from educational practice; history and economics and literature are taught alongside biology and physics and chemistry, and the radically different ontological status of their objects is not usually pointed out.

In addition to its historical and methodological sense, then, "structuralism" also names a philosophical position that emerged only slowly from the structuralist movement, and provides an alternative to positivism and doctrinaire Marxism. No longer just a methodology, structuralism becomes a metaphysics, or more exactly an ontology. Instead of asking what structures the objects of the social sciences *share,* a structuralism of this sort will ask what structures they *are:* the relations that *constitute* them, and not only the relations into which they enter. It turns out that for an important class of objects—a very large class, comprising most of the things (other than merely material ones) with which human beings are concerned—entities are constituted wholly out of relations.

A basic question here concerns the nature of relations themselves. One view of relations takes them to hold between separate, preexisting objects: If I place one chair to the left of another, the chairs exist independently of and prior to the relation "to the left of," which holds only when I have placed them in this way, and only for an observer situated as I am. But some objects come into being as the objects they are only when their relations to other objects are brought into the picture. Parents come into being as parents only when they have children. They are essentially relational beings, and the same could be said of almost all roles and positions in the social and political domain. How do these relations subsist? Not, as in the case of the chairs or other material objects, in physical space and subject to causal interactions, but rather as apprehended (or "intended") by conscious subjects to whom they are intelligible and significant.

In the formulation of this contrast, it will be noticed that the term *subject* occurs twice, with sharply different meanings. A subject is literally something "thrown down," in contradistinction to an object as something "thrown over against"; both derivations stress the contingency of the situation. A subject can be *subjected to* external powers (discipline, oppression, etc.), or it can be the

subject of its own experiences (speech, desire, etc.). The first of these senses is prominent in the later work of Michel Foucault, who after an early structuralist period (vehemently disavowed by him) in which he followed the structures of biology, economics, and linguistics from the Renaissance to modernity, came to concentrate on the structures of coercion represented by censorship, imprisonment, and the like. Foucault analyzed power relationships as permeating the structure of the social, coming in multiple, separate strands from below rather than in dominant influences from above, but the intertwined influences of knowledge and power, or "power-knowledge," still tended to subordinate the subject rather than empowering it.

Problem and Potential in Structuralism: For an Empowering Intentional Structuralism

Even in his avowedly poststructuralist phase, Foucault thus continued to fall prey to a problematic temptation of structuralism. This was the common, if far from necessary, temptation of structuralists to assume that there existed a determining superstructure that had a life of its own, of which human minds were the unwitting carriers. Hence, structuralist claims to the effect that "myths think themselves through us" or that "we do not write, we are written." In this view, structures appeared to be impersonal and autonomous and to exist objectively; the individual knowing subject was elided in favor of a mere placeholder in a network of structural relations. What was not clear in this interpretation was the nature of the carrier for these relations and the structures that embodied them.

The subject who is the agent of his or her own intentional life, rather than a being subjected to overarching structures of dominating power, represents a more positive and hopeful potential face of structuralism. The decline in structuralism's influence after its heyday in the 1960s might be accounted for by a failure of the structuralists themselves and of their followers to take seriously the ontological force of individually sustained intentional relations. There was a turn toward semiotics as the focus of inquiry, which once again seemed to confer an independent objectivity on linguistic structures, even though some structuralists (notably Julia Kristeva, following on the work of Jacques Lacan) sought to preserve the primacy of the speaking subject. To bring out the significance of this more active structuralism, it will be helpful to go back to the history (or protohistory) of the movement even before the advent of Saussure and Lévi-Strauss, and highlight the potential for a more empowering intentional structuralism already evident in Karl Marx's *Capital*.

Marx deals in elementary structures and their transformations, as, for example, when in *Capital* he shows the structure and transformation of the elements of exchange:

- *Commodities–money–commodities*: where it is obviously desirable for the commodities in the second group to differ from those in the first, is transformed (by a mere shifting of attention to an adjacent segment in the chain of exchanges) into the structural element:
- *Money–commodities–money*: where it is similarly (but less innocently) desirable for the second quantity of money to be greater than the first. What arises out of this simple move is the whole complex of economic and political relations that stretches from labor and theft to surplus value and exploitation and ideological dominance and institutional entrenchment and revolution.

It is characteristic of Marx that he reformulates what look at first like relations between things as relations between people. For example, private property is not just a relation of owners to their possessions, but a relation of possessors to the dispossessed; private property for some and deprivation for others go hand in hand. The basic characteristics of a historical order are the relations of production; the totality of these relations constitutes the economic structure of society, while law and politics are built on the economic foundation as a superstructure. This totality is a totality of individual cases, as Marx continually reminds us in the vignettes of the working class he provides in *Capital*. He does not arrive at the notion of the individual as an intending subject sustaining the reality of the social, but he does react against the transindividual abstractions of Georg Wilhelm Friedrich Hegel. Althusser considers the early Marx to be a structural transform of Hegel and the late Marx as a structural transform of the early

one. But Althusser's is still a grand or superstructural structuralism (what Roberto Unger has called "metastructuralism"). A more compelling view considers political structures to be cointentional, that is, the convergent result of mutual instruction and mutual criticism among and between particular knowing and intending subjects.

This structuralism of distributed cointended structures has yet to appear as a movement in political science. But there are interesting adumbrations of it. To repeat—structures have to be apprehended and intended by individual subjects, they do not have the objectivity of real objects in a common world. Large abstractions must be rooted in small intentions. In this light, an unexpected ally of structuralism in politics is Lewis Namier, who grounds the argument of *The Structure of Politics at the Accession of George III* in the ambitions of individual parliamentarians. In a similar way, the *Annales* school reads political history through particular *mentalités*, Ernesto Laclau and Chantal Mouffe stress what they call "particularisms," and Jacques Rancière insists on the real equality of individuals not subsumed under dominant structures. Teasing out the difference between an intentional structuralism on such bases and a repressive metastructuralism will take a lot of work. But this is the route the human sciences need to follow.

STRUCTURE

Structure is perhaps the most difficult concept to define in social theory; indeed, a recent trend has been to reject the idea altogether. Maintaining an idea of social structure often implies that the theorist believes that the social world can be studied in a similar way to the natural world (naturalism). Some interpretivist critics would claim that while it might be possible to identify structures in the natural world—atoms, gravity, biological species—the social world differs from the natural world in being conceptual, ideational, and normatively laden, and hence not open to this sort of classification.

Definition of Structure

The most general understanding of *structure* is simply an arrangement of different elements that have a particular and enduring pattern. This raises a question as to whether, in this notion, structure is anything more than just the sum of its parts; in other words, are structures more than simply aggregates? Critics of this definition would argue for a conception of structure as something deeper or underlying. In linguistics, for example, we see this in the idea of deep rules of grammar (as opposed to the surface expression of speech). This understanding of structure as something deeper than and underlying social events can go in two directions. A hermeneutic direction would reject what critics regard as positivistic conceptions of structure as reducible to objective laws or patterns of observable behavior and insist instead on the

importance of symbolic meaning and understanding, showing that the social world is constituted by meaningful human activities that rely on such things as language, culture, and shared beliefs. A more materialist direction, as might be found in various schools of Marxism, would emphasize the importance of things like mode of production and economic system as providing the basis of social life. A specifically structuralist school of Marxism would, however, be wary of giving economic structures too great an emphasis and would extend its analysis to talk of the autonomy of various other social structures that are cultural, political, or ideological. However, these materialist approaches, and structural Marxism in particular, are criticized for emphasizing structure at the expense of social agents and actors.

Structure and Agency

Indeed, in talking of social structure one must inevitably talk about social agents. The structure-agency question is one of the oldest issues in social science, and one that is destined never to reach a satisfactory conclusion. The three contending positions here are: (1) that structure largely determines agency, (2) that agents constitute structures, and (3) that structure and agency are mutually constitutive. The first view is characteristic of different schools of structuralism, ranging from the linguistics of Ferdinand de Saussure to the anthropology of Claude Lévi-Strauss to the Marxism of Louis Althusser, as well as some functionalist approaches. The second view is found among interpretivists, phenomenologists, symbolic interactionists, and ethnomethodologists. They essentially believe that individual actors construct their social environment through their activities and understandings.

The third view that emphasizes the importance of both structure and agency might be found among less individualistic constructivists, for example, Peter L. Berger and Thomas Luckmann. One of the most influential approaches is Anthony Giddens's structuration approach that, seeing structure and agency as mutually constitutive, lays importance on human practices, rules, and meanings. Indeed, rather than define structure as the properties of a social system, the emphasis here is on shared rules. For Giddens, it is rules and resources that structure our social relationships. A somewhat different answer to the structure-agency problem is provided by Pierre Bourdieu in developing the concept of habitus. Here, he tries to explain how social conditions are internalized into dispositions that allow us to engage in meaningful social practices across the social field. Habitus, as a set of dispositions, is not necessarily a conscious thing, but a durable set of classifications that organize our choices.

Functionalist Approaches

The early idea of structure, as with sociology in general at that time, was influenced by biological ideas, thus seeing it as akin to an organism made up of various specialized functions (Herbert Spencer). Émile Durkheim sees structures as collective relationships again similar to different organs of the body. But alongside these relationships he also recognizes collective representations like beliefs and ideas that create a social consciousness. For Durkheim, this combination of relations and representations gives society its enduring structure. This approach in turn influences the North American functionalist school of sociology. Talcott Parsons develops this approach by focusing on social norms. For Jose Lopez and John Scott (2000, pp. 19–42), this is an institutional approach to structure that sees such institutions as normative patterns of social relations. These normative patterns are carried in people's minds, but have their own separate existence, acting on individuals to create expected modes of action. This normative approach was most tellingly taken up by Robert Merton in his work on deviance and the way that people are socialized into certain social or cultural norms that guide our actions. Indeed, this sociological tradition tends to place much of its emphasis on social cohesion and consensus.

Marxist Approaches

In contrast to institutional structure with its strong normative aspect, Lopez and Scott point to a more relational understanding of structure. A good example is a Marxist approach that looks at people's relationship to the means of production. Marxism at its simplest posits a base-superstructure model of society. Grounded in material conditions, it is argued that these help to explain social

consciousness. The account presented in Karl Marx's *1859 Preface* argues that people enter into relations of production that are independent of their will. The economic structure of society constitutes a foundation on which arises a legal and political *superstructure*. This model is widely criticized for its economic determinism, although Marx and Friedrich Engels themselves criticized such a position. Another way of interpreting Marx's work is to suggest that while all societies are conditioned by their mode of production, the idea of mode of production is itself much broader than simply economic structure. Indeed, for economic relations to exist, it is necessary to have in place a legal structure that defines what these relations are (for example what constitutes private property), as well as a political structure (the state) that defends these relations and enforces the law. In this sense, legal and political relations are as much constitutive of economic relations as they are determined by them.

Another way out of the economic determinism present in some interpretations of Marx is the structural Marxist route put forward by Althusser, who argues for the relative autonomy of political, cultural, and ideological structures. For Althusser, the economy is only determinant "in the last instance" and society is complexly "overdetermined" by the interplay of various structural levels. However, as we have mentioned, this approach is criticized, if not for its economic determinism, then for its structural determinism and the claims that agents are mere *bearers* of social structures and that history is a process without a subject. It was challenged by various humanist approaches to Marxism, be they historical (E. P. Thompson) or praxis oriented (drawing on the earlier arguments of Antonio Gramsci, György Lukács, and Jean-Paul Sartre). But perhaps the best response is to recognize the dialectical interplay of structure and agency present in Marx's own comments from *The Eighteenth Brumaire of Louis Bonaparte* that people make their own history, but that they do so under conditions not of their own choosing.

Philosophical Realism

Although there are clearly problems deciding how best to interpret the Marxist approach, it is nevertheless the best example of what Douglas Porpora (1989) considers a philosophical realist view of structure that defines it as systems of human relationships among social positions (class positions would clearly be given prominence by Marxists). Structures are said to have properties and causal effects in their own right, often expressed as tendencies that may be exercised under particular conditions but which might encounter countertendencies. This emphasis on structural tendencies that have to be understood in the open context of the conjuncture of different conditions goes against the positivist search for lawlike connections among social facts.

Porpora criticizes the constructivist approach for reducing structure to an epiphenomenon of human behavior. Whereas for Giddens and structuration theory, structure refers to an organizing principle, the realist approach refers to the actual organization of society. Realist approaches such as the Marxist one see these relations as real and out there, whereas for Giddens, these relations are intersubjective and hence culturally or symbolically shared through norms, rules, and ideas, rather than material relationships. The effect is to reduce structures to social practices denying structures properties of their own. This is apparent in Giddens's "duality of structure" argument that the structure does not exist separately from the knowledge of the agent, and that the structure is instantiated through the agents' activity. Margaret Archer's (morphogenesis) approach challenges this by arguing that structural conditions preexist the activities of particular agents and shape and condition the way they can behave. Following this first stage is a second stage of social interaction and a third stage of structural elaboration. Giddens's error, for Archer, is to conflate these temporally distinct stages by suggesting that structures be understood as the activities of agents.

Structure in International Relations Theory

We will now take some of these arguments and see how they are applied in political analysis, or more specifically, international relations (IR) theory. There is no doubt that the dominant view of structure is influenced by positivist approaches that seek to make lawlike statements and define structure in terms of regular patterns of behavior (hence the description of this position as behavioralist). These

relations are stable, repetitious, and hence predictable. Kenneth Waltz is the best known of the structural realism or neorealists in IR. To understand the international system, we have to look at the distribution of capabilities (among states) under the ordering principle (anarchy). However, if for Waltz the world system is characterized by anarchy (in contrast to domestic societies that are characterized by hierarchy), then for constructivists like Alexander Wendt, "anarchy is what states make of it." That is to say, the self-interested, competitive model of anarchy, influenced by the political philosophy of Thomas Hobbes, and an analogy with market behavior, is only one of a range of possible structural outcomes. For Wendt, a more contractual (Lockean) or cosmopolitan (Kantian) system is also possible. However, constructivists in IR are themselves divided between system-level constructivists like Wendt, and unit level constructivists, who place more emphasis on the actors rather than structures, or those like Nicholas Onuf, who question the idea of structure altogether and emphasize practice and language games instead. However, none of these positions really engages with the more sociological understanding of structure found in Porpora and Archer. Further, the structure-agency issue is often conflated with the somewhat different argument about systems, units, and levels of analysis (domestic and international).

Problems might arise in relation to just how abstract the notion of structure is and the extent to which it is a metaphor or something real. The positivist position that influences much of the mainstream usually takes an instrumental stance. In Waltz's work, for example, the idea of structure is used as a theoretical model to explain the pattern of international relations and the behavior of states. But the concept of structure is used as an explanatory tool, rather than as pointing to something that actually exists. Philosophical realists, by contrast, would clearly want to say that structures are not merely theoretical constructs, but exist in the real world. But what, then, are these things if they are said to have an abstract and underlying nature?

We might suggest the obvious examples, like the family or kinship relations or the state. But then it might be suggested that these are institutions rather than structures, and that the idea of structure gets at something deeper than this. But if this is so, then it becomes almost impossible to give a concrete example of a structure because a structure is now by definition something abstract that is unobservable and underlying. Then again, we might try to get out of this dilemma by distinguishing between the more abstract notion of the process of structuring and the concrete thing that is structured. The concrete thing we call a family is a structured entity, whereas that which gives a particular form to a particular thing is a more abstract structure or indeed set of structures (such as economic relations or patriarchy). Clearly there are dangers of rendering the concept of structure virtually meaningless, and these dangers lie in both directions, making the concept either too concrete or too abstract.

Recent sociology has challenged the idea of social structure, suggesting either that the idea belongs to an outdated form of social theorizing or that structure itself has changed in the real world. The most influential of these critiques are those that argue that social structure has either changed into, or been replaced by, new types of social relations, namely networks and flows. These networks are seen as open systems made up of nodes that add themselves to the network and interact with one another. Whereas structure implies hierarchy, a center of power and vertical integration, the idea of networks implies mutually supportive nodes arranged in a more flexible and adaptable way, and reaching across greater spatial (or even virtual) distances.

Such a view (associated with scholars like Manuel Castells, Scott Lash, and John Urry) links in with the argument that capitalism has a new globalized nature that is driven by revolutions in communication, information, and technology that are fragmenting and restructuring traditional social relations like the workplace, the family, and the firm. Tying in with arguments raised by Giddens and Ulrich Beck, it is suggested that social life is increasingly marked by the destruction of traditional social structures through a process of individualization, which in turn forces social agents to become increasingly reflexive and self-responsible. Along with these developments, a new set of agents emerge. Castells's arguments about opposition movements see these as located, not in traditional social structures characteristic of the old industrial society (like class and nation), but in new networks

that produce new cultural (rather than social) identities.

Critics would say that these are still very much structural arguments, and deterministic ones at that. Driven by technological developments or, in the case of globalization, an unstoppable economic logic, these approaches are overly deterministic on the one hand, yet have too contingent a view of social relations on the other. Critics suggest that these arguments are overly influenced by developments at the top level of business, focusing on those who have access to this new information and technology. In fact, the reason why some people have access to these resources and others do not requires a deeper structural explanation similar to the social positions argument put forward by realists.

SUBALTERN

The *subaltern* as a concept within political theory gained momentum through the work of the Italian Marxist Antonio Gramsci. His conception of the subaltern has been reworked by Indian scholars such as Ranajit Guha and Gayatri Spivak and is now a fundamental concept in postcolonial studies. Subalternity refers to diminished political voice, organization, and representation on the part of nonelite social groups, their relative invisibility in historical documentation, and their non- or extrahegemonic subjection to the power of elites. For Gramsci, these groups include peasants, slaves, women, religious groups, different races, and the proletariat in Southern Italy; Guha includes all groups in South Asia subordinated by class, caste, age, gender, and office, or any other modality; for Spivak, a paradigmatic figure is the gendered and racialized peasant or subproletarian of the global division of labor. For all three, the subaltern is unpossessed by the state and outside the purview of state hegemony; theoretical consideration of the subaltern is based on a political concern with radical social transformation at multiple levels. Conceptually, subalternity has been significant to the field of political theory in its challenge to the prevalent categories of (sovereign) subjectivity, agency, political representation, and (rigid definitions of) class.

Marcus Green states that most readings of Gramsci's conception of the subaltern are incomplete and misrepresented due to the exclusions of comprehensive notes to Notebook 25, "On the Margins of History (The History of Subaltern Social Groups)" in established translations of Gramsci's *Prison Notebooks*. Gramsci gradually refines the category of the subaltern to mean marginalized social groups that exhibit varying levels of autonomy, political organization, consciousness, and initiative; he adopts an historical materialist approach based on a philosophy of praxis.

Subaltern Studies, a series initiated by Guha and his colleagues in 1982 of currently 12 edited collections, drew (minimally) on Gramsci's understanding of the subaltern to investigate various aspects of subalternity in relation to hegemony—from subaltern consciousness and agency, to the notion of the subaltern as a discursive effect; the approaches of Michel Foucault, Edward Said, and Jacques Derrida became increasingly influential throughout the series. Spivak's celebrated notion of subaltern silence emphasized the impossibility of retrieving a subaltern speaking position given the inescapability of its epistemic and political mediation by power and ideology.

Directly inspired by the Subaltern Studies Group, the Latin America Subaltern Studies Group emerged in 1993 and existed for several years. Founding members included Walter Mignolo and John Beverley. The journal *Nepantla: Views from the South* was established in part to explore the dynamics of subalternity in Latin social formations in the Americas.

SUBJECT

The term *subject* has a long and convoluted history that takes in both philosophical and political meanings. Indeed the two are extremely difficult to untangle, which is why any contemporary understanding of the term must pay at least some attention to its conceptual history. In most current political uses the term *subject* is opposed to the term *sovereign*. For example, in Britain, it is still common practice in law to refer to "Her Majesty's Subjects." However, in its earliest usage in philosophy, the subject was that which "lay under," and was that to which predicates could be applied (the logical subject) or to which accidents could happen (the physical subject). This understanding of the term is operative as far back as the philosophy of Aristotle. Many philosophers and political theorists have played on the myriad meanings of the word, opposing the term at various times to *object* or *predicate,* as well as understanding the term subject in either an active way (the thinking subject, for example) or passive way (the subject of an investigation, for example). The subject also has a complicated relationship to number. It can be used to refer to the individual experiencing subject, but also to a large collection of individuals in their anonymity—the political subject, for example. The rise and fall of notions of the subject in philosophical and political thought over the past few centuries, but particularly in the nineteenth and twentieth when the notion came under siege from a variety of different angles, is as complicated as the history of philosophy and politics itself.

Philosophical Background

Between Aristotle and the middle ages, the term subject (*hupokeimenon* in the Greek, which roughly translates as "substrate") underwent a series of transformations that changed its meaning from that which subsists or is constant in matter to that which subsists or is constant in the human subject. This is the primary way we have come to understand the concept of subject, particularly in the wake of a certain understanding of René Descartes. The "I" becomes that which can be depended on in the face of metaphysical uncertainty. Although there are disputes over the extent to which Descartes intended it to be understood in such central terms, the Cartesian subject is often argued to inaugurate a modern understanding of the subject. This subject is understood as a perceiving, reflecting being, possessed of consciousness and the capacity to represent ideas to itself. When referring to *the subject,* contemporary philosophy generally takes its cue from this reading of Descartes, whether it poses the question as a problem of subjectivity or as a question of how we are to understand ourselves as conscious beings. This understanding of the subject taken from Descartes emphasizes the individual nature of consciousness and also gives rise to a series of questions concerning the existence of other consciousness and the problem of solipsism: How can we be sure that other human beings are not just complicated machines, given that we only have access to our own consciousness?

A great deal of modern European philosophy consists of debates concerning the nature, status, and origin of the subject. Following Descartes, Immanuel Kant developed an entire philosophical approach that oriented philosophy away from debates either about the world as it is itself or from scholastic system building, and started by looking at the cognizing subject itself. By beginning with the experiencing subject, Kant's critical project aimed to provide an answer to the question of how we know what we know. Kant compared himself to Nicolaus Copernicus, who transformed science by starting not from the assumption of the Earth's centrality, but of the sun's. Kant's Copernican revolution was to begin not from assuming the

reality of the external world, but that of the subject perceiving it. Kant's subject-oriented philosophy was to prove extremely influential, both on thinkers who immediately followed him, such as Georg Wilhelm Friedrich Hegel, and on entire schools of thought, such as the phenomenologists, who take subjective experience of the world as it appears to us at the starting point for their investigations into the structure of human cognition. Immediately after Kant's philosophy appeared, German idealism attempted in different ways to conceive of a wholly self-grounding subject, such that the subject would generate itself without need for external support. However, Kant was clear that there could be no subject without a relation to an external world, just that we couldn't understand this world as it was in itself. It is in these post-Kantian traditions that the opposition between subject and object comes to be central, even though many of the philosophies attempt to reconcile or overcome this opposition (for example, in Hegel, the subject and the object cannot be understood outside of the movement that both characterizes and contains them). There are important implications in Kant and post-Kantian thought for our thinking of moral philosophy. If the subject is an autonomous being, it must also be held responsible for its actions, as the very idea of the subject is predicated on a certain notion of freedom.

Political Developments

Parallel, and often crossing into, these philosophical developments are changes in the political meaning of the term subject. One of the implications of the Cartesian use of the term is that what we are referring to is an individual being. This in turn implies that the Cartesian subject is also a person, which is a term whose legal implications are vast. If the modern subject is also a legal person, or a citizen, we have yet another dimension of the term. Just as the philosophical subject is free, autonomous to some degree, and capable of reflection, the legal subject or person is held to be responsible for his or her actions. But the history of the term is even more complicated than this. To be subject to a sovereign or to a legal decision is to be in a position of submission to an authority (indeed, the term *subjection* carries this implication to this day). Yet this meaning, in the wake of philosophical developments, once more gets transformed. In the work of Jean-Jacques Rousseau (1712–1778) the subject and the sovereign for the first time coincide. In Rousseau's concept of the general will, the individual is both comprised of the will of everyone and the freedom granted to each. It is thus both sovereign and subject at the same time. Rousseau's importance in this period is reflected in the French *Declaration of The Rights of Man* (1789), which describes the law as being the expression of the general will. It is at this point in philosophical and political history that the term subject crosses over from a passive notion to an active one, more in keeping with the Cartesian conscious subject that we inherit from philosophy of the seventeenth century. Philosophy and politics in this period play a curious game of catch up around the term subject, each moving from passive notions of the subject to more active ones, with implications for both how we conceive the modern mind and how we understand contemporary politics.

In the wake of Rousseau's double-sided conception of the term and the implications for related terms such as *citizen* and *mankind* in the wake of the French Revolution, the notion of the political subject as an active being gets taken up by left-wing and Marxist thinkers. Most exemplary in this case is György Lukács (1885–1971) who, in *History and Class Consciousness,* seeks to combine Hegelian and Marxist notions of the subject with a political claim about the material of this subject. Lukács argues that although the proletariat under capitalism is alienated and thus is treated (and treats itself) as an object, it is, in the end, the true subject of history. Although Lukács would later criticize his own conception of the proletariat as subject of history, his project represents the logical outcome of a certain kind of thinking about the active political subject, where the activity of the masses comes to stand in for the truth of history as a whole.

Attacks on the Subject

However, within both philosophy and politics there have been many criticisms of notions of the subject. After Kant, Friedrich Nietzsche (1844–1900) launched a devastating attack on both the metaphysical and moral dimensions of philosophy's claims about the subject. For Nietzsche, it is a trick of grammar to think that there is a "doer

behind the deed," and that Christianity and "slave morality" are responsible for constructing notions of conscience and interiority. The subject is thus the outcome of a long and vicious process of the taming of human beings by certain ideas, not the truth of consciousness as such. Furthermore, to think of the subject as a unified entity is to misunderstand the play of forces and perspectives that constitute human existence, and to presuppose that static being is more important than fluid becoming.

Nietzsche's highly suspicious approach to the certainties of philosophy on the question of the subject proved to be significant. Sigmund Freud (1856–1939) was strongly influenced by Nietzsche in his account of those aspects of human psychic life that weren't immediately available to consciousness. What is revealed in slips of language and dreams are the unconscious forces that comprise our mental existence. These dimensions of human existence cannot be captured by assuming that the subject is fully in control of his or her mental activity. If our hidden inner life reveals more about us than active conscious reflection, are we really entitled to think of ourselves as autonomous, rational subjects? Are we not, in fact, determined by things beyond our control? This has significance for our self-conception as moral beings, if an element of our responsibility is taken away from our conscious control.

Michel Foucault (1926–1984) discusses the disappearance of the subject from philosophical and historical enquiry, once it is admitted that the subject is a construct and not a necessary fact about human beings. Indeed, Foucault and other critics of the subject make the critique of the self-composed, autonomous conscious subject part of a larger attack on the pretensions of humanism. Foucault's famous hypothesis of the "death of man" was enormously influential for both philosophy and politics, as it provided a way of trying to think beyond Enlightenment narratives of progress, the transparency of thought, and the centrality of human beings in the universe. Martin Heidegger (1889–1976) was similarly engaged in a critique of philosophical notions of the subject, arguing that notions of the subject already presupposed the nature of such a being, and that philosophy should think more fundamentally about the nature of being before it begins to make claims about human nature or subjectivity. Some feminist philosophers have also attacked notions of the Cartesian subject, arguing that it presupposes a certain model of individuality that cannot account for the way pregnancy complicates our understanding of the self as unified and singular.

More recent philosophical approaches have tried to displace the subject less through critique than through reconfiguring the focus of discussion. Object-oriented philosophy, such as that found in the work of Bruno Latour and Graham Harman, attempts to return to the objects themselves and their relations, rather than start with the conscious human subject, as Kant did. The aim is to think about objects in relations to networks in which the human subject would merely be one thing among other entities. Many insights of modern science have further displaced the centrality of the human subject, emphasizing the role of genes and other nonconscious aspects of our being.

In politics too, the notion of the subject has developed some serious criticism. Many have argued that notions of the political subject as a mass entity (the proletariat, for example) are now historically obsolete and ineffectual ways of conceiving of the complexity of societal organization. The idea of talking about the subject as a collective came under attack along with any position that saw a necessary end point or progression to human history.

Returns of the Subject

Today, however, some philosophers writing about politics, in particular Slavoj Žižek and Alain Badiou, have reintroduced the notion of a political subject into contemporary discussions. In a break with earlier Marxist and determinist theories of the role of the subject, however, they are careful to state that the emergence of the political subject is rare and should be understood as an event, rather than as a necessary outcome of the contradictions of political life. One of the central features of this contemporary turn to rethinking the subject is how it pays attention to the complicated relationship between the political and philosophical history of the word outlined here. If contemporary

conceptions of the subject understand the historical transformations in the word, then we can rethink the term without making assumptions as to its nature or essence. One reason for wanting to return to notions of the collective subject in particular is to try to take account of the way in which political formations come about, why people suddenly and seemingly spontaneously protest or overthrow governments, for example. One overlooked text in the history of this philosophical-political attempt to understand group behavior is Jean-Paul Sartre's *Critique of Dialectical Reason* (1960), in which Sartre tried to present a rigorously abstract framework for the emergence of groups defined by their common political purpose from out of what he calls everyday *seriality,* where every individual regards himself or herself in opposition to every other. Sartre's text is important for Badiou's later conception of the political subject, which is also defined by its shared fidelity to a political event. What happens in the political event is that the collective subject realizes its shared commitment to a cause and its universal dimension. Unlike earlier Marxist conceptions of the self-realization of the proletariat and its supposed escape from alienation, this later conception of the subject presupposes no necessity to its emergence, and its appearance on the scene is not the result of identifiable historical causes. The death of the subject predicted by some twentieth-century thinkers has not yet quite taken place, either in philosophy or in politics.

Sustainable Development

Sustainable development is a central, yet complex and contested term within green politics and debates about the relationship between human societies and their economies and the natural world. The essence of sustainable development is that it integrates a concern for the environment and environmental protection with obligations to present and future human generations. In terms of its most famous definition, contained in the Brundtland Report, *Our Common Future:*

> Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two key concepts:—the concept of "needs," in particular the essential needs of the world's poor, to which overriding priority should be given; and the idea of limitations imposed by the state of technology and social organisation in the environment's ability to meet present and future needs. (World Commission on Environment and Development, 1987, p. 43)

Sustainable development is thus development that is ecologically sustainable, that is, development that is consistent with external, natural ecological constraints and limits and living within our environmental means. A shorthand definition of sustainable development would be *one planet living* (i.e., living within the equitably shared ecological and limited means—energy and resources—of the planet). Thus, sustainable development has at its heart both scientific and ethical dimensions, and its focus on *limits* means its normative center is a concern about distributive justice—as outlined further in this entry.

Sustainable development is not simply concerned with purely *ecological* concerns, but in terms of the popular *triple bottom line* view of sustainable development, sustainable development is concerned about the balance and relationship between the ecological, economic, and social dimensions of human social progress. Complementing this, sustainable development also outlines the role and relationship between the

	Ecological	*Economic*	*Social*
State			
Market			
Community			

three dominant institutions of modern life—namely: the state (including supra- and substate levels), the market (local, national, and global); and community or civil society.

Thus, sustainable development can be schematically represented as the table above.

Using this schema, different conceptions of sustainable development will be constituted by different emphases on which institution (state, market, or community) relates to, or is the dominant institution in relation to, ecological, social, or economic policy. For example, dominant green conceptualizations of sustainable development have a *nested* configuration across both dimensions. That is, greens would prioritize the community dimension and view the market as something that a democratic and decentralized state should regulate and ensure is as local in focus as possible, while prioritizing the social dimension in terms of well-being, social inclusion, and equality, and view the economic as subservient to these social objectives, nested within the limits of ecological thresholds. Thus, green accounts of sustainable development are characterized by strong community focus and an emphasis on one planet living and rejecting the stress on orthodox economic growth one finds in dominant accounts of "development" and "progress" within liberal, socialist, or conservative political and economic thinking.

From the point of view of political theory, sustainable development can be interpreted as extending ethical concern (including those of justice) in at least three dimensions—time, space, and the species barrier—as well as giving a new twist to conventional debates about socioeconomic justice and equality within societies.

The temporal frame of sustainable development is future oriented in that its concern for the future and future generations—the impact of development decisions (both sustainable and unsustainable) in terms of intergenerational justice and what the present generation owes future generations. Sustainable development is attentive to the brute fact that ecological problems do not respect national or cultural boundaries. Pollution problems, such as climate change, are transnational and global in scope. Equally, the social effects (in terms of injustice, harm, and inequality, for instance) of unsustainable development patterns of trade, exchange, and economic activity also are not confined to national boundaries. Thus, sustainable development and its associated politics and policies must also be transnational and global in scope and approach. Here, sustainable development can be seen as intimately related to debates around global justice and injustice.

Perhaps most contentious of all, sustainable development also raises the question of the justifiability of anthropocentrism that is limiting debate and concern to humanity. Given that sustainable development highlights the ineliminable *metabolic relationship* between humanity and the natural world, its normative concerns raise questions as to how we ought to view and treat the nonhuman world. Here, debates about sustainable development range over those who claim that given we cannot not use the natural world, the question then becomes one about establishing an *ethic of use* based on respect for the nonhuman world, and establishing symbiotic rather than parasitic ethical and metabolic relations to the nonhuman world. Others, such as deep ecologists, hold that we need to develop a nonanthropocentric or ecocentric worldview so that we may "walk lighter on the earth" and live simply so that human and nonhuman others may simply live.

In summary, sustainable development acknowledges:

- Human dependence on the natural environment (i.e., that the human economy is a subset of ecological systems, and relatedly, i.e., humans are not above or separate from nature)
- The existence of external natural limits on human economic activity
- The detrimental effect of certain human, collective activities on local and global environments
- The fragility of local and global environments to human collective action and the vulnerability of human societies to ecological thresholds and natural phenomena

- That one cannot talk about *development* without also linking it to the environmental preconditions for development and its social impacts
- Development decisions now may have consequences for present and future generations, those living in other parts of the world and the nonhuman world

In this way, sustainable development brings political theorizing about humanity "back to earth" given the ineliminable "ecological embeddedness" and "biological embodiedness" of human beings (Barry, 2007). As such, political theorizing, which is ignorant of the multiple concerns of sustainable development, is not just incomplete and immature but potentially misleading and dangerous as a guide to action.

Symbolic, The

The symbolic is a category in Lacanian psychoanalysis. It is used to designate one of three basic registers of human experience (alongside the imaginary and the real). In the second half of last century, the symbolic was brought to political theory by authors such as Louis Althusser, Ernesto Laclau, Chantal Mouffe, and Slavoj Žižek. This entry introduces the history and content of the symbolic in Lacanian theory. It then examines how the symbolic has been applied in political theory, principally in Slavoj Žižek's work.

Lacan's notion of the symbolic (or the symbolic order) is indebted as much to twentieth-century French sociology as to Sigmund Freud. The symbolic order of a society represents the collective representations it uses to understand itself and the world. Each new generation learns these representations, along with their mother tongue, in the first years of life. Lacan emphasizes how the symbolic order is always rule bound or normative. Each natural language is governed by a set of grammatical and lexical rules for the meaningful combination of words. More decisively, every culture is founded on the dual prohibitions of incest and murder that Freud's *Totem and Taboo* hypothesized to be the beginnings of human civilization. These prohibitions are impressed on subjects with the resolution of the Oedipus complex in the fifth to sixth year of life. At this point, the father should intervene to proscribe the child's ambition to monopolize its mother's attentions. The child at this point instead identifies with the norms of its society, or takes on the "name of the father" (for example, it is no longer only "little Johnnie," for example, but "John Smith"). Lacan's claim is that social order, kinship exchange, and subjects' sexual normality depends on the mediation of the symbolic between subjects. At a very basic level, we can only understand each other through language. Lacan's specifically psychoanalytic claim is that our sexual and social identities are overdetermined, at an unconscious level, by the places we hold in our societies' symbolic orders. The price of individuals' not successfully acceding to the symbolic is neuroses, perversions, or psychoses.

French Marxist Louis Althusser was decisive in bringing Lacanian psychoanalysis to political theory. Althusser's notion of how individuals are "interpellated" (roughly, "named") by political ideologies, backed by "ideological state apparatuses" (schools, churches, bureaucracies, media) is indebted to Lacan's theory of the "mirror stage." In this stage of their development, infants first anticipate their unified identity by seeing their own image in a mirror. Yet later, Lacanian political theorists have seen "ideological interpellation" as the process whereby subjects enter into a society's predominant symbolic order—a kind of political equivalent of the child's initial identification with the name of the father.

Lacan's emphasis on the importance of symbolic paternal authority in shaping subjectivity can take a conservative interpretation, as feminists have noted. However, particularly in the work of Slavoj

Žižek and his students, the symbolic has been put to use in the service of a revised, post-Marxian critique of ideology. Lacan's emphasis on how fundamentally our identifications within the symbolic order shape who we are is read as a powerful device in understanding the force of law. It is used to unmask just how deeply a society's dominant political beliefs and practices shape political subjects, and so why the radical change hoped for by the Marxian left has not occurred. The symbolic, for example, plays a key role in Žižek's celebrated analysis of the "ideological cynicism" of contemporary consumerist subjects. Their conscious sense of being rebellious, "resisting subjects" (promoted by advertising and postmodernist theory) misrecognises the unconscious hold of the symbolic order on them—a hold attested by how they mostly work 9 to 5 and worry about social acceptance and their careers in highly conformist fashion, while professing a cool cynicism about these commitments.

Lacanian political theorists hold that at the center of any society's symbolic order are "master signifiers" whose functional prototype is the "name of the father" in children's socialization. These are signifiers with which subjects identify particularly strongly. They undergird subjects' understandings of their societies and politics. Examples are *freedom* in the liberal West, or *the people* in the former Soviet Bloc. Laclau and Mouffe, and then Žižek, contend that the ideas and ideals of any society's symbolic order are for the most part politically unstable. Each can be signified in several different ways. The word *democracy*, for example, takes on different meanings if it is prefixed by *liberal* or *socialist*. The master signifiers in any society's symbolic order "quilt" or stabilize the meanings of all the other political signifiers. For example, if communism is our master signifier, democracy is quilted as meaning real versus formal, bourgeois democracy (a front for capitalism); feminism will be read as a response to the particularly intense exploitation of women under capitalist conditions; ecologism demands the overcoming of the profit motive if a more balanced approach to the environment is to emerge. If liberalism is our master signifier, by contrast, different interpretations of each of these terms emerge.

In this way, embrace of the Lacanian notion of the symbolic has led theorists like Žižek to a post-Gramscian emphasis on the politics of culture, or in the right's language: culture wars. Political struggle concerns which key master signifiers will shape a society's dominant (self-)understanding. Because these master signifiers are experienced by subjects as self-evident or natural, Žižek, for instance, argues that unless their hold on individuals is challenged, significant reform of a symbolic-ideological system is impossible. The work of political criticism hence becomes to show how a dominant symbolic order's (self-)understanding is always based on "ideological fantasies" about their societies' origins and ends that are self-contradictory, and in this way false.

Systems Theory

The concept of a system is abstract. It can often be little more than a metaphor used to describe any complex set of parts that forms a larger whole. At its most abstract, the concept of a system is thus just a way of thinking about macrostructures in terms of the relations among their units; it analyzes objects in terms of their parts and the relations between these parts in an attempt to facilitate problem solving. This concept of a system appears in diverse academic subjects, including biology, chemistry, and engineering, as well as political theory. For example, some biologists think of human beings as a system composed of subsystems (such as the vital organs), each of which performs a process essential to the maintenance of the system as a whole.

Systems theorists typically conceive of politics, and especially the state or governance, as a system composed of a series of subsystems operating within specific environments. A system consists of a set of subsystems or processes that are coordinated to accomplish defined goals. Each system or subsystem operates within an environment that is defined by fixed factors that constrain that system. Governance is the product of a complex network of interdependent systems. Many systems theorists also argue that systems are capable of regulating themselves so as to ensure that they evolve in a way that keeps their subsystems in harmonious relations with one another. Indeed, they often suggest that the self-organizing nature of systems makes the theory peculiarly appropriate to new forms of governance based on markets and networks, as opposed to bureaucratic hierarchies. In the absence of a dominant center or sovereign entity capable of guiding the whole, governance appears to resemble a self-organizing set of networks or subsystems.

Systems Analysis

How are we to analyze government networks conceived as systems and subsystems? Systems theorists have distinguished five different dimensions to such analysis. The dimensions are: the objective of the system, the environment that contains the system, the system's resources, the system's subsystems and their respective goals, and the management of the system.

1. The objective of a system is not always readily apparent: It can be concealed by the complexities of the system. Social scientists often identify the objective of a system by asking: For what ends does the system actually sacrifice external goals?
2. The system's environment consists of fixed external factors that define its operating parameters. So conceived, the environment does not include everything that surrounds the system but only static factors.
3. A resource is anything that enables a system to fulfill its functions. A system may vary its resources depending on the circumstances. Systems often contain internal mechanisms that periodically increase resource levels. An example of such a mechanism would be a production improvement within a firm. The firm's technological improvement may increase the amount of labor that can be utilized in the production process, and thus increase the resources within the system.
4. The actions of a system are often performed by coordinated subsystems. An analysis of the subsystems allows social scientists to consider their respective value to the system as a whole. In addition, they can consider which processes are critical and which might safely be removed.
5. System management ensures that the system's infrastructure is maintained and that the system is meeting its objectives. As long as these two conditions are met, the system will continue to exist.

Systems Management

How can the state (or other policy actors) manage the systems in which they participate? The application of systems theory to the study of politics has inspired two rather different approaches to system management. First, the autopoetic approach suggests that any system that persists over time will be self-regulating. In this view, all systems steer themselves, and they do so through closed, self-referential processes. The autopoetic approach thus leads to pessimism over possibility of the state (as a subsystem) steering society. Second, the interactionist approach identifies governance as a product of interactions within the system. This approach highlights the impact of relationships between governors and those being governed, between public and private actors, and between institutions and the social forces they regulate. All these interactions offer sites at which the state, and also societal actors, might intervene, so as to steer self-governing systems. In this view, recognition of the importance of interactions helps us to understand how steering becomes possible.

Problems and Prospects

Systems theorists debate the implications of the theory for governance and the possibility of consciously steering networks. Yet, these debates

already assume that the theory has a defined and valid content. In fact, systems theory is, as we have seen, often little more than a metaphor. Hence, there are arguably more important debates about the content and compatibility of different types of systems thinking.

More general debates about systems theory often concern the rival merits and compatibility of distinct variants. Schematically, we might distinguish at least four types of systems thinking: hard systems, organismic systems, soft systems, and critical systems. First, hard systems thinking arose in operations research methods and engineering design, where it is used to solve physical problems within clearly defined limits. Engineers break processes down into systems and subsystems in order to work on individual components in an efficient, organized manner. Second, organismic systems thinking arose in the biosciences. Organisms or their environments appear here as whole units or systems that in turn are composed of subsystems that possess varied characteristics. Organismic systems thinking leads to a more holistic approach than does hard systems thinking, with its focus on breaking down a problem into small parts. Third, social scientists devised soft systems thinking by drawing on organismic systems thinking in order to examine social problems. Many other social scientists had adopted atomistic approaches that broke society or social phenomena down into smaller and smaller institutions, groups, and the like. In contrast, soft systems thinking tried to grasp the nature of the whole before looking at the place of each component part within that whole. Finally, critical systems theory improves system design by bringing a greater awareness of human needs and actions to other types of systems thinking.

To conclude, we might note that these different types of systems thinking often use the concept "system" to describe different objects and to champion different ways of studying these "objects." If systems theory is to be more than a metaphor flowing uncritically from one type of object to another, it is necessary to examine more critically the differences between these objects or macrostructures and thus the different forms of analysis and explanation appropriate to them.

TACITUS (C. 56/7 CE–C. 117 CE OR LATER)

Publius Cornelius Tacitus (born c. 56/7 CE) was a Roman politician, orator, and historian. A member of the senatorial order at Rome under the early Roman Empire, he lived under a succession of emperors stretching from Nero through to the anti-senatorial Domitian before becoming consul—the highest political office—in 97 CE. Having held the governorship of the important province of "Asia" (Western Anatolia), he died either toward the end of the Emperor Trajan's reign (c. 117 CE) or sometime afterward under Hadrian. Tacitus is known primarily for four historical works, two written in 98 CE: the life of *Agricola* (*de vita Julii Agricolae*) and the *Germania* (*de origine et situ Germanorum*), followed later by the more celebrated *Histories* (*historiae*) and *Annals* (*ab excessu divi Augusti*). He was also the author of an extant *Dialogus de oratoribus* (Dialogue on Oratory), dedicated to a Roman consul of 102 CE.

The *Histories* and *Annals,* Tacitus's major works, survive today only in partial form—they covered the history of the early principate from the death of the first Emperor Augustus to the end of the reign of Domitian (14–96 CE). Written within a particular Roman historiographical ("annalistic") tradition, in which he was preceded, among others, by Sallust and Livy, the narrative of the *Histories* and *Annals* is a fundamental literary source for the political history of the early empire. Tacitus, however, was more than a historian—he was also a political actor and a political theorist. All of his works, in different forms, are concerned with exploring politics as a realm of elite decision making and performative action. Identifying himself strongly with a "traditional" senatorial culture of public virtues that had dominated the Roman state during the republic, Tacitus set out in his writing to dissect the nature and morality of political power itself.

That structures of power and institutional cultures of morality are liable to change, and sometimes rapidly, is a point that underscores the Tacitean approach to political theory:

> When there was democracy, it was necessary to understand the character of the masses and how to control them. When the senate was in power, those who best knew its mind—the mind of the oligarchs—were considered the wisest experts on contemporary events. Similarly, now that Rome has virtually been transformed into an autocracy, the investigation and record of these details concerning the autocrat may prove useful. Indeed it is from such studies—from the experience of others—that most men learn to distinguish right and wrong, advantage and disadvantage. Few can tell them apart instinctively. (*Annals,* IV. 33, trans. Grant).

Thus an important strand of the Tacitean tradition of political theory, from the Renaissance onward, is concerned with how language and rhetoric can "make realities" in any given system

of political control. Suffering under an age dominated by an (increasingly empty) rhetoric of imperial expansionism, Tacitus identified a causal link between autocratic rule and moral degeneracy. As well as providing an impetus to subsequent critiques of tyrannical power, Tacitus's insistence on the theatricality of political life under oppressive regimes, the necessity of acting out stage-managed roles, also influenced later Machiavellian theories of Realpolitik: to play the roles assigned to us, but to seek—when we can—to write the script ourselves.

Taoist Political Thought

Taoism (*Tao-chiao*) is a Chinese religious tradition valuing personal integration with the unseen forces of the universe. Most Westerners are acquainted with only one "Taoist" text: the *Tao te ching* (or *Lao-tzu*). Even scholars seldom know the ideas found in the thousands of later Taoist writings. Contrary to modern narratives, Taoism evolved among China's most educated classes, specifically fifth-century aristocrats who interwove varied earlier traditions into an inclusive framework to preserve China's indigenous heritage from being altogether overthrown by Buddhism (a recent arrival). Taoist writings articulate nuanced models of spiritual practice designed for rulers and intellectuals, as well as ritual programs that provided a political matrix through which Taoism adapted to changing times. But Taoists apparently developed few new intellectual models concerning political power or practice.

Earlier, in "classical China," anonymous writers had contemplated life's issues and proposed teachings by which society could harmonize with life's deeper, more spiritual realities. The most famous example is the *Tao te ching,* completed circa 285 BCE by an unknown intellectual who repackaged earlier behavioral ideals into a sociopolitical program. Though such minds worked independently and formed no self-aware school, it remains common to label them "Taoists."

Contrary to the modern misconceptions, Taoists have generally agreed with Confucians: Both urge individuals to develop themselves in ways morally, in order to enhance society's well-being. Unlike the Legalists, who urged aggrandizing state power above all other values, for Confucians and Taoists, the individual is never to become a slavish follower of external authority but rather a thoughtful practitioner of meaningful ideals that constitute the true basis of a healthy society. Both presupposed that the world should have a human ruler. One classical text, the *Chuang-tzu,* scorns notions of serving in government, but advocated apathy, not anarchy, and teaches us only that classical Taoists, like Confucians, never denounced monarchy or would have embraced alternative systems like democracy or socialism.

What distinguishes Taoist thought is that Taoists have never placed great faith in humans' conceit that careful thought and action by any group or individual can be expected to improve life in our world. But while some intellectuals today imagine the *Chuang-tzu* as "proto-postmodern," the more representative Taoist position appears in centuries of writings that, like the *Tao te ching,* urge individuals to bring the sociopolitical order into accord with life's deeper, spiritual realities through practicing self-restraint and cultivating those realities—all vaguely denominated "Tao."

Later Taoist political thought emerged from the imperial court. In 221 BCE, the ruthless Ch'in regime established a totalitarian state. Thinkers of the subsequent Han dynasty saw the imperial order as an effective political system, provided it could be ripped from its Legalist moorings and instilled with more humane values. They questioned neither the value of the imperial system nor the propriety of hereditary rule. As throughout imperial times, Chinese thinkers axiomatically agreed that moral principles are essential for effective government, though idealism alone is not a sound basis for government. So—like their counterparts in China today, equally deprived of freedom to express independent political ideas—they sought not to devise new political systems but rather to discover the most solid theoretical foundation for the system they had inherited.

Some Han thinkers argued that the universe is not a field of self-contained natural processes, but a dynamically correlative cosmos, in which human actions stimulate responses on other levels; the ruler, having been instituted by "Heaven" (*T'ien*—the world's semipersonal ruling force), has a decisive degree of such power. That vision of an interactive union of cosmos and polity inspired other Han dynasty officials to produce a different kind of text, which reveals the basic framework of virtually all Taoist political thought: the *T'ai-p'ing ching* (Scripture of Grand Tranquility). Echoing the *Tao te ching,* the *T'ai-p'ing ching* declares that antiquity's rulers had achieved Grand Tranquility by practicing *wu-wei* ("nonaction"—the ideal of trusting to the world's natural processes, rather than to one's own initiatives or collective action). The *T'ai-p'ing ching* maintains that Grand Tranquility was disrupted when rulers began meddling with the world. These ideas recur throughout later Taoist political thought.

Throughout imperial times, Taoist leaders served China's rulers as legitimatory aides: They served a functional role, providing effective legitimatory paradigms, comparable to European kings' "divine right." Some Taoist leaders were viewed as protectors of the realm, whereas others were embraced as "the sagely counselor," whose mere presence elevates his sovereign to mythical heights. The emperor, the Taoist master, and the divine realities of the universe were seen as co-participants in the same process: unifying the world—"all under Heaven" (*t'ien-hsia*)—in a state of "Great Tranquility" (*t'ai-p'ing*). Centuries of emperors decreed that Taoist priests should perform liturgical ceremonies to prolong the life of the emperor, ward off natural disasters, and ensure stability in the empire. Though modern minds discount such beliefs, traditional East Asian minds esteemed Taoist leaders as essential aides for rulers' reactualization of the halcyon utopia—*T'ai-p'ing*.

From the thirteenth century, China was often ruled by non-Chinese, like the Mongols and the Manchus. Such late-imperial dynasts suppressed all expressions of independent political thought. In response, Taoists integrated public virtues like "loyalty" into their more traditional ideals. Such "gentry Taoism" evolved into the organization still dominant in twenty-first–century China—Complete Perfection (*Ch'üan-chen*) Taoism, headquartered in Beijing. Late-imperial Taoist discourse continued among men and women of all segments of society, but Ch'üan-chen practices inspire neither nationalistic fervor nor individualized theoretical expressions. Authoritarian rulers—unhindered by independent legislature, press, or other countervailing social forces—have prevented intellectuals from articulating nontraditional Taoist models of or for political life.

TEMPORALITY

Temporality refers to the nature or structure of time, in terms of its objective existence, its subjective experience, or both, and particularly with

respect to the relations among its dimensions (past, present, and future) and the way in which it passes. It can also include time's relation to eternity and to history. This entry reviews concepts of time in Western thought and describes their elaboration in political theory.

The nature of time has always been an important topic in Western philosophy, although time has often been relegated to a subordinate status. Examples of this subordination include Plato's view of time as a moving image or copy of unchanging eternity, Aristotle's treatment of it as the number or measure of movement and change, and Augustine's contention that time cannot actually exist because past and future have no reality except in the mind's experiences of memory and expectation. Premodern conceptions of time are also frequently divided into circular models and providential or eschatological ones, neither of which grants any novelty or creativity to time or to the events occurring in it. However, despite many denials in both modern philosophy and science of its independent reality, time has been elevated to a primary position in many forms of modern and contemporary thought. Immanuel Kant, for example, holds time to be the a priori intuition that conditions all internal and external experience. Georg Wilhelm Friedrich Hegel, who defines time as the negation of what is given (i.e., what exists here and now), sees history as the dialectical unfolding of the Absolute in philosophy, religion, and the state, whereas Karl Marx sees it in terms of the dialectical development toward the emancipation and reconciliation of human species-being. Friedrich Nietzsche declares his discovery the eternal return as time's structure to be the highpoint of his thinking. And Martin Heidegger, who directly or indirectly influences most subsequent theories of temporality, holds time to be the horizon of our understanding of being.

Temporality has become important in many critical strands of political theory, including hermeneutic, historicist, and poststructuralist approaches, which reject universalist theories that appeal to ahistorical concepts of rationality, subjectivity, or truth. Stressing the way human beings are immersed in time and history, these critical approaches also reject the simple model of "clock time," which treats time as a linear continuum of past, present, and future, and as an empty medium in which events occur. Some theorists in the hermeneutic tradition analyze how temporal relations play a constitutive role in our understanding of events and of the past: Our present-day prejudgments, for example, circumscribe our interpretation of the past, while our dialogue with the past can help illuminate and modify our current prejudgments in both their distorting and their enabling roles. Others who practice conceptual history explore how temporality is experienced in different historical periods and how the modern experience of temporality—which includes our self-understanding of being historical, of our identity being delineated by history—underpins the concepts and social reality of the age. Still others maintain that the very structure of time constitutes the active force that propels changes that unfold in a linear, chronological way. Some recent theorists, drawing on Henri Bergson's philosophy of duration, hold that the past and memory remain embedded in the present in such a way as to drive the creation of new futures. Others, frequently influenced by Heidegger, stress that the future is not simply "ahead" of us but overhangs the present in the form of anxiety about death, and that in this way the future structures the present in both its relation to the past and its movement forward.

Many theories of temporality that focus on the structure of time as a force of change conceive of the event as a break in the continuity of time itself rather than a change that simply occurs in time. These theories argue that while an event may have a time and place that locate the site of its appearance, it also has an "untimely" aspect, a fourth dimension, so to speak, which does not allow it to be reduced to the effect of preceding causes in a linear order of past, present, and future. A political revolution would be considered an example of such an event, if it is held that prior economic and social conditions cannot explain its emergence or its effects. On this view, a historical account that explains the event after the fact, in terms of the events and context that preceded it and the new reality whose creation is attributed to it, is unable fully to explain the event's sense—there is a way in which the event is necessarily out of sync with the time and place of its eruption, which is precisely why it confronts us with the emergence of something new into history. Many theorists who emphasize the temporal structure of events therefore hold

that these events must be approached not through historical analysis but through an alternative that aims to grasp their temporal structure, such as the genealogical approach of Nietzsche or Michel Foucault. Genealogy aims to discern both the discontinuities of the event and the power relations that suppress these discontinuities in order to make history appear as an orderly and, in some cases, a progressive or teleological succession.

Terrorism

Terrorism is a highly contested concept with dozens of definitions, none of which are definitive. There is to date no globally agreed, unambiguous definition or description of terrorism. Indeed, recently, prominent legal scholars have questioned whether we ought to spend time worrying about precise definitional issues at all, except for specific legal purposes. Notwithstanding the hardships involved in pursuing a canonical definition of such a politically contested concept as terrorism, if we are to fruitfully pursue the timely moral, political, and legal issues regarding the changing character of modern warfare, we must first reach some understanding of what terrorism is.

The various conflicting academic definitions of terrorism fall roughly into two categories. One large group of contemporary definitions seeks to highlight a specific aspect of terrorism that is said to single it out as a particularly fiendish and condemnable practice. In contrast, a second group of definitions aims to blur the distinction between terrorism and other violent acts, suggesting that terrorism is no worse than many forms of state-employed violence. Each type of understanding, clearly, has its respective normative implications.

The former, stringent, type definition singles out terrorism distinctly from all other forms of political violence. On such narrow accounts, terrorism is, roughly, the intentional random murder of defenseless noncombatants, with the intent of instilling fear of mortal danger amid a civilian population as a strategy designed to advance political ends. This narrow understanding of terrorism, distinguishing it from all other forms of violence and describing it derogatively as the ideologically motivated random targeting of civilian objectives, violating civilian immunity, for political purposes, originates in Michael Walzer's classic *Just and Unjust Wars* (1977), and it is echoed in many other modern works. Most theorists agree that terrorist strategy necessarily involves instilling widespread fear among a civilian population (as implied by the term *terror* itself) in order to achieve the desired political ends.

This basic understanding of terrorism (which admittedly allows for some variation) as the intentional and intimidating random murder of civilians for political purposes has become the term of reference for practically every debate on the nature of modern terrorism, whether concurring or criticizing it. On this prevalent account of terrorism, the intentional murder of random civilians in direct defiance of noncombatant immunity sets terrorism apart (for the worse) not only from conventional warfare but also from other forms of revolutionary violence, such as guerrilla tactics aimed at armies and political assassination aimed at particular state officials.

In opposition to this understanding, wider inclusive definitions of irregular warfare deliberately refrain from defining terrorism independently of political violence in general, and regard it as synonymous or interchangeable with terms such as *guerrilla warfare* or *freedom fighting*. Quite

obviously, many acts of conventional warfare can also equally be described as violent and intimidating for political purposes and often incur civilian casualties, however incidentally they claim to do so. Consequently, it is argued, there is no justification for singling out and denouncing terrorism distinctly on the basis of its harm to civilians or causing fear. Several modern-day theorists therefore adopt a variety of inclusive accounts of terrorism that blur the distinction between terrorism and other forms of political violence, or altogether deconstruct the distinct notion of terrorism. Many theorists believe that the very concept of terrorism as distinct from other forms of belligerence, or at least its current usage as a derogatory term, has been sinisterly molded in order to serve the political interests of the stronger powers within the international community. This type of inclusive definition of terrorism/political violence, taken together, aims to obliterate the distinction between terrorism and other violent acts, with the clear implication that terrorism is, in and of itself, no worse than many other practiced forms of violence in the course of war, some of which are internationally sanctioned.

There is much controversy regarding the relative merits of these two conflicting types of definitions, as well as on the possibility of justifying modern terrorism under certain circumstances. The latter, more inclusive definitions allegedly aspire to neutrality with regard to the moral appraisal of terrorism. In fact, they go a long way toward endorsing it as an alternative form of warfare, a weapon of the weak, and a possibly legitimate last resort option in emergency situations. In contrast, the stringent definitions intentionally single out the objectionable traits that characterize terrorism as a distinct condemnable strategy. It is perhaps the strength of the narrow definitions, rather than their weakness, that they do so, as terrorism is commonly employed, at least in everyday political speech, as a derogatory term. The stringent definitions that tie terrorism to the intentionally intimidating violation of civilian immunity are helpful in accounting for and explaining the prima facie wrongfulness usually associated with this tactic, whatever the ultimate judgment of its use in particular incidents may be.

Theater: Antiquity and Middle Ages

Throughout Greek and Roman antiquity and the European Middle Ages, the theater was a central part of civic life and a collective experience. Shows were put on in accordance with civic and religious calendars and played an important role in creating a sense of community identity. The economic organization of the theater, however, varied greatly across these periods, as did the relationship between performers, audiences, and patrons.

Classical Athens

The Greek world in the classical period (fifth and fourth centuries BCE) was dominated by the city of Athens, where theatrical performance was an integral part of several religious festivals. As such, it was a collective experience, in which citizens played active roles as performers, spectators, and organizers, and the theater served as a vehicle for the city's self-presentation and self-examination.

The most important of these festivals was the Great or City Dionysia in the spring of each year, when tragedies and comedies were performed over a period of several days, along with choral songs (*dithyrambs*) celebrating the god Dionysus. These festivals were political and religious occasions, opening with processions, sacrifices, and public ceremonies in the theater during which public honors were announced and, at the height of Athenian power, the tribute paid by the city's

allies was displayed. The dithyrambic performances alone involved 20 choruses of 50 members, 2 from each of the 10 tribes that represented one of the basic units of democratic organization. It has been calculated that 1,200 individuals were involved in performing at each City Dionysia.

Though the origins of Athenian drama predated the beginnings of democracy at the end of the sixth century, the theater came to be closely intertwined with Athenian democracy in its themes and organization. All performers were Athenian citizens, and the dithyrambic choruses made visible on stage the structure of the democratic system. Along with the courts and the assembly, the theater was one of the mass meeting places of citizens; a special fund, attributed to Pericles, enabled the poorest to attend. Women, however, were probably excluded from the theater, as they were excluded from the political decision making of the Assembly and from the law courts. On stage, female roles were played by male performers.

The performances themselves were competitive events in which the three poets who had passed a preliminary selection each presented a single comedy or a trilogy of tragedies, followed by a comic satyr-play. Of the many plays presented each year, only a handful have survived in their entirety. These are by the three fifth-century tragedians, Aeschylus, Sophocles, and Euripides, and the comic poet Aristophanes. The work of the fourth-century comic poet, Menander, is known from substantial fragments.

The main cost of funding dramatic performances was born by wealthy citizens. One sponsor (*choregos*) was assigned to each poet and to each dithyrambic chorus and was expected to finance and organize the training of the chorus and to bear other expenses involved in the production. In return the choregos won prestige, underlined by his prominent role in the ceremonial, and an association with a winning play could bring political advantages. Rivalry between competing choregoi was intense.

The vast majority of tragedies presented traditional mythological subjects. (One attempt to depict a recent catastrophe in the early fifth century is said to have resulted in a fine for the poet, Phrynichus, for presenting distressing material.) Tragedy used many distancing effects, such as masks and stylized diction and gesture, but its stories of legendary figures served as a vehicle for direct and indirect commentary on contemporary politics and society. The city of Athens and its institutions are often depicted in a positive light, as is the Athenian hero Theseus, and the presence of the chorus ensured that the actions of legendary kings were placed in the context of a community. The plays can be read as explorations of tensions and contradictions inherent in relationships between men and gods, in the nature of power (as in Aeschylus's *Prometheus Bound*), the competing demands of loyalty to state and family (as in Aeschylus's *Eumenides* or Sophocles' *Antigone*) or the role of women in society (as in Aeschylus's *Agamemnon* or Euripides' *Medea*). War and its devastating effects were a frequent subject, particularly for Euripides whose depictions of the suffering of the defeated, like *Trojan Women, Andromache,* or *Hecuba,* were produced against the background of the Peloponnesian War (431–404 BCE). In his blustering leaders and their cynical maneuvers (*Hecuba, Iphigeneia in Aulis*) we may see a critique of contemporary politicians and of their misuse of language.

Fifth-century comedy (or "Old Comedy") played a minor role in the City Dionysia but was important in other festivals such as the Lenaia, when no foreigners were present. Known mainly through the plays of Aristophanes, Old Comedy offered a direct commentary on social realities by depicting contemporary citizens operating within the city of Athens. Typical plots showed the common man struggling against the odds, often against the background of the war. Known individuals were also satirized, notably the prowar politician Cleon in *The Knights* and the philosopher Socrates in *The Clouds,* as were aspects of contemporary society like the Athenian enthusiasm for courtroom battles (in *The Wasps*). Comedy had the power to shape, as well as reflect, public opinion if we are to believe Plato's suggestions that Aristophanes' portrayal of Socrates contributed to the public hostility that led to the philosopher's execution.

Plato also excluded drama (as well as epic) from his ideal state, as outlined in *The Republic,* partly on account of its emotional impact on the spectators, a criticism that was answered by Aristotle with his theory of *katharsis* in *The Poetics.*

Several institutional changes occurred during the classical period, including the introduction of prizes for actors in the mid-fifth century, which led to the development of acting as a profession. In the

second decade of the fourth century, competition in revivals of old tragedies was added to the program of the City Dionysia, followed by old comedies in 339. The concept of plays as "classic" texts to be read rather than pure performances was given further impetus when Lycurgus required authoritative scripts of the three great tragedians of the fifth century to be archived in Athens.

The Hellenistic World

The tumultuous events of the fourth century ended in the destabilization and weakening of democracy in Athens and the hegemony of the Macedonian dynasty of Philip and Alexander in the Greek world. The Athenian New Comedy of the late fourth-century Athens is represented by the plays of Menander (active 321–289), which show family dramas revolving around marriage and forbidden affairs, acted out by a range of typical characters. The chorus no longer had a role to play in the plot but instead performed interludes. The plays reflect a new interest in the individual. However, the family situations can also be seen as a microcosm of society, in which the union of citizens perpetuates Athenian democratic traditions despite threats from outside forces.

Outside Athens, Greek culture was spread throughout the eastern Mediterranean by the conquests of Alexander and the establishment of successor kingdoms in the region after his death in 323 BCE. The prestige of Athenian language and culture ensured that the texts of plays continued to be copied, read, and performed for centuries throughout this area. The creation of new festivals was another means of disseminating Hellenic culture and establishing the importance of local dignitaries. One sign of this flourishing theatrical culture is the professionalization of acting and the creation of a professional guild, the Artists of Dionysos. Another is the increasing theatricalization of public life and ceremonial.

Rome

In Rome, ritual dances had been part of Roman cult celebrations from the fourth century BCE (under Etruscan influence), but the first dramas in the Latin language were staged in the mid-third century; these reflected the growing influence of Greek culture. From then on, drama was integrated into the games (*ludi*) organized and financed by the state in honor of various divinities. These festive periods were strictly demarcated, with no public business being carried out. Entertainment of various kinds—chariot-racing, gladiatorial shows, drama, juggling, and acrobatics—was presented during the games and was understood as a gift to the people from their rulers. Seating arrangements replicated social structure, with the front rows of seats being reserved for members of the upper orders. Under the republic, the magistrates responsible for organizing the games supplemented the state funding from their own pockets in the hope of acquiring popularity and votes. The importance of the games was not lost on the emperors from Augustus onward, who continued this tradition as noted in Juvenal's remark about the role of "bread and circuses" (*Satire,* 10.81) in preserving the political status quo.

Roman actors and playwrights were considered to be hired laborers and, in the republican period, were often slaves of Greek origin. Actors, with a few exceptions, suffered from an array of legal disabilities, which excluded them from public life and from marriage with members of the aristocracy, even after they had retired from the stage. Such exclusions may reflect the desire to maintain a conceptual divide between politics and performance as well as the ambivalent position of the performer as a "gift" to the people who is an agent in his own right. Actors' degraded social status was in marked contrast to the adulation and rich rewards enjoyed by some and this paradox sums up the ambivalence of Roman attitudes to the theater.

Little remains of Roman tragedy, despite its immense importance and popularity, and it is not certain that the tragedies that do survive, by the first-century CE Stoic philosopher, Seneca, were performed. Roman comedies, known from the plays of Plautus (active 204–184 BCE) and Terence (active 166–159 BCE), were inspired by Greek New Comedy. These plays explore conflicts between the generations and often depict inversions of the social order, through the figure of the wily slave.

From the age of Augustus (27 BCE–14 CE) Roman theater was increasingly dominated by two types of performance art, both originally Greek: mime and pantomime. In the mime, a type of semi-improvised farce involving verbal wit, song,

dance, and physical comedy, actors appeared unmasked and women appeared on stage. The fluidity of mime made it an ideal genre for commenting on current scandals and reacting to tensions in society. Minority groups, like Jews, Christians, and various "Barbarian" peoples, were a target for crude satire in the mimes' skits. The mime was notorious for its depiction of adulterous liaisons; these and other transgressions can be read as attempts to challenge the established order and to subvert social convention staged within the ludic context of the festival.

The more prestigious pantomime was a solo mimetic dance form in which the mute and masked dancer (usually male) embodied a series of characters, male and female, human and divine, against a musical accompaniment. It reached its canonical form in Rome in the reign of Augustus and came to dominate theatrical performance throughout the empire for several centuries (its gestural language was particularly suited to a multilingual Roman Empire).

The Roman domination of Western Europe and the Mediterranean from the first century onward allowed the theater to flourish. Festivals, in which drama often played a part, continued to provide a means for local communities to express their sense of identity and local dignitaries were keen to fund them. Traditional Roman religious festivals, like the Rosalia and the Calends, and imperial festivals in honor of the emperor and his family were absorbed into local calendars throughout the empire. Artists traveled great distances to compete in the most important festivals. Tragedy and comedy (both new plays, of which no examples have survived, and "classics") continued to feature in dramatic competitions in the Greek-speaking world, but appear to have died out during the third century, with the exception of sung excerpts from tragedy performed by specialist singers or *tragoedi*. New competitions in pantomime and mime were introduced in the second and early third centuries, reflecting the importance of these new forms.

Political disruption and inflation in the third century appear to have diminished the festivals and thus the opportunities for employment. By the fourth century CE, theatrical entertainment was concentrated in large urban centers like Rome, Carthage, Alexandria, Antioch, and the new capital of Constantinople (founded in 324 CE). The fifth century saw considerable disruption of civic life, and therefore the theater, in the western part of the empire due to Barbarian invasions (though shows continued to be held in the city of Rome into the sixth century). In the cities of the eastern empire, theatrical shows continued, but their organization was gradually taken over by the four "factions" (Blues, Greens, Reds, and Whites) that had originally controlled and organized chariot-racing teams in Rome. This development relieved patrons of the practical burden of arranging shows and ensured that the vital element of competition was preserved.

During late antiquity, performances provided an important point of contact between citizens and their rulers (provincial governors, e.g.). The shows were themselves a display of power of wealth by patrons, most notably at the New Year festival of the Calends when the new consul sponsored entertainment. The auditorium offered a picture of society with spectators seated according to age, rank, occupation, or religious or faction affiliations. Audiences made their own grievances known at these events, and shows of all kinds often led to violent disturbances that resulted in several temporary bans on performances.

From the reign of Constantine onward, theatrical performance took place in an increasingly Christian empire. Performers were refused baptism unless they left the profession, and church leaders attacked traditional entertainments of all kinds on religious, moral, and economic grounds. These critiques also reveal an acute awareness of the role of the theater in creating a sense of civic identity, which threatened the creation of a Christian society, as well as concerns about the competition between church and theater for resources and for the attention of the people. Though they were to prove influential in later periods, the church fathers' tirades had little practical impact in their day: Theatrical and other shows were so much part of the fabric of civic life in the later empire that Christian emperors were careful to protect them and to ensure that funding continued as long as possible.

The Middle Ages

Pantomime and tragedy did not survive the Barbarian invasions of the West and the disruption

in the East caused by the Arab invasions of major centers like Antioch and Alexandria in the seventh century. The humble mime may well have survived, as it was a far more flexible art form that could be presented in the street or in the private houses of the wealthy. There are points of contact between Roman mime and the medieval jester or even the Commedia dell'Arte, though direct links are difficult to establish. Byzantine writers certainly seem to have been familiar with a type of satire of ethnic types that may well have roots in the Roman mime, although continuity is again hard to establish. There is little evidence for formal theatrical performance in Byzantium, though many sermons and speeches have dramatic elements and the ceremonial of church and empire can be defined as a type of spectacle. The Eastern Orthodox Church continued to reject theatrical representation and did not develop religious drama.

There is also little evidence for theatrical performances in the medieval West before the tenth century. After then, plays on Christian themes were performed in churches by clergy as part of the liturgy, possibly developing out of ritual reenactments of gospel stories (particularly the events of Easter week) and dramatic dialogues, making the boundary between "ritual" and "theater" difficult to establish. Other religious dramas were performed by members of the community, sometimes by members of trade guilds, using the vernacular instead of Latin. By the fifteenth century, secular farces and morality plays were also common. Overall, the medieval theater shows a great variety of types of performance, context, and organization, with the impetus sometimes coming from the citizens themselves or from overlords.

THEOLOGY

Within the context of political theory, theology might appear to be at the margin. The vocabularies of modern political thought are framed in opposition to theological world views; political theory begins where theology ends. At least this is the usual secular narrative. However, as pointed out by various perspectives within contemporary political theory, such as those associated with the work of William E. Connolly, Hent de Vries, and Charles Taylor, the relationship between theology and political theory is not necessarily so clear-cut. Some theologies articulate fully developed political theories or they have a political program; some political theories include theological imaginations or they have theological origins; and theologies and political theories compete over the political significance of their ontological assumptions and ethical guidelines.

When considering the canon of political thought, several theologians appear; among them are the church father Augustine (354–430) and his distinction between the City of God and the City of Man and the founder of the Protestant Reformation, Martin Luther (1483–1546), and his doctrine of two kingdoms: The heavenly and spiritual kingdom ruled through the gospel and the earthly kingdom ruled through secular government, that is, by means of laws. Augustine and Luther articulate their political theory as a subfield of their theology. As such, they demarcate the scope of politics from the point of view of theology as a sphere

subordinated to theology. In other words, within the work of Augustine and Luther, theology also operates as political theory.

The opposite is the case for political theory from early modern times and onward, where political regimes are conceived as being man-made and human experience and rationality the point of departure for political knowledge, as, for example, in the works of Niccolò Machiavelli (1469–1527), Thomas Hobbes (1588–1679), Baruch Spinoza (1632–1677), and John Locke (1632–1704). In various different ways, the aim of the early modern political thought is to establish a secular political order capable of settling the wars of religion, stopping the persecution of religious minorities and heretics, and guaranteeing the natural rights and liberties of every man and citizen. The political ideals of a secular political order that constitutes a common ground independent of religious doctrines and affiliations include liberty and toleration, equality and impartiality, neutrality and universality. Furthermore, the establishment of a secular political order presupposes the rationality of every man to be able to authorize and legitimize the common secular ground regardless of their religious points of view. Another aspect of this focus on human rationality is the priority of knowledge over faith and the ability to diagnose and criticize the misuse of power in the name of religion, that is, in the name of a Christian religious community. This foregrounds the Enlightenment critique of religion. In other words, in early modern political thinking, theology is subordinated to political theory framed as a new political science, and the sphere of religion is subordinated to the sphere of politics.

This opposition between theology and political theory is reflected, for example, in the diagnoses of contemporary world politics as a clash of civilizations; or more specifically, a cultural war between religion and secularism. The implicit theoretical assumptions of such diagnoses are, however, questioned by the various perspectives of contemporary political theory mentioned earlier. Rather than assuming any clear-cut opposition and differentiation of distinct religious and political spheres and their essential origins in different civilizations, theorists who allow for a more integrated view point out various dimensions of interchange and interdependence between religion and politics, theology and political theory. In doing so, such theorists take up several points of reference in the history of theological thinking and the history of political thought, such as the distinction between natural theology (*theologia naturalis*) and political theology *(theologia civilis*), first formulated by Marcus Terrentius Varro (116–27 BCE), or Jean-Jacques Rousseau's notion of civil religion. Among this group of political theorists, the claim is that both theology and political theory reflect upon the authoritative processes of setting the boundaries between religion and politics and the normative sources of legitimating the established relationship between religion and politics. Theology is thus political theory.

One crucial point of reference for the debate in contemporary political theory is the German interwar dialogues on political theology among figures such as Walter Benjamin, Franz Rosenzweig, Carl Schmitt, Gershom Scholem, and Leo Strauss. Three aspects of the German interwar dialogues play a vital role in the contemporary political thinking of religion and politics.

The first is that which Strauss has named the theologico-political problem, which emphasizes theology and political philosophy as distinct forms of knowledge and spheres of authority. On the one hand, one distinguishes and establishes a hierarchy between religion and politics, revelation and reason, faith and knowledge; on the other hand, one emphasizes that either theology or political philosophy is able to conceive the proper source of political authority, God or man, due to their modus operandi, revelation or reason. This is the political existential situation of choice one is placed in. The Straussian conception of the theologico-political problem has been rearticulated in the recent work of Mark Lilla and Heinrich Meier. For example, Lilla applies the identification of the theologico-political problem to the contemporary situation of decision framed as an either/or: either religious or secular worldviews. Within this political struggle, the theology component constitutes a permanent opposite pole and serious existential threat to the secular point of view that Lilla defends. Focusing on the permanence of the theologico-political, one could include French philosopher Claude Lefort. From Lefort's point of view, the permanence of the theologico-political refers to the symbolic principles of organizing society that

operate irrespective of the type of political regime and not only in absolutist regimes with an explicit political theology. In a modern democracy, the organizing principles assume the form of an empty space of power to be filled out in ongoing political struggles of symbolic representation, for example, when the people or the nation is identified as the last point of reference in constituting political authority. Even in a modern democracy, in other words, the theologico-political forms the constitutive principles of politics. Such an understanding of the permanence of the theologico-political also plays a role in the second aspect.

This aspect relates to the contested reception of Schmitt's political theology and especially his notion of sovereignty and the state of exception—"sovereign is he who decides over the exception" (Schmitt, 2005, p. 5)—and his conceptual sociology —"all significant concepts of the modern theory of the state are secularized theological concepts" (p. 36). The latter expresses the Schmittian understanding of the permanence of the theologico-political. In his terms, there is a structural analogy between, on the one hand, ancient and medieval theological concepts and, on the other, modern political concepts emphasizing both the theological origins of political concepts and the theologico-political horizon of politics. This leads to the first crucial element of Schmitt's political theology: his notion of sovereignty. The sovereign is the one who decides that there is a state of exception and makes decisions within this state of exception. The sovereign is both outside and inside this situation of choice—both higher than and involved in as sovereign power. Sovereignty is a boundary concept, both operating at the boundary and setting boundaries. In that sense, sovereignty is a theologico-political concept constitutive of modern politics, and the decision of the sovereign is the political act par excellence, setting the relationship between friend and enemy. Schmitt's conception of political theology plays a crucial role in, for example, the recent work of Giorgio Agamben and William E. Scheuerman, both of whom analyze the use of sovereign power in actual emergency laws and states of exception aspects of the so-called war against terror. However, this conception of political theology has become criticized by people emphasizing the need for normative restrictions on the sovereign use of power, which points to the third aspect of the German interwar dialogues on political theology and their revitalization in contemporary political theory.

The third aspect involves the various interpretations of the debate on messianism among Benjamin, Rosenzweig, Scholem, and others. The Jewish notion of messianism implies a temporal imagination of the Messiah to come and justice to be fulfilled in the world. In other words, the source of the ethical and political guidelines of how one is to organize and live one's life in common with others is a divine force outside this world that is expected to become part of the world. The debates on messianism in interwar Germany took their point of departure in the question how to speak of the divine in a world where the divine is almost absent. They focused on the weakness and fallibility of human beings in relation to forces outside the human, but without ascribing these forces any kind of determination. Within this frame, the theologico-political figure takes another character than the Schmittian one in the sense that it creates imaginations of ethical cultivation in response to the messianic call rather than consisting of the brute use of sovereign power only. The question is, however, whether messianism indicates the philosophical reflections upon ethical and political conditions of possibility or a call for political action justified by a divine force beyond politics. For example, Agamben—and later Jacques Derrida—reflect upon this question in their respective analyses of the dilemmas of messianism as both an ethical source of inspiration in political and legal matters and a point of reference for justifying political actions, including violent actions that annihilate the ethical relationship to others. Derrida frames this paradox of the theologico-political in terms of the coexisting conditions of possibility and impossibility of ethics and politics. This is the case with his notion of a hope for a democracy to come as an ongoing political struggle for the better without any articulated ethical criteria and determinate actions, which at the same time implies that one must take the risks of subversive elements within the processes.

These debates in contemporary political theory on the relationship between theology and political theory emphasize the processes of reflecting and setting the boundaries between religion and politics—especially the various forms of interchange and interdependence between the

theological and religious sphere, on the one hand, and the political, on the other. A point of view that is common among the various perspectives is the focus on the paradoxical situation that emerges when secular political theory repudiates theology and excludes the religious sphere from politics, thereby reproducing the authority that theology and religion formerly had, in a negative or positive sense. In other words, it is impossible not to include theological imaginations in thinking of a secular political order that is supposed to be independent of religion. Furthermore, the debates point out the circumstance that it is not that simple to establish an exclusively secular normative point of view for justifying political obligations and restrictions in the use of power without also including ethical points of view put forward by various theological doctrines. In the present post-secular situation, it is often claimed—for example, in the recent work of Jürgen Habermas—that the secular state must take theology seriously, both as a distinct form of knowledge and an academic discipline and as a religious authority constitutive of religious communities. This represents a necessary shift in the secularist self-understanding of the state in order to live up to the secular, democratic ideals of liberty and toleration, equality and impartiality, neutrality and universality.

In that sense, the debates in contemporary political theory addressing the boundaries between religion and politics point to the critical potential of theology and political theology with respect to the blind spots of secular political theory and secular political regimes. In general, this implies a critique of liberal democracy and its focus on formal procedures, rights, and liberties and especially the implied assumptions of the institutional separation of church and state neglecting the various existing and possible combinations of religion and politics and the founding of political orders in substantial social imaginations, religious or political. At the same time, the various perspectives in contemporary political theory reflect upon the societal disintegrative aspects of religious communities and the democratic dangers of political theologies for modern democratic societies.

Theories of Justice

See Justice, Theories of

Thomism

The term *Thomism* may be understood in two senses. In one it refers to the school of Thomas Aquinas, an unbroken tradition since 1274 in

which people study, teach, and promote the thought of Aquinas. In the other sense it seeks to identify the doctrines that distinguish adherents of this school. These distinctive doctrines are, in the first place, metaphysical and theological rather than political, although it can be argued that a distinctive political philosophy emerges from the application of Thomist doctrines to questions of government.

In this entry, Thomism is treated in both senses. In the first it requires identifying the important personalities and significant events in the history of the school of Thomas Aquinas. In the second it means considering the philosophical and theological teachings of Aquinas that are relevant to political philosophy, in particular his understandings of natural law, of the distinction between nature and grace, of the human person, and of that in which human flourishing consists.

A School in History

Early Followers

Aquinas did not gather a group of disciples to promote his thought, and it is clear that he never intended to found a "school." His secretaries and pupils finished some of the works left incomplete at his death. Reginald of Piperno wrote the remainder of the *Summa theologiae* using earlier writings of Aquinas and edited some of his Scripture commentaries. Two of Aquinas's main political works were incomplete and their subsequent editions were much interfered with, his commentary on Aristotle's *Politics* was finished by Peter of Auvergne, and his *De regno ad regem Cypri* (On Government to the King of Cyprus, also known as *De regimine principum*), was finished by Ptolemy of Lucca.

Although Aquinas nowhere presents a complete political philosophy, some distinctions introduced by him begin to be used with effect in early fourteenth-century treatises on government. The distinction between church and state, for example, is placed on a new footing on the basis of Aquinas's distinction between grace and nature, as is also a distinction between royal (*regimen regale*) and political government (*regimen politicum*), something he learns from Aristotle. Royal government belongs with what Walter Ullmann calls the descending theory of government (sovereignty from above), whereas political government opens the door for the ascending theory (sovereignty from below). There is a practical political wisdom in Aquinas's preference for a monarchy ruling in collaboration with an aristocracy chosen by the people. His familiarity with the practical realities came through his family's involvement in the struggles between the pope and the emperor, as well as through his contacts with those directly involved in government both ecclesiastical and secular. Nor should the particular form of government enjoyed by the Dominicans be overlooked: Many, though by no means all, Thomists have been Dominicans, members of the same order as Aquinas, and thus shared his experience of its democratic, representative, and capitular form of government.

Dante Alighieri may be regarded as an early follower. Although Aquinas was not canonized until 1323, Dante's *Paradiso,* written 2 years earlier, already places Aquinas in a privileged place in heaven. Likewise, Dante's work on government, *De monarchia,* has been described as Thomism in practice. The idea of state sovereignty begins to take hold in Dante, in other writings of the period, and in the papal decree *Pastoralis cura* of 1313. To what extent Aquinas and his followers reflect movements inspired from elsewhere and to what extent they contributed to instigating or strengthening those movements are matters for debate.

One of the early Thomists to write on royal and papal power was John of Paris (John Quidort), who drew Thomist principles to their logical conclusion, arguing for the autonomy of the state as a natural political community in which the king is chosen by the will of the people. John was suspected of heresy on other matters, but he died before action could be taken against him.

Renaissance and Early Modern Thomists

A school of Thomists in northern Italy before the Reformation shared the general interest of Thomists elsewhere in the central concerns of Aquinas's philosophy and theology, but some of them were particularly interested in the practical and moral aspects of his thought. This no doubt reflects also the particular political constitutions and concerns of the city-states from which they came. Aquinas's acceptance of Aristotle meant a theory was available for what was already observed in practice in many places. From the perspective of

moral and political philosophy, the most important of these early Renaissance Thomists is Saint Antoninus, archbishop of Florence, who wrote much on questions of justice, law, and economics.

Although their own form of government was democratic and based on representative chapters of friars, Dominicans tended to support the supremacy of the pope against conciliarist ideas. At the same time Thomists made important contributions to the development of international law in the sixteenth century. Francisco de Vitoria and his colleagues at Salamanca, supported by Cajetan, especially when he was Master of the Order in Rome, rejected the idea that the emperor or even the pope had a universal right to wage war and appropriate the goods of other political communities. They replaced the medieval notion of a universal jurisdiction of the church with natural law as a universal *lex gentium* (law of nations). Vitoria spoke of a global commonwealth, or *res publica,* which could enact the law of nations. The customs, treaties, and agreements that make up this law are binding on individuals and come close to what natural law requires. In fact natural law had developed in relation to, and informed by, such ideas of a *lex gentium.* Though they continued to think of a state properly speaking as something less than a world community, their thought defended the rights of Muslim and pagan states, for example, against unjust aggression on the part of Christian states.

Domingo de Soto is another key figure among the Salamancan Thomists. His work *On Justice and Right* was the most often printed and widely distributed book of legal and political theology in the sixteenth century. He said that he could not see where Spain's "right" to its colonies in the new world came from. He developed Vitoria's notion of natural right, adding to it a notion of personal liberty. The question of balancing individual rights and liberties with the requirements of the common good moved to the center of political philosophy. Early modern Thomism is marked by a tension between the priority to be given to the common good (a prioritization that makes politics the highest practical science) and the fact that each individual exists not purely for the political community but for his or her own sake (*propter seipsum,* the antitotalitarian principle). The latter side of this tension is seen, for example, in the rejection by all Thomist theologians of the use of force in the process of evangelization: To enforce conversion to Christianity, Soto says, would be "against the natural right of freedom."

Under the influence of Aquinas's appropriation of Aristotle's thought, these sixteenth-century Thomists replaced another medieval political conception—rule by persons with a divine mandate—with a modern one—an international rule of law based on the natural law to which all human beings have access and which recognizes individual human beings as bearers of rights and duties. It may seem paradoxical that this understanding that undoes all theocracy is itself theologically founded, based ultimately on the conviction that every human being is created in the image and likeness of God. Although they move beyond Aquinas, their work is based on the principles of his political thought. They developed what they had received particularly (a) in speaking of subjective rights or freedoms complementary to objective right and (b) in giving a universal scope to notions of right and liberty which apply to everyone "by nature" (see Roger Ruston).

The humanizing influence of Aquinas's thought is seen in another important Thomist of this period, Cardinal Thomas de Vio, known as Cajetan. His views on slavery stand out as enlightened for his time. In response to Spanish actions in the New World, he said that what was going on amounted to robbery on a grand scale. The lords of these new lands, in place before the Europeans arrived, although they are unbelievers, are lawful lords, he said. Slavery is the continuous affliction on a living human being of personal violence and the enslavement of the people of the New World is unjust and immoral.

Another key figure of the period is Bartolomé de las Casas, conquistador turned Dominican friar and later bishop of Chiapas in Mexico. With the support of Cajetan and others, his agitation and writings eventually gained the response of Pope Paul III's encyclical *Sublimis Deus* (1537), one of the milestone statements in the process of weakening the acceptance of slavery by Christian rulers. Not that it brought disagreement to an end: Even in 1550 and 1551 de las Casas was obliged to debate with the Jesuit Sepulveda on the question of the full humanity, and therefore of the rights and liberties, of the native peoples of the Americas.

Thomism in Decline

Although Aquinas continued to be recognized as an important figure, later thinkers, even while regarding themselves as Thomist, departed significantly from some of the characteristic principles of Aquinas's thought. Thus Francisco Suárez, an original thinker in the philosophy of law, developed it in an un-Thomistic direction, locating the essence of law in the legislator's will rather than in an ordinance of reason. Two difficulties explain this move: (1) the fact that intellect and will are both involved in the explanation of law and their relationship can be taken in different ways and (2) the fact that Aquinas's account of natural law leaves the origin of obligation unclear. Thinkers of the post-Reformation period wanted clearer answers to questions about will and obligation, and Suárez's account of natural law can be understood as an admirable attempt to provide such answers. However, he concedes so much to new ideas—developing a modern understanding of freedom as active indifference, for example—as to make his fidelity to Thomism questionable.

Protestant thinkers struggled with the same questions. "Keeping God in" seemed now to require a voluntaristic understanding of natural law so that when Hugo Grotius came to reject such an understanding of law, he felt able to take a further step and regard natural law as something self-standing, having its meaning and force "even if there is not God." But the question of obligation remained unanswered, a gap Immanuel Kant sought to fill with his categorical imperative.

Richard Hooker is the most important of the Anglican Thomists. In his *Laws of Ecclesiastical Polity* he acknowledges his debt to medieval political philosophy, accepts Thomist ideas of natural law and of power deriving from the community, and adapts the notion of universal harmony to the nation-state. John Locke acknowledges Hooker's work in his *Second Treatise on Civil Government* although on natural law Locke is more influenced by Samuel von Pufendorf.

Locke set limits to the claims of absolute monarchy and showed that government is responsible to the people it governed. This is what Aquinas taught also, though Locke's basis for it was different. Beginning with the idea that every man (the term is deliberate here) is endowed with the inalienable rights of life, liberty, and estate, the function of government became for Locke that of giving effect to and preserving these rights. In practice the focus moved to property, which then came to be regarded as an absolute right and the basis for other civil rights (so only men of property were entitled to representation in parliament). Lockean government moved in the direction of an oligarchy of the propertied classes. Aquinas warned about the possibility of any form of constitution becoming tyrannical, including the aristocracy that becomes oligarchic, as well as offering a more profound reflection on the basis of the right to private property, a right that for him is relative and not absolute.

The differences that had by now emerged between Aquinas's presentation of natural law and those found in modern political philosophy are connected with voluntarism, with the idea of a state of nature prior to the political order and with an understanding of law as setting limits to conflict rather than explaining the positive contribution of the human creature within a theological, cosmic harmony. Thomist ideas carried little weight in this new perspective: The highest good is no longer a matter of concern, the common good is simply the sum of individual interests rather than a qualitatively different good, and the human group is inherently problematic rather than naturally collaborative. In modernity, then, the distinction Aquinas made between the natural and supernatural orders becomes a full-blown separation and even opposition between a sacred order and a secular order, the implications of which continue to be worked out in contemporary political struggles and philosophy.

The Irish political philosopher Edmund Burke is another example of an Anglican whose political philosophy may well have been informed by Aquinas's thought, by however circuitous a route (he would have known Hooker at least). Burke appeals to principles that are obviously congenial to the thought of Aquinas, notably in impeaching Warren Hastings (for his treatment of Indians) "in the name and by virtue of those eternal laws of justice which he has violated" and "in the name of human nature itself, which he has cruelly outraged, injured, and oppressed."

Thomism After the French Revolution

There is a revival of Thomism from 1879 with the publication of Leo XIII's encyclical *Aeterni*

Patris, which argued that a return to scholasticism, in particular to the thought of Aquinas, was the best response to nineteenth-century philosophical difficulties about faith and reason. This Leonine Thomism, as it is sometimes called, reached its fullest development by the mid-twentieth century.

The French philosopher Jacques Maritain is the most important Thomist political philosopher of this revival. In fact it was politics that led to conflict with his mentor, Reginald Garrigou-Lagrange. Maritain wrote in many areas of Thomistic philosophy, particularly epistemology and metaphysics, but with important ventures into the philosophy of education and political philosophy. Garrigou-Lagrange taught in the areas of metaphysics, dogmatic theology, and spirituality, and his extensive account of Thomism in the *Dictionnaire de théologie catholique* has nothing to say about political philosophy. In the 1920s Garrigou-Lagrange organized Thomistic circles that were attended by the young Maritain. They collaborated with other French medievalists, philosophers, and theologians in the development of new approaches to Aquinas but fell out over the Spanish Civil War and Vichy. This history shows that Aquinas's political philosophy, schematic as it is, is not one that falls on either side of the right-wing/left-wing divide in modern politics but is concerned with more fundamental questions that inform political practice leaning in either direction.

Maritain advocated what he called an open Thomism, which would be conservative and yet progressive, faithful to the teaching of Aquinas and yet capable of assimilating the insights of modern philosophers and scientists. He was convinced that in Thomism were to be found the principles for a realistic and existentialist metaphysics which alone, he believed, could provide the basis of a political and ethical philosophy that would do justice to the dignity of the human being and his or her relationship with God. Maritain sought then to present a philosophy of being, of society, and of politics that would be open also to the gospel's message of love.

His many works in political philosophy include *True Humanism, Man and the State, Freedom in the Modern World, Christianity and Democracy, Moral Philosophy,* and *The Rights of Man and Natural Law*. He developed a Christian social philosophy of what he called "integral humanism," a valuing of the human person that was also theological, that called for a brotherhood of all peoples and that respected human dignity and rights. In the ideological turmoil of the twentieth century Maritain said that a new Christendom could only be established by a humanism that was heroic. He is without doubt a democrat, and he redefines the basic political concepts of Thomism—the body politic, the state, the people, and sovereignty—so as to make them serviceable for the defense of democracy. Freedom becomes a central concept in Maritain's political philosophy.

Yves Simon is another important twentieth-century political philosopher who, with Maritain, sought to move the axis of Thomist social and political theory toward liberal democracy (John P. Hittinger). Simon sees in Aquinas's view that law is properly enacted only by one who has care of a whole community, the seed of the transfer or transmission theory of power, explicitly proposed by the Jesuit Thomists Suárez and Robert Bellarmine. This theory regards government as legitimately established through a transmission whereby the people transfer power to the rulers and this provides the basis for democratic authority.

Maritain's personalist democracy was criticized by Aurel Kolnai, whose alternative political philosophy, the metaphysics of political conservatism, also appeals to Aquinas and to the importance for him, as for all medieval thinkers, of the notions of hierarchy, privilege (grace), and liberty. Kolnai's work is in response to any tendency to regard political life as capable of concerning itself with the fullness of human flourishing. The higher realms of human experience in art, philosophy, and spirituality reach far beyond the concerns of politics, he says.

Maritain was the first Thomist to contribute significantly to thinking about questions of authority and freedom in the context of modern pluralistic societies. A fundamental question is whether the modern nation-state coincides, and to what extent, with what Aristotle and Aquinas meant by the state. The Catholic philosopher and theologian Robert Sokolowski thinks that these two conceptions of the state are irreconcilable, the modern Hobbesian *Leviathan* being, appropriately, a totalitarian monster where Aristotle's *polis* is a humane community of persons in which reason can be exercised, prudence decide what

forms and constitutions are required as circumstances change, and prepolitical communities (or civil society) be respected.

Sokolowski makes no mention of Aquinas and argues that political philosophy has been shortchanged by Leonine Thomism. Maritain and Simon stand out as exceptions, he says, in a school for which political philosophy practically disappeared, with just a few questions such as just war and capital punishment being treated, and then as part of ethics rather than in a political philosophy as such. As a philosopher, Sokolowski is a phenomenologist rather than a Thomist, but his work is interesting in showing how a Catholic understanding of the (Aristotelian) state, critical of the Hobbesian alternative and dependent on the crucial notion of the person, can be developed without any Thomist mediation.

To be noted also is the extensive involvement of Dominicans in issues of social justice. Dominique Pire won the Nobel Peace Prize in 1958 for his work on behalf of displaced persons after World War II, and he is just the most distinguished of a large group of thinkers and activists from many parts of the world, all of them educated in the school of Aquinas. Francesco Compagnoni and Helen Alford have edited a substantial, but by no means comprehensive, record of Dominican involvement in such work.

Distinctive Doctrines

Distinctive doctrines of Thomism are, in the first place, philosophical, even metaphysical, understandings of being and of the knowledge of being. Thomism is a moderate realism with a commonsense confidence in the ability of human beings to come to know their world and appreciate to some extent how they ought to live if they are to flourish within it. The natural philosophy, metaphysics, and moral philosophy that characterize Thomism are closely dependent on Aristotle. Thomists have always regarded themselves as Aristotelians, keeping abreast of expanding knowledge of Aristotle's philosophy even when it came to be seen that Aquinas's knowledge of it was limited. One of the significant movements in Thomism through the twentieth century has been a fresh realization of Aquinas's indebtedness to neo-Platonism for important aspects of his philosophical theology.

In the early twentieth century the Roman Catholic Church identified 24 theses in Thomistic philosophy that were to be subscribed to by all Catholics as essential foundations for the theological teachings of the church. This was a controversial position, even within the church, and did not last long. Other attempts to identify the doctrines of Thomism have been made, but it is striking that political doctrines tend not to feature in these lists. That of James A. Weisheipl is an exception. Beginning with the distinction between nature and the supernatural, he lists 10 principles of Thomistic philosophy and 10 of Thomistic theology. The sixth philosophical principle reads:

> By nature man [*sic*] has the right to cooperate with other men in society in the pursuit of personal happiness in the common good; this pursuit of happiness is guided by conscience, laws both natural and positive, and virtues both private and public.

Thomistic doctrines that are most important from the point of view of political philosophy, then, are natural law, the distinction between nature and the supernatural, happiness, the virtues, and the notion of person.

Natural Law

For Aquinas natural law is the human being's participation in the eternal law. Such participation is intelligent and responsible, making the human being a participant in providence and not simply a passive object of it. All law is an ordinance of reason enacted by one who has responsibility for a community and has made that known to that community. The right to legislate positively, which belongs to those who have such responsibility, is part of natural law even if the natural law does not determine in advance the particular ways in which such laws should be enacted or what their specific content should be. The state, and so political authority, is natural for Aquinas as it was for Aristotle. There is no state of nature that precedes the political community. Natural law establishes the need for certain elements and values—for example, possession of property by citizens, government in some form—but there is still room for contractual agreement about the ways in which these elements and values are to be pursued within

a particular community. Thomist understandings of natural law bring together many strands of earlier philosophical thought, Roman jurisprudence, and canon law. Such strands of thought also included important considerations of notions such as right, person, and sovereignty.

Nature and the Supernatural

Although the order of grace transcends the order of nature, it does not replace that order but perfects and fulfills it, bringing nature to a fulfillment beyond its inherent capacities but still in the direction of its natural inclinations to happiness. The most important implication of this for political philosophy was a clearer distinction between sacred and secular. Thus the person under grace is more than the natural human being. This has two important consequences. The human being who is a subject in the church is at the same time a citizen in the state: There is autonomy of the natural created order within the overall economy of grace. Thus Aquinas acknowledges that there is true virtue among pagans (*Summa theologiae,* I.II 65,2). But he believes also that true human fulfillment is found only in the order of grace so that the human person is always more than the citizen.

The state is a relatively ultimate end in the line of the natural human instinct toward community. It is concerned with "the highest good," Aristotle says, and Aquinas follows him in this. Although it is not the absolutely ultimate end—which is eternal life with God, or the society of the heavenly kingdom—at the same time how can it be disentangled altogether from human seeking of that ultimate end? The state is not just for the management of evil tendencies but also for the promotion of good ones, for the encouragement of virtue.

This distinction of the good citizen and the good human being thus sets the scene for modern times. Some fear that Aquinas's distinction contained the seeds of a disjunction between the natural and the supernatural that led eventually to secularization, the cutting of any link between nature and God. Aquinas himself did not do this, and his followers would not want to. It happens rather with Marsilius of Padua, in the early fourteenth century, for whom the link between nature and God becomes a matter of faith. Aquinas's understanding of natural law remained essentially theological, and in this he belongs more straightforwardly than does Marsilius to the traditions coming down from the ancient Greeks and Romans.

Happiness and the Virtues

For Aquinas full human flourishing requires the body—not just the physical body but also the body politic of a human community. The human being does not flourish alone. Such a life would be beastly, says Aristotle, though for Aquinas it is perhaps divine in the case of some unusual saints. It is for the well-being of our beatitude (our complete happiness) that we are bodily, Aquinas says, and our flourishing is enhanced by the companionship of friends. Life in community requires the development of dispositions or virtues if it is to be established and sustained. As the human being needs to be temperate and confident if he or she is to be mature in personal affairs, so he or she must develop especially the virtues of justice and prudence in order to participate effectively in political life, the pursuit of common goods.

The Notion of Person

One of the central questions raised by Thomism is whether the notion of "person" presupposes a theological understanding of human nature and destiny. Theological controversies in the early centuries of Christianity helped to refine the meaning of "person" and "humanity. "These notions are central in Maritain's political philosophy, which is an important influence on the Roman Catholic Church's acceptance of the language of human rights. Recent popes have been happy to use this terminology, beginning with John XXIII in his encyclical *Pacem in terris* (1963). Paul VI was also significantly influenced by Maritain's work and made his notion of "integral humanism" central to the encyclical *Populorum progressio* (1967). John Paul II's social encyclicals likewise emphasize the dignity of the human person and the centrality of human rights. Although he pursued doctoral studies with Garrigou-Lagrange in Rome and was much influenced by Maritain, John Paul II was not simply a Thomist. His thinking about political questions is significantly shaped also by his lived experience of Marxist-Leninism as well as by Max Scheler's theory of value.

Contemporary Thomism

Contemporary Thomists appeal to Aquinas from different perspectives. Some have sought to show that his political views are compatible with forms of liberal democracy and that his understanding of natural law is not so dependent on theological beliefs that liberal critics must reject it out of hand. On the other side are efforts to show that Aquinas is misinterpreted if he is interpreted as liberal or as liberal-compatible; these Thomists argue instead that his political views support the kind of radical critique of which liberal democracy stands in need and that his (theological-philosophical) understanding of natural law offers one of the few credible alternatives to the dominant philosophy of culture. Thomists of various shades are important contributors to contemporary debates about the meaning and purposes of education, for example, and they also participate in debates about war, bioethics, and environmental ethics.

In the works of American students of Aquinas, such as Robert P. George and Peter Augustine Lawler, Germain Grisez, Ralph McInerny, and Jean Porter, and of non-Americans influential on the American scene such as John Finnis and Alasdair MacIntyre, is to be found a range of interpretations of natural law, a variety of uses of Thomist ideas, and telling contributions to contemporary political, social, and cultural debates. John Courtney Murray believed American Thomism's most important contribution was to defend a realist epistemology, to ground the genuine human goods to which people aspire, and to order freedom so that those goods might be affirmed as genuine. Thomism's strength continues to be in affirming the naturalness of social and political life while underlining that the secular is not ultimate for human beings. On the one hand emphasizing the importance of reason and freedom, Thomist approaches seek to ensure that the state does not become totalitarian (which can happen in religious, sacred dress also of course). The tension between freedom and truth, identified so clearly by John Paul II in *Veritatis splendor* (1993), has its roots not in 1960s libertarianism but much earlier, in the developments from Marsilius of Padua to Thomas Hobbes and beyond to the French Revolution, a tension that has grown ever stronger between a voluntarist idea of law as will and natural law as an intellectualist idea. So Thomism, in Mark Guerra's words, can praise the virtues of liberal democracy while moderating its dehumanizing excesses.

Thoreau, Henry David (1817–1862)

Henry David Thoreau was an antebellum essayist and naturalist whose work later inspired nonviolence activists, environmentalists, and advocates of counterculture.

Civil Disobedience

Like other members of the so-called Transcendentalist school, Thoreau believed that we are all born with a moral sense we can cultivate and that this moral sense allows us to distinguish right from wrong. In a democratic society, where policies are pursued in the name of the population as a whole, this moral common sense brings with it a duty to resist unprincipled government policies. There are always means at hand to take up this responsibility because exemplary acts of resistance to unprincipled governmental action (Thoreau was particularly incensed by the 1850 Fugitive Slave Law and by the Mexican–American war) can awaken the moral sense of the population even when the political system is at a stalemate and moral appeals fall on deaf ears. Thoreau believed that only moral suasion and the ethical cultivation of the hearts and minds of the population will bring about lasting change in the nation because political mobilization without ethical cultivation simply empowers and gives voice to an unprincipled population. In *Walden,* "Civil Disobedience," and "A Plea for Captain John Brown," Thoreau thus calls on the moral heroism of individual citizens as a spur to change public opinion and government policy.

Critics question the existence of the common moral sense to which Thoreau has such constant recourse, as well as his belief that ordinary citizens can make politico-ethical judgments for themselves; a position that strikes many as potentially leading to anarchy. Nonetheless, Leo Tolstoy, Mohandas Gandhi, Martin Luther King, and the leaders of the Student Non-Violent Coordinating Committee all credited Thoreau with showing the ethical and prudential advantages of nonviolent resistance to government policy.

Counterculture

Thoreau believed that one of the main reasons Americans colluded with unprincipled government policies was that many Americans were obsessed with anxieties about survival and success. In such a situation constant work seems the only viable life choice. Not only does this make a mockery of the supposed "liberty" offered by the United States, it also erodes the leisure necessary for individual self-development. Thoreau's autobiography *Walden* responds to this danger by spelling out an alternative form of individual economics and time management that would give everybody (even poor people) opportunities for self-cultivation. Via such new cultural pathways, ordinary people might deepen their experience of freedom and gain more resources for self-development. This kind of richness in poverty is possible because we live amid wild systems that serve as free resources for contemplation and individual self-ballasting.

Thoreau's attempt to build up a new repertoire of pathways and customs in order to remove America's cultural unidimensionality (i.e., its focus on survival and success) later inspired hippies, environmental activists, and other advocates of counterculture.

Thucydides (c. 470–396 BCE)

Thucydides was an Athenian historian who lived in the second half of the fifth century BCE. He wrote only one work: a narrative history of the Peloponnesian War (432–404 BCE), fought between competing Greek city-states. He tells us that he started his history at the outbreak of the war, foreseeing its significance. He includes an account of the end of the war, though the narrative itself breaks off abruptly in the twenty-first year (411 BCE). Biographers in antiquity speculate that he died a sudden and violent death and that this accounts for the unfinished style of his work. Thucydides made a significant contribution to

political theory in his formulation of the principle of political realism in international relations.

Pamphila (first century CE) says Thucydides was age 40 at the start of the war, and this is a good estimate. Thucydides tells us he was elected as a general by the Athenians for a campaign fought in Thrace in 424 BCE but was exiled for 20 years after having failed to relieve the city of Amphipolis before it fell. This shows he was an active politician as well as a man with military experience and standing in the community. He also reveals that that he held the rights to gold mines in the Thraceward area and was a man of influence in that region. He fell ill with the plague that struck Athens (430–426 BCE) and described its symptoms and effects on Athens in great detail.

The name of his father, Olorus, reveals he was related to a king of Thrace whose daughter, Hegesipyle, married Miltiades, who led Athens to victory against the Persians in the battle of Marathon (490 BCE). Late sources tell us that Thucydides' mother was also called Hegesipyle and his tomb was in the Athenian suburb *Koile Meletides,* next to those of Miltiades and his daughter Elpinice. Thus Thucydides was a member of an important aristocratic family that included such influential political figures as Miltiades' son, Cimon (c. 510–450 BCE), and Thucydides son of Melesias (most influential in the 440s BCE).

Thucydides structured his work chronologically, organizing each year's events by summer and winter. The modern division into eight books was formulated in Hellenistic times. Book 1 narrates the events leading up to the outbreak of the war. In this book Thucydides formulates a division between immediate and underlying causation. Book 1 also includes the *Archaeology,* an outline of Greek history down to the Persian Wars and the *Pentecontaetia,* an outline of events in the period between the Persian Wars and the Peloponnesian War: Thucydides avoids retelling the Persian Wars, the subject of Herodotus's history. In books 2 through 4 he describes the first ten years of the war—the Archidamian War. In book 5 significant events include the Peace of Nicias, the Mantinean War, and the Melian Dialogue. Books 6 and 7 describe an invasion of Sicily by the Athenians and the resumption of hostilities against the Peloponnesians. Book 8 is unfinished. It records hostilities in the Ionian War and the revolt of many allies of Athens.

Thucydides concentrates his narrative on two key issues: politics and war. Yet this narrow narrative focus is not his only subject. In describing political decisions and their ramifications, he allows his characters, both individual politicians and the generalized citizen body of various city-states (especially the Athenians), to reveal their own characters. Thucydides thus allows his narrative of the particular to explore the nature of government and political decision making within a democracy like Athens. He finds key forces, such as self-interest and the drive for the strong to rule the weak, as natural in relations among people and key factors in the development of empire and as causes of war. His focus on human decision making leaves no room for the divine: Explanations look to the rational rather than the irrational.

Thucydides' work features political speeches given by key named political figures as well as unnamed representatives of various city-states. These dramatize for the reader real political debates that occurred in a democratic city like Athens and show how the political issues were dealt with in the *ecclesia* (political assembly). Although some scholars see the speeches as Thucydides' own compositions, Thucydides says that the speeches are based on the gist of what was actually said on each occasion, claiming that he or an informant heard them delivered, while nevertheless admitting that he has made each speaker say what he thought that speaker ought to have said.

Thucydides is a significant political historian, not least for his contribution to thinking about relations between city-states. He created a political model in which city-states react as a generalized political body. War is the inevitable result of the competing interests of the states involved. His philosophy of history sees in the record of the past a significance beyond the events themselves, and he declares that he has composed his history to be a possession for all time, not for the enjoyment of an immediate audience. He argues for the utility of history: that human nature is a constant and so human actions will be repeated; thus knowledge of the past can help in understanding future events.

Tocqueville, Alexis de (1805–1859)

Alexis de Tocqueville was a French political thinker whose reflections on the nature of modern democracy are still considered prescient and comprehensive. Born into the French aristocracy, Tocqueville studied law in Paris and was appointed in 1827 to serve as a junior magistrate at the Versailles court. In 1831 at the age of 26, Tocqueville took a leave of absence from the court to embark on an extended tour of the United States with friend and fellow magistrate Gustave de Beaumont. The acknowledged "pretext" for their trip was a study of American efforts at penal reform, though their actual object of inquiry was much larger and more ambitious: the democratic way of life in America. Tocqueville's *Democracy in America* appeared in two volumes—the first in 1835 and the second in 1840—and earned its author virtually immediate election to the Académie française.

Although he is best known for his political writings and analysis, Tocqueville was not simply a detached observer of politics but played an active, if unspectacular, role in French political life. He served in the French Parliament from 1839 to 1851, a period that spanned the latter days of Louis-Philippe's July Monarchy and the entirety of Louis-Napoléon Bonaparte's Second Republic. During the Second Republic, Tocqueville also served for 5 months as minister of foreign affairs. Following Louis-Napoléon's coup d'état in December 1851, he resigned from parliament in protest and retreated from public life. He spent a good portion of his final years writing *The Old Regime and the Revolution,* published in 1856.

The central theme of Tocqueville's political thought is the advent of modern democracy, which he understands primarily as a "social state" rather than as a particular set of institutional arrangements and procedures. The characteristic feature of the democratic social state is the "equality of conditions" among men, an unprecedented condition that Tocqueville sees as requiring a "new political science" suited specifically to the analysis of modern democracy. In the course of conducting such an analysis, Tocqueville makes recommendations for how societies might work toward and maintain an enlightened democracy, or one in which equality is reconciled with freedom. His picture of modern democracy—its character, possibilities, and limitations—emerges from an intensive study of particular regimes, most notably those of America and France.

The Essence of Modern Democracy

Tocqueville's political thought revolves around a distinction between the old world of aristocracy and social inequality and the new, emerging world of democracy and social equality. Since the eleventh century, he argues, a democratic revolution has been gradually unfolding among the Christian peoples of the West. Through a diverse and apparently uncoordinated set of developments, the aristocratic principle of inequality has steadily lost ground to the democratic idea of equality. The aristocracy's power had depended upon the concentration of landed property in the hands of a few families and the relatively uninterrupted transmission of that property over the course of many generations. However, the rise of commerce, the democratic constitution of the clergy, and the

spread of enlightenment afforded alternative channels for gaining access to power through the application of one's industry and intelligence. Moreover, mutual antagonism between European kings and aristocratic nobles often redounded to the benefit of the commoner, whose role in politics increased as the Crown and nobility sought to hold one another in check. The eclipse of aristocracy by democracy is, Tocqueville insists, permanent and irreversible, a progression he typically attributes to the workings of Providence.

The "New Political Science"

According to Tocqueville, the novelty of a world tending toward equality requires that one consider anew how to approach the study of society and politics. His response to this dilemma is the development of a method he designates the "new political science." The new political science first attempts to apprehend and describe the modern democratic world by examining in detail particular political regimes. From this study of individual cases, Tocqueville develops a general view of the nature of modern democracy as well as a sense of how different cultures adapt and adjust to the arrival of democracy. Second, he uses this knowledge to offer suggestions for how one might improve democracy and counteract what he takes to be its natural shortcomings. Foremost among these shortcomings is democratic peoples' tendency to privilege the principle of equality while giving little thought to the importance of individual freedom. Because democratic citizens are enamored of equality as a matter of course, Tocqueville identifies strategies for inspiring in them a love and respect for freedom as well. Although Tocqueville's political thought owes much to the traditional analyses of regimes conducted by Aristotle and Montesquieu, several scholars have noted that his approach is distinct insofar as it assumes that historical circumstances have confined human choice to one regime—democracy—rather than several.

Tocqueville develops his general view of modern democracy primarily from the American case, for it was in America that the democratic revolution had reached its most advanced stage. Unlike the French, the Americans did not have the burden of an aristocratic, feudal past to overcome in order to establish democracy; since the Puritan settlement of 1620, democracy had existed there virtually unmixed with aristocratic elements. Based on his observations of and reflections on democracy in America, Tocqueville concludes that the quintessential feature of modern democracy is the "equality of conditions," a social state peculiar to modernity.

Equality of Conditions

For Tocqueville, a democratic social state or the equality of conditions obtains when individuals regard one another as sufficiently alike and equal to hold that no one has an inherent right to rule another. Although this understanding of the equality of conditions neither implies nor requires that individuals resemble one another in all respects, Tocqueville acknowledges that shared circumstances and interests promote sentiments of equality. He also observes that certain aspects of democratic life make actual differences among individuals appear less pronounced and even inconsequential, thereby reinforcing the idea of equality. For example, Americans are not strictly equal in terms of either material circumstances or intelligence, yet Tocqueville argues that they are in effect remarkably equal with respect to both. Although Americans will always possess disparately sized property holdings, they are all equally subject to rapid reversals in fortune that would have been inconceivable under an aristocratic order. Furthermore, because most Americans must labor both to acquire and to guard their fortunes, all attain a certain, general level of enlightenment, but few have the leisure to pursue knowledge for its own sake or cultivate any superior intellectual gifts.

The effects of the equality of conditions are pervasive, transforming the individual's self-understanding and, in turn, all human relationships. When the democratic citizen surveys the social world, he finds few great characters and certainly no great class—only others like himself. Confronted with a sea of equals and few superiors, one conceives of no reason to defer to the moral influence or authority of another individual. Instead, one proudly claims to evaluate all matters of public concern solely on the basis of one's own reason. Tocqueville identifies this assertion as a pretension, for no individual has the ability, time, or

effort to render such judgment. Reluctant to acknowledge the superior wisdom of another individual, democratic citizens readily concede that wisdom lies in numbers or is to be found in mass or majority opinion. The democratic citizen's reliance on mass opinion threatens individual freedoms in two ways, both of which are captured by Tocqueville's phrase the "tyranny of the majority." First, the majority might make decisions that directly violate the rights and freedoms of citizens. Secondly, the majority might tyrannize over individuals in a more subtle fashion. By exerting social pressure on individuals to conform their thoughts and behavior to its standards, the majority inhibits creativity and free thought or ensures that neither has an audience.

Democratic Government

The equality of conditions inevitably gives rise to democratic government, which may assume many forms. However, Tocqueville elucidates the spectrum of possibilities by identifying the best and worst alternatives. The best allows for the reconciliation of equality and freedom. Animated by a proper pride in their status as equal citizens, men actively and energetically participate in political life and in the formation of majority opinion. Though often inefficient and inattentive to minority rights, democratic government of this sort requires the cooperation of alert and engaged citizens. Moreover, it enables citizens to experience the value of freedom and empowers them to find political solutions for the problem of majority tyranny. In so doing, democracy creates a space for the recognition of individuality and difference.

Tocqueville fears, however, that individuals will prefer a less demanding form of government he describes as a "democratic despotism." Democratic despotism originates in a sentiment Tocqueville calls "individualism," or the inclination of democratic citizens to turn to the private and abandon the public realm. Unwilling to contest publicly the will of the majority or to shoulder the burdens of self-government, the individual withdraws from public life and retreats into the private sphere of friends and family. There, he anxiously strives for material gain and personal fulfillment; as a rule, his ambitions are narrow and vulgar. The responsibilities of governing he gladly relinquishes to a benign, centralized administration that assumes the task of methodically ordering the social and political world on his behalf. Because little is asked or expected of the individual under such conditions, Tocqueville argues that he will experience a declining sense of personal and political efficacy. Having lost his will if not his formal rights, the individual exists in a state of existential servitude and becomes increasingly incapable of judiciously exercising his political rights.

The Maintenance of Democracy: America and France

Along the spectrum of better and worse alternatives, American democracy tends to be healthier than that of France, largely because Americans have found ways to preserve a space for freedom and personal independence under conditions of equality. America's relative success is partly owing to the fortuitous circumstances surrounding the initial Puritan settlement and partly due to the wisdom and skill of more recent political actors. Tocqueville cites many factors that contribute to the health and maintenance of American democracy, but among the most significant are administrative decentralization, associational life, and religiosity. First, since the inception of the New England township, Americans have been accustomed to participating in the administration of their own affairs, a practice reflected in, and reinforced by, constitutional federalism. Multiplying opportunities for political engagement, a decentralized administrative structure helps stem the tide of individualism by furnishing citizens with opportunities to observe the close connection between their private affairs and those of the broader community. Second, Americans habitually form and join civil and political associations. By associating with other likeminded citizens, the otherwise isolated democratic individual feels his own strength and, acting in concert with his associates, can better resist the tyranny of majority opinion. As a host of associations organize to assert their respective, particular rights, democratic citizens are reminded that individuality and particularity need not be sacrificed to the principle of equality. Finally, the Americans were from the outset a religious people, and Tocqueville argues that religion is indispensable for the maintenance of democracy. More

specifically, the basic tenets of Christianity discourage individualism by mitigating the democratic man's obsession with material goods and orienting him toward a concern for his fellows.

On Tocqueville's view, the French struggled to combine equality with freedom and stable government in the wake of the French Revolution precisely because they lacked the Americans' experience with self-government and intermediate institutions. Despite the fact that the various prerevolutionary social classes shared more common interests than at any previous point in French history, they were nevertheless ill prepared to cooperate in the joint venture of constructing a free and stable postrevolutionary government. This, Tocqueville argues, was the fault of the late monarchy, which prepared the French not for self-government but for overdependence upon a central state.

Under the late monarchy, the effects of the democratic revolution were palpable throughout French society, particularly on the level of material circumstances. Forced to sell much of its land in order to maintain its standard of living, the nobility was significantly poorer than it had been in centuries past. At the same time, the bourgeoisie was economically and socially ascendant, and even the peasants had begun to acquire land. The march of equality was afoot.

According to Tocqueville, the French monarchy's efforts to weaken its rivals and consolidate power had the unintended consequence of loosening the social bond among individuals and classes just as society as a whole was becoming more homogenous. Since the Middle Ages, the classes had been distinct yet were not completely isolated from one another. They had interacted in the Estates-General and in other assemblies, and the nobles had generally accepted responsibility for the welfare of the lower orders within their domains. However, in an effort to diminish other loci of authority, the late monarchy had ceased to convene the Estates-General and divested municipalities and provincial bodies of any meaningful control over local affairs. Tocqueville maintains that this centralization was lethal to common feeling among the classes, for it deprived them of both the opportunity and the incentive to associate with one another. As a result, the classes were more isolated than during medieval times, when their common interests had been much less apparent. By assuming the functions once performed by local and intermediate institutions, the monarchy created a situation in which the Frenchman was constantly forced to turn to the central government alone for assistance, advice, and permission.

The French Revolution did succeed in eliminating what remained of aristocratic and feudal privileges—the most visible and reviled aspects of the old regime. However, lacking in practical experience with self-government, the French were compelled to adopt in modified form the principal feature of the old regime—its central administration. The state was perceived as the only entity capable of calming the furor unleashed by the revolution and restoring peace, prosperity, and order. Though present before and during the revolutionary moment, the desire for freedom could not sustain itself in the absence of free institutions and a citizenry accustomed to making use of them.

Toleration

Toleration denotes a refusal to impose punitive sanctions for dissent from prevailing norms or policies, a deliberate choice not to interfere with behavior of which one disapproves. As such, toleration may be exhibited by individuals, communities, or governments, and for a variety of reasons, although this entry confines itself largely to toleration as a *political* concept practiced (or not) by governments. One can find examples of toleration throughout history, but scholars generally locate its modern roots in the sixteenth- and seventeenth-century struggles of religious minorities to achieve the right to worship free from state persecution. As such, toleration has long been considered a cardinal virtue of liberal political theory and practice, endorsed by such important thinkers as John Locke, John Stuart Mill, and John Rawls; and it continues to speak to a variety of contemporary political and legal debates, including issues of race, gender, and sexual orientation. This entry provides a brief overview of the definition of toleration and its status as a "negative" liberty; explores religious toleration in the early modern world and extensions of toleration to new arenas of social and political life; and examines some criticisms of toleration as both a concept and a political practice.

Toleration as Negative Liberty

The term *toleration* is derived from the Latin verb *tolerare*—to endure, or to bear with—and involves a two-step process comprising disapproval and permission: One judges a group, practice, or belief negatively, yet makes a conscious decision not to interfere with or suppress it. For instance, ruling elites might view an unconventional religion as fundamentally erroneous, and its doctrines utterly misguided, while nonetheless endorsing the rights of its adherents to profess it free of legal penalties. In a similar vein, one who disapproves of homosexuality might support legislation outlawing discrimination on the basis of sexual orientation, on the grounds of liberty or equality. The achievement of toleration in any given realm of society, then, involves a willingness on the part of individuals or governments to provide protections for unpopular groups, even groups they themselves might consider deeply mistaken.

Compared with more expansive terms like *recognition* or *acceptance*, then, toleration is fairly minimal. As a species of what Isaiah Berlin has called "negative liberty"—characterized by noninterference, or the absence of external constraints on individual action—toleration has historically tended to fall somewhere between persecution on the one hand and full liberty and equality on the other. And yet this minimal, negative term has played a key role in the protracted struggle on behalf of broader understandings of political rights for unpopular minorities. Tolerationist politics seeks to provide a sort of foothold for such groups, as they carve out a protected social space for themselves; it represents an acknowledgment of both the reality and the permanence of diversity within contemporary societies. (In this sense, a minimal term like *toleration* may require extensive government action to safeguard unpopular minorities from violence at the hands of their fellow citizens or other actors in civil society.) It often, though by no means always, serves as a springboard toward efforts at more far-reaching protections.

Across time and place, reasons for tolerating can and have varied widely. In some cases, prudential, strategic, or instrumental considerations—including weariness of the social costs of continued persecution—lead elites to support rights for members of unpopular groups. At other points in history, religious convictions about the importance of free assent in matters of faith, such as we find in the thought of Locke, have advanced the tolerationist cause. Epistemological skepticism, moral relativism, and philosophical commitments to autonomy as a fundamental human value have grounded tolerationist thought and practice as well. In other words, the *practice* of toleration (by individuals or governments) may or may not reflect a *virtue* or ethic of "tolerance"; it may rather express far more concrete and particular judgments about specific situations. Historians of political thought have explored the emergence of arguments that either support or oppose policies of toleration, whereas scholars conducting empirical studies have focused on the dynamics that lead citizens to support or suppress the civil and political rights of unpopular minorities. The structure of toleration as a concept, and debates regarding

which unpopular positions may be tolerated safely and which strike at the heart of social life (especially in the wake of the September 11, 2001, attacks and the rise of religious extremism around the world), will no doubt continue to occupy the attention of political theorists for years to come.

Liberalism and Toleration: Religion and Beyond

Historically, toleration has most often been associated with matters of religion, as marginalized or minority religious groups seek the right to follow their consciences unmolested. Scholars trace the roots of modern toleration to the wars of religion in early modern Europe and to seventeenth-century England, where religious issues were intimately connected with political disputes that led to the beheading of one king (Charles I) and the abdication of another (James II). Such historical eras witnessed the coalescence of a host of arguments (philosophical, political, psychological, theological, epistemological, economic) supporting religious toleration and the victory of tolerationist forces in France under the Edict of Nantes, in England during the mid- and late-seventeenth century, and across the Continent. At the same time, tolerationist systems of various sorts had existed under the Roman Empire, in the Ottoman millet system, and in the work of medieval thinkers who envisioned adherents of diverse religions coexisting peacefully. Scholars have also located tolerationist sentiments outside the Western tradition entirely, in such important figures as Emperor Ashoka of India (third century BCE) and in certain core concepts in the Islamic tradition.

Such historical resources notwithstanding, however, it is the liberal tradition that has most powerfully articulated the grounds, significance, and potential of the tolerationist ideal in recent years. Modern liberal theory has built its approach to social difference and diversity generally upon the cornerstone of toleration as a blueprint for addressing socially divisive phenomena. John Milton's *Areopagitica* (1644), with its plea for freedom of the press, also functioned as a defense of the rights of religious minorities, since the censorship Milton denounced was often directed at unconventional religious treatises. Locke's *Letter Concerning Toleration* (1690) is generally considered the most important liberal defense of religious toleration, yet the significance of Locke's formulation lies not so much in its originality but rather in the way that Locke synthesized over a century's worth of European tolerationist arguments, many of them deeply Christian in nature. Lockean toleration, in turn, entered the American tradition due to its influence on Thomas Jefferson's "Bill for Establishing Religious Freedom in Virginia," first drafted in 1779 but not passed until 1786.

But important as he was to the American case, Locke was just one of many important early modern figures (along with Michel de Montaigne, Pierre Bayle, Baruch Spinoza, and Sebastian Castellio, to name just a few) who contributed to the spread of tolerationist ideas in Europe. Works by important French and German Enlightenment thinkers—for example, Voltaire's *Treatise on Toleration* (1779) and Immanuel Kant's "What Is Enlightenment?" (1784)—embraced the cause of toleration in matters of religion and provided a template for the broader Enlightenment championing of free inquiry and freedom of thought and speech. Still later, Mill's *On Liberty* (1859) broadened the liberal defense of conscience and speech into a theory championing the rights of individuals to *act* on their deepest beliefs in matters that did not harm others and to be free not only from political and legal sanctions but also from the tyranny of majority opinion.

Toleration has been as important in practice as it has in theory, as a conceptual foundation for such basic liberal practices as the separation of church and state and constitutional efforts to protect individuals' ability to act in accordance with their deepest convictions. Protection for conscience and religion is enshrined in the First Amendment to the U.S. Constitution and in the UN Universal Declaration of Human Rights, and such rights ground a host of wider protections: In the words of David A. J. Richards, toleration lies "at the very moral heart of the dignity of constitutional law" (1986, p. x). Rawls famously (and controversially) claimed that his system completes and extends the struggle for toleration that began in early modern Europe.

But questions of toleration extend beyond religion into other areas of social and political life, wherever unpopular or controversial groups face a hostile environment and stand in need of protection

from state interference or their enemies in civil society. Over time, tolerationist arguments have been employed in attempts to protect groups marginalized on account of race, gender, and political views. In the twenty-first century, matters of sexual orientation continue to engage the attention of legal and political theorists as they probe the nature and limits of toleration. What would toleration look like in the area of gay and lesbian rights? If toleration simply requires decriminalization of homosexual conduct, then the U.S. Supreme Court's decision (in *Lawrence v. Texas* [2005]) striking down anti-sodomy laws would seem to have accomplished this task. But *Lawrence,* and rulings like it in courts around the world, has only opened new avenues of debate. Does toleration require legislation outlawing discrimination in the economic sphere on the basis of sexual orientation? Does anything short of extending the full benefits of marriage to same-sex couples (either de jure or de facto) fail the test of toleration? Many scholars self-consciously analogize campaigns for gay and lesbian marriage with those of early modern religious minorities and seek to bring the full power of the tolerationist tradition, from the early modern period down to our own day, to bear on such contested questions.

Toleration: Critical Perspectives

Like any other central political concept, toleration has always had its detractors. Early modern critics viewed defending religious orthodoxy as an integral responsibility of legitimate government. On this understanding, religious toleration threatened to undermine one of the key ingredients of social solidarity and to weaken the state, perhaps fatally. More recently, critical theorists—most notably, Herbert Marcuse, in his noted essay "Repressive Tolerance"—have objected to the fact that toleration's emphasis on maximizing individual choice leaves in place powerful social disparities. Marxist-informed critics aim to uncover the ways in which structures of power influence, often in deeply hidden ways, the very bases of what it means to form religious or political beliefs, a process that seems to be overlooked by toleration's acceptance of individual preferences as sacrosanct. Postmodernists, multicultural theorists, and those seeking a more positive celebration of difference often criticize toleration as insufficient and grudging, unable to provide authentic respect for the diversity that lies at the heart of contemporary social life. (Toleration, on this view, grants permission for difference but does not praise or affirm it.) And those who rank social unity, religious truth, or collective values more highly than individual autonomy continue to object to, or at least to question, toleration's decoupling of political society from overarching views of the good life.

Such critiques possess a degree of truth. Yet toleration's achievements—the cessation of armed conflict between groups with long histories of violence, the extension of basic political and institutional protections to unpopular groups, the fixing of some minimal bounds of integrity around individuals acting on their most deeply held beliefs—remain significant nonetheless. Toleration, in whatever sphere of social or political life one examines, represents a necessary though not always sufficient political achievement. Surely toleration—as an ideal, if not a concrete and fixed goal—recognizes the significance of the gradual, often halting, and always contested nature of progress in achieving civil and political rights, and the tradition of toleration continues to play a central role in ongoing struggles for human freedom and dignity.

Ferdinand Tönnies (1855–1936)

Ferdinand Tönnies was a German social philosopher and intellectual historian. Today Tönnies is known as one of the founders of classical sociology. The son of a farmer, he was born in the rural area of Schleswig-Holstein (then under Danish rule). He studied in a number of German universities, becoming a *Privatdozent* at Kiel University in 1881. While visiting England in 1878, he discovered several original manuscripts of Thomas Hobbes, leading him to eventually publish the authoritative edition of Hobbes's *Elements of Law* and *Leviathan.* Tönnies's publications were pivotal in reviving the scholarly interest in Hobbes. In 1909 he cofounded the German Society for Sociology and served as its president until 1933, when he was ousted by the Nazis. He obtained full professorship at Kiel University only in 1913. (His academic promotion was slow partly because of his socialist leanings.) During World War I, like many other German intellectuals of that time, he took part in the propaganda effort, justifying the German cause. In the final years of the Weimar Republic, he joined the Social Democratic Party, becoming a vocal critic of National Socialism.

Tönnies's main ideas and convictions cannot be easily categorized. His political views were progressive and even social-democratic, yet they were based on a strong conservative sentiment. He was a pessimistic critic of modern industrial society, yet he did not believe that the clock of history could be turned back. A German patriot, he believed in the ideal of world peace and democracy. Criticizing modern rationalism, which subjected the natural process of life to the logic of goal-oriented calculation, he also professed faith in the principle of scientific objectivity. Although he held strong communitarian sympathies, he based his theory of social life on individualistic presuppositions.

This theory was elaborated in his book *Gemeinschaft und Gesellschaft* (1887). Though famous today mainly for its distinction between community and society, this treatise was more than just a work in social theory. It was, in fact, a philosophical-historical volume that attempted to present a comprehensive vision of human nature and its projection into various forms of social interaction and their historical expression in the development of European legal arrangements. Influenced by Hobbes, Tönnies built his theory on an individualistic premise that human will lies at the basis of every human association. There are, however, two very different kinds of human will, he claimed: *Wesenwille* (essential will) and *Kürwille* (arbitrary will). *Wesenwille* is an organic drive of every creature toward preservation and development. This kind of will includes thought (as every will is necessarily a thought) but is not dominated by it. Thought here is part of the natural flow of living activity. In *Kürwille,* on the other hand, thought gains autonomy and imposes itself on the organism. Conduct here is purpose-oriented and driven by cold calculation toward a premeditated goal.

These two kinds of will correspond to two kinds of association—*Gemeinschaft* (community) and *Gesellschaft* (society). Gemeinschaft is a natural, "organic" association, which exists for the sake of itself and is based on the mutual sympathy of its members. Gesellschaft is an artificial, "mechanical" association consisting of purposive individuals, who are united by agreement in the view of achieving a certain purpose.

These two kinds of human will (and of human association) are ideal types. Neither exists in reality in a pure form. Yet human beings and associations

can be distinguished, depending on which ideal type seems to be more prevalent in them. Thus young people, women, inhabitants of rural areas, and artists are likely to possess a stronger element of *Wesenwille,* just as villages, small towns, guilds, and the church are mainly Gemeinschaft-type associations. By contrast, older people, men, urban dwellers and scientists have a more salient presence of *Kürwille,* just as cities, modern economic corporations, and the state are generally Gesellschaft-type associations.

In his subsequent works, Tönnies elaborated on this basic structure. He distinguished between three different but mutually supporting forms of sociology: pure, applied, and empirical. *Pure* sociology constructs an abstract conceptual apparatus employed to understand society. The theoretical argument, outlined earlier, belongs to this type of sociology.

Applied sociology aims at grasping the logic of historical development. For Tönnies, because the development of civilization is generally characterized by strengthening the Gesellschaft element of social life at the expense of Gemeinschaft, his writings in "applied sociology" are mainly dedicated to exemplifying and explaining this thesis. Thus, in his work, *Die Sitte* (1909), Tönnies described custom as an expression of social Wesenwille, arguing that the force of custom is seriously erased in the condition of modern Gesellschaft. "Public opinion," on the contrary, is an expression of rationalistic collective judgment based on Kürwille and is thus a necessary factor for maintaining modern society (see *Kritik der öffentlichen Meinung* [1922]).

The task of *empirical* sociology is to conduct inductive research on a given social phenomenon. Here, too, Tönnies's scholarship was on the whole determined by his general sociophilosophical concerns and served to buttress his general theory. For example, in his statistical research on criminals in the area of Schleswig-Holstein, Tönnies distinguished between those who are likely to be predominantly Wesenwille-types (e.g., native-born and rural-born), and those likely to be Kürwille-types (e.g., nonnative, urban-born), arguing that these two types of criminals tend to commit crimes of a different kind. Wesenwille-types tend to perpetrate crimes of passion (such as murder or arson), whereas Kürwille-types tend to commit crimes of deliberation (theft or fraud).

Personally, Tönnies felt more sympathy for Gemeinschaft, which he regarded as the only truly satisfying form of human association that corresponds to human nature in its entirety and not only to an artificially detached element of rational deliberation. At the same time, he did not reject modernity altogether, hoping to find resources for the revival of some form of communal life within the framework of modern democratic society.

TOTALITARIANISM

Totalitarianism is a term used to denote contemporary forms of tyranny that involve genocide or large-scale human suffering at the hands of ideologically motivated dictators. It is also a politically charged term redolent of the cold war, when the easy equation of communism with Hitler's National Socialist regime (and fascism more generally) held obvious attractions for liberal and conservative commentary. It has never been entirely clear whether the term has a use beyond being a "boo word" that could, as Frederic Fleron memorably put it, be applied to "boo regimes." Nonetheless, as is clear from a brief survey of the

term, many political theorists have deployed the term in various ways that in turn highlight their own normative and philosophical commitments. An evaluation of the concept of totalitarianism thus provides a useful insight into the preoccupations of some of the key thinkers of recent decades.

In terms of mapping the various meanings and uses of the term, it is useful to focus on three quite distinct ways in which theorists have explored totalitarianism: as a way of understanding the rise of Nazism and communism, as a term for use in comparative political analysis, and as a way of analyzing the pathologies of modernity. This entry focuses on these three dominant usages labeling each in turn genetic, structural and modernizing theories. The entry concludes with a brief account of *post-totalitarianism*, a term coined by Václav Havel to describe late communist regimes.

Genetic Theories

Given the concurrent emergence of Stalinism and Nazism, it is hardly surprising to find that numerous theorists were concerned with documenting the common origins of the regimes that emerged out of them, despite obvious differences between these regimes in ideological terms. The classic work on the subject, *The Origins of Totalitarianism* (1951) by Hannah Arendt, speaks to this form of inquiry. Her view is that totalitarianism is the product of nineteenth-century political phenomena, specifically colonialism and the emergence of mass society. Both undermined the distinctiveness of the individual in favor of the group, whether that group be racial, ethnic, or national in essence. *Origins* documents the disintegration of the body politic and the querying of liberal values in favor of motion, expansion, and the advancement of the group, in turn preparing the ground for a new kind of fanatical politics based on perpetual movement and the obliteration of the distinction between public and private, and between individual and collective. Thus although communism and Nazism might not have shared a common end or vision, they both gave rise to a relentless expansionist politics and war against outsiders. Totalitarianism should thus be read as the product of a unique constellation of factors that together combined to normalize the most extraordinary inhumanity.

Variants on Arendt's inquiries into the causal antecedents of totalitarianism are provided by Friedrich von Hayek (*The Road to Serfdom* [1944]) and Karl Popper (*The Open Society and Its Enemies* [1945]), both of whom had provided analyses of the "totalitarian threat" by the end of World War II. To Hayek communism and Nazism were extreme examples of the "collectivism" that saw the birth of the welfare state in Britain and Europe. As for Arendt, so for Hayek, the sacrifice of the individual to the larger aggregate prepared the way for a utilitarian politics in which the needs and interests of the group are paramount. The difference is that Hayek focused in on the deleterious effect of economic planning, a demand of both socialist and social democratic ideologies in the interwar years. Planning involves second-guessing individual needs, wants, and desires, which in turn gives massive impetus to bureaucracies in their search for "social justice." As a market economist Hayek was convinced that planning was irrational and impossible to achieve without the imposition of central controls over all aspects of social life.

Popper shared many of these concerns but focused, in his *The Open Society and Its Enemies,* on the corrosive effect of group psychology on the driving forces of a progressive society. As with John Stuart Mill, Popper's concern is with freedom of thought and action, which both believe to be essential to progress and a flourishing culture. Totalitarianism is the product of a herd mentality that is uneasy with the consequences of liberty, of uncertainty, experimentation, and newness. What links ideologies such as Nazism and communism is thus the promise of certainty, of redemption, and comfort for the group. That such qualities were formerly associated with organized religion should not in this sense be overlooked. As essentially secular faiths, ideologies such as communism and Nazism fill the gap that was once provided by faith in God. Far from being modern, totalitarianism in this sense can be read as a form of pathological nostalgia for a lost world of prophets and oracles.

Structural Theories

Whereas genetic theories focus on what are perceived to be the shared origins of different totalitarian

movements and systems, structural theories seek to show that these differences are less marked than the similarities. The most important statement of this approach is that of Carl Friedrich and Zbigniew Brzezinski, whose *Totalitarian Dictatorship and Autocracy* set the template for a great deal of the comparative discussion to come. In their view regimes such as those of Hitler, Stalin, and, to a more questionable extent, Mussolini observed the same "syndrome" of traits and characteristics. The traits are a "totalizing ideology," a single mass party led by one man, a system of terror operated by an extensive secret police apparatus, and monopolies on mass communications, the use of force and economic activity via a controlled and directed economy. Debate subsequently concentrated on whether and to what extent any regime displayed all traits simultaneously. Others debated the degree to which any syndrome of this kind did not display a liberal bias against particular kinds of system that seemed to depart from the free market and the "open society" as defined by theorists such as Popper.

Largely in response to these criticisms Leonard Schapiro, a noted historian of the Soviet Union, criticized Friedrich and Brzezinski in his *Totalitarianism* for confusing features of the system (or "contours") with the "pillars of control," which he argued clearly distinguished the Nazi and Soviet regimes from other kinds of dictatorship. Schapiro argued that the contours are "the leader; the subjugation of the legal order; control over private morality; continual mobilisation; and legitimacy based mass support." The pillars, however, are the party, the police, and the ideology without which this particular form of rule would cease to be distinctive. However Schapiro's own analysis is questionable on its own terms. Why, for example, the party should be regarded as a "pillar" when respectively the Nazi and communist parties were emasculated under Hitler's and Stalin's rule is not made clear. Nor is it clear how Schapiro escapes the largely descriptive approach taken by Friedrich and Brzezinki, which leaves the key question posed by Arendt (Why did totalitarianism emerge?) unanswered.

A rather more persuasive "structural" account is offered by Arendt as part of her more general analysis of the origins of totalitarianism summarized earlier. In her view any viable account of totalitarianism needed to focus on terror and the use of concentration camps or gulags as the key instrument of social control. Without terror, power becomes routinized and totalitarian regimes become a mere instance of tyranny or dictatorship as opposed to the radically distinct systems she believed them to be. Tyrannies are marked by clear hierarchies and a sense of stability underpinned by regularized norms or practices. Totalitarian regimes, on the other hand, are marked by the obliteration of hierarchy in favor of an "onion structure" with the leader at the center progressively enveloped by layers of functionaries and followers. The effect of the onion is to insulate those nearer the center from the real world and to necessitate a war on truth, facts, and reality at all levels of society. Uncertainty, suspicion, and perpetual motion are the hallmarks of totalitarian regimes. Arendt's account thus accentuates the sense in which such regimes are novel departures from traditional autocratic or dictatorial systems. It also captures in analytic terms the features that have interested authors such as Yevgeny Zamyatin and George Orwell, who attempted to capture in their respective novels *We* and *1984* the distinctive character of twentieth-century despotisms and the dystopias to come.

Modernization Theories

As the previous analyses suggest, there is often a barely concealed subtext contained in the analyses of totalitarianism: that totalitarianism represents an extension of logic contained in the process of modernization and thus that all modern societies contain certain pathologies that may, if unchecked, develop into full-blown totalitarianism. A notable inspiration for such analyses is Max Weber, who described the construction of the "iron cage of modernity," by which he meant the growing constraint on individual flourishing caused by our subjection to "instrumental" processes necessitated by modernization. The most noteworthy successors to Weber are the members of the Frankfurt School, formed in the 1930s to offer critical analyses of the trends and tendencies of modern society. The School produced two highly influential analyses of totalitarianism: *The Dialectic of Enlightenment* (1944) by Theodor

Adorno and Max Horkheimer and *One-Dimensional Man* (1964) by Herbert Marcuse.

Like Weber, Adorno and Horkheimer were convinced that what thinkers from Blaise Pascal and Denis Diderot to Jeremy Bentham and Karl Marx took to be the chief virtue of modernity—the growing predominance of a secular, rational, and instrumental basis for social life—was its chief vice. In subjecting nature, the body, and individuality to rational calculation, the Enlightenment set in motion a way of conceiving the world that was utterly at odds with the aesthetic, the sensual and distinctive. Uniformity and subordination to calculus becomes the norm with the effect that individuals come to be seen as, in the language of Kant, "mere means" for the pursuit of ends which are themselves unquestioned. The world comes to appear as a mere "resource" for utopian schemas, whether they be collectivist or individualist in design. People are reduced to passive consumers of "mass culture" and subject to a totalitarian logic of instrumental reason, calculation, and dumbing down in the name of the efficient control and manipulation of society. In Adorno and Horkheimer's analysis the factory methods of mass entertainment thus derive from the same logic that generated the factory methods of genocide and human destruction. Each manifests a cynical detachment from the human, broadly conceived, in favor of mechanistic or inhuman efficiency.

Marcuse's analysis is similarly pessimistic but was written at a point in time (the early 1960s) when there was a larger audience for an analysis of this kind. Marcuse similarly identified the emergence of instrumental reason or "one-dimensional" thought as the common thread uniting various otherwise distinct regimes from the USSR to the United States, only in his view it was the latter that demonstrated the more advanced form of domination. State violence was, from this point of view, a mark of the failure of a system of control rather than its success, as earlier theorists such as Arendt had argued. To Marcuse, modernity equated to an unquestioned logic of economic growth, to the subordination of social life to the bottom line and thus the necessity for increased consumption, built-in obsolescence, and the generation of false or artificial needs. He thus repeated Marx's early humanist critique of capitalism but augmented this considerably in his analysis of the methods used by elites to generate compliance—principally through inducing forms of thought and behaviour that are utterly compliant or "positive"—as opposed to "negative" behavior, which queries the status quo. In a mirror of the analyses of commentators such as Friedrich and Brzezinski, he documented how the methods associated with schooling and socialization in Nazi Germany and the USSR were actually more developed in countries such as the United Kingdom and the United States, though better disguised as "normal" or "natural."

A self-consciously provocative work, *One-Dimensional Man* went on to become a best seller in the "post-materialist" markets of those very countries Marcuse agitated against. It also chimed with various forms of social critique offered in the run-up to the rebellious days of 1968 by figures such as Raoul Vaneigem, Guy Debord, Cornelius Castoriadis, and Jean Beaudrillard. Indeed Marcuse's work spawned the critique of "neo-totalitarianism," now associated with the work of a diverse range of theorists such as Giorgio Agamben, Slavoj Žižek, and Noam Chomsky, all of whom equate political passivity with the processes documented by Marcuse. His work might also be seen as the inspiration for the exploration of "totalitarianism" as an artistic genre. *The Matrix* series has an obviously Marcusean flavor, as do dystopian films such as *Rollerball, Logan's Run, The Island,* and *Sleeper,* all of which document the "air conditioned" comfort of near-future totalitarian oppression.

Post-Totalitarianism

One remaining twist in the saga of the concept of totalitarianism has yet to be documented, and this is the notable contribution of Václav Havel. Writing as a dissident member of Charter 77 in communist Czechoslovakia, Havel's 'The Power of the Powerless" (1978) offered a compelling analysis of what he termed *post-totalitarianism*. In an echo of Marcuse, he documented how power in the Eastern and Central Europe of the 1970s and 1980s had transmuted from an overt, violent impositional kind of rule to one that rested on the acquiescence of self-consciously subject populations. Havel gave the example of a greengrocer who displays the slogan "All Power to the

Workers!" in the window of his shop. As he analyzes it, the slogan is less evidence of the success of the regime in instilling the required ethic in a subject population and more a sign of the quiet capitulation of ordinary individuals confronted with impossible odds. Better to hang a slogan in the window, live the lie, and survive than bring suspicion upon oneself by not going along with what is expected of citizens.

The importance of Havel's analysis is that it highlights the shortcomings of mainstream approaches to totalitarian regimes that rest on the binary of terror and consent to highlight the difference between totalitarian and nontotalitarian regimes. In Havel's view one has to interrogate the nature of the "consent" elicited under contemporary conditions. As his plays (*Audience, Private View*) document, this applied not just to communist regimes but to any kind of contemporary society where power and influence are located at the level of elites as opposed to the social. In this sense Havel anticipates the analysis of what is sometimes termed *micro-power*, or the way in which power operates at the capillary level to produce an outward image of conformity in a subject population. It thus anticipated the study of everyday struggles and resistance associated with critical sociology and anthropology such as the work of James Scott, Detlev Peukert, and Stephen Kotkin, all of whom have in their own way undermined the stock of assumptions associated with the classic studies of totalitarianism.

TOTALITY

Depending on whether it is understood as an ontological, epistemological, or axiological (normative) concept, "totality" has various, but interrelated, meanings. The concept has had political relevance since its inception in ancient Greece, where it occurs in reflections on the nature of the universe and of the state; its contemporary, use, however, is most closely related to classical German philosophy and Marxism.

While the tendency to understand the essence of the world according to an a priori schema was already present in René Descartes, conspicuous in Baruch Spinoza's holism, and called into question by David Hume, it was Immanuel Kant who first radically problematized totality in modern philosophy. In *Critique of Pure Reason,* he denied the possibility of knowing the totality but claimed that the *concept* of totality is methodologically necessary for knowledge. However, he claimed that as a concept, it necessarily leads speculative, and thereby practical, reason into irresolvable contradictions.

G. W. F. Hegel responded with the affirmation of dialectical reason, guided by the principle of the synthesis of contradictions. For Hegel, contradiction is not a mere illusion of human thinking, as it is for Kant, but a necessary aspect of all of reality, one that makes totality possible. It is through creating and abolishing, or overcoming, contradictions that totality realizes itself, both in thought and in being. Accordingly, every result, state, or event is only but part of a universal process and thus relative in relationship to it: The place, role, and significance of each part is determined only in its relationship to the whole. In turn, only the whole—the final result *and* the entire historical movement of its dialectical becoming—is, according to Hegel, true. In fact, Hegel held that he stood at this crucial point in history (or at the end of it) and that his philosophy—and any genuine philosophy from then on—would be but a reflection of the path traversed. According to Hegel, this path, and thus totality itself, was nothing but self-realization of what he called "world spirit."

Hegel's closed speculative (and spiritual) totality was rejected by Marx. Such a system was, according to him, not only mystical but also reactionary, because it hypostasized totality and thus

denied the possibility of any essentially new, different, future. Marx agreed that totality is a dialectical process, that it is not merely a methodological category but an ontological one as well, that all facts are meaningless unless considered within a dialectical whole, and that the whole has a teleological aspect to it. However, the only meaningful totality, according to Marx, is human history—that is, the history of human material and cultural self-production, of human purposive activity. As such, totality is for Marx an open-ended totality, a process of totalization.

This process, however, has not always and everywhere been to the benefit of humanity. In fact, despite the great achievements of science, industry, and art, human history has been, according to Marx, a history of man's alienation from his latent dispositions for free, creative, versatile, and genuinely communal existence. Taking up the Renaissance idea of *uomo universale,* Marx held that the objective historical conditions had been created for the realization of the "total man," one whose life would not be physically and spiritually crippled by existing social relations. According to Marx, only a class of people thinking and acting from the standpoint of universal human interests would be able to carry out this project.

These ideas have been further elaborated within twentieth-century Marxism, especially by Georg Lukács, and criticized by postmodernists.

Transitional Justice

Transitional justice refers to institutions or practices that define and address injustices committed under a prior regime as part of a process of political change. Contemporary debates on transitional justice took shape during democratizing transitions of the 1980s and 1990s as successor regimes in Latin America, Eastern Europe, and Africa considered the problem of how to address political violence and repression committed under prior regimes. More recently, transitional justice debates have expanded to encompass the role of responses to past abuses beyond the context of regime change in processes of conflict resolution and more general political reforms. These debates center on the meaning and role of justice in the aftermath of widespread forms of political violence with a focus on specific strategies or practices, such as prosecution, truth commissions, reparations, administrative purges, amnesties, apologies, and forgiveness.

It might be argued that all justice is transitional justice, given that the political realm is always undergoing change in some form, however slowly. Transitional justice is generally distinguished from ordinary criminal justice in two ways. First, transitional justice addresses violence that was authorized or legitimated by political authorities, which means that it cannot necessarily rely on established laws or traditions. Instead, it entails the reclassification of practices once considered appropriate or even patriotic as unjust, criminal, and abusive. Second, transitional justice addresses widespread and systematic abuses. Whereas criminal justice is commonly designed to address actions that deviate from the norm, transitional justice addresses abuses that could not have been carried out without the active involvement and tacit complicity of a significant portion of the population.

In the context of a liberalizing or democratizing transition, these features give rise to a common set of dilemmas. The central goal of criminalizing violence authorized under a prior regime is in tension with procedural standards for establishing the integrity of law, such as the prohibition of retroactive punishment. The sheer number of those implicated in political violence would overwhelm even a well-functioning judicial system, but transitional justice implies a context where the judicial system is itself undergoing transformation. The process of condemning actions that were widespread or authorized by political leaders is controversial and potentially destabilizing. The question as to how such challenges ought to be addressed has become the subject of a rapidly growing body of scholarship in the fields of human rights, international relations, comparative politics, and political theory.

One set of theoretical debates associated with transitional justice concerns the relationship between measures to address *past* injustices and the pursuit of a just *future*. Theoretical debates on transitional justice in the 1980s through the mid-1990s commonly centered on the question of how to negotiate among perceived trade-offs between backward-looking and forward-looking approaches to justice, or between principle and pragmatism. Human rights advocates played an important role in framing such debates and commonly associated justice with individual criminal prosecution in accordance with evolving principles of international human rights law. Critics argued that human rights prosecutions would undermine the pursuit of a just or democratic future by destabilizing newly democratizing countries, draining scarce resources from other reconstruction efforts, or simply by opening "old wounds." Similarly, scholars have argued that reparations might undermine national unity or political and economic support for forward-looking social justice projects by shifting resources and attention to past divisions. Administrative purges might be seen as a desirable form of retribution, as well as a basis for advancing political change, but they may also be destabilizing or rely on questionable information. The earliest truth commission to receive widespread attention was established in Argentina as a pragmatic compromise between the demand for prosecution and the demand for impunity. Truth commissions investigate and report on patterns of political violence but do not prosecute or punish individuals.

South Africa's Truth and Reconciliation Commission challenged the perception of truth commissions as a pragmatic, "second best" alternative to prosecution by arguing that truth commissions could advance restorative justice in lieu of retribution. Restorative justice is an informal, responsive approach that draws on communitarian theory and indigenous practices. In contrast with the legalistic focus on impartial procedures and enforcement, restorative justice is defined in relation to the goals of healing, mediation, and social repair. South African leaders, along with a number of scholars, have argued that restorative justice bridges backward-looking responses to the past with the forward-looking pursuit of political reconciliation. They also proposed that truth commissions might contribute to restorative justice by fostering support for forgiveness, reparations, and a common understanding of the past. South Africa's truth commission generated new theoretical debates on the role of truth commissions, amnesties, and political forgiveness as approaches to transitional justice. The proliferation of truth commissions since the mid-1990s has also informed theoretical debates on the political role of human rights investigations and public remembrance. Scholars engaged in these themes have been influenced by earlier debates on the German process of "dealing with the past" or *Vergangenheitsbewaltigung,* in the aftermath of the Nazi era and the "historian's debate" over the role of myth and memory in nation-building projects.

In recent years, increased international involvement in promoting transitional justice has generated new theoretical debates over the relationship between local and global responses to political violence. A defining aspiration of the human rights movement was to expose and condemn state-sponsored violence by establishing mechanisms for international oversight. However, a number of scholars have argued that international responses to political violence will lack legitimacy unless they are integrated with local traditions and practices. The expansion of international involvement has also generated critical theoretical interpretations of transitional justice as a discourse of human rights and state legitimation. Instead of evaluating transitional justice in relation to legal or moral criteria, these scholars have examined how transitional justice debates are framed. Although transitional justice institutions purport to challenge repression and denial, such scholars have countered that an emerging discourse of transitional justice has more complicated political implications and may establish new political mythologies that function to displace or undermine alternative ways of defining political and social change.

TYRANNICIDE

Tyrannicide, the act of killing a tyrant (also, the killer of a tyrant), was not an abstract concept in antiquity. Some classical states legislated to exempt those who killed a tyrant or would-be tyrant from prosecution, and some tyrants met violent ends at the hands of self-styled liberators. But as in all areas of political life, definitions proved more difficult in practice than in theory, and ancient philosophers devoted much thought to the question of precisely what constituted tyranny and under what circumstances it was justifiable to kill a tyrant.

The archetypal tyrannicides were Harmodius and Aristogeiton of Athens, who in 514 BCE planned to murder the tyrant Hippias, son of Pisistratus. They succeeded only in killing the tyrant's brother Hipparchus before being killed themselves, but they nevertheless received great posthumous honors from the Athenian populace. Harmodius and Aristogeiton's deed did not end the Pisistratid tyranny—Hippias ruled for 3 more years, and their act was, furthermore, personally motivated, a response to an insult by Hippias (according to Herodotus) rather than the product of political conviction. But they became known in popular tradition as a symbol of resistance to tyranny.

The laws on tyrannicide passed in the classical period make the idea appear uncomplicated: If anyone aims at tyranny or succeeds in becoming a tyrant, he or she can be killed with impunity. In practice, however, the motives of tyrannicides were rarely politically pure. In many cases the term was used to justify an unedifying cycle of political murders, as would-be rulers declared their rival to be a tyrant and murdered him. Only among philosophers do we find disinterested motives: Under the influence of Plato's condemnation of tyranny, some students of philosophy chose to risk their lives against tyrants. Clearchus, tyrant of Heracleia on the Black Sea, for instance, was killed in 352 BCE by a group led by his court philosopher Chion. The tyranny did not fall—Clearchus was succeeded by his brother—but the tyrannicides appear to have acted from political conviction.

The image of the paranoid tyrant who fears assassination at every moment derives principally from the works of Cicero. In *De Officiis* Cicero suggests that all tyrants inevitably meet death at an assassin's hand and that killing a tyrant is not morally wrong. Cicero emphasized these ideas as a means of justifying the act of tyrannicide in his own time, and the conspirators against Julius Caesar in 44 BCE presented their deed as both the overthrow of a tyrant and the restoration of the republic, reaching back into history for precedent to Brutus who drove out the last of the Roman kings, and to Harmodius and Aristogeiton themselves. In the early Roman Empire conspiracies against the emperor were common, but although the conspirators usually claimed to be removing a tyrant and restoring the republic, in general they aimed simply at replacing the ruler. From this point on, arguments about tyrannicide came to center on the ethical nature of rulership—the point at which constitutional rule became tyrannical—and the legitimacy of opposition to it. Yet antiquity continued to provide a fertile source of inspiration for would-be tyrannicides of all kinds.

Tyranny

In modern times the term *tyrant* has come to mean the worst kind of ruler—someone who exploits his or her power for personal ends, irrespective of the law. For the ancient Greeks, however, a tyrant was not necessarily a bad ruler; in its original form (*tyrannos*) the word was used to describe a man or woman who held absolute and personal power within a state, distinct from a king whose rule was bound by constitution and law. Some were usurpers who came to power by their own efforts, others were elected to rule, and yet others were imposed by intervention from outside. Certain rulers, such as Phalaris, tyrant of Akragas in Sicily, who burned his enemies alive in a brazen bull, were bywords for uncontrolled cruelty and self-indulgence, but others, such as Pittakos at Mytilene, were remembered favorably in later sources as wise and moderate rulers who brought prosperity and peace to their city. Later on in classical history, however, the word gradually acquired more of its modern flavor, implying a ruler whose sole motivation was power and personal gain, and as a result its use in public life became controversial. The idea of tyranny has thus been at the center of debate about legitimacy in rulership and the balance of power between ruler and people; from Roman times onward philosophers have argued for the moral right of the citizen to overthrow a tyrant whatever the law, and have debated the point at which monarchic rule becomes tyrannical. This entry discusses the changing definition of tyranny in classical antiquity and tyranny in its Greek and Roman contexts.

Definitions

The best-known definition of tyranny comes from Aristotle's *Politics:* "Any sole ruler, who is not required to give an account of himself, and who rules over subjects all equal or superior to himself to suit his own interest and not theirs, can only be exercising a tyranny" (1295a, pp. 19–23). Aristotle presents tyranny in a very negative light, as a form of monarchy which has deviated from the ideal, and by listing the characteristics of the tyrant—he comes to power by force, has a bodyguard of foreigners to protect him, and rules over unwilling subjects—Aristotle suggests that a tyrant was always a violent usurper. Pisistratus, tyrant of Athens, is a classic example; he made three attempts to seize power, finally succeeding in a military coup in 546 using forces from outside, and ruled for 30 years. But it is more complex than Aristotle implies: Pisistratus did not dismantle the structure of government, and assemblies of the people continued to be held and magistrates to be appointed under his rule. Most notably he was succeeded by his two sons, Hippias and Hipparchos, turning the rule into a hereditary one. Some tyrants had power conferred on them by the state, such as Clearchus at Heracleia on the Black Sea, who was appointed in 364 BCE to resolve a civil conflict, whereas others, like Mausolus and Artemisia of Halicarnassus (creators of the Mausoleum, one of the Seven Wonders of the Ancient World), ruled with tyrannical power but were in constitutional terms *satraps* (governors) within the Persian Empire.

But even if there was no simple definition of a tyrant, there were classical rulers who, for a long or short period of time, dominated a state and had the ability to do whatever they wanted—found cities, move populations, wage war, create new citizens, build monuments, or accumulate money. These rulers had certain fundamental features in common: They were sole rulers with direct and personal power over the state, unconstrained by political institutions. Their power was dependent not on a right to rule but on their own ability to command and retain control. Perhaps because of the insecurity of their position, tyrannical rulers tended to have grand ambitions: They were empire builders, colonizers, conquerors, and constructors. Aristotle says rather cynically that tyrants' building projects, such as temples and public fountains (and indeed the Egyptian pyramids), were intended to keep the people poor and prevent them from plotting revolution (*Politics,* 1313b, pp. 18–25), but in fact tyrants were best placed to implement large-scale projects

for public benefit. All tyrants aimed to hand power on within their family, and some succeeded in establishing a rule lasting many generations.

Although few surviving classical authors have anything good to say of tyrants, they were generally successful in government, bringing economic prosperity and expansion to their cities. The Aristotelian view suggests that tyrants were inevitably unpopular, ruling a cowed citizenry who feared and hated them and wished only to be free. But as we have seen, some tyrants were chosen by the state to rule with a specific purpose: to put an end to civil war, to impose a new code of law, or to offer leadership in a time of danger. Indeed it was often proposed that a sole ruler with overall control of military and political affairs was the best option in wartime. Though opposed to monarchy on principle, the Romans in times of threat would appoint a dictator, one individual who was granted complete control over the army and state for a period of 6 months, a position described by the historian Dionysius of Halicarnassus as an "elective tyranny" (*Roman Antiquities,* 5.73). Philosophers, too, saw tyranny of a certain kind as a positive: The philosophers of the fourth century constructed their designs for the ideal state around an enlightened and self-controlled monarch, the "philosopher king," who would live a virtuous life himself and could impose the best constitution on his subjects.

Greek Tyrants

Greek attitudes toward tyranny, as already noted, changed over time, shaped by external events. In the beginning the tyrant figures in the poetic sources as an enviable status, something to which an aristocrat might aspire. In the early stages of the Greek *polis* (city-state) the hereditary aristocracy held all political power and ruled as a group, with the mass of citizens excluded from political life. Tyrants first appear in this milieu in the mid-seventh century BCE, and there is controversy about precisely how. One view sees rivalry between aristocratic families who vied to take all power into their own hands; the other suggests that tyrants were representative of a newly politically conscious *dêmos* (people) who supported their rise in the hope of improving their position within the state. Although the idea of any political consciousness on the part of the *dêmos* in the seventh century is optimistic, it is true that early tyrants tended to have popular support: Figures such as Cypselus at Corinth and Cleisthenes at Sicyon offered an alternative to exploitation by the aristocrats, and certainly tyrants introduced reforms intended to please the *dêmos,* codifying the laws and establishing justice—Pisistratus in Athens set up traveling courts—and gathering resources for public projects, such as fountains to supply water and grand temples.

The tyrants of the archaic age, then—Cypselus, Cleisthenes, Pisistratus, and Polycrates—were popular, presiding as they did over an era of prosperity and expansion. But these attitudes shifted in the course of the fifth century, under the influence of the Persian invasions of Greece in 480/479 BCE. Most sources for Greek history are Athenian, and for them the defining moments of the Athenian state were the establishment of the democracy in 510 and the Greeks' astonishing defeat of Persia in the next generation. The outcome of the Persian War was interpreted as the success of the free and democratic Greeks against the autocratic and tyrannical Persian king; consequently in Athenian writing after 480, tyranny became the hated opposite of democracy. This colored attitudes toward tyranny in the past as well; rulership that had previously seemed positive and acceptable was condemned as oppressive and self-serving. In Herodotus's *Histories* the Corinthian Sosicles says, circa 500 BCE, that "there is nothing more unjust or bloodthirsty among men than tyranny" (5.92a). The drama of the fifth century takes the contest between tyranny and law as one of its central themes: Plays such as Sophocles' *Antigone* dramatize the confrontation of the tyrannical ruler and the upholder of natural law.

The idea that tyranny vanished in 510, however, is a false one. One of the most successful tyrant dynasties ruled in Sicily between 406 and 367, that of Dionysius the Elder and his sons, and tyrants reappeared in numbers in the fourth century BCE. In part this reflects a genuine change in political circumstances: Impoverishment and an increase in foreign interference meant that constitutions tended to become unstable, and hence many of these classical tyrants came to power on a platform of economic reform to benefit the lower classes, offering the cancellation of debts and redistribution of land. But the reappearance of tyranny also owed something to the growing interest among philosophers

in the consideration of political forms. Thinkers such as Aristotle and Plato led an intellectual movement in favor of enlightened ("philosophical") monarchy, which opened up debates about the role of the ruler, because they believed that neither democracy nor oligarchy represented the ideal form of the state. Only an all-powerful ruler could bring about the changes necessary to ensure that the state was run in ways that promoted virtues, and in the service of this idea, figures from the past such as Cyrus the Great of Persia were presented as "ideal kings." Plato went so far as to put his scheme into practice, visiting the court of Dionysius the Younger at Syracuse in 359 in an attempt to win the young tyrant over to philosophical rule, believing that he would then be in a position to impose ideal laws upon his citizens. Dionysius proved less than amenable and Plato was lucky to escape, but his pupils were not deterred by this failure and several went on to try to influence other tyrants or to set up their own tyrannies, such as Clearchus at Heracleia (364–352 BCE).

By the end of the fourth century Philip of Macedon had conquered the Greek states and put an end to their political freedom, and under Alexander the Great, a huge Macedonian empire was created. This in turn spawned new tyrannies and monarchies. At first, dependent governments were set up under Macedonian rule. After Alexander's death, independent kingdoms were established by his successors and imitators. The third century saw the creation of new tyrannies that were less and less distinguishable from hereditary monarchies, such as the rule of Hieron II in Syracuse. Under these circumstances the idea of tyranny changed from a constitutional issue to an ethical one, and *tyrannos,* rather than indicating a ruler who was not a king, came to be used to describe a particular type of king: one who put his or her own interests before those of the citizens and acted without restraint by the law.

Tyranny in Rome

Roman attitudes toward tyranny were clear. Early in their history Romans had been governed by kings, but the true beginning of the Roman state was the foundation of the republic in 509 BCE. Kingship, according to Roman historians, could all too easily turn into tyranny, and the later kings are depicted as tyrants of the negative type—cruel, exploitative, and self-indulgent—so under the republic, the Romans set their faces against monarchy of any kind. Clear limits were set to the amount of power any one individual could command. The dictatorship existed as an emergency measure whereby one man could be appointed to overall power in the state, but it could be held for 6 months at most. Much Roman history, however, was written several hundred years later, in the first century BCE, and betrays a very contemporary concern with the problem of tyranny. By 133 BCE the growth of the empire had changed Rome from a small city-state to a global power, and the conquest of Italy and the Mediterranean had created the conditions for individual generals to gain both enormous wealth through conquest and a huge following among their soldiers, paving the way for them to seek personal power through military force. Generals began to use the dictatorship unconstitutionally to achieve domination. Sulla was the first to bring his army to Rome in 82 BCE after fighting a civil war and was elected to an indefinite dictatorship by a cowed Senate. He chose to lay down the role and returned to private life, but his example was noted by Julius Caesar. In 46 BCE Caesar also brought an army into Italy and was made dictator first for 10 years, then 2 years later dictator for life. This made him effectively a king, superior to all other magistrates and not subject to their veto or appeal, and in this context the idea of tyranny began to be discussed by historians and philosophers. Thinkers such as Cicero adopted the language of Greek tyranny to describe Caesar's position and debated the moral justification for tyrannicide. The assassins of Caesar presented themselves as overthrowing a tyranny, but the removal of one man could not prevent the drift to monarchic power in Rome, and Caesar's heir Augustus took control as the first emperor.

At several points under the early emperors conspiracies were formed to remove the ruler and restore the republic on the grounds that the imperial power was unconstitutional and therefore illegal, but they failed due to lack of support by the people (who strongly favored monarchic rule) and the individual ambitions of the conspirators. Soon the imperial rule was established as constitutional, and the language of tyranny again became ethical in application rather than political.

Accusations of tyranny came to refer to the quality of rule rather than its legitimacy: An emperor who abused his power or used it for personal ends was seen as despotic, although it took a brave man to say so in public.

Conclusion

The most significant change in the conception of tyranny from the ancient world to the modern lies in the role of the people under a tyrant. In ancient times tyrants tended to be popular because the people saw them as upholding their interests. It is striking, for instance, that whereas Augustus avoided holding the dictatorship, hoping to differentiate himself from his adoptive father Caesar, the Roman people clamored for him to accept it on several occasions. Tyrants often introduced measures to improve the economic and social status of the poor; it was the aristocracy who wrote the histories who tended to oppose tyranny, because, in bypassing the constitution, tyranny threatened their traditional privileges. But as absolute rule became established in the Roman Empire the terms of debate shifted, focusing on the question of when monarchic power became tyrannical in nature. From this springs the idea of tyranny in its modern sense: a situation in which the power of the ruler outweighs that of the ruled. This definition allows even a representative government to be labeled a tyranny.

U

Universality

Political theory has conventionally proceeded on the basis that its insights are applicable universally. The universal applicability of political theory is now far less self-evident, due to challenges to the idea of universality from a number of quarters, including communitarianism, feminism, and postmodernism. These challenges have led some to abandon the ideal of universality, while leading others to rethink and reinterpret the notion of universality.

Accounts of the debate over the utility of universality within political theory have generally proceeded through delineating the oppositional relationship of liberal and communitarian theory. Liberalism is cast as adhering to the value of universality, in its insistence on the necessity for neutral universal norms derived by abstracting people from their particular situation. Communitarianism disputes liberalism's elevation of abstract individualism. Instead, it emphasizes the priority of community over individuality and conceives of normative principles as embedded in communal practices. Rather than abstracting people from their social context in order to distill universally applicable normative principles, communitarianism suggests that such values derive from localized social and cultural traditions.

The liberal/communitarian opposition does not exhaust the range of debate over universality. Rather, it overlaps with numerous other contests over the necessity of universality in political theory. The notion of universal personhood has been strongly challenged by feminism, which argues that the characteristics of this abstract *man* are, rather than universally shared, in fact valorized attributes of masculinity—rational, unencumbered, self-knowing—against which femininity has been defined and excluded. Further, universal norms have been challenged by postcolonial critics, who discern in them an insidious cultural imperialism. Such critics argue that those—usually privileged, Western voices—who have enumerated universal values have done so by generalizing their own values across many incommensurable moral frameworks. Enlightenment notions of truth, justice, and equality are criticized for their reliance on a framework deeply imbricated with Western society, a framework that has been summarily imposed on other cultures.

The other major challenge to universality comes from postmodern theory, which challenges the "grand narratives" of universality and truth on the basis that these grand narratives totalize and systematize a complex and competing set of smaller or local narratives.

Questioning the validity of universal theory has attracted vehement critics, who have insisted that to turn away from the idea of universality entails relinquishing any possibility of making cross-culturally applicable normative pronouncements, and thus withdrawing from effective political action. On this view, critiques of universality are considered to engender moral relativism and to enable only narrow particularist claims.

However, rather than wholly rejecting universality, the concern of much recent theory has been

with critically rethinking the notion of the universal. Some theorists have reinterpreted the idea of universality by considering more closely its relationship to politics. Whereas the status of claims to universality as claims to eternal or transcendent truths may once have meant that universality stood outside the fray of political contest, more recent approaches associated with radical democracy see the definition of universality as an eminently political question. On this view, the universal becomes the site of continual contestation and revision of its meaning and limits. This struggle over the definition of universality is not something we should strive to resolve, but rather an essential ingredient in ensuring that the universal remains open to challenge, contestation, and redefinition.

The increased interest in the concept of cosmopolitanism—the notion that we are in some way citizens of the world—provides another instance of a reinterpretation of universality. In the past, cosmopolitanism has been straightforwardly equated with abstract universalism. Its perspective was that of the unattached world traveler. In contrast, newer approaches to cosmopolitanism tend to pose the relationship of globality and locality as a central question for research. This attention to the relationship between universality and particularity is marked in the terminology used by theorists of cosmopolitanism—by focusing on cosmopolitanisms, for instance, or by qualifying the term cosmopolitanism, as in the notion of *cosmopolitan patriotism*.

The other major area of political theory where the status of universality is at issue is work on human rights. Recent work on rights has been concerned with whether, and to what extent, the notion of human rights can operate in the face of challenges to the universal status of humanity that have come from those emphasizing the significance of difference—in particular, sexual and cultural difference. These reworkings of the notion of human rights renounce claims to universality based on their eternal and transcultural "truth" and instead tend to focus on the historical emergence and cultural locatedness of the idea of human rights.

Universal Monarchy

Universal monarchy is a doctrine that had its origin in the Roman Empire, but its best-known form is in Dante Alighieri's *De monarchia,* completed some time after 1310. Dante's argument concerns the proper location for temporal authority. The logic of Book 1 of *De monarchia,* which takes up the question of whether there should be one temporal ruler over all, is derived from Aristotle by way of Aquinas. All human beings have ends, which must be coordinated for any social institution to work. The indispensable condition for human beings to work out their ends is peace, which means finally universal peace. Following Aristotle, he argues that each social grouping works to the extent it has one person placed over it to coordinate its activities, to ensure that all ends come together harmoniously. Nor is this a task that can be left to kings over particular territories: because kingdoms may disagree with each other, one authority must be placed over all of them. This is the universal monarch.

The question had great significance in Dante's time because of a long-standing conflict between emperors and popes concerning who had supreme temporal authority. These conflicts had become acute in the century leading up to Dante, especially in the Pontificate of Innocent III, who claimed authority to give the empire to whomever he desired, and to withhold it as well, keeping in the meantime supreme temporal authority for himself. Dante's argument is a rebuttal to this concept of papal authority.

The argument is fleshed out in Books 2 and 3 of *De monarchia*. Book 2 argues that the Roman Empire, established independently of the church and existing in full power at the time of Christ's birth, is the true repository of temporal power, to be preserved in its way exactly like the power of the church. Book 3 rejects the two primary arguments given for the papacy's power, the Donation of Constantine, in which the emperor supposedly gave control of the empire to the pope, and the status of the pope as vicar of Christ, who has power over heaven and earth. No argument presented up to Dante's time can justify the intrusion of the church on public life, in part because no such justification can be given. Each functions best when their roles are separated.

Universal monarchy regains importance as a concept during the reign of Charles V as Holy Roman Emperor. His Grand Chancellor, Mercurino Gattinara, was an admirer of Dante and encouraged Charles to think of himself as a new Charlemagne, remaking juristic law and opposing the temporal aspirations of the pope in Italy and elsewhere. It is later taken up by subsequent Holy Roman Emperors to attempt to reconquer nations that had left the Catholic Church. It receives its last major expression in European thought with Napoleon, who aspires to universal control of Europe and takes Charlemagne as a model. The term changes its meaning after Charles V; instead of being a term of approbation, it becomes a means to abuse those with aspirations of empire. The baron de Montesquieu and English political theorists use the term to deride figures like Louis XIV and Napoleon.

UTOPIANISM

Theodore Adorno, the German philosopher and sociologist in *The Authoritarian Personality* (1950) talks about the existence of an "anti-utopia complex" in some individuals that literally makes them afraid of utopias. True or not, Adorno's observation is suggestive of the powerful resonances of the utopian. Utopia is such a deeply contested concept, to some it represents mental space in a confining world, to others the height of human folly. While the Irish dramatist Oscar Wilde (1854–1900) maintained that a map of the world that didn't contain utopia was not worth looking at, Thomas Macauley (1800–1859), the great whig historian, declared that he would much prefer an acre in Middlesex to a whole principality in utopia. That the concept emerged and developed in early modern Europe is perhaps not surprising, given that this was a period that saw the beginnings of massive social, economic, and political change. The construction of utopias was a way in which those who welcomed change could explore further possibilities, while to those who feared such change, or were concerned about the actual or proposed direction of change, the term *utopian* suitably colored could be a powerful weapon in their rhetorical struggle.

Definitions

The word *utopia* was coined by the English lawyer, politician, and writer Thomas More as the name of an imaginary commonwealth in *Utopia* (1516). The text is full of enigmas, and scholars have long pondered on the author's intentions; More's term *utopia* itself has an inbuilt double meaning, one that anticipates the later usage of the term. Although the book was written in Latin, utopia is a pun in ancient Greek in which the first syllable simultaneously denotes *eu*-topia—good place—and *ou*-topia—no place. The word thus lent itself to very different forms of deployment: on the one hand to various attempts to visualize the good society, but on the other as a critical term to castigate the search for the better or the best society or to reject specific plans for change, where "no place" is conceived as the unrealistic. This latter negative usage became so entrenched in popular and political usage that advocates of the good society were reluctant to use the term utopian to describe their own projects, and indeed would use the word themselves to denigrate alternative conceptions of social felicity. It is only since the end of

the nineteenth century that one finds theorists and activists in any number who self-consciously use the term utopian to signify in a positive manner their political hopes and aspirations.

Given its early modern coinage and its recurrent negative usage, the term *utopian* when used as a category of historical analysis is usually a retrospective judgment rather than a registering of the explicit self-identification of historical actors. Thus, the term has been used to characterize writings such as Plato's *Republic* (c. 380 BCE), which clearly predates More, as well as a variety of post-More writers who did not describe their works or projects as utopian. Inevitably, as the various histories of utopia demonstrate, given the differing definitions of utopia there is a good deal of disagreement as to what historically qualifies as a utopia. Furthermore, given the emergence of utopia as a Western category, there has been debate about the relevance of the term to non-Western societies, some arguing that it has little or no applicative value in such societies, others that the term has a sufficiently universal character to lend itself to global deployment, with a concomitant growing scholarly literature on, for example, Chinese and Japanese utopianism.

Turning to the "topia" aspect of the word, from the Greek *topos* (place), in More's case this had a spatial referent. Written in the time of the "Voyages of Discovery," Utopia was a newly discovered island, and the account of its institutions and people takes the form of a traveler's tale, as it does in the later *New Atlantis* (1627) of Francis Bacon. The spatial utopia, while not dying out (later there were lost valleys and forests and, of course, outer space in science fiction), increasingly gave way to the temporal utopia. Partly this was due to the so-called opening up of the globe, which rendered the notion of unknown lands implausible to Western eyes, but also because the temporal utopia—the good society lying in the future—was in tune with the linear progressivism to be found in first liberalism and then socialism. Indeed, it is possible to conceive of these ideologies as themselves embodying strong utopian impulses with their goals of the "free" or "equal" society to come; political opponents certainly saw these movements as dangerously utopian. The forward glance could also be accompanied, or even helpfully concealed, by the backward glance. A supposed glorious past, be it ancient Greece and Rome or earlier, itself heavily utopianized in the telling (for there was usually a strong element of the enhanced colors of a "golden age" in these supposedly objective accounts), could be a way of talking about a desired future without admitting to utopianism, as in strongly anti-utopian ideologies, such as Marxism (where discussion of the period of alleged prehistoric "primitive communism" was a way of talking about the communism that would be delivered by the "objective" processes of proletarian revolution), or could furnish resources for outlining a society of the future, critiqued in Karl Marx's account of the liberal need to dress up in the garb of classical antiquity.

The adjective "utopian" has certainly been used in many different ways. There is a range of what one might term *negative* usages, where the term is used as a synonym for unrealistic or impossible. Thus, conservatives have wielded the term in asserting their imperfectionist view of human nature against what they take to be radical perfectionism of liberalism and socialism; many twentieth-century liberals, such as Karl Popper (1902–1993), viewed the phenomena of Fascism and Soviet Communism as the poisonous fruit of a utopian cast of mind; while Marx and Friedrich Engels called some of their socialist predecessors and competitors "utopian socialists" on the grounds that they reduced socialism to a personal, unrealizable fantasy. In the case of those who wish to use the term in a more neutral analytical sense or a more positive political sense, what constitutes the utopian is a moot point. There is a spectrum from exclusive to inclusive definitions of the utopian. At the exclusive end, some analysts wish to confine the term to a form of imaginative literature initiated by Thomas More and reject any attempts to expand the concept to describe premodern literary forms or modern forms of political radicalism—a utopia is simply a modern literary genre. At the inclusive end, there are those who wish to characterize a great range of hopes, aspirations, and desires as utopian. It is probably true to say that in the main, the term *utopian* has become more inclusive over time. A spur to this has undoubtedly been the work of the German utopian Marxist, Ernst Bloch. In a series of influential texts, notably *The Spirit of Utopia* (1918) and *The Principle of Hope* (1938–1947), Bloch embraced the utopian and sought to anatomize the dream world of humanity from the

simplest of daydreams through to the sophisticated yearnings of culture and religion, finding articulations of hope at all levels of human endeavor and in all spheres of life, whether it be architecture, technology, fashion, travel, or the other areas explored in his encyclopedic *The Principle of Hope*.

As an analytical category, therefore, utopian can be used, and has been used, to designate a range of phenomena. There are the huge number of literary utopias with their various models of alternative societies—works such as William Morris's *News From Nowhere* (1890), Edward Bellamy's *Looking Backward* (1888), and H. G. Wells's *A Modern Utopia* (1905). There are the utopian aspirations and visions to be found in social and political thinking over the centuries, be they in individual thinkers such as Jean-Jacques Rousseau and Marx, or in broader ideological movements, such as anarchism and socialism. Not that utopianism is confined to the so-called progressive ideologies, for it makes sense to categorize the visions at the heart of Fascism and racially exclusive nationalism as utopian—though one need not subscribe to Popper's understanding of the utopian in relation to these ideologies. Then there are the various forms of community building—the various Owenite socialist communities set up in the first half of the nineteenth century, for example, or the Israeli Kibbutzim, or the various New Age communities established in many parts of the globe. Or, following Bloch, one might speak of a host of utopian traces to be found glistening at every level of social reality—little intimations of a better world sensed in a song, or a favorite place, or in the texture of a fabric.

Better and Best

But what is the "good" in the good society? Because historically utopia became associated with the notion of the best or perfect society, radicals of various persuasions could claim that their projects, because they merely aimed at a *better* state of affairs, were not utopian. In contemporary inclusive usages of the term *utopian,* where a much wider range of political visions are included in the category—some relatively modest in scope—there has been a strong tendency to conceive of the utopian in terms a search for a *better* society. It is possible that the gravitational pull of the negative definition of utopia is at work here; that the claim that the utopian was about pipe dreams, based on unsustainable claims about human potential, and therefore needing oppressive totalitarian structures did hit home. Whether or not this is the case, it is certainly true that there is a tendency to stress that utopians aspire to a *better* society, and the word *best* has rather dropped out of the definition. To use a phrase to be found in the later work of John Rawls (1921–2002), the aim is to be "realistically utopian." The better can of course be *radically* better, so this stance is not necessarily a sign of a lack of political and social ambition, or of a willingness to compromise key values, but it can be accompanied by a feeling that talk of perfection will deeply compromise the utopian. Others, however, from a different perspective, while acknowledging the necessary role for a realistic utopianism, fear that a reluctance to consider the best is to rob the utopian of one of its vital dimensions, radical fantasy, as in the dreams of the French "utopian socialist" Charles Fourier, where planets copulated with one another and the oceans turned to lemonade, or in the sublime words of God to Job in the Old Testament: "Where wast thou when I laid the foundations of the earth…When the morning stars sang together and all the sons of God shouted for joy?"

Change and Continuity

The producers of utopias face a challenge to which many of them fail to rise—the problem of making goodness compelling. The passage from Job, just quoted, is gripping because it can legitimately be termed sublime, and the sublime, as Edmund Burke (1729–1797) reminds us, contains an element of dread, it is truly *terrible*. Historically, few utopias have attempted the sublime. The more usual portrayals of quotidian contentedness always run the risk of a certain emotional and political one-dimensionality, and the odor of a sermon. But imaginative writers and thinkers have been aware of this fact and have sought to reconstruct the way utopias are created.

In two influential books, Tom Moylan has sought to identify ways in which contemporary utopian authors have sought to overcome these problems. Although his focus is on literary texts,

the analysis has broader application to the issue of the utopian. In *Demand the Impossible* (1986), he proposed the concept of the "critical utopia"—a form that is not simply critical of existing society, but critical of the traditional elements of closure in so many utopian texts. This type of utopia identifies defects in the utopian world, highlights fundamental controversies, gives dissident voices a hearing, and avoids authorial omniscience; one example he examines is Marge Piercy's *Woman on the Edge of Time*. In a later work, *Scraps of the Untainted Sky* (2000) his starting point, following Lyman Tower Sargent, is the concept of the "anti-utopian"—the belief that utopianism is an inherently dangerous activity that will inevitably lead to despotism and human degradation. In "dystopian" form, anti-utopianism issues forth in depictions of societies ravaged by the ignorance and hubris of utopian experiments. Utopians also have gravitated to the dystopian form, but unlike the anti-utopians, have adapted the form to keep hopes alive. Thus, we have the "critical dystopia," equipped with all the appurtenances of the bad society, but containing, in both form and content, a destabilizing element of dogged hope; Marge Piercy is again mentioned as an exemplar, this time with *He, She and It*.

These developments testify to the resilience of the utopian. Whether or not one subscribes to the notion of a utopian impulse in humans, the sheer weight of social dreaming over the centuries and across cultures suggests that it meets some fairly basic human needs. It shares with normative political philosophy a concern with fundamental values, but moves beyond the abstract in its attempt to think through or imagine what the embodiment of such values would look like in an actual society. This gives it an immediacy and a connectedness to human concerns and experience that it shares with imaginative literature. It is also a potent form of critique with the absences of specific negative features in its alternative society throwing their presence in existing society into high relief. In this sense, utopias are potent thought experiments grappling with what is essential and nonessential in social relationships. They can also be a form of serious playfulness, a speculative turning of the world upside down to see what might happen. Above all, it seems to partake of the human need to daydream, to imagine oneself and others in different positions and relations, undergoing different, more exciting, more fulfilling experiences. Even those with an acre in Middlesex will occasionally scan the map for that far-off utopian principality.

V

Value-Free Social Science

Much of the modern debate about value freedom in social science has taken place within a framework articulated, in the early twentieth century, by the sociologist Max Weber. In his discussions of objectivity and ethical neutrality in social science, Weber made a sharp distinction between the "vocations" of science and politics on the basis of what he insisted was a fundamental logical difference between a claim about what "is" and a claim about what "ought" to be. The latter included value judgments, ideals, and interests, which were assumed to be expressions of choice and decision whose validity was largely a matter of faith rather than factual or empirical demonstration. Weber, however, stressed the interaction between these spheres. He noted that because values inevitably inform empirical inquiry through the perspective, commitments, and presuppositions of the investigator, there could be no absolutely objective analysis of social phenomena, but he also argued that factual knowledge could in various and important ways influence and guide value judgments in areas such as public policy. He maintained that despite the subjective element inherent in the point of view of the investigator as well as in the values embedded in political and social phenomena themselves, empirical and causal claims in social science could be judged by universally valid and objective standards of factual and logical truth.

Some have interpreted Weber's analysis as the paradigm case of the position that social science can never be truly objective and scientific, while others have characterized him as the principal exponent of the idea that social science can and should be value free. Most commentators, however, have failed to recognize the practical intention of Weber's formulation. His primary reason for distinguishing between science and politics, or fact and value, was to establish the independent cognitive authority of social science, and this same purpose, both before and after Weber, has been central to the history of the social sciences in both Europe and the United States. Lacking any inherent political authority, the hope for social scientific intervention in social and political matters was predicated on transcending ideology and grounding its claims on scientific objectivity.

This was even true of the philosophy of logical positivism which, after Weber, created the terms of much of the subsequent discussion of the issue of value freedom. During the early years of the twentieth century, positivism emerged in Europe as a liberal, and sometimes radical, challenge, in the name of science, to traditional intellectual and political authority. The original impetus was not unlike that which informed the creation of organizations such as the American Political Science Association (APSA, in 1903). Although the APSA perpetuated the practical aspirations of nineteenth century political science, it was founded not only on a different ideological agenda but on the assumption that those aspirations could only be achieved by embracing the basic methodology of natural science. Positivism, and its elaboration in the philosophy of logical empiricism, whose

principal representatives had, by the 1950s, immigrated to the United States, increasingly became the source of the image of science embraced by social scientists. In both cases, however, the pursuit of scientism eventually became detached from its political origins.

The positivists famously argued that there were three basic and mutually exclusive forms of language and human judgment: logical, factual, and evaluative. While empirical or factual judgments could be verified or falsified by reference to observable phenomena and were thus the foundation of science, value judgments, as well as metaphysical ethical claims, were, strictly conceived, meaningless and noncognitive. For many social scientists, this suggested that value words, and evaluative and prescriptive claims, must be excluded from social science, and it also implied that much of political theory and political philosophy was questionable as a cogent endeavor. Although for early twentieth-century political scientists such as Charles Merriam, science was clearly a means to the end of speaking truth to power, the succeeding generation of political scientists, who were the founders of the behavioral movement, sublimated practical concerns in the pursuit of emulating the methodology of the natural sciences. This methodology was understood as entailing not only a belief in the logical and epistemological unity of science but the necessity of value freedom. Following the lead of philosophers such as Ernest Nagel and Carl Hempel, political scientists such as Robert Dahl and David Easton stressed the heterogeneity of values and facts. They argued that if the discipline was to be value free, it must distinguish between the value concerns of political philosophy or normative political theory and empirical political science. In their view, this could be achieved in large measure by eliminating value terms from the vocabulary of political science. By the 1950s, some commentators, such as Peter Laslett, despairingly concluded that because political philosophy was largely an extension of ethics, the triumph of positivism entailed that political philosophy and normative political theory was, in effect, dead. Political theorists such as Leo Strauss, Isaiah Berlin, and Charles Taylor, however, advanced arguments to the effect that it was impossible to separate the language of values from descriptive claims and that an evaluative perspective was inherent in any social scientific investigation.

Vestiges of this basic controversy continue to reverberate in the discourse of political theory and political science. The terms of controversy about a value-free social science, as well as the distinction between normative and empirical theory, were still bound by the Weberian and positivist frameworks. Today, however, positivism is, at most, an obsolescent philosophy, and, consequently, the traditional formulation of the issue has become questionable. Philosophers such as Ludwig Wittgenstein, J. L. Austin, and Stephen Toulmin have stressed the limitations of the fact-value dichotomy as an account of language, forms of reasoning, and, in general, "what we do with words"; and other philosophers, such as Thomas Kuhn, have pointed to the paucity of the positivist image of the logic and epistemology of natural science. Similarly, the distinction between empirical and normative inquiry is seldom any longer viewed as exhaustive.

VIOLENCE

While the question of violence in general is daunting, when considered from the perspective of political theory, it immediately becomes more manageable through a focus on the relationship between *violence* and *politics*. In the history of

political theory, this relationship has been formulated in different ways by three groups of thinkers. The first, which traditionally includes thinkers as varied as Niccolò Machiavelli, Max Weber, and Vladimir Lenin, is thought to have identified politics—or more precisely, political power—with force, domination, coercion, in short, violence. Hannah Arendt is emblematic of a second group of thinkers who share the definition of violence proposed by this first group while emphatically rejecting its association with political power. Arendt also rejects a third group of thinkers—whose clearest representatives are Georges Sorel and Frantz Fanon—with whom she disagrees on the definition of violence itself. However, something is lost in this conceptual incongruence, as this third group can be seen to propose an understanding of violence that is in many ways compatible with Arendt's formulation of politics.

Violence and the State

Machiavelli is frequently seen as the earliest and least apologetic of political thinkers with regard to the association between violence and politics. Credited with an unsurpassed realism by admirers and considered the very embodiment of evil by detractors, notably Leo Strauss, Machiavelli is seen as the ultimate proponent of might-makes-right political instrumentalism. Such a view relies on chapter 18 of *The Prince,* in which many have claimed Machiavelli insisted that, in politics, the ends justify the means. Peter Bondanella and John Musa, however, insist that this is a translation error and that the author is merely noting the absence of impartial judges and the need to take the end result into account when judging an action.

Indeed, the traditional view of Machiavelli as purveyor of bare Realpolitik would need to reckon with several other enigmatic moments in the same chapter, in which he associates law with man and force with beasts and further distinguishes between sly beasts like the fox and powerful and violent beasts like the lion. But not all men can shun the beastly parts of their nature, and given Machiavelli's notably critical view of human nature, it remains true that he never excludes the need to resort to beastly measures of any stripe to counter the self-interest of others. The difficulties of navigating the human world lead Machiavelli to distinguish valuable quantities like glory and skill (*virtù*) from the ambivalences of violence and power, as in his critique of Agathocles the Sicilian in chapter 8.

In fact, the further one moves from the frequently cited chapter 18 of *The Prince,* the less conventionally instrumental Machiavelli's understanding of violence appears. For if his positive evaluation of Romulus may initially appear to endorse the claim that means justify ends, it serves equally to introduce a qualitative distinction between different kinds of violence: It is not the same, for Machiavelli, to turn violence toward destruction as it is to turn violence toward restoration. Constructive violence can here be read in relation to Machiavelli's innovative view of the productive and generative effects of conflict that would lead him, with the example of the Roman Republic, to defend republicanism as a form of government against those contemporary critics who dismissed it as unstable and anarchic. This defense of republicanism then adds another twist to *The Prince,* turning Machiavelli's earlier emphasis on military strength as the basis for good laws (chap. 12) toward a view in which proper military organization—specifically, a militia structure—itself has a politically generative effect that transcends brute domination and points toward more democratic forms of organization.

Much of the instrumental understanding of violence generally attributed to Machiavelli is arguably better located in German sociologist Max Weber (notwithstanding the claim by Reinhard Bendix that both thinkers share a view of society as an object of governance). Unlike Machiavelli, whose objects of analysis oscillated between power and glory, Weber set out more directly from the conundrum of the state, and it is in responding to the question of the preconditions for the very existence of the state that he turns to violence. In so doing, Weber explicitly distinguishes means from ends, insisting in his seminal lecture "Politics as a Vocation" that given the multiplicity of ends toward which states can direct their energies, these cannot define the state as such. Rather, citing Leon Trotsky's similar declaration, the state can only be defined by the *means* that it employs and that is specific to it: physical force or violence (*Gewaltsamkeit*). Having set out from the state, Weber defines politics in those same terms, as a

struggle over the distribution of power within or between states. However, given Weber's early critique of what he deemed "Sultanism," he was acutely aware that this brute force that defines state power was insufficient as an understanding of the operation of subjection. Violence toward the populace invoked fear, which for Weber as for Machiavelli was a weak foundation on which to build lasting power: What was missing was the process through which this violence from above was met with consent from below.

It is at this intersection that Weber's concept of *Herrschaft*—translated alternately as "domination" and "authority"—is central. Historically, Weber identifies three pure types of domination, each of which involves its own form of encouraging legitimation or consent from below: *traditional* domination indicates a relationship between masters and followers on the basis of an unquestioned and perpetual rule, operating largely through personal relationships; *charismatic* domination, in which individual leadership qualities are prized over traditional ones; and *legal* domination, in which consent is granted through administrative mechanisms to laws rather than individuals. It is precisely on the basis of the development of this last form of *Herrschaft* that Weber is able to argue that the specifically modern state, rather than merely deploying force, instead enjoys a monopoly on its *legitimate* use. But legitimacy here should not be interpreted as a term of endorsement, as Weber himself would turn to charismatic domination as a potential counterweight to the "iron cage" of modern bureaucracy.

While Lenin insisted in *State and Revolution* that the ends toward which state violence is directed do matter, he nevertheless agreed with Weber's sociological approach whereby the state is defined in such a way as to accommodate distinct ends (i.e., bourgeois or proletarian). But in so doing, Lenin implicitly rejects the formal universalism of Weber's modern state, in which citizens have come to replace subjects or followers, opting instead for an understanding of the modern state as class rule operating through the same military (monopoly of legitimate force) and bureaucratic (legal domination) institutions that Weber had identified.

Arguing simultaneously against opportunists, for whom the bourgeois state could be seized ready-made, and anarchists, for whom no state could justifiably be seized at all, Lenin argued that bourgeois and proletarian states fundamentally differ even though both qualify as instruments of class domination: The former represent domination of the poor by the rich and the latter the opposite. Hence, the applicability of the concept is maintained without the universalism: To have a proletarian state is still to have a state, but the inversion of domination that it represents clears the way for the second stage, the withering away of the state itself (and violence more generally) through the replacement—on the model of the Paris Commune—of the bureaucratic and military elements of the modern state with a directly democratic and armed communal structure. Hence, although Lenin continues to view violence as pertaining to the state, he nevertheless creates a space, like Machiavelli, for a consideration of qualitatively different types of violence.

Arendt's "Mute" Violence

In both *The Human Condition* (1958) and *On Revolution* (1963), Arendt's distaste for violence is clear. In an effort to redefine and reclaim politics, she self-consciously adopts the formulations of Aristotle, which see man as both a political being (*zōon politikon*) and a speaking being (*zōon logon ekhon*), thereby tying the political intimately to the phenomenon of speech. If Arendt's understanding of the political is determined both in terms of its location (the *polis*) and its content (*logos*), then the same can be said of violence, which is not excluded from her theory but merely relegated to the private sphere of the household (*oikos*)—the site of labor as opposed to action—and dismissed as the opposite of speech, as silence. Violence, she tells her readers in *On Revolution,* cannot speak and must therefore be banished from the political realm and left to technicians.

If violence is condemned in the public sphere as the antithesis of politics, Arendt tacitly justifies the function of violence in the private, or household, sphere. For Arendt, the household realm is closely associated with labor, that cyclical, immediate, and inescapable process of fulfilling one's physical necessities. The violence of the ancient household was directly associated with the effort to escape necessity: It was only through enslaving others that one's own necessities could be fulfilled by another,

thereby allowing escape from the private world of necessity and entry into the public world of politics. But if the association of violence with labor and necessity is clear in Arendt's work and contributes to her central project of distinguishing the public from the private, the same cannot be said for the concept of work, whose violence is less clearly distinguishable from her understanding of the political.

As the process that creates the durable human world, work necessarily involves an element of violation, an exhilarating violence toward the world in the process of dominating it. Hence, the violence involved in labor and work are not qualitatively different, but merely have different victims and objects: We bind *others* to the necessity of nature to free ourselves from labor, whereas to engage in work entails a more direct domination of nature. But because work and the relative permanence that characterizes its artifacts—the epitome of which is the work of art, consciously placed beyond usage—transcends the merely private realm of necessity and consumption and enters the public realm of political action, so too does its domineering violence. Thus, if violence in the political realm was categorically condemned, it was indirectly justified in other realms through the exceedingly high premium Arendt would place on politics. This then gives rise to a second reason why she opposes political violence: Not only is it essentially antipolitical in its silence, but it also frequently represents—as in the case of the French Revolution—the violation of the division between public and private that Arendt hopes to preserve, the forced entry of necessity into politics that she so dreads.

While Arendt was heavily influenced by Weber, she disagreed with him on this point, not due to his definition of violence—which they in fact shared—but rather for his association of that violence, through the nexus of the state, with the political realm. Her position toward Machiavelli was equally complex, occasionally dismissing his instrumental view of politics—instrumentality, for Arendt, being a characteristic of work, not action—but occasionally attempting to see in his appeal to leadership (something to be found as well in Weber's appeal to charisma) something more closely related to her own view of the political. This ambiguity toward Machiavelli points us toward a third category of thinkers that Arendt would spare no ink in critiquing. These thinkers differ with Arendt not—as did Weber—on the question of the political, but rather on the question of violence itself, which they see in terms more compatible with Arendt's notion of politics: as a generative force characterized by its capacity to speak.

A Violence That Speaks

French syndicalist Georges Sorel is perhaps the best-known thinker to focus his attention directly on the phenomenon of violence, but it is important not to be misled by what he means by the term. Toward the end of his *Reflections on Violence*, Sorel observes that his central task was the establishment of a distinction between two phenomena: force and violence. *Force* indicates the repression of the majority for the benefit of a politically dominant minority embodied in the institutions of the state, whereas *violence* properly understood represents the liberatory power of the proletariat aimed at destroying that state. Here we have, not an inversion of Machiavelli's discussion of destructive versus reparative violence, but rather continuity under redefined terms: For Sorel, the state is institutionalized destruction, whereas it is proletarian violence that "mends." Violence, for Sorel, is therefore determined less by its form (i.e., Weber's "physical force") than by its proletarian content, and this distinction places Sorel in tension with both the realist Weberian tradition that associates politics with violence and the Arendtian tradition that holds them in opposition.

In practice, Sorel's concept of violence functions toward the consolidation of class identity. In the absence of objective class categories and in the face of an increasingly powerful ideology of harmony, Sorel formulated violence—in the form of the general strike—as an intervention capable of rescuing the working class from incorporation into the social totality. Through the violent assertion of social antagonism, the working class would be empowered, the bourgeoisie provoked and scandalized, and the existence of social classes would become more generally salient. The world-historical function of this violence would then, for Sorel, become apparent: By restoring the class division of society in all its purity, the objectivity of Marxist science would also be restored.

It is likely that Fanon read Sorel, despite never citing him. Indeed, Sorel's importance for Francophone discussions of violence was so great that Jean-Paul Sartre—in his preface to Fanon's analysis of violence in *The Wretched of the Earth* (1961)—went out of his way to dismiss Sorel's relevance entirely. The importance of violence for Fanon's framework is clearly visible in his 1952 work *Black Skin, White Masks*. In this earlier work, however, Fanon formulates a violence that is almost entirely symbolic, consisting of the violent assertion of one's own existence in the face of ontological disqualification. Speaking in Hegelian terms, Fanon insisted that racialized subjects were perceived as nonbeings, and that the only way to create the basis for a Hegelian structure of recognition was through violent appearance. This focus on the symbolic and ontological elements of violence continued throughout Fanon's later work and his relocation to the Algerian context, but the overwhelming and concrete violence of the colonial structure forced him to focus on the violence of the state in a way more reminiscent of Sorel. Against the violence of colonialism, the colonized was to reply with a qualitatively distinct violence that maintains the ontological function of *Black Skin, White Masks*. If Sorel's violence sought the reestablishment of class identity, Fanon's was oriented toward the construction of national consciousness.

Both Sorel and Fanon celebrate *violence* in a manner that Arendt finds unacceptable, but what she fails to recognize is the importance of the distinction that both introduce into the term. In her short book *On Violence,* published at the height of the 1960s tumult, Arendt maintains her assessment of violence as instrumental, while blurring her own categories by recognizing that it is also a form of action. While this might seem like a step toward Sorel and Fanon—as violence is drawn closer to the political—Arendt sees it as even more foreboding than muteness: the unpredictability and irreversibility of action make violence all the more threatening. This is because, if she tacitly recognizes the capacity of violence to speak, it remains monolingual. What Sorel and Fanon embrace is a liberatory violence that operates in much the same way—as noninstrumental, open-ended, transformative, communicative, and creative action—as Arendt's own understanding of politics. But this liberatory violence is held in constant tension with the repressive state violence or force that characterizes more traditional, Weberian accounts of politics. If, for Arendt, ancient slaves were deemed "slavish" in nature for their refusal to resist their own enslavement and fight for their liberty, then nothing could appear less "slavish" than the resignification of violence offered by Sorel and Fanon. And would not her tacit justification of the violence that subdues necessity also lend support to those whose needs have still not been met today?

VIRTUAL

In common parlance, to classify or describe something as virtual is to contrast it with what is real. The real is characterized by physical, tangible qualities that can be observed empirically. The *virtual* represents—re-presents, copies, simulates—the

real. Consider, for example, the concept of copresence: two or more people sharing the same space at the same time. Real copresence is most obviously registered through the senses: the capacity to see, hear, touch, and smell those whose presence one is sharing. In contrast, virtual copresence describes the sense of sharing time and space, even though one has indirect and limited access to those who appear to be present, while quite possibly being far away, asleep, unaware of you, or doing something else. A telephone call suggests a virtual copresence of voices, but not of sight, touch, or smell. A videoconference offers an opportunity to see and hear others, almost as if they were present, and yet they remain physically untouchable and environmentally dislocated.

The virtual is sometimes spoken of as a degraded form of the real or original. It is argued that even though virtual entities, events, and communications may at times offer a convenient substitute for the real, they can never convey the multidimensionality of actuality. From this perspective, the inevitable failure of mimetic correspondence between the virtual and the real dooms the former to epistemological and aesthetic impoverishment.

In complete contrast to the previous perspective, others argue that virtuality serves to supplement the original. While the real can only ever be an approximation of its ideal, the virtual can be designed to correspond to ideal qualities. An avatar, for example, can be revised and refined until it conforms to an aesthetic ideal. Or, in a virtual economic model, actors can be designed to behave in accordance with economic laws rather than in the less predictable ways that characterize real market behavior. In this sense, virtuality is seen as a way of resolving the incompleteness of reality; in Jean Baudrillard's terms, it constitutes a form of hyper-reality.

A third notion of the virtual sees it neither as degradation nor supplement of the real, but a playful space of counterfactuality in which alternative realities can be imagined, designed, or acted out. In this sense, the virtual should not be evaluated in terms of whether it adequately reproduces the original, but regarded as a utopian or ludic counterreality. For example, Second Life should not be judged on the basis of whether it replicates the real world; it is supposed to be an alternative *real world,* appealing precisely because it is unaffected by many of the physical and cultural constraints of known historical reality.

Two examples of the political use of the term *virtual* will help to illustrate the different ways in which it has been employed and understood. In British elections in the eighteenth century, only a minority of the population had the right to vote. They claimed to be voting not only for themselves, but on behalf of "the most poor, illiterate and uninformed creatures upon earth" (notes Edmund Burke in a letter to Sir Hercules Langrishe in 1792) whom they believed lacked the ability to make political decisions for themselves. This act of disenfranchisement was known at the time as virtual representation. The suggestion here was that, while most people were disqualified from voting, their interests were being taken into account by an elite who understood them better than they did themselves. In this sense, virtuality was intended to imply that the majority of British people, though physically absent from the electoral process, were somehow made present through the actions of others. Virtuality was used as a rationale for political exclusion, much like being offered a *virtual tour* of a building one would be unwelcome to enter physically.

A more recent use of the term has been to describe the Internet as a potential public sphere. Building on John B. Thompson's theoretical account of mediatization as a process whereby "the exchange of symbolic forms is no longer restricted primarily to the contexts of face-to-face interaction, but is extensively and increasingly mediated by the institutions and mechanisms of mass communication" (1990, p. 15), some scholars have argued that citizenship is increasingly taking a virtual form, for example, in online social movements, online communities, and e-enabled relationships between governments and citizens. In the 1990s, the notion of the "Netizen," as a virtual citizen, became fashionable, as did ideas of virtual politics and virtual democracy. Unlike virtual representation, which sought to justify the absence of people from power by characterizing them as virtually spoken for, Internet-related virtuality has tended to be employed as a way of enhancing representation and participation. For example, by diminishing social cues that might lead to some people being ignored in the physical world, or allowing ideas to move globally without entailing the costs of international travel,

virtual communication broadens the possible range of democratic inclusion.

It is unwise to think of virtuality in a politically deterministic way. That is to say, being virtual neither empowers nor weakens citizens; it neither broadens nor constrains public spheres. Being virtual is historically contingent: In some situations, it allows people to engage in more meaningful communications that strengthen opportunities for consequential collective action; in other situations virtual interaction might be a poor substitute for physical intercourse. It is equally unwise to think of the virtual as being wholly decoupled from the real or physical; in most cases, acting virtually—such as sending an e-mail, taking a photograph, or joining a global movement—leads to social activities in the real world. Although some virtual experiences (such as online gaming) are fairly self-contained, most are not.

Being virtual can be seen as an extension of time-space distanciation, whereby relations between social actors have become increasingly disembedded from physical presence. This is one of the most conspicuous characteristics of modernity, giving rise to a range of highly significant social reconfigurations, most notably globalization, with its virtual flows of finance, knowledge, and power.

VIRTUE

In political theory, the word *virtue* usually refers to the disposition or character traits appropriate to a citizen. Someone who takes the responsibilities of citizenship seriously, to the point of putting the common good ahead of his or her personal interests, is thus said to display *civic virtue.* Political theorists have frequently warned that such virtue cannot be taken for granted, however, and many of them have urged that steps be taken to promote or foster civic virtue. This concern for the fragility of civic virtue is a clear theme in ancient (or classical) political thought, but it has also played an important part in modern and contemporary political theory.

The Concept of Virtue

The English word virtue derives from the Latin *virtus,* but scholars typically trace the concept of virtue to the Greek idea of *aretē,* which may be translated as either "virtue" or "excellence." To ancient thinkers, virtue was not so much a matter of holding and following the right beliefs as it was a matter of outstanding ability—that is, of excellence. A great warrior, such as Achilles in Homer's *Iliad,* would exhibit the virtues of courage and strength; a great philosopher, such as Socrates, would exemplify the virtues of wisdom and justice. But virtue was not something confined to human beings. Anything that was excellent in the appropriate way, including animals and tools, would be virtuous. Traces of this way of thinking are still with us, as when someone speaks of the virtue of a watch being its accurate time keeping, or of a knife that has the virtue of cutting cleanly. Such usages, though, are likely to seem quaint, and perhaps even archaic, in a time when virtue is usually regarded as *moral* goodness.

Ancient philosophers and poets concerned themselves more with the virtues of people than with those of animals and implements, of course, and in this regard it is important to note the connection between the Latin words *virtus* and *vir,* or man. Women could be excellent in their own way, but for the Romans virtue largely consisted in the kinds of excellence expected of men. In Virgil's *Aeneid,* for example, the hero Aeneas is a leader of men, a mighty warrior, and a model of piety who shows proper reverence for both his father and the gods—a paragon of all that a man should be. Aeneas also put his love of country and devotion to duty above his own happiness and pleasure, and in doing so he served as an exemplar of *civic* virtue.

This connection between virtue and manliness persisted into modern history, as the next section will indicate, but the rise of Christianity presented a powerful challenge. For ancient philosophers, the cardinal virtues were courage, wisdom, temperance (or prudence), and justice. These are not exclusively military or "manly" excellences, to be sure, but it was easy to think of them as being more appropriate to men than to women, who were largely confined to domestic life. To these classical virtues, however, Christians added the "theological virtues" of faith, hope, and love (*agapē* in Greek, *caritas* in Latin)—virtues that are neither martial nor particularly manly, in the classical view.

The growing emphasis on the theological or Christian virtues in late antiquity may also have contributed to the tendency to think of virtue as a matter of moral goodness rather than excellence or outstanding ability. This tendency is reflected in the distinction that we have come to draw, at least implicitly, between a *virtuoso* and a virtuous person. A virtuoso is someone who possesses and displays outstanding ability of some sort—usually outstanding musical ability—but there is no reason to think that a virtuoso will also be a virtuous, or *morally* admirable, person. In this respect, the modern conception of virtue is quite different from the ancient.

Civic Virtue in Ancient Political Thought

For the classical political philosophers of the ancient world, civic or political virtue was largely a matter of putting aside private desires and personal interests in order to do what is best for the public at large. In his *Republic,* for example, the Greek philosopher Plato (427–347 BCE) argues that ruling, or statesmanship, is a craft that aims at what is best not for the ruler, but for those who are ruled. Plato's student Aristotle (384–322 BCE) went on to say, in his *Politics,* that the citizen is someone who both rules and is ruled—that is, someone who has a say in determining what policies and laws should be enacted, but who also has a responsibility to obey those policies and laws. For Aristotle, the conditions that foster a virtuous life, including the life of the virtuous citizen, are those of the middle class, for the people in this class are neither so rich as to be spoiled by a life of luxury nor so poor as to be ground down by poverty. Those in the middle class are prosperous enough to be able to devote some time to politics, and to think and speak independently when they do, but not so wealthy as to lose respect for the value of work and thrift. The most fortunate political society, then, is the one in which people of middling means dominate, for there civic virtue is most likely to thrive. For Plato and Aristotle, moreover, education is of fundamental concern, for the proper education will cultivate the proper dispositions and traits among those young people who are to become citizens.

Similar attitudes prevailed among Roman political thinkers, especially Cicero (106–43 BCE) and other champions of the republic. As its derivation from the Latin *res publica* indicates, the republic is the "public thing," or the public business of all citizens. The good citizen, therefore, will be the one who distinguishes himself—and citizens were exclusively men—by his devotion to the good of the republic. Civic virtue, in other words, was *republican* virtue, and the most virtuous were those who would bear arms or otherwise risk life and fortune to preserve the republic. One celebrated model of the republican citizen was the general Cincinnatus, who left his farm to lead the Roman army in the fifth century BCE, only to relinquish his command and return to farming once victory had secured the survival of the republic.

Civic Virtue in Modern Political Thought

Virtue has remained an important concern of modern political theorists, and nowhere more plainly so than in the writings of Niccolò Machiavelli (1469–1527), a citizen of Florence. Machiavelli wrote in Italian rather than Latin, but his frequent references to *virtù* indicate that virtue remained for him very much a manly and martial quality. In his most famous book, *The Prince,* he finds virtue not only in those who are bold and brave, but also in those who are deceitful and cruel, at least when deceit and cruelty will help to preserve the state. In his *Discourses on Livy* and other writings, moreover, Machiavelli praises republican virtue and advocates a militia composed of arms-bearing citizens, which he took to be a better safeguard of the citizens' liberty than reliance on mercenaries or a standing army of professional soldiers.

Like other republicans, Machiavelli tended to think of *corruption* as the enemy of civic virtue. If civic virtue is the disposition to put the public good ahead of one's own, then corruption is what ensues when people think first and foremost of their private or personal interests. In order to promote and sustain civic virtue, then, it is necessary to be on guard against ambition, avarice, and luxury—that is, against the love of power, of money, and of the soft, easy life. Establishing a citizen militia would be one way to cultivate devotion to the common good while combating corruption.

This opposition of virtue to corruption continued to play an important part in modern political theory, but less obviously so as virtue came to be associated as much with commerce—in the form of such bourgeois virtues as thrift, industry, and far-sightedness—as it was with citizenship or piety. This desire to promote both commercial and civic virtues appears, for example, in the works of the French philosopher the baron de Montesquieu (1689–1755) and some of the founding fathers of the United States.

Montesquieu placed so much emphasis on virtue as love of one's country and "love of equality" in his *The Spirit of the Laws* that he found it necessary, in a foreword to the second edition, to assure church authorities that his concern was with "political" rather than "moral" or "Christian" virtue. For Montesquieu, political or civic virtue is the "principle"—that is, the mainspring or motivating force—of republican governments. What moves people to act in a monarchy, he said, is the love of honor; in a despotic regime, it is fear; and in a republic, it is virtue, understood as love of a country where the citizens are equal under the law. The problem is how to preserve this political virtue in an increasingly commercial, profit-driven world.

One answer to this question is to design political institutions in such a way as to make reliance on virtuous citizens less necessary, if not altogether unnecessary. Montesquieu thought that the British had hit on one way of doing this by the separation of powers in their government, with executive power vested in the crown, legislative power in the parliament, and judicial power in the courts. By separating power in this way, self-interested or ambitious attempts to advance private interests would be frustrated by their inability to gain control of all the branches of government. To this device other political thinkers added the checks and balances that enable those who control one branch of government to thwart the designs of those in the other branches.

Separation of powers and checks and balances are key features of the U.S. Constitution, and there is no doubt that the framers of the Constitution intended these devices as safeguards against ambition, avarice, and other vices. As James Madison wrote in *The Federalist,* number 51, the need for government is itself a reflection on human nature; and just as government must control the governed, so must it also control itself. That is why "[a]mbition must be made to counteract ambition" in a system of checks and balances. Yet Madison also held, in *The Federalist*, number 57, that every constitution ought to aim first at placing power in the hands of those who possess "most virtue to pursue, the common good of society," and then aim at "keeping them virtuous whilst they continue to hold their public trust." Like the ancient philosophers, Madison and other early modern thinkers remained convinced of both the importance and the fragility of civic virtue.

A similar concern seems to have led Alexis de Tocqueville (1804–1859) to warn in his *Democracy in America* against the threat of "individualism," which he took to be a withdrawal from public life in favor of life in the narrow circle of family and friends. Part of the remedy, Tocqueville said, is to educate people to see that self-interest properly understood requires them to bear a share of the responsibility for democratic government. His English contemporary, John Stuart Mill (1806–1873), went on to argue against the secret ballot on the grounds that voting is not a right but a public trust—a trust that is best fulfilled by casting one's vote openly. Mill seldom spoke explicitly of civic virtue, however, and in that regard he seems typical of political theorists throughout the nineteenth and twentieth century.

The reasons for this neglect are no doubt manifold and complicated. According to some scholars, the emphasis that social-contract theorists and others gave to natural rights and individual liberties drew attention away from civic duty and virtue—and perhaps fostered the kind of individualism that Tocqueville deplored. Virtue may also have seemed unimportant to thinkers who believed that

a proper grasp of human nature or history would provide the key to the proper arrangement of political society. For the utilitarian Jeremy Bentham (1748–1832), for example, the knowledge that desire for pleasure and aversion to pain govern our actions leads quickly to the conclusion that the business of government is to promote social happiness by punishing those who cause pain and rewarding those who give pleasure. This was a step, moreover, that required no attention to civic virtue. For Karl Marx (1818–1883) and many other socialists, virtue and other moralistic terms were ideological vestiges that would be left behind once class conflict and technological growth had brought about a new historical epoch in which every individual will be equally free to develop his or her potential. To the extent that it still carried aristocratic connotations as a celebration of excellence, virtue may also have seemed hostile to the egalitarian ethos that motivated not only socialists but all advocates of democracy.

Civic Virtue Today

Whatever the reasons for its neglect in the nineteenth century, political theorists' interest in civic virtue clearly began to revive late in the twentieth century. This revival is likely related to the renewed interest in "virtue theory," with its long look backward to Aristotle, on the part of moral philosophers. Another contributing factor is the growing sense that liberal democracy requires some significant degree of virtue among its citizens if it is to survive. As societies have become more populous, the state or government seems to be more remote from the citizen; and as societies have become more diverse ethnically and culturally, the bonds that draw citizens together seem to be weaker than in decades past. In conditions such as these, a virtuous citizenry cannot be taken for granted; nor is it clear that institutional arrangements and incentives can sustain liberal democracy in the absence of civic virtue. As a consequence, many political theorists are once again asking how this fragile virtue can be fostered and protected. One result is a renewed interest in civic education; another is increased attention to the question of what it means to be a citizen in a multicultural society and an increasingly cosmopolitan world. Yet another is the question of whether the concept of civic virtue is irretrievably tied to the idea of the arms-bearing male citizen, or whether it is capacious enough to accommodate women.

How these questions are or ought to be answered is the subject of lively debate in the early twenty-first century. The fact that the debate goes on, however, and that it is so lively, testifies to the continuing importance of virtue to political theory.

Vitoria, Francisco de (1485–1546)

Francisco de Vitoria was the leading figure in the School of Salamanca, which revived scholastic

theology and the natural law philosophy of Thomas Aquinas in sixteenth-century Spain. Like Aquinas, Vitoria entered the Dominican order at a young age and studied at the University of Paris. As a professor of theology at Valladolid and Salamanca, he helped to spread the use of Aquinas's framework as the primary source for university training in theology. However, one would be mistaken to assume that Vitoria's work is a restatement of Thomistic theology. He drew on many kinds of sources and perspectives, including classical philosophy and rhetoric, patristic theology, civil and canon law, and conciliar theory. His commentaries reveal him to be focused on the moral and political problems of his own time. Vitoria's surviving works are of two kinds: lectures on Aquinas's *Summa Theologiae* and on Peter Lombard's *Sentences,* and a series of annual *relectiones* or rereadings. This entry on Vitoria's contributions to political theory will be informed by his reflections and will focus on his conception of civil association and his contribution to the theory of natural rights and to the emergent modern law of nations.

Vitoria argued that the end of the civil association or commonwealth is a natural necessity, not just in terms of the material requirements of human life but in terms of the development of the moral and intellectual capacity of the members. In this, his views are similar to Aristotle and Aquinas. He identified God as the efficient cause of the commonwealth. Because the material cause of the commonwealth is the people, he concludes that civil authority is delegated from the people to the rulers. The actual ordering of offices in the commonwealth is a matter of human law and custom. Vitoria defended monarchy as the best kind of rule and went far beyond Aquinas, arguing that royal power as distinct from civil power in general is granted by God directly to the king.

The political role of the church and the papacy in Vitoria's time complicate his concept of civil association. Vitoria was determined to oppose Protestant understandings of the church by insisting that the royal power of the papacy was granted by Christ to Peter and the other apostles, and consequently that ecclesial authority was limited to the ordained clergy. Nevertheless, he was also interested in explaining the civil authority of the papacy as being limited and subject to resistance when abused. The concept of *dominium* (lordship) became central to Vitoria's solutions to the problems of religion and politics that he faced, not only in his confrontation with the teachings of the Protestant Reformers but also in his writings about the New World.

Vitoria understood dominium to be the intellectual capacity of human beings to order their own acts, to own and use material goods, and to exercise legal jurisdiction. According to Vitoria, all human beings have true dominium by nature. This led him to conclude that the "barbarians" of the New World were true owners and true rulers of their lands, and not natural slaves as some of his contemporaries had argued. Because no principle of natural law exists whereby one person could claim dominium over the entire world, there could be no actual papal or imperial claim to authority over the world. Consequently, papal bulls granting Spain the right to preach the Gospel in the New World were not justification for conquering and dispossessing the indigenous peoples. To put this directly, the peoples of the New World and other non-Christians had natural rights to property and self-government. Still, Vitoria and his fellow Dominican Bartolomé de las Casas never directly opposed the imperial interests of the Spanish crown in the Americas.

Vitoria's treatment of dominium as a natural right recognized the legal authority of non-Christian rulers and supported his refutation of the view that spiritual and civil lordship is based on grace, a view he attributed to John Wyclif and the Waldensians. Vitoria argued that unbelief does not undo the natural and human law, and because dominium derives from natural and human law, it is not forfeit due to lack of faith. Thus, natural reason persists in fallen nature, and the divine law of grace comes to perfect natural reason, not to nullify it. This stands in contrast to the view of fallen nature and civil association held by Martin Luther, John Calvin, and the other early reformers.

Vitoria and his Dominican and Jesuit successors developed an approach to international politics based on the existence of a community of independent commonwealths within a moral order. His defense of the rights of the indigenous peoples of the New World and his theory of just war are central to this approach. Vitoria argued

that war was only justified to repel an attack or respond to harm caused by an aggressor. His treatment of war retains a medieval emphasis on the loss of wealth and the need for retributive justice, emphasizing that one should only seek to regain what had been lost. He even accepted the practice of plundering the enemy and ransoming captives. The work concludes with three rules of warfare: civil rulers should strive to avoid the causes of war; once war breaks out, one should pursue justice and peace rather than the destruction of the enemy; and having won a victory, one should behave with moderation and Christian humility.

VOLTAIRE (1694–1778)

François-Marie Arouet (1694–1778), better known under his adopted pseudonym of Voltaire, was one of the major figures in the French Enlightenment and arguably his country's most important philosopher of the eighteenth century. Best known for philosophical tales such as *Candide*—the best-selling book in the Europe of its day—Voltaire was also a significant political thinker whose views were later to influence both the American and the French Revolutionaries. His body, like that of his long-time rival Jean-Jacques Rousseau, was transferred to the Pantheon in 1791.

Although Voltaire focused less on politics than did Rousseau, the *Philosophical Dictionary* and *The A B C, or Dialogues between A B C* contain important critiques of social contract theorists such as Thomas Hobbes and Hugo Grotius, as well as of the categorization of political constitutions of the baron de Montesquieu, and the account of the noble savage offered by Rousseau. In many of his works, Voltaire satirized religious intolerance and defended social reform and civil liberties. Voltaire is famously reputed to be responsible for the saying, "I hate what you say, but will defend to the death your right to say it." Although apocryphal, the statement is an apposite summary of Voltaire's defense of freedom and toleration. Voltaire's dispute with Rousseau centered on the latter's critique of the Enlightenment and valorization of nature. Voltaire was an unabashed believer in progress, improvement, and refinement. He famously satirized Rousseau's *Discourse on Inequality,* in which the author argues that the latter stages of the state of nature were something of a golden age for humanity, as being a "book against the human race."

Candide and the Philosophical Tale

Candide, or Optimism was published in 1759 when Voltaire was 65. It exemplifies his use of the philosophical fable, as well as his opposition to philosophical system building on the grounds that the complexities of life could not be made to accord with any one philosophical system. Influenced by John Locke's *Essay Concerning Human Understanding,* Voltaire adopted an approach to the discovery of knowledge that was empirical rather than deductive and that sought to be plain—or candid—rather than based on preconceived notions of truth. In *Candide,* as in other tales such as *Micromegas* and *Zadig,* Voltaire bases his narrative on the journey of an innocent observer until each arrives at something like wisdom. Candide has to overcome the optimistic rationalism of his childhood philosophy tutor

Dr. Pangloss, who insists, in spite of any evidence to the contrary, that this is the best of all possible worlds, and the Manichaean principles of the scholar Martin, who incorrectly insists that Candide's faithful servant Cacambo will ultimately betray him, and learn to keep an open mind. Although Candide comes to see the optimism of Pangloss as blind to the reality of human existence, he does not conclude that cynicism must take its place; rather he determines on a life of practical activity, which he describes as tending our gardens.

Although it takes the form of a parody of chivalric romances, *Candide* uses satire to comment directly on the political events of the day, notably in its description of the Lisbon earthquake of 1755, which was to become one of the battlegrounds in Voltaire's war of words with Rousseau. In having Pangloss pontificate in vain on the sufficient causes of the earthquake and suggest that the harbor was created just so that their friend Jacques would drown in it, Voltaire ridicules the Leibnizian idea that disasters will ultimately prove beneficial. Other philosophical tales adopt similar satirical devices to make their points: for example, in *The Ingenu,* Voltaire parodies Rousseau's account of the noble savage so as to suggest that society does not adversely affect our natural goodness, while in *The White Bull,* the Old Testament is presented as a series of fables akin to those of Ovid so as to oppose religious intolerance. Voltaire valued the philosophical tale precisely because it enabled him to satirize the pretensions of any systematic philosophy.

Philosophical Dictionary and Other Political Writings

Voltaire conceived his *Philosophical Dictionary* as a supplement to the *Encyclopédie* that Denis Diderot had edited for many years, and the later *Questions on the Encyclopedia* had the same purpose. Many of the entries in both books address political questions, such as the nature of democracy, laws, government, and war. Combined with *The A B C,* and other works, such as the commentary on Cesare Beccaria's *On Crimes and Punishments,* they allowed Voltaire to develop substantial political platforms on many of the issues at debate in the French Enlightenment. Notable in this regard is his dispute with Montesquieu on the powers that should be granted to the parlements, which are discussed later. Voltaire used historical writing to advance political argument. This is most notable in his *The Age of Louis XIV,* which tied together the ideas of progress and of Enlightened Absolutism.

Voltaire's political thought was inspired by a sojourn in England in the 1720s, and the country remained an inspiration in his writings. However, he was not an advocate of revolution. Moreover, Voltaire rejected Montesquieu's dichotomy between republics and monarchies and argued against any further extension of power to the French parlements. Montesquieu not only advocated granting power to the parlements, but was at one stage a leader of them. Voltaire, on the other hand, placed his trust in the central monarchy. In the context of eighteenth-century France, their dispute was as much political as it was typological. In Voltaire's view, an absolute monarch whose power was kept in check by respect for the law and by tolerance—something akin to the enlightened despots of the eighteenth century—would be the ideal ruler. For this reason, Voltaire briefly formed an association with Frederick the Great of Prussia. Although he recognized that many individual monarchs had not proven to be wise sovereigns, he thought that both monarchies and republics could only work once humanity had become more enlightened.

Despite this ambiguity, Voltaire remained a determined advocate of political freedom throughout his life, including the freedom to own property, which was a central plank of his critique of Rousseau. For Voltaire, the right to own property helped to hold society together. In the 1760s, Voltaire took his advocacy of religious freedom into the political arena, by defending numerous victims of church power. The major problem, in Voltaire's view, was the involvement of the papacy in the government of Catholic countries, which led to both intolerance and civil unrest. In his commentary on Beccaria, Voltaire again insisted on the importance of excluding the church from the definition of a crime and argued that crimes were strictly secular acts.

Voltaire died on May 30, 1778, during the celebrations of his tragedy *Irene,* little more than a month before the death of his arch-nemesis Rousseau.

WEBER, MAX (1864–1920)

Max Weber was a German legal scholar, economist, and sociologist whose contributions to theory still reverberate in modern social thought. His name is associated with a wide range of concepts and pieces of theory. The former include, for instance, ideal type, status, social closure, legitimate domination, charisma, bureaucracy, rationalization, and the famous typology distinguishing instrumentally rational, value rational, traditional and affectual types of social action. Equally famous are his analyses of the Protestant ethic and its relation to the spirit of capitalism, his discussion of nations, ethnicity, and nationalism, his notion of "monopoly on the legitimate use of violence" as a defining characteristic of the state, his definition of power as "the probability that one actor in a social relationship will be in a position to carry out his own will despite resistance," and his insistence on value-free social science.

Although these traces of Max Weber's thought in contemporary social science are impressive, the list is nevertheless the product of a selective reception process. Weber's elevation to the status of a sociological classic began in the United States in the late 1930s, with the publication of Talcott Parsons's *The Structure of Social Action* (1937), and with a series of English translations appearing in the years after World War II. This first wave of Anglophone translations and commentaries significantly shaped the reception of Weber. The concepts and arguments previously alluded to are all contained in the corpus thus defined: *Economy and Society,* some of the methodological essays, *The Protestant Ethic and the Spirit of Capitalism* (translated by Parsons already in 1930), parts of the sociology of religion, and the twin lectures *Politics as a Vocation* and *Science as a Vocation*. As a point of comparison, the edition of Weber's collected works, the *Max Weber Gesamtausgabe,* is estimated to comprise over 40 volumes.

Max Weber was a celebrated scholar and public intellectual in Germany in his own time. Many of the works that established his reputation fall outside the canon. In what follows, the objective is to facilitate an understanding of Weberian arguments and concepts that students of social and political theory are likely to encounter. But we shall proceed by relating this universe of widely circulating notions to the less familiar edifice of which they form a part. The next section provides a brief overview of Max Weber's academic career and writings. That sketch offers the starting point for a discussion of the formative impact of Weber's background in jurisprudence and transition to economics on his theoretical and methodological stance. The concluding section draws on this discussion to provide an interpretive key to a set of central Weberian concepts and arguments.

Academic Background and Writings

Max Weber received a doctorate in law in 1889, with a dissertation on the "Development of the Principle of Joint Liability and a Separate Fund of

the General Partnership out of the Household Communities and Commercial Association in Italian Cities." The thesis was published the same year as a chapter in a larger study on the "History of Commercial Partnerships in the Middle Ages." He two years later produced a study of Roman agrarian history and its importance to public and civil law (1891).

Parallel to his highly specialized legal studies, Weber became involved in associations oriented to the practice and study of social reform, the *Evangelisch-Soziale Kongreß* and the *Verein für Sozialpolitik* (the latter also serving as professional organization for German academic economists). Both associations were to involve him in research on the so-called agricultural labor question. For the Verein für Sozialpolitik, Weber conducted a survey of the conditions of rural laborers east of the Elbe, published in book form in 1892. That book, and a series of related articles and speeches, earned him a reputation as an expert on rural labor issues. It also paved the way for a career shift.

In 1894, Weber was offered—and accepted—a professorial chair in economics in Freiburg. His change of discipline was less peculiar than it might seem to a modern observer. In Germany of the 1890s, both jurisprudence and economics had for a long time been dominated by historical schools. (Marginal utility theory was on the rise, but it still belonged to the heterodoxy.) Because the mainstream of both disciplines was historically oriented, the hurdles separating them were not forbiddingly high.

Max Weber's transfer to economics therefore occasioned no sudden shift in research interests. His inaugural lecture in 1894, on "the nation state and economic policy," related directly to his studies of the conditions of rural laborers east of the Elbe. He continued to make contributions in that area. His research on antiquity likewise saw a continuation in several essays in the years to come, and Weber's writings about the stock exchange, published between 1894 and 1897, belong to jurisprudence as much as they do to economics.

Weber left Freiburg for Heidelberg in 1897 for another post in economics. Shortly thereafter he suffered a serious mental breakdown, rendering him incapable of fulfilling his duties as an academic professor. In 1903, he was finally relieved from his duties. It would take another 15 years before Weber once again held a teaching position at a university, first in Vienna (1918) and then in Munich (1919) until his death in June 1920. During this 15-year absence, Weber was nevertheless very much a part of academic life. He still took active part in the Verein für Sozialpolitik, and was deeply involved in the founding of the German Sociological Association in 1910. He was coeditor, along with Werner Sombart and Edgar Jaffé, of the economics journal *Archiv für Sozialwissenschaft und Sozialpolitik,* and was entrusted by the publishing company J. C. B. Mohr to organize and edit a multivolume, state-of-the-art handbook in economics, the *Grundriß der Sozialökonomik*. Above all, and intertwined with these activities, he published and conducted an extensive amount of research.

Thus, in 1903, when Weber had just been relieved of his academic duties, he resumed his publication activities. He wrote a methodological critique of the founders of the historical school of economics, an essay on "objectivity" of knowledge in social science and social policy (published in the *Archiv für Sozialwissenschaft und Sozialpolitik* as the new editor's declaration of intent), the Protestant ethic and the spirit of capitalism (also published in the *Archiv*), and critiques of the methodological views held by historian of antiquity Eduard Meyer and legal scholar Rudolf Stammler. Through the Verein für Sozialpolitik, he became involved in a research project on the psychophysics of industrial work, and his famous essay on ethical neutrality in economics and sociology emerged in response to a debate in the Verein on the place of values in academic teaching and science. As to the planned *Grundriß der Sozialökonomik,* Weber's own contribution to it did not see completion during his lifetime. It was published, unfinished, after his death as *Economy and Society*. In addition, Max Weber's scholarly productions after his recovery include, among other things, several volumes on the economic ethic of the world religions, an essay on socialism, and the general economic history (assembled after his death from student lecture notes).

During his entire life, Max Weber was intensely preoccupied with politics. Weber's insistence on a separation between the worlds of politics and science was, at least partly, grounded in a concern for the *autonomy* of the political. He thought it a dangerous illusion that a science, however construed,

could settle political and other value questions, for it deprives the individual of the responsibility of deciding for herself what ultimate values to believe in. Fact and value (whether political, ethical, or aesthetic) belong in different spheres. While science can teach us techniques for prolonging life, it cannot decide whether it is desirable to do so.

Yet Weber recognized that a discipline dealing with economic relations has, and must have, multifarious relations to politics. As he expressed it in his inaugural lecture, "the science of economics is a *political* science." One task of his methodological writings was to identify these relations, examine their meanings and limitations, and weed out transgressions. This was an urgent matter for Weber. Already his early works on the conditions of the rural laborers east of the Elbe and on the stock exchange put him in the midst of a highly charged political force field: the political legacy of Bismarck, the class interests and political power of the east German estate owners (*Junker*), the social effects of the rapid transformation of rural labor from patriarchy to the soft violence of the free market, and the power-political implications of a decreasing proportion of Germans in West Prussia. Weber held strong political beliefs—a version of "economic nationalism," in Weber's own words—and he had good reason to think through the logical relations between empirical analysis and valuation.

From Jurisprudence to Economics

J. P. Mayer once remarked of Max Weber, in a classic monograph on his political sociology, that "a predominantly legal training has formed the style and mould of his thought." This section is designed to indicate some ways in which Weber's background in law shaped his thinking, and links this account to a discussion of the intellectual consequences of his transition to economics.

The first formative aspect of Max Weber's legal background is that it exposed him to two contrasting types of analysis. The exams in law school prepared him for the study of law as, in Weber's words, a *dogmatic* discipline; his dissertation, on the other hand, was an *empirical* historical investigation of developments in commercial law. Weber was acutely aware that the jurist and the historian of law regard the same event from different points of view, that those aspects of the event that are legally significant may be irrelevant to the historian, and vice versa. Related to this, he was also vigilant about tendencies to assume that an actual course of events must conform to what would have been the legally (or mathematically or logically) correct procedure. What matters to the historian is how people actually acted. If they acted on subjective beliefs that are incompatible with the "objective" rules of mathematics, law, or logic, then the empirical scientist must take that into account. It is useful, Weber would later say, to treat the logically, mathematically, or legally typical ("correct") procedure as elements in an ideal type, but it is vital not to conflate it with reality. The different points of view of the jurist and the historian likewise had implications for concept formation. When the historian compares legal constructs over time and between nations, Weber held, he must be careful not to conflate his own concept of the "state" from the corresponding *legal* concept. In particular, he must avoid projecting legally or administratively defined constructs, peculiar to a political unit and time, onto political units and times where they do not apply. This concern is evident, for example, in the somewhat tortuous terminological deliberations in *Economy and Society*.

Second, Max Weber's dissertation in law exhibits a particular style of argument, which he transposed to economics and which echoes, in some form, in most of his writings. One important feature is how he constructed the *explanandum* of the inquiry. He wished to explain the emergence of two types of commercial partnership, the general partnership and the limited partnership, both of which were found in the German commercial law code in Weber's day. He proceeds by contrasting "general liability" in modern law with the Roman law of Societas, so that the point-by-point comparison yields a list of characteristics peculiar to the modern legal construct, and the question to be answered is, somewhat simplified, how we got there. The list of characteristics thus arrived at forms a configuration—a *historical individual,* as Weber would call it—and that configuration serves as explanandum. But the argument Weber made is configurational also in another sense. "Joint liability," one of the characteristics that make up the explanandum, is explained by the conjunction of a set of factors relating to the household communities in medieval Italian cities. "Solidary

liability," a second characteristic in the explanandum, emerges via a different path. This style of argument, cast as a bundle of separate historical causal chains coalescing in the historical individual to be explained, can be found throughout Max Weber's work.

Third, Max Weber's background in law furnished him with a tool to address an analytical issue related to the style of argument previously depicted. That issue was not brought to the fore, however, until after his transfer to economics. A few preliminaries are needed before we can see what this tool helped him to do.

We noted earlier that the barriers between law and economics in Germany were far from insuperable, partly because they had both long been dominated by historical schools. But Weber entered a discipline where this dominant strand was increasingly challenged in the German-speaking world by the Austrian marginal utility school. Max Weber characterized the situation by recounting the reaction of a Viennese student who was bewildered to find "*two* sciences of economics." In the 1880s, the two contending schools had clashed in the so-called *Methodenstreit,* and thereafter they continued side by side. Weber thought that this debate had resulted in confusion.

Although the style of argument in Max Weber's works was of a distinctly historical brand, it fitted poorly into either position in the debate over method. Gustav Schmoller, the main proponent of the historical school in the Methodenstreit complained, for instance, that they had been falsely accused of only striving to portray reality in narratives and not to gain general knowledge of the laws governing economic life. They too, Schmoller said, were in the business of finding scientific laws, only they did so inductively rather than deductively. But where would that leave Max Weber? Consider first his dissertation on the historical emergence of the general and the limited partnership. Weber was not interested in these particular legal forms because they were instances under some generic concept, and he was not interested in those characteristics that they shared with every other specimen falling under such a concept. In the terminology Weber would later use—borrowing an argument from philosopher Heinrich Rickert—the scientific significance of these constructs lay instead in their cultural significance. And what makes an event culturally significant is often that it exhibits a unique, or at least rare, combination of traits. So while Max Weber's style of argument would posit a highly individualized explanandum, the procedure proposed for the historical school of economics ruled out individual contingencies in the interest of inductively constructing the laws of economic life.

The other party in the Methodenstreit, the marginal utility theorist Carl Menger, came closer to describing what Weber had in mind. He distinguished between *theoretical* and *historical* economics. A theoretical science—the preferred point of view of marginal utility theory—directs our scientific interest toward phenomenal forms that always recur in the flux of concrete phenomena (i.e., toward that which is *general*). A historical science, by contrast, aims at attaining knowledge of the *unique and individual.* But because the response from the historical school was to deny that they were pursuing economics as a science of the unique and individual, both schools huddled on the generalizing side of Menger's distinction. The individualizing side was left vacant.

In the essay on "'objectivity' of knowledge in social science and social policy," Max Weber declared that the social science he wished to pursue aims at an "understanding of the *uniqueness* [*Eigenart*] of the lived reality within which we are placed." On the one hand, he continued, we wish to understand "the context and cultural significance of individual phenomena in this lived reality," and on the other, "the reasons for their being historically so and not otherwise." This declaration of intent fits the description already of Weber's dissertation in law. It also places him firmly on the individualizing side of Menger's distinction.

Max Weber had thus entered a divided discipline. And what is more, his empirical studies represented, in his own mind, a position that had been vacated by both contending parties. Hence, he had to clarify, to himself and to his fellow economists, what he was doing. If the aim is to explain particular individual phenomena, which in some way or other have cultural significance to us, certain analytical issues crop up.

How, one may ask, is the *causal explanation* of an *individual* fact at all possible? Even complete knowledge of psychological or other laws would not solve that question, for the task is to understand

how they combine in a particular context to produce a concrete individual phenomenon. None of the participants in the Methodenstreit addressed this issue. But there were other models close at hand: jurists, especially those specializing in penal law, have long had to grapple with the issue whether a certain concrete individual action is responsible for bringing about a concrete individual result. Max Weber therefore borrowed a theory of causality currently in use in German law, the *adequate cause* theory, to deal with causal attribution in historical studies of the economy.

Adequate cause theory is a probabilistic theory, elaborated to distinguish causes from mere conditions, or adequate from coincidental causes, in the infinite causal chain leading up to an event. To qualify as an adequate cause, a factor must (a) be a sine qua non and (b) sufficiently increase the probability ("objective possibility"), of the resulting event. This is why Weber's works—particularly *Economy and Society*—contain so many references to the terms *adequacy* and *probability* (and *chance* or *objective possibility*). But there is an additional reason to bring up the theory of adequate causation. Max Weber conceived of his research in economics as individualizing, but other economists of his day perceived their task to be that of establishing the laws of economic life. He had to get to grips with what *they* were doing, particularly the theoretical economics practiced by the marginalists. What sort of concept was "economic man," "the law of marginal utility," or "Gresham's law"? Max Weber suggested that they were *ideal types*. As we shall see in the last section, where the aim is to provide an interpretive key to more familiar concepts and arguments, adequate cause also plays a role in Max Weber's conception of ideal types.

A Guide to Understanding Weberian Concepts and Arguments

In the beginning of this entry, we listed a series of concepts associated with Max Weber. They stem mainly from *Economy and Society,* Max Weber's unfinished contribution to the handbook *Grundriß der Sozialökonomik*.

Let us begin, however, with *The Protestant Ethic and the Spirit of Capitalism*. The outline of Weber's argument in this work conforms to the pattern established in his earliest publications. He is interested in the historical origins of the "spirit" of capitalism (i.e., with the rise of a mode of conduct "adequate" to modern capitalism). This "spirit" is conceived by Weber "as an historical individual, i.e. a complex of elements associated in historical reality which we unite into a conceptual whole from the standpoint of their cultural significance."

As in the case of the investigation of the origin of joint and limited partnerships, the traits assembled to form the explanandum are here selected because of their contemporary value relevance. They describe a methodical mode of conduct to which, he thought, modern economic subjects have to conform lest they be eliminated from the market. Formulated in maxims, the "spirit" of capitalism is made up of a nexus of imperatives: remember that time is money and that credit is money, be punctual in the repayment of loans and debts, be vigilant in keeping accounts, be frugal in consumption, do not let money lie idle but reinvest it. In modern times, the forces of economic selection ensure that the economic world is populated with agents who meet this description. But whence did this "spirit" come from? How did it first emerge as a mode of conduct carried by entire groups of people?

Max Weber argued that the roots of the "spirit" of capitalism were to be found in the history of puritan Protestantism. Martin Luther's bible translation played a key role, for in his hands, the concept of "calling" fused "calling to God" with innerworldly work. But Lutheranism, according to Weber's argument, did not foster the mode of conduct he wished to explain. It was produced, rather, by the peculiar innerworldly asceticism of neo-Calvinist sects.

John Calvin taught a doctrine of predestination. Your destiny beyond the grave is determined beforehand, and there is nothing you can do to influence it. You can, however, observe signs of whether or not you are among the chosen ones. If God permits you to lead your life in accordance with his will, this is an indication that you are among the *electi*. And God wished that man lived his life frugally and prudently, devoted to working in his calling, and refraining from luxuries and frivolous pleasures. The doctrine of predestination combined with these commands to lend the conduct of the puritan a highly methodical streak:

A lapse from proper conduct could not be compensated for by good deeds, but would instead remain a lasting and disturbing sign of exclusion from grace.

Weber's argument here gives some important clues for how to read his other works. It illustrates the notion of "heteronomy of ends," for the rise of a mode of conduct adequate to modern capitalism is the unintended product of religious, hence value-rational, beliefs. Economics, in Weber's view, must deal not only with economic phenomena but also with how noneconomic factors influence the economy and with the impact of economic on noneconomic processes.

It also provides an illustration of a central Weberian concept, for the "Protestant ethic" previously described is construed as an *ideal type.* In the introduction to *Economy and Society,* Weber declared that whenever he refers to "typical cases," the term should be understood as meaning ideal (or pure) types. *Economy and Society* is replete with types and typical cases. He also noted that ideal types are "always constructed with a view to adequacy on the level of meaning." What does that mean? Consider how Weber pieced together elements to form the ideal type of the "Protestant ethic" from the beliefs of a number of neo-Calvinist sects. There is a sense of logical integration to the conjunction of predestination, a perpetual search for signs, and a concept of calling that lends religious significance to work and renounces frivolity and unnecessary spending. What accounts for this sense of logical integration is that, purely on the level of meaning, such a combination of beliefs would appear causally adequate for the mode of conduct Weber wished to explain.

To recapitulate, then, an ideal (or pure) type is a conceptual construct characterized by "the highest possible degree of logical integration by virtue of their complete adequacy on the level of meaning." By implication, the ideal type is therefore a heuristic device, for the task remains to determine to what extent concrete empirical instances approximate or deviate from it. Another implication is that an ideal type is construed in relation to some specific explanandum. Because Weberian explananda are composed with an eye to their contemporary value relevance, their selected traits can and will vary over time (thus potentially rendering old ideal types obsolete).

For this reason, the traits that go into a particular ideal type (e.g., capitalism, feudalism, or market situation) may highlight aspects of the phenomenon that may seem alien to common usage. This is arguably the case with Weber's ideal type "sects." He juxtaposed "sect" to "church," emphasizing that membership is mandatory in a church but depends in a sect on election by those who are already members. This trait was of singular importance for Weber because the type was first construed in relation to an argument about the economic effects of Protestant sect membership in North America. In order to be admitted into these sects, an aspiring member had to gain acceptance, and this in turn entailed a careful scrutiny of his or her moral character. Weber's argument is that the qualities under scrutiny coincided with the virtues you seek in a business partner. In this way, sect membership signaled reliability. It became a generalized trust mechanism: the unintended—or occasionally, on a more cynical note, intended—consequence of belonging to a sect was to promote member businesses. When Weber included this ideal type "sect" in *Economy and Society,* he was careful to point out that a concept of sect could be construed differently, as indeed it can. The fact that he kept to it indicates that, here too, he was interested in the differential effects of mandatory and varieties of voluntary membership.

What has previously been said could be translated into a reading guide to *Economy and Society;* we offer one such argument sequence as illustration. Weber's use of the probabilistic adequate cause theory is signaled in his definition of power as "the probability that one actor in a social relationship will be in a position to carry out his own will despite resistance . . . regardless of the basis on which this probability rests," and, as a special case, of "domination" as "the probability that a command with a given specific content will be obeyed by a given group of persons." The concept of domination is thus kept highly abstract and allows a variety of reasons why commands are obeyed, ranging from the threat of violence to a belief in the legitimacy of the order within which the command is issued. Max Weber then went on to distinguish three pure types of legitimate domination—legal-rational, traditional, and charismatic—according to the respective grounds on which the validity of their claims to legitimacy

are based. And if they are conceived as ideal types, the reader should look for how they are construed "with a view to their adequacy on the level of meaning," and hence how they are related to some explanandum.

To bring this out, it is instructive to juxtapose traditional with charismatic authority. Traditional domination rests on a belief in the sanctity of immemorial traditions and the legitimacy of those exercising authority under them. Charismatic authority, on the other hand, is vested in an individual person, relying on the belief that he or she is endowed with extraordinary powers, and granting the charismatic the right to make the rules. The contrast is neatly captured in the Sermon on the Mount, where "Ye have heard that it was said to them of old time" is followed by "but I say unto you." But charismatic authority is unstable—not only in the sense that, if he fails to perform, the bearer of charisma is liable to be disposed of, but also in terms of generational shifts. When a charismatic dies, he can either be replaced by a new charismatic (who may impose very different rules) or his followers can record his words and deeds and live by his example. The latter case involves a shift from charismatic to traditional domination, suggesting a causal relation between the two types.

The third pure type of legitimate domination—legal-rational domination—is the distinctly modern form. It rests on a belief in the legality of enacted rules and the right of those elevated to authority under such rules to issue commands. The organizational form corresponding to this type is *bureaucracy*. Bureaucracy, too, is formulated as an ideal type, made up of a configuration of elements in a manner similar to his earliest publications: a bureaucracy (a) covers a fixed area of activity, which is governed by rules; (b) is organized as a hierarchy; (c) is where action that is undertaken is based on written documents (preserved as files); (d) is where expert training is needed, especially for some; (e) has an official who devotes his or her full activity to his or her work; and (f) is where the management of the office follows general rules that can be learned.

Weber had a dual interest in bureaucracy as a phenomenon. On the one hand, he wished to explain how legal-rational domination and the modern bureaucracy emerged from organizational forms associated with traditional domination (patriarchalism, patrimonialism). On the other hand, he was concerned with the influence of bureaucratic rule on other aspects of modern life, notably the economy but also, for example, political parties. An apparently omnipresent element of modern society, bureaucracy both had a distinct value relevance and a derived significance due to its economic effects and causes. For it should be remembered that even though *Economy and Society* can be read as a general social science treatise, it was intended as part of a huge handbook in economics, alongside treatises on banking, theoretical economics, the history of economics, and so on. Weber had taken it on himself to write that part of the handbook that dealt with the relations between economy and society, including the influence of noneconomic factors on the economy and the impact of economic on noneconomic processes. This, too, provides a useful hint to those who wish to pursue other argument sequences in *Economy and Society* than those dealt with here.

Weil, Simone (1909–1943)

Simone Weil was a teacher, a labor activist, a public intellectual, and a political theorist with deep and varied religious and mystical sensibilities. She

was born in Paris to an assimilated bourgeois Jewish household, and studied at the Ecole Normale Supérieure where she earned the nickname "Red Virgin" for her enthrallment with asceticism and the mystique of labor, combined with a militant commitment to trade union activities. A teacher in the French lycée system, Weil's real interests lay in working-class and left-international politics, particularly against the tides of war, fascism, and Stalinism in the 1930s. She took on a year of factory work in Paris (1934–1935), which left her in permanent ill health, and joined the Republican cause in the Spanish Civil War (1936), an adventure cut short by an injury sustained in camp. In 1940, the family fled the German occupation of Paris, first to Vichy and then Marseilles, where Weil's attraction to Christianity and mysticism intensified. The final years of her life were spent in New York (1942) and London (1942–1943), where she worked for the Free French on proposals for the reconstruction of France, while attempting to return there. The cause of Weil's untimely death was officially listed as tuberculosis; but it resulted from a refusal of food and inability to eat, probably linked to anorexia nervosa.

Weil's writing can be appreciated in light of three powerful themes that characterize her political concerns. The first addresses disenchantments of modernity, particularly as they appear in the alienation of labor and the diminishment of collectivities epitomized by the factory work and the assembly line. "Reflections on the Causes of Liberty and Social Oppression" (1934) identifies permanently destabilizing forces in human affairs that dehumanize individuals and substitute means for ends, evident in both communist and capitalist regimes. To counter the effects of oppression, Weil introduces the notion of "methodical thinking" (*pénsee méthodique*) as a kind of regulative principle for understanding liberty in terms of the reunification of knowing and doing, and imagines new forms of labor organized through small working collectivities.

The second theme involves the ethics of self and subjectivity, understood in terms of finitude, gravity (*pesanteur*), the love of God, and affliction. Weil formulates a counter to gravity's law as "sovereign on earth" in a spiritual disposition of "attention" (*attention*) that requires a stripping away of the "I" (*dépouillement*) and a "waiting for" God. Although attention is presented as a capacity that is simultaneously interiorizing and denunciatory of the self, it also harbors a mode of loving the "other" as "neighbor," where it assumes a form of human engagement through the recognition of suffering.

The third theme attends to the death and destruction wrought on all sides by the harrowing consequences of war. *The Iliad or, The Poem of Force* (1940) reads Homer's epic as an exemplary act of impartiality and tenderness that figures both victor and vanquished together, under the domain of force. *The Need for Roots* (1943), Weil's final work, reflects on the consequences of rootlessness (*déracinement*) and proposes for France a new patriotism, reconciling spiritual values (compassion, attention, righteousness, and truth) with love of country, and a need for political belonging that disavows both nationalist visions of greatness and the desire to exact revenge.

Welfare State

The *welfare state* is a distinct form of governance established by Western capitalist societies during the 1930s and 1940s that combines the taxation of the wealthy with public investment in education, safety net entitlements, old age pensions, and the regulation of the market economy. For political theory, the welfare state raises questions about the relationship between the state, economy, and society, and about distributive justice.

The classic liberals Robert Malthus and David Ricardo deviated sharply from their eighteenth-century forebears in the political economy field by displacing morally based policy prescriptions with

visions of the market as a self-regulating sphere of instrumentalist profit seeking. Malthus held that the church and the government should not interfere with the "natural" trends in the "autonomous" labor market by providing "excessive" aid to the poor. In both Britain and the United States, relief for the needy during the nineteenth century was provided almost exclusively through the poorhouse: a sadistic institution that usefully reminded the working class outside that the decline into pauperism was so devastating that they had to accept the harsh labor market conditions.

Karl Polanyi convincingly argued that the classical liberal perspective is misleading. The market sphere can never be self-contained and self-regulating; the modern Western state has always attempted to manage inflation, prevent labor unrest through the measured provision of aid, and safeguard the population from food shortages. Even the business leaders themselves call for the government to step up its already influential role in the economy whenever some degree of public investment, business regulation, tariffs, and central bank intervention in the credit market would serve their interests.

Writing in the mid-1930s, John Maynard Keynes argued that market economies typically settled at points of equilibrium that were far below the full employment rate. The classic liberal paradigm and its contemporary advocates, Friedrich von Hayek and the neoliberals, teach that taxing the wealthy tends to restrict growth by discouraging savings and investment among high-income individuals. Keynes held that the collection of revenues through the taxation of the wealthy can be favorable to capital growth insofar as the state properly devotes itself to the stimulation of demand through sound public investment. In the British and American cases, the government's provision of immediate relief, combined with public education programs, infrastructural development, the provision of old age pensions, and military spending, did much to resolve the economic crisis. The Keynesian monetary initiatives—the establishment of a regulated banking system and the furnishing of low-interest credit for moderate income home buyers—also played a significant role in the recovery.

The neoliberal followers of Margaret Thatcher and Ronald Reagan reject the Keynesian view and hold that social spending ought to be kept at an absolute minimum. Neoliberalism has become a global phenomenon, thanks in large part to International Monetary Fund (IMF) conditionality: the provision of desperately needed foreign aid and debt forgiveness to developing countries only insofar as they agree to slash social spending and to open their markets to the goods produced in the developed countries.

On the other end of the political spectrum, social democrats and progressives agree with the Keynesians that the unregulated capitalist market gives rise to severe inequalities that are ultimately dysfunctional. Where some entrepreneurs really do serve society by engaging in useful innovation, they could be motivated by much more modest rewards than the bloated windfall profits that are doled out by the unregulated market. However, the social democrats and progressives also believe that Keynesianism illegitimately preserves the decision-making power of private corporations over key decisions about production and fails to respond adequately to the capitalist market's wastefulness and environmental destruction. These critics believe that instead of delivering social justice, Keynesianism merely protects workers from the worst effects of the capitalist market. Their vision of just welfare policies includes a much greater degree of redistribution, that is, the egalitarian sharing of wealth, such that the gap between the "haves" and the "have-nots" would be greatly reduced.

The legitimacy of redistribution is hotly debated. John Rawls argued that if a group of rational individuals occupied a hypothetical "original position," in which each of them did not know what his or her socioeconomic status would be and what natural talents he or she would possess, they would choose a moderate version of the welfare state, that is, a society in which basic rights and duties would be equally shared, and the only forms of inequality that would be allowed to exist would be the ones that benefited society as a whole, and that particularly benefited the least endowed. Robert Nozick, by contrast, contended that our obedience to the state is justified only insofar as the latter remains absolutely minimal in form. For Nozick, welfare policies, such as redistributive taxation and the regulation of private business, illegitimately encroach on the individual's liberty.

In Amartya Sen's terms, the redistribution of a significant amount of profit from the wealthy to

the poor is indispensable to economic development that is both sustainable and morally defensible. In conditions of severe inequality, the poor are deprived of the capacity to pursue their life projects and cannot participate in public discourse as respected fellow citizens. T. H. Marshall understood the welfare state's empowerment of the citizen as the establishment of social rights. Against the neoliberals, Marshall held that social rights are fully compatible with liberal democracy, and that the welfare state's recognition of social rights represents the third phase in the unfolding of liberal democratic citizenship, following the previous recognition of civil and political rights.

For their part, feminist advocates have a complex relationship to the welfare state: On the one hand, they are critical of the ways in which many welfare programs have privileged the needs of male wage earners over those of women, in spite of the fact that women perform the greatest share of unpaid childrearing labor in the home. On the other hand, feminists call for a gender-sensitive redefinition of the welfare state such that the unpaid caregivers—the individuals who voluntarily assume intimate obligations as parents and caregivers for the ill, disabled, and elderly—would receive a generous entitlement in exchange for their essential contributions to society.

WHITENESS

Whiteness is a social and historical construction that functions both as a basis of identity and as a criterion for the distribution of various forms of social, cultural, political, human, and financial capital. It does not refer to a biological essence or natural kind and thus is not dependent on biology to establish its semantic legitimacy. Rather, it is best understood as a theoretical/metaphorical construction amenable to multiple strategies of utilization. This entry examines the nature of whiteness as a construct, through an analysis of its metaphorical use as a normative category in social, civic, and legal contests, as an economic metaphor, and as a psychological metaphor.

Adopting this constructivist/historicist approach in which whiteness is a sociocultural concept does not entail construing it as unreal or as a fiction, and downplaying the biological approach to whiteness is not to deny the significance of color *or other phenotypical features* in sustaining notions of whiteness. The term *whiteness* is not an empty and meaningless semantic term, contrary to arguments made from the perspective of dogmatic realism/positivism. The best theoretical approach to whiteness, consistent with constructivism, is dynamic nominalism, as formulated by Ian Hacking. Nominalism is a metaphysical view that denies the existence of universals and abstract objects. Only general or abstract terms, according to nominalism, exist. For example, individual red things exist, but there is no universal essence called redness that exists; only the general term *redness* exists. Hacking calls his position dynamic nominalism because he connects nominalism with our interaction with, and description of, the world. Hence, he maintains that categories of people come into being at the same time as the people falling under those categories and that there is a reciprocal relation between these processes. Applying the insights of dynamic nominalism, we can infer that people's racial identities do not exist independent of socially constructed categories such as whiteness, or that people who consider themselves as sharing characteristics create a racial category to name them.

Hence, racial identification with whiteness was, among other things, contingent on the constitutional construction of the category of whiteness. Indeed,

Theodore Allen has argued that constitutional decree, meaning that legal creation of categories of people for various political, social, and economic purposes, has more to do with the creation of race and whiteness than it does with biology.

Whiteness as a Trope/Metaphor

Viewing whiteness as a trope/metaphor that is utilized in different contexts and sites of contestation explains its ontological role as a basis of identity and as a criterion for the distribution of various forms of social, cultural, human, and financial capital. Consequently, understanding whiteness requires a search for the multiple metaphors of whiteness, the various styles of thinking that make whiteness possible, and the metaphors structuring its intelligibility.

Whiteness and Normativity

Whiteness masquerades as various forms of normativity—social, civic, and legal. Whiteness as *social normativity* defines social acceptability or the paradigm of humanity. Whiteness as *civic normativity* functions as a form of consciousness beyond race. Here, whiteness functions as normativity only because predominantly white institutions are seen as racially neutral institutions, grounded on rational Enlightenment principles of equality, rationality, and objectivity. Third, whiteness functions as legal normativity. Critical race theorists expose the law as complicit in maintaining hegemony through cultural practices and beliefs that reinforce exploitative social and political structures that are partial to whiteness. For example, whiteness may function as legal normativity when whites appeal to progressive liberal values of equality and impartiality in opposing policies such as affirmative action that target the victims of racial discrimination. These formal appeals favor whites to the extent that the structural inequalities that benefit whites are not addressed but are made to appear as the fair outcome of natural competition.

Whiteness as an Economic Metaphor

Another role of the concept of whiteness is its mediation within economic metaphors. Cheryl Harris has analyzed whiteness as property to underscore the extent to which the dominant understanding of the notions of rights, property, race, and even affirmative action have been skewed by the historical coding of the metaphor of whiteness as property. Whiteness is both something valuable to possess, as well as a precondition for the right to own property. George Lipsitz has also used economic metaphors to frame whiteness as "possessive investment." Lipsitz shows whiteness to be a construction connected to the distribution and accumulation of power and wealth, regulated mainly in terms of the social reality of whiteness.

Whiteness as a Psychological Metaphor

A third category of the metaphorical analysis of whiteness concerns psychological metaphors, which center on strategies of denial. It may seem contradictory to claim that whiteness is both affirmed and denied by whites. However, there is a difference between the affirmation of whiteness in the sense of conjuring whiteness (i.e., making the world white as a phenomenon of historical facticity) and affirming whiteness by pretending not to be conjuring whiteness but still succeeding in allowing the world to remain white. The world was made white through the invention of a modern style of thinking based on race. But, once the world became white (i.e., once whiteness entitled an individual to social status tied to economic and political privileges), it made rational economic sense to invest in whiteness, to keep the world white. However, the investment in whiteness now takes the form of denouncing all notions of race in precisely those ways that reinforce the privileges of whiteness. Hence, when rejecting affirmative action by claiming that whites are unfortunate victims of reverse racial discrimination, whites are conjuring up a world in which whiteness is a harmed ethnicity. Whiteness's true state of being is obscured when viewed as victimized.

The psychological dimensions of whiteness were also obvious to W. E. B. Du Bois, who described white workers as refusing to pursue any meaningful conception of working class solidarity with blacks. Instead, they chose to mobilize along lines of white supremacy, indicating that protecting whiteness (i.e., being white and free) is better than associating with blacks. But, in so choosing a white identity, white workers, according to Du Bois, settled for the "public and psychological wages" of whiteness.

William of Ockham (c. 1285–1347)

The Franciscan theologian and Oxford philosopher William of Ockham is one of the giants in late medieval scholasticism. Ockham's political theory is characterized by an elaborate theory of heresy and dissent, the separation of temporal and spiritual powers, and an emphasis on individual rights and liberties. His literary output is bifurcated by his summoning to the Avignon papacy in 1324: before that year, Ockham devoted himself, mainly at Oxford, to purely theological and philosophical works. These writings contain little that can be discernibly classified as political. After 1324, however, he produced a series of antipapal polemical works, which contain rich and complex political ideas.

Ockham's involvement in polemics coincided with his sojourn in Avignon in 1324 to 1328. Ockham was asked by Michael of Cesena, the minister general of the Franciscan order, to examine some papal bulls issued by Pope John XXII. An examination of the bulls, which condemned the Franciscan doctrine of evangelical poverty, convinced Ockham that the pope had fallen into heresy. Thus, he took refuge in Munich, the power base of Ludwig of Bavaria, whose claim for the imperial crown had been rejected by Pope John XXII, and devoted the following two decades to antipapal polemical activities until his death in exile.

Ockham's first polemical work, *The Work of Ninety Days* (*Opus nonaginta dierum*), was a defense of the Franciscan position on poverty from papal attack. The theological dispute over the nature of Christ' poverty gained a legal dimension when the Franciscans, including Ockham, attempted to demonstrate that the Friars Minor can and do renounce all positive rights including the right of use, which were sharply distinguished from inalienable natural rights. The idea of natural rights, which had been discussed in canonist literature since the twelfth century, thus entered the political lexicon for public controversies.

Despite his passionate defense of the Franciscan doctrine, it is probably inaccurate to describe Ockham as a Franciscan ideologue because he considered the poverty dispute to be the result of an unjust intervention in doctrinal matters by canonists. John XXII, a distinguished canonist, was, for Ockham, ignorant of theology. Ockham's later polemical works are permeated by an ideological hostility toward canonists on the basis of the superiority of theology to canon law. Thus, Ockham shifted his polemical focus from the defense of the Franciscan doctrine to the demonstration that the pope was a heretic.

For this purpose, Ockham examined the idea of heresy from a theological perspective. In his gigantic *Dialogue* (*Dialogus*), Ockham rejected the canonist view that heresy is dissent from ecclesiastical (especially papal) authority and asserted that heresy is the contradiction of the sources of Christian doctrine, thereby reducing heresy to an interpretative, not an institutional, category. This redefinition of heresy entailed significant implications for the problem of papal heresy. Because heresy is not seen as disobedience to church authority but as incorrect reading of doctrinal sources, correction of doctrinal errors does not require institutional office. Hence, anyone who reads scripture correctly can legitimately correct the error made by the pope. This volte-face of the hierarchical theory, which would be read widely among conciliarists in the fifteenth century, justified Ockham's dissent from John XXII and his successor Benedict XII.

From 1337 onward, however, Ockham shifted his polemical concerns from papal heresy to the nature of papal power, motivated by Benedict XII's claim for papal monopolization of doctrinal decision making in his bull *Redemptor noster*. Ockham thus turned his critique to the erroneous doctrine of papal "plenitude of power." Ockham rejected the view that papal "plenitude of power" enabled a pope to do anything in both the spiritual and temporal spheres, as long as it does not contradict divine or natural law. Ockham's logical reading of scriptural verses led him to the conclusion that papal power must be exercised to create an environment where every individual is able to pursue the moral life freely. Every human, Christian or non-Christian, is given "rights and liberties by God and nature." Human beings cannot be virtuous unless they are free to choose moral actions. The erroneous doctrine of papal "plenitude of power" deprives Christians and non-Christians of such "rights and liberties."

Thus, Ockham attributed great freedom to the individuals. The reverse side of this is that Ockham did not subscribe to an Aristotelian educational understanding of political rule. Ockham's individuals are sufficiently rational to maintain peace and order. What concerned him was how to deal with the crisis created by the malfunctioning of ruling institution, particularly in the case of the church due to such contingencies as papal heresy. Ockham's political program is in this respect a theory of crisis management. This is why he did not propose any radical reform in both ecclesiastical and temporal orders: Unlike Marsilius of Padua, Ockham did not subsume the church in a civil polity. Ockham proposed that the spiritual and secular orders should operate separately until the self-corrective process within one order breaks down; only then can the other order intervene.

Ockham's political thought, then, may be described as a theory of political judgment in one respect and as a defense of human liberty in another. Ockham explored human cognitive abilities in the judgment of public issues by questioning the pope's orthodoxy. He called for action to rescue the necessary conditions for the moral life by dissenting from heretical popes and criticizing the erroneous definition of papal power. The antipapal polemics that persisted for two decades were driven by a passionate devotion to the common good: that is, the preservation of orthodox faith and the protection of "rights and liberties given by God and nature." Ockham's political thought is often categorized as belonging to the tradition of constitutionalism and liberalism. Situated in context, however, Ockham's political thought is rich and complex enough to defy such schematic categorization.

Wollstonecraft, Mary (1759–1797)

Mary Wollstonecraft is widely recognized as the most important early feminist thinker. While she

lived at a time when no women's movement existed, she articulated themes that would prove both inspirational and foundational for successive waves of feminist thinkers and activists in the nineteenth and twentieth centuries. Nevertheless, political theorists have only come to pay serious attention to Wollstonecraft in the past twenty years.

Life and Works

Wollstonecraft was born in London in 1759 to a family wracked by her wastrel father's domestic violence and alcoholism. She was largely self-taught but, remarkably, before she was yet 30 she had committed herself to becoming a writer, and already produced a book on young women's education, a book of children's stories, and a novel and was reviewing large numbers of texts for her publisher Joseph Johnson's new periodical, the *Analytical Review*. She also mixed socially and professionally with many leading Enlightenment figures, including Richard Price, Joseph Priestley, William Blake, and Thomas Paine. In 1790, she wrote the first published reply, entitled *A Vindication of the Rights of Men,* to the great conservative thinker Edmund Burke's enormously influential *Reflections on the Revolution in France*. She followed this up in 1792 with the work which is considered the touchstone of modern feminism, *A Vindication of the Rights of Woman*. She traveled thereafter to France, staying through the violent period of the Reign of Terror, when many of her friends and political compatriots were executed or fled. During this period, she wrote an extraordinary book, *An Historical and Moral View of the Origin and Progress of the French Revolution* (1794), and also gave birth to a daughter whose father, Gilbert Imlay, would subsequently abandon them both. She returned to London in 1795 where, depressed, she twice attempted suicide, yet continued to write. In 1796 to 1797, she met and eventually married the British political philosopher William Godwin. Wollstonecraft died as a result of complications from childbirth in September of 1797, but her second daughter, Mary Wollstonecraft Godwin (Shelley) lived, and would later go on to write the famous novel *Frankenstein, or the Modern Prometheus*.

Immediately after her death, Godwin published intimate details of Wollstonecraft's private life and unconventional relationships that effectively scandalized her reputation for posterity. Because she was a woman, Wollstonecraft's work and ideas were eclipsed by her biography, a fate that seldom if ever befalls male political theorists, even when they memorialize their highly unconventional personal lives in graphic detail, as Wollstonecraft's sometime theoretical ally Jean-Jacques Rousseau did in his *Confessions*. Complicating matters, when Wollstonecraft's ideas were finally rediscovered by scholars much later, she was initially described as a "liberal feminist," a term that contemporary scholarship has shown fails to capture the depth of her radical theoretical project, and thus misses the most crucial aspects of the first moment in modern feminism.

Political Theory

In order to understand Wollstonecraft's political theory, we need to focus on her three most directly political works, the two *Vindications* and her history of the French Revolution. In the first, entitled *A Vindication of the Rights of Men,* Wollstonecraft set about dismantling Burke's moral theory and the historical arguments he had used to justify it, focusing particularly on his defense of the church and nobility. She attacked Burke's reliance on the moral intuitionism of common sense, sympathy, and sensibility, and stressed instead the socially constructed nature of modes of social interaction, or morals and manners. Against Burke's attempt to naturalize and reify the status quo, Wollstonecraft argued that the ancien régime's system of manners was developed in a hierarchical institutional context that stunted and warped the development of reasonable and virtuous character. In *A Vindication of the Rights of Woman,* Wollstonecraft specifically addressed how this European system of manners had affected women. She presented women's oppression as the result of an aristocracy of sex, the product of a hierarchical world in which men dominated the church, the nobility, the family, the military, and economic and educational institutions of all sorts. To change this world fundamentally, she urged what she called a revolution in female manners as part of the broader goals of the French Revolution. Far from being a simple extension of public sphere rights to women, Wollstonecraft's revolution required the democratization of all

political, economic, and social as well as gender relations, because all of these contributed to character formation in ways that were necessarily entwined for both women *and* men. Wollstonecraft argued that individual and collective self-government required an understanding of the mutually reinforcing relationship between the public and the private spheres, and necessitated the simultaneous radical egalitarian transformation of both.

Wollstonecraft would subsequently rely on the arguments at the heart of her two *Vindications* in order to explain the revolution's violent turn in her *Historical and Moral View of the Origin and Progress of the French Revolution,* a brilliant and still largely underappreciated text. Therein, she reiterated that equality was the necessary prerequisite for developing the distinctively human capacity for reason sufficient to achieve virtuous character. While refusing to justify the revolution's violence, Wollstonecraft consequently sought to explain it as the predictable consequence of malformed character, itself the necessary concomitant of the ancien régime's multiple artificial hierarchies, which its supporters had refused to change. However, the tragedy of the Reign of Terror notwithstanding, she remained hopeful that intellectual and technological progress could help reshape simultaneously both the public and private spheres. For these reasons, Mary Wollstonecraft presents perhaps the most theoretically consistent commitment to human equality in the canon of the history of Western political thought.

Women's Suffrage

Women's suffrage refers to the right of women to participate in democratic processes through voting on the same basis as men. In the medieval and early modern periods in Europe, the right to vote was typically severely limited for all people by factors such as age, ownership of property, and gender. The development of the modern democratic state has been characterized internationally by the erosion of these various limitations following periods of collective struggle. Women's suffrage has been achieved as part of this process of modernization at different times in different national contexts, although very few nations granted women the right to vote in national elections before the twentieth century. This entry presents the arguments for women's suffrage that have been proposed and considers the forms of political campaigning that have led to the achievement of women's suffrage internationally since the late nineteenth century.

In medieval Europe, it was not uncommon for women to be allowed to vote in municipal elections if they were heads of household (either unmarried or widowed). But it was not until the late eighteenth century in Europe that more general philosophical arguments were made for women's political rights. Thus in 1791, Olympe de Gouges, French playwright, political activist, and advocate of human rights, published *Declaration of the Rights of Woman and of the Female Citizen,* which argued that women should be given the same political rights as men, including the right to vote, while Mary Wollstonecraft's *A Vindication of the Rights of Woman* of 1792 painted a powerful picture of the social and moral benefits of educating women to allow their full participation in a social and political order founded on reason.

Political agitation for extension of the franchise for men throughout the nineteenth century was often accompanied by specific requests for the

extension of voting rights also to women. The People's Charter, for example, which was drafted by the London Working Men's Association in the 1830s to demand the extension of the vote to all men over 21, initially included a clause advocating the extension of the franchise to women. The clause was withdrawn because of anxiety that this demand would weaken the chances of success of the campaign as a whole, but the Chartist movement did provide the opportunity for many women to participate in political campaigning and generated a culture of strong involvement in the political process for thousands of women.

The extension of the franchise to women commonly built on such grassroots political agitation, drew on philosophical texts that argued the case for equality, and also depended on the active support of prominent parliamentarians or political leaders. For example, the first convention held to campaign for women's rights in the United States was held at Seneca Falls, New York, in 1848. Many of those attending, including Elizabeth Cady Stanton and Lucretia Mott, had been actively involved in antislavery campaigning, and drew their political and philosophical arguments for equality from the United States Declaration of Independence's articulation of inalienable rights to life, liberty, and the pursuit of happiness. By the end of the nineteenth century, a number of states, including Wyoming and Utah, had granted women the right to vote in State elections, but it was not until 1920, and with the support of President Woodrow Wilson, that the Nineteenth Amendment, which prohibited gender-based exclusions from voting at all state and federal levels, was ratified and women's suffrage was achieved.

Similarly, in the United Kingdom there was a mixture of parliamentary and extraparliamentary activism from the mid-nineteenth century until women were eventually granted the vote on the same basis as men in 1928. In 1865, the utilitarian philosopher John Stuart Mill was elected to parliament and agreed to present a petition in favor of women's right to vote. Following the failure of his attempt to amend the 1867 Reform Act to allow women's suffrage, a number of regional women's suffrage societies were established, culminating in the creation of the National Union of Women's Suffrage Societies in 1897. In 1903, Emmeline Pankhurst and others broke away from the National Union and established the Women's Social and Political Union, the "suffragettes," who deployed much more confrontational forms of political campaigning, including demonstrations, hunger strikes, and vandalism of property. In 1918, after World War I, women over 30 were granted the vote in national elections, and in the Representation of the People Act of 1928, women in the United Kingdom were finally granted the vote on the same terms as men.

New Zealand has some claim to be the first nation to grant women the right to vote on an equal basis to men; having done so in 1893, it was ahead of all presently existing independent countries. Australia followed closely behind, establishing women's suffrage in 1902, while Finland granted women the right to vote in 1905. Throughout the twentieth century, women across the globe gradually gained access to the right to vote: in Albania in 1920, in Brazil in 1932, in Cameroon in 1946, in Egypt in 1956, in Malawi in 1961, in Switzerland in 1971, in Namibia in 1989, in Samoa in 1990, and in Oman in 2003.

The length and intensity of campaigns to secure women's right to vote across this period indicates something of the strength of resistance to women's suffrage. The reasons for this are many and varied. The most extreme resistance to women's rights to vote has come from those who believe that women are constitutionally ill suited (by nature or by virtue of their limited education) to form rational judgments or to bear the responsibility of democratic decision making. Others have argued that while it might be reasonable for women to vote in local or municipal elections, which typically deal with housing, education, or the care of children, national elections are concerned with matters of state, and in particular with war, which are not women's domain. Resistance to women's suffrage has also come from political activists who believed that women are inherently conservative, and thus that the extension of the franchise to women would inhibit broader progressive social and political reforms, or from those who argue that women's political authority would be contrary to core religious or social values.

Despite such resistance, women's suffrage has become an increasingly established principle of international law over the past 50 years. The United Nations' *Declaration of Human Rights* of 1948

asserts in Articles 2 and 21 both that everyone is entitled to the rights it sets forth, regardless of race, color, or sex, and also that the right to participate in elections run on the basis of universal and equal suffrage is fundamental. A further *Convention on the Elimination of all Forms of Discrimination against Women* was adopted by the United Nations in 1979, and entrenched the right of women to participate on an equal basis in all aspects of democratic government. This international consensus has been tested on many occasions, and there are still a number of states where women are not granted the right to vote, or at least not granted it on an equal basis with men. The establishment and the preservation of women's suffrage thus remains an active focus of political activism across the globe.

World-Systems Theory

The title of this entry, while certainly capturing a common phrase in the world of international analysis, is a bit of a misnomer. World-systems theory is in reality a broad "approach," which has only been deemed a "theory" against the hopes of some of its central proponents. The world-systems approach seeks fundamentally to broaden the frameworks of analysis generally deployed in the social sciences in two directions: geographically, through the transcendence of the nation-state in favor of the "system," and historically through an emphasis on the "long duration." While most closely associated with sociologist Immanuel Wallerstein and the Fernand Braudel Center he founded at State University of New York at Binghamton, world-systems theory draws on many tributaries and has given rise to a broad variety of occasionally contrasting perspectives.

Origins and Tributaries

World-systems theory finds its most direct predecessor in the theories of dependency developed by scholars in underdeveloped nations as a theoretical and political response to so-called modernization theory, according to which individual nations progressed along a linear and universal path from traditional to modern societies. In the work of proponents like Walter Rostow, modernization theory served both to conceal and legitimate the privileged positions enjoyed by already wealthy nations, most of which had been colonial superpowers.

Where modernization theory insisted on a national focus—thereby blaming or crediting the individual nation in question for its relative "development" or "backwardness"—dependency theory would respond with a fiercely international focus. Argentine economist and head of the United Nations Economic Commission on Latin America (ECLA) Raúl Prebisch is widely credited with founding dependency theory in 1950, with the argument that, against modernization theory, the wealth of wealthy nations is not endogenously derived, but instead a result of their economic exploitation of other countries. Countries could be analytically divided, according to Prebisch, between "core" and "periphery," with the latter providing both raw goods and potential markets for the former, creating a circuit through which peripheral countries are systematically impoverished and locked into underdevelopment. As a result, while modernization theory was often associated with advocating economic liberalization and free trade, dependency theory would insist that, for the most part, structures of international dependence meant that more economic contact would result not in development, but its opposite, and dependency theorists came to advocate some form of import-substitution industrialization or endogenous development scheme.

While the establishment of world-systems theory proper represented a modification and development

on dependency theory, it was not limited to this. The nominal founder of the approach, Immanuel Wallerstein, has his intellectual origins in the discipline of sociology, and specifically as an Africanist. While his many influences would eventually include Frantz Fanon, Ilya Prigogine, Marc Bloch, and Paul Sweezy as well as Prebisch, the two central elements of Wallerstein's analysis are constituted by what Carlos Aguirre Rojas has termed the "double-helix" of Karl Marx and Fernand Braudel.

From Nation-State to Historical System

While on the surface, world-systems theory may seem to be fundamentally an intervention in political economy or geography, for Wallerstein, it was always indistinguishable from a series of epistemological questions he confronted in the late 1960s and early 1970s. While his studies of Africa drew heavily on neo-Marxist development theories like the dependency school—specifically, such concepts as unequal exchange, the general core-periphery framework, and the rejection of traditional claims of third world "feudalism"—Wallerstein found these approaches lacking in some clear aspects. Most evidently, the dependency school could not deal adequately with a historical conjuncture marked by the creeping crisis of both the socialist camp and the United States itself, as well as the unprecedented rise of the so called "Asian Tigers," which were no longer to be clearly relegated to peripheral status.

For Wallerstein, the theoretical tools offered by the French historian Fernand Braudel and his Annales School offered an escape from this quandary. While dependency theory had in a way globalized our understanding of power relations through the concept of unequal exchange—whereby a cycle of dependency is established between core and peripheral countries, with the latter providing raw materials for industrial production in the core, only to then be resold these products at a premium—it had nevertheless done so without breaking with the nation-state as its primary unit of analysis. While much of dependency theory was therefore still a theory of unequal *international* exchange, Wallerstein would draw on Braudel's work to reconceptualize international economic relations as a truly global *system.*

This notion of system, moreover, would be elaborated in both its spatial and temporal aspects. Inspired by Braudel's epic work on "The Mediterranean"—which paid little heed to actual geographical boundaries, focusing instead on the internal dynamics of the system constituted around the Mediterranean commercial circuit—Wallerstein would come to theorize the global structure as a "world-system." But drawing again from Braudel's theorization of the various levels of time, Wallerstein would also grant this system a peculiarly historic character. According to Alvin So, this peculiar fusion of dependency theory with Marxism and Braudelian concepts was originally conceived as a fivefold, epistemological "protest" against the existing structure of the social sciences.

An Epistemological Intervention

First, world-systems theory represents a critique of the disciplinary structure of the social sciences, which it historicizes as an expression of the development of liberal ideology, arguing instead for a unidisciplinary historical science capable of grasping not merely the state, the economy, or even "society," but instead the broader historical system within which these are embedded.

Second, world-systems theory addresses and undermines a further distinction among the social sciences: that between what Wallerstein terms the nomothetic approach, seeking universally valid laws, and the idiographic, which focuses its sights more on the identification and mapping of particularities, with no universal pretensions. To the traditional transposition of these two objectives onto the realms of social science and history, respectively, world-systems theory responds again with an insistent refocusing of the unit of analysis. According to Wallerstein, the unit of analysis needs to be one that situates the historical-social scientist between the nomothetic and the idiographic. It must be substantial enough to be law governed but restricted enough to be finite and particular.

Third, it is the Braudelian concept of system that best suits this methodological demand, and the historical-social scientist is one who analyzes the *general laws of particular systems,* as well as the historical relationship between these systems. To attempt a nomothetic analysis on

the basis of the traditional unit of analysis—the state or society—would be to grant universal pretensions to what are in reality much more historically particular and situated units. Wallerstein identifies three general types of historical systems, each governed by their own internal logic and generally located in a specific historical period: before 8000 BCE, "mini-systems" oriented around a logic of reciprocity predominated; later, and until approximately 1500 CE, these were supplanted in many areas by "world-empires," whose logical mode was extractive; and finally, in the post-1500 period, "world-economies" based on a logic of capital accumulation. Historically, the last of these would expand, replacing the other systemic forms and establishing, by the late-1800s, a single historical system the world over (a claim that would be disputed by many working within the world-systems approach). This single, historical system—the modern, capitalist world system, the first and only world system to date—is Wallerstein's own central object of analysis, to which he has devoted three seminal volumes of *The Modern World System* published between 1974 and 1989, focusing respectively on the sixteenth century, the first half of the seventeenth century, and the turn of the nineteenth century.

It is this capitalist world system that replaces the dependency school's formulation of unequal exchange, a substitution that entails two further, interrelated epistemological critiques. Dependency theory had long questioned the claim that underdeveloped countries remained "feudal"—that is, situated in capitalism's historical past—insisting, however tentatively, that feudal relations were frequently buttressed by interaction with purportedly capitalist countries. But once Wallerstein had broken with the nation-state as unit of analysis, two further elements became clear. First, what we deem "capitalism" is more often than not modeled on the English model of free-labor transaction, but once capitalism is viewed as a world system, the so-called *feudal* relations predominant in the periphery become internal to it, and capitalism as a historical system can only be seen as one that combines free labor and unfree labor within a stratified global system. Such a view, second, breaks in no uncertain terms with the linear, progressive, narrative characteristic of modernization theory, and Wallerstein would later make even more radical claims against deterministic views of progress, under the influence of the physicist Ilya Prigogine and the theory of "historical bifurcation."

Beyond Bimodal Analysis: The Semi-Periphery

It was as a result of Wallerstein's turn to the Braudelian concept of the system that he would make his most important structural contribution to dependency theory. As long as dependency theorists maintained an emphasis on the nation-state, the simplistic relationship of unequal exchange between nation-states could be understood as a binary one: Core countries extracted primary resources from peripheral ones, manufactured intermediate goods, and exported these back to the same peripheral countries, locking the latter in an unbreakable cycle of dependency.

For Wallerstein, however, such a view failed to grasp the multiplicity of relations within the global system or that system's internal dynamics. From the perspective of a system and its organizational logic, bipolarity is not a stable or organically sustainable situation. Furthermore, in practice, this bipolarity lacked explanatory value, permitting no movement from periphery to core and vice-versa, and thereby objectively excluding, for example, the Asian Tigers. Wallerstein responded by adding a third conceptual category: that of the "semiperiphery." Semiperipheral nations or areas constitute a middle stratum—functioning simultaneously as exploited and exploiters—which plays a fundamental role in the stability and maintenance of the system as a whole, a role that is both ideological and economic. From an economic perspective, the semiperiphery can provide a necessary escape valve during a profit squeeze in the core, as we see today in the phenomenon of outsourcing production to lower-wage areas and countries. Ideologically, the existence of semiperipheral states conceals the hierarchy of the system, a function revealed in the assault on dependency theory itself, as the Asian Tigers were and continue to be held up—however dishonestly—as examples of modernization theory in practice.

The addition of the category of semiperiphery goes a long way to explain the reality, however difficult, of mobility within the world system. Peripheral countries, according to Wallerstein, could rise to semiperipheral status by one of three

means: taking advantage of momentary systemic or core weakness, through invitation by core countries (as in the case of the Asian Tigers), or through developing endogenous economic institutions. A further promotion to membership in the core itself often has to do historically with cornering and developing the domestic market through a variety of protectionist or Keynesian measures. It is worth noting that, in his effort to grapple with the difficulty that the Asian Tigers posed for a rigidly binary dependency theory, Wallerstein's own explanation of the phenomenon—emphasizing invitation by the core as well as state intervention—surpasses even that provided by the free-market claims of the many modernization theorists who hold up Asian development as exemplary.

The "Long Twentieth Century"

Alongside this critical-historical analysis of the various long centuries, Wallerstein has also developed an analysis of the "long 20th century," with specific importance granted to the symbolic year of 1968. The idea of a "long" century is another Braudelian legacy that, like that of the system, has to do with a problem-oriented approach, whereby unit of analysis is adapted to suit the questions at hand. So in contrast to those who think in terms of a "short" twentieth century—defined in terms of state socialism and the cold war, and as a result limited to the period between 1917 and 1989—Wallerstein instead emphasizes the centrality of the consolidation of U.S. hegemony, a process beginning around 1870 and which, while in its terminal stages, still has yet to conclude. 1968 represents precisely the turning point in this process, beginning the decline of liberal hegemony. It is on the basis of this recent history that Wallerstein has also turned his attention to the present moment and immediate prospects for systemic transformation, for which he has received no small amount of criticism. Here, capitalism—and not merely U.S. hegemony—is seen to enter terminal crisis, a crisis that is equally economic (determined by the intersection of Kondratiev "long waves"), political-cultural (the post-1968 crisis of liberal hegemony), and environmental (the limits to growth posed by the impending environmental crisis).

Other Variants

While scholars across a broad variety of disciplines have been influenced by some element or another of the world-systems approach, several groups of scholars from within the approach have also sought to lead it in contrasting directions. For example, Andre Gunder Frank—an early proponent of dependency theory—has argued that a sinocentric world-system predated the establishment of the capitalist world system by many millennia. Others, like Aníbal Quijano and Ramón Grosfoguel, have attempted to complicate the very concept of world system itself through the addition of qualifiers such as "modern," "colonial," and "patriarchal" as defining features of the predominant world system. Quijano has further sought to group these elements under a different conceptual umbrella: that of what he deems "coloniality," and which was established on a global scale with the conquest of the Americas.

Current Implications

If some variants of dependency theory were associated with national strategies in less developed countries such as import-substitution industrialization, delinking, or autarky, world-systems theory has contributed to a more recent wave of resistance to global capital that has explicitly sought to transcend the nation-state as unit of analysis. For example, in Venezuela's Bolivarian Revolution, former dependency theorists like Oswaldo Sunkel have contributed to a theory of "endogenous development," or development of industrial capacity from within, without sacrificing an understanding of global capital as a stratified system. As a result, President Hugo Chávez has emphasized the concept of "regional integration," drawing on the historic example of Simón Bolívar's "Gran Colombia," a nation comprising what is today Venezuela, Colombia, Ecuador, and Panama. In practice, this "regional integration" has involved a strengthening of regional economic ties through South-South free trade and assistance agreements such as Mercosur and the Bolivarian Alternative for the Americas (ALBA), and diversifying import and export markets to reduce traditional dependency on the United States.

Wyclif, John (c. 1327–1384)

John Wyclif (c. 1327–1384) was an Oxford theologian and philosopher whose political theory is characterized by a radical alternative to traditional medieval ecclesiology and the vindication of the royal power over church reform. While Wyclif pursed his academic career, culminating in his doctorate in theology in 1372, he also had a somewhat tumultuous life as an ordained priest. None of his theological and philosophical works written before 1373 include any ideas directly relevant to contemporary politics.

The circumstance that prompted Wyclif to turn to political issues was probably the national financial crisis, which was triggered by the Hundred Years War. Wyclif was directly involved in politics when he was among a delegation sent by King Edward III to Bruges in 1374 in order to negotiate a settlement with papal legates in connection with papal provision to English benefices, taxation of the clergy, and the rights of clergy to appeal to papal courts. The secular magnates, John of Gaunt, Duke of Lancaster in particular, were increasingly critical of the English church's wealth. Wyclif played a significant part as a polemicist in this dispute between the English crown and church. Following *On Divine Dominion* (*De Dominio Divino*) (1373–1374), Wyclif produced *Summa Theologiae* (1375–1381), which consists of many treatises including *On Civil Dominion* (*De Civili Dominio*), *On the Church* (*De Ecclesia*), *On the Duty of the King* (*De Officio Regis*), and *On the Power of the Pope* (*De Potestate Papae*).

The predominant theme that permeates these works is ecclesiastical wealth and the authority of temporal rulers over the church. The church's corruption as Wyclif saw it stemmed partly from his Augustinian notion of history: the history of humanity was progressing from the time of the Old Testament, culminating in the time of Christ and the apostles. However, the Donation of Constantine, which confused the distinction between temporal and spiritual authority, marked the beginning of a decline; the rise of papal monarchy in the thirteenth century was the symptom of further downturn, and the late fourteenth century was "the age of Antichrist." Wyclif, however, was convinced that his time was ripe for reform that would bring the church back to its pristine state. Further, Wyclif's aggressive attack on the church also derived from his criticism of the contemporary derogation of the Bible. At the heart of Wyclif's call for ecclesiastical reform was his desire to restore scripture to the place of the only, supreme, and infallible authority. Accordingly, he asserted the superiority of theology over canon law, thereby opposing legalism that underpinned contemporary church government.

From these standpoints, Wyclif expounded a distinctively theocentric ecclesiology. According to him, the church was a congregation of all who are predestinate. No ecclesiastical office or institution

can constitute the true membership of the church. The doctrine of predestination effectively declared that the sacramental power of the ecclesiastical office was null and void. Christ, not the pope, is the single head of the *corpus mysticum*.

The doctrine of predestination renders to God alone all the power that determines eternal salvation or damnation. No believer can know that he or she is predestinate. Nor should anyone assert that he or she is predestinate; such an assertion would be utterly blasphemous. Nonetheless, Wyclif did not regard the institutional church as irrelevant; he stressed the importance of individual belief in God's grace and the ecclesiastical duty of mutual aid among believers. He also imposed a heavy duty of preaching and biblical studies to the clergy. However, he maintained that the corruption of the church was so serious that it could no longer be rectified through the institutional mechanism of the church itself.

Identifying kingship with the remedial means for church reform was central to Wyclif's conception of kingship. Wyclif argued that the king should provide the optimal environment for the spiritual well-being of Christians through the divestment of ecclesiastical wealth. This reform program was couched in his theological idea of dominion (*dominium*). Divine dominion determines the very existence of any created being. At the heart of Wyclif's metaphysics was the idea that the power exercised by any individual was grounded in, and causally dependent on, divine dominion. Human beings enjoyed true dominion before the Fall; Original sin, however, deprived human beings of what Wyclif called natural dominion. Natural dominion was thus replaced by human dominion that presumed human selfishness in desiring exclusive property ownership. One such human dominion, civil dominion, is exclusive property ownership or dominative relations instituted and required by sinful human beings. It can only be exercised by a secular lord who has received divine grace and hence acts as God's steward, because property and jurisdictional power were merely loaned by the Lord; the king—not the pope—is Christ's vicar.

However, Wyclif did not glorify kingship; nor was his reform program exclusively entrusted to the king. The king is required to consult theological experts in order to conform to Christ's law in his government. Theological knowledge underpins the legitimate rule of the king not only in his reform of the church but also in his governance of the realm. The rigorous conformity to Christ's law, Wyclif contends, should dissuade temporal rulers from waging war, however just it may seem, thus promoting Christian pacifism. Wyclif envisaged a community of the clergy who aspire to apostolic ideals and believers who thirst for biblical knowledge under the rule of a king who willingly and justly bears the burden of civil dominion as a steward of God. In this vision, only God is glorified. Wyclif's ecclesiology and political thought were translated into action by his followers, such as the Lollards in England and the Hussites in Bohemia.

WYCLIFISM

Wyclifism refers primarily to the theological views of the followers of late-fourteenth-century English theologian, John Wyclif. In terms of political theory, Wyclifism assumed not only an intellectual form but also popular forms in movements such as the Lollards and the Hussites. These heretics attempted to translate the Wyclifite program of church reform into action.

The Lollard Movement

Wyclif did not instigate any "movement" to disseminate his theological teachings; however, his idiosyncratic views found a number of loyal heirs among his students at the University of Oxford. Wyclif's English followers are collectively called

the Lollards, a term of abuse that originally meant mumblers. The first Lollards included Philip Repington, an Austin canon in Leicester; Nicholas of Hereford, who contributed to the translation of the Bible into Middle English; and William Smith and William Swinderby, both lay preachers in Leicester. The archbishop of Canterbury, William Courtenay's condemnation of Wyclifite teachings at Oxford during the 1380s met with opposition from the university chancellor, Robert Rigg, but it resulted in the Wyclifite intellectuals' recantation of their errors after Wyclif had retired in Lutterworth and subsequently died in 1384. By the late 1380s, intellectual Wyclifism was largely suppressed; however, Wyclifism took root among the laity and continued to develop as a popular movement throughout England from the 1390s to the 1410s. The clandestine movement supported by a variety of lay people generated a great volume of vernacular Lollard literature. The revolt of Sir John Oldcastle in 1414, which ended in his execution in 1417, marked the decline of the Lollard movement. The movement invited polemical responses from church apologists such as the Carmelite Thomas Netter (c. 1370–1430) and the theologian Reginald Pecock (c. 1393–1461).

Lollardy was primarily an ecclesiastical and spiritual reform movement inspired by Wyclif's theological views including his distinctive Eucharistic doctrine, which rejected the substantial or corporeal existence of Christ's body in the host and accepted the substantial resonance of the bread and wine after consecration. However, the Lollards also played a decisive role in the popular dissemination of Wyclif's ecclesiological and political ideas in late medieval England. They inherited the Wyclifite idea of the church as the congregation of predestined; therefore, the Lollards denied that one was bound to believe the "bishop of Rome" to be a member of the church. Like Wyclif, they asserted the primacy of scripture and attacked the church's legalism by expressing an abhorrence of canon law. The Lollards also rejected the inalienability of ecclesiastical property and, like Wyclif, demanded the disendowment of the church. The duty of the clergy should be characterized by poverty and the preaching and the study of the Bible. The Lollards not only deplored the Great Schism; they also saw it as vindication of their view on the contemporary state of the church. The Lollards thus endorsed the king's instrumentality in church reform. Because the Lollards were more concerned about the corruption of the church than about secular tyranny, their militant opposition to the church was markedly contrasted by their reluctance in resisting a secular tyrant.

John Hus and the Hussite Movement

The influence of Wyclifism was not limited to England. The Hussites in early fifteenth century Bohemia exemplify another reform movement inspired by Wyclif's thought. The migration of Wyclifism to Bohemia is due in part to its closer relationship with England through the marriage of Anne, sister of King Wenceslas, to Richard II. The leader of the Hussite movement was the theologian John Hus (c. 1372–1415). Hus emerged as a spearhead of the Wyclifite movement in the dispute over the question of papal obedience in the Great Schism. The Council of Pisa failed to depose the competing popes, Gregory XII and Benedict XIII; rather, it added a third pope, Alexander V. The University of Prague, whose rector was then Hus, rendered support to the new pope. Zbyněk Zajíc, Archbishop of Prague, who remained loyal to Gregory, charged Hus with heresy and excommunicated him. This dispute was followed by another controversy fuelled by Pope John XXIII's call for a crusade against King Ladislas of Naples. The dispute over the church's right to wage war and the controversy over indulgences between Hus and his opponents, including Stanislav of Znojmo and Stephen Páleč, paved the way to the official condemnation of Wyclif, Hus, and his fellow theologian Jerome of Prague. Jerome defended Wyclif's and Hus's ecclesiological views at the Council of Constance (1414–1418), which aimed at the extermination of heresy.

The investigation conducted by leading theologians, including Pierre d'Ailly, Jean Gerson, and Franciscus Zabarella, revealed that Hus's heresies were ecclesiological. While he was not Wyclifite in terms of metaphysical and speculative doctrines, as he accepted transubstantiation, for example, Hus assimilated Wyclifite ecclesiology. He argued in his treatise, *On the Church* (*De ecclesia*), that the church is the congregation of the elect. Christ is the only head of the true church and membership of the church does not depend on ecclesiastical

institution. This effectively amounted to a rejection of the infallibility of general councils: A position deemed to be heretical from the viewpoint of conciliarism as was declared in the decree *Sacrosancta* (1415). Hus also rejected blind obedience to ecclesiastical authorities, examining the circumstances in which Christians ought to withdraw obedience, thereby asserting the superiority of individual conscience to hierarchical authority.

The execution of Hus in 1415 did not silence his supporters; on the contrary, the Hussite movement developed into a national revolt (the Hussite wars) led by John Žižka and, after his death in 1424, Procopius the Bald. Describing the Hussite movement as the manifestation of Czech nationalism may be misleading because Czech nationalists were not always Hussite and the Hussites included Germans. The Hussite movement was rather the turning point from a popular heretical faction to the creation of an independent church: the precursor of the Protestant Reformation.

Appendix A: Chronology of Political Theory

Dates BCE	
650	Approximate date of rise of Sparta to prominence
510	Establishment of Athenian democracy by Cleisthenes following the tyranny of Hippias
510	Approximate date of the expulsion of the Tarquins from Rome and the foundation of the Roman Republic
490–420	Protagoras
484–425	Herodotus
460–395	Thucydides
431	Outbreak of the Peloponnesian War
428–348	Plato
404	The Peloponnesian War ends with victory for Sparta, resulting in the rule of the Thirty Tyrants in Athens and the suspension of democracy
399	Trial and execution of Socrates
384–322	Aristotle
264	Start of the First Punic War between Rome and Carthage
241	End of the First Punic War with Rome triumphant
218	Start of the Second Punic War with Hannibal's march into Spain
211	Hannibal forced to retreat after defeat in the Second Battle of Capua
203–120	Polybius
201	Roman victory in the Second Punic War, leaving Carthage as little more than a client state
149–146	Third Punic War results in Carthage being razed
148	Romans defeat the Macedonians at the Second Battle of Pydna
146	Rome destroys Corinth, resulting in its conquest of Greece
106–43	Cicero
59	Formation of First Triumvirate between Caesar, Pompey, and Crassus
44	Assassination of Caesar by Brutus, Cassius, and other Roman senators fearful of his ambition
43	Formation of Second Triumvirate between Octavian, Mark Antony, and Lepidus dedicated to defeating the assassins of Caesar
27	Octavian becomes the first Roman emperor and renames himself Augustus Caesar; end of the Roman Republic

Dates CE	
56–117	Tacitus
354–430	Augustine
410	Rome sacked by Alaric, king of the Visigoths
476	Collapse of the Roman Empire in the west
872–951	Abu Nasr Al-Farabi
1095	The First Crusade launched by Pope Urban II
1147–49	The Second Crusade
1189–92	The Third Crusade
1199–04	The Fourth Crusade
1225–1274	Thomas Aquinas
1265–1321	Dante Alighieri
1275–1342	Marsilius of Padua
1288–1348	William of Ockham
1325–1384	Wyclif
1363–1434	Christine de Pizan
1469–1527	Niccolò Machiavelli

1480–1546	Francisco de Vitoria
1492	Discovery of America and expulsion of the Jews from Spain
1517	Publication of Martin Luther's 95 Theses, beginning of Protestant Reformation
1530–1596	Jean Bodin
1543	Copernicus and Andreas Vesalius spark revolutions in astronomy and anatomy with the publication of their work
1568–1645	Hugo Grotius
1588–1679	Thomas Hobbes
1611	King James Bible is published
1618–1648	Thirty Years War
1632–1704	John Locke
1632–1694	Samuel von Pufendorf
1632–1677	Baruch Spinoza
1633	Galileo warned by the Catholic Inquisition
1642–1651	English Civil War
1648	The Peace of Westphalia
1670–1733	Bernard de Mandeville
1687	Publication of Sir Isaac Newton's *Principia Mathematica*
1688	Glorious Revolution in England
1689–1755	baron de Montesquieu
1694–1778	Voltaire
1711–1776	David Hume
1712–1778	Jean-Jacques Rousseau
1723–1816	Adam Ferguson
1723–1790	Adam Smith
1724–1804	Immanuel Kant
1729–1797	Edmund Burke
1737–1809	Thomas Paine
1738–1794	Cesare Beccaria
1748–1832	Jeremy Bentham
1748–1836	Emmanuel Joseph Sieyes
1751–1766	*Encyclopédie*: most material edited by Diderot
1752–1788	Gaetano Filangieri
1753–1821	Joseph Marie de Maistre
1758–1794	Maximilien Robespierre
1759–1805	Friedrich Schiller
1762–1814	Johann Gottlieb Fichte
1767–1830	Benjamin Constant
1767–1835	Wilhelm von Humboldt
1770–1831	Georg Wilhelm Friedrich Hegel
1775–1783	American Revolutionary War
1780–1831	Carl von Clausewitz
1782–1850	John Caldwell Calhoun
1787	Constitutional Convention (U.S.)
1788–1860	Arthur Schopenhauer
1789	French Revolution begins
1799	Napoleon Bonaparte rises to power (France)
1803–1882	Ralph Waldo Emerson
1805–1859	Alexis de Tocqueville
1805–1872	Giuseppe Mazzini
1806–1873	John Stuart Mill
1809–1865	Abraham Lincoln
1813–1855	Søren Kierkegaard
1814	Congress of Vienna
1817–1862	Henry David Thoreau
1818–1883	Karl Marx
1818–1895	Frederick Douglass
1820–1903	Herbert Spencer
1822–1888	Maine, Henry Sumner
1823–1892	Ernest Renan
1830	July Revolution (France)
1832	Reform Act (Britain)
1835–1922	Albert Venn Dicey
1838–1900	Henry Sidgwick
1844–1900	Friedrich Wilhelm Nietzsche
1847–1922	Georges Sorel
1848	Revolutions in Europe
1848–1923	Vilfredo Pareto
1854–1938	Karl Kautsky
1855–1936	Ferdinand Tönnies
1856–1939	Sigmund Freud
1858–1917	Émile Durkheim
1858–1918	Georg Simmel
1859–1952	John Dewey
1859	Unification of Italy
1861–65	American Civil War
1863–1931	George Herbert Mead
1864–1920	Max Weber
1864–1929	Leonard Trelawny Hobhouse
1865	Abolition of U.S. slavery; Abraham Lincoln assassinated
1870	French Third Republic established
1870–1924	Vladimir Ilich Lenin
1871	Unification of Germany; Paris Commune
1883–1946	John Maynard Keynes
1888–1985	Carl Schmitt
1889–1943	Robin George Collingwood

1891–1937	Antonio Gramsci
1909–1943	Simone Weil
1914–18	World War I
1917	Russian Revolution
1922	Fascism rises to power in Italy
1929	Great Depression begins
1933	Nazism rises to power in Germany
1939–1945	World War II
1945–1990	Cold War
2001	September 11, 2001

Appendix B: Web Resources

Stanford Encyclopedia of Philosophy

http://plato.stanford.edu

The *Stanford Encyclopedia of Philosophy* is an online encyclopedia on a wide variety of philosophical topics and authors.

Wikipedia

http://www.wikipedia.org

Wikipedia offers an online compendium of various topics in several languages.

EpistemeLinks

http://www.epistemelinks.com/index.aspx

EpistemeLinks is a set of comprehensive resources for philosophers, which dedicates a great deal of attention to political theory and ethics.

Answers.com

http://www.answers.com

Answers.com offers brief overviews of the periods in question as well as of the thought of the significant thinkers. Readers can post their own questions.

Electronic Enlightenment

http://e-enlightenment.com

Electronic Enlightenment is a project of the University of Oxford's Humanities Division, available online via Oxford University Press. This subscription resource offers online access to correspondence from the long eighteenth century.

Early Modern Resources

http://www.earlymodernweb.org.uk/emr

Early Modern Resources is a gateway for all those interested in finding electronic resources relating to the early modern period in history.

Early Modern Texts

http://www.earlymoderntexts.com

Early Modern Texts is an effort to make classic works of early modern political thought more accessible to students and researchers. Texts have been translated and posted as .pdf files.

Marxists

http://www.marxists.org

The most complete database of Marxism. Includes a collection of texts by Karl Marx, Friedrich Engels, Vladimir Lenin, and several dozen other Marxist and socialist thinkers.

Utilitarianism

http://www.utilitarian.net

Comprehensive Web site on utilitarianism, including an exhaustive collection of writings by and about utilitarian thinkers such as Jeremy Bentham, John Stuart Mill, and Henry Sidgwick.

Social Theory

http://www.sociosite.net/topics/sociologists.php

Links to resources on a large number of social theorists ranging from Jean-Jacques Rousseau and Alexis de Tocqueville to Max Weber, Émile Durkheim, Ferdinand Tönnies, and Antonio Gramsci.

German Philosophy

http://www.wcas.northwestern.edu/germanphil/resources.html

Links to resources on German philosophers.

History of Economic Thought

http://cepa.newschool.edu/het

Extensive resources on the history of economic thought. Includes biographies, surveys of schools of thought, links to other Web resources.

American Philosophy

http://www.american-philosophy.org/resources.htm

Links to resources on American thinkers.

American Political Thought

http://www.geocities.com/Heartland/Fields/9206/welcome.html

A wealth of primary and secondary sources on American political thought.

Hegel

http://www.gwfhegel.org

A Web site devoted to Georg Wilhelm Friedrich Hegel, including primary and secondary sources and useful links.

Modern Political Thought

http://www.psr.keele.ac.uk/thought.htm

Links to Web resources on a wide, eclectic variety of topics in modern political thought, from Friedrich Nietzsche and Émile Durkheim to Marxism and Fascism.

Liberal Theory

http://oll.libertyfund.org/index.php?option=com_content&task=view&id=191&Itemid=258

Resources on liberal thought, especially Anglo-American.
