The question of how to manage power also lay at the fore of the best-known contribution of the Enlightenment to social and political thought: its reconsideration of religion. This concern has been so often and repeatedly noted that many now see the Enlightenment as indistinguishable from antireligious polemic. But here again an appreciation of the context of these discussions is necessary. Clearly, the principal Enlightenment thinkers were deeply troubled by the instability that the wars of religion and the sectarianism of previous centuries had brought to Europe. So, too, were they troubled by the persistence in their own day of religious enthusiasm, zealotry, and factionalism. Nevertheless, it would be wrong to allow the most extreme forms of antireligious polemic to stand in for the whole. Voltaire certainly spoke for many when his anticlericalism culminated in his indignant call, *Écrasez l'infâme!* ("Crush the infamous thing!"—that is, the church). But he hardly spoke for all. Full atheism, even among the *philosophes,* was quite rare, and even their most hard-line efforts had modest effect on the actual religious practices of many until fairly late in the eighteenth century. More important, the wedge that Voltaire and other French thinkers sought to drive between philosophy and Christianity was hardly typical of the Enlightenment elsewhere. Outside of France—and especially in Scotland—many of the key philosophers of the age found themselves associating with moderate divines, understanding them to be fellow contributors to a common project.

But what then is this common project? Stated most simply, it was not to eradicate or undermine religious belief but to moderate it; to mitigate the potentially politically destabilizing aspects of organized religion while yet preserving a space for the Providentialism characteristic of what came to be called natural religion. These schemes to mitigate revealed religion took many diverse forms. Occasionally, they were polemical, like Voltaire's famed writings on toleration in response to the tragic affair of Jean Calas. Others took different approaches. Hume, for example, argued for the state establishment of a religion—on the grounds that an established religion was more likely to atrophy and wither! His friend Smith took a diametrically opposed approach to reach the same end, arguing that religious zealotry and factionalism would be best mitigated by multiplying the number of sects, ensuring that they would have to remain moderate in their competition for new adherents and preventing any one sect from becoming so dominant (arguments embraced by Madison in number ten in *The Federalist,* which

proposes a similar scheme for managing political faction). What all of these proposals shared was the hope that the most destabilizing political effects of religion could be contained, an argument that underlay the many significant steps taken in the Enlightenment for separation of church and state and guarantee of freedom of conscience.

Finally, in at least one sphere, the Enlightenment, contrary to its popular reputation, was decidedly friendly to religion. For all of the skepticism that it voiced toward what is known as revealed religion—that is, religion founded on the direct revelation of divine teachings to men—many of its leading practitioners were amenable to if not adherents of natural religion—that is, a faith founded on conviction of the existence of God as inferred from the study of nature. In our age, which regularly presumes the incompatibility of faith and science, this perspective can be difficult to grasp. But yet, amid all their many critiques of the Christian mysteries—Christ's atonement, transubstantiation and the real presence, the trinity, the biblical history of creation—many of the leading natural philosophers of the Enlightenment believed their work to be nothing less than an effort to reveal and thereby prove the existence of an intelligent designer, knowledge of whom was available to all through the use of reason. In this sense, the same scientific fervor that questioned revealed religion did much to promote belief in natural religion. Herein lies one of the Enlightenment's own mysteries—one that reveals it to be much more complex, more interesting, and indeed more relevant to us today than any simple caricature might suggest.

ENTHUSIASM

Enthusiasm entered the English political vocabulary in the seventeenth century, a period of intense religious and political turmoil marked by the English Civil War (1642–1651), the Protectorate of Oliver Cromwell (1653–1658), and, finally, the achievement of political stability following the Glorious Revolution of 1688. In left-wing Protestant or Puritan theology, enthusiasm was a second manifestation of conversion through baptism in the Holy Spirit by the infusion of revelatory grace. Religious communities of the converted, ranging from Muggletonians, Diggers, and Levellers to Congregationalists and Quakers, separated themselves from the Church of England. Church and royal opposition to their demands for ecclesiastical reform, coupled with suppression, set the stage for revolution. By the end of the century, reaction against religious antinomianism, regicide, and the

imposition of strict codes of morality turned enthusiasm into a term of reproach, denoting fancied inspiration, vain confidence of divine favor, and extravagant forms of speculation.

While respecting the psychological and social power generated by religious enthusiasm, Thomas Hobbes, in *Leviathan* (1651), characterized it as an intellectual defect, a kind of madness, justified only by true prophetic revelation attested in the Old Testament by God's miracles, but having no place in the secular political orders mandated by posta-postolic Christianity. Whatever individuals may claim regarding their own experience of supernatural inspiration, this knowledge can have no public or ecclesial standing. All public interpretation of biblical prophecy must repose in the authority of the political sovereign. John Locke continued this critique in a chapter on enthusiasm appended to *An Essay Concerning Human Understanding* (1693). He condemned the pretensions of enthusiasm by clearly distinguishing it from reason-sanctioned biblical revelation but provided collective space for shared prophetic belief by urging toleration for all Protestant churches based on differing interpretations of written revelation for church organization, formal articles of belief, and, within the civil law, personal conduct.

David Hume set the pattern for a deeper theoretical understanding of the relationship of enthusiasm to politics. His essay, "Of Superstition and Enthusiasm" (1741), was part of a larger project to moderate and compose the political, religious, and cultural divides that tore apart England in the previous century and, in the form of ideological political parties, threatened political stability in his own day. Associating enthusiasm with extreme republican principles and superstition with extreme monarchical beliefs, Hume outlined ways in which both tendencies have been mitigated by the rise of commercial society and material progress. Here, however, the analysis takes a more interesting turn. Superstition supports priest-craft, persecution, and slavish dependence; it is the cultural-religious power behind political and economic interests that represses moral and material progress. Enthusiasm, in contrast, empowers leaders and followers with political courage and social recklessness in its assault on prevailing practices. By "clearing the field" of previous institutional and intellectual impediments, it paves the way for the reconstitution of society on a more rational basis. The necessary vices of hot enthusiasm become the cooled virtues of modern society: personal sobriety, moral self-discipline, economic reliability, and political obedience. Speaking more broadly, Hume suggested that politico-religious enthusiasm is both anarchic and proto-totalitarian, demanding religious freedom and the extirpation of God's enemies. For Hume, Cromwell was a charismatic leader of the first order, one who embodied all sides of enthusiasm's political and institutional possibilities—and, in the process, laid the foundations for modern constitutionalism. Hume's analysis anticipates what Max Weber termed the *routinization of charisma*.

In the two centuries that followed, the political face of enthusiasm emerged in evangelical Protestantism. Intense missionary activity and movements for moral and social reform swept England and America. Revivalists and postmillennial religious perfectionists powered the temperance, antislavery, and woman's suffrage movements. God's kingdom was on the horizon. Even Pentecostal ideas, including divine healing and speaking in tongues, filtered into social gospel enthusiasms in mainstream American Protestantism. From the late nineteenth century onward, separate Pentecostal religious bodies founded by charismatic leaders proliferated in America, penetrating deep into African American and poor white communities. While this downward movement tended to marginalize Pentecostal theologies, under the influence of historicism and the democratic dreams of the new social sciences, liberal Protestant thinkers saw in movements for social justice and welfare the progress of God's kingdom on Earth; each advance in the material world was a further infusion of spirit in human history; every victory for social reform was a victory over sin. Avowedly secular thinkers (e.g., John Stuart Mill, John Dewey) were not immune from some of these same enthusiasms.

By the early twentieth century, distinctly religious enthusiasm was no longer of interest to political theorists but was replaced by a close analogue: secular ideologies and utopian dreams, with their power to mobilize revolutionary and totalitarian movements. Here the focus was on the psychological stresses and irrational responses occasioned by modernity, almost a repeat of Hobbes's arguments but with the academic support of sociology,

social psychology, and psychoanalysis. Of growing interest in contemporary scholarship has been the rapid rise of Pentecostal Christianity in Latin America, Africa, and Asia and among immigrants from those areas in Europe and America. Many scholars tended to dismiss this growth as the artificial effects of American missionary activity and resources and, when this seemed inadequate, to the ineffective and privatizing responses of poor rural populations streaming into the vast conurbations in developing countries. Now, however, social theorists are exploring the ways in which Pentecostal beliefs and communities are a form of "walkout" from prevailing but dysfunctional practices that mark their present condition and the acquisition of new forms of personal and collective action, leading both to economic advance and social agency. Political theorists term this a form of micropolitics leading to new forms of personal and social empowerment that soon become expressed on the larger political stage—a process not unknown to students of religious enthusiasm in seventeenth-century England and Northern Europe.

Environmentalism

In the literature on environmental political thought, *environmentalism* is generally held to be distinct from *ecologism* on the basis of the degree of social, economic, and political change that is held to be necessary. Ecologism, in its various forms, seeks a comprehensive restructuring of society and economy and a fundamental change in the way the relationship between the human and nonhuman worlds is perceived. In this view, the solution to the perceived environmental crisis can be brought about only through a radical change in ideology, economy, and society. Environmentalism, in contrast, while sharing with ecologism the view that the world is experiencing serious environmental problems, seeks to ameliorate the problems within, rather than by replacing our current economic and political systems. Andrew Dobson, thus, denies it a place as a distinct political ideology. Environmentalism (or what Arne Naess called "shallow ecology") thus tends to seek such things as better regulation, more appropriate economic incentives, or additional government investment in certain technologies, rather than the wholesale overthrow of the existing liberal-capitalist order.

Historical Context

Concern for environmental goods such as clean air, potable water, and attractive natural environments is of course nothing new, and local or national political campaigns for environmental ends have a long history. John Evelyn, for example, complained in *Fumifugium* (1661) of the smoke to be found in London, which rendered the inhabitants "obnoxious to a thousand inconveniences, corrupting the lungs and disordering the entire habit of their bodies." The work of the American transcendentalist environmentalists, such as John Muir and Henry Thoreau, and the former's campaigns for the establishment of national parks and founding of the Sierra Club are justly famous, and the National Socialist government in Germany (1933–1945) was the first in Europe to instigate nature reserves, one act among others that has led to a controversial literature on whether or not that regime can be seen to have genuine environmental credentials.

If there is any element that distinguishes contemporary environmentalism from these historical forebears it is its emergence as a phenomenon that is global in terms of both its reach and its concerns. The 1960s and 1970s saw the development of a transnational environmental movement on the

back of concerns raised in publications such as Rachel Carson's *Silent Spring* and the *Limits to Growth* report for the Club of Rome. Environmentalists began to see that the problems raising their concern were not only local and specific (although they were still this, as well) but also global and systemic. In particular, worries about pollution, resource depletion, and human overpopulation were taken to be generic to the developed world (and the developing world as well in the case of overpopulation). The responses to this new conception of global environmental problems varied from calls for the suspension of democracy and rigid state control in the neo-Hobbesian eco-authoritarian literature to anarchistic calls for the dissolution of the state and the deep ecological call for *metaphysical reconstruction*—a fundamental change in how "we" (human beings in the industrialized world) view the nonhuman natural world and, indeed, all matter. At this point, the environmentalism–ecologism divide begins to take shape, as some thinkers seek to render the existing system environmentally sustainable, and others seek the radical overthrow of industrial society.

Sustainable Development

Following the former track here, the 1980s saw an increasing concern with sustainability as a key concept. This became entwined with questions of continued economic growth and resulted in the emergence of a key environmentalist discourse articulated around sustainable development. There is a large literature on sustainable development and many suggested definitions, but the one perhaps most employed and widely known is that from Gro Harlem Brundtland's World Commission on Environment and Development report of 1987, *Our Common Future,* which described sustainable development as that which "meets the needs of the present without compromising the ability of future generations to meet their own needs." At this level of generality, sustainable development is an idea that can gather much apparent support. It is much more difficult to determine exactly what kinds of development can actually meet the needs of the present without compromising the position of future generations—much depends on, for example, whether human-made capital is taken to be substitutable for natural capital and what the long-term costs and benefits of existing or alternative patterns of development are taken to be. Nonetheless, for all the difficulties involved at the level of specifics, sustainable development remains one of the central themes of environmental political thought.

Ecological Modernization Theory

Deep ecologists and eco-authoritarians might both be described as technological pessimists, in that either they see current industrial technologies as fundamentally misguided or they do not believe that there is sufficient time to apply a technological fix before environmental catastrophe hits. This view is not shared by all environmental political theorists, and a strand of thought known as ecological modernization theory has emerged in recent years, which holds that technological improvements can take us a considerable way toward resolving the environmental crisis. Ecological modernization theory draws on some of the insights of economists such as Julian L. Simon and suggests that the appropriate use of economic incentives can change human behavior in an ecological direction and move society toward the internalization of environmental externalities, such that the price we pay for goods and services will reflect their true social and environmental cost. Early ecological modernization theory tended to be techno-corporatist or "weak"; it emphasized the role of science and technology in both causing an environmental crisis and resolving it, and it stressed the potential of the market to send signals about relative scarcities and to change incentives via price signals, which in turn would change behavior. Here, there is clearly a regulatory role for government, although governance would not necessarily take place at the level of the nation-state; there may be good reasons to regionalize some decision-making levels and to globalize others. Later reflexive or "strong" ecological modernization theory retained these features, but in response to critics of early versions of the theory, it has been more amenable to the critique of markets and capitalism emanating from other corners of the green world. The role of social movements is more strongly emphasized, and ecological modernization theory calls for more open and inclusive forms of democratic decision making in which those social movements that are not antisystemic are given a prominent role. More emphasis is also placed on

questions of environmental justice, and intergenerational solidarity is taken as a core principle of strong ecological modernization.

Environmental Justice

Another recent development in environmental thought is the rise of the environmental justice movement, which originated in America as a grassroots campaign for a more equitable distribution of environmental benefits and burdens among different socioeconomic groups, in particular for people of color. Theories of distributive justice (e.g., John Rawls's *A Theory of Justice)* have been concerned with the questions of what goods (and bads) are to be distributed, who the agents and recipients of justice should be, and what principles should govern the distribution of the appropriate goods and bads. Campaigners for environmental justice have something to say on all of these points. Most important, of course, they want explicit recognition of environmental benefits and burdens as one of the primary goods to be distributed. For too long, in this view, elements such as polluted air and groundwater or contaminated land have been ignored by the relevant authorities, and for theorists of environmental justice, environmental goods have also been underplayed in mainstream justice theory. Scandals such as the building of houses on contaminated land at Love Canal in New York and Carver Terrace, Texas, and the clearly skewed distribution of environmental burdens on different communities indicate that the claims of environmental justice campaigners have some merit. Note, however, that this discourse remains firmly within the anthropocentric domain, relating environmental benefits and burdens to questions such as human health and poverty. It would be far more controversial to try to bring in goods such as species preservation or the protection of wilderness under the environmental justice rubric; this seems instead to take us toward the domain of ecological justice. The latter raises the prospect that demands for justice can cross the species divide, entailing that nonhuman species may have rights to ecological space grounded in claims of justice against humanity. In another strand of cross-species justice literature, the Great Ape Project, championed by Peter Singer among others, suggests that the members of the great ape species should have rights grounded in their capacities for communication, rationality, and self-consciousness. In contrast, for environmental justice theorists, both the agents and the recipients of justice are human beings, and various principles have been proposed to regulate the distribution of environmental resources, most revolving around some notion of the (at least prima facie) equalization of benefits and burdens.

It is worth noting that for environmental justice theorists, distribution alone does not exhaust the field of concern with regard to environmental justice. Theorists such as David Schlosberg and Kristin Shrader-Frechette also see a denial of recognition and a lack of opportunities to participate as central underlying causes of environmental injustice. These three elements link in that lack of recognition (of, for example, the claims of communities of color) is viewed as leading to the lack of opportunities to participate, and without participation, such communities have no influence over the ultimate distribution of environmental goods and bads.

Skeptical Environmentalism

A recent development in the field of environmental political thought has been the rise to prominence of so-called skeptical environmentalism associated with the Danish statistician Bjørn Lomborg. Lomborg's work looks back to the reaction that followed the first wave of global environmental concern, particularly that of economist Julian Simon in his books *The Resourceful Earth* and *The Ultimate Resource*. Simon had dismissed the doom-laden predictions of the eco-authoritarians and the systems analysts behind the Club of Rome report, arguing instead that economic growth, human ingenuity, and growing technological sophistication would leave human societies well-placed to deal with emerging environmental problems. Lomborg takes a similar view; on most indicators, the environmental quality of developed nations is getting better rather than worse, and developing nations can expect similar improvements to accompany their economic growth. Where there are genuine environmental problems, such as climate change, it would be foolish to give up more than marginal amounts of economic growth to mitigate greenhouse gas emissions. Lomborg sets a stark contrast between the requirements of future generations and the needs of the existing global poor.

We can expect people living, say, 100 years in the future to be significantly richer than their compatriots today, such that a Bangladeshi living in 2100 may (if existing trends continue) expect to be as wealthy as a Dutchman living today. We may help the future Bangladeshi by a small amount (but so small as to be very ineffectual) by seeking to limit climate change emissions quite radically today. This might be a good thing if nothing else were at stake for present people, but much is. We could do very much more for the present global poor by spending our resources on HIV/AIDS treatment, malaria treatment, or clean drinking water than we could do for future people by Kyoto-type treaties to limit emissions of carbon dioxide and other greenhouse-related gases. What we have to do is look at the possible welfare payoffs from any dollar spent, and on a cost-benefit analysis of that sort, spending resources on the alleviation of climate change looks like a very poor use of scarce goods.

Lomborg's thesis is not, of course, uncontroversial, and he has been roundly criticized for neglecting the possibility of catastrophic tipping points and for his assumption that standard cost-benefit analysis techniques can be applied to climate change despite the great uncertainties involved. He has even, somewhat bizarrely, been compared to Hitler by Dr. R. K. Pachauri, the chair of the Intergovernmental Panel on Climate Change, for his views on global warming.

Environmental Activism

An integral part of environmental politics has been the phenomenon of environmental direct action. This raises questions about how environmentalists conceive the domain of politics and, in particular, how they understand the relationship between their own political ends and the liberal democratic order as it is constituted in most developed nations. The globalization of environmental concern referred to above was also accompanied by the development of (in addition to many local and specific groups and campaigns) transnational environmental campaigning organizations such as Friends of the Earth (founded in 1969 when David Brower split from the Sierra Club), Greenpeace (1972), and Sea Shepherd (1981, from a parting of the ways between Paul Watson and Greenpeace). Such campaigning organizations can be seen as environmental rather than ecological, on the distinction given at the start of this entry, on the grounds that they seek to deal with a series of specific environmental problems rather than radical systemic change. By contrast, the direct action group, The Earth Liberation Front, articulates an anarcho-primitivist ideology that seeks the complete overthrow of civilization, including the state, capitalism, and organized religion.

These direct action groups set their own values focused on environmental preservation against the priorities of development and economic growth embodied in industrial societies. This campaign form can be seen as undemocratic, as it often seeks to increase the costs of engaging in legal business transactions for government, business, and individuals and claims a "trumping" justificatory status for a set of environmental values over and above other values reflected in public policy. In defense of what they do, activists will point to the flaws in the existing policy-making process, such as planning laws, which in their eyes disproportionately favor one set of interests (usually business/economic) over others, bringing into question the democratic nature of the political system. They also point to the irreversible nature of many environmental changes, such that they cannot expect effective policy reversal in the future, thus making their case all the more urgent. They may also point to a higher moral or natural law in justification of their direct action campaigning, which is taken to provide a more fundamental justification than the positive laws inscribed in statute. Existing treaties and laws may also, however, be cited in defense of environmental action: Sea Shepherd claims to be enforcing international maritime law against whalers, and the recent successful defense, in the United Kingdom, of climate change protesters accused of criminal damage rested on an existing law permitting the infliction of damage to property in the cause of preventing greater damage at some point in the future.

EQUALITY

The demand for equality is central to modern politics, but it is a complex and highly contestable demand. Recent work in political philosophy has exposed it to rigorous scrutiny. Drawing on this work, we will consider the nature and plausibility of the demand in four stages:

1. Equality of opportunity and John Rawls's critique
2. Four criticisms of Rawls's theory of distributive justice
3. The leveling-down objection
4. Relational egalitarianism

Equality of Opportunity and John Rawls's Critique

In contemporary politics, the demand for equality is often understood as the demand for equality of opportunity. Equality of opportunity is closely related to the ideal of *meritocracy* (Miller, 1996). In a meritocratic society, valuable jobs and positions are to be allocated to individuals strictly according to the talents they have that are relevant to good performance in the jobs and positions in question. This constitutes distribution according to merit. However, in practice, distribution according to merit might be blocked by other factors, for example, a preference for one job candidate over another on the basis of race, gender, or class background, where these features are not relevant to the individual's capacity to perform in the relevant job or position. Where such features obstruct distribution according to merit, we often say that there is a failure of equality of opportunity. Some candidates for jobs or positions are advantaged, and others disadvantaged, in an arbitrary way by virtue of these features. The demand for equality of opportunity is, in the first instance, a demand for a purely merit-based distribution of these goods; or, in other words, a demand for a nondiscriminatory distribution of the goods, where *discrimination* in this context is a particular kind of injustice occurring when a job or position is allocated according to criteria other than merit. The ideal of *weak meritocracy,* as we might call it, is the ideal of a society in which there is an absence of discrimination in this sense.

However, although the absence of discrimination is crucially important, critics argue that it is not sufficient for equality of opportunity. For example, even if individuals have access to jobs and positions on a nondiscriminatory basis, they might still have unequal access to jobs and positions on the basis of merit for other reasons, for example, unequal endowments of wealth, which influence their opportunities to set up businesses. And even if they have equal opportunity to compete for jobs and positions on the basis of merit, they might have very unequal opportunities to develop the talents that are the criterion of merit, for example, because

of inequalities in educational opportunity in childhood. The ideal of *strong meritocracy* is the ideal of a society in which there is equality of opportunity in the deeper sense indicated by these comments. The underlying ambition is akin to that which John Rawls (1999) describes under the heading of "fair equality of opportunity," which prescribes that any two individuals with similar natural ability and motivation should have the same opportunity to gain jobs and offices, regardless of their parental class background (p. 73). Concretely, the ideal draws attention to the impact of inequalities in financial inheritances, educational opportunity, and the cultural and social capital of different families and neighborhoods.

However, one major school of thought in contemporary political philosophy questions whether strong meritocracy would result in distributive justice. Strong meritocracy envisages a world in which individuals have equal opportunity to develop their job-relevant talents and to compete for jobs and offices solely on the basis of these talents, but in which there might well remain substantial inequalities of reward, and thus of income and wealth, between differentially talented workers in high- and low-paid jobs. But job-relevant talent is a function of our underlying endowments of natural ability. Is it just to allow the distribution of income and wealth to be shaped by differences in ability endowments, as strong meritocracy permits? The strong meritocrat accepts that it is wrong for our prospects to be shaped by accidents of birth such as the social class of our birth parents. But our natural ability is also an accident of birth. Surely, it is no less improper for our prospects to be determined by the one accident of birth as the other. As Rawls (1999) puts it: "There is no more reason to permit the distribution of income and wealth to be settled by the distribution of natural assets than by historical and social fortune" (p. 64).

In Rawls's theory, as set out in *A Theory of Justice,* inequalities attributable to differential talents are handled in the following way: goods such as income and wealth are to be distributed equally unless an unequal distribution would make those worst-off under the ensuing inequality better off. Indeed, according to *the difference principle,* inequalities are justified when they work to the maximum benefit of the worst-off group (Rawls, 1999, pp. 65–73; 2001, pp. 61–64). The talented cannot claim a right to (say) a higher income on grounds of desert, given the moral arbitrariness of the distribution of natural ability. The only justifiable grounds for allowing inequality is that it somehow works to make prospects better for the least advantaged. It might do this, for example, because higher incomes for talented workers give them *incentives* to produce more, and this higher output can, in part, be used to raise the income of less talented workers.

Four Criticisms of Rawls's Theory of Distributive Justice

Rawls's proposal has, in turn, generated a huge critical literature. Here we will focus on three lines of criticism: (1) the choice-sensitivity criticism, (2) the metric of equality criticism, and (3) the incentives criticism. We will also note a fourth line of criticism: (4) the global justice criticism.

The Choice-Sensitivity Criticism

In *A Theory of Justice,* Rawls (1999) argues that differences in productive contribution do not warrant unequal reward when they reflect differences in natural ability *and* when they reflect the different choices people make about how far to deploy their talents productively (pp. 89, 274). Rawls faced criticism early on that this implied an arguably unfair subsidy to those with productive ability who, instead of using it, choose instead to "surf all day off Malibu" (Musgrave, 1974). Rawls amended his theory in light of the criticism (see especially Rawls, 2001, p. 179), but other theorists have sought to give a much more prominent place to the role of choice in developing a theory of egalitarian justice (as an alternative to meritocracy).

A key contribution here is that of Ronald Dworkin (2000, Chapter 2). In developing a sophisticated theory of equality of resources, Dworkin introduces a distinction between "brute luck" on the one hand and choice and "option luck" on the other. If Smith has lower earnings capacity than Jones due to forces beyond her control, such as natural endowments, then this is a matter of bad brute luck and is properly a matter for concern. If she has lower earnings than Jones because she chooses to work fewer hours, or because she elected not to take a risk or gamble that Jones did

(option luck), then, on Dworkin's view, this is to be respected.

In an influential paper, G. A. Cohen (1989) argues that the brute luck/choice distinction captures something of fundamental importance to egalitarian theory. In the case of inequalities in advantage due to differential brute luck, there is a justice-based reason to remove or compensate for them; in the case of inequalities due to choice (including option luck), by contrast, there is a justice-based reason to tolerate them. This expresses the basic idea of what has come to be known as *luck egalitarianism* (Anderson, 1999). Some philosophers who endorse the idea seem to think that there is little else to the question of distributive justice (or to the issue of what degree of equality is desirable) other than luck egalitarianism. Others, such as Cohen, regard it as describing one important normative concern for a theory of distributive justice, without claiming that it is necessarily the whole story. Clearly, one challenge to luck egalitarianism is that of how to conceptualize exactly, and operationalize the pivotal distinction between disadvantage due to brute luck and that due to choice. For example, choices reflect preferences, but preferences are often shaped by circumstances that are largely a matter of brute luck (e.g., attitudes to smoking are strongly affected by one's social context, which is to some extent a matter of brute luck). Philosophers sympathetic to luck egalitarianism have sought to elucidate these complexities (Roemer, 1993, 1998; Stemplowska, 2009). As we will see below, luck egalitarianism has also been subject to fierce criticism in recent years.

The Metric of Equality Criticism

We spoke above of Rawls's views on inequality of reward. This is inexact. More exactly, Rawls argues that in approaching the topic of equality, we need to focus on individuals' shares of *social primary goods*. These include certain basic liberties, occupational opportunity, "powers and prerogatives of offices and positions of responsibility," income and wealth, the "social bases of self-respect," and leisure time (Rawls, 1999, pp. 78–81; 2001, pp. 58–59, 179). The difference principle applies not only to an index of social primary goods that includes income and wealth, but also to the powers and prerogatives of offices and positions of responsibility, the social bases of self-respect, and leisure time (Pogge, 1989, pp. 162–164; Rawls, 2002, p. 179).

However, is this the right metric for thinking about (in)equality in distributive shares? Rawls sets out his primary goods metric as an alternative to what has come to be called *welfarism:* that we should assess relative positions in terms (and only in terms) of welfare levels, where welfare is understood either as pleasure or as preference satisfaction. Many recent philosophers have agreed with Rawls in rejecting welfarism, so defined. Dworkin (2000, Chapter 1) argues, for example, that a welfarist account of equality has two implausible implications: (1) that we should give extra resources to people who cultivate tastes that are expensive to satisfy and (2) that we should deny extra resources to people who suffer severe handicaps, for example, very limited mobility, if they are nevertheless capable of enjoying as much welfare as others.

As an alternative, Dworkin (2000, Chapter 2) proposes a *resourcist* conception of equality: What we should be seeking to equalize, fundamentally, is not welfare but resources. Rawls's metric of social primary goods is one kind of resourcist metric. Dworkin proposes a similar metric, which takes in both external resources (the resources of the external world, e.g., land) and internal resources such as talent. What Dworkin refers to as handicaps represents a kind of resource deficit. Dworkin develops a complex theory of *hypothetical insurance markets* to help us determine how deficits in internal resources (low earnings potential, handicaps) should be compensated or otherwise addressed.

But is resourcism the most credible alternative to welfarism? G. A. Cohen (1989) argues that while Dworkin is right to reject welfarism, on the grounds indicated above, he is nevertheless wrong to deny welfare any place at all in a theory of the underlying metric of equality (pp. 916–921; see also Arneson, 1990). Imagine, for example, someone who is able to move his arms, but who, for reasons beyond his control, suffers severe pain some time after doing so. An egalitarian will rightly see this vulnerability to pain as something that matters. But, Cohen argues, this must surely reflect a judgment that a person's welfare is one thing that matters in a fundamental way for egalitarians. According to Cohen (1989), the fundamental "currency of egalitarian justice" is neither

welfarist nor resourcist but pluralist. What matters is equality in access to advantage, where *advantage* is a complex notion incorporating resourcist and welfarist concerns (pp. 916–917). This position is similar (although not identical) to Amartya Sen's (1992) proposal that we should treat individuals' *capabilities* as what matter in a fundamental way for an egalitarian theory. A capability, in Sen's terms, is a person's ability to achieve various significant beings and doings (or functionings). These significant functionings should not be reduced to a simple concern for a person's welfare, but they might include welfare, or specific kinds of welfare (such as security against involuntary pain).

Dworkin argues that the points raised by these *pluralist* theories of the metric of equality can, in fact, be handled adequately within his resourcist framework. Returning to Cohen's example of the man who suffers involuntary pain after moving his arms, Dworkin (2000) argues that this "pain-producing infirmity" is "a canonical example of a lack of personal resources" (p. 297). It is the kind of internal resource deficit that people would, on average, choose to insure themselves against in a hypothetical insurance market and, as such, should receive compensation or some other appropriate form of redress. Critics like Cohen (1989) argue, however, that this is really to concede the relevance of welfare while expressing (and perhaps thereby obscuring) the concession in the language of resources (p. 919).

The pluralist approach seems, therefore, to have some intuitive strength. But its pluralism also generates potential problems. Consider, in particular, Sen's capabilities theory. In saying that we ought fundamentally to care about equality in the space of capabilities, we raise the obvious question: *Which* capabilities, out of the huge number we could identify, matter? A worry here is that in answering this question, we might be guided by overly specific, controversial theories of human flourishing, making our theory of equality *sectarian* in an objectionable way. The desire to avoid this sectarian danger is, of course, one motivation for the resourcist approach. Rawls chose to focus on social primary goods as the metric of equality because he sought a way of thinking about citizens' basic interests that is not tied closely to a particular "conception of the good life" but which would be a common ground for citizens with diverse conceptions of the good life (Rawls, 1993, pp. 187–190; 2001, pp. 57–61). The challenge to the pluralist, therefore, is to develop the pluralist theory in a way that retains the nonsectarian or ecumenical ambition of resourcism (see, for example, Nussbaum, 1990).

The Incentives Criticism

Rawls's theory allows for incentive-based inequalities. Starting from a position of equality in (for simplicity's sake, let us say) income and wealth, we should allow inequality if the effect is to somehow motivate some workers to greater efforts, which, at the end of the day, also benefit the group that is worst-off under this inequality. This seems like common sense. How could one object to an inequality if those worst-off under it are better off than they would be under greater equality?

However, in an important sequence of writings, G. A. Cohen (1995; 2000, Chapters 8–9; 2008) has challenged the fundamental justice of incentives-based inequality. Cohen points out that if higher pay for (say) talented workers leads them to work harder, thus raising output from which even the poor benefit, in general, this is because the talented would *choose* to work less hard under equal pay. But then we can ask: Do the talented workers act justly when they choose to work less hard under the policy of equal pay? If, for example, these talented workers themselves accept as a principle of justice that the worst-off be as well off as possible under any distributive regime, then do they not violate this principle of justice by choosing to work less hard under equal pay? They *could* choose to work just as hard under the equal-pay regime as they do under inequality, and, if they did, more of their output could be shared with the worst-off.

Cohen's challenge identifies a major issue for egalitarian theory. All can agree that principles of (egalitarian) justice apply to the design of institutions, for example, tax laws. But to what extent ought they also to apply to the decisions that individuals make within the formal rules and institutions of their society? On the one hand, we can imagine a pure institutionalist approach, which would call on government to design laws and policies to work to the maximum benefit of the worst-off (or to promote whatever other egalitarian objective is seen as appropriate) while leaving

individuals free to be as selfish in their economic decision-making as they like, so long as they comply with their legal obligations. On the other hand, we can imagine a maximal egalitarian approach, which would require all citizens to make considerations of egalitarian justice always the overriding consideration in making personal economic decisions. Cohen argues that what I have called the maximal egalitarian approach gives too little weight to legitimate self-regarding concerns. Nevertheless, he argues, a just society will feature an egalitarian ethos that shapes individuals' economic decision-making. Critics variously argue that the proposal remains too oppressive of personal freedom; or that the proposal violates an important requirement of publicity (that we be able to see that others are doing their justice-based duties); or that the proposal is otiose because other features of a (Rawlsian) just society would anyway eliminate the kinds of selfish productive motivations that are truly objectionable (see J. Cohen, 2001; Daniels, 2003; pp. 263–270; Estlund, 1998; Williams, 1998).

The Global Justice Criticism

Rawls advances his theory for an independent, self-contained society. It is intended to apply to the internal arrangements of a liberal nation-state. In *The Law of Peoples,* Rawls (1999) argues that some duties of justice apply across nation-states (or peoples), but these are not the egalitarian duties that he argues apply within liberal peoples. However, many of those sympathetic to Rawls's theory have rejected this limitation of the scope of egalitarian distributive justice, arguing that there are compelling grounds for applying egalitarian justice at the transnational or global level (Beitz, 1999; Caney, 2005; Pogge, 1989, pp. 240–280).

The Leveling-Down Objection

Recall Rawls's claim that inequality is to be preferred to equality if inequality works to the benefit not only of those who are well-off under inequality but also of those who are worst-off. If we think further about this aspect of Rawls's theory, are we perhaps led to question whether *equality,* as such, is really of value?

Imagine two possible societies, X and Y. In X, social class A has 20 units of opportunity, whereas class B has 10 units. In Y, both classes have 9 units of opportunity. Which should we prefer? Surely, we should prefer X to Y. Y is more equal than X. But to insist on Y, for the sake of equality, simply makes everybody, including the worst-off, worse off than they need be. That doesn't seem very sensible. Or imagine a variant of X, X*, under which class A has 20 units of opportunity and class B has 9 units. If X is unavailable, and we had to choose between Y and X*, which would we prefer? Even though the worst-off are no better off under X* compared to Y, they are not worse off, and those in class A are much better off. So again, although Y is more equal, it seems implausible to prefer it to X*. To insist on Y over X* on grounds of equality allegedly makes no moral sense, given that the option of equality makes nobody better off and makes some people worse off.

Proponents of the leveling-down objection use cases such as these to challenge the thought that equality, as such, is of intrinsic moral significance (Parfit, 2000, pp. 97–99; see also Raz, 1986, pp. 227, 234–235; Clayton & Williams, 2000). In its simplest form, the objection says: If equality matters, we'd be willing to level down; reflection on the above cases shows that we aren't willing to level down; so equality, as such, can't be what we are concerned with. Proponents of the objection then proceed to argue that what we are really concerned with is not equality as such, but something that is being confused with a concern for equality. Thus, our real concern is not equality, but priority to the worst-off (choosing that distributive regime which makes the worst-off as well off as possible). Or perhaps our real concern is sufficiency (ensuring that everyone has a decent standard of living rather than equalizing standards of living; see Frankfurt, 1987; Waldron, 1993; for criticism of this view, see Casal, 2007).

However, the leveling-down cases suggest only that equality is not our *only* value, not that it is not itself a value. Go back to the choice between Y and X*. Say we do prefer X* to Y. Does this reveal that, in fact, we place no value on equality as such? Not necessarily. I might think that all things considered, taking into account all the values in play, X* is preferable to Y. But, as Larry Temkin (2000) argues, this is entirely consistent with thinking that Y is superior to X* in one respect—namely, that it is more equal. The leveling-down objection, as

summarized above, too readily assumes that if we think equality is valuable for its own sake, we must always want to place this value first when it competes with other values (such as efficiency or aggregate utility). The leveling-down cases certainly suggest that equality does not plausibly have this status, but that need not mean that equality as such is not a value.

Relational Egalitarianism

As we have seen, Rawls's theory of distributive justice generated a critical literature that sought to refine egalitarianism. The emergence of luck egalitarianism is especially important here, with its pivotal distinction between inequality in advantage due to choice and that due to bad brute luck. However, this development has, in turn, generated a second wave of critical literature, pointing to alleged deficiencies in the luck egalitarian perspective. This criticism has proposed an alternative perspective that may be termed *relational egalitarianism* (see especially Anderson, 1999, and, for related perspectives, see Fraser, 1995; Scheffler, 2003; Wolff, 1998).

Elizabeth Anderson (1999) provides a particularly forceful statement of the relational egalitarian perspective. In essence, her argument identifies two concerns as properly fundamental to egalitarianism: status and power. An egalitarian society is, first, one in which there is an absence of status hierarchy. An egalitarian society is one in which people do not look down on others (or up to them) because of differences in features such as race, gender, class background, or disability. It is also, second, a society in which no person is dominated by another. It is, therefore, a society with meaningful equality in the formal political sphere and one in which personal relations, in the family and the workplace, are characterized by an absence of oppression. The underlying thought is that a society is egalitarian not (fundamentally) in virtue of the way it distributes goods, but in virtue of the quality of social relationships. If one wanted a slogan to summarize the quality that social relationships ought to have, then perhaps that slogan would be: No masters, no slaves.

Of course, the way in which society organizes the distribution of income and wealth can have an impact on status and power. The relational egalitarian calls for distributive arrangements that will underpin the achievement of status equality, political equality, and the prevention of personal domination. The exact degree of equality of income and wealth necessary in this respect is a matter for empirical research. However, Anderson argues, we can be sure that the sort of equality demanded by the luck egalitarian will not meet these needs. On the one hand, the luck egalitarian's willingness to leave people to suffer the consequences of their lifestyle choices could easily result in social relationships in which weaker parties are degraded or dominated. On the other hand, the luck egalitarian's insistence that brute luck disadvantages such as disability be met with financial compensation is itself degrading to those who receive such compensation. In the case of the disabled, for example, Anderson argues that the appropriate approach will focus on integration of the disabled as equals into mainstream society, not on financial compensation expressing an attitude of condescending pity.

Luck egalitarians have argued that Anderson's (and related) criticisms are at least overstated. For example, luck egalitarians are not committed to saying that the only, or best, policy response to disability is necessarily merely to pay the disabled financial compensation. A given brute luck disadvantage has a justice-based claim to redress on the luck egalitarian view, but this does not mean that redress always ought to take the form of financial compensation.

More fundamentally, Anderson's critique arguably overlooks different ways in which the luck egalitarian idea might enter into an overall, action-guiding political theory. To think that the choice/luck distinction is relevant to distributive justice, and, thereby, relevant to policy, is not necessarily to think that it is all that matters from the standpoint of distributive justice or policy. One can quite intelligibly be a pluralist who thinks that the luck egalitarian concern points to one thing of relevance to distributive justice and, therefore, policy design, without thinking it exhausts distributive justice or that (even if it did) it ought to override all other moral considerations in policy design (G.A. Cohen, 1989, pp. 908–909). Anderson's critique is forceful, understood as a critique of the views that only luck egalitarian concerns are relevant to distributive justice or that only luck egalitarian

concerns should govern policy. But it is not clear that (all) luck egalitarians hold these views (for example, G. A. Cohen, 1989, certainly does not), rather than the more moderate views that the choice/luck distinction is justice- and policy-relevant.

Intuitively, there seems much to be said for a pluralist approach that would seek to combine the insights of the luck egalitarian and relational egalitarian perspectives. However, the pluralist position raises a tough question: How are the respective concerns of luck and relational egalitarianism to be integrated? And lurking behind this question is the more fundamental question of whether the demand for what we call equality is an internally harmonious ideal or one that refers to a plurality of legitimate moral concerns that can conflict and that are not, ultimately, reducible to some single, underlying principle (Berlin, 1969). As Bernard Williams (1973) noted in a related context, this might be "an uncomfortable situation, but the discomfort is just that of genuine political thought. It is not greater with equality than it is with liberty, or any other noble and substantial political ideal" (pp. 248–249).

Equality of Opportunity

There is widespread agreement that equality of opportunity is a good thing, even a constituent of a just society, but very little consensus on what it requires. Defenders of equality of opportunity suppose that it requires people to be able to compete on equal terms, on a "level playing field," but they disagree over what it means to do so. They believe that equality of opportunity is compatible with, and indeed justifies, inequalities of outcome of some sort, but there is considerable disagreement over precisely what degree and kind of inequalities it justifies and how it does so. This entry examines the approaches to equality of opportunity taken by advocates of fair equality of opportunity, luck egalitarianism, and libertarianism.

Fair Equality of Opportunity

Many believe that equality of opportunity requires advantaged social positions to be subject to open competition. (This view is sometimes captured by the slogan, "careers open to talents.") The idea here is that jobs and limited educational places should be open to all and that the selection procedures for them should be designed to identify the best-qualified candidates. This appears to be an efficient way in practice of allocating jobs so as to maximize productivity and of distributing prized educational places to those who are likely to gain the most from them. But even if it is a necessary condition of equal opportunity, it cannot be a sufficient condition. For if it were, equality of opportunity would permit differences in people's social circumstances, such as the economic class, family, or culture into which they were born, to have too deep an impact on their prospects. (This is why it is sometimes described as merely formal equality of opportunity.) The ideal would be compatible, for example, with a society in which those born to a lower economic class have radically different prospects from those born to a higher economic class as a result of the way that the different resources at their disposal influence their access to the qualifications required for success. The solution, it might be thought, is to suppose that equality of opportunity requires not only open competition for advantaged social positions but also fair access to qualifications. The resulting position is often called *fair equality of opportunity*. (Some also refer to it as substantive equality of opportunity, in contrast to the formal equality of opportunity provided by open competition on its own.)

John Rawls defends a version of fair equality of opportunity. He argues that advantaged social positions should be open to all, not only formally, but also in such a way that each has a fair chance of attaining them, which he treats as equivalent to the idea that those with the same level of talent and ability, and the same willingness to use them, should have the same prospects of success, regardless of factors such as class, race, and sex. Although Rawls does not explicitly say so, he presumably also means to allow that those with a higher level of talent and ability and a greater willingness to use them may legitimately enjoy greater prospects of success than those with lower levels of talent and ability and less willingness to use them. Implementing fair equality of opportunity would require counteracting the effects of differences in class, race, sex, and the like, and it would have

substantial implications for the design of a system of public education, including the tax regime required to fund it. Some have worried that even the provision of high-quality public education would be insufficient to guarantee fair equality of opportunity, on the grounds that differences between families, such as the different values they attach to education and the different resources they have available to them, could continue to prevent those with the same level of talent and ability (and the same willingness to use them) from having the same prospects of success. This raises the question of whether fair equality of opportunity, if it were implemented in an uncompromising way and without regard to other values, would require abolishing the traditional family.

Some have thought that fair equality of opportunity is highly unstable, however. It appears to be motivated by the desire to prevent differences in people's social circumstances from significantly affecting their prospects in life relative to each other. Yet, if the reason for doing so is that an individual's social circumstances are beyond his control (they are simply a matter of, say, being born into a particular family, class, or culture, or being a particular sex or member of a particular race), then the same can be said of people's "natural circumstances," such as the genetic potential with which they happen to have been born or what we might call their natural endowment. Consistency would seem to require preventing differences in people's natural endowments, not just their social circumstances, from significantly affecting their relative life prospects. This has led to worries that the ideal of equality of opportunity ultimately collapses into the different one of equality of outcome or condition. Indeed, it might seem that we are confronted by a stark choice between retreating to an unacceptably thin conception of equality of opportunity, which holds that it consists in open competition for advantaged social positions and nothing more, and a much more expansive notion, which maintains that it requires us to counteract the differential effects of anything that is beyond a person's control.

But there are potential lines of argument open to those who endorse fair equality of opportunity but do not want to extend it to counteracting the effects of differences in people's natural endowment as well. The most prominent among these is the argument that when the effects of different social circumstances have been redressed, people *deserve* the benefits they receive: In other words, when there is fair access to qualifications and the best-qualified candidates are appointed to advantaged social positions, they deserve those positions and the rewards the market attaches to them, despite the existence of differences in natural endowment. This line of argument, however, is vulnerable to the reply that people cannot truly deserve the extra benefits they receive unless the effects of differences in natural endowments have been neutralized and differences in effort alone are being rewarded.

Luck Egalitarianism

Even if the ideal of equality of opportunity, strictly thought out, did require us to counteract the effects of different natural endowments as well as the effects of differences in social circumstances, we would not be led inexorably to the conclusion that this requires equality of outcome. That aim is consistent with allowing people's life prospects to be influenced by their values and choices. Indeed, it is consistent with the idea that those who are ambitious and want material success may legitimately end up with a greater share of resources than those who value leisure or time with their families. Some have wanted to claim that a deeper conception of equality of opportunity emerges from these reflections, with a more radical vision of what is required to level the playing field. From this standpoint, the underlying motivation of the ideal of equality of opportunity, properly understood, is to counteract the effects of people's different natural and social circumstances while permitting inequalities of condition that emerge as a result of their choices. When inequalities arise from differences in choice, they are just; indeed, if we do not allow inequalities to arise in this way, we fail to give personal responsibility its due. This view is sometimes described as luck egalitarianism.

Luck egalitarianism provides us with a particular account of what it is to level the playing field in the way that justice requires. It maintains that inequalities are unjust if they derive from differences in people's circumstances because these are a matter of brute luck, but inequalities are just if they are the product of people's voluntary choices.

It is, in effect, a combination of two different claims: first, that justice requires us to neutralize the effects of differences in people's circumstances; second, that it is just to require people to bear the costs, or allow them to enjoy the benefits, of their voluntary choices. In making these claims, luck egalitarianism invokes a distinction between choice and circumstance, or brute luck and option luck, which it assigns direct normative significance. Such an approach might be thought to offer the best way of understanding the ideal of equality of opportunity. Indeed, luck egalitarianism is attractive because it gives an account of what it means to level the playing field that goes further than other theories of equality of opportunity, but which at the same time aims to hold people accountable for how well their lives are going.

Luck egalitarianism has its critics, however. Given the social forces to which each of us is subject, the distinction between choice and circumstance, or between brute luck and option luck, is not always easy to draw in a plausible way. Even if we can find a satisfactory way of drawing these distinctions, there is the worry that luck egalitarianism is too harsh in the way that it holds people responsible for their foolish or reckless behavior. It seems to imply that those who end up needy as a result of their own imprudence can justly be forced to bear the costs of their choices. So a person who chooses to smoke in full knowledge of the risks involved and develops lung cancer may have no entitlement of justice to the health care that he or she needs but cannot afford. Uncompromising luck egalitarians may insist that they have no objection to voluntary schemes to help those with self-inflicted needs but that they regard the forcible extraction of taxes to help those who are responsible for their plight as sanctioning the exploitation of the prudent. Others, however, may concede that luck egalitarianism requires supplementing with a further principle of justice, for example, a principle holding that the needy—that is, those whose condition falls below some threshold—are entitled to support regardless of how their needs arose.

Some regard luck egalitarianism as radically misconceived, however. Elizabeth Anderson rejects it in favor of what she calls democratic equality. Democratic equality has a positive and negative dimension. Its negative dimension consists in a rejection of oppression, that is, forms of relationship by which some are dominated, exploited, marginalized, or demeaned; its positive dimension consists in a commitment to a social order in which people stand in relations of equality, which requires democratic self-government involving open discussion among equals in accordance with mutually acceptable rules. Anderson regards democratic equality as a relational theory, whereas she claims that luck egalitarianism is a distributive theory because it conceives equality as a pattern of distribution. This contrast is perhaps somewhat overdrawn: Luck egalitarianism itself may be part of an account of what it is to treat people as equals, with equal concern and respect, while democratic equality has distributive implications even if it is not itself a theory of distribution. But the two accounts of equality do have a different character: Luck egalitarianism is troubled by inequalities of access as such, whereas democratic equality is moved by them only insofar as they play a role in oppression or exploitation or undermine democratic self-government. In laying out its vision of a society without domination, oppression, or exploitation, democratic equality has room for a more specific conception of equality of opportunity that stands opposed to discrimination in spheres such as employment, education, and the provision of public services and requires fair access to qualifications. This might in some respects resemble the idea of fair equality of opportunity but without the grander ambition of neutralizing the effects of differences in people's social circumstances, which has often animated that idea.

The Libertarian Perspective

This entry began by suggesting that there is widespread agreement that equality of opportunity is a good thing, and indeed a requirement of justice. But there are some dissenters. Some on the left argue that equality of opportunity is simply a way to legitimate inequalities of wealth and income that are inherently unjust. No doubt the idea of equality of opportunity does sometimes play this role, but both fair equality of opportunity and luck egalitarianism can provide the basis for a critique of real world inequalities of wealth and income and justify extensive redistributive schemes. A more fundamental challenge to the idea that equality of opportunity is a component of justice comes

from a libertarian perspective. Libertarians argue that employers are entitled to fill vacant positions within their workforce with whomever they want, for whatever reason they want.

According to this libertarian position, the entitlement of employers to decide who should work for them on whatever basis they choose is grounded in their property rights. (Managers acting on behalf of their employer might be regarded as having a similar entitlement that derives from the employer's property rights.) But any reasonable account of property rights must recognize that they are limited by the rights or entitlements of others: A person may own a car but is not in general entitled to use that car to run others over. Even if a person may in some cases have a right to do wrong, he does not have a right to violate the rights of others or to act unjustly. So the most obvious strategy for defending the idea that equality of opportunity is a component of justice will involve trying to show that applicants for jobs have rights or entitlements that restrict the reasons for which selectors can legitimately reject them. (This would not by itself show that the decisions of employers should be subject to legislative constraints. Such constraints might be regarded as ineffective or counterproductive.) Influenced by a libertarian perspective, however, some will argue that the rights or entitlements of applicants for jobs are not such as to impose a duty on employers to select the best-qualified candidates. Matt Cavanagh, for example, maintains that candidates have a right not to be treated with unwarranted contempt but argues that this does not entail that the best-qualified candidates have a right to be selected, for employers may have a variety of reasons for rejecting them that do not express unwarranted contempt.

EQUITY

Equity is a term used in jurisprudence and ethics to distinguish judgments that exceed, circumvent, or contradict the letter of the law in order to uphold principles of humanity, natural law, or moral conscience. It is closely related to notions of equality, fairness, clemency, and justice. In the English and American legal systems, equity also refers to a set of principles used to provide relief in cases where the rules of common law are deemed unfair or inadequate. The principle of equity recognizes that the law is sometimes at odds with natural justice and that the strict application of legal justice may not fulfill the moral or rational demands of each specific situation. Equity demands that unusual cases be treated unusually, a concept that has its roots in the ethical and legal philosophies of the ancient world.

Equity in Ancient Greece

Greek philosophy was particularly sensitive to the tensions between legal and natural justice. In the *Statesman,* Plato argues that the rule of law is inferior to the rule of a wise king because the law cannot determine what is most just for each individual. The complexity of human action makes it impossible for any law to apply universally; only a perfectly wise ruler can determine the appropriate application of justice in each circumstance. However, because a ruler possessing such perfect wisdom cannot be found, it is necessary to adhere

to established laws in all cases. Laws can be changed, but until that is done wisely, it would be worse to violate them than to follow them strictly.

In distinguishing between the ideal and actual state of affairs, Plato highlights the problem without endorsing specific measures to ensure equity. In a subsequent work, the *Laws,* he proposes supplying the law code and many individual laws with preambles to facilitate a deeper interpretation of their true meaning. He also suggests that, while a judge is bound by the rule of law, he must rely on his own discretion in determining matters of fact. If used wisely, this allows for individual cases to be distinguished from each other under the same written law. Finally, Plato states that there are unwritten laws, the ancient customs and traditions of the society, which cannot be easily rejected.

Aristotle provides a more explicit definition of equity and further bridges the theoretical and practical concerns. In the *Nicomachean Ethics,* he defines *epieikeia* (equity) as a kind of justice that corrects and completes legal justice in cases where the law is defective because it is too general or absolute. This corrective is necessary because the law must be universal, which leads to gaps in some cases and outright errors in others. This is not the lawmaker's fault; the sheer variety of possible situations cannot be anticipated. The correction of the law in a particular case is an attempt to recover what the lawmakers would have included if they had known the facts. In this regard, equity is not entirely opposed to legal justice, but it is superior to the absolute interpretation of the law.

In the *Rhetoric,* Aristotle describes how equitable judgments should be made, highlighting the importance of adopting a forgiving attitude toward human behavior. An equitable person should attempt to see things from the wrongdoer's perspective to understand the particular errors and misfortunes that led to the act. In this way, the strictures of the law can be tempered by examining the full moral context of the crime and showing mercy. Aristotle then discusses applications of these concepts in forensic speeches. In cases where the written law is clearly against the accused, he recommends an appeal to the more natural and constant principle of equity, which is a part of true justice. This is consistent with surviving evidence from Greek oratory, where litigants regularly demand special consideration for their cases. Aristotle's theories thus reflected actual legal practice regarding equity.

Equity in Ancient Rome

The concept of equity in Roman jurisprudence combined Greek theories with independent judicial innovations. In his ethical and political writings, Cicero describes justice as essentially equivalent to equity, which he calls *aequitas*. He quotes a Latin proverb, *summum jus summa injuria* ("extreme law is the greatest injustice") to demonstrate the error of adhering too strictly to human laws. Justice is a natural and rational principle that transcends the customs and rules of states. Like Plato, Cicero emphasizes the distinction between written and unwritten law, but he also connects equity to the Roman legal principle of good faith. Legal rights cannot be enforced in bad faith, and equity promotes more thorough investigation of both the facts of the case and the spirit of the law.

In practice, equity occupied a place of ever-increasing importance in the Roman legal system through the establishment of praetorian law alongside the traditional law code. The praetors were magistrates with supreme judicial power, and they gradually introduced principles of equity to allow for flexible interpretation of the established law. As judicial rulings rather than legislation, the praetors' edicts were not binding on future magistrates, but the most useful ones eventually cohered into a parallel body of law. The edicts were especially shaped by the notion of natural law as a means of determining the proper interpretation of old laws in new situations that were not anticipated by the lawmakers. This is consistent with Cicero's views and earlier Greek theories of equity, with which the Roman jurists were familiar.

Essentialism

In general terms, essentialism is the doctrine that (some) objects have essential, rather than merely accidental or contingent properties. In philosophical discourse, essentialism is a complex term that picks out different positions. Stretching back to Plato's doctrine of Forms, it can refer to abstract entities that exist only in a "heavenly place," so that the concrete physical objects we experience in the world are no more than imperfect copies. In more analytical terms, essentialism is the view that something can have an essential property by virtue of its definition or description: For example, a man can be necessarily defined as two-legged insofar as he is a cyclist. Essentialism can also be thought of as a metaphysical doctrine in which objects or kinds of objects have certain properties without which they could not be the things they are. By contrast, an accidental or contingent property is something an entity or object may or may not have. For example, Aristotle maintained that the property of rationality is essential to human beings, whereas the property of having a long nose is not.

In contemporary social and political theory, debate has raged between those who claim that objects (such as human beings) have essential properties, and those who argue that all objects (including humans) are radically contingent and historical entities that are unstable and open to change. Essentialism is here understood as a belief in the real and true essence of things—the unchanging and immutable properties that define what something is—and it is often contrasted with various forms of constructivism, postmodernism, or poststructuralism, whose proponents insist that there are various ways of constructing entities, depending on the actions and interactions of social agents. The anti-essentialist perspective of the latter does, however, admit of variation, with some stressing the role of intentional actors situated in historical traditions or knowledge systems, whereas others emphasize the constitutive operation of discourses in shaping social agents and their identities.

Despite these differences, anti-essentialists are agreed that essentialism is a pejorative term that precludes an investigation of change and multiplicity in the name of natural and fixed characteristics. However, other political theorists find it normatively and descriptively attractive to invoke ideas of essential properties, such as an intrinsic human nature, to capture those distinctive attributes and features of entities like human beings. In their view, such an account can provide a way of better understanding human beings while also furnishing the means to articulate and justify the defense of their basic needs and interests.

Another group of critical political theorists have questioned the sharp distinction between essentialism and constructivism. Some argue for a *strategic essentialism,* in which oppositional movements acknowledge differences within groups but choose to essentialize their demands and identities in the name of more pressing political goals. On the other hand, various discourse theorists in the poststructuralist tradition stress the mutual interweaving of essence and contingency. In the latter perspective, all objects are socially constructed in different ways by competing actors and their respective discourses, but no discourse or identity can ever fully exhaust the meaning of an object. Each and every object is penetrated by contingency and is thus open-textured, although there are constant efforts to partially fix the meanings of entities. Instead, an important part of social and political life consists of various struggles to impose particular meanings onto essentially contingent objects and practices.

EUERGETISM

Euergetism—the word derives from the ancient Greek word for a benefactor (εὐεργέτης)—is a term used by ancient historians to refer to the phenomenon of elite benefaction to towns and communities through voluntary gifts, such as public buildings or endowments for various forms of festival or distribution. The process has been seen as critical to understanding how city-states functioned in the Hellenistic Greek east and throughout the wider Mediterranean world in the Roman republican and imperial eras.

Gift-giving was a well-established aristocratic prerogative from very ancient times in the Greek world (the Greek mainland, as well as Greek-speaking communities across the eastern Mediterranean). It was ill-suited to Athenian democracy but became well established from the late fourth century BCE under the Hellenistic kingdoms of the successors to Alexander the Great and continued to form an important element of civic life as the influence and then the imperial presence of Rome came to dominate the area. As Rome also colonized the less-urbanized west, a very similar system of rule by gift-giving local elites was developed there.

Euergetism contributed to the physical development and sociopolitical stability of ancient cities. It bound local elites into a system of reciprocity with their communities and also allowed them to model their conduct on that of hegemonic powers—at first, the Hellenistic kings honored as liberators and benefactors and later, Roman emperors, frequent recipients of divine cult in the east.

Euergetism, therefore, acted as a system that mediated wealth and status differences, enabling the spread of urbanism and enriching the lives of citizens. However, it was not conspicuously motivated by what would now be regarded as conventional charitable or philanthropic motives; seldom, for instance, do we hear of gifts being aimed specifically at the relief of poverty. Indeed, euergetism tended to perpetuate inequalities of wealth and power by entrenching a strongly hierarchical social system with a limited political class. In this, it can be compared to other systems of power brokerage in the ancient world, such as slavery and patronage, which also tended to reinforce a strongly hierarchical status quo. By fostering a spirit of competition in gift-giving within and between towns and by helping to negotiate the subordination of previously autonomous city-states to successive larger kingdoms and empires, euergetism also had a wider political dimension.

Benefactors and Recipients

It has been suggested that a crucial feature of civic euergetism in the classical world was that its benefits and obligations were distributed equally to all those who wanted them. Such benefits were not aimed at favored factions but were received by the city as a single entity, preventing the practice of euergetism from descending into mere bribery or partisan patronage. The concept of collective benefits has been criticized; it can be shown that some benefactions were aimed at specific recipient groups, including (for instance) cash benefactions and alimentary grants. However, for the most part, it seems that euergetism did not collapse along factional lines but remained a quasi-institutional process negotiated between benefactors and recipient cities as something distinct from the world of private patronage.

Euergetistic benefactions, in fact, were not simply imposed from above on supine civic populations; rather, there is some evidence that both the *boule* or *ordo* (town council) and *demos* or *populus* (popular assembly) of the recipient communities could exercise a degree of scrutiny and even control over proposed gifts, acting as the legal authorities for ratifying and receiving benefactions and, for example, administering projects donated through legacies. The honors offered to benefactors were also usually granted in the name of these organs of local government. Such scrutiny and administrative oversight, being the prerogative largely of social and political peers of the potential euergetes, tended to reinforce rather than challenge euergetism as a system, but it did allow recipient communities to retain a role in the process and reminded all parties of their engagement with a wider population of fellow citizens.

Towns, which possessed revenues and executive powers of their own, could even act in concert with benefactors. We know of several joint enterprises from the Roman world, such as the library at Timgad, Algeria (begun by a private benefactor and then completed by the town); the theater Pliny mentions at Nicaea in Bithynia appears to have been a joint undertaking by the town and various private benefactors who have provided adjoining halls and a gallery. Towns could also levy an entrance fee (*summae honoriae*) for high civic officeholders, formalizing the intersection of city finances with private resources.

However, euergetism remained for the most part the prerogative of individual benefactors, who were usually, although not exclusively, male: The rich benefactions of women like Plancia Magna at Perge and Eumachia at Pompeii reflect the importance of the dynastic element of local benefaction.

Forms of Benefaction

Particular categories of benefaction were especially appealing to the exponents of such a system. Monumental public building, in particular, was a frequent choice, offering certain important benefits to donors. It was suitably spectacular and appealingly permanent. It could bring obvious benefits such as flowing water to a town or act as the backdrop for crowd-pleasing events such as theatrical performances, religious sacrifices, or bathing. Buildings could also effectively act as dynastic monuments; the famous façade of the Celsus library in Ephesus acts as a large stone billboard that advertised the career of the donor (in bilingual inscriptions) and the precise terms of his benefaction. It framed multiple statues of himself, his family, and his personified intellectual virtues—a neat epitome of the *quid pro quo* a wealthy benefactor hoped to achieve.

Large-scale civic building projects were also suitable for euergetistic benefactors in that they usually required resources of land, labor, and materials that were more readily met by large one-off capital outlays from the very wealthy than by the steady revenues available to most city treasuries. Indeed, one study suggests that it would have taken 90 to 140 years for public revenues to pay for the public buildings of a typical town in Roman North Africa, the buildings in question being four temples of average size, a set of baths (many towns had more than one), a forum, a marketplace, a theater, at least one porticoed square, paved roads, and essential infrastructural features such as drains and walls. In fact, many towns show concentrated bursts of development over much shorter periods, suggesting—even if we did not have thousands of dedicatory inscriptions recording private benefactions—that euergetism must have provided a significant proportion of funding for public building.

Besides buildings, benefactors could endow distributions of cash or foodstuffs (typically grain or oil), or festivals of various sorts. Such events could coexist with buildings, raising their profile and reminding the townspeople of the identity of the donor; in Ephesus, statues of the donor of the library, Tiberius Julius Celsus Polemaeanus, and of his heirs were to be garlanded annually on his birthday.

Endowed festivals and processions could also stand alone as separate benefactions for which the whole city served as a setting. Among the better known examples of this sort of euergetism are the Artemis procession of Vibius Salutaris at Ephesus and the near-contemporary Demostheneia endowed by Demosthenes of Oenoanda, a festival involving artistic competitions, sacrifices, processions of 26 officials, the provision of at least 28 bulls from surrounding villages, the dedication of a golden ceremonial crown with relief portraits of Apollo and the emperor Hadrian, and a distribution of free grain.

This famous festival shows that in the Roman east, euergetism can be studied in particular connection with the second sophistic movement, which saw a reformulation of Greek civic and cultural identity under the Roman Empire through spending by local notables and aristocrats. Acts of euergetistic benefaction were made by local patrons acting autonomously and in conscious awareness of local religious and civic traditions, but also incorporating elements of the Roman present. The procession at Ephesus, for example, taught the town's citizens about the town's history and institutions through its choice of participants, route, and activities and combined this with acknowledgement of Roman imperial government and cult, perhaps as a response to the growing dominance of Rome. Euergetism was not part of a top-down imposition of Roman uniformity on the province

but something in which influential natives wanted to play a part. Through euergetism, towns asserted their individual identities and vigor while gaining the typical suites of public buildings—baths, forums, theatres, paved and colonnaded streets lined with statues—that still act as hallmarks of the Roman presence.

Indeed, Rome's emperors provided a pattern of philanthropic expenditure that others could follow. Imperial spending of this sort became an expected function of the emperor, as it had been of ambitious politicians under the republic; spending freely on "bread and circuses," in Juvenal's famous phrase (*panem et circenses; Sat.* 10.81), was necessary to legitimize the emperor's position at Rome and maintain his base of popular support. Moreover, generous spending on architectural and other acts of benefaction was one criterion of imperial success for writers such as the imperial biographer Suetonius.

The emperor's largesse stimulated similar spending by Roman senators and provincial elites. Trajan, for instance, hailed in his own lifetime as "best of emperors," spent on alimentary schemes (in which the interest on loans to farmers was paid toward the upkeep of children in towns); so did his senatorial subordinate and exegete Pliny. Trajan spent on baths and libraries, and so did Pliny and a host of other provincial donors; and the monumental adornments of imperial Rome—arches, stadiums and theaters, aqueducts, forums—sparked imitations across the empire.

Benefactors might find friends and supporters among their peers with whom they could discuss their schemes. However, the role of euergetism in enhancing the prestige of leading local families and thereby helping their members to office naturally made it also a source of tension or dispute. The rival ambitions of the urban elites who engaged in euergetism led on occasion to conflict and dispute both within and between towns. The disputes within towns could be mediated by the town in question or, under the Roman Empire, referred to Roman officials such as the governor Pliny.

The disputes between towns, less easy to check in the absence of any really developed infrastructure of government at a tier above the level of the individual town, and in light of the fact that euergetisic projects were conceived individually rather than in response to any coherent plan of urban development, could lead to disastrous emulous spending on impractical "white elephant" projects. Pliny's letters from his province of Bithynia to the emperor Trajan refer to the emperor several abortive or ill-managed projects by cities whose ambitions exceeded their abilities to see the projects through, such as an aqueduct at Nicomedia, which consumed more than 3 million sesterces but was not completed, and the joint-funded theater at Nicaea, built on sinking ground and apparently subject to a dispute between architects (Pliny *Ep.* X.39). At Prusa, meanwhile, rivals of the orator-statesman Dio tried to derail his own euergetistic library project by denouncing it to the governor (Pliny *Ep.* X.81). These failed or contested projects are an important addition to the record because archaeological and epigraphic evidence has a natural tendency to reveal successful benefactions rather than those that failed.

Motivations of Benefactors

In light of the expense and potential for rivalry that attended euergetistic projects, what motivated benefactors? Various factors have been suggested, such as the desire of the local elites to show their participation in metropolitan fashions at the court of Hellenistic kings or later of Rome, as well as their desire to emulate the cultural activities that went with them; the balancing of these tastes with local identities has already been mentioned. Civic pride and fellow feeling are not to be underestimated, nor are religious or genuine philanthropic sentiment, although their expression was rather different from modern equivalents. Self-commemoration went hand in hand with giving large sums to the public purse, so that gifts given for altruistic motives served the donor's interests as well: A citizen from Ebusus (Ibiza), for example, left 90,000 sesterces to help the citizens pay their taxes in difficult times—and to provide a display of lights on his birthday.

The desire for power, for posthumous prestige or memory, and the Greek *philotimia* and its Latin variant *honor*—the competitive pursuit of public esteem—were also powerful motivating factors. No doubt a lavish gift would do a donor no harm as he sought election for himself or his relatives to positions of power within a town, but as we have seen, the role of the town in receiving gifts and

rewarding them with honors meant that euergetism was not simply bribery or purchase of office.

This crucial function of the communities receiving euergetistic gifts can be understood as a partnership between the town and the wealthy individual donor: A system of reciprocity through euergetism developed, ensuring that the social position of local elites was dependent on following its established practices. In this partnership, the benefactor offered money and organizing initiative; the town in return offered civic prestige, expressed through titles and honorific statues as a sort of currency.

The formulaic nature of honorific inscriptions, often carved on the bases of statues erected by recipient communities, suggest that this pattern—whereby civic titles such as benefactor or patron or civic honors such as a public funeral were offered in return for euergetistic gifts—was very well understood. Such titles could then be advertised by the benefactor to present and future urban audiences, one factor behind the epigraphic habit that littered the ancient world with tens of thousands of public inscriptions.

Such rewards made the donor and his peers more willing to give further gifts and resulted in a system that remained essentially stable for several hundred years. The financial, political, and military crises of late antiquity led to higher tax burdens on the rich, and the importance of voluntary obligation began to decline; eventually the long-established system of euergetism gave way to new forms of patronage as part of a wider pattern of social and political change.

EUGENICS

Eugenics is a term coined by the nineteenth-century British biologist Francis Galton to refer to a program of breeding better people. In an era, nation, and class that tended to see civilization as progress and itself as the most civilized, Galton saw the attributes of civilization as the expression of innate endowments, rather than as the product of historical contingencies and opportunities. Thus, eugenics afforded a biological—a scientific—means of advancing society.

There was an immediacy to eugenics as well, however. Insofar as the lower classes were having more children than the wealthier classes, and the lower classes were assumed to be genetically inferior, it followed that the present demographic trends would retard civilization. To this "scientific" problem, a "scientific" solution had to be sought. In the United States, before income taxes and a large federal budget, when equal rights and opportunities were not taken for granted (women could not vote until 1920), when the perceived good of the state or the race could take precedence over individual civil liberties, and where sprawling urban slums were being fed daily by large numbers of new immigrants from southern and eastern Europe, the eugenic platform made a good deal of sense. As articulated by Madison Grant (1916) in *The Passing of the Great Race,* America's existing and impending social problems could be dealt with scientifically, indeed, surgically.

> A rigid system of selection through the elimination of those who are weak or unfit—in other

> words, social failures—would . . . enable us to get rid of the undesirables who crowd our jails, hospitals, and insane asylums. . . . [Sterilization] can be applied to an ever widening circle of social discards, beginning always with the criminal, the diseased, and the insane, and extending gradually to types which may be called weaklings rather than defectives, and perhaps ultimately to worthless race types. (p. 46)

This was coupled to a program to stem the immigration of "inferior strains"—those very "huddled masses, yearning to breathe free" about whom Emma Lazarus's poem "The New Colossus," at the base of the Statue of Liberty, spoke. Science was again invoked, ostensibly demonstrating (with IQ tests) the innate intellectual inferiority of the new immigrants.

Grant's work was endorsed by both the leading human geneticist in America, Charles Davenport, and the leading evolutionary biologist, Henry Fairfield Osborn. Grant himself was head of the New York Zoological Society. When the American Eugenics Society was formally incorporated in January of 1926 (having been preceded by less formal associations), Grant was one of its founders and officers. Serving beneath him, on its advisory board, were nearly all of America's most prominent geneticists and biologists.

Also on its advisory board was Congressman Albert Johnson (R-WA), who sponsored the bill enacted in 1924 to restrict immigration, targeted specifically at eastern and southern Europeans (which was a euphemism for Italians and Jews). Eugenicist Harry Laughlin testified to a gradient of criminality stretching from northwestern Europe to southeastern Europe, as evidence for the genetic undesirability of these immigrants. The Johns Hopkins University geneticist Herbert Spencer Jennings examined the evidence and concluded that the data showed only that newer immigrants were poorer than previous waves of immigrants had been. Jennings quietly dissociated himself from the eugenics movement.

Eugenicists were particularly successful in appropriating the scientific voices of Charles Darwin and Gregor Mendel in their work. To oppose eugenics was to risk being labeled antiscience or even creationist. Consequently, the initial opponents of the movement came from areas other than biology: journalists like Walter Lippmann and H. L. Mencken (who queried the judgments of scientists about the innateness of intelligence); civil libertarians, like the lawyer Clarence Darrow (who objected to political intrusion into private life); anthropologists, like Franz Boas (who found the assumptions about the past and future of civilization to be specious); and Catholics, like the English novelist G. K. Chesterton (who objected to human interference in reproductive matters).

Nevertheless, the eugenicists had managed to convince the educated world that they spoke for science and could solve the problems of the modern world cheaply and scientifically. The U.S. Supreme Court upheld the state of Virginia's right to sterilize a poor white woman involuntarily in the notorious case of *Buck v. Bell* (1927). Tens of thousands of Americans were subsequently sterilized under new state laws.

The first American biologist to criticize the eugenics movement publicly was the Johns Hopkins University geneticist Raymond Pearl. After the stock market crash and the onset of the Great Depression, other geneticists, such as Hermann Muller, also wrote strong critiques. Muller's paper, called "The Dominance of Economics Over Eugenics," tried to come to grips with what everyone except the biologists had already grasped—that wealth and power and social prominence are historically very ephemeral and have little to do with inherited endowments, but have rather a lot to do with circumstance, opportunity, hard work, and luck.

In Germany in the 1930s, eugenicists found a national ideology with which they could work well. By 1933, German universities were introducing courses in "race-hygiene," explicitly based on Grant's work. American eugenicists were generally envious of their German counterparts, and Laughlin considered it an honor to be awarded an honorary degree in 1936 by the Nazis, who were basing their sterilization laws on the ones he had drafted in America. By this time, however, American sentiment was turning against eugenics, both as a result of its obvious fallacies laid bare by the Depression and also as a result of its large-scale implementation by the Nazis.

In the aftermath of World War II, the field of human genetics had to be largely reinvented. Shifting the focus from the race to the family, from coercive to voluntary measures, and from

imaginary social diseases to real medical conditions, human genetics in America managed to discard the basic trappings of the eugenics movement.

Unfortunately, some geneticists resurrected the word *eugenics* to refer to the newer areas of genetic counseling and prenatal screening, leading to needless confusion. The word is best left to the era and the ideologies that spawned it.

EVANGELICALISM

Evangelicalism, a transdenominational movement of Christians devoted to the biblical doctrine of salvation by faith alone, has exerted considerable influence on a global level and in America. Since its inception in the eighteenth century, evangelicalism has played a formative role in the character of American life and thought and has exerted considerable influence in the political realm. This entry reviews its history as well as its status in the United States today.

Evangelicalism emerged from what is commonly called the Christendom model common to European countries in the Renaissance era. In this model, religious identity mingled with nationalistic sentiment as the state shaped the spirituality of its residents. When a young monk named Martin Luther (1483–1546) began to advocate the doctrine of justification by faith, Christendom took its first major blow. Luther's change of mind helped create the "protesting" church and aided in the development of the doctrines of justification and *sola scriptura* (Scripture's absolute authority). Other efforts of similar emphasis occurred in various European settings in this era, including England (led by John Owen), Switzerland (led by Ulrich Zwingli, 1484–1531), France (Jean Calvin, 1509–1564), and Scotland (John Knox, 1510–1572).

In the new world, the New England colonies soon fell into spiritual malaise despite sharing a strong Christendom base. Spiritual renewal came in the mid-eighteenth century in the form of two passionate evangelists from Britain, George Whitefield (1714–1770) and John Wesley (1703–1791); with the titanic Massachusetts pastor-theologian, Jonathan Edwards (1703–1758), they preached the "new birth" to great effect.

This revolution of religion continued in the nineteenth century as figures like Charles Finney (1792–1875), Jonathan Edwards, Jr. (1745–1801), and Francis Asbury (1745–1816) preached all over the young country in what is known as the Second Great Awakening. These efforts combined with religious disestablishment to create what some have called a market-based spiritual economy that drew thousands of people to evangelical groups like the Methodists and Baptists. The nineteenth century also witnessed the birth and rapid expansion of the modern missions movement, jumpstarted in different places and times by four students from Williams College, a brilliant linguist named William Carey (1761–1834) and a single woman named Lottie Moon (1840–1912.

A diverse group of leaders, including the evangelist D. L. Moody (1837–1899) and the Princeton theologian B. B. Warfield (1851–1921), publicly defended their brand of historic Christianity against late nineteenth-century Protestant liberalism and

its social gospel. They published a series of volumes called *The Fundamentals* (1910–1915) to stake their position. In this same period, Pentecostalism began in a small Los Angeles church. It soon dwarfed many traditional denominations and profoundly influenced the evangelical movement.

The conflict reached a head in the Scopes trial of 1925, where a fundamentalist politician named William Jennings Bryan (1860–1925) and a modernist lawyer named Clarence Darrow (1857–1938) fought in a Tennessee courtroom over the right of a public school teacher, John T. Scopes, to teach evolution. Bryan won the trial but lost the public relations war. Coupled with the defeat of Prohibition a few years later, the fundamentalists fell on hard times. Some withdrew from the culture, while others remained engaged in evangelism, missions work, and care for the poor.

Another phase of the evangelical movement was brewing, one led by a dynamic young pastor named Harold Ockenga (1905–1985). Preaching from Park Street Church on Boston Common, Ockenga began to outline his vision for a "new evangelicalism," one that would not retreat from society but would transform it through a reinvigorated evangelical effort that spanned denominational lines. Ockenga partnered with radio personality Charles Fuller (1887–1968), with whom he founded the influential Fuller Seminary (1947) in California; evangelist Billy Graham (1918–), with whom he formed *Christianity Today* (1956), an evangelical periodical that was an alternative to the mainline *Christian Century* (1884); and theologian Carl F. H. Henry (1913–2003), the first editor of the periodical, who published the hugely influential text, *The Uneasy Conscience of Modern Fundamentalism* (1947). Ockenga also served as the first president of the National Association of Evangelicals (1942), a clearinghouse formed in response to the World Council of Churches (1937). In Great Britain, John Stott (1921–), J. I. Packer (1926–), and D. Martyn Lloyd-Jones (1899–1981) led various corners of the evangelical movement while traditional denominations wilted all over Europe.

Led by the neo-evangelicals, Christians reentered all sectors of American society, reentering the political realm forcefully in the 1970s. Billy Graham became widely known as the "pastor to the nation" and personally counseled numerous presidents. Jimmy Carter (1924–), a professed "born again" Christian, became president in 1976, the same year *Newsweek* labeled "the year of the evangelical." The moral majority, driven by men like Jerry Falwell (1933–2007), Pat Robertson (1930–), Oral Roberts (1918–2009), and others, helped to usher in a conservative president, Ronald Reagan (1911–2004), and many Republican political leaders on the local, state, and national levels. In 2000, George W. Bush (1946–) famously cited Jesus as his "favorite philosopher." Evangelicals now formed a significant voting bloc and were regularly courted by politicians of varying ideologies.

In the current day, evangelicalism pulses with life even as it seeks stability. Prominent evangelicals like Mike Huckabee (1955–) and John Thune (1961–) run for office, academic specialists like Alvin Plantinga (1932–) and Mark Noll (1946–) teach in elite universities, musicians like Jon Foreman (1976–) and artists like Makoto Fujimara (1960–) create renowned art, and pastors like Rick Warren (1954–) and Mark Driscoll (1970–) oversee "mega-churches." Simultaneously, financial and marital scandals and compromise on matters like inerrancy, the nature of the gospel, and gender roles have weakened many institutions and churches. Critics have noted the perpetuation of racial segregation in evangelical circles. Lamin Sanneh and Philip Jenkins (1952–), among others, have argued that explosive evangelical growth in Africa, Asia, and other areas has shifted the center of evangelical influence from the decadent West to the non-Western world. China in particular booms with evangelical activity, much of it under the radar.

The evangelical movement, begun in the strictures of Christendom but now remarkably destabilized, faces an uncertain future. Although its prospects vary, it is clear from its history that evangelicalism often proves most successful when it is most challenged.

Event

The event is arguably the core concept in contemporary European philosophy. Although there is no shortage of references to the event in the Anglo-American tradition, from Alfred North Whitehead to Donald Davidson, the concept serves above all to define the principal stake of so-called continental thought, from Martin Heidegger to Jacques Derrida to Catherine Malabou and from Michel Foucault to Gilles Deleuze to Alain Badiou. Genealogically, the event emerges with particular force toward the late sixties, marking a possible crossover point between structuralist and subject-centered approaches. Among the features that are relatively invariant in the use of its concept, we can mention the event's contingent, unpredictable, singular, and radically transformative nature. Beyond these basic invariant traits, however, each individual thinker also gives the event a specific inflection. Major polemics thus concern the unicity or plurality of events, their ontological or nonontological inscription, their immanence or transcendence to the world as is, and their susceptibility to a hermeneutical or a dialectical understanding. Finally, the primacy attributed to the event in contemporary philosophy is not immune to criticisms and attacks from a political point of view, insofar as eventfulness, contingency, and difference in the context of late capitalism can be seen as descriptive of the current functioning of the global market, instead of promising its revolutionary transformation.

Genealogically speaking, we might say that the event becomes the central topic of theoretical and philosophical reflection precisely in the wake of the worldwide events of 1968. To think this revolutionary sequence, then, entails investigating what happened and asking the underlying question of how to think the happening of that which happens. In French, this is often called the *événementialité* of the event, awkwardly translated as the "eventality" of the event, with the task of thinking, whether in history, in political theory, or in philosophy, being described as *événementialisation,* "eventalization." Of course, we can also enumerate many conceptual precursors for this notion, such as Aristotle's *tuchè* or chance as opposed to automatism or *automaton;* the role of *clinamen,* deviation or swerve, for ancient atomists after Lucretius; Niccolò Machiavelli's *fortuna,* fortune or chance in relation to *virtù* as capacity or power for intervention; Stéphane Mallarmé's *coup de dés* or dice throw as the attempt to abolish chance; Friedrich Nietzsche's destiny of breaking in two the history of humanity; or Martin Heidegger's *Ereignis* as enowning. These concepts have been variously retrieved among contemporary thinkers of the event, but they appear as precursors only in retrospect and as a result of such retrievals, which do not begin to give shape to a common doctrine until the late sixties in what is then frequently called postmetaphysical or antifoundational thinking.

More specifically, the concept of the event bridges two traditions that otherwise are at loggerheads: a humanist, subject-centered approach and an antihumanist focus on the action of the structure. An event is neither the expression of free human action nor the causal effect of structural determinisms. Instead, an event occurs precisely when and where a certain dysfunction or systematic deadlock becomes visible through the intervention of a subject who, by gaining a foothold in this gap in the structure, at the same time profoundly reshuffles the coordinates that otherwise continue to be determining in the last instance. The event, in other words, transversally cuts across the traditional oppositions of freedom and necessity, action and system, spontaneity and organization, movement and the state.

Among the event's defining features we should list its contingency, its unpredictability, its singularity, and its transformative capacity. Beyond this basic consensus, however, we find a wide range of divergent and often polemical orientations. In the Heideggerian tradition, for example, there is good reason to speak of the event only in the singular,

as the event of being itself—being which "is" not but "happens" or "occurs." This then raises the difficult question, which thinkers as diverse as Derrida and Deleuze grapple with in much of their work, of defining the relation between the unique event of being qua being and the occurrence of plural events in the everyday sense of the term. For Badiou, on the contrary, the event is that which is *not* being qua being. In this orientation, therefore, ontology, as the science of being, can literally say nothing of the event, which rather calls for an intervening doctrine of the subject as operative in various fields or conditions, such as art, politics, or science.

A related polemic concerns the immanent or transcendent nature of the event with regard to the situation at hand. Here a Deleuzian orientation, which involves a reevaluation of virtuality outside the traditional binary of the real and the possible, will insist on the presence of the unique event of being as if folded into particular accidents. To this image of the event as fold, by contrast, we can oppose the notion of a radical break, which Badiou, for example, finds at work in Nietzsche and Mallarmé. Neither immanent nor transcendent, in fact, the event crosses out this very opposition for Badiou.

The method for thinking the event also changes depending on which of these basic orientations we adopt. Thus, if in everything that happens the virtuality of the one and only event of being is always already present, then our approach will ultimately take the form of a hermeneutic interpretation in which each item or entity (this or that occurrence) can also simultaneously be read as the expression of the immanence of being (the happening of all that occurs). Conversely, if an event is inscribed in a specific situation by way of this situation's deadlock and yet depends on a break with (existing representations of) being, then our approach will most likely take the guise of a dialectical articulation (not in the orthodox terms of negation and the negation of negation but as a logic of scission and of the exception).

The proliferation of theories of the random, multiple, contingent, and radically transformative event, however, can also be seen as the product of late capitalism, rather than as a counteracting force. Karl Marx was, after all, quite enthusiastic about the power of capitalism to break down old feudal, patriarchal, or idyllic bonds and hierarchies. But, if it is indeed capitalism itself that reveals all presence to be a mere semblance covering over random multiplicity, then the event as the core concern of postmetaphysical thought might turn out to be little more than descriptive of, if not complicitous with, the status quo. Difference, multiplicity, or the primacy of events and becomings over subjects and objects, far from giving us critical leverage, thus would define our given state of affairs under late capitalism and its attendant cultural logic.

Evolution

Philosophers since Greek antiquity have distinguished between *nature* and *nurture,* and political theorists have typically based their ideas on the parallel distinction between *human nature* and *custom*. Today, however, this dichotomy—which spawned a rigid division between natural sciences and social sciences—has been bridged by developments in the life sciences. Since Charles Darwin, traditional accounts of human origins have been challenged by evidence of human evolution from earlier primate species. These findings, reinforced by behavioral studies of nonhuman primates, reveal similarities as well as differences between our species and nonhuman primates like chimpanzees or gorillas. More important, recent developments in genetics, neuroscience, and toxicology directly contradict the attribution of all human traits to cultural practices and individual learning.

For example, John Locke's theories rest on the concept that humans are born with a *tabula rasa* (i.e., the brain is a "blank slate" on which experience and learning shape behavior). Similarly, Locke, Thomas Hobbes, and Jean-Jacques Rousseau had theories of the "state of nature," which purported to describe human life before the formation of political societies based on a "social contract." These views are contradicted by a variety of findings. As Frans de Waal revealed in *Chimpanzee Politics* and ethologists confirmed in observations of other monkey and ape species, nonhuman primates are often social animals with patterns of leadership and alliance formation within the group. Anthropologists have found complex social and political activity even in stateless societies among tribal peoples often described as primitive, who often live in tribes organized around clans and other kinship groups. Paleontologists' discoveries of fossils from earlier stages of hominid evolution show signs of tool making, and human art as well as artifacts have been observed in prehistoric caves like Lascaux.

Developments in genetics are rapidly uncovering genes associated with specific behavioral profiles (such as attention-deficit hyperactivity disorder ([ADHD]), autism, alcoholism, and many other health outcomes). Already, for $1,000, Americans can buy a list decoding the nucleotide bases for all sites in their genome now identified as having effects on human health or behavior. Specialists predict that within a decade, it will have become routine (at least in developed societies) to record the entire sequence of each individual's genome in infancy. Increasingly, innate propensities of behavior are not merely inferred but can be traced to genetic predispositions.

Cognitive neuroscience has also transformed our understanding of the brain and behavior. Using functional magnetic resonance imaging (fMRI) and other techniques, the brain structures and neurotransmitters (and sometimes genes) linked to specific behavior can be identified. Such research is far from the genetic determinism once feared so widely. Frequently, genes and environmental influences interact in complex ways that could sometimes increase (rather than decrease) individual responsibility. For instance, a recent research study found that if individuals with a particular gene (D2, D3 dopamine receptor mutation) use cocaine as teenagers, they have a significant likelihood to develop schizophrenia by age 35 or 50. Similar interactions between environmental factors and a specific gene creating vulnerability can probably help explain autism, ADHD, substance abuse, and some forms of Alzheimer's disease.

In short, the understanding of human nature of modern thinkers like Hobbes, Locke, and Rousseau is inconsistent with a wide range of recent observations and theories. To be sure, Hobbes's concept of the state of nature as a "war of all against all" may seem to describe the breakdown of a civilized society (not the original condition of all humans), but Hobbes's view of human motivations is not always observed, even in circumstances when settled societies degenerate into chaos and violence. One reason is that experimental studies using fMRI sometimes show cooperative or altruistic responses unlike those attributed to human nature by these thinkers. Another factor is that kinship plays a far greater role in human social behavior than these early modern thinkers imagined.

The findings just sketched are being rapidly extended, modified, and transformed by researchers in many fields. By the time this text is put in print, it will already be obsolete in some details. Because new scientific studies increasingly challenge traditional barriers between natural and social sciences, although it is impossible to say

exactly how the results will be integrated, some traditional explanations of human political and social behavior now appear increasingly questionable. For instance, sociologists who speak of the "social construction of reality," based on Skinnerian conditioning of an organism without innate propensities, will have difficulty maintaining their views. Instead, there is growing interest in new fields like biopolitics, which explore how research in the life sciences relates to the study of politics. Given practical applications of findings in neuroscience, genetics, ethology, and toxicology, the need for more coherent criteria of regulating biological techniques that change human behavior will be greatly increased. And in our universities, students destined for responsible positions in the private as well as public sectors will need to have an opportunity to take courses in human biology as well as biopolitics.

The American controversy in 2007 and 2008 over embryonic stem cell research provides a useful illustration of the need for more extensive knowledge of the details linking evolutionary biology, human life, and public policy. President George W. Bush limited the development of new lines of stem cells, claiming that it was unethical to take lives (by taking stem cells for research from embryos) to save lives. However, in this research, what were called embryonic stem cells are taken from *blastocysts* (not embryos). When a female's eggs (ova) are fertilized with male sperm, the resulting cell complex is technically called a blastocyst until it attaches to the wall of the womb. Only then, when the fertilized egg is capable of receiving nutrients and developing into a fetus, is it called an embryo in the precise sense. Although the word *embryo* is often used to describe a blastocyst, technically, they are different insofar as a blastocyst that is not yet successfully implanted in the womb is—like sperm from masturbation—only potentially a source of pregnancy.

The blastocysts from which stem cells have been harvested are usually associated with in vitro fertilization (IVF), which is now widely used to assist infertile couples. Because blastocysts do not always successfully bond to the womb to become an embryo capable of development into a viable birth, IVF couples usually provide eggs and sperm for up to a dozen blastocysts. In this treatment, these fertilized eggs are often used three at a time to attempt to produce a pregnancy. Typically, successful implantation and formation of an embryo occur before all blastocyts are used, so that to date the excess fertilized blastocysts have been discarded. These discarded cells were being used to produce what were called embryonic stem cells (even though in precise terminology, embryonic stem cells form only after a pregnancy has begun in a fertilized egg attached to the womb).

As a result, some specialists considered that President Bush's position could be called anti-life. The unused fertilized blastocysts from IVF can retain potential viability only for a short time in a freezer (and are not normally used for genetically different couples). Hence, current IVF techniques typically have the effect of destroying blastocysts. Critics of Bush's policy argue that if this is immoral, to be consistent, the president should have sought to ban current IVF procedures, thus depriving infertile couples of this approach to pregnancy.

This example shows the great complexity of the contemporary biological processes that are now being linked to actual political decisions. Because some biologists may well contest the formulation above, moreover, the appropriate assessment of controversial issues must be the product of dialogue between researchers of different perspectives and values. Indeed, virtually all statements above will be qualified as new research generates discoveries and potential conflicts over issues that have not yet manifested themselves. Hence, the intersection of evolutionary biology and political theory will remain a dynamic area in which interdisciplinary teaching and research should become far more broadly developed than at present.

Exception

The concept of the exception is often used to elaborate a critique of liberalism, especially of the liberal rule of law. It is probably most readily associated with the work of Carl Schmitt, who was probably the most influential German jurist of the interwar period and whose work is now enjoying some resurgence in popularity. His idea of the exception is developed in reference to political thinkers such as Thomas Hobbes, Jean Bodin, and Juan Donoso Cortés, showing that the concept has a long history in political philosophy. The idea of the exception has also gained attention in debates on the use of emergency powers in the War on Terror and is central the recent work of the Italian theorist Giorgio Agamben.

Schmitt argues for the importance of the exception in the text, *Political Theology,* first published in 1922 and revised in 1934. Beginning with the famous sentence, "Sovereign is he who decides on the exception," *Political Theology* outlines a strong critique of the liberal rule of law through emphasizing the role of the sovereign in establishing when the normal rule applies. For Schmitt, the sovereign is a borderline concept, meaning that through its power of decision, it determines whether a situation is normal or exceptional. This categorization, in turn, determines whether the rule applies because rules can do so only in a normal or ordered situation. If the situation is deemed to be exceptional, however, then the rule of law is suspended. Furthermore, if a situation is exceptional, then the sovereign must also determine what to do in response to it because the constitutional powers that would otherwise take effect may no longer be applicable. In this view, the exception is fundamentally linked to the survival of the state through the decisional capacities of the sovereign authority. In addition, the existence of the exception works to ground emergency powers in contrast to normal rule.

Emergency powers can be exercised by a state when faced with a national crisis, emergency, or declaration of war. In some jurisdictions, such emergencies may include natural disasters. Emergency powers may involve the suspension of certain aspects of constitutional law, although this is not always the case (e.g., in the United States, emergency powers suspend *habeas corpus* but do not suspend the Constitution). In developing his idea of the exception, Schmitt was particularly concerned with Article 48 in the Weimar Constitution and the suspension of basic rights that it allowed. Although emergency powers provisions are usually enacted temporarily to enable the sovereign to respond to a specific emergency or crisis that threatens the state, there have been circumstances in which such powers are enacted indefinitely, notably in Nazi Germany, where the Third Reich suspended the Weimar Constitution indefinitely. Because of various problems, particularly the perceived threat of terrorism, the United States is effectively in an indefinite if not permanent state of emergency. Other countries such as Israel (1948), Egypt (1967), and Syria (1963) have also been in extended periods of states of emergency.

Schmitt's constitutional approach to the role of the exception in politics and legal rule was criticized at the time by the radical German thinker Walter Benjamin. Benjamin saw the exception as having a more intransigent and fundamental role in politics. He writes that the state of emergency enacted by the Third Reich is not the exception but the rule. Furthermore, it is necessary to bring about a real state of exception to combat the inauthentic exception that Fascism represented. For Benjamin, the exception is not simply an occasional event that requires the suspension of normal rule but rather a central feature of law itself. This formulation from Benjamin, which is presented in his essay, "On the Concept of History" (1940), has been important for recent thinkers of the exception, especially Giorgio Agamben.

Drawing on both Schmitt and Benjamin, Agamben argues that the very possibility of juridical rule and the meaning of state authority are at stake in the state of exception. In *Homo Sacer,* he argues that the suspension of the law that is characteristic of the sovereign response to the exception reveals a more profound condition of possibility of law itself. Thus, in the modern world, law operates in a (permanent) state of suspension. He calls this condition the sovereign ban. This idea

of the ban is central to his account of biopolitics and the notion of "bare life," by which he means life that is singularly exposed to death. Guantanamo Bay is one example of this condition of legal suspension and bare life.

Agamben, thus, places the exception at the heart of contemporary juridico-politics: Our condition is effectively one of exceptional politics. He extends on this portrayal of contemporary politics as inherently exceptional in his book, *State of Exception*. He argues that whereas Schmitt attempts to harness the power of the exception back to law, Benjamin's call for a real state of exception radicalizes this power. In doing so, it may allow for a possible response or resolution to the biopolitical violence of modern liberal democracy. While Agamben's understanding of the role of the exception in modern politics has been heavily criticized for some of its more extreme elements, his central thesis that the exception (and the sovereign decision it demands) is fundamental to the operation of law and state authority is important.

In general terms, this thesis highlights the way that the liberal rule of law is disrupted by circumstances for which laws cannot be codified in advance. This reveals the limits of the liberal rule of law, but it also presents a more fundamental challenge. Liberal approaches to political or legal theory that attempt to ground positive law in a deeper normative order do not often deal with the implications of the necessary suspension of the law in conditions of emergency. To do so requires taking on the paradox that central aspects of liberal democratic governance must be suspended to protect itself from a threat. That is, liberal democracy survives through its own suspension.

EXISTENTIALISM

It is helpful to distinguish between existentialism, as a philosophy of existence that flourished intermittently across Europe during the nineteenth and twentieth centuries, and the existentialist movement, which rose to intellectual prominence in France after World War II. Although the former poses many provocative ethical questions, it remained rather diffuse and apolitical until it was seized on by a group of French intellectuals who identified themselves as members of a distinctive movement led by Jean-Paul Sartre. The latter's influence on radical political thought has been extensive, and despite the movement's demise by the 1960s, an existentialist style of philosophizing about everyday life and existentialist concerns about individual freedom continue to reverberate in contemporary political theory.

There is no consensus as to which thinkers qualify as existentialists, and the label was first proposed by Gabriel Marcel in the 1940s. In addition to those who would explicitly identify with the existentialist movement, the term is applied retrospectively to thinkers such as Sören Kierkegaard, Karl Jaspers, and Martin Heidegger, with additional names—such as Fyodor Dostoevsky, Friedrich Nietzsche, Albert Camus, and various religious thinkers such as Martin Buber—being associated with important existentialist themes and approaches. Existentialist elements can be discerned, too, in work written in the wake of the existentialist movement, such as that of Frantz Fanon, Erich Fromm, Abraham Maslow, Judith Butler, and the later Michel Foucault. A more useful approach than naming authors is to identify major themes that allow certain ideas or approaches to be designated existentialist.

Key Themes in the Philosophy of Existence

First, philosophies of existence are philosophically radical inasmuch as they renounce the formalism and systematization practiced by traditional philosophy, now viewed as too remote from life and too rational in its approach to Being. Georg Wilhelm Friedrich Hegel is a particular target of such critiques. With its roots in a skeptical tradition, existentialist philosophy may be characterized as a style of thinking that throws familiar, personal experience into question, often addressing its audience in the first-person rather than positing or classifying truths in an abstract, theoretical way. Existentialists strive for a rigorous analysis of religious, extraordinary, but most often prosaic experiences to explore what they reveal about the human condition.

Second, a corollary of existentialists' ethical interest in what it would mean to live authentically is a critique of the inauthentic life. This is typically associated with mindless conformity to social or moral convention and with an existence that is consequently perceived to be shallow and banal. This pathology chimes with Weberian and Marxist critiques of modernity, complementing critical modernists' concerns about rationalization and alienation. Nietzsche's contempt for the tame herd animals to which life-denying customs condemn us, Heidegger's conception of "everyman," and Sartre's notion of bad faith are all examples of the inauthentic life.

Third, existentialism is associated with autonomy, individualism, and liberty. To some extent, it therefore resonates with liberalism. However, existentialism is interested in the ontological aspects of such norms (such as the nature and limits of free will) and the existential possibility of living them, rather than in political (negative) liberty or normative universals. To exist authentically, existentialists believe, individuals must wean themselves from the security of merely following public opinion, common sense, or scientific or religious dogma. This means recognizing their singularity, perhaps by confronting the uniqueness of their own death, as Heidegger suggests. Authenticity and freedom are associated with taking responsibility for one's own existence and decisions, where determinism or moral imperatives are judged to be alibis excusing bad faith rather than a legitimate explanation of the human condition. Rather than focusing on duty to a rule, the ethical life means existing without hypocrisy but with passionate fidelity to commitments sustained despite the lack of any final reasons or authority to justify them.

This is related to a fourth existentialist theme, which is a concern with subjective experience. Existentialism pays attention to emotions and moods in a way that is philosophically distinctive. Its interest lies not in psychology but in the more general ethos or style of being that a particular mood imparts or in the way an emotional event might shock an individual from his or her complacency. Thus, Kierkegaard distinguishes between the ascetic, tepid way most believers subscribe to religious doctrines and the ungrounded passion of one who chooses in fear and trembling. The particular range of moods on which existentialist thinkers focus—fear, anxiety, nausea, shame, dread, boredom, guilt, *ressentiment*—attracts accusations of nihilism, but it also lends their work affective impact, allowing it to speak to us in a way that is sometimes captured better by literature than by theory and permitting existentialist writing a broader range of styles than philosophy usually accommodates. Nor is this summoning of affect merely gratuitous; it may be used to jolt us from our customary slumbers, forcing us to confront the contingent nature of human existence. Only having done so might an individual acquire the capacity to live according to a different affective economy, expressing perhaps the joyful vitality Nietzsche associates with an affirmation of life. Existentialism is not, however, hedonistic: responding authentically to the human condition is a serious and ongoing process of becoming. Singularity or uniqueness, not narcissism or egoism, is the goal for a hazardous subjectivity that is always in process.

A fifth theme indicates why subjectivity is so troubled: Glimpses of the entirely ungrounded nature of its existence catch it unawares, resulting in vertiginous experiences of contingency or gratuitousness that existentialist philosophy strives to intensify. The inauthentic life is a flight from this unwelcome insight, which forces a realization that there is no higher, transcendent authority to appeal to and no ultimate justification for human suffering. This is eloquently sketched by Nietzsche in *The Birth of Tragedy* (1872). Humans suffer because they recognize their mortality, but they are most disturbed by the purposelessness of their suffering in

a cosmos where they are merely chance accretions of nature's exuberance. Nietzsche accordingly quotes the mythical wisdom of Silenus: It is better never to be born, not to be, but the second best option is to die soon. Nietzsche rails against the metaphysical comforts that humans create to avoid this wisdom: art, science, ideology, religion, everyday routines—these are so many strategies of denial. Yet, they come at a high price because they cut us off from life, instilling a nihilistic, mean-spirited mode of existence. Only by looking into the void, embracing the world's lack of any ultimate truth or reason, and creating one's own values might one live incandescently as a free spirit or sovereign individual.

A final existentialist theme is more philosophical inasmuch as it entails an ontological inquiry into the nature of existence. It is exemplified by Heidegger's *Being and Time* (1927). The preeminent question here concerns what it means to be, to exist. A crucial distinction is made between the kind of inert objective things described by classical science and philosophy and existence as self-expressive, immanently generative Being. Heidegger's concern is that Being has been forgotten, covered over, since the Greeks, and he charges modernity in particular with reducing it to objects: natural stuff that lies ready-to-hand awaiting human mastery. Because it is not possible to access Being directly (fundamental ontology), Heidegger must first embark on an exploration of human existence, or *Da-sein* (literally, being-there). *Da-sein* exists as an opening for Being, an expressive space or clearing wherein Being discloses itself. In imposing anthropocentric meaning on Being and approaching it instrumentally, *Da-sein* strays from its destiny of caring for Being. It turns away by immersing itself in everyday routines and seeking to control beings rather than to question Being. Rather than the Cartesian, cognitive subject, *Da-sein*'s mode of existing is temporal, expressive, reflective. This is what distinguishes it from the raw, brute beings it manipulates and erroneously mistakes for Being as such. Existence is thus a normative as well as an ontological term for Heidegger: the authentic attitude toward Being is letting-be or opening-to.

The Absurd

While the premise of an ungrounded, indeterminate world is a defining aspect of existentialist philosophy, the idea of absurdity is fleshed out graphically in essays Camus wrote around 1940 and in Sartre's first novel, *Nausea* (1938). They describe a world that is not merely devoid of higher purpose but one where the meanings routinely imposed on everyday life disintegrate, robbing the world of its familiarity and yielding an experience of the uncanny. Camus describes awakening to the absurd as a process of undermining and collapse. The connections that make sense of things are broken; The material world seems suddenly alien, nature fundamentally strange; others' gestures are no longer means of communication but a grotesque pantomime. To confront the absurd is to experience an autistic sense of alienation that reveals the unbridgeable gap between our certainty of existing, with its irrational longing for clarity, and a world indifferent to human desire or design. But is life still worth living? Camus pronounces this the fundamental question for philosophy. Suicide, he suggests, is a sign that one has recognized the lack of any profound reason to persist. Yet, he denies that absurdity logically entails suicide: Metaphysical revolt against human futility is preferable, an ever-renewed provocation lived without appeal, without hope, but equally without resignation, as a passionate will to exist. In "The Myth of Sisyphus," Camus retells the Homeric myth of Sisyphus as an account of the absurd hero. Condemned by the gods incessantly to repeat the futile labor of pushing a rock up a mountain, a rock that just as incessantly rolls back down, Sisyphus's tragedy is that he is conscious of the utter purposelessness of his task. His heroism is to live his punishment with scornful lucidity. He overcomes his grief to achieve an absurd victory by performing his task joyfully.

Sartre's account of the nausea provoked by an encounter with absurdity in a municipal park is one of the great moments of existentialist literature. It is not merely the collapse of meaning that disturbs his fictional character, Roquentin, but the realization that this massive, bloated stuff that envelops him, and of which his own embodied self is part, *is* what it means to exist. Its materiality is simply what it is: excessive, superfluous, overflowing and undifferentiated, gelatinous, inexplicable. It is simply indifferent to human measure, yet its viscosity is also threatening, inspiring feelings of vulnerability and disgust. Roquentin does not

embark on joyful revolt. His instinct is to succumb to bad faith by immersing himself in boring habits, resigned to a life without meaning. But his tragedy is that although he seeks only to lose himself, he cannot forget himself: His consciousness refuses the self-annihilation for which he longs.

The Existentialist Movement

While they have found existentialist themes evocative, critics often doubt their ethical, let alone their political import. Despite using normative terms that imply an ethical obligation to others, such as responsibility and commitment, it has not been easy to elicit intersubjectivity from philosophies of existence whose individuals seem to suffer a sense of traumatized isolation when they are not willfully independent. Existentialism's subjects tend to be described in a rather solipsistic way, and when they do encounter others, their response is likely to be disappointment at being misunderstood by them or hostility to those who threaten their freedom. Sartre's statement that "hell is other people" seems emblematic of a lack of empathy with others.

Nevertheless, the ideas of the politically committed intellectual and of existentialism as a concrete philosophy of liberation dedicated to transforming the way we live encouraged a group of French radicals to proclaim themselves existentialists in Nazi-occupied France. Sartre, Maurice Merleau-Ponty, and Simone de Beauvoir composed the main core of the movement while others, like Camus, embraced some of its principal ideas but kept their distance. The movement's members seized the rather inchoate themes of philosophies of existence and gave them a recognizable form they associated with leftist politics. This linkage was by no means inevitable: Nietzsche's politics are more inclined to aristocratic elitism, while the Spanish existentialist Ortega y Gasset gives them a right-wing orientation. Sartre and Merleau-Ponty co-edited *Les Temps Modernes,* the main existentialist journal, until the mid-1950s, when political and philosophical differences resulted in a famous quarrel. Shortly thereafter, the rise of structuralist antihumanism resulted in the eclipse of existentialism as a movement. Its Sartrean form, in particular, was now rejected as a philosophy of subjectivist humanism: a view that supplemented charges by communist critics, who disparaged his individualism. Sartre himself now declared existentialism but an ideological moment of Marxism, while Merleau-Ponty pronounced the Movement dead and turned to exploration of an antihumanist ontology of existence more indebted to Heidegger than to Sartre.

As a movement, existentialism was associated with cultural innovation as well as philosophy. In her autobiography, de Beauvoir recalls with some bitterness that it was often their enemies who applied the existentialist label to their work, with the label soon extending to a certain style of painting, writing, and music whence it was exploited as a new vogue quickly seized upon by the media. By 1947, she laments, existentialism was popularly associated with the brawls, festivities, and sexual licentiousness attributed to a café crowd that adopted an Italian penchant for dressing entirely in black as the marker of their unconventional mode of existence. De Beauvoir concedes, nonetheless, that Sartre was enthusiastic about the youth, jazz, and dance of this countercultural movement. Indeed, after the austerity of the war and the stifling conformity of French traditions, such modes of existence seemed to express something of the existentialist ideas that were transforming intellectual life. Did the new bohemians not exemplify, after all, the life of freedom that Sartre and de Beauvoir seemed to be advocating in their work and which their own lifestyle suggested? In place of the fidelities of bourgeois existence, with its monotonous productive toil, domestic labor, sexual inequality, monogamous family life, and Catholic piety, here was a child-free couple that ate in cafés, lived by writing, engaged in exotic sexual freedoms, traveled extensively, and proclaimed their atheism. Their example inspired many who would became part of the events of Paris 1968, while their rejection of bourgeois life complemented their socialist politics, their rejection of French colonialism, and their affinity with the artistic avant-garde.

All this should not, however, detract from the seriousness with which existentialist philosophy was being developed and its political implications explored. Against the background of the German Occupation, claims that individual freedom is inextinguishable had found a receptive audience.

Existentialists also helped to illustrate the stark political choices—between collaboration and resistance—that ordinary individuals were called on to make. Existentialist humanism was sympathetically received, too, by those who were weary of the dominant liberal idealism but also distrustful of the austere, positivist form of Marxism associated with the French Communist Party.

Existential Phenomenology

Leading members of the existentialist movement all practiced a phenomenological mode of existentialism. Sartre's *Being and Nothingness* is subtitled *A Phenomenological Essay on Ontology;* Merleau-Ponty titled his first major existentialist work *Phenomenology of Perception;* de Beauvoir's work, too, is distinctly phenomenological in its approach. This encouraged a shift away from the language of absurdity to one of ambiguity and contingency. Coupled with phenomenological attention to the lifeworld as a synonym for concrete existence and reinforced by their interest in Marxism, this shift helped the existentialists to understand individual freedom in a context of social constraints and thus to undertake more politically engaged criticism.

The main phenomenological influences on existentialism were Heidegger and Edmund Husserl, whom Sartre had studied in Berlin during 1933 and 1934. Heidegger had already combined the two approaches in maintaining that existents are thrown into a world that has practical familiarity for them on a precognitive level as beings-in-the-world. Husserl had defined the lifeworld (*Lebenswelt*) as the preobjective, prereflective realm of existence that underlies and precedes philosophical or scientific objectification and which the latter simply takes for granted. His ambition was to describe this primordial realm of lived experience as it appears to consciousness. The philosophical challenge is not to objectify or survey the lifeworld but to plunge into it, analyzing its patterns and meanings as they appear, from within.

Jean-Paul Sartre (1905–1980)

Sartre's major work of existentialist philosophy is *Being and Nothingness* (1943). The book is structured by an opposition between being-in-itself (*en-soi*) and being-for-itself (*pour-soi*). The monstrous existence described in *Nausea* now becomes being-in-itself: an irreducible plenitude that is simply what it is. There is not, Sartre insists, the slightest emptiness in its being; not the tiniest crack through which nothingness might enter. It remains inert and self-identical, undifferentiated and indifferent, opaque and solid. Sartre's main interest lies, however, with being-for-itself, and its equation with consciousness and human existence gives his existentialism its distinctively humanist form. Consciousness is an awareness whose self-presence always slips away from it: Its mode of being is not to be what it is and to be what it is not. It lacks both the self-identity of objects and the self-centeredness of the Cartesian "I think, therefore, I am." It is free because nothing determines it. Nothing ties the self to an identity or mode of being. Because it can question, doubt, and negate, it can transcend any particular condition. An individual will, nonetheless, develop a particular style of existing that is manifest in his or her acts and choices. Through existentialist psychoanalysis, people can discover the basic mode of being-in-the-world that orientates their decisions and lends expressive integrity to their character. A life of freedom is one committed to a ferment of self-transcendence whereby the self is constantly recreated through future-oriented projects. *Being and Nothingness* nevertheless reaches the dismal conclusion that human beings are a useless passion, absurd and tragic. Unable simply to be like an object or to renounce their consciousness, the freedom to which consciousness condemns them often reads more like a recipe for intense anxiety than a source of liberation.

The human species is similarly defined by Sartre as being that creates itself historically. His humanism is a corollary of existentialism's atheism. As he would argue in *Existentialism is a Humanism* (1945), if there is no God, then there can be no god's-eye view from which the truth or destiny of humanity is proclaimed. This is the sense of Sartre's rather opaque claim that for the existentialist, existence precedes essence. The human species has no essential characteristics that define it or that underlie its appearances. Through its historical existence, it makes itself what it is. It cannot be, only become.

An attraction of Sartre's work is the way he illustrates these abstract ideas with arresting examples drawn from ordinary life, which in turn illustrate how even the most banal experience can become a site for philosophical reflection. The café waiter, for example, can only play at being a waiter inasmuch as he cannot *be* that identity, which would mean existing in the mode of the in-itself. Insofar as he acts under the illusion that his being *is* that of a waiter, he denies his freedom and is in bad faith. He can, however, interpret his situation in such a way that he chooses to play this role without becoming it, thereby retaining his freedom and his employment. This example has a further aspect that is important in light of critics' common complaint that Sartrean freedom is too voluntaristic and his subjects too disencumbered by their material context. The facticity of the waiter's situation precludes his simply choosing to be a diplomat or to not-be a worker. His freedom resides in giving a meaning to his situation and choosing a response within its constraints. Unlike a determined condition, *the situation* is a relatively open context in which one could always do otherwise. It is a signature concept of existentialist writing.

As subject, I am the one for whom there is a world; yet when I observe the other, I realize both that my world is hemorrhaging away to another center and that the other is looking at me. I spy through a keyhole, immersed unreflectively in the practical task, when suddenly I hear footsteps and realize I am observed. I see myself as the other sees me. I experience shame at falling under the other's gaze, reified as a jealous voyeur. While my situation offers me a range of possibilities, the other's look objectifies me. I am thereby enslaved, a condition that for Sartre is the permanent structure of my being-for-others, who even when they regard me with love, seduce or capture my freedom. If ontologically I am with others, their presence also marks an unassailable experience of alienation, inasmuch as myself-for-others never coincides with my being-for-myself (an experience later captured by Jacques Lacan's mirror stage). Sartre's existentialist analysis of "the look" would influence feminist studies that equate it with the male gaze, as well as postcolonial studies such as Edward Said's *Orientalism*. A good deal depends, in the concept's politicization, on whether the look is reciprocated in an unresolved struggle for recognition or its structures are instantiated in broader relations of power, whereby some categories of person are permanently reified as other.

The analysis of being-for-others did not seem propitious for a socialist politics predicated on collective action and solidarity. Yet, it does challenge liberal views that the self is most (negatively) free when it is left alone. For existentialists, freedom occurs only within a contingent milieu wherein we co-exist. While Sartre's account was also at odds with determinist forms of Marxism, members of the existentialist movement insisted on its compatibility with a humanist Marxism that pays attention to the consciousness of the revolutionary subject and the contingency of history. Existentialism was able to dramatize the mediations between theory and practice (*praxis*) whereby some individuals become committed to action. But was this enough? Although Sartre maintained that humanity's salvation depends on the liberation of the working class, it was difficult to see how the dualism of *Being and Nothingness* and the emphasis on daily experience could either yield a critical analysis of the broader socioeconomic structures that suppress its freedom or describe a genuinely intersubjective field structured historically by class relations. Sartre would rework his philosophy considerably in *Critique of Dialectical Reason* (1960), now referring to the sedimentation of human relationships as the "practico-inert" and trying to establish a historical anthropology predicated on rethinking the dialectic.

Maurice Merleau-Ponty (1908–1961)

Merleau-Ponty was determined that existence should be described in all its concrete, inexhaustible detail as it emerges. He recognizes a debt to Hegel's phenomenology but interprets this through an existentialist lens, insisting on the hazardous emergence of corporeal and historical meaning. In earlier writings, such as *Humanism and Terror* (1947) and the essays in *Sense and Non-Sense* (1964), he attributes a similar appreciation of contingency to Marx. Rather than Sartre's meaningless being-in-itself confronted by a subject, Merleau-Ponty's emphasis on corporeality and the primacy of perception allows him to describe embodied consciousness interacting with a world

saturated with corporeal significance. Corporeal existence entails pre-personal and intercorporeal relationships that support reciprocity and enrichment as well as violence and objectification. Rather than seeing the world as absurd or alien, he describes an affinity and continuity between different dimensions of existence that are only relatively more or less conscious or free to reassemble themselves. He describes the phenomenal body as a reversible dyad whose capacity to touch and be touched by the world introduces reflexivity into the very heart of being. By locating negativity in the flesh of the world, Merleau-Ponty avoids Sartre's dualist ontology of *en-soi* and *pour-soi*. This allows him to describe an existential field, or interworld, as temporal flesh wherein meaning and matter are entwined and the contingent emergence of consciousness is understood from a nonanthropocentric, posthumanist perspective.

This field is alive with signs and portents that orient bodily acts and ensure that objects are not just dead matter but phenomena that matter to us because we coexist with them. In this sense, animals, too, inhabit an existential field, albeit a relatively impoverished one. While symbolic meaning will enhance capacities for expression and enable more complex structuring, Merleau-Ponty insists that corporeal significance is never outrun, with the consequence that reason remains a provisional, creative undertaking. Consciousness is thus put back into a world whose density is set alight by the generative complexity of its relationships. It is this vivid pell-mell of emergent, practical existence that he describes. Within this dense field of intersecting relationships, where sediments from the past and anticipations of the future grant the present its complexity while constraining but also engendering freedom, politics is made. This is the milieu, immune to control but not to interpretation, into which the engaged philosopher or political actor must plunge. From this perspective, Merleau-Ponty offered his analyses of the cold war, rejecting both liberal-capitalism and bureaucratic communism. He demonstrated how existentialist criticism interrogates the style of being-in-the-world a regime actually entails, rather than judging solely on the basis of its ideological self-presentation.

Merleau-Ponty and de Beauvoir both considered the ethics of using political violence; their conclusions help illustrate existentialist ethics more generally. Neither simply rejects violence as categorically immoral because both recognize that good intentions can yield appalling consequences, while violence is ineliminable from the collective life of embodied actors. They accordingly dismiss a Kantian moralism of good intentions and clean hands. The tragedy of politics is that violence is sometimes necessary—for example, to resist fascism or enact a revolution against oppression—yet, its consequences remain unpredictable. In *Humanism and Terror* (1947) and the *Ethics of Ambiguity* (1948), the two existentialists respectively show how starting from an existentialist appreciation of contingency, there can be no ultimate justification for or against violence, while there is a significant danger posed by those who claim otherwise. Only in retrospect will it become clear whether an act opened or closed the existential field, or made life livable for a greater number. Yet, ethical behavior obliges us to take responsibility for trying. Any table of moral imperatives would act like a kind of bad faith in foreclosing the freedom to decide. The task of an existentialist ethics, therefore, is not to offer guidance but to describe the ambiguity of the political, where despite the contingencies of collective life, life and death choices have to be made.

Simone de Beauvoir (1908–1986)

De Beauvoir's work, with its attention to the body as both a lived situation and the medium through which we are situated in the world, is in many ways closer to Merleau-Ponty's existential phenomenology than to Sartre's. This is her approach in *The Second Sex,* the book that established her as a founder of modern feminism. While the volume as a whole investigates the phenomenology of gendered existence in exquisite detail, the introduction draws on a combination of Sartrean existentialism and Hegelian phenomenology to explain woman's construction as other. Sartre's account of the free subject who continuously transcends himself toward new projects is now gendered: Man, de Beauvoir argues, has consistently been identified as subject and encouraged, materially and culturally, to assume his freedom as autonomous being. Woman, inversely, has enduringly been defined as man's other: Her identity is to be what he is not.

De Beauvoir argues that otherness is a fundamental category of human thought, an idea she elicits from Hegel's account of the hostility between consciousnesses that results in a fight to the death. It is not—as in the Hegelian account—the slave that triumphs, however, nor is there reciprocity: Woman is always the slave. De Beauvoir notes that this self/other struggle is incipient in all group relations, with outsiders perennially denigrated as different and inferior. She recognizes this as the basis of racism, anti-Semitism, colonialism, xenophobia, and class, but its most resilient form is misogyny.

De Beauvoir suggests that the reason for this enduring opposition and for women's failure to contest it lies in its sheer longevity, but this is in turn grounded in women's role as reproducers of the species and thus in their identification with the body. Their heteronymous, inferior status looks natural. It is important to understand in this context that de Beauvoir is both recognizing female embodiment as central to women's oppression and arguing that the way it is lived and its significance remain contingent. She does not argue that the body is natural but gender contingent; rather, she presents the more subtle phenomenological argument that the way the body is experienced as gendered, and the ways in which gender is replicated through corporeal performances, remain contingent. One is not born a woman but becomes one. She describes what it means to exist as a feminine being-in-the-world, illustrated by accounts of how women undergo an apprenticeship into becoming women at each stage of their lifecycle.

The first part of *The Second Sex* explains how biology, psychoanalysis, and historical materialism present sexual identity as a natural destiny and repeats existentialist hostility to all forms of determinism. De Beauvoir does not, however, suggest that the way one lives one's sex is after all voluntary. The female body really does suffer pains and seductions bequeathed by the species, while patriarchy is sedimented in social and quotidian structures that make its avoidance extremely difficult. She describes women's complicity as a mode of bad faith: They retreat into the immanence of the inert thing in-itself by inhabiting a received identity and its roles. Yet, she appreciates that for the powerless second sex, assuming a conventional role as wife, mother, sexual plaything, or domestic laborer is a comforting, if inauthentic mode of existence that grants security, vicarious social status, and material comfort.

Assuming the status of free subject is no easy undertaking, and it is unlikely that sheer resoluteness of the will is sufficient. Collective action is necessary to pursue the material supports needed for living a life of freedom. De Beauvoir accordingly emphasizes the benefits of reproductive technologies like contraception and safe abortion, on the one hand, and a socialist welfare state to relieve women of domestic drudgery, on the other. Even then, choosing employment over motherhood or independence over marriage is not enough, although de Beauvoir advocates both. Women's situation at work is not identical to a man's: Women must negotiate their identification as objects of desire without becoming simply pale simulacra of their male colleagues. Women must become otherwise, living the body and femininity differently, writing new scripts, and developing new repertoires for themselves. In exploring the micro- as well as the macrolevel changes for which the oppressed must struggle, de Beauvoir shows the importance of existential phenomenology as a supplement to more abstract analyses of structural oppression and of politics more generally.

EXPLANATION

Three key issues drive discussion of explanation in the social sciences: First, must explanation be of a certain form to be regarded as scientific? Second, how does explanation contrast with the notion of understanding? Third, how can explanations be evaluated? The answers interrelate in important ways.

The notion of explanation has at its root philosophical usage a connection to the provision of causes, and in particular of causal mechanisms. This leads by the usual logic of causal or mechanistic explanation to a demand for laws and predictions. For, the thought goes, a law is just a regularity in nature. Hence, any event that can be explained (the *explanandum*) by adverting to the relevant law that identifies its cause should also be predictable, given knowledge of the presence of the antecedent conditions (the *explanatia*). This is the essence of the deductive-nomological (D-N) model of explanation. A great virtue of this model (long associated with logical positivism but surviving its demise) involves the fact that it provides a purely formal or syntactic criterion by which to adjudge whether an explanation exists. The D-N model also provides a straightforward criterion for evaluating the soundness and not just the formal adequacy of an explanation.

However, at this point, matters become contentious, for well-known counterexamples to this model exist. The counterexamples demonstrate that law-like connections may well have no causal connection to the phenomenon to which they may be correlated. For example, a falling barometer may correlate highly with the coming of rain, but the barometer's falling has no causal connection to the rain. Merely fulfilling the D-N model, thus, cannot be sufficient for explanation. Likewise, reasons may count as causes, but reasons do not provide mechanism and typically rationalize actions rather than explain them in the sense of making the actions a logical consequence of some antecedently specified conditions.

A key element involved in criticisms of logical positivism in the social sciences concerns the place of the D-N model and its heirs as defining proper scientific explanation. While some criticisms can be understood as philosophically valid, they can also reflect an animus toward the presumed absence of any normative concerns underlying this model. There may also be doubts regarding the existence in the social sciences of the sorts of laws or robust generalizations on which application of the model relies. The question that lingers, however, is how to evaluate purported explanations, absent some such models.

Explanation Versus Interpretation

In the philosophy of the social sciences, the term *explanation* is typically used as a contrast to that of *interpretation*. The contrast involves many differences. The most fundamental concerns whether or not the goal or purpose of social inquiry should be to reconstruct actions (i.e., purposive behavior) in terms of an agent's (individual actor's) perspective. An alternative view maintains that the purpose of social inquiry should be to develop explanations, that is, accounts that have robust predictive value. Explanation, from this point of view, is unconstrained by any need to reflect or reconstruct the view of agents with respect to the events to be explained. So, for example, economic explanations of choice of marital partner or ecological explanations of cultural traditions employ underlying regularities to account for observed behaviors but diverge from any account that might be offered of those whose behavior is so explained.

The aims of interpretation and explanation appear *prima facie* incompatible. An interpretative account focuses on reasons specific to an agent, a time, and a situation. The expected result

would be an account that did not generalize but applied only to the people and the time studied. These historicist or ethnographic approaches to the study of human behavior must be distinguished from case studies because the latter but not the former are taken to provide a basis for generalizations.

While we owe the term *positivism* to Auguste Comte, logical positivism names the philosophical movement (also referred to as the Vienna Circle) that emerged in the 1920s and 1930s through the writings of associated philosophers, scientists, and social scientists. Following the dispersion of these thinkers to England and the United States due to the rise of fascism throughout central Europe, logical positivism became the dominant account of what defined scientific explanation. Within the social sciences, the term positivism enjoys wide use as an epithet attached to all views that insist that the purpose of social science explanation requires being able to apply generalizations to account for observed cases. Ideally, generalizations used to explain would also allow social scientists to make predictions. In the terminology of logical positivism, a statement of that which is to be explained is termed the *explanandum* (pl. *explananda*); *explanans* is the class of statements (pl. *explanantia*) that account for the explanandum.

Because a primary goal of logical positivists was to help distinguish scientific from pseudo-scientific explanations, two key criteria were developed that were thought to capture the relevant differences. The first offered a syntactic formulation for an explanation. This requirement held that good explanations had a specific form, and this form allowed for the logical derivation of the explanandum from the explanans. This format also required the use of an appropriate law-like or statistical generalization.

The second requirement concerns the need for empirical testability. Logical positivists themselves differed with regard to the so-called logic of confirmation for explanations. The basic split concerned whether testing of hypotheses should stress confirmation or disconfirmation. The essence of the controversy involved the fact that no law can ever be fully confirmed by observed positive cases; the law makes claims about cases seen and unseen, as well as past, present, and future. Thus, no finite amount of observed evidence, however great, suffices to prove that a statement about some observed regularity expresses a law.

However, observational data can *disprove* a supposed law of nature by providing just one counterinstance. Thus, some hold that the purpose of testing should be to seek disconfirming instances of laws. Laws that survive repeated attempts to disconfirm them may then have claim to some degree of verisimilitude. But whatever one's view of the evaluation of proffered explanations by empirical test, the orthodoxy holds that proper explanation requires laws and empirical information that allows for a logical connection between the explanans and the explanandum. Only by virtue of the logical connection can one determine whether the observed instances follow from the statements said to explain them, and only by virtue of the logical connection can one assess whether the generalization appealed to in the explanation has been confirmed or survived disconfirmation, and so has a real use for purposes of explanation. All models of scientific explanation, in short, take explanation to consist in a relation between some theory and instances that the theory is a theory of.

Absent any logical connection between explanans and explanandum, however, no rational assessment of an offered explanation appears possible. This insistence on the syntactic formulation of explanation, one that provides a logical connection between explanans and explanandum, remains an important yet largely unappreciated feature of positivist accounts of explanations. This syntactic standard allowed a clear formal criterion by which to identify a candidate explanation.

A recurrent criticism of positivist models of explanation concerns the principled absence of any need to incorporate the perspective of those whose actions are to be explained. In addition, the syntactic structure of positivist explanation is viewed as also precluding any normative evaluations of the actions. Scientific explanations are typically held to be purely descriptive. Absent an overt inclusion of a normative premise, no normative conclusion can be derived.

For example, in explaining why people might be co-opted to be mass murders in the case of the Holocaust, the use of generalizations that a large majority of people simply tend to obey authority might be employed, together with other

information. However, this might lead to complaints that perpetrators are in fact thoughtless, that is, not portrayed as making a choice about how to act. To the extent that perpetrators did not make choices, then they might appear to be less morally culpable for their acts. Culpability typically involves holding people responsible for the choices they make.

Alternatively, explanations in the positivist mode may be thought to offend against the specifics of the situation. Did the Hawaiians murder Captain Cook because he violated expectations attached to the god Lono, whom Cook was thought to be? Or did they do so because the Hawaiians, as rational agents, perceived Cook for what he was—an agent of an alien political power—and acted to protect themselves from this threat? The difference between explanations here is just the difference between an emphasis on the culturally specific and a universalizing rational agent approach to explanation. The former explains by reconstructing the agents' reasons for doing what they did but yields no generalization. The latter explains by seeing this action as typifying what any rational agent (taken as a generic notion) would do in such a case. The same explanandum event is in this instance explained by incompatible explanantia.

Explanation After Logical Positivism

The demise of positivism and so of the hegemony of positivist accounts of explanation have had mixed impact on debates in the social sciences regarding explanation. In a philosophical context, positivism fails for two fundamental reasons. The first concerns the holistic relationship between the sentences that make up a theory and statements about the evidence taken to support them.

Logical positivism assumes that sentences *taken individually* can be assessed for their truth or falsity. This is critical to the logic of empirical testing, and so of the evaluation of statements deduced from those said to explain or predict it. The inability to assess statements apart from the theoretical context that explains them has, as a consequence, an ambiguity with regard to what statements need revision when an explanatory theory runs afoul of experience. If no single sentence has a logically tight connection to specific statements in the theory, on the one hand, and the recalcitrant experience(s) on the other, then any failure of experience to apparently agree with what theory implies can be accommodated in an *ad hoc* fashion by the explanatory framework.

Moreover, it is important to note that even the staunchest advocates of the positivist models of testing came to holist conclusions about the theory-evidence relationship. Only within the context of a prior theory do statements serve as evidence for or against the explanatory efficacy of the theory in question. Moreover, theories could be adjusted to accommodate apparently discrepant experiences, that is, those that at first might seem incongruous with the way a theory says things should be. This close relationship between how theories characterize the world and the evidence in it came to be known as holism. The chief consequence of this view is the way it clouds questions of when an explanatory hypothesis can be saved by altering other aspects of the theory connected to it, or when the explanation has been refuted by evidence. Historical studies of science offer up numerous cases of how theories variously adapt to or otherwise incorporate apparently disconfirming results.

A second feature of the so-called postpositivist era involves the failure of logical positivism to succeed in providing any way of characterizing the unity of science. The separate sciences, for example, biology and physics, did not, it turns out, neatly fit as a group into positivist-designed models for what the form of explanation had to be for a discipline to be a genuine science. The individual cases of scientific investigation within one or another science could be studied, but no general model of explanation could be tailored to fit all accepted scientific practices, even within those sciences unproblematically regarded as such.

From these specific shortcomings—that is, the failure of logical positivism to provide a demarcation criterion by which to distinguish science and nonscience and to find a syntactic model of explanation adequate to all scientific activity, which could be evaluated for explanatory adequacy by its form alone—arise the postmodern moment with regard to views about explanation. It comes, that is, when philosophy of science appears to lose its grip on what to count as a scientific explanation properly so-called and on the logically and empirically determinate criteria for assessing the goodness of explanations.

Into this philosophical vacuum rushed postpositivist theorists. These theorists were happy to declare the demise of any "master-narrative." Yet, the problems that positivism meant to solve did not disappear or go away. By what mark does one identify an explanation as an explanation? The positivists had a neat, straightforward, and seemingly rationally defensible account of what this mark should be: deducibility. Postpositivist accounts within philosophy have looked to less straightforward but still roughly quantifiable criteria, for example, the ability to unify fields that were previously thought to be unconnected. Informally, such criteria hold that good explanations contribute to understanding, and understanding consists primarily in unifying fields of scientific inquiry.

A shared but unfortunate feature of much that postpositivists offer as explanations concerns the fact that no visible effort goes into examining what might possibly play the role of confirming or disconfirming any of the explanations offered. This appears to be the case whether explanations of social phenomena are advanced in the name of one or another science—for example, evolutionary psychology, decision theoretic models, sociobiology—or are tied to more explicitly political or normative explanatory accounts, as in cultural studies or traditional Marxist theory. Absence of predictions, or failure of prediction, appears to leave these accounts untroubled. Much more so than the natural sciences, the social sciences suffer from the underdetermination of explanation, that is, the fact that competing explanatory frameworks appear capable of accounting for the known data. This fact underlines the desirability of once again having clear criteria for explanations and ways of testing the proposed account. Yet, what constitutes the mark of explanation remains unknown.

EXPLOITATION

Exploitation refers to using a resource, situation, or person for a purpose. In a technical, neutral sense, this might mean no more than making use of a resource for benefit, for example, when the existence of underground sources of energy is exploited by drilling and extraction. In social theory, however, the term implies a normatively negative evaluation of the use being made, although identifying the norm being violated is not straightforward. For example, some have argued that such exploitation is a violation of justice, but this may be identified with a rights violation, a lack of reciprocity, or a failure of equality. Others, again, have concentrated on an infringement of liberty, perhaps construed as the consequence of coercion, or the lack of opportunity for self-development, or autonomy.

The relationship between the neutral and the condemnatory applications of exploitation is complicated by two considerations. First, in the history of social thought, the exploitation of nature was contrasted with the exploitation of people by other people, where this latter referred to the situation in which the direct producer was placed. Exploitation in the wage labor market, in particular, had historical priority in developing the normative usage. But the best-known account of exploitation under capitalism was provided by Karl Marx. His official account of exploitation concerns the fate of

surplus value, and it is highly controversial whether he thought—or was entitled by his own theories of the relativity of values to modes of production to claim—that this was unjust. If Marx was debarred from claiming that capitalism was unjust, his account of exploitation has to be read as a technical, non-normative explanation of the surplus value received by the capitalist.

Second, when the idea of exploitation is applied to natural resources, there may be a normative component—suggesting, for example, that the use is excessive and damaging to the interests of the environment or future generations. We, therefore, have to decide on the relationship in our analysis between exploitation as a term of negative normative evaluation in social relations generally and its application to the circumstances of the direct producer. We might hope for a general account, of which a more specific version could be applied to the position of the worker.

This entry first explores the concept of interpersonal exploitation, briefly discussing Immanuel Kant's concept of treating people as means and Alan Wertheimer's analysis of taking unfair advantage. To explain the notion of taking unfair advantage, the theorist has to elaborate the baseline (or baselines) invoked to justify the charge of unfairness. In the more specific application to the position of the worker, it refers to "the power-based extraction of benefits resulting from control over valued assets." If the case of the worker is to be a more specific version of the general conception, the theorist has then to elaborate on the normative content of the complaint and the relationship between the power, the control, and the benefits. In both cases—the general application and the specific application—the specification of the baseline and the range of counterfactual alternative possibilities will be the site of moral and political disagreement.

The Definition of Interpersonal Exploitation

When exploitation is a category in social theory, perhaps the most general current understanding—and also the most difficult to apply to particular instances—has a Kantian provenance. In this way, the analogy with the exploitation of natural resources is straightforward—in both cases, the core idea is "making use for a purpose." But in the interpersonal case, this making use is regarded as reprehensible because some ways of making use of someone for one's own ends are not acceptable. Exploitation is seen as a way of treating people in which they are not recognized as having their own ends and are used *merely* as instruments of the exploiter. Some instances of interactions seem amenable to this sort of treatment. When it is said that prostitution or pornography exploits one (or more?) of the parties engaged in them, some of the features of narrower accounts of exploitation do not appear to be present. The high-class prostitute, who sells his or her services for substantial sums of money and is not controlled by a pimp, is apparently content in the work, and has the opportunity to engage in other work; the client who is willing to pay and has no special weaknesses—these people interact in ways that would not fall within some narrower accounts of an exploitative relation. The claim about pornography may also, at bottom, be a claim about the portrayal of people as sex objects, as *mere* means to another's gratification. Of course, trafficking and the sex industry are commonly exploitative. Nevertheless, making sense of *some* claims about exploitation seems to require this Kantian account. A moment's reflection, of course, tells us that we must inevitably "make use" of one another in social life, and the problem is to distinguish which occasions are benign and which are to be condemned. It is not clear that the notion of failure to recognize the full personhood of others will help with this discrimination.

Taking Unfair Advantage

A common response has been to refine making use by adding a reference to fairness, and exploitation is widely construed as taking unfair advantage. I took advantage of the services of the bus driver who drove me to work this morning, but I set neither the fare nor his rate of pay, and if there is any unfairness in his position, it does not seem appropriate to associate me with it in any direct way. We therefore need a standard by which to determine when advantage is *unfairly* taken.

In his book *Exploitation,* Wertheimer distinguishes between the general case of exploitation as taking unfair advantage and two particular cases. One of those is harmful exploitation, in

which the exploited person is harmed in relation to some appropriate baseline. The other is mutually advantageous exploitation. Here the exploiter and exploited are involved in an exchange that benefits the exploited person, but the exploiter gains excessively or unfairly by reference to that baseline.

Mutually Advantageous Exploitation

Two points may be made here. First, this analysis is intended to apply to many interactions, including those involving labor. For example, suppose B is in urgent need of funds to secure a very lucrative outcome. A lends B money but requires to be repaid twice what was lent, even though A has to wait only a short time for repayment. This looks like a case of mutually advantageous exploitation. But again, that description might be applied—and, indeed, was, but not of course in those words—to some early understandings of the capitalist/wage-labor contract.

Exploitation Relative to a Baseline

The second point is the reference to baselines. Wertheimer talks about defining harm or benefit according to "some appropriate baseline." Clearly, the analysis does need some standard by which we can determine whether A has harmed B or benefited B, even while taking unfair advantage. Before that, however, we need another standard by which to judge whether an advantage is fairly or unfairly taken. On this view, obviously, A cannot claim to be taking *fair* advantage simply because A confers *some* benefit on B because the characterization refers to unfair or excessive gains. Suppose I have a generous friend who insists on buying two rounds of drinks to my one every time we meet. Am I gaining unfairly? I benefit, but am I fairly allowing him to express his generosity or unfairly taking excessive advantage of it?

Theorizing Exploitation: The Problem of Baselines

This problem of baselines is endemic to discussions of exploitation (and coercion). The notion that exploitation may be defined as taking unfair advantage is not uncommon in the literature, even when not elaborated in the extensive way that Wertheimer does, but fair advantage remains elusive. To take another example of a modern theory of general application, Robert Goodin treats exploitation as "taking unfair advantage of the vulnerable," leaving us in need not only of a standard of fair advantage but also a measure of vulnerability. Goodin is especially interested in characterizing those cases in which a person "plays for advantage when it is inappropriate to do so." This is not to say that Goodin does not try to provide these standards; he has a book on the moral duty to protect the vulnerable and another in which he defends the thesis that the purpose of the welfare state is to protect people against vulnerability. But it is to say that these issues of the baseline or standard are likely to be the focus of controversy about whether any particular interaction or social structure is exploitative, not least in relationships between workers and others. Are poverty, ignorance, and low earning power characteristics of which it would always be unfair to take advantage? Or, more particularly, is it always unfair to take advantage of the fact that someone has no access to the means of production? If the answer in both cases is that it depends on *how much* advantage is taken, we are just redescribing the problem in terms of another version of the baseline.

A contemporary application of this problem arises from the international mobility of capital. If capital is relocated from a prosperous country to a less prosperous one to take advantage of significantly lower wage rates, the advantage may appear excessive relative to a relevant baseline of expectation in the more prosperous country. There will then be argument about the relationship between a moral baseline and the market.

Preconditions for Exploitation Versus Exploitation Itself

Before we go on to look at some theories of exploitation that emerged under nascent capitalism, we should acknowledge that the discussion of exploitation thus far has been concerned with fairness. Exploitation has been characterized as forced unpaid labor, which seems to be a conjunction of coercion (which is liberty reducing) and lack of payment (which is putatively a violation of justice). When Marx talked about *external forced*

labor he used the expression to cover slavery, serfdom, and wage labor, and the focus is again on coercion (which is liberty reducing). If we talk of unfair advantage, the focus is quite clearly on justice; and hence, exploitation may itself not be an infringement of liberty. Of course, exploitation may well be taking unfair advantage of a *precedent* unfreedom, but that does not entail that it adds any *further* unfreedom.

This is the second general problem about theorizing exploitation (the first being the baseline problem). The problem is: How do we distinguish what makes the exploitation possible and what is the exploitation itself? This problem might be illustrated by glancing at some of the theories of exploitation that were developed in the nineteenth century. At the most general level, it seems that analyses of division of labor and of exploitation were stimulated by the coming together of an attempt to understand the new commercial society by contrast to what had gone before and the emergence of the new political economy.

There was general agreement that the new society (whether it be called commercial, as by Adam Smith, industrial as by Henri de Saint-Simon, scientific as by Auguste Comte, or capitalist as by Marx) had as its central characteristic increased productivity occasioned by the new division of labor. At the same time, modern political economy presented and developed the idea of the market as its central intellectual pursuit. Wealth was thought of as that which had exchange value; and some political economists identified political economy as the science of exchanges, or catallactics. But the nature and extent of division of labor was crucial to determining the extent of exchange relations. So who or what controlled the division of labor, and who benefited from it? Was modern division of labor radically different from previous forms or merely an intensification of them? Equally, historical periodizations drew attention to changes in power relations and thus to the question of what had changed about the position of the direct producer. Smith, for example, saw commercial society as *increasing* the independence of the worker, compared to previous formations in which the worker had been dependent on particular other individuals. While Smith acknowledged that wage labor involved giving up freedom for its duration, he also insisted that any restriction on the laborer's right to exercise it (such as restrictions on his movements) violated his natural rights.

Radical arguments, of course, tried to diagnose (what came to be called) exploitation and to offer prescriptions for a society that would overcome it. Charles Hall, writing at the beginning of the nineteenth century, the so-called Ricardian Socialists later, the Saint-Simonians (the first as far as we know to talk about interpersonal exploitation by that name), and Marx are well-known examples. They struggled to provide a diagnosis that was partly related to a concern with poverty and partly an attempt to unravel the mysteries of the wage relationship. Some started from the worker's right to the full product of his labor, some from a concern with the disposition of the value the worker created, and so on. There were many differences in diagnosis and prescription, which illustrate the difficulty mentioned earlier—distinguishing what makes exploitation possible from what is the exploitation. But they all had something to say about the coercive state—in relation to taxation and in relation to its guarantee of property rights. They all examined the nature and distribution of property rights. They were all sensitive to historical change, either because of a periodization of history or because of seeking to explain the detachment of the worker from the means of production. Through differences in emphasis, they came to different conclusions about hopes for a nonexploitative society. Did it require the abolition of wage labor altogether, or a change in the background conditions (for example, a redistribution of productive assets)? But for all these writers, exploitation could be characterized as "the power-based extraction of benefits resulting from control over valued assets," a more specific version of "taking unfair advantage" which mentions power and control and therefore a concern with the freedom of those subject to it. Coercion variously appears in the arguments as state interference with the worker, with its guarantee of property rights, and in the analysis of the wage relation itself. Control over valued assets may well confer coercive power, but also important was the imposition of labor discipline. This discipline was covert in Smith's analysis and overt in Marx's, part of the explanation of the increased productivity associated with division of labor. Both

recognized that the worker subject to that discipline was to that extent unfree.

F

Fabianism

The Fabian Society was founded in London in 1884. Since then *Fabianism* has been prominent in British socialist theory. The Fabian name derives from Quintus Fabius Maximus—the Roman general famous for his delaying tactics in the fight against Hannibal. The early Fabians rejected the revolutionary doctrines of Marxism, recommending instead a gradual transition to a socialist society. The most influential early Fabian theorists included Sidney Webb, George Bernard Shaw, and Graham Wallas. In the twentieth century, prominent Fabian thinkers included the academics Harold Laski and G. D. H. Cole (both of whom were sometimes far more radical than mainstream Fabians), as well as Labour Party politicians and activists such as Beatrice Webb, R. H. S. Crossman, Roy Jenkins, Ian Mikardo, Denis Healey, and Margaret Cole. The Fabian Society survives today as a think tank for moderate British socialists.

When Fabianism emerged in the United Kingdom during the 1880s, collectivism was widely considered necessary for human flourishing. Although some traditional liberals clung to laissez faire politics and economics, theorists of new liberalism, such as T. H. Green in the 1880s, believed that substantial state intervention would be necessary if ordinary individuals were to prosper. In the early years of the twentieth century, the dominant liberal position involved the acceptance and advancement of the extension of public control in industry. This dominant position also involved collective responsibility for children's education and nutrition, housing, employment, along with support for care of the sick and aged. Fabians, who sought to propagate their ideas by means of permeation, targeted collectivist liberal politicians and radical social activists.

Two pioneers of Fabian theory—Shaw and Sidney Webb—were each advocates of this strategy of permeation. Nevertheless, they differed in their views of the most appropriate target. In his essay "Historic" in the *Fabian Essays in Socialism* of 1889, Webb insisted that unconscious socialism had already proceeded through public control of services, largely by the municipalities. He thus believed that the Fabians should strive to influence the mainstream Liberal Party. Although in his preface to the 1919 edition of the *Fabian Essays* Webb said that the Fabians had always intended to create a new party, it was in fact Shaw who pressed for this when Webb saw no need. Shaw hoped to gradually replace rather than merely reform capitalism. He considered that Fabianism would be far more fruitful if it sought to inspire and permeate the existing Radical Party, which, he hoped, would eventually merge with socialist activists in Great Britain to found a new party of the left.

Although permeation remained a key concern among Fabians, some of the other ideas that characterized Fabian socialism in its formative years became less prominent as the twentieth century progressed. This was the case regarding their adoption of David Ricardo's theory of rent, which Shaw had discussed in his essay "Economic" in the *Fabian Essays*. Sidney Webb's idea that pragmatism should outweigh firm commitments was also abandoned as

Fabians influenced by Shaw pressed for more coherent socialist or social-democratic thinking with the aim of influencing public policy.

Shaw had always been more concerned than his fellow Fabians to develop a socialist theory, rather than rely on pragmatism. Sidney Webb, nevertheless, came to accept that the failure to sufficiently emphasize equality was a weakness. In his 1919 introduction to the *Fabian Essays,* he conceded that it was Shaw who insisted that equality must be a key and prominent concern. This should involve not just equality before the law, in eligibility for office and in voting power, but also equality of material circumstances. Notwithstanding this development in Fabian theorizing, the society's publishing activities waned in the late 1920s. Moreover, in the 1930s, the Webbs became supporters of Soviet communism and Shaw momentarily expressed admiration for Benito Mussolini.

Nevertheless, Fabianism was revived with the New Fabian Research Bureau (NFRB), formed by Cole independently of the society in 1931. The NFRB included a number of social-democratic intellectuals, such as Leonard Woolf, William Robson, Hugh Dalton, and Evan Durbin. Laski was briefly involved in the early 1930s. The bureau amalgamated with the Fabian Society in 1939.

Laski and Cole had, by this time, begun to juggle social-democratic and Marxist ideas. Nevertheless, in 1952, in his article "Towards a Philosophy of Socialism" in the *New Fabian Essays,* Crossman disapproved of Laski's efforts to merge Marxism and Fabianism. The Labour Party needed a sense of direction, but not one influenced by Marxism, which forced policy into conformity with an imported, rigid doctrine. Theory needed to challenge the status quo and expose the inadequacy of tradition as a guide to policy. He singled out Durbin for praise for having realized in the 1930s that this was so. For Crossman, theory must be based on the principles of the British Labour Party and inspired by the belief that only human will and social conscience can liberate human beings.

As Bernard Crick's political theory since the 1960s illustrates, influencing public policy has remained a Fabian priority in the contemporary era; thus permeation is still a Fabian activity. Poverty, furthermore, is still a major concern, and gradualism remains key to Fabian strategy. Nevertheless, the search for a coherent socialist theory that Fabians once thought should replace the early pragmatism has now waned. In the early twenty-first century, the society declared that it seeks to define progressive politics from the left of center.

Face

Face is a pivotal term—together with *the Other*—in the work of Emmanuel Lévinas. Lévinas thought that there are two main tendencies in Western philosophy: autonomy and heteronomy, and that in modern times the former dominates. In Immanuel Kant's works, for example, the rational subject freely legislates and subjects itself to the moral law. Lévinas prioritized responsibility over freedom. In his view, the core of ethical experience is being's inescapable affectivity as it is confronted by the face of the other calling it into question and demanding it to respond. In his phenomenology, Lévinas argued that the empirical other affectsme more than I can see and think, and in that sense, functions otherwise than as an object of my intentionality (namely otherwise than how I understand/imagine it in the context of my habits and knowledge). Although the

other's particular characteristics can always be seen/known/imagined, classified, compared, and so on, I am confronted with a *de facto unique* face that signifies alterity in excess of the sum total difference of these characteristics. Hence, the face functions as a sign of infinity or absolute Other. This is the social expression of the formal structure whereby "in thinking infinity the I from the first thinks more than it thinks" (Lévinas, 1987, p. 54). The face has no identity. It signifies the extreme proximity to me of the other as absolute Other; it lacks essence but awes me as pure mortality, "nakedness and defenselessness" (Hand, 1989, p. 83). Before a face, I am not an actively intending self-consciousness, but a passive *me* in the accusative. Humbled by the face, my ego loses its self-coincidence " . . . as if I were devoted to the other man before being devoted to myself" (p. 84). The *face* and *me* are the two elements of the purely ethical relationship that Lévinas named proximity and face-to-face. This is an asymmetrical, nondialectical, nonreciprocal, and nonutilitarian relationship characterized by radical alterity and infinite and anarchic responsibility of one being for another-*as*-Other: "Responsibility for the other, for the naked face of the first individual that comes along" (p. 84), which goes beyond what I may or may not have committed. The other's face is also a source of my individuation because it serves as a

> ". . . summons to responsibility [that] destroys the formula of generality by which my knowledge (*savoir*) or acquaintance (*connaissance*) of the other man re-presents him to me as my fellow man. In the face of the other man I am inescapably responsible and *consequently the unique and chosen one*. . . . This is the anteriority and chosen nature of an excellence that cannot be reduced to the features distinguishing or constituting individual beings in the order of their world or people, in the role they play on history's social stage, as characters, that is, in the mirror reflection or in self-consciousness." (p. 84, emphasis added)

Lévinas thought that the face-to-face is "primary sociality" (Lévinas, 1969, pp. 304) " . . . whose whole intensity consists in not presupposing the idea of community" (Hand, 1989, pp. 83–84). This is quite distinct from "constructing a community out of an egocentric perspective or, alternatively, an ego out of a conventionalist or social point of view" (Lévinas, 1995, p. 64) and from a master–slave type dialectic. Because of this, Lévinasian ethics is at odds with any ontology of the state or any other political association because it exposes the contingency of sociality and demystifies/denaturalizes any existing bonds. Who is my neighbor? Everyone with a face! "Absolving himself from all essence, all genus, all resemblance, the neighbor, the first one on the scene, concerns me from the first time (even if he is an old friend, an old lover, long caught up in the fabric of my social relations) *in a contingency that excludes the a priori*" (Lévinas, 1981, p. 86; emphasis added). This contingency occasions a responsibility for "my neighbor, for the other man, for the stranger or the sojourner, to which nothing binds me—nothing in the order of the thing, of the something, of number or causality. It is the responsibility of a hostage which can be carried to the point of substitution for the other person and demands an infinite subjection of subjectivity" (Hand, 1989, p. 84). The face and the responsibility, into which it immediately and inescapably summons me, are at once irreducible and linguistic. Being a human, namely a linguistic being, primarily and irreducibly means *dire* (saying) *me voici* (here I am!) (also the Hebrew *hinneni* of Abraham's response to the demand of God in Genesis 22) to the other's face who forbids me to kill (I could not kill the other *as* other; I can only attempt to kill the other as a figment of my imagination) and independent of distinctions (i.e., friend or enemy); I speak *for* the other's sake. *Saying* is the most basic instance of what Lévinas called infinite and anarchic responsibility for the other *as* Other. It obeys no preexisting law other than that the other as Other always comes first, literally first, before me, singling me out and turning me into me by facing me. Meaningful language, or the symbolic order, on the other hand, with its grammar, rules, and themes, is the precariously stable outcome of this ongoing confrontation: reciprocal communication. No adherence to a linguistic code or law can ever absorb my responsibility for responding to the other because the face of the other who commands me to speak is inexhaustible and recedes from thematization. Hence, while Lévinas would agree that there is nothing outside language, he could also claim that the "[F]ace-to-face founds language" (Lévinas, 1969, p. 290).

Following Lévinas's death, more has been written on the question of the relation of face-to-face to politics. Simon Critchley has suggested that the political significance of face-to-face rests in its anarchistic character that allows one to act from a distance from the totalizing state. The demand of the face of the other is "too much" but the subject can "sublimate" it through political praxis opening up the "dissensual space of democracy" (Critchley, 2007; Diamantides, 2007, chapter 5) motivating a "politics of resistance" (Critchley, 2007, p. 89). Less fruitful are eulogistic texts that mistakenly equate the face-to-face with relations based on respect for particularity. Among the critics, Slavoj Žižek has argued that the face "necessarily refers to the human face" (Žižek, 2005, p. 145) and, therefore, excludes the terrifying "inhuman" (p. 158). Specifically, he charges that the "face" functions as a " . . . fetish" that "gentrifies the terrifying Thing that is the ultimate reality of our neighbor" (p. 146) by disavowing the truth that what horrifies us most is not death and the dead but the "monstrous life-substance which persists in the Real outside the symbolic" (p. 172). Arguably, this view rests on misunderstanding Lévinas's views on death as nothingness, which is not true. By contrast, Critchley argues that the other's face "stands in the place of the Real in Lacan" and "the demand of this Thing lodges itself at the heart of the subject" (Critchley, 2007, p. 66), resulting in a constitutionally split subject. A vegetating patient's face, for example, commands responsibility, even as nothing can justify our decision either to keep the patient alive or acknowledge the patient as already dead, precisely because it confronts us with life's monstrous excess, which is epitomized by the literary notions of "the living-dead" or the "undead machine" and by the idea of language as a symbolic undead machine (Diamantides, *The Ethics of Suffering,* chapter 1; Diamantides, "The Subject May Have Disappeared but Its Suffering Remains").

Faction

A political *faction* consists of a group of individuals pursuing a specific purpose. The nature of a political faction has changed according to different historical periods. In the era of mass politics, factions had to operate in structured and aggregative contexts; whereas in the era of elite politics, factions could operate as autonomous actors in the restricted electoral arena. Historically, elite factions were the prologue of political parties. During the formative years of the United States, factions were considered a mortal threat to the deliberative spirit of the new republic (as expressed by George Washington's *Farewell Address* of 1796). The rationale of the 1787 Philadelphia Constitution was indeed to prevent the tyranny of factions. A faction was considered to be a "number of citizens . . . adverse to the rights of other citizens, or to the permanent and aggregate interests of the community" (James Madison's "Federalist 10").

Enlarging the size of the polity (through the formation of the federal union) made contrasting a faction with another faction easier. For the American founding fathers, the old republics degenerated

because they were small. In such a context, a number of citizens could, first, constitute a majority and, then, transform that majority in a political tyranny. However, their distrust toward factions did not prevent them from inventing the first political parties of modern history. With the democratization of the country, the danger of factions was tamed through the formation of a highly pluralistic system of parties' and interests' representation and competition. The United States never experienced the tyranny of the majority, although it experienced periods in which powerful minorities were able to stop or to postpone legislation supported by a large majority of the country (as the civil rights' legislation was long obstructed by Southern senators of both parties, the so called conservative coalition). In this case, one might argue that such factions acted as tyrannical minorities.

At the time when Europe was influenced by the Jacobin tradition, factions were considered a hurdle in the formation of the popular will (as all the intermediary groups interposing between the people and the state). Nevertheless, even here, the process of modernization and democratization introduced incentives to the formation of both interest groups (articulating social and economic interests) and political parties (aggregating those interests in the electoral and parliamentary arena). Indeed, the larger the aggregative capacity of the party was, the stronger the pressure was for giving the different interests and values within it a distinctive voice. Regardless of the organizational model adopted by the various mass political parties, they came to register the formation of several factions within themselves. In the era of mass politics, when the gatekeepers of the decision-making process are political parties, a faction needs to organize within the latter for promoting values and careers. In modern political language, a faction is thus "a party in the party." Moreover, factions may also be found in legislative settings (committees and subcommittees), coalescing members belonging to different parliamentary groups or congressional caucuses when issues of an ethical or principled nature are at stake. Factions are inevitable actors of the organization of modern political parties.

Fair Trade

Fair trade is an international movement for social and environmental justice that develops alternative economic spaces of production, trade, retailing, and consumption. The relevance of fair trade for political theorizing is threefold: It draws attention to the materials around which political contention and mobilization are generated; it challenges assumptions that citizenship and consumerism are opposed principles of action and identification; and it challenges assumptions that political responsibility can or should be contained within national boundaries, or that citizenly acts can or should only be directed against the state.

The goals of the fair trade movement include improving the livelihoods and well-being of small producers; promoting development opportunities for disadvantaged groups of producers, in particular women and indigenous people; raising awareness among consumers of the negative effects of patterns of international trade on producers in the Global South; campaigning for changes in the regulatory regimes governing international trade; and the protection and promotion of human rights. The international fair trade movement consists of certification agencies, producer organizations and cooperatives, trading networks, and retailers.

The fair trade movement began to develop internationally in the 1980s, with the launch of Fairtrade labeling in various national contexts; and in the 1990s, the emergence of international umbrella organizations establishing worldwide standards of labeling and certification began. The growth of markets for fair trade products has been associated with the development of new forms of collective, organized political action that focus on questions

of poverty, sustainability, and justice, and that view states, international agencies, and multinational corporations as objects of contention. Most research on fair trade focuses on the impacts of initiatives on producer communities, assessing the degree to which goals of enhancing democracy, empowerment, inclusion, participation, and sustainability are achieved in practice. And far from being faceless, placeless consumers, fair trade encourages people to engage in various forms of social action as members of collectives, such as church communities, schools, cities, and towns.

Fair trade presents challenges for political theorizing in three areas. First, it draws attention to the importance of the materials around which political contention and mobilization can be generated. Fair trade has focused primarily on particular types of food products, such as coffee, bananas, and chocolate. As it has extended to other commodities, such as cotton, the movement has had to develop new strategies and enroll new actors into extensive networks of campaigning and regulation. The growth of fair trade also generates tensions between different material interests that shape the ongoing development of this movement: between the commitment to small-scale, democratic control over production and the mainstreaming of fair trade into corporate retailing; between the cooperative principles of the fair trade movement with the principles of international labor union movements; and between the global scope of fair trade and the autarkic, localist imaginaries of the organic food and slow food movements.

These tensions draw into view the second key issue that fair trade raises for political theorizing. Fair trade challenges long-standing assumptions that citizenship and consumerism are opposed principles of action and identification. Fair trade is an example of the phenomenon theorized by political scientists as political consumerism. It illustrates the ways in which repertoires of consumerism can be creatively deployed for explicitly political goals of social justice and participation.

Third, fair trade challenges taken-for-granted assumptions that relationships of political responsibility can or should be contained within national boundaries, or that citizenly acts can or should only be directed against the state. Fair trade illustrates the emergence of new forms of transnational political solidarity that are based on ethical commitments; support activism that is often directed toward nonstate actors, such as multinational corporations; and use innovative technologies such as labeling, certification, and the repertoires of popular entertainment. In each case, it is an example of emergent forms of "global deliberative politics" that is reshaping understandings of the objects, mediums, and agents of political action.

Fanon, Frantz (1925–1961)

Frantz Fanon was a Martinican psychiatrist, philosopher, and revolutionary whose writings established him as a leading thinker of the twentieth century. Fanon ushered in the decolonial turn in critical theory, a move calling on those both within and outside of Europe to challenge the coloniality of the age and to forge a new vision of politics in the postcolonial period. Fanon's major works include *Black Skin, White Masks* (1952), *A Dying Colonialism* (1959), *The Wretched of the Earth* (1961), and the posthumously published *Toward the African Revolution* (1964). The contributions of Fanon to political theory center on six areas of inquiry: existential phenomenology, the social-psychological critique of Freudian psychoanalysis, critical race theory, colonialism and the politics of empire, the relationship between violence and revolution, and the concept of freedom.

Intellectual Formation

Fanon was a lycée student of the Négritude poet-politician, Aimé Césaire, and this association with Césaire would animate much of Fanon's thought throughout his formative adult years. Négritude asserted a radical conception of black consciousness amid a world replete with white supremacy. Although Fanon questioned the metaphysical presuppositions of Négritude, he remained forever indebted to Césaire's political theory.

Fanon escaped from Vichy-occupied Martinique to fight voluntarily for the French forces during World War II, only to witness the limitations of Francophone universalism due to the segregation of French soldiers and reduced agency of French colonial subjects. After World War II, Fanon returned to Martinique to assist Césaire on a mayoral campaign. He subsequently left for France to pursue a medical degree. While studying psychiatry, Fanon attended lectures by Maurice Merleau-Ponty and wrote a series of plays. Upon completing psychiatric studies and publishing his first book, Fanon took a post at the Blida-Joinville hospital in Algeria. This geopolitical relocation inaugurated a mutation in Fanon's theoretical unit of analysis from the "I" of Caribbean Martinique to the "We" of the emerging Algerian Revolution.

In addition to Césaire, one of Fanon's crucial intellectual collaborators was French existentialist Jean-Paul Sartre. Fanon shared Sartre's desire to ascertain the implications of bad faith for coerced agents and to enact revolutionary change in the human condition by focusing on eradicating bad faith at individual and collective levels. Fanon defended a creolized Marxism that, unlike Sartre, did not banish racial particularities and nonclass forms of identification from politics. Fanon spent his remaining years as an ambassador for the Algerian resistance, never losing sight of his Caribbean roots. He died in Bethesda, Maryland, after undergoing treatment for leukemia. Fanon rapidly composed *The Wretched of the Earth* mainly via dictation prior to his death.

Existential Phenomenology as Critical Race Theory

Fanon developed a novel branch of existential phenomenology that merged inquiry into lived experience with the analysis of race. Prior to Fanon, Heidegger addressed the question of Being, Merleau-Ponty investigated the phenomenology of perception, Simone de Beauvoir explored women's embodiment in a patriarchal world, and Sartre examined the premises of the anti-Semite's metaphysical creation of the idea of the Jew. None of these analyses, however, offered a sustained meditation on critical race theory at a moment when racial states defined polities worldwide. Fanon reoriented the existential phenomenological tradition by applying it directly to the topic of race and anti-black racism.

Fanon probes Sartre's contention that the anti-Semite abdicates freedom in upholding an attitude of bad faith—the conscious act of an agent who avoids responsibility by deluding other agents into believing they are not free. Fanon compares the case of the anti-Semite to that of the Negrophobe. For Fanon, despite areas of convergence, anti-black racism has a uniqueness in that the anti-black racist creates metaphysical positions with regards to the black through overdetermining from the visual exterior the characteristics of this agent. Fanon, in turn, rejects universalizing ontological explanations of human attributes because, as in the instance of the black Antillean, ontology alone cannot explain the Look or racial gaze. Fanon extrapolates this lived experiential position to denounce the universal categories of Freudian psychoanalysis, stating instead that all psychological studies must be understood within social contents.

The Coloniality of Empire

Fanon formulates a critique of empire that is pertinent beyond the colonial period. This critique is based on a refashioning of the veil. W. E. B. Du Bois and John Rawls provide two differing veil conceptions. For Du Bois, the veil explains the double-consciousness and second sight that New World blacks possess and the dual racial-national identity of these agents. The veil is metaphorically living behind a veneer, which could potentially free one or keep one in subjugation. Rawls's concept of the veil of ignorance, in contrast, is a tool for abstracting away from all identity claims and imagining how to construct a just society if agents do not know their identity or status before entering civil and political society. Fanon inserts an alternative third schematic that embraces hybrid identities,

chooses non-ideal over ideal theory, and takes into consideration the real world veil of Algerian women revolutionaries. Fanon's earlier analysis of the phenomenology of race aligns with a later preoccupation with empire, the figure of the Arab, feminist theory, and how veiling or unveiling in the public sphere impacts debates on secularism, fundamentalism, and the architecture of colonial and postcolonial governance.

Revolution, Violence, Freedom

Freedom is the concept uniting Fanon's overall work. In *Black Skin, White Masks,* Fanon formulates love as a means to achieve freedom from states of bondage. Freedom for Fanon must be taken, not given. As his critical reading of Georg Wilhelm Friedrich Hegel on recognition and the master–slave dialectic suggests, Fanon acknowledges that a struggle for recognition is unavoidable when opposing agencies exist side by side in a social system. In contrast to Hegel, Fanon does not associate freedom with recognition and the achievement of self-consciousness. Freedom emerges after the stage of recognition, and it requires a confrontation not solely with the identity of another, but with the violence of revolutions.

The Wretched of the Earth is the culmination of Fanon's theorizing on freedom as it presents an analysis of inevitable revolutionary violence outside of an instrumental means-ends continuum. Fanon's exploration into the meaning of intrinsic violence for struggles against the global empire's misadventures offer lasting resources for critical theorists today.

Fascism

Fascism is a political ideology combining virulent nationalism, extreme political authoritarianism, corporatist or quasi-socialist ideas, and a cultural rebellion against democracy, liberalism, and Marxism. Fascist ideology reached its zenith in Europe between 1918 and 1945, when it was promoted by social and political movements across Europe and sometimes managed to seize the reins of government. And yet fascism is not limited exclusively to interwar Europe. Its ideational and cultural origins can be traced back to the late nineteenth century; and fascist movements and ideas continued to surface in the post-1945 era, when they came to be known as neofascism. The term *Fascism* derives from the name of the Italian movement founded by Benito Mussolini in 1919, and which ruled Italy from 1922 to 1943. In contemporary social science, however, fascism is also used generically in recognition of the fact that many of the features and ideas associated with the original Italian variant have also been espoused by other movements and thinkers outside of Italy.

Although fascist ideology only crystallized and attached itself to a political movement after World War I, its ideational core had already emerged at the end of the nineteenth century: namely, as a distinctive synthesis of nationalist and quasi-socialist ideas, articulated by figures such as Maurice Barrès in France, Georg Schönerer in Austria, Enrico Corradini in Italy, and various anti-Semitic thinkers in Germany. The nationalist socialism adopted by fascism rejected, on the basis of an organic conception of the nation, both the Marxist precept of class struggle and the liberal conception of society as an atomized aggregate of individuals. Instead, it aimed at a systematic, hierarchical organization of society to harness it in service of the national interest—without, however, dismantling the fundamental structures of

capitalism, primarily wage labor and private property. All social and economic activity was to be organized and coordinated in order to maximize national productivity and to sustain efforts of war and imperial conquest led by a strong, dictatorial political regime. Cooperation between all the *productive* classes of the nation would be ensured through corporatist forms of socioeconomic organization. With the idea of a strong state apparatus seeking to extend its control over all aspects of social, economic, and cultural life, fascist ideology was totalitarian in its aspirations. Indeed, the term *totalitarian* was explicitly used by Benito Mussolini and other fascist thinkers in reference to their conception of the state.

Underlying this socioeconomic and political program was a deep, urgent sense of cultural crisis. Fascism (like its nationalist-socialist predecessors) diagnosed the national condition at the turn of the twentieth century as one of precipitate cultural, moral, and spiritual decline. It attributed this national degeneration to what it regarded as the pernicious, disintegrative effects of liberalism, democracy, and Marxist socialism, which in turn were associated with the legacy of the eighteenth-century Enlightenment and the French Revolution. Fascism castigated democracy for generating anarchy and disorder by allowing the wild play of political forces and the impotent quibblings of parliamentarianism. It condemned liberalism for its egotistic, materialistic individualism. And it inveighed against Marxism for its equally materialistic and antinational doctrine of class conflict and international class solidarity. All these forces were understood not only as disrupting the proper social, political, and economic order of things, but also as destroying the nation's moral fiber and spiritual constitution.

Fascism offered itself as a rebellious antidote to this deep national crisis, claiming to be capable of leading the nation to a revolutionary spiritual as well as social and political rebirth. It promised an overhaul of all aspects of life on the basis of a comprehensive set of moral values: the affirmation of soldierly duty and sacrifice, of heroism and virility; the exaltation of authority, hierarchy, and the state; the primacy of the spiritual over the material and of the irrational over the rational; and the cult of violence and struggle (along with the purging of struggle from the domestic arena and its deflection to the international sphere). What must be remembered is that all the dynamic, energetic, and revolutionary impetus of this value complex was to be exercised only against the backdrop of an unquestioned imperative of national order and political authority. This important qualification notwithstanding, the revolutionary and dynamic drive of fascism was one of the main factors that distinguished it from conservatism. Another such factor was fascism's active, systematic embrace of modern technology and an equally systematic manipulation of mass society, mass politics, and mass communication.

The two largest fascist movements, as well as the most successful in achieving and maintaining political power, were the Italian Fascists and the German National Socialists. Italian Fascism, whose ideology was formulated mainly by Benito Mussolini, Giovanni Gentile, and Alfredo Rocco, was of course the paradigmatic case of fascism as a whole. Nazism, on the other hand, is a more idiosyncratic case in view of the centrality of biological racism in its ideology. National Socialism was driven by a biological-racist worldview, particularly a racial anti-Semitism that placed the Aryan race (to which the Germans belonged) at the top of a rigid hierarchy of human races, whereas the Semitic race (a term used to refer to the Jews) was considered not only as the bottom rung of the racial ladder, but also as a deadly menace to the Aryans and to all other races. National Socialism shared most aspects of fascist ideology, whereas the racial, anti-Semitic element came to dominate Nazi ideology and political practice to such an extent as to introduce a major, qualitative difference between National Socialism and most other fascist movements. This difference is most evident in the systematic, industrialized extermination of the Jews undertaken by Nazi Germany during World War II. The exterminatory project became such an overriding obsession that it was pursued even when it robbed Germany's war effort of essential resources, such as labor power and transportation infrastructure. Finally, Nazism also differed from most other fascist movements in its assertion of the primacy of the *Volk* (or organic national community) over the state, in contrast to the typical fascist belief in the absolute primacy of the state.

FEDERALISM

Federalism is a concept that describes forms of government that are organized by a division of power and jurisdiction between the national and subnational governments (typically states or provinces) according to legal and constitutional prescriptions. Federalism embraces a variety of forms, and all federal states have two defining characteristics. First, there is a division or sharing of power among different levels of government. Second, more than one unit of government has responsibility for a citizen living in any part of the country. Federal states are the opposite of unitary states, in which all sovereign power rests in the national government and all other units of government are merely its subdivisions.

Federalism is a much less common way of organizing governments than the unitary model, both historically and in the contemporary world. However, while there are fewer than 20 federal states in the world out of more than 200, they represent a large share of the global population and include many of the biggest and most powerful countries, such as the United States, Germany, India, Mexico, Australia, Russia, Brazil, and Canada. In order to understand federalism, we have to consider its historical evolution as a political principle, the distinct kinds of federal systems, and the current issues and experiences of federalism.

History of the Idea of Federalism

The word federal originates from the Latin term *foederis,* meaning league. The concept of federalism has an undoubtedly ancient pedigree, and it has changed and evolved considerably over the centuries. Some scholars see the first emergence of federalism in the leagues and alliances established among the independent city-states of ancient Greece and Italy. These leagues were in the nature of a confederation of sovereign states that ally primarily for purposes of mutual defense. Unlike in modern federal states, there were no central governments in these leagues with the authority to command and legislate for the separate member city-states. The leagues of classical antiquity did, however, embody the spirit of local self-government that remains integral to federalism today. Other scholars see important elements of federalism in the Old Testament biblical tradition. They identify the biblical notion of covenant seen in the alliance of the 12 tribes in the Hebrew commonwealth as a model for the kind of loosely organized polity with numerous autonomous religious communities bound together by covenants with God and with each other. Daniel Elazar in particular has highlighted the influence covenant theology had on the federalist thinking of sixteenth- and seventeenth-century Calvinist thinkers in Europe, as well as the American framers. Yet other scholars look to medieval Europe as a foreshadowing of federalism, wherein the relations of the papacy to the bishops within the church itself, as well as the relations between the papacy and the secular rulers, was sometimes described as a division of authority between different levels and kinds of government.

Despite the classical and Judeo-Christian foreshadowing of federalism, it is commonly held that the theoretical origins of the modern federal state derived from early modern Europe. Sixteenth- and seventeenth-century Europe witnessed the rise of the modern doctrine of sovereignty. In the original form articulated by Jean Bodin and Thomas Hobbes, unitary government characterizes the modern nation-state. It is also marked by the absolute and indivisible sovereignty that these theorists believed was necessary to secure peace and order. It was in this context that federalism emerged in this period as a theoretical response to the prevailing idea of absolute and unitary sovereignty. The modern idea of federalism rested on the principle that sovereignty can, and should, be limited and in some sense divided.

Early modern federalist thinkers were driven by a variety of motivations. Some thinkers, like Gottfried Leibniz and Baruch Spinoza, saw a

version of federalism with sovereignty divided between cities and estates, on the one hand, and imperial or union authority, on the other, as the only theoretically coherent way to account for the existence of heterogeneous and compound political entities, such as the Holy Roman Empire and the United Provinces of the Netherlands, that simply did not conform in actual practice to the theory of unitary and absolute sovereignty associated with Jean Bodin and Thomas Hobbes. Others such as Johannes Althusius saw federalism in the form of local governments or consociations as a way to protect the autonomy of minority religious communities in a post-Reformation context. Yet others such as baron de Montesquieu and David Hume turned to federalism in the form of confederations or county governments out of concern for the loss of individual and political liberty in the face of the authoritarian tendencies of the highly centralized modern state. Near the end of the eighteenth century, Immanuel Kant rehabilitated a version of the classical idea of leagues, which he presented as a federation of free republics that would further the cause of international peace and progress. Whether understood as a means to promote diversity, to protect local privileges, to reform international relations, or to encourage the virtues of self-government, federalism emerged in the early modern period as one of the major theoretical alternatives for the arrangement of political power in the modern nation-state.

The American Republic established in 1787 was the first modern federal state created by design. The Constitution produced a union of 13 separate states, each with their own republican forms of government that were subordinated to a central national government, while enjoying considerable autonomy in the constitutional division of power. American framers such as James Madison and Alexander Hamilton, writing under the pseudonym Publius, not only put preexisting political theory into practice, they also made two major theoretical achievements that furthered the development of federalism considerably. First, by establishing a national government with a direct legal connection to individual citizens rather than member states, they clarified the difference between confederations such as the Articles of Confederation that governed the United States prior to 1787, on the one hand, and federal states such as the Union created by the Constitution, on the other. Second, Madison and Hamilton rejected the traditional idea that republics must be small in order to remain democratic, and that monarchies are naturally suited to large territories. The American framers demonstrated that federalism allows for the extended republic, in which democratic principles can operate in a large territory by means of subdividing the nation into subnational governments. Although practical examples of federalism would remain few in nineteenth- and early-twentieth-century Europe, the American model of constitutional federalism would have a profound impact on later European federalist theorists such as Alexis de Tocqueville, Pierre-Joseph Proudhon, Louis Le Fur, Carl Schmitt, and Altiero Spinelli.

In the course of its historical development and evolution from the loose confederations of antiquity to the modern federal state introduced by the United States, federalism developed as a concept with both an empirical and normative dimension. As an empirical principle, federalism is used to describe the structural and institutional arrangement of power distributed among a multiplicity of political bodies representing national and subnational units. Federalism has also, however, come to be associated with certain values, such as tolerance, civic participation, and local self-government, that are often seen as holding intrinsic worth. The dual empirical and normative dimensions of federalism remain an important feature of federalism studies to this day.

Kinds of Federalism

Federalism by its very nature is a flexible concept adapted to local history and changing conditions. There are, however, generally held to be three major types or classifications of federal states characterized and distinguished by various degrees of decentralization of power. First, the *centralized* federal state is formally federal, but in practice operates virtually the same way as centralized unitary states. In this instance, the subnational governments provided for in the constitution have no real role in decision making and are prevented by the central government from exercising genuine autonomy. Russia, Brazil, Venezuela, and Nigeria are examples of centralized federal states today.

A second kind of federalism is often referred to as *mature* federal states. These are federations that may have begun as highly decentralized federations, but have gradually acquired a considerable degree of economic, social, and political integration among its constituent parts. In mature federations, the subnational units exercise constitutionally protected jurisdiction over different areas of public life, but in practice have yielded much authority to the national government as the supreme actor in the constitutional system. The United States, Australia, Mexico, and Germany generally qualify as mature federal states.

The *conciliatory* or *cooperative* model of federalism characterizes the third and most decentralized kind of federal state. This is most common in countries marked by a large measure of cultural, ethnic, regional, or linguistic diversity. The conciliatory or cooperative model of federalism involves an ongoing process of compromise and negotiation between the national government and subnational units. This perpetual process produces considerable equality among political units with respect to the division of power and jurisdictional claims. These federal systems are often distinguished by highly contentious relations between the national government and subnational governments, and thus effective administration typically requires achieving cooperation between them. Examples of the conciliatory or cooperative model of federalism would be Canada, India, and Switzerland.

The principle of subsidiarity is related to federalism, although it can be applied in principle to both federal and unitary states. Subsidiarity is an idea originating in nineteenth-century Catholic social teaching and maintains that the proper level of government for dealing with matters is always the lowest or most local level. If a public service or function can be performed at the local or regional level, it should be. Central authority must only act on matters that cannot be dealt with at the lower level. Although subsidiarity is present in some unitary states, its theoretical and practical connection to federalism is obvious. Many federal states have adopted the principle of subsidiarity, as has the quasi-federal European Union, which explicitly incorporated subsidiarity into Article 5 of the Treaty Establishing the European Community.

Current Issues in Federalism

One of the historical and continuing problems confronting federal states is the challenge posed by secession, wherein one or more of the member states in a federation try to leave the union or confederation and establish an independent nation-state or join another nation-state. In the past, this has led to civil war in the United States (1861–1865) and more recently in Yugoslavia in the 1990s.

There have been a number of important recent developments in federalist states. First, federalism has emerged in several countries as a potential instrument for social, political, and economic development. For instance, in Latin American countries such as Brazil, Mexico, Venezuela and Argentina, as well as in India, federalism is often seen as a spur to economic development through implementation of local and regional economic policies and as a support for the democratization process as political parties compete for power at the subnational level. Even in highly developed federal states such as the United States and Canada, theories of fiscal federalism have gained great currency recently. These theories of fiscal federalism involve devising strategies by which income distribution and regional equalization can be advanced through the use of tax and spending power by various levels of government.

Second, federalism today is sometimes viewed as an institutional arrangement well suited to provide for conflict management and internal stability in countries with deep political divisions and cultural diversity. In heterogeneous polities such as South Africa, and even in Iraq and Afghanistan, some form of federalism adapted to local conditions and history is a frequently heard prescription for reconstruction and domestic order because federalism offers the promise of balancing the need for national unity with the value of local or regional self-government.

Third, recently we have seen the introduction of federal elements into established unitary states as a means to address specific regional demands or to improve government efficiencies. For example, the federal principle can be seen at work in the United Kingdom with Scottish, Welsh, and Northern Irish devolution, as well as in Spain's granting of autonomy to Catalonia, Galicia, and the Basque region.

Finally, one of the most interesting recent developments in federalism studies has to do with the debate over the federal, or quasi-federal, character of the European Union. Both the supporters and the opponents of greater European integration typically describe their differences in the language and terms of federalism. Opponents of greater integration, known as Eurosceptics, tend to see the European Union as a confederation of sovereign states combined in a political form resembling the classical idea of a league united by treaty. Supporters of greater integration, however, point to the common institutions and authoritative bodies in the Union, as well as the monetary union and proposed common defense and foreign policy initiatives, as proof of the gradual process by which national governments are ceding sovereignty to an eventual Federal States of Europe. In 2005, the demise of the proposed Constitutional Treaty, which sought to strengthen the federal aspects of the European Union, after ratification referendum defeats in France and the Netherlands seemed to mark the victory of the Eurosceptics, but in many respects the push for greater European integration continues in its successor, the Lisbon Treaty. It is perhaps fair to say that the European Union represents another stage in our understanding of the gradually evolving conception of federalism.

Feminism

Feminism is usually thought of as a political and/or social movement, but it also includes the analysis of power in its various forms as it relates to women. It advocates critical inquiry into the more and less obvious mechanisms that distribute power. One cannot state that feminism is a movement advocating equality for women, because some feminists argue that standards of equality developed by the state are based on the exclusion of female identity: The abstract neutral citizen is presumed to be male. Feminist political theory includes a consideration of political action, institutions, movements, social change, and cultural practices, in addition to developing lens of analyses to understand how power is distributed, redistributed, and challenged. Feminist political practice has often aimed at inclusion into the political process and advocated for transformations of governance and the policies of institutions so that they serve the interests of the population in its entirety.

Feminism has proven to be particularly important for the field of political theory, as it points out how our ideas about femininity and masculinity have structured the opportunities available to and expectations for all human beings. Feminism recognizes how ideas and perceptions create the social world. One characteristic of feminism has been to develop a stronger linkage between theory and practice, seeing that challenging commonly held ideas can lead to changing practices, and that emerging practices can challenge received wisdom. For this reason, it is impossible to segregate feminist political theory and feminist political movements; they need to be considered in conjunction with one another. The development of new forms of critique has spurred feminist political action, and

feminist political action has changed theoretical analytics of power.

Feminist Political Practice

At many times women have joined together and acted in concert. But feminism, as a more formal political movement that demanded inclusion in and empowerment through established political institutions, can be described as occurring in three different waves or movements.

The first wave is commonly traced back to the emergence of movements demanding suffrage for women. However, it should be noted that women played a central role in the French Revolution; the fight for universal rights was successful in part because of women's participation in the democratic uprising. In 1789, the Declaration of the Rights of Man and Citizen was declared, giving all men within the French state equal rights. Female revolutionary, Olympe de Gouges responded with the Declaration of the Rights of Woman and the Female Citizen in 1791; however, her document did not win endorsement by the government or a majority of the French population. Modern feminism and modern forms of democratic citizenship have identical origins. As long as the universal rights of citizens have been declared, women have demanded inclusion. However, this movement was denied success for more than 100 years.

The problem was, what exactly made one an equal citizen? As Aristotle and Locke had established, they believed in equality, but only for those who *by nature* were equal with one another. The biological differences between men and women were taken to signal women's difference from men, hence their inequality. This presented the central conundrum of first wave feminism, should women deny biological differences and claim political equality based on their sameness or on the universality of the human condition? Or should they emphasize their differences and demand the right to represent themselves because they are different from men?

The same problem haunted the suffrage movement in the United States that emerged during the Reconstruction Era following the Civil War. Should women be given the same political rights because they are human beings, which in all essential matters are the same as men, or because they are different from them, and hence in order to be represented, they need to represent themselves? Ultimately, the argument that women are different and more moral than men was one of the winning strategies for achieving women's suffrage in the United States through the 19th amendment in 1911. It was proclaimed that if women were given the right to vote, they would engage in a *national housekeeping* and protect the rights and interests of the vulnerable populations with their new influence inside the established political structure. Paradoxically, women were awarded equal rights because of, not despite, what was considered their natural differences from men. In this way, formal political equality was achieved when all parties were assured that it would not change the natural order of house and home, where women were expected to subordinate their interests to their husband and children.

Second Wave Feminism

The second wave of feminism became a popular movement in the 1960s, but its guiding principle can be traced back to Simone de Beauvoir's *The Second Sex,* which observed, "One is not born, but rather becomes a woman." A clear sign of how little feminist perspectives were understood in the 1950s is that Beauvoir's text, a philosophical reflection on female identity throughout history, was assumed to be a book about the female body. An American publishing company sent the text for review to a French-speaking biology professor at Smith College who was impressed enough by the profundity of the argument that he undertook the translation of the text into English himself!

Whereas first wave feminists ended up gaining political inclusion by endorsing the status quo in private life, Beauvoir's observations challenged the division between political and private life and traced women's secondary social and political status back to their sense of self. She argued that women are taught to see themselves in contrast to men; men are considered the standard, female identity is considered a variation. Beauvoir observes that women see themselves as *the other* and as less essential than men. This view of self is reinforced through family relations, economic opportunities, formal education, and religious beliefs: Virtually every single cultural and political structure becomes

complicit in this view of women. The second wave of feminist practice questioned whether the previously accepted understanding of women's so-called natural differences was correct. They proposed that it might be more appropriate to talk about how women are socialized to be different from men.

Once the theory that female identity was not given but rather a social construction became widely disseminated, the platform for political action shifted immediately. In order to change women's role in the world, women's conditioning, expectations, and self-perception needed to be challenged. As a result of this insight, the "The Personal is Political" became the defining slogan of second wave feminism. In the United States, Betty Freidan wrote *The Feminine Mystique,* describing the lack of social engagement and frustration felt by many women, who experienced it as personal dissatisfaction in isolation from one another. However, Freidan argued that what was experienced as personal was in fact the result of larger social and political arrangements. Feminist politics meant reevaluating one's life in all different realms. Only by changing the patterns of living could the social and political world be changed.

The emphasis on personal identity created all different forms of henceforth untried political practice, from a collective engagement over the division of labor inside the home, to organized advocacy for child care, sexual freedom and experimentation, and rejection of standard conceptions of female beauty. One group of feminists staged a beauty pageant crowning a sheep Miss America in order to expose what they considered the degradation of women in beauty pageants who were judged by looks like animals in a stockyard. Investigation of personal identity created tension between groups of women, as women from different racial backgrounds started to question whether the women's movement was constructed around a white, middle-class female, just as the standards for what was considered the average human being had long been assumed to be that of a white male. There were also divisions between different groups over sexuality: Some groups claimed that lesbianism was the only way to live one's life outside of patriarchy, whereas others argued that such a position would permanently marginalize feminists to the periphery of society. Inevitably, groups began to fracture along racial, ethnic, class, and sexual differences as politics, cultural practices, and personal identity became more indistinguishable.

Third Wave Feminism

The third wave is above all characterized by a plurality of strategies and a desire for inclusivity. The start of the third wave was declared in *Ms. Magazine* in 1992 by Rebecca Walker in a piece titled, "Becoming the Third Wave." Throughout the 1980s, feminism had come to be considered an outdated battle, or one that had been won during the 1970s due to the gain in reproductive choice and the inclusion of girls and women into sports, the military, professional life, and educational institutions. Walker's declaration was that it was not a post-feminist age, but rather that the start of a new form of feminist movement has grown in popularity with the political shifts in the twenty-first century. Women's rights and opportunities appear to need defense, even as women around the world gain more inclusion in the formal political process.

As a result of the innovations of second wave feminism, rather than approaching feminism as a natural alliance among all women, there is a recognition in the third wave that both male and female identity is socially constructed, and that part of a feminist revolution includes restructuring gender identity all along the spectrum of possibilities. There is an increased awareness of transgendered individuals and the need to include them in the movement, as well as a desire to contest and investigate how society defines both masculinity and femininity. Similarly, there is a recognition that not all women hold the same amount of power, and that gender identity intersects with other characteristics in unique ways. There is a growing global consciousness that recognizes that women and men in different countries enjoy different amounts of power, not purely determined by their gender status. For instance, it would be difficult to argue that a powerful American woman such as Hillary Clinton is less empowered than an average man in Eritrea. Different groups seek to build alliances across national borders, so the third wave is characterized by an attempt to envision a more global feminist movement, one that seeks to empower all women and girls, not to accept the success of a

small minority of women as an indication that the feminist project is now complete.

Feminist Political Theory

Greek playwrights and philosophers took up the women's role in the polis and conducted early debates about the role of family, reproduction, and whether women could act in the same capacities as men. One of the earliest works of political theory written by a woman is Christine de Pizan's *The Book of the City of Ladies*. Pizan's exceptional status as a noblewoman who received unusual encouragement in her scholarship from her father provides a feminist lens into the history of political thought. The fact that hers is one of the few contributions by a woman into the early canon of political philosophy underscores the fact that women were very rarely given the tools, encouragement, and audience to develop their ideas. The history of political thought records the history of feminist perspectives largely by their exclusion.

Most generally, the pattern that emerges when surveying the development of feminist political thought is the emergence of feminist interpretations of existing theoretical paradigms such as liberalism, Marxism, and anarchism. However, the debates within feminist movements that examined the construction of female identity as a political process created a radical shift in political thought. New modes of power analytics were developed, understanding that power does not only operate through the more familiar mechanisms of laws, institutions, administrators, and leaders. Instead, we need to understand how power operates in every aspect of the human experience. More recently, schools of feminist theory have been central in developing the paradigms they espouse: poststructuralism, postcolonialism, psychoanalytic, transnational, and eco-feminist movements.

Though each of these movements and paradigms can be identified and to some extent stand apart from one another, it is helpful to identify particular concerns that have dominated feminist political thought and made appearances in all of these different schools of thought. The strands are mutually informing and are best understood as a series of different emphases rather than mutually exclusive paradigms. For instance, a Marxist feminist approach to understanding power may emphasize class distinctions and the exploitation of labor as central. The Italian Marxist feminists had a movement to demand wages for housework, arguing that providing a wage for women's labor would be one way of addressing the root of female inequality. The analysis shifts if one takes a transnational perspective rather than a purely Marxist one, however. Now in an increasing number of homes in more developed countries, even middle-class women pay women from developing counties to perform duties in the home. Does this mean the problem of inequality and gender has now reached a resolution because housework is given a wage? Clearly not, because the wages women earn, the feminization of particular occupations, and the disparities in earning power between females from different countries is a cause for concern. This is one example of the overlapping concerns of different schools of feminist thought. To understand the many forces at work in something as common as hiring someone to clean one's home, one must analyze different expectations about gender roles and familial responsibility, class structure, and transnational economic forces.

Here are four predominant themes in feminist political analysis: feminist ethics, the division between public and private spheres, the politics of identity, and the relationship between gender and political economy. There are other important strands of inquiry, such as epistemology, representation, reproductive politics, and the position of women in relationship to the law. These four themes, however, unify feminist politics and inquiry across a number of different fields.

Feminist Ethics

One school of thought has accepted the differences between femininity and masculinity as they are socially constructed and made arguments that society as a whole would be more just if it were to incorporate female models of behavior into the normative standard. The notion that there is a difference between female and male ethics is longstanding, but its more recent incarnation can be traced back to responses to a survey conducted by Lawrence Kohlberg in 1970, from which he concluded that females were less ethical than males. He asked girls and boys whether it would be right for a man to steal medicine that his wife needed from

a pharmacy. More of the girls responded in an ambiguous fashion, hence Kohlberg concluded that females exhibited less moral reasoning than males. Carol Gilligan wrote a reply to this study, *In a Different Voice,* examining the results of the study carefully. She pointed out that girls were more likely to ask questions about the nature of the wife's illness, whether the man tried to negotiate with the pharmacist, and whether the pharmacist understood the dire nature of the situation.

Gilligan concluded, in a fashion consistent with Beauvoir' observation that women develop a sense of self in relation to others, female ethics are also developed contextually and relationally. They think about how actions will affect relationships between people, not whether the principle itself is right or wrong. Therefore, although self-reliance in principle may be an excellent ideal, insisting on self-reliance for someone who is ill, young, or impaired in some way would be cruel. Different people and situations require different responses; hence ethics is something that needs to be understood in light of the particular situation, not universally applied to all situations.

This sense of morality has been called "an ethics of care" and has been promoted as an alternative to liberal, individualist political institutions that emphasize autonomy, individual reliance, and proceduralism. For instance, in the United States, welfare policies have been seen as fostering dependence that in the tradition of American citizenship makes one's status as a citizen suspect. However, these feminist ethicists insist that dependency is a necessary aspect of the human existence: The sick, young, and elderly in particular need care, and everyone needs care occasionally. A feminist perspective on the welfare state argues that dependency needs to be accepted as an inevitable aspect of the human condition; we should not link state assistance with second-class citizenship. This viewpoint argues that having an ethics of care and interdependence will create a more just and humane model for society, as currently those who engage in the care of others have their work devalued by the marketplace and policy, education, and law emphasizes autonomy and separation, rather than interconnection.

More recently, feminist scholars have also taken feminist ethics and used them to critique standard conceptions of security. Security is frequently defined as a state's preventing harm to its citizens. Feminist scholars have argued that our notion of security needs to be expanded to incorporate all aspects of human needs. People need food and shelter, not necessarily stronger militaries, in order to be secure.

The Division Between Public and Private

One of the more consistent themes in feminist political theory has been an inquiry into how custom and law has divided society into different spheres of activity and regulation. In ancient Greece, Aristotle distinguished the household from the public, arguing that only those who were by nature equals could leave the household, a sphere of dependence and economic production, to enter the public, a space of deliberation, equality, and justice. In this way, he was able to create a form of government that gave citizens the right to rule themselves and others, while simultaneously preserving what he considered a natural hierarchy, excluding women, children, and slaves from participation in governance. John Locke created a similar division in his work: He distinguished paternal and political authority, arguing that the development of new forms of egalitarian rule need not disturb the father's rule in their households. The private realm is considered the realm of absolute freedom and should ideally remain outside of regulation of the state. By delineating the public and private sphere, Locke is able to provide for limited government power, an attractive proposition for those worried about the abuse of political power. The designation also supported Locke's argument for toleration: If all private practices are limited to the private sphere, then it is possible to accommodate different religious beliefs within one government. In short, the division of society into public and private spheres has been a way to define the relationship between family and state and develop the boundary of state regulation.

However, many feminists have looked at these configurations and argued that the division between public and private spheres is deeply gendered. Women are expected to reside in the private sphere and are subject to suspicion and particular criticism when they leave the sphere considered appropriate. Carole Pateman's book, *The Sexual Contract,* argued that social contract theory was

actually a contract of sexual subordination, the liberal model of politics allowed for the perpetuation of patriarchy in private in the name of equality in public.

Some feminists have argued that it is not clear that the privacy of the home is indeed a space of freedom for females and children. If the state adopts a policy of noninterference in the home, who protects women and children who are abused within it? Or for instance, by protecting the freedom to worship as one chooses in private, does the state end up condoning some religious practices that subordinate women? These issues continue to be debated around the world as different religious groups who believe that females must be subordinate to men reside within polities that espouse principles of gender equality.

Feminists have also pointed out that the boundary between families and the state has been sporadically enforced. The state has defined the conditions of marriage and tried to offer incentives for procreation to occur within state-sanctioned marriage. Laws about marriage and adoption continue to be debated, as different groups—from interracial couples to homosexual ones—try to assert their right to have families outside of the realm of government intervention. The state, different religions, and medical and legal practices all define, and to some extent enforce, norms about family structure, sexuality, and marriage. Studies examining the administration of the human body by such powers refer to this cluster of practices as *biopolitics*.

It is crucial to emphasize that there are no actual public and private spheres; they are divisions that have been used to determine both where government regulations and principles should end and also how to understand the relationship between the body and the social world. Nevertheless, these designations have a tremendous impact on how people live their lives and have created social, economic, and familial patterns. For instance, women are still considered keepers of the home, and even if they now work outside of the home as well, they still maintain primary responsibility for providing care for other members of the family. This is what is known as "the second shift." Women who run for office are also scrutinized to see whether they may be neglecting their other duties, such as caring for their children. Although it can no longer be said that women are confined to the private sphere, it is clear that they are still ascribed—and largely accept—primary responsibility for it and are evaluated differently when they become figures in public.

Identity Construction

Since Simone de Beauvoir argued that one is not born a woman, there has been a flurry of inquiry into the difference between sex, a biological category, and gender, socially developed norms of femininity and masculinity. Although initially there was effort to determine the boundary between sex and gender, and what was natural and what was socially constructed, this endeavor was soon abandoned, as it proved impossible to determine (just as, for instance, the debate whether genetic or environmental factors contribute more to a child's development is still unresolved). Some feminists called *essentialists* have sought to define what characteristics are shared by all women. Other feminists emphasize gender as socially developed and are known as *constructivists*. Because gender identity is socially constructed and hence malleable, feminists have tended to focus on how society develops, propagates, and reproduces gendered norms and behaviors. This is understandable from a political perspective, as such inquiries can explore how these expectations have changed and can be changed.

Judith Butler's *Gender Trouble* argued that gender is actually performative, something that we engage not as a reflection of who we are deep inside, because our "true identity" is unfathomable. Instead we are social creatures, and perform the roles for others that we consciously or unconsciously choose. Part of the book's argument rests on an analysis of drag culture, whereby men and women are able to perform the gender identity they choose. In a related argument, others have focused on gender as image. Without the shared systems of representation, it would not be possible for a woman to imitate a man so easily, nor a man to present himself as a woman, or for that matter, for a women to "play" a female. Teresa de Lauretis argued in *Technologies of Gender: Essays on Theory, Film, and Fiction* that "The construction of gender is both the product and process of its representation" (1987, p. 5). Social images reflect

conceptions of what it means to be masculine and feminine, but also that systems of representation themselves produce gender identity itself.

Recognizing that identity is socially constructed has led to a more general consideration about how different identities are socially formed as well. There is not one single position that all women occupy; instead, female identity intersects with other religious, racial, ethnic, sexual, national, and class identities as well. Once we start to recognize that identities are social constructions, it is important to recognize that many different identities intersect in every individual's life. A shared identity links people together but cannot be assumed to manifest itself in the same way in every individual's experience. For instance, a Latina on the Supreme Court may envision her ethnic identity differently than a Latina artist who lives in Tennessee. Neither woman can be said to be more authentically Hispanic than the other.

This understanding of how people have many different factors constructing a sense of self has led to a newer emphasis on gender as a continuum. Some have argued that one of the problems is that there are only two genders that are commonly recognized, and two options cannot possibly encompass the full range of gender identities that are actually experienced. To impose a binary model on the variety of human experience is to do utter violence to the diversity of human experience. Also, the relationship between gender and sex has come under increasing scrutiny. With more research on biological diversity, it is starting to be questioned whether sex is a socially, not purely natural, construction. Doctors assign genders to babies born with ambiguous genitalia, and considering the experiences of some transgendered individuals, it has been argued that one's gender—one's image of oneself—is more determinate than one's physical attributes.

Gender and Political Economy

One of the oldest branches of feminism was developed in relationship to Marxist political thought, arguing that women as a group performed many of the world's unremunerated and underpaid tasks. Tasks that are considered women's work, if paid a wage at all, are paid relatively poorly. The explanations for this phenomenon are varied, but are the result of social expectations. Women are largely assumed to be dependents. For instance, married women's work is thought of as supplemental to their husband's income, a rationale that was used even if a woman happened to be unmarried. Younger unmarried women are assumed to be largely supported by their fathers. The assumption was that women were dependents themselves, and in turn had no dependents, and therefore could subsist on smaller wages. Conversely, it is assumed that men do have dependents, and therefore their labor needs to be awarded a higher wage. These assumptions often do not correspond with facts, but these beliefs still end up generating a lower wage for women's labor around the world.

Cultural and political patterns have contributed to what some scholars have called the feminization of poverty. In addition to the still intact practice of paying women lower wages for equal work, expectations of family roles also contribute to the poor economic status of women. If children are born out of wedlock, or in the event of a divorce or separation, mothers are frequently given custody of the children. The father may be asked to provide child support, but this rarely amounts to half of the cost of providing children housing, clothes, and food. Due to their socially accepted role as primary caregivers, women then also shoulder more of the economic burden of child rearing, even though they make less! This is just one more factor that means that women around the world have less income and property at their disposal. Their secondary economic status makes women a more vulnerable population and makes them less able to exercise political power.

During the last 40 years, in the newest restructuring of the global economy, women around the globe have been incorporated into the formal and informal global workforce in an unprecedented fashion, as evidenced by the large number of women who now do much of the manufacturing labor. Interestingly, women's roles as caregivers make them desirable as migrant laborers as well. Women from other countries are hired to care for children, work as nurses, and provide cleaning around the world. The predominance of women in these occupations and the need for such positions to be filled means that women migrant workers now outnumber male ones for the first time in modern history. They send portions of

their earnings home to support their families; such earnings are called remittances. Today, many governments openly recruit their female citizens to send them abroad to work. The increasingly widespread practice has created debates in some countries, such as the Philippines and Sri Lanka, about how having an absent mother impacts family structure and child rearing. It may also have long-lasting impacts on gender roles in the countries that most engage in it: What is the role of a male if he is not providing for his family? The effects of economic globalization on women's wages and opportunities, the family structure, and gender roles around the world are still very much evolving and are areas of great scholarly and political interest.

Ferguson, Adam (1723–1816)

Adam Ferguson was a Scottish historian and moral philosopher who wrote during the period of concentrated intellectual activity known as the Scottish Enlightenment. He exerted considerable intellectual influence in Britain, Europe, and America and is sometimes posited as the parent of modern sociology. Yet his reputation has long been overshadowed by those of his more famous friends and contemporaries, David Hume and Adam Smith. Further, despite his disagreements with both of them, it is common to encounter readings in which his ideas and orientations are automatically conflated with theirs, as well as with those of other thinkers of the Scottish Enlightenment.

A Pioneering Social Scientist

Ferguson was deeply interested in social change. In his time, the Scottish lowlands were the economic wonder region of Europe, so he was well placed to study the effects of the intense social, economic, moral, and political changes brought on by development. In the first sustained critique of market society, Ferguson offered a penetrating analysis of the social and political effects of specialization, consumerism, expansion, urbanization, bureaucratization, centralization, individuation, privatization, depersonalization, and hedonism,

stressing the importance of (what we now refer to as) social capital and political efficacy to the maintenance of strong polities. He linked this critique to the problem of political corruption, understood in the classical sense as loss of political and martial virtue. Perhaps his most influential idea was the theory of spontaneous order, which later informed the anti-constructivist, laissez-faire strand of classical liberal thinking developed and popularized by Friedrich Hayek. Ferguson also influenced the work of Georg Wilhelm Friedrich Hegel, Karl Marx, Herbert Spencer, and, more recently, those looking for early sources on the nature and preservation of civil society (e.g., Ernest Gellner).

Insisting on the natural sociability of the species and reacting to commercialism's increasing reliance on instrumental rationality, Ferguson wanted to reinstate the passions as the foundation of community. The result is a defense of noncognitive processes mounted on two fronts. The first is moral and emotional, conceived through the prism of a classical sensibility about the perils of political corruption and focused on the importance of spontaneous affection. The second defense is social-scientific: Ferguson's defense of the passions as the source of social order consists in a highly developed theory of spontaneous order that presages nineteenth-century structural functionalism and signposts and aids the emergence of social science proper. His main target here is the type of a priori reasoning associated with rational constructivism and contractarianism. Social arrangements emerge spontaneously, gradually and almost imperceptibly from the unintended consequences of countless individual actions performed over time; through a protracted process of ad hoc experimentation and adaptation and the preservation and transmission of tacit knowledge via norms.

A Transitional Thinker

Ferguson's philosophy reflects a transitional phase in Western political thought. It straddles traditions; anchored in antiquity and natural religion yet oriented toward the concerns of modern social and political science. Though scholars generally group him in either the republican/civic humanist or liberal camp, his thought is perhaps best understood as a sustained effort to nudge a space between the classical tradition and emergent liberalism.

Whereas the Scottish Enlightenment has been characterized (principally in the figure of Smith) as an attempt "to legitimise bourgeois civilisation at an early stage of its growth" (Mizuta, 1976, p. 1459), Ferguson stood apart as a figure that frequently acted to subvert and *de*-legitimize it. He wanted to understand the processes that underlay the apparent political, military, affective, and moral decay of his own society and to discover how to offset the damage done to a state in which people had lost their virtue and become "incapable of public affections."

Ferguson portrayed commercial life as alienating, isolating, and affectively sterile. The contractual relationships of market society "introduce the spirit of traffic into the commerce of affection" and under the "growing sensibility to interest" and the reigning ethic of the market, we "consider kindness itself as a task" (Ferguson, 1767/1996, pp. 86–88). The "bands" of friendship in commercial society appear to us of a "feeble texture, when compared to the resolute ardour with which [precommercial] man adheres to his friend, or to his tribe" (Ferguson, 1767/1996, pp. 22–23).

By contrast, Smith and Hume both saw commerce as creating superior forms of sociability that enhance personal relations and mutual dependencies. Both reject the simple social forms admired by Ferguson in favor of large scale, nonparticularistic communities regulated by impartial justice. Dismissing Ferguson's fond portrait of an intimate precommercial "knot of friends" united by beneficence and common interest, Hume regards barbarity as a dreary state of "solitude" in which each is compelled to live with "his" fellows in a "distant manner" (Hume, 1987, pp. 270–271). By comparison, commercial life is sociable, congenial, and open, characterized by a proliferation of clubs and societies, all of which reflect the breakdown of aristocratic privilege and other exclusivistic social categories.

Ferguson's pessimism about progress and modernity reaches its lowest point in his opposition to Smith on the issue of citizen militias. Smith had a generally positive attitude to the professionalization of security: An organized system of justice underpinned by regular armies affords "to industry, the only encouragement which it requires,

some tolerable security that it shall enjoy the fruits of its own labour." Standing armies also provide the best defense against foreign invasion. Ferguson disagreed. Dependence on professional armies, coupled with the growth of market culture, results in a generalized and devastating decline in public virtue. Scotland, like other commercial nations, had become "a Nation of Manufacturers, [in] which each is confined to a particular branch and sunk into the Habits and Peculiarities of his Trade." Its citizens were now "gross, sordid, void of sentiments and Manners," ready to be "pillaged, insulted, and trod upon by the enemies of their country" (Ferguson, 1751, p. 14). Whereas Ferguson sees security as an intimacy-enhancing enterprise that could not be safely assigned to an organized state and a specialized standing army, by contrast, Smith argues that such institutions not only offer better security but generate positive changes in the social fabric. By releasing citizens from public duties, they permit them to get on with their independent pursuits while at the same time engendering the levels of trust and order necessary for such pursuits to flourish. For Smith, there is no dilemma of wealth and virtue because he was generally positive about progress and more liberal in his outlook. Ferguson's sympathies could be best described as liberal republican. They are not purely republican because he is deeply ambivalent about progress.

Although progress might erode political virtue, it is also inevitable and natural; a result of the Providentially inspired laws of spontaneous order. Much is gained by progress, including an expansion of freedom and rights, a diffusion of wealth and economic independence, and a welcome diminution of brutality, religious superstition, cruelty, and malice. He hoped that the traditional opposition between private wealth and public virtue was misconceived: Community and commerce, wealth and virtue, civic élan and private liberty might all be balanced rather than played off against each other by the judicious application of such remedial measures as citizenship training within schools and the reintroduction of citizen militias. But Ferguson's attempted reconciliation of the two sets of goals was never decisive; indeed, ambivalence about wealth and progress could be described as the keynote of his oeuvre.

FEUDALISM

There have been many feudalisms. If we make an exception of the Marxist-Leninist conception of *feudalism* as that set of production relations preceding capitalism, the core referent of the term is the predominant political structure of Western Europe during the Middle Ages, to such an extent that for nonspecialists, *feudal* is practically synonymous with *medieval*. Historians also use the term to describe periods of Japanese and Chinese history. Sociologists, political philosophers, and op-ed journalists routinely apply it to such a bewildering variety of relationships that the term has lost almost all explanatory power. Yet its very multifacetedness indicates how indispensible feudalism is to analysts and intellectuals. In view of this, the only universally accurate statement one can offer is probably that feudalism is or has become a semantic problem; to solve it would

require a multivolume intellectual history of social science.

Etymology of the Fief

The etymological roots of the word *feudalism* are the Latin noun *feudum* and its cognate adjective *feudalis,* both of which were common by the end of the twelfth century in Western Europe but which even then had a long prehistory stretching back to the early Middle Ages, and ultimately to Germanic and possibly even Celtic languages. Feudum means fief; this is the origin of the bastard term fiefdom, which has entered common usage to describe an illegitimate or at best morally questionable private or privatized power to influence events in a particular category or place. Whatever else the centuries since the Middle Ages have done with the notion of the fief, feudalism is an idea formulated by intellectuals in response to this legal institution. It is therefore essential to gain an acquaintance with the fief. The meaning of the fief has been difficult to establish throughout history. Medieval analysts found the fief to be a slippery concept. One of the most influential teachers of law in the thirteenth century, the canon lawyer Henry D'Souza admitted: "I never heard an adequate definition of the fief." The best consolation he could offer was: "However, it can be described well enough with magisterial [i.e., a teacher's] authority."

About a century and a half later, the equally famous lawyer Baldus de Ubaldis noted during his course of lectures on the Roman law of Justinian that the fief was unknown to the Romans, and further, if they had known of it, they would have disapproved for two reasons. First, the fief seemed to embody an uncomfortable blend of servitude, both of persons and things; and second, a fief brought with it rights of jurisdiction over people, something that according to Baldus's Roman law–conditioned values should only belong to the public authority. This is perhaps the earliest pithy summary of a thesis that would dominate academic work in the early twentieth century, now known as juridical feudalism. The fief that Baldus described was a parcel of rights held by a vassal from his lord in return for a variety of personal services, originally military service. Vassalage itself was a form of personal subjection created by an oath of fidelity and, in many regions of Europe, an accompanying ceremony of personal abasement called homage, resulting in the vassal becoming the lord's *man.* The lord was more than just a landlord, therefore; he had the right to discipline his vassal in a number of ways. Conversely, the vassal's duties were not primarily conceived as rent, or anything like it, but rather as a set of personal obligations, owed because the vassal was a vassal, not because the vassal held a fief (which not all vassals did anyway). However, by the later Middle Ages, the fief was regarded as a key constituent of the feudal relationship, alongside the oath of fidelity. By the time Baldus wrote, indeed for several centuries before his time, it was hard to say whether a vassal owed service because he had sworn an oath of fidelity or because he held a fief. This is why Baldus thought the fief embodied a mixture of principles that a tidy-minded lawyer trained in the categories of Roman law would rather have kept apart. This blend of the proprietorial and the personal was, therefore, one aspect of the fief.

Historians have generally been more impressed by the second aspect of the fief: jurisdiction. This too was a word with a history. It achieved prominence in medieval analysis during the twelfth century as a result of the renaissance in the study of Roman law and came to typify governmental activity for medieval theorists. Even medieval lawyers then saw the fief as a *political* not just proprietorial phenomenon. In that sense, even the most unreflective modern uses of the term feudalism have some basis in historical reality. Baldus did not have any such modern word at his disposal as *state,* but his comment about jurisdiction belonging to the public power rather than to just anyone as a piece of private property at least prepares us for the later conception, prevalent to this day, that whatever is feudal is somehow antithetical and inimical to the state. This usage has a venerable tradition behind it, even among specialist historians of medieval Europe. At the axial point in his now classic study of the Mâconnais region of Burgundy, France, in the early Middle Ages, Georges Duby summed up the situation toward the end of the tenth century as the Carolingian State belonging to the past, whereas the future belonged to the feudality. By feudality (French: *féodalité*) Duby meant feudal retainers—vassals—in distinction to the count, the representative *par excellence*

of the now moribund "public" authority of the Carolingian dynasty. The Carolingians had ruled Francia (formerly Gaul, but Francia since the Frankish invasions of the fifth century) since 751 CE. They are called Carolingian after the second ruler in their line, Charlemagne (aka Carolus Magnus and Charles the Great), in whose person the defunct Western Roman Empire had been resurrected by the papacy at an "imperial" coronation in Rome on Christmas Day in the year 800 CE. At its apogee, the Carolingian Empire stretched from just south of the Pyrenees to beyond the Elbe River in Saxony, from the border with Denmark to southern Italy. Feudalism is what, in a now rather outdated vision of developments, is supposed to have happened to this empire, bothas a symptom and exacerbating cause of its decline under the pressure of external attack (especially by the Vikings) and enmities within the dynasty itself.

The key term in this story was the fief. Counts were the principal representatives of the king-emperor at the local level; they held court, dispensed justice, protected the ruler's estates, mustered the army when necessary, and generally communicated the ruler's orders to the free population. They were sustained by a temporary grant of land and rights known as a benefice (Latin: *beneficium*), which they exploited for as long as their appointment to that particular county lasted. This benefice is carefully distinguished in Carolingian legislation from a count's own property (Latin: *proprium*). That was because the benefice was a perquisite of office; when office became hereditary, which it did as tenth-century West-Frankish rulers lost more and more control over the regions, so did the benefice. From the early eleventh century onward and with increasing frequency, that word beneficium tends to be replaced by the word *feudum* or "fief" in the surviving documentation. This is why the fief always kept that aura of coercive jurisdiction in later centuries, at least as far as lawyers were concerned: It had begun as a form of payment for a public official, defined as such by his exercise of the king's powers in the king's name. Duby's lapidary comment refers to the next stage in the degeneration or "privatisation" of the originally public authority of the ruler. The count himself had already lost control to a lower echelon of violent and parasitic armed men, who by usurpation and other forms of force, had parceled out what remained of the count's powers and settled themselves in fortified settlements, thence and henceforth to dominate, as vassals of the more or less powerless count, the remnants of the free Frankish people and slowly depress their status to that of serfs. Thus is born the late-medieval landscape of a multiecheloned military aristocracy and dependent peasantry.

This is what historians mean by the expression "juridical feudalism": The fief in this vision of things is a *legal* institution, describable in the colorless terms of jurisprudence as a form of property that was held by a vassal from a lord, heritably, in return for military service, implying some (usually formal and weak) power of jurisdiction by the lord over the vassal, and allowing the vassal rights of exploitation not only over land but frequently over people too. As concomitants to the pristine distinctions of a more or less legalistic vocabulary ran brutal social and economic realities of astonishing longevity. The sum of both was feudalism.

Challenging the Notion of the Fief

Every element of the previous story has been challenged, some of them from as early as the sixteenth century, when humanist philologists and lawyers hypothesized Roman instead of Frankish origins for the fief and vassal. In more recent historical scholarship, the count of supposedly public Carolingian character has often been revealed to be a local strong man, enjoying a private or, better, *informal* hegemony, rather than tidily delegated powers of the ruler. The validity of the distinction between private and public coercion is hard to maintain against the results of detailed research into the dynamics of power in the early medieval period. Some efforts have also been made—albeit with less success—to question the legal distinction between the benefice/fief and other forms of property. Local variation over such a vast area as the Carolingian Empire has also been emphasized repeatedly; the story of Western Europe is not entirely the story of the West Franks, that is, the French. What cannot reasonably be denied, however, is the importance from the early eleventh century onward of vassalage and its concomitant, lordship. Literally thousands of documents from all over Western Europe imply a close, though of

course not uniform, relationship between oaths of fidelity, often homage, vassalage, fiefs, and lords. No adequate account of this period in European history could be given that did not ascribe central if not definitive importance to such phenomena in many regions, although certainly not all. Not to recognize this would be to waste the hint that eleventh-century authors themselves give us, for they were much exercised by the implications of vassalage. True, it will not do to posit the state as the counterpart and antonym of feudal relationships between lord and vassal, but other words, truer to the time and its sources, can serve instead.

From the later twelfth century onward, those words would often be found in the texts of Roman law. The demise of feudalism in the West has often been associated with the rise of Roman law conceptions of public power. Roman law is supposed to present a *quasi-absolutist* vision of the relationship between rule and subjection, because the Roman law harks back to the period when the Roman Empire (the real one, rather than its Carolingian imitation) still existed in all its authoritarian might. Historians of political ideas frequently contrast the period of absolutism with the putatively "constitutional" feudal period immediately preceding it, that is, the later Middle Ages. The association of the feudal with the constitutional arises from the notion that the feudal relationship between lord and vassal was contractual: A lord could only demand so much from his vassal. Moreover, several influential legal texts from the twelfth century onward imply or actually state that a vassal may legally attack his lord under certain circumstances, such as for denial of justice or for confiscation of the fief without due cause and a preceding judgment of a properly constituted court. Of course, this vision of things relies on the reduction of all of the most important political relationships between rulers and subjects to the relationship of lord and vassal, and some historians, among them some of the very best, have explicitly defended this proposition, on the grounds that a medieval king's most important subjects were usually vassals, military aristocrats, his natural advisers and companions. The rise of the state is seen as the nemesis of feudalism, in the strict sense that the state is supposed to have arisen on feudal foundations, as rulers exploited the few resources that remained to them as feudal lords over noble vassals and welded them into that complex amalgam of legal and liturgical elements known as later medieval kingship. Once again, the story is worryingly and misleadingly French, but beyond territorial myopia there are strong grounds for questioning a reconstruction of events that posits such a passage from feudalism to absolutism. Crucially, Roman law could be put into the service of antiauthoritarian theories of government in which an abstract or corporate people emerged as the true ruler. Such theories constitute some of the quintessentially *medieval* contributions to the history of political theory, yet they have little or nothing to do with "feudal" conceptions of contractarian rulership and justified resistance.

Feudalism therefore seems to be vulnerable both at the end as well as the beginning. But this does not evacuate it of all meaning and utility in the study of political thought and medieval European institutions. On the contrary, provided some shibboleths are abandoned, it becomes hard to do without a concept of feudalism. Roman law conceptions were not univocally authoritarian; the uses to which the lord-vassal relationship was put in various polemical and reflective works were not exclusively corrosive of authority—so much for the shibboleths. Indeed, feudal terminology underpins some of the most virulently authoritarian political programs of the later Middle Ages, just as Roman law could support popular and consensual politics. Yet this is precisely why we cannot afford to ignore feudal terminology, still less to sublimate it into broader categories of vocabulary and effectively dissolve it as a specific term. Medieval thinkers knew they were tapping a subtly different source when they argued from and about lords, vassals, and their mutual obligations. Henry D'Souza and Baldus de Ubaldis were, respectively, experts in canon and Roman law; one might expect them to have subordinated all reality to the analytical categories with which, as lawyers, they had grown up. Yet each recognized in his own way that there was something different about fiefs and vassals, together with the structure of obligations that gave them shape and meaning; it would be arrogant to assume that we know more about their civilization than they did.

Fichte, Johann Gottlieb (1762–1814)

Born on May 19, 1762, in Rammenau, Saxony, Johann Gottlieb Fichte was one of the most remarkable and yet most neglected modern political thinkers. Son of an impoverished weaver, a young Fichte became a protégé of a local aristocrat who enabled him to get an education at the universities of Jena and Leipzig. In 1790, while in Leipzig, Fichte read Immanuel Kant's *Critique of Practical Reason,* which led him not only to abandon a Baruch Spinoza–type determinism, but also to acquire a new understanding of Kant's *Critique of Pure Reason*. From this point on, Fichte claimed to be a "Kantian," and saw his own work as a clarification of the views held by his great predecessor. Nonetheless, Fichte was an original thinker in his own right.

What Fichte found groundbreaking in Kant's work was the idea of moral freedom, of the autonomy of the moral subject. What he rejected was the distinction Kant made between appearance and the "thing in itself," and, correspondingly, between theoretical and practical reason. In Fichte's view, these distinctions established a rift in our conception of man and of the world, and thus undermined the unity of Kant's philosophy. More importantly, however, they threatened to deliver human practice over to the iron necessity of natural laws.

In his quest to salvage freedom, Fichte rejected Kant's logical formalism and negative dialectic, which assumed the existence of the unknowable "thing in itself," and developed a tripartite subject-object dialectic grounded in a social and historical movement. Accordingly, he turned his attention away from nature and natural science, so important to Kant, and built his system around an ethical, historical, and political problematic. Finally, when seeking the one fundamental principle of Kant's transcendental idealism, and thus of all being, he found it in the freedom of self-creative consciousness. He thereby completed Kant's "Copernican revolution," and pursued Cartesian metaphysics of subjectivity to its most radical consequences.

Man was neither a fact nor a substance, according to Fichte, but an act. Foreshadowing twentieth-century existentialism, Fichte claimed that it is through activity that the subject posits itself. This was in radical opposition to René Descartes, who took thinking as his starting point. Furthermore, practical activity was for Fichte the foundation of everything that is and is a source of all experience, knowledge, and thinking. In this creative process, however, the subject is always already limited by something other than itself, which it experiences as resistance or negation. The opposition thus established is resolved in the synthesis of the subject and its other (thesis and antithesis), which always results in the production of new oppositions. Fichte held that by revealing the historical creation and mutual conditioning of opposites as the fundamental structure of all being, he did away with the external opposition of consciousness and being, and thus with the dualisms that plague Kant's philosophy.

This dialectic of self-creation was also the source of Fichte's thinking about human culture and society. In fact, it would not be an exaggeration to say that Fichte's entire system was a reaction to the French Revolution and its philosophical implications—so much so that, in his early writings, he grounded the possibility of revolution in the very essence and meaning of human existence, namely in freedom. For Fichte, revolution was a sort of a permanent activity, for one must permanently work on liberating

oneself from external determination, a task one can never fully complete. It is from this standpoint that Fichte interpreted the theory of natural law: Insofar as it is seen as a right to freedom, revolution was for Fichte an inalienable human right, and thus always legitimate. From the same standpoint, Fichte launched into an extensive critique of conservatism, especially that inspired of Edmund Burke, and of its historicism and empiricism.

However, a life in freedom cannot be fought for only by individuals, even though Fichte stated explicitly that the right to revolution belonged to each and every one of them (he later limits it to peoples). According to Fichte, man is destined to live in society, he should live in society, and he is an incomplete and contradictory individual if he lives in isolation. Only in society can man be free.

Guided by the ideals of the French Revolution, Fichte understood political freedom as self-determination and, more particularly, as self-legislation. Under the strong influence of Jean-Jacques Rousseau, he appropriated the theory of the social contract; the contract is always alterable, and everyone has a right to withdraw from it. Thus founded, the state is understood as a mere means, its sole task being the realization of a "culture towards freedom." Far from being man's purpose, the state was, according to Fichte, a necessary obstacle to freedom, one that withers away as it fulfills its task.

Fichte wrote about this task in greater detail in his work on the closed commercial state. He demanded the satisfaction of, at least, the basic needs of all citizens (proper food, clothing, housing), a planned production and consumption, the right to work in humane conditions, and an extension of leisure time. Influenced by John Locke, Fichte saw private property as based in labor. He was for equality and against privileged classes, for a form of economic and political self-management and against the anarchy of the world market. Fichte promoted elements of state socialism, whose ultimate task was to help create an autonomous individual.

Although there are certain other elements in this picture that could alarm a contemporary reader sensitive to the experiences of totalitarianism, it was Fichte's last writings on the state that acquired a more pronounced (and perhaps disturbing) tutelary aspect. In his search for the possibility and the source of emancipation, Fichte invoked the enlightened leader as an educator and possessor of legitimate force. His role, however, diminishes in proportion to the emancipation of his constituency.

In all his writings, which differ considerably and thus lend themselves to different interpretations (besides a Jacobin and a socialist, Fichte has been labeled a nationalist and even a protofascist), Fichte was always concerned with one question alone: the complete realization of human freedom. In that sense, his work exhibited not only the priority of practical over theoretical reason and of ethics over politics, but also an understanding of politics as a realization of philosophy. The latter two aspects constitute a radical negation of Machiavellianism (even though at one point Fichte did approve of it in international affairs).

Fichte was often seen merely as a transitional figure between Kant and Georg Wilhelm Friedrich Hegel, especially in the development of idealism and the historical subject-object dialectic. Nonetheless, the importance Fichte assigned to human practice, freedom, and revolution, as well as to the practical power of philosophical thinking had a direct influence on Marxist tradition, as did the expressly emancipatory character of his work, its future-directedness, his socialism, and his critique of the state. His near-heroic personality forever changed our understanding of philosophical existence.

Fichte died on January 29, 1814, in Berlin, Germany.

Filangieri, Gaetano (1752–1788)

Known today mainly as a precursor of modern constitutionalism whose ideas possibly influenced Benjamin Franklin, Gaetano Filangieri was a Neapolitan nobleman who failed to complete his magnum opus *La Scienza della Legislazione* (1780–1791) before his premature death from tuberculosis. In 1774, Filangieri published a minor work *Riflessioni politiche* to support the legal reform project of Bernardo Tanucci in his native Naples. In the same years, as short texts in contemporary Italian journals show, his main project developed.

Precisely at the time when the breakdown of legal common ground between the British and French perspectives on the interstate system took place, *La Scienza della Legislazione* spread throughout Europe and was recognized by influential thinkers on both parts of the opening divide as in tune with their own views. While Europe went to war, Filangieri gained a reputation as a new baron de Montesquieu. Filangieri, however, made a point of his disagreement with Montesquieu, who had treated the legal remnants of the past and the customs that had grown in the course of European history since the fall of the Roman Empire as a legitimate and natural basis for the growth of modern law and government.

Filangieri saw the complex history of Europe as the cause of social and economic disorders, as well as of the Anglo-French "Jealousy of Trade," which as the most recent instantiation of backfiring self-interested politics had caused two world wars. Yet, what made *La Scienza della Legislazione* an important text in late eighteenth-century political thought was Filangieri's insistence that the reform movements of the Enlightenment tended themselves to replicate the confusions of the European legal-political system that they set out to eliminate. Filangieri criticized Jean-Baptiste Colbert financiers and was sympathetic to the marquis de Mirabeau and the reform spirit of the physiocrats. Nonetheless, he accepted commerce, luxury, and inequality as foundations of modern societies. What was required first, in order to reconcile trade and the nation-state and eventually to be able to reform international politics, was a profound "scientific" reconsideration of the moral philosophical foundations of modern law and government and to bring this theory together in one frame with the actual history and current practice of the political and legal system of modern Europe. The confrontation between theory and practice, as the project of Filangieri's science advanced, was to result in a detailed legal reform program for European nation-states and their interaction as a system.

Force

Force is a term that encompasses several related concepts. In its most basic meaning, it describes any physical influence on an object, especially one that changes its motion. In the sense of violence or the potential for violence, it can refer to wrongful acts that endanger, injure, or destroy the property, freedom, or life of a person, as well as such acts against the larger community. It can also describe

the legitimate force used by a government to preserve order. The distinction between legitimate force and violence is not always clear, and much of the discourse on the subject revolves around this dichotomy. A good sense of the origins of the debate can be gained from a brief comparison of three ancient notions of force.

Aristotle on Force

Max Weber's definition of the modern state as the institution that has a monopoly of legitimate force for a given territory provides a useful framework in which to examine ancient Greek views on force. The question of what makes a force legitimate occupies several of Aristotle's works. In the *Nicomachean Ethics,* Aristotle distinguishes between voluntary actions of an individual and two kinds of involuntary actions: mixed actions, which an individual chooses because of threats or extreme pressure, and forced actions, in which there is no freedom of choice at all. These roughly correspond to the modern legal categories of coercion and compulsion. Elsewhere, Aristotle argues that anything that is forced is contrary to nature, and that anything contrary to nature in the sphere of social conduct is unjust, which together appear to imply that forced actions are unjust and therefore legitimate force cannot exist. But it is unclear whether this argument applies to mixed actions and how it changes in the case of groups or governments.

In *The Politics,* Aristotle addresses the latter issue by describing the role of force in his ideal type of government, the monarchy. The king should have a force around him through which he can compel those unwilling to obey. This force should be stronger than any individual or small group, but weaker than the people as a whole. This prevents the kingship from becoming a tyranny, because a correct form of government serves the common advantage of its citizens. Aristotle then lists another set of legitimate purposes for maintaining an armed force in any correct form of government (monarchy, aristocracy, polity): self-defense, exercising leadership in foreign affairs to benefit those who are ruled rather than harm them, and mastery over slaves. The second purpose appears to sanction imperialism through military force, but the emphasis on benefiting those ruled is consistent with the domestic aims of his ideal government. The difficulty lies in whose determination of benefit should apply.

Thucydides on Force

In his work, *History of the Peloponnesian War,* Thucydides offers a memorable example of the problem of legitimate and illegitimate force. In the Melian dialogue, the Athenians threaten to kill every adult male on the neutral island of Melos and enslave the women and children if they do not submit to their hegemony and pay tribute. The Melians attempt to engage in a debate about neutrality and international law, but are rebuked with the classic formulation of realism: The strong do what they have the power to do and the weak accept what they must. Only equally strong parties can discuss justice. The Melians refuse to surrender and are eventually destroyed. The Athenians ultimately behave in a way that is inconsistent with Aristotle's account of the legitimate use of force for the benefit of those ruled, but the initial attempt at coercion is ambiguous. The Melians are a former Spartan colony hostile toward Athenian imperialism, so the Athenians could claim self-defense as a justification for their threat of force. On the other hand, their claim that might makes right may reflect Aristotle's third use of legitimate force, mastery over slaves. To the Athenians, the weakness of the Melians combined with their reluctance to submit makes them fit to be slaves.

Force in the Bible

The Hebrew Bible is not univocal in its treatment of legitimate force and violence, but there is a clear sense that only God's authority can guarantee legitimacy. In addition to the Torah's system of retributive justice for individual crimes, which regularly entails physical force as a punishment, the Bible also contains clear examples of collective violence. God regularly uses extreme force to restore the world, and later Israel, as in the case of the Flood or the plagues in Egypt. In the Deuteronomic history, God often demands the total destruction of a particular enemy of Israel, placing them under the ban or proscription. Unwillingness to comply with God's commands in these cases can be disastrous, as when Saul is rejected as King of Israel because he refuses to

destroy Amalek. Likewise, unsanctioned use of force is punished harshly, regardless of the status of the person using it. When King David arranges for the death of Uriah in battle to cover up his affair with Bathsheba, God responds by killing their infant son and condemning David's family to internecine strife. When God is not involved, the legitimacy of force is ambiguous. After the rape of their sister Dinah by Shechem, two sons of Jacob kill the culprit and all the males of his town. Jacob rebukes his sons for making trouble with the inhabitants of the land. Because the episode takes place before the revelation of the law code, without an explicit intervention by God, there is no way to determine whether their violence qualifies as a legitimate use of force.

Foucault, Michel (1926–1984)

Michel Foucault is best known in political theory for his discussions of power and knowledge during the 1970s. *Discipline and Punish* (1977); *The History of Sexuality, Volume One* (1978); and the interviews and lectures reprinted in *Power: Essential Works of Foucault, 1954–1984, Volume 3* (2000) were widely acclaimed for extending the sphere of the political to include the variety of ways in which individuals were constructed as certain kinds of subject and for showing how relations of power were embedded in all kinds of social relations, including those between parents and children, men and women, doctors and patients, and teachers and pupils. In contrast to normative political theory's concern with the nature, limits, and legitimate exercise of power, he insisted on a descriptive analysis of power focused on the means by which it is exercised. These included the disciplinary techniques deployed in workshops, factories, armies, schools, and prisons from the sixteenth century onward, as well as the techniques relating to sexual behavior employed within families, churches and various kinds of medical practice up to and including psychoanalysis. *Discipline and Punish* provided a meticulous analysis of the various spatial and temporal techniques of disciplinary power, symbolized by Jeremy Bentham's architectural design for a panopticon prison that would ensure continuous surveillance of any kind of institution involving multiple inmates.

Foucault's focus on power relations at the extremities of the social body sought to divert attention away from the traditional figure of sovereign power. Yet he was well aware that micropolitical techniques were not the only or even the most important ways of exercising power in modern industrial societies. At the end of *The History of Sexuality, Volume One* and in his final 1976 lecture, he drew attention to the emergence of another kind of power directed at the conditions that sustain life. This new form of "biopower" took shape during the latter half of the eighteenth century and was accompanied by new forms of statistical, epidemiological, and economic knowledge. It became the focus of his lectures at the Collège de France from 1977 to 1979 and the point of departure for an approach to the political domain quite different to that adopted during the first half of the 1970s. He undertook the study of "governmentality," by which he meant the ways in which the exercise of political sovereignty was theorized, partly in order to show that his approach to power could equally be applied to the government of populations and economic management of an entire society. His governmentality lectures approach the state from the perspective of the technologies of power that have determined its functions and influenced its development, in a manner that parallels his indirect approach to other institutions, such as the asylum or the prison. Against what he referred to as the "state phobia" widespread in contemporary political thought,

Foucault argued that the central political problem today is not the state but the forms of power that have made it what it is. He views the state as the effect or historical residue of the tactics of governmentality that have defined its areas of competence and solidified in its institutions. While these lectures have given rise to an extensive literature of "governmentality studies," much of this has tended to remain descriptive and sociological in character (Rose, O'Malley, & Valverde, 2006). The publication of these lectures requires a major reassessment of the significance of Foucault's work for normative political theory.

Power and Freedom

Foucault's analyses of micropolitical techniques of power for the coercion, control, and training of individual bodies challenged both the Marxism that informed much of French political thought at this time and the "juridical" theory that provided the historical and conceptual framework of liberal normative approaches to power. Where Marxism tended to treat institutional forms of power as superstructural phenomena necessary for the perpetuation of relations of production and class domination, Foucault drew attention to the ubiquity and relative autonomy of power relations. He advocated an inversion of the direction in which power was analyzed, such that power relations were not understood from the perspective of the sovereign instance or global forms of class domination, but rather described at the extremities of the social order in their particular institutional forms. In this manner, the local forms of power exercised over servants, workers, or the mentally ill were understood as supports on which global political power rested, rather than as effects of state or class domination. The social field appeared as a complex fabric of power relations, woven according to identifiable strategies but without reference to a unique strategist. In the *History of Sexuality, Volume One,* he described a number of such strategies in relation to individuals and populations and strongly criticized, on empirical as well as conceptual grounds, the idea that power was essentially repressive. Far from repressing sexual behavior and discourse about sex, he argued, the modern deployment (*dispositif*) of sexuality has incited and multiplied both.

Where the classical social contract accounts of the origin and limits of sovereignty conceived of power as something like a commodity that individuals possessed and could transfer, Foucault insisted that power was a consequence of relations between physical, institutional, and ideational forces, and that it existed only in the forms of its exercise at different levels of social interaction. He sought to describe power in terms of the techniques and tactics of its exercise in a manner that was not tied to juridical sovereignty or the institution of the state. Initially, Foucault paid no attention to the normative dimensions of the concept of power, focusing instead on the mechanisms and techniques by means of which individual and group domination was effectively achieved. He was widely criticized for his failure to distinguish between domination and benign forms of the exercise of power and for his failure to provide normative grounds for the justification or condemnation of power relations. Jürgen Habermas summed up the view of critics such as Nancy Fraser, Charles Taylor, Richard Rorty, Michael Walzer, Herbert Dreyfus, and Paul Rabinow when he argued in *The Philosophical Discourse of Modernity* (1987) that Foucault's critical project was incoherent by virtue of the lack of explicit normative foundations: Without these, it amounted to nothing more than an historiographic presentism, a moral and political relativism and the expression of an arbitrary preference for certain kinds of resistance to power.

In an afterword to Dreyfus and Rabinow's influential work *Michel Foucault: Beyond Structuralism and Hermeneutics* (1983) titled "The Subject and Power," Foucault responded to these criticisms and set out a detailed analysis of the concept that substantially modified his approach and his terminology. He sought to clarify his differences with the liberal view that sees power as essentially independent of and opposed to the freedom of individuals. For this tradition, the exercise of power is justified only under certain conditions, such as the consent of those over whom it is exercised or the establishment of legitimate political authority. By contrast, his approach drew on thinkers such as Baruch Spinoza and Friedrich Wilhelm Nietzsche, for whom power is constitutive of freedom. On this view, social relations always and everywhere involve power relations

and the exercise of power can be defined in terms of the different ways in which the action of individuals or groups amounts to action on the action of others. Individuals or groups exercise power over others when they act in such a way as to affect the field of possible actions by others. Foucault drew on his discovery of the sixteenth-century proliferation of discourses on ecclesiastical, pedagogical, economic, and political arts of "government," using this term in its early modern sense to refer to all of the ways in which one could act on the possibilities for action of others, for example, by developing or hindering the capacities they acquire or by expanding or limiting the possible courses of action open to them. In short, he now defined the exercise of power as government, where to govern means to structure the possible field of action of others.

Foucault's reorientation of his thinking about power was also informed by the genealogy of the conception of power relations as essentially warlike and involving struggle between contending force undertaken in his 1975–1976 lectures, *"Society Must be Defended"* (2003). This led him to abandon the terminology of bodies and forces, which he had employed in *Discipline and Punish* and *The History of Sexuality, Volume One,* in favor of the view that power is only exercised over another insofar as the other is recognized and treated as a free subject capable of action. In other words, his revised definition implies that power is exercised only over free subjects and only insofar as they are free to act in a variety of ways. This definition allows him to provide a reason for his earlier claims regarding the coextensivity of power and resistance, because it implies that there will always be a spectrum of possible responses to the exercise of power on the part of those over whom it is exercised, ranging from compliance to resistance or outright challenge. In this sense, he argues that there is an "agonism" at the heart of all power relations.

Foucault's modifications of his concept of power go some way to address the criticisms of Habermas and others that he cannot meaningfully distinguish acceptable from unacceptable forms of power. Whereas his earlier studies of technologies of power neglected important differences between the exercise of power over individuals and populations and the exercise of violence or the maintenance of structures of domination, his revised definition of power in terms of the government of the conduct of others enabled him to distinguish clearly between different kinds of power, such as enslavement, domination, or merely affecting the conduct of others. At one extreme, there is the relatively free play of antagonistic actions and reactions in which neither side is assured of superiority because reversal is always a possibility. At the other extreme are relatively fixed relations of domination and subordination where one party's room to maneuver is severely curtailed. In between lies the range of more or less effective ways of directing or governing the conduct of others.

Despite these modifications, Foucault's approach remains focused on the descriptive task of understanding what forms are assumed by the exercise of power and how these might be changed, rather than the normative task of justification or condemnation. However, his subsequent discussions of the moral and political grounds for resistance to particular forms of power suggest a novel kind of response to the demand for normative grounds raised by many critics of his earlier work on power, namely that such grounds are often derived from existing discourses of moral or political right. For example, his 1975–1976 lectures *"Society Must Be Defended"* retrace the vicissitudes of an adversarial discourse of right that grounded its claims in history rather than natural law. He relies on a similarly historical conception of normative grounds for action when he suggests at the end of the second lecture (January 14, 1976) that the appeal to sovereign rights is ineffective against disciplinary power because the system of sovereign right had long functioned alongside discipline, concealing it while continuing to legitimate the exercise of state power. It is as though these were two distinct but intertwined poles of power that functioned in concert: a series of disciplinary coercions that ensured the cohesion of the social body and with a structure of public right built on the principle of sovereignty. The same historical conception of normativity is illustrated by his analysis in his 1977–1978 lectures, *Security, Territory, Population* (2007), of the forms of "counter-conduct" that flourished alongside the institutions and practices of pastoral power in medieval and early modern Europe, and by his parallel remarks about the forms of resistance to modern governmentality

between the late eighteenth and the early twentieth century. His studies of forms of governmentality at the end of the 1970s provide further evidence of his commitment to this kind of contextually grounded criticism. Resistance to political power cannot be content with the denunciation of violence or reason in general, or with the condemnation of the state as such, but rather must question its existing forms. There are no universal grounds for resistance to political power, only particular grounds embedded in a given historical and discursive context. That is why Foucault argues in "What Is Critique?" that it is helpful to understand resistance to power as the art of not being governed or the art of not being governed in a particular way and at a particular cost (*The Politics of Truth,* 2007). The political task, in his view, is not the rejection of power as such, but the criticism of certain ways of being governed.

Governmentality

Foucault's 1977–1978 lectures set out to explore how the fundamental biological features of the human species became objects of political strategy through the development of techniques for the government of populations and management of events that threatened their security, such as food scarcity and disease. However, from the fourth lecture onward, he realigned the study of these security mechanisms within the broader framework of a history of "governmentality" (*Security, Territory, Population,* 2007). Initially, this term referred to the range of institutions, procedures, analyses, calculations, and tactics that were involved in the eighteenth-century government of populations. However, he quickly expanded the scope of his study of "governmentality" by proposing to retrace the different forms of governmental reason that have informed the exercise of European state power since the sixteenth century and that continue to delineate the objectives and methods of modern political government. In this manner, he outlines some elements of a genealogy of modern state government.

Chronologically, the story begins with Christian pastoral techniques for guiding the conduct of individuals. Foucault traced the origins of the individualizing tendency of modern political government to the Hebraic conception of the relationship of shepherd and flock, which was incorporated into Christian pastoral power. This paradoxical form of power individualized by granting as much value to a single sheep as to the entire flock. While the church's exercise of this pastoral power declined after the eighteenth century, Foucault points out that elements of the shepherd–flock relationship remain in the modern state's responsibility for the welfare of individuals. Western societies, he suggests, are unique in their reliance on this "strange technology of power treating the vast majority of men as a flock with a few as shepherds" ("*Omnes et singulatim*" in *Power: Essential Works of Foucault, 1954–1984, Volume 3*).

A key turning point in the formation of modern governmental reason was the emergence of the doctrine of raison d'état at the end of the sixteenth century. Foucault pointed to the emergence of a concern with an autonomous art of political government in a series of anti-Machiavellian texts. These marked the appearance of a type of government that was no longer subject to the requirements of a divine order or the particular interests of a monarch. Foucault suggests that this was an event in the history of Western reason no less important than the revolution in natural science associated with Johannes Kepler, Galileo Galilei, and René Descartes. Initially, raison d'état was a conservative doctrine that sought above all to maintain the integrity of the state. Although it recognized the need to increase the power of the state through diplomatic alliances, military force, and the circulation of money and goods through commerce (mercantilism), it was not preoccupied with the increase of the state's power and did not take population as the specific object of government. The new arts of specifically political government only acquired their full scope and consistency in the course of the eighteenth century, when population came into focus as the true object of government. Whereas earlier conceptions of government took as their object the territory and its inhabitants conceived as subjects of the sovereign, the eighteenth century saw the discovery of population as an entity in its own right, with its own regularities, rates of death and disease, and cycles of scarcity and abundance. From this point onward, the aim of government was not just to ensure peace and order within the borders of a particular territory, but to improve the condition of the population, to

increase its wealth, longevity, and health. Such a new kind of action on the field of action of populations rather than individuals required new kinds of knowledge, such as statistics and political arithmetic, and new techniques, such as those provided by the means of ensuring security against food scarcity, urban disorder, and disease. The body of doctrine that spelled out the means of enhancing the power of the state by attending to all aspects of the welfare of its population was the seventeenth- and eighteenth-century science of police. According to classic texts such as Nicolas de la Mare's *Traité de la Police* (1705–1719) and Johann von Justi's *Grundsätze de Policey-Wissenschaft* (1756), the state should regulate all aspects of the lives of its citizens, not only roads, public safety, health, and supplies but also religion, morals, and the liberal arts. Von Justi defined police very broadly to include all the laws and regulations concerning the internal life of a state, including those that seek to strengthen and increase its power, to make good use of its forces, and to ensure the happiness of its subjects. Insofar as it was concerned with the welfare and well-being of each citizen, police government was also an individualizing power.

Liberalism

Foucault's 1978–1979 lectures, *The Birth of Biopolitics* (2008), analyzed liberalism as the form of governmental reason that sustained the emergence of biopolitical power. In some respects, liberal governmentality represented a significant departure from the principles of raison d'état and the science of police because it introduced new objects, knowledge, and techniques of government. Against the idea that the population was an object in need of detailed and constant regulation, liberalism advanced conceptions of civil society and the economy as naturally self-regulating systems. Government should confine itself to establishing mechanisms that respect the laws of these natural phenomena with the fundamental objective of ensuring the security of economic or other processes intrinsic to populations. Whereas the science of police operated on the assumption that there is never enough regulation, liberalism operated on the principle that there is always too much government. Foucault argued that, from the eighteenth century onward, liberalism provided a framework both for the criticism of techniques of government and the reinvention of those techniques. The most important reinventions of liberalism in the twentieth century were inspired by one of the key mechanisms identified as a natural limit to the power of government, namely the market.

Out of the 12 lectures given in 1979, seven were devoted to the examination of two contrasting approaches to the role of the market and the kinds of government intervention required to sustain it: the Ordoliberalism that inspired the postwar reconstruction of a market economy in the German Federal Republic and American Chicago School neoliberalism. Part of the reason for this turn to contemporary political history lay in Foucault's critical engagement with views common among the French left at this time. Chief among these was an essentialist conception of the state that regarded administrative, welfare, bureaucratic, fascist, and totalitarian forms of state as expressions of the same underlying form, endowed with the same intrinsic tendency to expand and take over all that remains of civil society. Versions of this conception could be found in Marxist theories of the state as an instrument of class domination, as well as in anarcho-Nietzschean theories of the state as the coldest of all cold monsters. Foucault's primary objection to this "state phobic" conception is that it allows its protagonists to deduce critical analyses from first principles and avoid altogether the need for empirical and historical knowledge of contemporary political reality. Its proponents were largely unaware of the history of suspicion of the state from its origins in German Ordoliberalism between the world wars. His genealogy of neoliberal governmentality thus served as an instance of the broader strategy that he describes as putting knowledge of the past to work on the experience of the present.

Foucault's critical remarks about state phobia directed at his own intellectual milieu are offered from the position of a citizen engaged in the background culture of politics. John Rawls distinguishes the background political culture within which citizens argue about all kinds of things related to the political and the public good, including theories of justice and the nature and business of government, from public reason proper, within which citizens, legislators, and government officials argue about constitutional essentials and matters of basic justice (*Political Liberalism,* 2005).

The crucial difference is that in public reason, citizens are constrained by the publicly acceptable conceptions of justice. In a well-ordered and pluralist society, citizens must offer rationalities to one another in terms that all can reasonably be expected to endorse. This conception of public reason is normative in the sense that it expresses an ideal view of the manner in which citizens of a democratic society should relate to one another, but also quasi-empirical to the extent that the limits of public reason, the political values that provide the contours of public reason in a given society at a given point in its history, will ultimately depend on the considered judgments of the society along with the background culture that sustains efforts to systematize such judgments in a political conception of justice.

Rawls and other theorists of public reason do not pay much attention to the ways in which political power can be exercised over and above certain minimal constraints imposed by his theory of justice. Any legitimate sovereign government will have to maintain security, stability, and equality of opportunity while maximizing the production of primary social goods subject to equal and just distribution of those goods. In Foucault's terms, this approach does not concern itself with the "how" of power, even though it is clear that it should do so because large swathes of public policy bear directly on questions of basic justice. At this point, Foucault's analyses of liberal and neoliberal governmentality provide an important supplement to Rawlsian conceptions of public reason. They draw attention to a dimension of political culture that is only marginally present in Rawls's own account, namely conceptions of the nature, purposes, and methods of government and of the ways in which these impact on the basic structure of society and its public policies. They draw attention to a kind of discourse about the nature and function of government that, although it may not form part of public reason itself, is capable of inspiring a range of contributions to public reason on matters of basic justice.

Foucault's account of German and American neoliberal governmentality identifies some of the elements of contemporary public reason and shows how these emerged in the postwar period. Because these lectures were delivered at the end of the 1970s, the marketization of national economies through competition policy and privatization of public services has continued to develop as neoliberal policy has become orthodoxy in most Western capitalist countries. They provide a historical account of the terms in which these debates about public policy took shape in capitalist democracies and point to an important vector of change in the boundaries of public reason during the twentieth century. The founding texts of neoliberal governmentality do not fall within the sphere of public reason narrowly defined, but nor do they fall within the sphere of the background political culture. They occupy an ambivalent place in between background culture and public reason, forming a kind of historically moveable border region that Rawls occasionally refers to as "public political culture." Background culture includes all of the kinds of nonpublic reasons found in churches, universities, scientific societies, and professional groups. It includes the philosophical theories in terms of which philosophers might theorize the political domain, along with the historical, philosophical, and moral theories that inform certain kinds of political parties. By contrast, public political culture refers to the fundamental political ideas current within a given society at a given time. These will include the kinds of ideas about the appropriate functions and techniques of government that Foucault considers under the rubric of governmentality. If the boundaries of public reason are historically mobile by virtue of changes over time in the comprehensive moral beliefs of citizens and to the family of reasonable political conceptions of justice, then Foucault shows us how these boundaries are also mobile by virtue of changes in public political culture and its impact on policy. To the extent that neoliberal ideas have emerged from the pages of academic journals and semiprivate forums to become the guiding principles of government throughout the capitalist world, they have progressed from background culture to public reason proper. In directing our attention to these ideas, Foucault's analyses of liberal and neoliberal governmentality enlarge our understanding of the discursive and normative frameworks within which contemporary sovereign power is effectively exercised.

Subjectivity and Care of the Self

In *Discipline and Punish* and *The History of Sexuality, Volume One,* Foucault famously argued

that power creates subjects. In the final period of his work from 1980 until his death in 1984, he often suggested that it is not power but the subject that forms the general theme of his research. However, the real novelty of his work in this period lay in the increasing focus on different ways in which subjects are involved in the production of their own subjectivity. The hypothesis that informs his study of the Greek ethics of moderation and self-mastery in *The Use of Pleasure* (1985) is that there is a rich and complex field of historicity in the way that individuals are supposed to recognize themselves as ethical subjects of sexual conduct. In order to analyze this field, he proposed a novel conception of ethics as the form of the relation of the self to the self practiced within a given style of moral life. There are four dimensions to this relation: the part of the self or its actions that is relevant for ethical judgment (ethical substance), the manner in which the self relates to moral rules and obligations (mode of subjection), the kinds of activity undertaken on the self by the self (ethical work), and finally, the goal or type of being the self aspires to become (*telos*). This conception of ethics provides a framework for the analysis of the variety of techniques employed in ancient and Christian forms of care of the self.

The relationship between care of the self and the exercise of power was a constant theme of the ancient literature from Plato to the Stoics. Foucault took this to imply that the kind of genealogy he had undertaken in relation to governmentality must be accompanied by a genealogy of ethics in the sense previously defined. *The Care of the Self* included a chapter on the techniques of self-cultivation that flourished in the first two centuries of imperial Rome and made it a "golden age" in the history of the cultivation of the self. He devoted his 1981–1982 course, *The Hermeneutics of the Subject* (2005), to exploring this almost forgotten aspect of Greek and Roman culture. He argued that the reconstitution of an ethics of the self remains an indispensable task for present-day politics, if indeed it is true that there is no final point of resistance to political power other than in the relationship the individual has to him or her self. His point is not that the relationship of the self to itself is the only source of resistance to political power, but rather that it is an inescapable dimension of any such resistance. For this reason, the genealogy of ethics understood as the forms of government of the self adds an important further layer to the genealogy of governmentality. Foucault's analyses of the ancient arts of caring for the self remind us that, even as subjects of power and forms of subjectivity imposed from without, we are nevertheless free to question present limits and to experiment with ways of going beyond them.

Freemasonry

Freemasonry is an international network of fraternal organizations that took their modern form in the 1710s through the 1720s and became tightly associated with the philosophical developments and social reforms of the eighteenth century. Many of the philosophers and statesmen of the Enlightenment and the American Revolution are known to have been Freemasons, including baron de Montesquieu, Voltaire, Frederick II, Claude-Adrien Helvétius, Benjamin Franklin, and George Washington; and many others have long been thought to have been. Freemasonry was an important vehicle for the transmission of the aspiration to build a civil society on the basis of nonsectarian, nondogmatic rationality, philosophy, and moral improvement. Later, it became a perennial target for opponents of rationalistic enlightened philosophy and its presumed progeny, especially the American and French Revolutions.

Current historical research suggests that freemasonry developed directly out of Scottish and English stonemason guilds—that is, the craft guilds of practicing masons. Stonemasons as craftsmen were well-versed in geometry and mathematics, and master masons practiced something close to engineering and architecture. They were also enamored of a degree of mystical rhetoric and symbolism—famously claiming, for example, that their order was founded by and included King Solomon, who taught the mystical geometric secrets that were used in the construction of the Temple in Jerusalem. Masonry thus offered an appealing combination of mystery and science to a late seventeenth-century world in which Isaac Newton showed the mathematical and geometric structure of the world and engaged in alchemical research.

At a more mundane level, Masonic lodges began to admit paying members from among the local educated gentry, and to offer themselves as sites for discussion of natural and moral philosophy. By 1717, when four London lodges joined together to form the Great Lodge that effectively founded modern Freemasonry, it appears that the craft guild origins of the organization had been decisively overshadowed by its speculative and intellectual present. The new form quickly spread throughout Western Europe and the British colonies in North America, and by 1750 or so was perhaps unparalleled as an international nongovernmental and nondenominational intermediate organization.

Freemasonry carried over the system of hierarchy (e.g., apprentices, masters, and grand masters) characteristic of guilds, and indeed added to it as Freemasonry became a federated collection (or sometimes rival confederated collections) of local, regional, and national bodies. This hierarchy, and the accompanying tradition that there are secrets and mysteries to be revealed only at higher levels, has often made Freemasonry suspect to democratic and egalitarian temperaments. But the hierarchy within the organization did not track hierarchical distinctions outside of it—a commoner might happen to be a higher-level initiate than a nobleman—and Freemasonry taught an egalitarian ethos within any one of its levels. Accordingly, it was frequently viewed with intense suspicion and persecution by eighteenth-century monarchs and police. The Catholic Church likewise viewed it as subversive, both of appropriate hierarchies and of orthodox belief; Freemasons were required to affirm a belief in a deity but the organization was committed to leaving denominational and sectarian struggles in the pre-enlightened past. Moreover, internal government had a strongly republican structure, and relations among lodges were governed by texts called constitutions. The apparent connections with republicanism, deism, and enlightenment, the international character of the

organization and its British roots, and its secrecy around structures and membership made it an appealing target for those worried about revolutionary or subversive conspiracies. After the French Revolution, the idea that Masonic conspiracies brought down kings became firmly entrenched in part of the popular imagination, and it has remained there ever since. There was undoubtedly an affinity between Masonic ideas and those of the revolutionary era. However, Freemasonry was strongly dedicated to a kind of moral education and improvement that clearly included law abidingness and support for civil order; and in some places, notably Prussia, it was closely connected to the established political order.

Freemasonry was understood as both the embodiment and the vanguard of a meritocratic modernity unfettered by inherited prejudices, distinctions of blood and birth, superstitious quarrels, and medieval ignorance. It modeled civil society in the eighteenth-century sense—a society of equals, governed by known laws and undivided on religious lines—even as it served as a forerunner for civil society in the twentieth-century sense of the web of intermediate voluntary organizations between the household and the state. Metaphors of light and enlightening ran not only through the century's philosophical works but also through Masonic imagery and rhetoric. Freemasonry came to stand for the enlightened philosophy of the era as a whole, and to see its reputation rise and fall along with that of the idea of enlightenment itself.

Freire, Paulo (1921–1997)

Paulo Reglus Neves Freire was a Brazilian educator and critical theorist who influenced the formation of critical pedagogy and educational theory worldwide, while engaging in literacy campaigns and school reform in Latin America and Africa.

Paulo Freire was born into a middle-class family in Recife, Pernambuco, of northeastern Brazil, on September 19, 1921. During the 1929 world depression, Freire's family was forced to move to nearby Jaboatao, where Freire gained an early consciousness of how poverty and hunger affect education and the community. He returned to Recife to attend a traditional, upper-class, all-male high school as a scholarship student. After high school, Freire attended law school while simultaneously studying philosophy and the sociology of language. However, instead of practicing law, Freire's interests and passion for teaching and effecting change through education persisted. Freire taught Portuguese in secondary schools, acted as director of literacy and then as school superintendent in Pernambuco until 1957. João Goulart, president of Brazil in 1961, publicly recognized the democratic and empowering effects of Freire's rural literacy program. Freire was then named director of the commission of popular culture by Goulart. However, when Goulart was disposed by a military coup d'état in 1964, Freire was accused of being a subversive, imprisoned for 70 days, exiled to Bolivia, and left soon after for Chile. In Santiago, Freire published his seminal piece, *Pedagogy of the Oppressed*. From 1970 to 1980, Freire worked with the World Council of Churches and collaborated with newly liberated African countries Guinea-Bissau, São Tomé and Príncipe, and Cabo Verde. Freire returned to Brazil in 1980, taught at two universities, and helped to found the social democratic Workers Party. As the secretary of education for São Paulo from 1989 to 1991, Freire directly applied the pedagogy that had given impetus to the popular education of his adult

literacy programs to the formal schooling of millions of children.

Freire is the champion of critical pedagogy, and his theories and practices influence philosophers, educators, and politicians alike. He is one of the most prominent educational theorists due to his understanding of the oppressive mechanisms of capitalist education and his vision of literacy as a cultural and political tool in the struggle against such oppression. Freire's primary approach to literacy education was to pose problems having to do with his students' political and economic situation and to teach literacy as a tool for analyzing and understanding the nature of their oppression. This problem-posing education provides a sharp contrast to the top-down state and nationally mandated curriculum and the one-size-fits-all view of learning that Freire labeled "banking education." Banking education refers to schooling that treats students like passive repositories of information, rather than free and critical thinkers. Instead, Freire proposed a dialectical relationship between teacher and student in which both are learners in the educational process. Freire stressed the importance of dialogue and praxis in which participants engage in active learning for the purpose of social change. Freire's pedagogical-political practice engages students in the three-part process he called *conscientização*—critical consciousness raising—in which students "name" their world (that is, they determine for themselves the categories with which to analyze the nature of the socioeconomic system), identify their position in the world, and become transformers of this world. Freirian constructivism guides students to "read the world in the word," or to use literacy to understand and challenge the status quo rather than passively accept it. Freire explained how conscientização is a necessary condition for *revolução*—or revolution that revolves or rolls back the current government through forcible overthrow—but as a nonviolent and popular revolution based on consciousness and not physical force. Freire believed that nonviolent revolução would allow for the development of a more egalitarian system that allows the acquisition of new thoughts, ways of viewing society, and understanding one's position in that society.

Drawing from both critical theory and his faith, which was based in liberation theology, Freire revolutionized education by urging critical educators to systematically change the structure and dominant ideologies of society by reorganizing the means of production and involving workers in their own education. Freire stressed the importance of bridging mind, heart, body, and spirit in learning how to come to a new awareness of selfhood that embraces love and hope. Through such philosophy, Freire brings humanity back into education.

Although Marxist critics have sometimes pointed to Freire's Christian convictions in questioning the revolutionary nature of his thinking, the thrust of Freire's work is undeniably Marxist. Other critics have complained of inaccessible language, idealism, and a simplistic political analysis, and some have questioned the originality and practicality of his approach. However, despite such criticisms, Freire remains a critical visionary who has not only inspired millions of women and men throughout the world, but has also provided a method of hope to lovingly transform this world to a more humane and just society.

Freud, Sigmund (1856–1939)

Sigmund Freud, the inventor of psychoanalysis, was born in Moravia, Czechoslovakia, in 1856. His family moved to Vienna in 1860, where Freud remained until forced to flee to Britain in the aftermath of the 1938 *Anschluss*. Freud published his first work of psychoanalysis, *Studies in Hysteria* (with Josef Breuer) in 1895, after a career in neurological research and medical practice.

In his 1917 "A Difficulty in the Path of Psychoanalysis," Freud described psychoanalysis as the third great blow to human narcissism. The first was Nicolaus Copernicus's refutation of the centrality of the earth; the second was Charles Darwin's refutation of the centrality of mankind to creation. The third was Freud's discovery that people were not even central to their own mental processes: The mind cannot be equated with consciousness because most mental functioning occurs unconsciously. Against philosophical and psychological orthodoxy, Freud insisted that consciousness occurs only in *part* of the mind—what Freud termed *das Ich* (usually translated as the ego)—which only ever attains "incomplete and untrustworthy perceptions" of unconscious mental processes. Thus, the conscious, rational ego is "not master in its own house," a fact for Freud that both summarized the enormity of his discovery and explained why so many people were unwilling to accept it. Despite such resistance, psychoanalysis became one of the most influential psychological schools of the twentieth century.

Conflict and Repression

From its conception, psychoanalysis is a theory of psychic conflict. *Studies in Hysteria* was groundbreaking in attributing hysterical symptoms (a range of conditions like fainting fits, paralysis, and fugue states), not to inherited biological defects, but to psychological conflict between a person's unconscious sexual drives and his or her cultural and ethical ideals. Freud introduced "repression" as the attempt to repel from consciousness the thoughts and memories connected to such intolerable drives. The hysterical symptom emerges as a defense against the return of repressed desire; it is a "compromise formation" that allows both the desire's expression and its repudiation at once. Freud proposed that these symptoms are relieved if the unconscious conflict at the source of a symptom is made conscious. This relief was achieved through new techniques of listening to patients that were alert to symbolic meanings within symptomatic complaints. It was a "talking cure," as one of the patients in the *Studies in Hysteria,* "Anna O," succinctly dubbed it.

Dreams and Two Principles of Mental Functioning

Freud's 1900 *Interpretation of Dreams* launched the psychoanalytic theory of the mind. Freud's theory of dream interpretation demonstrates continual conflict between the unconscious sexual drives and the conscious ego's resistance to them. A dream is a symbolic representation of the dreamer's unconscious desire, rooted in repressed infantile sexuality. Freud's method did not employ universal symbols, but stressed rather the contingency and specificity of dreaming to the life of the dreamer; it is less concerned with the promulgation of a methodology by which the truth of all dreams is discovered, than with exploration of the unconscious *processes* by which the mind works. Chapter 7 of the *Interpretation* introduces Freud's "topographical" model of the mind, dominated by the "unconscious," with smaller areas of the "preconscious" and the (conscious) ego.

This model of conflict leads Freud to propose his "Two Principles of Mental Functioning" in a 1911 paper of the same name. The "pleasure principle" works according to the associative thought processes that enable dream work to escape the censorship of the ego and thus discharge accumulated tension. The "reality principle," faced with the solipsistic limits and unrealistic demands of the pleasure principle, aims at the attainment of discharge through interaction with the "real world." It instigates rational and logical thought processes. The two principles always work in concert, but Freud defines neurotics (those who develop symptoms because of psychical conflict) in terms of a "flight from reality": The pleasure

principle has drawn them away from practical engagement with "reality."

Narcissism and Melancholia

Freud's 1914 "Narcissism, an Introduction" was a major development in his thinking, shifting his focus from instinctual conflict to the relation of self and other. In narcissism, the ego itself (not just external love objects) is invested with erotic energy (libido). Freud is interested in how the ego is formed from a state, which he calls "primary narcissism," in which self and other, ego and object, cannot be distinguished (the situation of the newborn baby).

Freud proposes that repression proceeds not simply from the ego, but from an agency within the ego that contains its moral conscience and cultural standards: the "ego ideal." This ideal is drawn from criticism by parents and all the educational figures who follow. This ideal is the basis for group psychology; identification with others develops in accordance with the common ideal of a family, a class, or a nation. "Idealization" occurs when someone substitutes his or her internal ego-ideal for an *external* object, an expedient that may resolve certain internal conflicts (a "cure by love"), but one that Freud considers undesirable because it leads to a dangerous level of dependence.

"Mourning and Melancholia" (1917) develops the theory of narcissism by proposing a novel theory of "internalized object relations," according to which people identify with others by figuratively taking them into themselves, as internal objects. Thus, even a lost object relation (with the death of a lover, for instance) continues to live on inside a person. Moreover, a part of a psyche identified with an object in this way can conflict with other parts of the psyche. The neurosis of melancholia (depression) produces endless self-reproach because the melancholic person identifies with hated aspects of the lost object and punishes himself or herself for them. Thus, Freud introduces another form of conflict, based on identification rather than the drives. Freud's theories of identification have important implications for his analyses of social life and political power.

The Death Drive and the Super-Ego

The events of World War I led Freud to look beyond the conflict of the pleasure and reality principle to a theory of aggression. *Beyond the Pleasure Principle* (1920) proposes an inherently self-destructive force in the mind, which Freud calls the death drive, defined as "an urge inherent in organic life to return to an earlier state of things." Aggression is this urge deflected in self-defense onto external objects. Eros, the urge to develop "higher unities," opposes the death drive. Freud subsumes sexuality within Eros, and relates it to Plato's conception of the erotic in *Phaedrus*. These two drives represent Freud's final model of dualistic instinctual conflict in the psyche.

Freud's 1926 *Ego and the Id* introduces a new "structural" model of the psyche, which supplements rather than replaces the "topographical" model of the *Interpretation of Dreams*. This new model divides the mind into three "agencies." The unconscious "id" contains the drives; it is the reservoir of psychic energy, or libido. The id conflicts with the (now *partly* conscious) ego, which defends against the drives with a number of mechanisms (including repression). The super-ego is a development of the earlier "ego ideal." It is the part of the ego that judges and criticizes, holding its moral ideals and experienced by the ego as self-observation. It is formed through the internalization of parental prohibitions and demands. The ego is thus left in an invidious position; it is caught between the ravenous id and the punitive super-ego, like a "politician" desperate to keep favor with irreconcilable factions.

Social and Political Writings

Totem and Taboo *(1914)*

Freud's more overtly social and political writings began on the eve of World War I. Freud introduces his origins myth of the social bond. From Darwin he draws the idea that prehistorically, humanity was organized in "hordes," each ruled by a "primal father" who tyrannized the other men and monopolized the women. History is inaugurated by a crime, the murder of the primal father by a band of brothers and sons. After the murder, no new father came to prominence; instead, society was organized by the equality of the brothers who established the incest taboo to ensure that women were circulated and not engrossed. But the murder was also traumatic for the brothers, who loved as well as hated their father, and the burden

of guilt was passed down the generations "phylogenetically." This guilt, and the repressed incestuous wishes underlying the taboo, Freud views as the structuring inheritance of modern social life.

Group Psychology and the Analysis of the Ego *(1921)*

For Freud, individual psychology *is* group psychology; he rejects theories of separate group or herd instincts. The strange behavior of crowds is not a deviation from individual psychology. It is the dominance of unconscious drives enabled by the loosening of repression that crowds experience. The ties that bind groups are not based in mutual recognition of interest, but are libidinal. Love, in its widest sense (here Freud cites Plato's Eros again), is what holds groups together.

Freud analyzes group structure in the army and the church, proposing that their libidinal bonds operate in two directions. First vertically, because an illusion is maintained of a leader who loves each member equally. Each individual identifies with his or her leader, who is idealized and placed in the position of the superego. Second, horizontally, because on the basis of this equality of love, bonds extend between the members. The formation of groups through narcissistic identification overcomes internal conflict: Each individual feels loved by the superego, while instinctual aggression is projected outward, to enemies of the group. This shared idealization of the leader as superego accounts for the extraordinary suggestibility of groups: Freud describes the relationship between a hypnotist and patient as a "group formation with two members."

Thus, the authoritarian group is structured as a dyad between leader—Freud ominously uses the word *Führer*—and members; it is a triumph of narcissism, because the ego can feel assured of love and repudiate difference as external to the group. Political absolutism is the absolutism of the ego. Freud returns to the primary social model of *Totem and Taboo* to insist that man wants to be led: He is not a herd animal, "he is rather a horde animal, an individual creature in a horde led by a chief." The fulfillment of infantile desire in the love of the leader allows for the casting out of neurotic conflict; it is an effective, if dangerous, "illusion." Freud suggests a strong parallel between religious and nationalistic fervor, and between individual and national fantasy.

The Future of an Illusion *(1927)*

Freud argues that religion is an illusion because it is the fulfillment the "oldest, strongest and most urgent wishes of mankind." Illusions are to be distinguished from error or falsehood: They are defined by their origins in the most basic, infantile desire, rather than a de facto opposition to "reality." Religion for Freud is a way of compensating for humankind's helplessness in the world, and of controlling the drives. Science ought to supersede it.

Civilization and Its Discontents *(1930)*

Freud examines why man suffers discontent (or discomfort, *Unbehagen*) in civilization. He enumerates ways in which people reconcile the demands of unconscious drives with unyielding reality, whether through narcotics, mass delusions, or neurotic flight into illness. As a means to happiness, Freud views love relations with the most optimism: If man cannot manipulate nature or his own body beyond certain limits, then at least libidinal ties might be modified. Acceptable forms of love are simply too uniformly narrow to satisfy most people. At this point, there seems to be an implied solution to man's discomfort in the reform of moral strictures and normative sexual conventions.

But from here Freud turns to a more intractable problem. Civilization also seeks to curb aggression, which is redirected back to the ego through the harsh superego. Freud calls this guilt, which is not the same as feeling bad about having committed a crime (remorse), but is rather a basic painful condition of living in civilization, forced to channel one's aggression away from others. As in *Totem and Taboo,* the superego is formed in infancy: The aggression the child feels toward the father is redirected as guilt to the child's own ego, and the superego is established as an internal agent of surveillance and punishment. This, finally, is why life in civilization is so hard to bear. It is a situation incapable of reform: Guilt is the most important problem in the development of civilization and the price of its advance. Freud insists that education fails to prepare the young not only for

the complications of sexuality, but also the inescapable aggression in all erotic relations.

Moses and Monotheism *(1938)*

Freud's last book, published in England, shifts his social analysis from collective illusions to a theory of the transmission of cultural memory through history. He controversially proposes that there were two Moses. The first was an Egyptian who introduced a monotheistic religion to the Israelites and led them from Egypt. The second Moses followed 800 years later, and synthesized Jewish monotheism with the Midianite god, Yahweh. The first Moses was murdered and (as in *Totem and Taboo*) the guilt that followed the murder became the foundation of religious law. Traditional history disavows the murder and conflates the two Moses.

Freud revises the idea of historiography, proposing that official histories are in fact histories of denial and distortion. With cultural traditions, as with symptoms, there is a latent, "material" truth to be interpreted from a "historical" truth. Freud proposes a mechanics of cultural transmission for this latent truth: Unconscious memory is inherited through the generations, just as are the instincts of the id. It is a kind of cultural Lamarckism, by which characteristics are unconsciously inherited.

After Freud

Later social and political theorists, while often critical of Freud, have turned to psychoanalysis to explain the politics of delusional systems (Gilles Deleuze and Félix Guattari), the connections between fantasy and nationalism (Jacqueline Rose), the problem of national history (Jacques Derrida), the operations of despotic power (Elias Canetti), the dynamics of colonialism (Frantz Fanon), the performances of gender (Judith Butler), and the configurations of race (Anne Cheng).

FRIENDSHIP

Ideas about *friendship* (*philia* in Greek; *amicitia* in Latin) were central to Greek and Roman political thought. In the Greek world, traditional ideas of morality and justice were based on the idea that one should help friends (*philoi*) and harm enemies, an idea that is known as early as the sixth century BCE, noted by Greek poet and political reformer, Solon, and which the fourth-century BCE philosopher Plato develops and challenges in the opening chapters of his *Republic*. Earlier, in *The Lysis,* Plato had discussed the notion of friendship in terms of loving and being loved, and asks whether friendship was only possible between the good. Although Plato's treatment of the nature and morality of friendship in *The Lysis* was ultimately inconclusive, it opened the way for other discussions of friendship that explored the relationship between morality and utility in friendship. In fact, by raising the issue of what one owed to friends as the opening gambit of *The Republic,* Plato was signaling the importance of friendship to political thought, which was to have repercussions through Greek, Roman, and medieval literature and political theory.

Aristotle, for his part, in the mid- to late fourth century BCE, took up the issue systematically. In his *Politics,* he describes the city as an

"association." In the *Nicomachean Ethics,* on the other hand, he makes clear that all associations are based on "friendship," and that the state is held together by such relationships. Thus, the study of friendship as presented in the *Nicomachean Ethics* is fundamental to Aristotle's discussion of the state and the political life in *The Politics,* because both man is by nature a political animal who naturally wants to live in political associations, and the state is an association that aims at the highest good.

As a result, discussions of friendship were to become intrinsic to understanding the political life and a significant part of ancient political discourse. Theophrastus, Aristotle's successor at the Lyceum, wrote a (now lost) treatise *On Friendship,* which may have indirectly influenced (through the second-century BCE Stoic philosopher Panaetius of Rhodes) the work of the Roman lawyer and political thinker, Cicero, of the first century BCE, who wrote a treatise of the same name, *de Amicitia.* Another second-century BCE Stoic philosopher, Zeno of Citium, was also interested in communities and the bonds that held them together, and in his *Republic,* like Plato in his, was interested in concord and friendship.

In the first instance, however, friends and friendship for the Greeks had a wider semantic range than modern usage generally allows. For Aristotle, as for other ancient writers, friends could include not only family and comrades (for the tragedian Euripides, companions are like brothers and owe each other the responsibilities of brotherhood), but also a range of nonintimate relationships such as fellow workmen or fellow citizens, and even hereditary "ritualized friendships," which were often arranged between elite families of different cities to act as "quasi-kin" (although these relationships were also often overtly political in nature). Furthermore, side-by-side with a specialized language for relations between states, political alliances between states could also be called friendships (*philiai*). This kind of social labeling for political relationships brought with it attendant, though putative, expectations for the relationships, especially of intimacy, longevity, and durability, though these were not always fulfilled. As a result, there was a deep crossover between the political and the social, or the public and the private, and there was a general expectation that a friend in one context should also be bound by the same expectations in other contexts. This intrinsically political nature of friendship, and its potential lack of intimacy, is an idea that was rejected by the Epicureans and which Cicero later challenges in the *de Amicitia.*

Very aware of both Plato's and Aristotle's discussions, Cicero argues that friendship should be for the pursuit of virtue, not for political ends, and questions whether it is possible for an enemy to be virtuous. He also recognizes, however, the inherent danger in friendship is its manipulation for political ends. This is a point that he illustrates through those who supported Tiberius Gracchus's revolution against the state in the second century BCE, and asks whether it is right for a man to bear arms against his country for the sake of friendship. Certainly, Cicero could call himself the friend of Caesar but not support his political policies.

Yet, for the most part in ancient thought, the basis of friendship was a balanced reciprocity and an exchange of like-for-like. Although Aristotle asserts that friendship between the good and the virtuous was the best kind of friendship, he also says that friendships based on pleasure (especially among the young) or utility (especially among the old) were also possible. Xenophon, the fourth-century BCE polymath, in his *Memorabilia,* claimed that the exchanges of friendship were part of natural justice, and to breach them brought their own punishments; those who fail to make returns are hated for their ingratitude and then are forced to pursue the acquaintance of those who hate them. The integrity of the relationship was founded on the fact that the exchange was supposed to be equal, and indeed it was generally assumed that citizens were alike, and therefore equal, in being free and by their nature in their wish to rule and be ruled. Euripides also picks up the tension between equality and power in his *Phoenician Women* produced about 410 BCE, and has the tyrant Eteocles' mother rebuke him for his ambition, and exhorts him instead to honor equality, which is natural, binds communities together, and creates balance. Plato, in *The Laws,* also repeats the maxim that friendship is equality, and Aristotle says that friendship is said to be equality, and especially in friendships between the good. This idea of balance in and equality in friendship can be found as early as Homer's *Iliad* of the eighth or seventh century BCE, where the heroes, Diomedes and Glaucus,

refuse to fight each other when they meet in battle because of the ritualized friendship their families have with each other, and they make an exchange of armor to reconfirm the relationship. Homer makes the joke, however, that Zeus took away Glaucus's wits because he exchanged his gold armor for Diomedes' bronze, so that it was not equal after all. In the world of the late Roman Republic, Cicero agrees that a friendship should be mutually advantageous, though Seneca in the first century CE deplored the morality of giving gifts on the basis of receiving a return on moral grounds, and the vapidity of pretending generosity. Indeed, Greek literature is littered with complaints about those who did not return favors owed, and so reneged on their friendships and betrayed trust.

In fact, there was an awareness that an equal society based on equal relationships was difficult to achieve, and Aristotle is forced to limit his ideal city only to the *mesoi,* the "middling men," and to exclude farmers, shopkeepers, and mechanics. Otherwise, where he concedes that there may be inequalities of status, the exchange needs to be of different kinds, so that balance in the relationship is achieved. Xenophon, on the other hand, who seems to desire a hierarchical society, thought that unequal relationships were important for creating "willing obedience" by the ruled for the ruler, an idea that later influenced Polybius and Cicero in their idealizations of the perfect state. Indeed, in the late fifth and early fourth centuries BCE, the nature of equality itself was being questioned, with some arguing that real equality was based on individuals getting what they deserved commensurate to their contribution (which in turn partly legitimated the argument that the strong should rule the weak). This notion of proportionate equality was proposed in opposition to a democratic, or arithmetic, equality, where everyone received the same reward irrespective of what they contributed, and was influential in the political thought of Plato, Xenophon, and Aristotle.

In the first century BCE, however, Cicero objected to this instrumentalist view of friendship and claimed that real friendship was based on affection. Aristotle had already considered this point, and thought this must be true among friendships between the good, but that it was less important in other kinds of relationships. However, even he finds reason to doubt that relationships based on utility alone could really be friendships after all. For it was generally understood that friendship and goodwill went hand in hand; yet, although goodwill was the beginning of friendship, of itself it was not friendship, just as Cicero argues that friendship does not attend on advantage, but advantage on friendship. However, the role of goodwill (even putative goodwill) in friendship was important, especially in overtly political relationships, by providing the oil to grease the wheels of the relationship (or "the juice" as Aristophanes, the fifth-century BCE comic playwright, called it). In particular, Aristophanes in the *Lysistrata* of 411 BCE compares the handling of political relations in the city to the work of wool carding, where everyone is mixed together in the basket of common "goodwill." For Aristotle, it is affection that can ease the gap and balance the relationship between social unequals; and Cicero says that those of a superior status should allow themselves to come down to the status of their inferiors. Nevertheless, he says, decisions about friendships should not be formed until one is more mature, because friendship should not be ruled by an intemperate goodwill and lead to demands for services that should not reasonably be met.

In line with the positive, and even affectionate, expectation for friendship relationships, even political ones, friendship also presupposed trust. So it was that one trusted one's friends to help not only oneself, but also one's other friends, and to harm one's enemies. Often the first step in establishing a friendship relationship was the giving of a gift or a benefaction that one could only hope would be returned. Xenophon's Socrates in the *Memorabilia* says that this is how friendships, even between family members should be formed; whereas his Hieron opines that a tyrant has few friends, few that he can trust. It was the breakdown in trust that marked the decline in the close relationship that Alexander the Great had with his innermost circle of generals and advisers, his companions.

In the post-Alexander world of the Hellenistic kingdoms of the third and second centuries BCE, relationships between the cities and the central administrations were also built on these "friendship-type" relationships. In particular, the kings bound themselves to cities, and the cities to the kings, by honorific bonds of mutual obligation framed in the language of friendship and goodwill. Part of the

point of using this kind of language was to disguise power relations behind an appearance of benefaction and equality. Similarly at Rome, the language of equality and friendship politely occluded social and political hierarchies without making an impact on the political ideologies of inequality. In the Greek world, however, the ideology of equality remained important, even when it was not achieved in fact.

The Hellenistic cities themselves also awarded honors to the kings, or to the kings' "friends," in order to establish an intimate, or pseudointimate, relationship with the court. Thus, honors of citizenship or financially remunerative tax exemptions were given to the closest companions of the king, either in return for benefactions already given or in the hope that they would be. In this way, the cities themselves took an active part in the dialogue of empire and attempted to redress the power imbalance by awarding honors, which expected a return, to members of the kings' innermost circles. Although these honorific awards were often prospective in nature, they allowed the cities to play the game of benefaction and return so that they not only stood to receive straightforward and substantial benefits for honors conferred (and decrees from this period record substantial services performed for cities by the friends of the king), but also more subtle second-order returns. Thus, cities were, on the one hand, engaging with the institutional processes that brokered power and, on the other, attempting to renegotiate their own position within those processes and the power balance itself.

Yet, not all were sympathetic to the power games of benefaction. The Stoic philosopher Seneca rejected the giving of gifts and benefactions as a means of acquiring friendships, so in this sense he is not far from Cicero, but thought that the importance of the gift was in the intention, not the object, and in the expression of friendship, not in its creation or maintenance. Seneca's moral doctrine of giving for the sake of giving and for the return of feeling, rather than for the return of the benefaction, was also an idea picked up in the thirteenth century CE by Aquinas. However, for the most part, Aquinas closely followed Aristotle's understanding of friendship, although for the medieval theologian and political thinker, the community of friends is formed by those who share in the love of God. In a similar vein for Aquinas, the ultimate friendship is friendship with God, who is loved first as a benefactor and then ultimately for his own sake as a friend.

FUNCTIONALISM

Functionalism is an approach to social explanation associated with the disciplines of anthropology and sociology, although it has also been influential within political science (and political sociology, in particular).

Functionalists are concerned with the properties of systems of interaction, arguing that these systems cannot be reduced to component actions of individual actors. They argue that society should be understood as made up of elements and parts that are organized and interdependent. This organized interdependence constitutes a system, and it

operates as a relatively bounded entity in interaction with an environment. Functional theorists are interested both in the organization of the system and in the organization of its relations with its environment. Emphasis is on self-regulation and the processing of information and learning via feedback mechanisms.

Functionalism was particularly important in the 1950s and 1960s, when it was the direct antagonist of rational choice theory (or exchange theory, as it was then called), with its rigorous adherence to the principles of methodological individualism. However, it came to be criticized for a conservative bias toward equilibrium and social order. The emergence of new social movements and associated radical approaches in the 1970s contributed to its decline. With their displacement in turn by neoliberalism, rational choice theory came to dominate again as an approach better adapted to neoliberal political sensibilities. However, with the emergence of new sciences of complexity concerned with interactions within complex systems and their application to environmental problems such as global warming, systems approaches are increasingly relevant to the social sciences.

The Logic of Functionalist Explanation

Although functionalism mainly came to prominence as a school of sociological theory in the 1950s, its origins can be traced to an earlier generation of writers working in the field of anthropology in the first decades of the twentieth century and in the work of the French sociologist, Émile Durkheim.

Given the anthropological interest in explaining "alien" beliefs and practices not directly intelligible to members of different cultures, a central methodological precept was that behaviors are not explained simply by the identification of the meanings they have for the actors involved in them. They are to be explained by the function they serve for the wider social group. On this view, the meaning of individual actions cannot be understood independently of the wider system of collective practices and beliefs within which they are embedded. These collective practices, in turn, are to be explained by the functions they serve for the system of social life as a whole. Different elements of social life depend on each other and fulfill functions that contribute to the maintenance of social order and its reproduction over time.

Functionalism departs from the traditional logic of causal argument where a cause should precede its consequences. Functionalists identify a causal loop, or feedback, linking cause and effect. For example, when an anthropologist asks: "Why do the Hopi dance for rain?" a functionalist considers the consequence of the dance and notes that it maintains group solidarity. The functionalist concludes that if the rain dance did not have this positive function, it would not be reproduced. Functionalists generalized this to argue that all societies have to meet some universal and interconnected requirements—as well as group solidarity, economic subsistence, social control, sexual reproduction, socialization, education of new generations, and the management of sickness and death—and that these can be the means of access into "alien" cultures and can form the basis of cross-cultural comparisons.

Functionalists are aware of the problem of illegitimate teleology, arguing that the explanation of the origins of a practice should be distinguished from that of its reproduction. They distinguish between *diachronic* and *synchronic* analysis; that is, between the analysis of change of a system and the analysis of the interaction among parts of a system at a moment in time. The latter is the proper domain of functional analysis. However, it proves difficult to maintain the distinction, and most functionalists are criticized for conflating it; or, where the distinction is rigorously maintained, they are criticized for the overemphasis on order.

General Functionalism

Perhaps the most influential functionalist theorist is the sociologist Talcott Parsons. For Parsons, there are four different interconnected systems bearing on human action: the human *organism,* the individual *personality,* the *social system,* and the *cultural system.* The behavioral organism is concerned with the human body as the primary vehicle for engaging the physical environment; that of personality corresponds to the individual actor viewed as a system. It includes conscious and unconscious motivations (or *need dispositions*). Actors respond not only to positive rewards, but also to internalized feelings of guilt, anxiety, and

the need for approval. The social system is a system of positions and roles organized by normed expectations and maintained by sanctions; and the culture system refers to the symbols and meanings that are drawn on by actors in the pursuit of their personal projects.

Parsons's primary focus was the social system. He proposed four functional imperatives necessary to its constitution and operation (the A-G-I-L scheme). *Adaptation* is concerned with relationships to external environments and the utilization of resources in the pursuit of goals. *Goal attainment* is concerned with the direction of systems toward collective goals. *Integration* refers to the maintenance of coordinated relationships among the parts of the system, and *latency,* or pattern maintenance, describes the symbolic order in terms of mutually reinforcing meanings and typifications.

This scheme also provides four subsystems of the social system that can be analyzed in their own right, as well as in terms of their interdependence with other subsystems. Each is defined by the operation of a primary functional imperative, but also involves the secondary operation of the other imperatives. Thus, the economy as a subsystem is defined by adaptive function, but it also has *political* conditions of existence, as well as requirements of appropriately motivated participants. Similarly, there is a polity subsystem defined by the *goal attainment* imperative, with *economic* and *motivational* conditions of existence. The other two subsystems are called by Parsons the *societal community* (defined by the integration imperative) and the *fiduciary subsystem* (defined by the latency imperative).

With these distinctions in mind, it was possible to construct the comparative analysis of politics on a rigorous theoretical basis in terms of the nature of different political systems and their institutional configurations. This was undertaken by a number of political scientists influenced by Parsons. However, the most important contribution was by David Easton, who set out a "behavioral revolution" in political analysis, where broadly normative questions would be replaced by the scientific study of political behavior. The latter was to be understood as a system of behavior, and the major unit of analysis was the political system. As with Parsons, the latter was defined in terms of the authoritative (or binding) allocation of values for society.

According to Easton, the purpose of a systems approach to politics is to identify political activities and processes characteristic of all political systems. The political structures, or institutions, through which these processes are manifested were various and a secondary matter. It is also possible to speak of *parapolitical* systems referring to the political processes associated with any group activity, but, for Easton, the crucial issue was that of the formal political system and its interactions with other formally defined systems and subsystems in its environment. As with Parsons, but without following his precise categories, Easton identifies an "intra-societal environment" made up of ecological, biological, personality, and social systems. The latter, in turn, is divided into cultural, social structural, economic, demographic, and other subsystems.

An innovation of Easton's account is his specification of an *extra-societal* environment (or international society), with parallel subdivisions of international political, ecological, and social systems. Taking the political system as the central focus, the systems approach analyzes the exchanges or flows of effects between these various systems and the political system. The political system is understood to be relatively stable over time, but must manage disturbances that arise in the different regions of the environment. Here, it responds by different kinds of outputs—for example, by administrative decrees, legal statutes, and the like. In this way, political structures can change, while the underlying political process remains stable.

Where Easton suggested that political structures may be various, the formal development of a functionalist scheme, such as Parsons's A-G-I-L scheme, also allows the classification of societies in terms of the level of structural differentiation or institutional specialization around functions—for example, the extent to which political institutions are separated from economic institutions, or economic institutions separated from the household. This analysis gave rise to important studies in the historical sociology of early empires and the rise of modernity. However, the idea of the superiority of higher over lower stages of developmental complexity carries the implication of evolutionary change, where better-adapted forms are realized

out of the deficiencies of lesser forms. Modernity—more substantively, the United States, which Parsons called the new lead society—is the culminating stage of development. Soviet-type societies were regarded as less differentiated along the political and economic axes than liberal capitalist societies and, thus, would betray strains toward convergence with the latter.

Although this analysis now seems quite pertinent with the collapse of Soviet-type systems, at the time it seemed to critics to be an extreme form of teleology. Moreover, it revealed an ideological bias inherent in a scheme that Parsons (and other functionalists) had presented as a "logical framework" without substantive content.

Functionalism as a Research Program

Where Parsons and Easton each regarded functionalism as part of a unified general theory, Robert Merton saw it as an adjunct to the development of empirically grounded theories of what he called the "middle-range." A standard criticism of general functionalism was that it was unfalsifiable, and Merton wanted to establish an approach to theory where it had direct empirical content. Merton identified three unsatisfactory postulates of functionalism that tended to confirm its unfalsifiable character: the *functional unity* (or integration) of a society, *universal functionalism,* and *indispensability.*

According to Merton, it may be that some nonliterate societies show a high degree of integration, but it is illegitimate to assume this would pertain to all societies. It is also possible that what is functional for society, considered as a whole, does not prove functional for individuals or for some groups within the society and vice versa. This suggests that alongside the concept of function, it is necessary to have a concept of *dysfunction,* that is, where the consequences of a practice are negative for some individuals or groups. For Merton, persisting forms have a *net balance of functional consequences,* either for society considered as a whole or for subgroups. Finally, it is necessary to distinguish between functional *prerequisites*—preconditions functionally necessary for a society—and the social practices, or institutions, that fulfill those prerequisites. Although the former are indispensable, it is not required that particular institutions meet those functions. There are always alternative ways of meeting any particular function. Each of Merton's qualifications was designed to transform the postulates into *variables.*

Merton's argument was also important for proposing that functionalism had no intrinsic conservative bias. According to him, Marxism was also a functionalist approach, albeit one that differed from the standard Parsonian approach in terms of how it addressed the question of functional for whom and the possible dysfunctions associated with class relations. Certainly, as Marxist theorists became concerned with specifying the relationships between the economic mode of production and separate spheres of politics and ideology, their approaches adopted characteristic features of functional systems theory with the political sphere, for example, characterized by its management of "contradictions" in the economic system.

From Integration to Complexity

For other systems theorists, the problem with general functionalism was the overgeneralized nature of Parsons's theory. According to Walter Buckley, systems theory could be applied directly to concrete systems without any assumption of the priority of equilibrium over "chaotic complexity," or of consensus over conflict, and without the artificial constraint of just four functions with which to account for differentiation. These ideas were developed by the German sociologist and student of Parsons, Niklas Luhmann, to develop a constructivist, or self-referential, account of systems. Communication, not action, should be the core concept of social science; modern societies, or social systems, are too complex to be reducible to actors' reasons for acting, which can be multifarious. According to Luhmann, self-regulating social systems construct themselves self-referentially as social relationships made up of differentiated subsystems. These subsystems interact, but have their own relatively autonomous logics, and are not limited by a pregiven set of functions.

Differentiation increases communication and the scale and complexity of society. Like Buckley, Luhmann argues that this form of systems theory avoids the priority given to integration in the Parsonian scheme. His theory is not about the reestablishment of equilibrium in the face of contingent

disturbances from the environment, but about the renewal of system elements; all elements must pass away in time, and reproduction is a matter of dynamic stability. Disintegration and reproduction are intertwined. In this way, Luhmann brings functionalist systems theory into dialogue with complexity theory and, thus, posits the possibility that it is in this form that functionalist arguments in sociology and political science will be renewed.

FUNDAMENTALISM

The entry begins by asking whether the term *fundamentalism* is a useful category for political theory in its dealing with the place of religion in politics. There are reasons to ask this question despite the fact that prominent scholars work and publish on this subject. Martin Marty and Scott Appleby initiated a large research project conducted at the American Academy of Arts and Sciences (Marty & Appleby, 1991–1995). Nevertheless, this kind of research on fundamentalism is largely ignored. Instead, people often try to avoid dealing with the term and the issues it raises. For example, one student of Islam states in a footnote: "The word fundamentalism has generally been applied. . . . I side with those who do not find this term helpful" (Lee, 1997, p. 21). No argument is presented. Opinion leaders and policy makers also often avoid the term. At a major conference of the RAND Corporation in Santa Monica, California, attended by representatives of major federal U.S. departments, including the Pentagon, politicians announced publicly that they would not use the term fundamentalism, because it is considered offensive to Muslims. Yet, Islamists themselves do not seem to find the term offensive. To the contrary, the prominent Islamist philosopher, Hassan Hanafi, titled one of his books *al-Usuliyya al-Islamiyya (Islamic Fundamentalism)* (Hanafi, 1989). We should ask: Does the focus on Islam in the debate about fundamentalism end up in Islamophobic connotations? Is fundamentalism an Orientalist category or a significant analytical category in the social sciences?

There is regrettably a loose use of the term *fundamentalism* in public debates. To illustrate the worldwide distorted meaning, one can refer for instance to Germany, where a distinction is made between dogmatic and open-minded green ecologists. The former are addressed negatively as fundamentalists, in contrast to the latter, viewed favorably as realists. In order to get away from this unhelpful usage of the term fundamentalism, one needs to bring the notion back to where it belongs: It is an analytical category in the study of religion and politics. Fundamentalism is to be defined with reference to the response of religion to challenges it has been exposed to in the context of cultural modernity. Without considering this context, there would be no proper understanding of religious fundamentalism. The phenomenon addressed is related to cultural modernity. Religious fundamentalism is a response to a challenge. At issue is a global phenomenon that exists in all religions as a response to modernity done in a variety of ways (therefore: fundamentalisms used in plural). The

challenges arising from cultural modernity and its disenchantment of the world are the background for the emergence of this phenomenon under issue.

The discourse of modernity is also a political one and is in substance secular. However, contemporary cultural modernity is in a crisis that promotes the return of the sacred. Today, modernity itself is being challenged and a process of desecularization (Tibi, 2000) is taking place generating challenges that assume in each case the shape of a variety of religious fundamentalisms. Even though the phenomenon of fundamentalism is a global one, the Islamic variety of it is, for a number of reasons, the most prominent case (Sidahmed & Ehteshami, 1996). The origin of the phenomenon is to be traced back to American Protestant fundamentalism (Ammermann, 1991, pp. 1–65).

> What is fundamentalism all about? In "The Fundamentalism Project" a consensus was established to view the phenomenon as an indication of a fight, therefore fundamentalists see themselves as militants . . . they react, they fight back . . . next they fight for . . they fight with particularly chosen repository of resources . . . they fight against others . . . they also fight under God. (Marty & Appleby, 1991, pp. ix–x)

All varieties of fundamentalism claim to be a revival of religion, but despite this claim, they are not an indication of a religious renaissance. At issue is something else: an invention of tradition in the course of a politicization of religion and religionization of politics. Fundamentalism is therefore not only a defensive-cultural response to modernity, but also and foremost an indication of a political phenomenon aimed at a remaking of the world. Habermas aims to deal with a religious renaissance through his notion of postsecular society (Habermas, 2001; Tibi, 2002). This is however disputable.

The fundamentalist is regularly a male who acts as a political man opposing popular sovereignty as sovereignty of the people entitled to determine government and politics. Fundamentalists act as the defenders of God and argue—at least in the Islamic case—for an Islamic world revolution and for the restoration of *hakimiyyat Allah* (God's rule). They believe that God alone is sovereign!

The overarching context of fundamentalism is the reality of a worldtime of globalization. In fact, each civilization is based on a particularism of its own time documented in its own calendar. Additionally, one can speak of premodern civilizations while avoiding evolutionary thinking. There are also civilizations that are not secular and therefore religion based. The historical roots of contemporary and modern globalization are the process of the European expansion. The related processes are viewed as an expansion of the international society established in the aftermath of the Peace of Westphalia signed in 1648. This globalization is a secular process that results in the mapping of the world into the system of the secular nation-states. It was believed that this mapping was also a part of the universal process of Westernization and secularization. Today, the religious fundamentalisms uprising in non-Western civilizations against the West belie this assumption. Anti-Westernism is, for instance, the substance of Islamist fundamentalism as the vision of a restoration of a religious order against secularity and the West, as well. The U.S. variety of Protestant fundamentalism also contests modernity and it is, despite the great differences to other varieties of political religions in Asia and Africa, a religious fundamentalism and a political religion in the understanding outlined.

On a theoretical-conceptual basis, this entry describes how there is a simultaneity of structural globalization and cultural fragmentation (Tibi, 1998, Chapter 1; Tibi, 2005, Chapters 4–6). This formula refers to the "European expansion," which has generated global structures mapping all civilizations in one process. Parallel to this process of globalization there is no parallel process of a universalization of Western values. In short, cultural universalization does not match the successful globalization of structures. The tensions arising from simultaneity of globalization and fragmentation lead to the emergence of religious fundamentalisms.

Raymond Aron argues in his book *Paix et guerre entre les nations*—published at the height of the cold war in 1962—that bipolarity "veiled the heterogeneity of civilization." Following the end of the cold war, the return of the sacred in the shape of various religious fundamentalisms has been the foremost salient feature of post-bipolar politics.

Secularization has been challenged by religious fundamentalism, which engages not only in a revival of religion, but also in a politicization of it. This is the foremost aspect of the new phenomenon and basically what all fundamentalisms are about. The remaking of the world with regard to government and politics is the basic issue in the fundamentalist agenda.

Fundamentalism also religionizes political, economic, and social conflicts and makes these intractable. The reason for this is the fact that religious claims are viewed as God's claims and are therefore nonnegotiable. In fundamentalism, "God" acts against secular modernity. Therefore, one encounters the major streams of fundamentalism as a revolt against the modern secular structures. This contestation occurs basically in civilizations based on belonging to a religious community. Given this major feature of religious fundamentalism as a "revolt against the West," the phenomenon's occurrence is mainly in non-Western civilizations, despite its roots in U.S. Protestantism. Therefore, it is acknowledged that the phenomenon of religious fundamentalism, though a global one, has originated in Protestant Christianity of the United States, not in the world of Islam, nor in any non-Western civilization. Why then is it often associated with Islam?

The fundamentalism project mentioned at the outset of this entry dealt with all varieties of the phenomenon, although it was not spared of the blame of a focus on Islam with the implicit accusation of an Islamophobia. Indeed, the rise and growth of political Islam, interpreted as an Islamic fundamentalism, provides the foremost case in point for the study of this global phenomenon. Nevertheless, Islamists' vision of a desecularization and a remaking of the world is not restricted to Islamic civilization, it applies to the world at large, and therefore the particular significance in case. In Islamist fundamentalism, the connection to terrorism contributed to inflaming a debate that predates 9/11 (O'Balance, 1997). However, the "holy terror of September 11, 2001" (Lincoln, 2003; Elshtain, 2003) revived the implementation of the approach used in the study of religious fundamentalism; it also created obstacles to the same. Since then, it is considered to be politically incorrect to look at political Islam in this way and to relate it to 9/11 as a threat to international security. However, it is a fact that the jihadist terror grew from political Islam. Involved scholars were accused of being trapped between myth and reality, not to speak of the accusation of "Orientalism." The focus on the Islamic case in the study of religious fundamentalism is not only related to media coverage. There are other reasons. Islam is—next to Christianity—the only religious faith that is based on a universalism. The politicization of this universalism results in a political internationalism. This happens in the ideology of Islamism, which is, however, one prominent variety of religious fundamentalism. Islamism is a political Islam that aims at a remaking of the world and therefore its pertinence to political theory. To be sure, Islam itself is not a fundamentalism, and it is for this reason that a distinction is made between Islam and Islamism.

Of course, it would be wrong to reduce the political impact of fundamentalisms simply to the spread of ideas. For sure, religious fundamentalisms do not fall from heaven and do not come from nowhere. All fundamentalisms arise from a crisis situation. On the one hand, there is a crisis of meaning and, on the other, a crisis related to political and socioeconomic constraints, a structural crisis. Some suggest that fundamentalisms are a passing phenomenon and present again the example of Islamism as the Islamic variety of fundamentalism believed to be declining. Nevertheless, that fact of a double crisis in the meaning addressed refers to what is underlying the phenomenon itself. If these constraints are still looming, it does not seem likely that a decline of the phenomenon is to be expected. In addition, fundamentalisms that grow also from a predicament with modernity are not something like a day-to-day politics. For the time being, fundamentalisms seem likely to be a lasting phenomenon for some decades to come.

The end of the East–West conflict promoted the return of religion to world politics, but all fundamentalisms predate post-bipolarity. Nevertheless, the ascendance of the new role of religion in global politics is related to religious fundamentalisms. To look at this global phenomenon with a focus on the case of Islamic fundamentalism need not be based on any bias and may relate solely to the significance of Islamism and its dual character (Jansen, 1997). Even though the fundamentalist movement in the world of Islam, established since the foundation in 1928 of "The Society of the

Muslim Brothers" is based on a politicization of general Islamic beliefs, it is basically related to the challenge of modernity (Watt, 1988). These "Defenders of God" (Lawrence, 1989) want an order/government/*Nizam Islami* based on the specific religious doctrine for a remaking of "world order." This can also be practiced as "Terror in the Mind of God."

In this understanding, jihad has been promoted to a jihadism of an irregular war conducted as terrorism. This kind of resort to religion to legitimate violence as terrorism exists in all religions. In the Islamic case, the combination of jihad as jihadism, for a remaking of the world, is a basic tenet of religious fundamentalism.

In this context, traditional Islamic universalism is reinterpreted as an Islamist internationalism that makes a special case of fundamentalism in world politics (Tibi, 2008).

Fundamentalism is a global phenomenon in the late twentieth and early twenty-first centuries that challenges traditional secular political theory. The pertinence of the phenomenon can be stated in the reference to the following issue areas:

- Political religion and the challenge of cultural modernity
- Politicized religion, secularization, and desecularization
- Religion and political order on the level of the state and the international system
- Religion and legitimacy
- Religion and law
- Religion and political pluralism
- Religion and political legitimacy

The ideology of politicized religion addressed in this entry as a contestation of the existing order and aimed at a remaking of the world covers all of these listed issue areas. The prominent case of Islamism is one variety of the ideology that religionizes politics. This entry ends by questioning the view that the interpretation of Islamism as a variety of religious fundamentalism suggests Orientalism imposed from the outside on Islam.

Among scholars today, one observes a tendency to decouple Islam and Islamic civilization from Islamism (i.e., the Islamic variety of fundamentalism). The argument presented is that culture and divinities in terms of belief in God have nothing to do with politics and government. These scholars suggest that fundamentalists abuse religion, in this case Islam, as a pretext for furthering their political and economic secular concerns. It is also argued that these references are only superficially presented as an Islamic agenda. True, Islamism is not Islam, but it is not a secular ideology, it grew from an interpretation of Islam, and it is a political religion based on the divine, in contrast to secular political religions, such as fascism and communism.

In short, religious fundamentalisms refer in their quest for a new divine order to religion, but not in an instrumental manner. They are in opposition to the secular nation-state to be replaced by a new order believed to be the true government of God based on divine precepts. The study of fundamentalism leads to the insight that at issue is a competition between religious and secular order. If we look at the writings of major fundamentalists—for instance in the Islamic case—we see the religious-cultural underpinning of their political argumentation. In fundamentalism, the foundation of a religious government is the pivotal concern, as can be shown on the case of Islamic fundamentalists.

The concept of divine order is envisaged to challenge and subsequently replace the prevailing Westphalian order of sovereign states. This order is by its origin Western, as a state system was created in the aftermath of the Peace of Westphalia in 1648, but it is the state system of today imposed on the entire world since the wave of decolonization that completed the mapping of the globe into a Westphalian system. This secular political world order is now threatened by religious fundamentalisms, in particular the Islamist one (Philpott, 2002). In some parts of Asia and Africa, these religious fundamentalists question the outcome of decolonization. In the Islamic view, the civilizational response is a rejection of the incorporation of the world of Islam into the international system of nation-states. The new states that have emerged from the dissolution of the imperial Islamic order are formally committed to secular nationalism. In reality, they have never been free from the existing tension between Islam and the nation-state (Tibi, 1997). Religious fundamentalists want to replace these nominal nation-states by states based on religious tenets. To study these realities of the

twenty-first century and their pertinence to political theory is neither an Orientalism nor a politically incorrect inquiry.

Game Theory

Game theory offers a common mathematical language that promises to unify modern political theory (from Thomas Hobbes, Jean-Jacques Rousseau, and David Hume to contemporary theorists). This entry explains this audacious claim and concludes with two cautionary notes.

A Brief History of Game Theory

Game theory emerged in the 1920s as a branch of mathematics. The first textbook was published in 1944 by John von Neumann, a leading twentieth-century scientist who made major contributions to economics and computing science, and Oskar Morgenstern, an economist. In the early 1950s, propelled largely by the escalation of the cold war and two remarkable theorems by John F. Nash, Jr., game theory's fame grew. Having established early on a symbiotic relationship with economics, it was heralded in the 1980s as a potential unifying language for all the social sciences. Six game theorists have been awarded the Bank of Sweden (Nobel) Prize in Economics.

What Is Game Theory?

Game theory offers a comprehensive analysis of *rational behavior* under circumstances of *strategic interdependence*. However, its definition of what constitutes rational behavior in a social context is controversial.

Game theory assumes that our reasoning is an instrument in the service of prespecified, current, and sovereign ends. Jill ranks the consequences of her actions in terms of their utility to *her* and then behaves *as if* to maximize the (utility) rank of her actions' consequence. This is a form of utilitarianism, which neoclassical economists developed in the latter part of the nineteenth century. It differs both from the deontological approach of Aristotle or Immanuel Kant (according to whom our reason has a capacity to judge that certain actions are right or wrong irrespective of their consequences) and from the classical utilitarianism of Jeremy Bentham and John Stuart Mill.

By treating politics as reducible to the instrumental acts of individuals, game theory confines itself to a particularly narrow form of liberal-cum-methodological individualism. Institutions, ideologies, and norms are explained in terms of behavior driven solely by Jill's and Jack's utility ranks, which are: (a) bleached of all moral and social psychology, (b) interpersonally incommensurable, and therefore (c) incapable of suggesting whether assigning a certain prize or burden to Jack or to Jill serves the common good. While well-placed to explore the conceptual limits of any political theory that models society as a contested terrain on which apolitical agents act, game theory's contribution to political science is impaired by the assumption that agents have no capacity to submit their own (and others') preferences (about outcomes) to rational scrutiny, a capacity that some (e.g., Aristotle, Rousseau) say distinguishes a *ζώον πολιτικόν* (political animal) from the brute.

Consider a situation where what you will do depends on what you think others will do. If the same applies to them, everyone is caught in a web of predictions regarding one another's behavior. Game theorists call this *strategic interdependence* and offer a powerful analysis of how instrumentally rational people behave under it. Consequently, there is hardly a social situation that falls outside game theory's scope. In an election, for instance, both politicians and voters are subject to strategic interdependence. The former choose their policies on the basis of predictions of their rivals' political platform, while the latter often vote in response to predictions of how other voters will behave at the ballot box. In markets, firms choose prices after forecasting the pricing policy of their competitors, who in turn price according to predictions of *their* competitors' prices. Even when it comes to choosing what to wear at a party, we often rely on predictions of what others will be wearing, which in turn depends on what they think we will be wearing, etc. In Shakespeare's words: "All the world's a stage, and all the men and women merely players."

Two Types of Games and Their Relevance for Political Theory

Noncooperative Games

Noncooperative games are strategic interactions where binding contracts between players are not possible *ex ante*. Consider the famous Prisoner's Dilemma (PD), devised in the early 1950s as a demonstration of game theory's potential for the social sciences.

Jack and Jill are picked up for a robbery and placed in separate cells. The assistant district attorney visits each and says: "If you deny the charges, but your partner confesses, you are facing a five-year term. But if you confess while your mate does not, I shall intercede with the judge to suspend your sentence, on account of your assistance in bringing about a conviction. Moreover, I am prepared to put in a good word with the social security people for that pension you are after. To be frank, if you both deny the charges, I shall have to set you free due to lack of evidence. But, naturally, if you both confess, you are both going to jail, say for three years."

Jill, being a rational prisoner, knows that due to the symmetry of their situation, if X is her best choice, it is also the best choice for Jack. But which is X? Of the two symmetrical outcomes "both confess" or "both deny," the latter is vastly superior, as it means freedom for both. However, as long as each prisoner's utility depends on *the individual's* years in prison (and the promised pension), Jack and Jill are caught in a PD that will result in a three-year sentence! Jill (and Jack) muse: "If my partner confesses, I am better off confessing too. And if she (or he) denies the charges, I am again better off to confess (recall the nice pension). *Ergo,* I shall confess *regardless of what my partner does*."

Note that their tragedy is not caused, as one may be tempted to imagine, by the fact that they cannot communicate. Even if they can talk through their cell's wall and agree to deny the charges, their individually best action is still to confess. Hobbes famously made the same point in *Leviathan* when arguing that covenants not supported by the sword are mere words.

The PD fascinated political theorists because it is an interaction where the individually rational choice produces a collectively self-defeating result. Each does what is instrumentally rational to do, and yet the outcome is painfully suboptimal for all. The paradoxical quality of this result helps explain part of the fascination. But the major reason for the interest is also empirical: Outcomes in social and political life are often less than we might hope, and the PD provides one possible explanation of the frequent clash between the private and the collective interest.

Bargaining or Cooperative Games

Things are different in the presence of a mechanism that enforces an agreement—Hobbes's "sword," if you like. This could be anything, from a sense of honor among thieves, the fear of future punishment dished out by an informal institution (such as the local mafia), or the creation of a collective agency such as an association, cooperative, or indeed the state itself, whose purpose is to make covenants bind. In fact, ever since game theory became fashionable, it is commonplace to explain Hobbes's justification of the state's authority as an institution that allows potentially belligerent citizens to escape the PD's logic.

When binding contracts are possible, agents must resort to bargaining to reach agreements on how to divide the mutual gain from avoiding

PD-like traps. Whenever a bargain is struck, some mutual benefit is unlocked, a potential conflict is resolved, and the benefits are distributed in proportion to the bargainers' relative aggression. The most abstract form of bargaining is the Bargaining Problem, which game theory has studied exhaustively: Imagine N persons who are offered the opportunity to divide among themselves an asset of value V. They hold talks that last a finite period and then retire to separate rooms where they write on a piece of paper the percentage of V that each wishes to claim for himself. Afterward, a referee collects these numbers and sums them up. If the sum is less than or equal to 100, each gets what she claimed. If the sum exceeds 100, no one gets anything. What is the rational claim?

The Relevance of Noncooperative and Bargaining Games to Political Theory

The PD captures a host of famous arguments that have left their mark on the theory of the state: (a) Hobbes's suggestion that, without a strong state "keeping us all in awe," we are prone to fall into a PD trap that will wreck peace and make life "nasty, brutish and short"; (b) Adam Smith's optimism that we do not need an interfering state to coordinate production because the profit motive pushes producers straight into a PD that leads them, against their will, to supply the largest possible quantity at the lowest possible price; and (c) Karl Marx's argument that capitalists need the bourgeois state to impose on them a type of behavior that is in *their* interests but which, left to their own devices, they will not adopt, as a result of their PD-like logic.

Of course, there are other classic noncooperative games that relate to central concerns of political theory; for example, Rousseau's parable of the fragility of social coordination, known as the Stag Hunt: A group of hunters strive to coordinate their efforts to catch a stag but find that the only way this will happen is if there is a high degree of optimism within their group that they will, in fact, succeed in coordinating their efforts (otherwise, each defects and seeks small prey). A similar logic underpins John Maynard Keynes's view that the Great Depression was caused, largely, by self-fulfilling pessimism of potential investors.

Game theory formulates simple games that depict most arguments regarding the state crisply and helpfully. Even the anti-state liberal tradition, which began with Hume's idea that order will emerge spontaneously in society through the surreptitious evolution of conflict-minimizing conventions (which later turn into moral norms), is given a new twist when game theory studies the evolution of rational behavior in games (such as PD) that are repeated indefinitely.

Some liberal theorists argue that the legitimate state is one that free and rational people could have agreed to found. Suppose the state we find ourselves living under (with its panoply of laws and institutions) *might* have resulted from some grand bargain between us all. Then, it takes a decisive legitimacy test (notwithstanding the obvious fact that no state ever came about in this manner). If it fails, it must be reformed to correspond to something akin to a social contract that we *could have* all signed, potentially, for the purposes of establishing the rights and obligations of each.

Although different political theorists within the social contract tradition (e.g., Hobbes, Locke, Rousseau, John Rawls) offered different blueprints of the legitimate state (and its limits vis-à-vis interventions in the life of its citizens), they all share one simple idea: The state ought to be thought of in terms of some potential agreement among all its citizens regarding the distribution of rights over life and property. But what would that agreement be? Suppose that game theory can offer a uniquely rational solution to the N-person bargaining problem. Then it would be holding the key to the state's legitimacy.

Nash's Two Main Theorems

Suppose a game's *equilibrium* is the outcome to which players tend the more rational they are, and the more confident they become of each other's rationality. In 1951, John F. Nash, Jr., defined it as follows: N players' actions are in an equilibrium when one's action is consistent with one's beliefs about what others will be doing *after rejecting all beliefs which, if held, would lead to actions that would falsify these beliefs*. Equivalently, Nash admitted only beliefs that are confirmed by the acts they recommend. Put differently, he assumed that rational players, who recognize that their competitors are also rational, will always choose acts that are best replies to the acts of everyone else.

Then, Nash went on to prove, in a mathematically awe-inspiring manner, that *every conceivable game possesses at least one such equilibrium* (as long as the set of actions for each player is bounded). This is an immensely powerful result because it gives game theorists the opportunity to claim that they have the key with which to unlock all forms of unregulated social, political, and economic interactions.

In a 1950 paper, Nash proved, against the grain of opinion among social scientists, that all bargaining situations feature a *unique* solution: Rational bargainers, Nash predicted, will settle for the division of the pie that maximizes *precisely* the product of their utility ranks.

Suppose that during a negotiation, Jack offers Jill x% of the pie, but she rejects it demanding a higher share of, say, y%, and threatening Jack that, unless he relents, she will abandon the negotiations with probability p. Jill's rejection is deemed credible if she prefers, on average, the prospect of getting y% of the pie with probability $1 - p$ rather than x% of the pie with certainty. Next, let us define Division A to be an *equilibrium of fear agreement* as follows: When Jill offers A to Jack, and he credibly rejects it in favor of some alternative Division B, then Jill can credibly reject B (for all B) in favor of her original suggestion A. Nash first proves that bargainers will settle only for an equilibrium of fear agreement and then proves that only one such agreement exists: his proposed solution to the bargaining problem.

Concluding Remark

If Nash's two theorems solve both noncooperative and bargaining games, then in principle, game theory holds the key to unlocking the mysteries of both the state and civil society. The point of the liberal state would then be to enact some social contract reflecting Nash's uniquely rational solution to the bargaining problem, while all our individual actions, beliefs, and conventions would be explainable in terms of his equilibrium.

Game theory has not one but two Achilles' heels. First, there is radical indeterminacy, caused by a proliferation of equilibrium solutions. Thus, game theory depicts almost any outcome as the outcome of rational play; but a theory that rationalizes everything explains, in the end, very little. Second, it suffers from deep logical inconsistencies that result from its adoption of a particularly narrow, and simplistic, view of what rational political animals are capable of in a social context.

Gandhi, Mohandas (1869–1948)

Born in Porbandar, Gujarat, Mohandas Karamchand Gandhi was later known as mahatma or "great soul." His father was a public servant and his mother, who had a great influence on him, was an adherent of a nonviolent strain of Hinduism. Between 1888 and 1891, the young Gandhi studied law in London and was admitted to the bar there. After returning to India for a few years, he moved to South Africa, where he spent most of the next 22 years. In response to its racial policies, Gandhi employed nonviolent civil disobedience and there formulated his theory of *satyagraha,* which can be translated as "truth force" or nonviolent resistance. His campaigns in South Africa were generally directed to the legal and economic conditions of Indians.

On his return to India in 1915, his initial expressions of nonviolent action were not directed against the government, but within a few years, he initiated the first of several mass civil-disobedience

campaigns against British colonial rule, and not all of them nonviolent as Gandhi had demanded. In 1922, he suspended a satyagraha campaign after 22 policemen were killed in Chauri Chaura. His last campaign was on behalf of immediate Indian independence during World War II. The British relinquished power in 1947 but to a largely Hindu India and predominantly Moslem Pakistan. As Moslem-Hindu violence mounted, Gandhi tried to quell the killing and hatred through his appeals for peace and his fasting and calming the areas he visited. On his way to a prayer meeting in 1948, he was assassinated by a Hindu fundamentalist who feared Gandhi's appeals for communal harmony, friendship, and peace.

Gandhi's Theory of Nonviolence

Gandhi is most famously known for his theories of nonviolent civil disobedience and direct action. As he saw matters, violence should never be used, even for ostensibly moral purposes. Violence not only inflicts pain, destruction, and often death on the combatants as well as innocent victims but also changes those who employ violence. Each side believes it must return violence for violence; indeed, combatants are convinced they must apply superior violence if they are to carry the day. Gandhi argued that those locked in violent conflict convince themselves that their end justifies their means, including employing greater levels of destruction and suffering. Because he believed the end can never justify the means, Gandhi insisted that we cannot dispense with moral, ethical, and humane conduct because we think we are fighting on the side of righteousness. On his reading, none of us possesses the complete truth, although most of us grasp important fragments of the truth. Not omniscient, we have no warrant to play god, to determine who is worthy and who is to be violently punished.

Gandhi believed that satyagraha is self-limiting in ways that violence cannot be. Holding that we are all equal and deserving of respect, the *satyagrahi* (or one who practices nonviolent direct action) is said to enter the contest without rancor, hatred, anger, or revenge. Because violence carries such dispositions, Gandhi argued, violence contradicts rational discourse, but the satyagrahi complements and fosters reason. Driven by passions, the best the violent combatant can do is to calculate how to destroy the enemy. Gandhi wants his satyagrahi to bring different people together to talk about what they share and how they can solve problems and settle grievances. But reason and talk, by themselves, are often wanting, and when this is the case, Gandhi wants the satyagrahi to generate nonviolent power and bring grievances to the public agenda in order to approach just solutions. Gandhi claimed that satyagraha is not only philosophically, morally, and politically grounded but also pragmatic. According to him, violence, at best, can provide some temporary relief to the victors, but its evil is permanent.

His strictures on violence, however, did not lead Gandhi to avoid conflict. On the contrary, he embraced it, but with important caveats. The conflicts he spawned, notably against British rule in India and the treatment of the *dacoits* (or untouchables as they were called at the time), were nonviolent and, he argued, designed to promote justice. For Gandhi, injustice meant the domination of others by denying them their autonomy and freedom. One of his most famous books, *Hind Swaraj,* is about self-rule, both for India as a nation and for each of its people.

Action is crucial to Gandhi's confrontation with what he saw as injustice. As he put it, petitions without force are useless, and the force he had in mind is nonviolent mass mobilization. Moreover, Gandhi argued, nonviolent direct action aims at converting rather than coercing his opponents. He reasoned that if his opponents were forced to capitulate to him but were unconvinced that his cause was just, those opponents would return to their old ways at the next opportune moment.

Because his nonviolent campaigns often involved civil disobedience, Gandhi insisted that all possible remedies be taken before laws were broken. When that fails, the satyagrahi is expected to act publicly and accept punishment willingly. According to Gandhi, voluntary suffering reveals the sincerity of the satyagrahi. No one, he reasoned, would risk punishment about matters that are unimportant to the person or beliefs that are not deeply held. He went on to claim that if the satyagrahi was mistaken, any harm from nonviolent direct action would be felt by those protesting and not others.

To face such risks takes courage. Without courage, Gandhi insisted, we let others govern us, and we are not in charge of our own lives. Ruled by

fear, the uncourageous person either has no moral convictions or only weak ones that are not incorporated into the individual's own plan of life. Gandhi's contempt for cowards is vividly expressed in his several observations that if one does not know how to act nonviolently in the face of injustice, it is better to be violent than to accept it. Having said this, he always insisted that nonviolence is superior to violence or quiet withdrawal. For Gandhi, nonviolent politics is available to anyone, whether young or old, physically strong or weak, male or female, learned or unlettered. In this way, he hoped to democratize conflict, involving everyone, not just those with formal power.

Gandhi's Theory of Power

Gandhi was highly suspicious of power, both of state power and nongovernmental power that is lodged in society, the economy, hierarchies of all sorts, and cultural permissions and taboos that open choices for some but constrict them for others. Accordingly, Gandhi called for the dispersal of power, fearing that concentrations of power are apt to run roughshod over the weak. Too often, the powerful convince themselves that they deserve their power, and it is up to them to decide how to use it. The hierarchies that sprout up with imperialism, great wealth, gender, caste, and race elevate some and consign others to continuing subordination. Such asymmetrical distributions of power cannot be morally justified, in Gandhi's view, even though they might be shown to be efficient or productive. Promises of some future good that justifies contemporary human suffering and domination carry no purchase for him. His point of reference is the dignity, worth, and equality of all people now, which cannot be overridden by privilege, convenience, or even perceived necessity.

Although Gandhi believed in nonviolence, the dispersal of power, and respect for all, he recognized that these ideals are illusive; nevertheless, they stand to guide the way in the real world where there is a persistent tendency for power to become concentrated, inequality to expand, and privilege to assert itself. Accordingly, Gandhi wanted people to be skeptical about visible power, but he also wanted to promote a skepticism that questions the claims of nongovernmental powers that justify domination of others and that seek to hide their power and pretend that their power is something else. Claims, for example, that gender or caste or racial inequalities are sanctioned by nature or religion and therefore legitimate are, for Gandhi, masquerades. They hide the constructedness of domination, pretending that those at the bottom somehow deserve their lot and should learn to accept their helplessness and subordination. Only when people are skeptical of the claims of the powerful will they work to change matters.

Gandhi's Views of Modernity and Tradition

Gandhi saw the forces of modernity and modernization generally hiding their power to direct and control human beings and to organize and reorganize society, politics, culture, and the economy according to their own rules. Modern civilization, he repeatedly argued, sees itself as superior to what had preceded it and claims to be justified in imposing standards on life's many facets. Celebrating what is new, it disregards traditions and familiar ways of living. It promises control over nature when, according to Gandhi, we are losing more and more control over our own lives. Moreover, on his reading, modernity favors an impersonal society and economy, shunning the traditional ideal of an interdependent community.

According to him, modern civilization dangles materialism and consumerism before us, greatly multiplying our desires as it promises more and more. But Gandhi found the prize is hollow; modern civilization cannot possibly satisfy everyone's ever-expanding multiple desires. And materialism turns out to be an empty prize because it concentrates on what we can consume, pretending that this is the core of human existence. But life is too rich, textured, and diverse to be flattened along one dimension, according to Gandhi. The depth and breadth of our individual and collective lives requires a dimensionality that materialism by itself cannot provide.

Although he believed that one of the casualties of modern civilization is tradition, something he takes to be generally valuable, Gandhi is hardly an all-forgiving apologist for tradition. He sees it as constructed and evolving and, along the way, justifying various inequalities and subordination, something he found in his own tradition regarding *dacoits* and women. Even though our received

traditions contain corrupted elements, Gandhi insisted that at their core, these traditions contain ideals and moral principles that are important to human beings but are avoided in modernity. On his reading, at their best, traditions teach us that all human beings are equal, that we are not to treat others as means to our own ends, that we have duties and responsibilities to others, and that our knowledge of good and evil as well as of causality is fallible. For him, modern civilization is not necessarily at war with all moral principles. He often employed the modern concept of rights, for example, to describe what he believed was denied to colonial India, *dacoits,* and women. However, Gandhi claimed that modernity, often unwittingly, displaces traditional values with inferior surrogates. Duties to others are shunted aside in favor of personal success, the ties that bind a community are unraveled by the demands of efficiency and productivity, the vitality of the local is smothered by the heavy hands of centralized efforts to coordinate, and the rich diversity of life makes way for a bland consumerism.

Summary and Conclusions

Gandhi remains an influential and original thinker on the nonviolent resolution of conflict. Even so, he has not been without critics. Gandhi claimed that satyagraha is universally applicable, regardless of the target or circumstances. Sympathetic observers have questioned his advice to Jews to resist the Nazis nonviolently. They argue that for all of the faults of British colonialism, it was not Nazism (or Stalinism). Hitler's government would not have been content to disapprove of civil disobedience and imprison the demonstrators; rather it would kill them. Such critics hold that Gandhi's nonviolent confrontations depend for their efficacy on particular conditions and, therefore, are applicable only selectively. Other critics hold that violence will never disappear from the world, and it is both prudent and moral for countries to possess the kind of force that will dissuade and, if necessary, resist aggressors.

Support for this latter position comes from the extraordinary violence of the twentieth century. But this has also been a time when much of the world changed, indeed was transformed, for the better without massive violence, and Gandhi's theory of satyagraha continues to have broad appeal. Both the British and Soviet empires were dismantled without much violence, and apartheid in South Africa crumbled without wide-scale violence. Moreover, many of the world's marginalized have resisted domination and promoted their own nonviolent movements as they pressed for equality without regard to class, race, caste, or gender. However, Gandhi's critique on the excesses of modernity and modernization has not gained the kind of following that his ideas regarding nonviolent protest have. His arguments with modernity and modernization are probably too sweeping and do not provide solid counsel to taming their worst features. However, some in the environmental community react to his suspicions about the dangers that follow a disrespect for nature and an arrogance about exploiting nature.

What weaves the many parts of Gandhi's thinking into a coherent whole is his unswerving commitment to the worth and dignity of every individual. Critical to his understanding is his belief that everyone should be treated equally, that there is no natural or divinely ordained hierarchy that anoints some people as superior and makes others inferior. Therefore, he concluded, there is no justification for treating others as a means to satisfy our own ends, no matter how moral we think these ends are. Moreover, he holds that any human being can know only fragments of the truth. None of us is God, who knows the whole truth, even though we sometimes aspire to be omniscient and omnipotent. In promoting claims that everyone is equal and everyone is limited, Gandhi advanced a nonviolent politics where power is transparent, dispersed, and accountable; a society that attends to the least well-off and recognizes that everyone carries duties to others; and a culture that moves beyond consumerism and recognizes the many facets in any individual's life and shows men and women that they are part of an interdependent cosmos.

Gender

Gender is commonly understood to refer to the culturally constructed behaviors, roles, and identities associated with men and women. Simone de Beauvoir's claim that one is not born one but rather becomes a woman is frequently invoked to capture the sense in which what it means to be a man or a woman derives from the social and historical context in which we live rather than from natural or biological fact.

Gender is an important question for political theory. Theorists are concerned with how political institutions and concepts used in political theory are gendered—that is, how their development and definitions have operated to construct and perpetuate gender divisions. In addition, how we understand the concept of gender is itself an important focus for political theorists.

Feminist theorists have pointed out that much traditional political theory, while purporting to be neutral, is gendered. Perhaps most important, feminist theorists have argued that the concept of the person or the individual that underpins much political theory turns out, on closer inspection, to equate to an individual who possesses characteristics—such as rationality, impartiality, and independence—traditionally associated with masculinity. This gendering of the individual was once explicit, as in the French Revolution's Declaration of the Rights of Man and Citizen (1789), but it continues implicitly in the work of much political theory. It persists precisely because of this history of exclusion of women from participation in the political sphere. Although the formal limitations on women's participation in public life have been removed, many feminists contend that this historical exclusion has continued effects. This history has contributed to our understanding of the characteristics associated with masculinity and femininity. The ideals guiding public-sphere participation—reason, impartiality, exercising judgments in accord with universal rules, not sentiment—come to be associated with masculinity and to be defined against the attributes associated with femininity. Thus, publicity, reason, universality, and masculinity are aligned in opposition to privacy, emotion, particularity, and femininity.

How we are to understand what the term *gender* refers to is also a matter of substantial debate within political theory. One interpretation of the meaning of gender is to understand it in terms of a distinction between sex and gender. On this social constructivist understanding, sex is natural or biological—maleness or femaleness—whereas gender is culturally constructed meanings attached to these biological facts—masculinity and femininity.

Other interpretations of gender have challenged the adequacy of the sex/gender distinction, arguing that the idea that sex is a natural fact is not self-evidently true but is itself a culturally constructed notion. An alternative to this understanding of sex as natural and gender as cultural is Judith Butler's influential theory of gender performativity. This theory argues that sex is as constructed a notion as gender is. Performativity theory is a more thoroughgoing version of social constructivism, arguing that there is no natural sex—instead, it is the repeated performance of gender that produces, over time, the effect of a natural sex that underlies these performances. The constant repetition of gender congeals over time to give the appearance of a natural truth underlying these performances. On this understanding, the order of primacy is reversed—it is not sex that dictates or shapes our performance of gender, but rather the repeated performance of gendered behavior that accretes, over time, to produce the idea of an underlying sex.

The notion of gender performativity does not mean that performances of gender are a matter of free choice. Instead, these performances are constrained—they repeatedly cite norms of gendered behavior (in particular norms of heterosexuality),

and in doing so serve to strengthen and perpetuate these norms. This understanding of gender suggests that the means to transform gender come not from stripping away false cultural constructions of gender but instead from performing gender differently—from subverting gendered norms, and in the process, transforming them.

Still other interpretations challenge this approach to gender, suggesting that a performative reading of gender obscures the question of nature. This approach suggests that the constructivist interpretation of gender entailed in performativity theory tends to result in an emphasis on questions of discourse and representation at the expense of thoroughly rethinking the notion of nature and bodily materiality. Theorists associated with this approach sometimes prefer to use the notion of sexual difference rather than gender, believing that this captures more of a sense of the intertwining of nature and culture than is offered by gender.

GENEALOGY

The philosophical concept of genealogy, introduced as a term of art by Friedrich Nietzsche's *On the Genealogy of Morals* (1887), has come to be associated with two related but distinct practices of philosophical reflection. The first—of which Nietzsche's text is the primary exemplar—is critically directed to undermining some aspects or elements of our current evaluative orientation or perspective. The second—which is taken to be exemplified by David Hume's account of the origin of justice in Book III of his *A Treatise of Human Nature* (1740)—is directed to the vindication of some aspect or elements of our current evaluative orientation or perspective. More recently, the critical and vindicatory modes of genealogy have been revived, most notably by Michel Foucault and by Bernard Williams, respectively. What links the two practices is that they each seek to provide naturalistic histories or quasi-historical stories concerning the emergence of an evaluative orientation (say, justice or morality) that are designed to affect our confidence in the value and authority of the object of genealogical enquiry. Genealogy can be located as one kind of approach to the practice of engaging in philosophical reflection through historical reflection; examples of other approaches would include works ranging from Georg Wilhelm Friedrich Hegel's *Phenomenology of Spirit* and Theodor Adorno and Max Horkheimer's *Dialectic of Enlightenment* to Alastair MacIntyre's *After Virtue* and Charles Taylor's *Sources of the Self*.

But on what grounds can (quasi-)historical stories about the formation and development of our norms, values, ethical beliefs, and so on that compose our evaluative orientation play any role with respect to our reasonable judgments concerning the value and authority of that perspective? A condition of the motivation of genealogical reflection is an acknowledgment that the history of how we come to have a given perspective that we now exhibit is not in and of itself vindicatory. In contrast to the Providential views of history targeted by Hume and the teleological views targeted by Nietzsche and Foucault, the genealogist starts from a standpoint in which the historical triumph of a given perspective cannot by itself be taken to underwrite any claim to normative legitimacy.

In the case of vindicatory genealogy, the central example is Hume's genealogy of justice. Hume's strategy is to provide a fictional history that demonstrates how people with certain relatively simple psychological motivations of the kind that we recognize as typical, given a plausible and probable set of circumstances, come to develop a virtue—and hence reasons for action—that they did not previously have. Notably, Hume's account of the

emergence of the artificial virtue of justice is one in which a shift from one outlook to another is explained in functional terms such that the later perspective makes sense of itself and of the earlier orientation and of the transition from the one to the other, in such terms that holders of both outlooks have reasons to recognize the transition as an improvement. A more recent example of vindicatory genealogy that attempts to extend the approach is Bernard Williams's *Truth and Truthfulness*.

Perhaps the earliest example of a critical genealogy is Jean-Jacques Rousseau's *Discourse of Inequality,* which similarly starts from a simplified psychology to provide a functional account of how we reach a more complex psychological condition that holders of the early outlook would *not* be able to endorse and that holders of the present outlook must find disturbing. This approach is further developed by Nietzsche's *Genealogy,* in which he attempts to show how the different elements composing morality can be accounted for best in terms that are incompatible with the requirements of the outlook of morality.

More generally, we may say that in the case of critical genealogy, the destabilization of our confidence in a given perspective is accomplished by showing (a) how we have come to be captivated by this way of seeing; (b) how this way of seeing renders us obscure to ourselves in various ways or renders us blind to, for example, forms of power or injustice; and (c) how a shift of perspective can clarify and illuminate our condition to us. Two examples will illustrate the nature of this practice:

1. In *Discipline and Punish* and *The History of Sexuality (v01.1)* as the first example, Foucault's general concern is based on the thought that we are held captive by a picture of politics fundamentally shaped by discourses and practices of sovereignty—and which leads us to assume that sovereignty is the preeminent locus of political reflection. As he puts it:

> At bottom, despite the differences in epochs and objectives, the representation of power has remained under the spell of monarchy. In political thought and analysis we *still have not cut off the head of the king.* Hence the importance that the theory of power gives to the problem of right and violence, law and illegality, freedom and will, and especially the state and sovereignty. . . . To conceive of power on the basis of these problems is to conceive it in terms of a historical form that is characteristic of our societies: *the juridical monarchy.* (Foucault, 1978, pp. 88–89)

Foucault's concern is that our captivation by this sovereignty-based picture of politics means that we fail to make sense of our political agency. The substance of this concern is, thus, that in being so captivated, we are blind to the operation of forms of domination articulated through relations of power that this picture does not disclose. His task is, thus, to enable us to free ourselves from this picture such that we may begin to make sense of ourselves as political agents in ways that support, rather than undermine, our capacity for self-government.

There are three stages to the process of genealogical self-reflection. First, Foucault provides an account of two types of political relations, those organized around sovereignty and those organized around biopower, and their relation to each other to unsettle the grip of the sovereignty picture on our political imaginations. Second, by giving an account of the emergence and development of biopower, Foucault shows us how we have remained captivated by the sovereignty picture and how this captivation leads us to fail to make sense of the circumstances and character of our political agency. Third, by enabling us to make sense of our political agency and, in particular, our current failure to make sense of our own political unfreedom, Foucault's account motivates us in terms of our own commitment to self-government to engage in the practical task of overcoming this condition of unfreedom by altering our games of government to minimize the degree of domination within them.

2. In *Strange Multiplicity,* James Tully provides a perspicuous representation of the character of demands for cultural recognition by surveying the range of political struggles that have rendered cultural diversity problematic, causing it to become a locus of political action and philosophical reflection, to outline a set of conventions that would allow speakers their due. To achieve this goal, he offers a genealogy of constitutionalism to lay open to view those conventions that obstruct

our understanding of claims for cultural recognition and, thereby, prevent us from rendering what is due to the advocates of such claims by way of (a) an historical account of how a given language of "modern constitutionalism" has become hegemonic within contemporary constitutionalism, marginalizing and excluding what Tully refers to as the language of "common constitutionalism"; (b) an illustration of how this modern picture causes us to overlook distinctions and uses of concepts in the language of contemporary constitutionalism that enable us to do justice to demands for cultural recognition; and (c) a demonstration that once we are freed from captivity to the conventions of the language of modern constitutionalism, we can see the justice of the constitutional conventions Tully recovers and reconstructs from historical examples of the practice of common constitutionalism for addressing contemporary struggles of recognition.

In both cases, what is initially seen as a limit or bound of reason is exposed by way of the historical investigation to be not natural, necessary, or obligatory but a product of contingent, arbitrary constraint.

It is important in reflecting on genealogy to be clear that it is not a general method for the social sciences; rather, genealogy is a specific kind of investigation designed to address a particular kind of problem, namely, the authority of our current political perspective or some aspect of it, where the scope of "our" is given by the focus of the specific object of investigation. Vindicatory genealogy is designed to support our confidence in the authority of our perspective, and critical genealogy to undermine it, but both take this focus. In this respect, there is no necessary incompatibility between genealogy and other forms of vindicatory or critical reflection that are oriented to different problems.

General Will

The central idea in the political thought of Jean-Jacques Rousseau, the general will (*volonté générale*) had already figured in French theological and philosophical discourse for a century before Rousseau appropriated it and made it forever his own.

The general will first gained wide circulation in the writings of Nicholas Malebranche, who employs the term in the *Traité de la nature et de la grace* to characterize the way in which God's will operates in the world. He argues that God wills generally, establishing laws to regulate the universe as a whole, rather than by willing

particularly to assign specific attributes and destinies to individual people and things. Physical deformations and moral evil are not part of God's general will, Malebranche argues, although they arise as predictable but unwilled consequences of the operation of general laws.

In Book 11 of *De l'esprit des lois,* Montesquieu characterizes the legislative activity of a state as the expression of its general will and the action of its judiciary as the articulation of a particular will. Unlike Malebranche, who contrasts the wisdom of God's general will with the arbitrariness of particular wills, Montesquieu attaches no moral valence to either. Montesquieu insists only that the two powers must be institutionally separated because their union in the same body necessarily results in tyranny.

In his entry on "*Droit naturel*" in the *Encylopédie,* Denis Diderot seeks to refute moral skepticism by demonstrating that the general will of all humankind provides the natural foundation of morality. Humanity's general will is always oriented toward the good, he claims, because it aims at the happiness of the entire species. Diderot's general will, however, is an ideal standard known by reflection, not an empirical act of willing.

In the first manuscript version of *Du contrat social,* Rousseau rejects Diderot's account. There can be no empirical reality to a general will of the human species, he argues, because humankind as a whole is so diverse and dispersed that it cannot act as a subject with a single will. As an ideal standard, Diderot's principle cannot satisfy the moral skeptic, Rousseau claims, because what skeptics really lack is not knowledge of the good but a motive to prefer the welfare of others to their own.

The published version of *Du contrat social* explicitly addresses the problem Rousseau thought Diderot had left unresolved. In the preface to Book I, Rousseau announces that he aims to discover the rule any government must follow if it wants its subjects to be both morally obligated to obey its commands and motivated to do so. That rule proves to be the general will.

People as they are, Rousseau holds, are naturally free, and in their freedom, they will the preservation of their own lives and goods. Nevertheless, the extensive needs of socialized human beings make it necessary for all to live in organized communities with others. Rousseau conceives the establishment of any such community as the making of a contract with the following terms: The individuals who join the community accept that their properties and lives will be subject to the supreme authority of the community's general will; the community, in turn, promises to regard each individual as inseparable from the whole community. There is nothing mysterious about this contract and the general will it creates. According to Rousseau, every group of people dedicated to a common purpose has a general will to accomplish that purpose, and the existence of such a general will distinguishes a community from a mere aggregation (*The Social Contract* [SC] 1.5). The body politic or political community is the community that aims at the overall well-being of all its members.

Rousseau's social contract is not, as was Hobbes's, an exchange of freedom for security. It is, rather, the exchange of one *identity* for another, the transformation of individuals into citizens, who collectively are sovereign. The people's sovereignty, according to Rousseau, is both inalienable and indivisible. It is inalienable because it is nothing but the active expression of the citizens' will that the community flourish (SC 2.1) and indivisible because the exclusion of any citizens from political participation would preclude the expression of a truly general will (SC 2.2). In other words, only the entire body of the people can make law, which is, properly speaking, nothing but the declaration of the general will. Because the citizens are bound only by the laws they have themselves made, they are not subject to the authority of any individual person and therefore remain as free as they were before accepting the social contract (SC 2.4, 1.6).

Rousseau adds that the general will is always "upright" (SC 2.3); it aims at what the people believe is good for themselves collectively, which is not the same as saying that it is always good, or wise (SC 6.1). The rectitude of the general will is guaranteed by a combination of its generality and the natural self-interest of the citizens. Because each one benefits from the welfare of the whole, every member has a motive to advance the common weal. As long as the whole body of citizens genuinely seeks the good of the whole community and enacts regulations that bind the entire community equally, the result will necessarily be equitable (SC 2.4).

Rousseau does not waver from regarding the general will as an empirical phenomenon, not an ideal of reason, but he does recognize that it can be difficult to design institutions to discern the content of the general will from the votes cast by citizens in any real political assembly (SC 4.1–4). It is yet more difficult for the people as a whole to discern the substantive content of the common good that it knows it wants in the abstract: Rousseau writes that "the judgment which guides" the general will "is not always enlightened" (2.6). Hence, Rousseau envisions that a wise legislator will propose a code of laws and will invoke the aid of religion to induce the people to will his laws as their general will; if the laws are well adapted to the people, the people will come, in time, to love them and embrace them, not only as the dictates of religion, but also as the basis of their own public happiness.

These difficulties, which Rousseau recognized, became practically manifest in the politics of the French Revolution and the Terror, whose leaders were enthusiastic, if less than careful readers of Rousseau. Mistaking his own will for the general will, Maximilien Robespierre notoriously regarded opponents of his policies as enemies of the sovereign people, who must be expelled from the body politic, which is to say, executed.

Georg Wilhelm Friedrich Hegel argued that, because it lacked any grounding in an objective ideal of reason, Rousseau's account of the general will led ineluctably to the Terror. Benjamin Constant agreed in blaming Rousseau for the excesses of the French Revolution, but for a different reason: Constant rejects the total subordination of the citizen-subjects to the determinations of the general will.

Immanuel Kant transforms Rousseau's political theory of freedom under the general will into the moral theory of autonomy through the categorical imperative. The general will retains a role in his political theory, but Kant treats it as an ideal standard, not an empirical expression of the citizens' will. In his account, a law is illegitimate only if it could not have been willed by the people as its general will.

After Kant and Hegel, the general will continues as a topic of analysis and discussion, particularly in political theorists working in the idealist tradition, such as T. H. Green and Bernard Bosanquet, but it never regained the prominence it had held in the philosophy of Jean-Jacques Rousseau.

Global Civil Society

The contemporary study of civil society is generally seen to reflect the relatively recent emergence of activist forms of political participation dating from the 1960s. The movements of that decade seemed to follow a quiescent period in all industrial democracies and, for many, were all the more surprising given the general economic prosperity of the times. But even a cursory look at the historical record suggests that none of these forms of activity or activism was very new, even then. Although we cannot pinpoint a specific date, decade, or even century when "civil society" begins to take on something of a familiar form and recognizable social movements start to appear, it seems safe to say that, by the last quarter of the eighteenth century, the conditions were ripe. With the emergence of social activism during the 1980s in the socialist states of Eastern Europe, the term

civil society was revived; its extension to the global first appeared around the time that the Soviet bloc disintegrated and disappeared. In that context, the term *global civil society* came to refer to the transnational activism and activities of various nongovernmental organizations (NGOs) and social movements.

Much of the literature on global civil society focuses on the structure, motivations, and activities of NGOs, both domestic and transnational. The global number of NGOs is quite large, perhaps in the hundreds of thousands or even millions, and their activities span a broad range of issue areas and countries. As commonly understood, global civil society almost certainly does *not* include the myriads of civil and civic associations that are largely apolitical, although even these organizations play a role in the structuring and maintenance of state-market-society relations and do, now and then, engage in political activities. Nor is the notion of NGOs ordinarily extended to market actors, such as corporations, even though growing numbers of business associations and companies are deeply involved in activities similar to both NGOs and social movements. And there is the perennial question: Who elected the NGOs? Who are their members, and whom do they represent? And don't the wealthier, more influential NGOs from the Global North dominate the poorer NGOs from the Global South? Finally, many NGOs themselves are constituted as businesses because they must generate income to go beyond voluntary status. Some offer retail goods and services for sale and have annual expenditures greater than $100 million. This is small by corporate standards but quite respectable for many academics and even institutions of higher education (excluding Harvard, Berkeley, and other such wealthy universities).

Whether *global* civil society makes analytical or empirical sense is not at all clear. In a liberal system, civil society is concerned with social reproduction in the private sphere and with ensuring that neither state nor market takes complete control of the bourgeoisie and its "life, liberty, and property." Civil society is regarded as possessing a high degree of autonomy from the state, even as it exercises its control functions. From a Marxist perspective, the division between public and private, as well as the structural reasons for that distinction, are foundational to capitalism, the liberal state, and the activities of capital. Political authority over segments of the public realm is transferred to the private sphere, where property rights are guaranteed by but insulated from the state's direct and structural power. In the absence of a world state, however, it would seem that a global civil society cannot exist because there is no evident global political authority.

There is no world state but, to a growing degree, the global political economy constitutes a singular transnational capitalist social formation that resembles, more and more, a state in the making. Within this arrangement, global civil society is generated through productive power—in a sense, it is willed into existence—as particular agents in command of certain discursive resources seek to impose limits on the autonomy of market-based actors in the face of a very weak global ethical and normative regulatory structure. The majority of these agents pursue their goals through institutions—that is, through the rules and authority of national and transnational agencies and association—and attempt to induce change in the moral behavior of state- and market-based actors. Some agents—especially those commonly described as social movements—work through productive power in an effort to transform the ethical bases of political action and thereby to reconstruct the structural principles governing both domestic and global political economy.

Global civil society is best understood, therefore, in terms of a dialectical relationship between developing modes of public global governance and a global market system that is only weakly regulated by states and international institutions. Global civil society is constituted out of social relations within an expanding global neoliberal regime of governmentality and, with and through the capillaries of productive power, helps to legitimize, reproduce, and sometimes transform internally that regime, its operation, and its objectives. In this respect, global civil society is generated by agents who seek to resist or moderate the expansion of the market into various realms of social life but who may, nonetheless, act in ways that, perhaps unwittingly, support the logics of the market and its further expansion. Paradoxically, the same relations of power that give rise to this form of social action also engender movements that pursue major structural change in the global political economy,

this in a quest to alter the social ethics that enable or constrain individual and corporate autonomy within politics and markets. In other words, global civil society manifests itself in two forms, acting alternatively through markets or politics.

GLOBALIZATION

Globalization is an essentially contested concept. It has many definitions, and there is little agreement as to its existence, its magnitude, and its operation. For the purposes of this entry, globalization can best be understood as the extension and deepening of flows, rules, and practices associated with capitalism. In this respect, globalization is not a new phenomenon, inasmuch as capitalism has been globally expansive since at least 1500 CE. The relevant question is, therefore, what is new or different about contemporary globalization.

Analytical Approaches to Globalization

Standard arguments about globalization tend to focus on flows—of goods, capital, labor, travel, technology, and information—as measures of the rate, degree, and extent of economic and social change since roughly 1970. Such indicators are relatively easy to quantify, are taken as significant in themselves, and most important, are routinely collected by governments and other authoritative institutions. International trade and capital flows have, for example, grown by orders of magnitude over the past half century, and the information revolution has, as many put it, resulted in an unprecedented "compression of time and space." Response times to events and crises have diminished greatly, and if a currency collapses in Asia, the ramifications are soon felt in the United States, Europe, and elsewhere. But these are hardly new phenomena: Although the speed with which things happen has increased, as has the size of flows, they have all been characteristic of the global economy for centuries.

A second, minority view argues that globalization is not happening or, if it is, the magnitude of the phenomenon is little greater than that seen in Europe prior to World War I. Advocates of this perspective focus largely on volumes of cross-border trade and capital flows, along with levels of foreign direct investment. Proportionally, these are less than was the case in 1914, although the absolute magnitude of the international economy is greater, even taking into account inflation rates of more than 1,000% since then. Such a narrow view of globalization rests on a very limited conceptualization of the phenomenon and, consequently, defines it out of existence.

A third approach focuses not on the flows or stocks of things but, rather, the global diffusion of rules, processes, and practices. In this light, globalization has two important features: First, it involves the expansion, extension, and deepening of capitalist social relations, "trickling down" even into those countries and places that are regarded as only marginally integrated into the global economy. Second, there are "knock-off effects" on existing social relations that transform established patterns of employment, wealth, power, status, hierarchy, expectations, and politics, destabilizing customary patterns of production and reproduction, challenging naturalized social hierarchies, and triggering political and social change and upheaval. Globalization thus offers numerous opportunities for the emergence of social movements and other forms of political organization and action, even as it disrupts existing beliefs, values, behaviors, and social relations. At times, these disruptions may generate social violence and even war.

In historical terms, there is little new in this, inasmuch as the present phase of capitalist expansion is only the latest in a centuries-old trend toward worldwide economic integration: As Karl Marx and Friedrich Engels declares in the first section of the *Communist Manifesto,* "All that is solid melts into air" (p. 63). Technological change, commodification, accumulation, and cultural change expose the fluidity and hollowness of hierarchies and networks, downsize or eliminate various niches in the societal division of labor, and open or expand others. Although there is a class character to these impacts and their consequences, the political and social alliances that develop to resist such change tend to be based on cultural elements—religion, race, ethnicity—rather than strictly economic or class factors.

Conceptualizing Globalization

Globalization is better understood, therefore, as simultaneously an *idealist* set of beliefs; a *behavioral* set of principles, rules, and activities; and a *material* set of outcomes and infrastructures. Globalization is a form of idealism through reification of a complex process that, it is said, will make the world richer and happier, and it is rationalized and naturalized in the name of efficiency, competition, and profit, as an inevitable concomitant of the historical triumph of liberalism. Globalization is a form of behavioralism in its reorganization of existing institutions, resulting changes in the practices of real live people, and creation of new conditions of normality that are of benefit to some and not others. Finally, globalization is a form of materialism in the sense that flows of capital, technology, goods, and, to a lesser degree, labor move rapidly, putting in place new infrastructures and landscapes of production, exchange, and consumption.

The ideology associated with contemporary globalization is widely identified with neoliberalism, although its origins are to be found in the liberal economic system established through the post–World War II Bretton Woods regulatory regimes. Neoliberalism looks to the market as an institution best suited for fostering both individual accumulation and social progress; it favors minimal political intervention into their operations. Drawing on a crude version of Adam Smith's "invisible hand," deregulated markets are believed to maximize social benefits and utilities. In fact, neoliberalism involves a shift in regulation from the market itself to the political economy in which markets are shaped. When encoded in international law, treaties, and conventions, rules and regulations become globally binding on all signatories, and violators may be sanctioned and fined. Such meta-regulation is less visible to individual participants in markets and more distant from national political institutions but, in many instances, provides specific advantages to capital (see the discussion of intellectual property rights, below).

The behavioral consequences of globalization arise in terms of responses to meta-regulation and in the ways that individuals and societies are reorganized and made to alter older forms of practice. For example, production of high-value agricultural commodities in developing countries for export to wealthy countries may result in land consolidation, decline in subsistence production of food, and migration of landless and unemployed farmers into urban areas. The ability to move large amounts of capital rapidly into high-return, high-risk investments can foster bubbles, and their subsequent collapse can have all kinds of ancillary consequences.

The material consequences of globalization arise as economies grow differentially, and established lifestyles and infrastructures are made obsolete in some locales and built up in others (compare here Bethlehem, Pennsylvania, and Shanghai, China). This has transformative impacts on both place and space; although those impacts are rapid, their long-term effects can span centuries. During the current phase of globalization, in particular, the production process has become much more complex, with raw materials, commodities, semi-processed materials, parts, and finished goods moving among locales and plants in different countries according to both interstate/interregional and intrafirm logics of comparative advantage. Rapid and efficient global communication systems have fostered the outsourcing of services such as design, accounting, travel bookings, and so on. The specific forms of these processes, as well as the paths of corporate and social change, are determined less by the relative costs of factors of production, as would follow from the classical theory of comparative advantage. Rather, those forms are

more dependent on factor costs internal to the production chain, the costs of capital—financial, human, and intellectual—the burden of social costs imposed in specific locations, and the size of local subsidies, if any.

Furthermore, besides involving the redeployment of capital and production factors (and, it should be noted, both legal and illegal labor mobility), the current phase of globalization is also very knowledge intensive. It is knowledge intensive in terms of the complexity of production, in terms of the commodification of knowledge, and in terms of our understanding of globalization's impacts on both social and natural environments. The globalization of an intellectual property rights system, through the World Trade Organization's TRIPS (Trade-Related Aspects of Intellectual Property Rights) agreement, is only one of several new commodity frontiers that bring most of the world's countries under hegemonic regulation of knowledge production and exchange.

The History of Globalization

The current round of globalization has its roots, as noted above, in the post–World War II economic system propagated by the United States. This, in turn, drew heavily on the nineteenth-century international economy, which was based on the gold standard, protected by the British Royal Navy, and anchored in the City of London. The Bretton Woods (BW) system, devised in large part by John Maynard Keynes and Harry Dexter White and modeled to some degree on the earlier British-sponsored system, sought to address the trade, currency, and fiscal crises associated with the Great Depression, which were believed to have contributed to the war. The four major BW institutions were the International Bank of Reconstruction and Development (IBRD, aka, the World Bank), the International Monetary Fund (IMF), the dollar-based gold exchange currency system, and the later established General Agreement on Trade and Tariffs (GATT). Their forms and functions were premised on the existence of relatively autonomous, state-regulated national economies, subject only to a limited set of meta-regulations. During its fully-operational lifetime, the BW system was a great success, helping to spur European reconstruction and high rates of economic growth and prosperity in Europe, Japan, and the United States.

Nonetheless, by the 1960s, the currency component of the BW system was coming under growing strain, as international dollar liquidity exceeded demand (the Triffin dilemma) and U.S. trade deficits appeared and grew, fostered by American spending on the Vietnam War and growing imports due to lower tariffs negotiated under the GATT. The oil price hikes and inflation of the 1970s, accompanied by rapidly increasing wages and declining rates of profit, motivated a turn to neoliberalism, on the one hand, and gradual liberalization of capital movements, on the other. During the early 1980s, a double global recession, engineered by the U.S. Federal Reserve to squeeze inflation out of the U.S. economy, set in motion incentives to restructure U.S. and global production and further integrate the world economy through a purely dollar-based currency standard.

Today, although national economies remain notionally autonomous from each other, they are deeply integrated in a number of ways. Most critically, it is very difficult for any country to insulate itself from disruptions, whether economic, political, or social, in other parts of the world. In particular, having yoked their individual prosperity to international trade and exchange as well as growing rates of fossil fuel consumption, virtually everyone is exposed to the massive dollar overhang resulting from recent U.S. budget and trade deficits, extraction of household equity as a mechanism of global demand stimulation, and foreigners' purchase of various forms of American bonds and securities as a store for surplus dollar holdings. Although it is conceivable that one or another major American creditor—China, Japan, the European Union—might choose to break with the dollar standard, there is a general concern that this could cause global financial turmoil that would exceed that during the Great Depression.

The Implications of Contemporary Globalization

As noted above, one of the most important impacts of globalization involves the disruption of social relations that arises from displacement and destruction of older patterns of production, exchange, consumption, and lifestyle. Although this process

is reified as one of the costs of economic progress and the raising of factor productivity, it may also play a role in phenomena such as terrorism. The individual freedom associated with global consumer capitalism helps to erode the social discipline and peer pressures associated with older patterns of behavior and practices, and globalization makes available technologies and methods that facilitate capital and individual mobility as well as the dual use of everyday technology and communications. Because social disruption also involves major shifts in status, hierarchies, and relative well-being, it may foster the formation of both activist social movements and networked terrorist groups and associations. This hypothesis, however, requires further research.

Another significant consequence has to do with the global environmental effects of globalization, evident in at least three ways. First, growing levels of fossil fuel burning and other greenhouse gas emissions appear to be changing the world's climate, although the scale and scope of this change are, as yet, highly uncertain. As a result, however, people around the planet are likely to experience impacts for which they bear little or no responsibility. Second, global trade and consumption of goods and services have impacts far from their points of origins, with deleterious effects on land use, water resources, forests, and cities. In effect, negative environmental externalities are being exported around the world. Furthermore, the transformation of landscapes arising from the relocation of production; the exploitation of forests, minerals, and water resources; and the rise in international tourism, among other processes, are diminishing global biodiversity. Again, these impacts often affect people very different and distant from those who consume goods and services.

Finally, what are the impacts of globalization on people's well-being and social welfare? This is a point of some dispute: Has globalization improved the lot of the world's poorest? On the one hand, the very high rates of economic growth in China and India have raised the incomes of hundreds of millions above the World Bank's official poverty line of $1 to $2/day, and some data suggest that mean incomes have risen in many countries (with the notable exception of those in Africa). On the other hand, there is evidence that the divide between the very wealthiest and very poorest of the world's people has also increased, in both developed and developing countries. According to the UN Development Program, 54% of the world's income goes to 10% of the world's population, while 40% of the world's population receives only 5% of the world's income, a gap that is growing larger.

Conclusion

Globalization is not a uniformly negative phenomenon. It facilitates comparative advantage among countries, regions, and corporations. It can raise incomes and welfare and enhance the social mobility of people who have lacked such opportunities. It fosters a closer and more interdependent world and facilitates knowledge production and education. But globalization also has its downsides and is currently lacking forms of social regulation that could soften many of its harder edges. The future of globalization rests, most of all, on the modes and mechanisms of management and regulation that states, corporations, and other groups are able to devise and implement. Whether these will emerge is also disputed and, in any event, will likely take decades to become effective.

Global Justice

Theories of justice provide principles to guide the moral assessment of existing or hypothetical social arrangements. Principles of distributive justice, in particular, assess the terms on which social arrangements make important economic advantages accessible to people (such as property in productive assets, income, wealth, and opportunities for employment). Until recently, philosophical discussions on distributive justice tended to focus only on the assessment of rules and institutions framing the interactions of individuals within a domestic social structure. There is, however, increasing discussion about principles that address the global level. These principles would orient supranational rules and institutions that affect international markets in capital and labor, international trade and monetary arrangements, the access to natural resources, and the conditions and limits of the sovereignty of states.

This entry articulates current debates on global justice in reference to three kinds of issues. The first concerns the identification of plausible distributive principles. The second focuses on the formulation of conditions under which the global application of these principles would be morally justified. The third area of discussion concerns the issue of whether the implementation of global principles of distributive justice is feasible.

Three Kinds of Distributive Principles

The first area of debate concerns the identification of distributive principles. We can identify at least three kinds of principles:

1. *Basic sufficientarianism.* We should, to the extent that we reasonably can, pursue social arrangements in which everyone has enough access to certain important advantages, thus avoiding absolute deprivation.
2. *Intermediate inclusion.* We should, to the extent that we reasonably can, pursue social arrangements in which everyone has a level of access to certain important advantages, which secures the avoidance of absolute deprivation and the absence of glaring forms of relative deprivation.
3. *Egalitarianism.* We should, to the extent that we reasonably can, pursue social arrangements in which everyone has equal access to certain important advantages, thus avoiding relative deprivation.

According to basic sufficientarianism, we should try to secure that everyone has access to what they need to avoid severe poverty. A standard way of construing this demand is in terms of basic socioeconomic human rights to basic resources, housing, health care, and education. These rights range over objects people need to live a minimally decent life. Although most political philosophers now agree that a global version of basic sufficientarianism is a valid demand, they disagree on its precise status. Thomas W. Pogge and Michael Blake, for example, are among those who see it as a strict demand of justice, whereas others, including Thomas Nagel, construe it as a weaker humanitarian duty. Another disagreement concerns the nature of the fundamental duties of justice associated with basic sufficientarian claims. For Pogge, such duties are negative duties to refrain from depriving others of access to the objects of their basic human rights. John Rawls, David Miller, and other philosophers construe the fundamental duties as being also positive, demanding that we provide others with what they need to live minimally decent lives. The first view can yield positive duties of justice but only derivatively: X may have a derivative positive duty to help Y avoid severe poverty when X has been involved in the causation of the poverty that Y suffers. A typical example occurs when Y suffers poverty partly as a result of an international order (supported by X and others) that encourages corrupt elites to oppress and dominate vulnerable people like Y in poor areas of the world (e.g., by allowing such elites to sell natural resources from their countries in the global markets or to contract debt in the name of the people they rule). Although the second view need not reject this way of yielding positive duties, it can more directly say that X should help relieve the poverty of Y simply because X can do so at reasonable cost. An advantage of this approach is that it does not need to rely on empirical claims about the history of the current world order and counterfactual hypotheses about how it would have proceeded had different political choices been made,

which are quite hard to assess. Another advantage is that it can in principle address all kinds of unchosen poverty, including those for which the global rich are not causally responsible. Its polemic weakness, however, is that in some cases it has less motivational power. Other things being equal, most people feel more ready to act to attend to the needs of others when they are responsible for their suffering than when they are not. Another advantage of the negative duties approach is that it seems more likely to have ecumenical appeal. It might, for example, be convincing even to libertarians, who are normally reluctant to accept distributive demands that are based on putative positive duties to improve the economic condition of others.

Consider now the two kinds of suprasufficientarian principles: intermediate inclusion and egalitarianism. Both principles go beyond basic sufficientarianism, demanding that we be concerned not only with people having enough, but also with people being more or less equally well-off. Principles of intermediate inclusion are less demanding than egalitarian principles. Egalitarianism calls for a pursuit of strict economic equality of opportunity or the elimination of inequalities in income and wealth for which people cannot reasonably be held responsible. Intermediate inclusion demands, instead, that differences in economic prospects not be so wide as to make economic cooperation a matter of sheer exploitation. Natural applications of intermediate inclusion arise in the assessment of policies and decision-making procedures of institutions such as the World Trade Organization, the International Monetary Fund, and the World Bank. Although less demanding than egalitarianism proper, the global implementation of intermediate inclusion would still make a significant difference. David Miller is among the many authors who indeed argue that in a world of deep economic inequality, international institutions tend to be controlled by the global rich, who routinely use their overwhelming superiority in bargaining power to impose exploitative terms of cooperation on the global poor.

Moral Justification

The second area of debate concerns the issue of what makes the global application of distributive principles morally justifiable. Although the arguments articulated below apply to the three kinds of distributive principles, we will focus on suprasufficientarian principles and in particular on egalitarianism. Indeed, the most contentious issue in contemporary philosophical debates on global justice concerns the question of whether global egalitarianism is justified. Many authors argue that egalitarianism is appropriate for domestic contexts, but not for the global level. There are two kinds of arguments for this conclusion. The first tries to show that the implementation of global egalitarianism is simply infeasible, whereas the second attempts to show that even if it were feasible, the implementation of global egalitarianism would not be obligatory at the bar of justice. In what follows, we consider some debates on the issues raised by these strategies, beginning with the second.

The relevant question is: What has to be true of any two individuals for it to be morally appropriate to claim that principles of egalitarian distributive justice apply to them? There are two broad answers to this question. The first is the *humanist* answer, according to which principles of egalitarian justice apply to all persons qua persons, regardless of their country of provenance. A route to this view proceeds along the following lines. We start by affirming the moral equality of all individuals as ultimate units of equal moral concern for everyone. This is the standard moral axiom of cosmopolitanism. We then proceed to note that an appropriate demand for concern arises when people are disadvantaged through no fault of their own. We proceed to trigger obligations of egalitarian distributive justice by identifying serious cases of this kind of disadvantage that result from people being born in poorer rather than richer countries. Consider two children: Maria, who was born in Nicaragua, and Judith, who was born in the United States. Maria's educational opportunities are significantly lower than Judith's. Is this fair? On the humanist egalitarian view, this inequality in educational opportunities is not fair, as it results from factors beyond Maria's and Judith's control. Equal concern would demand that we do not let unchosen circumstances impose inequalities of access to important advantages such as education, wherever these arise.

The second answer to the question about the scope of egalitarian justice is the *associativist* view, according to which principles of egalitarian

distribution apply only among those who share an associative framework of the relevant kind. There are, of course, many versions of this kind of approach, depending on which associative framework is deemed relevant. The following are some examples formulated by Joshua Cohen and Charles Sabel in their 2005 work. According to statism, the relevant associative framework must be co-membership in a political community involving a centralized use of legitimate coercion (a state). According to institutionalism, duties of distributive justice exist where institutions can be charged with the responsibility of assigning the relevant advantages. According to cooperativism, the relevant associative framework is some consequential regime of mutually beneficial cooperation. According to interdependence, the triggering condition is present "whenever the fate of people in one place depends substantially on the collective decisions taken by people in another place, and the fate of people in that latter place depends substantially on the collective decisions of people in the former" (p. 153). Another important form of associativism is, of course, nationalism, according to which people have duties of justice to each other only if they are co-nationals (i.e., they share a certain set of institutions, a language, and a collective history).

The associativist approach qualifies egalitarianism's scope by saying that its appropriate application tracks certain facts of association. Now, philosophers endorsing associativist views are divided on the issue of whether global egalitarianism is justifiable. Some claim that no associative framework of the relevant kind is global in nature, concluding that global egalitarianism must be rejected, at least until the relevant global associative framework emerges. Others argue that associativist premises need not yield a rejection of global egalitarianism. On these approaches, a rich description of the current trends of global economic and political interaction, including overt or covert military interventions, international institutions like the World Trade Organization and the International Monetary Fund, multiple regional organizations, international social movements, and so on suggests that some version of institutionalism, cooperativism, or at the very least interdependence in fact yields global egalitarian demands. Charles R. Beitz is among those who argue, for example, that analogues of Rawls's domestic principles of justice as fairness, including global fair equality of opportunity and a global difference principle, are warranted.

It is worth noting that some associativist philosophers who reject global egalitarianism can nevertheless endorse certain global suprasufficientarian demands, advocating a form of global intermediate inclusion involving, for example, the full spectrum of human rights, fair governance of international institutions, and global labor standards. The demand here is not to secure equality of opportunity or condition, but certain (higher than sufficientarian) minima of advantage and a more fair (although not strictly egalitarian) distribution of benefits resulting from some international cooperative ventures.

The cogency of these associativist arguments for global principles depends, of course, on how we characterize the current trends of globalization. They also depend on how frequent and intense global interactions must be for different suprasufficientarian global principles to be deemed morally appealing on an associativist view. Here it seems important to avoid too stringent a view of the depth of the requisite global interactions because this would lead to an uncritical acceptance of the status quo. But it also seems important to avoid an account that is so lax as to dissolve the specificity of associativism. Mere interaction and the possibility of creating schemes of more inclusive distribution may not be enough. Thus, a crucial but difficult task for associativist approaches is to provide criteria for the precise level of international interaction needed for each kind of global principle to be triggered. This is not a problem faced by humanist views, for which it may be enough to show that the implementation of global principles is feasible.

Feasibility

The implementation of a principle may be feasible either because we already possess the institutions needed to fulfill it or because we can create them. Some conceptions of justice favoring global principles claim that there is a natural duty of justice to uphold institutions implementing those principles when they exist and to create them when they do not. Both associativist and humanist conceptions may endorse a natural duty of this kind,

although they would construe it in slightly different ways. For example, associativists would not demand that we create new associative frameworks that could make feasible the implementation of principles of justice that are more exigent than the ones warranted by currently existing associative frameworks. A humanist would, on the other hand, be ready to entertain transitions of this sort, at least insofar as their pursuit does not impose unreasonable costs on anyone.

The issue of what is currently feasible and what can, and perhaps should be made feasible in the future has increasingly become a focus of discussion as philosophers begin to consider the demands of global justice in the non-ideal circumstances of our current world. Circumstances are non-ideal when people are unable or unwilling to honor demands of justice. Examples of such circumstances are the absence of robust international institutions and the lack of a strong ethos of cosmopolitan solidarity. These institutional and motivational deficits pose feasibility obstacles for the implementation of principles of global justice. A response to them would require that we address issues of global *political* justice. Besides the question of what principles should guide the distribution of economic advantages, there is the issue of how decisions regarding such distributions should be made. How should political power be construed in the current context of globalization? What global political practices and institutions are needed to progressively approach the fulfillment of demands of global distributive justice? If we were to face tradeoffs between global political justice and global distributive justice, how should we calibrate them? Many political theorists are starting to address questions such as these. For example, many claim that although it may be true that, for the foreseeable future, a world government would be both undesirable and infeasible, we can and should move beyond a Westphalian framework that fails to limit the sovereignty of states in order to approach global justice. Simon Caney, Robert E. Goodin, and David Held are among those who propose, instead, that we introduce a multilayered system of governance including global authorities and substate institutions besides state-level decision making.

GOVERNANCE

From the mid-1980s and onward, *governance* has become a catchword in discussions about how the economy, society, and different kinds of organizations are, or should be, governed. In August 2008, a Google search on *governance* gave more than 50 million hits, almost twice as many as *globalization.* The widespread reference to governance creates frequent translation problems, as many languages do not have a proper equivalent to the term. Because many people tend to stick to the English term, governance has itself become an instance of globalization.

Governance is one of the most fashionable terms within political science, and it is also widely used among practitioners. Part of the attraction is that governance signals a weakening of the state-centered view of power and societal steering, which has dominated the Western world for centuries but now seems to be problematized by contemporary empirical and ideological developments. Governance is a notoriously slippery term. Nevertheless, it aims to grasp the current movement away from the classical form of government through hierarchical command and bureaucratic rule and toward a more open and flexible type of governing based on the participation and interaction of a plethora of public and private actors in different kinds of networks, partnerships, and quasi-markets. These new forms of governance chime well with both the neoliberalist individualism and the postmodern decentering of society because they invoke the principle of "regulated self-regulation," which permits individual and collective actors to work together to find joint solutions while maintaining a large degree of operational autonomy.

Governance is often used in conjunction with other terms. Hence, *good governance* refers to the recent endeavor of international organizations such as the United Nations and the World Bank to assess and measure the quality of the governing institutions and practices in terms of their stability, interaction, transparency, responsiveness, procedural fairness, effectiveness, and adherence to the rule of law. *Global governance* refers to attempts to develop regulatory policies in response to global problems in the absence of an overarching political authority. *Corporate governance* refers to the institutionalized interaction among many players—including shareholders, management, the board of directors, employees, customers, financial institutions, regulators, and the community at large—involved in the process of directing and controlling business firms. *Project governance* refers to the conditions, practices, and exercise of leadership that help to ensure that projects based on cooperation among several actors lead to innovative and yet feasible solutions. *Multilevel governance* refers to the rise of regional policy making and implementation structures such as the European Union, which link political authorities at different levels while, at the same time, involving relevant and affected actors from the private sector, thus leading to the formation of complex and tangled networks. Last but not least, it should be mentioned that *public governance* has become a buzzword in the consecutive waves of public-sector reforms that are inspired by the *new public management* doctrine, which aims to enhance the role of the market and introduce corporate management techniques in the public sector. The governance literature contains many other examples of the widespread use of the notion of governance, and there is no point in arguing about which of the many usages is the right one. We have to dig deeper and provide a generic definition of governance that can subsequently be used in radial categorizations of different kinds of governance.

Defining Governance

An initial look at the terminological genealogy reveals that governance has its distant roots in the Latin word *gubernare,* which means "to direct, rule, guide," and the Greek word *kybernan,* which means "to steer or pilot a ship" and forms the basis of the notion of cybernetics. From the sixteenth century onward, the notion of *government* becomes a frequently used term in the English-speaking world. Government is derived from the French *gouvernement,* which in turn comes from the medieval French notion of *gouvernance.* Hence,

we might conclude that governance is an old term for providing direction to society that went out of fashion a long time ago and only recently rose to its current fame.

Some contemporary commentators define governance in terms of either the formation of a collective will out of a diversity of interests (politics), a system of rules shaping the actions of social and political actors (polity), or a political steering of social and economic relations based on soft, cooperative policy instruments such as persuasion, voluntary coordination, or procedures for benchmarking of public performance (policy). A few definitions even attempt to combine all three elements in highly inclusive definitions of governance. However, none of these different definitions really captures the distinctiveness of governance, either because they fail to show what governance adds to the traditional notions of politics, polity, or policy or because they fail to put bounds on governance, which tends to include everything and nothing.

Governance is also sometimes defined as a general concept for any pattern of ordered rule including hierarchical government. Although this definition facilitates analysis of how different modes of governance, typically bureaucracies, markets, and networks, are combined in various countries and policy areas, it betrays the fundamental idea that governance implies a change in the role and nature of government. Alternatively, governance can be defined as the complex process through which a plurality of societal actors aims to formulate and achieve common objectives by mobilizing and deploying a diversity of ideas, rules, and resources. This definition emphasizes three distinctive features of governance. First, governance designates a *process* rather than a set of more or less formal institutions. Second, the process is driven by a *collective ambition* to define and pursue common objectives in the face of divergent interests. Third, the process is *decentered* in the sense that common objectives are formulated and achieved through the interaction of a plurality of actors from the state, the economy, and civil society.

Emphasizing the process element makes governance research akin to both policy analysis and implementation studies, which are also looking at processes. Hence, governance research aims to combine process-oriented analysis of policy *input* (policy analysis) with process-oriented analysis of policy *output* (implementation studies). Yet, at the same time, governance research aims to transcend the narrow focus on political and administrative processes taking place within the formal institutions of government. Highlighting the collective ambition to formulate and achieve common objectives is equally important as it takes us beyond the notion of concerted action, which fails to capture the shared ambition of the actors involved in governance to define and solve common problems through joint action. Finally, stressing the decentered character of governance makes it clear that governance cannot be reduced to steering, at least not in the traditional sense where steering refers to the government's exercise of sovereign power to achieve particular, pre-given goals. Defining governance as a decentered process through which policy is formulated, selected, and implemented tends to exclude the kind of unicentric, top-down government that is supposed to have existed prior to the new public management-inspired reforms that have swarmed the public sector from the mid-1980s and onward.

By contrast, governance can be said to include a variety of interactive policy processes. Some of these take the form of *pluricentric networks,* which aim to respond to complex, conflicting, and ill-defined policy problems by facilitating negotiated cooperation among relevant stakeholders on the basis of interdependency, trust, and self-regulated rules of the game. Others take the form of *multicentric quasi-markets,* which aim to respond to problems associated with public monopolies by enhancing negotiated competition in public regulation and service delivery through the establishment of relational contracts between public authorities and private providers. Networks and quasi-markets seldom exist in pure forms, and combinations of the two basic forms of governance are frequent. Public–private partnerships, which combine elements of competition with elements of cooperation, are a case in point.

The state is, to an uneven but increasing extent, supplemented or supplanted by pluricentric networks and multicentric quasi-markets. However, this development does not necessarily result in a "hollowing out of the state," as some commentators have suggested. Most public tasks are still undertaken by fairly traditional forms of bureaucratic

government, and public authorities such as municipalities, regional governments, national ministries, supranational institutions, and international organizations also play an important role in facilitating and managing governance. However, the role of the state seems to vary across the different scales at which governance operates. Hence, whereas public agencies typically play a relatively large role in setting up and coordinating different forms of governance at the local, regional, and national scales, they tend to play a more limited role in relation to global governance and in relation to intra- and interorganizational forms of governance.

The Rise of Governance

The rise of governance, both as a discourse and a set of practices, can be traced back to the Trilateral Commission. In the mid-1970s, the commission initiated a worldwide discussion about "the overload of government" resulting from the mounting expectations of citizens and the limited capacities of public bureaucracies and about "the ungovernability of society" allegedly caused by the decline of public-spirited values. Neoliberal political parties and governments responded to the problem of government overload by recommending the privatization of public enterprises, contracting out of public services, and commercialization of the remaining public sector. In continuation with these neoliberal recommendations, new public management reforms sought to limit the role of elected government to the formulation of overall policy objectives and to place the delivery of public services in the hands of private contractors and quasi-autonomous public agencies operating on the basis of contracts and agreements with central government agencies. In response to the increasing ungovernability of society, new public management has aimed to integrate private organizations and firms in public governance through the formation of networks and partnerships and to enhance the exit and voice options for citizens in public-service delivery through enhanced consumer choice and the creation of user boards.

In political science, there has also been a growing concern for the crisis of the modern welfare state, and in the attempt to provide an alternative to state-sponsored welfare, public-choice theory has highlighted the allocative efficiency of the market. However, the research on steering and control conducted at the Max Planck Institute in Cologne and at the Center for Interdisciplinary Research in Bielefeld, Germany, has emphasized the limits of both hierarchies and markets. Hierarchies have problems dealing with societal complexity, and markets suffer from collective-action problems. The inherent problems of hierarchies and markets call for the development of new modes of governance based on negotiated interaction among interdependent policy actors. The viability of voluntary coordination beyond state and market is further supported by the work of the American political scientist Elinor Ostrom, who has demonstrated how common pool resources can be regulated through the development of durable cooperative institutions. In the early 1990s, Jan Kooiman summarized the new insights in the claim that no single actor, public or private, has the knowledge and capacity to solve complex, dynamic, and diversified problems. Kooiman and others among his Dutch political science colleagues saw the formulation of governance networks as the solution to this challenge, whereas other researchers saw contract-based partnerships between public and private actors as the way forward. The focus on governance networks resonated well with the works of a number of Anglo-Saxon scholars who had been criticizing the notions of corporatism and neocorporatism for their narrow focus on the tight cooperation among public authorities, trade unions, and business organisations and developed a more open and flexible notion of policy networks that were divided into tight and exclusive policy communities and loose and inclusive issue networks. The emphasis on network types of governance is extended further by international relations theorists, who have developed related notions of advocacy coalitions, epistemic communities, and multilevel governance. Finally, a mixed group of radicals and critical theorists perceive governance either as a neoliberal attempt to "roll back the state" or as the promise of a new democratic order based on associations in civil society that escape the systemic logics implicit to state and market. The latter interpretation turns governance into a prescriptive rather than descriptive concept and invokes the widely contested assumption that civil society is a power-free zone and, therefore, provides the ultimate source of emancipation.

Criticisms and Research Avenues

The research on governance, which sometimes gets carried away in an overly optimistic appraisal of the merits of the new forms of interactive governance, has been met by a series of objections that seem to correspond to the three phases of denial. First, there are those scholars who claim that governance hardly deserves scholarly attention as it remains a marginal phenomenon vis-à-vis the overwhelming predominance of public bureaucracy, which still performs most government functions in most states. The counterargument to this claim will be that governance is on the rise, already plays a significant role in some policy areas, and deserves attention because it blurs the distinction between the private and the public and transforms the role of the state.

Second, among those political science researchers who agree that public policy increasingly is produced and delivered through public–private interaction, many will deny that governance is new and refer to long-lasting traditions for involvement of private actors in the formulation, selection, and implementation of public policy. However, to this unobjectionable observation it should be added that, although governance is not in itself new, it is increasingly considered as an effective and legitimate way of governing society. Hence, what seems to be new is the central role governance is playing in the restructuring of the public sector and its boundaries.

The third and final form of denial is the claim that governance is a new but highly unfortunate phenomenon that should be countered by all means because it creates huge problems in terms of public accountability. While it is undeniably difficult to ensure accountability in pluricentric networks and multicentric quasi-markets, the conclusion is not necessarily that we should return to old-style hierarchical and bureaucratic rule. In our increasingly complex, fragmented, and multilayered societies, interactive forms of governance that bring together actors with different ideas and competences have come to stay. The task is, therefore, to develop new forms of accountability that transcend the traditional forms of electoral and bureaucratic accountability, which merely aim to hold administrators accountable to elected officials, who are in turn held accountable by the voters through regular elections.

The defense of governance research against the three objections raised above does not imply that governance research is a flawless endeavor without any serious problems. The theoretical underpinning of governance research is still relatively weak. There is also an urgent need for methods that combine quantitative and qualitative analysis in the study of governance. Furthermore, only a few empirical studies take us beyond single case studies. These problems bear witness to the fact that governance research has not yet been consolidated into a new political science paradigm. In addition, it should be noted that the new research on governance tends to have an insufficient understanding of the role of power and political conflict, needs to rethink important political science concepts such as sovereignty and democracy, and has been slow to develop tools for assessing the normative implications of governance. The future research agenda will also include: (a) analysis of the formation and transformation of governance arrangements, (b) studies of the situated (inter-)actions of different actors, and (c) reflections on the causes of governance failure and the possibility of meta-governing governance processes through a combination of institutional design, political and discursive framing, process management, and direct participation.

There is no unified theory of governance on which to build the future studies of governance; rather, a broad set of competing theoretical approaches seem to offer crucial insights into the formation, role, functioning, and management of governance. Principal-agency theory envisages the problems arising from incomplete or asymmetric information when a principal hires an agent to carry out a particular task; it can help to analyze the attempts to align the interests of public purchasers and private providers in quasi-markets. Systems theory focuses on communication within and among systems and subsystems and offers crucial insights into the need for intersystemic coordination in the face of fragmentation and complexity and into the various forms of higher order governance (meta-governance) that select, institutionalize, and govern actual governance processes in accordance with particular norms and values. Rational choice institutionalism examines how institutions shape the behavior of rational, self-interested actors by influencing their anticipation

of the consequences of alterative courses of action; it is particularly useful in analyzing the game-like situations through which mutually dependent actors aim to enhance horizontal coordination. Normative institutionalism focuses on how the identity and conduct of social actors are shaped by rules, norms, and values that prescribe what is appropriate for the actors to do in particular situations. It emphasizes the dynamic development of identities, capacities, and political accounts through processes of normative integration and is helpful in analyzing the spread and adoption of new governance paradigms within the public sector. Interpretative policy analysis perceives social actors as interpreting subjects who construct particular, context-bound interpretations of their own identity and their immediate environment and emphasize the role of collectively constructed policy discourses and story lines in shaping the individual actors' interpretations. Last but not least, poststructuralist governmentality theory analyzes the collective rationalities and institutionalized practices that define how to govern and be governed. It shows how a new advanced liberal governmentality aims to shift the burden of government to local networks and partnerships in which the energies of free and responsible actors are mobilized and given a particular direction to ensure conformity with overall policy objectives. Although the different theoretical approaches can be further developed and refined, they all provide important insights into problems and practices of modern governance, and the presence of competing theories founded on different assumptions about the social action and the nature of society fosters critical debates and academic exchanges that tend to sharpen the conceptual frameworks, arguments, and methods.

Gramsci, Antonio (1891–1937)

Antonio Gramsci was one of the pioneers of Western or humanistic Marxism—a tradition that opposed orthodox Marxism for its determinism and its objective materialist conception of history. Disenchantment among Marxists with the prevailing orthodoxy was fueled by unfolding historical events. By the mid-1930s, economic depressions had come and gone without producing the systemic collapse of capitalism that Marx had predicted. World War I, from 1914 to 1918, and the subsequent disintegration of proletarian internationalism nourished the suspicion that the European masses had ceased to be a revolutionary force—if indeed they ever were. The rapid rise of fascism and Nazism in the years following the war reinforced the gathering sense that Marx's predictions were mistaken. In place of deterministic modes of analysis, a new breed of Marxist, influenced by Hegelian categories of thought, began to highlight the importance of human agency, of creative human action, in historical development. Every contribution Gramsci made to Marxist theory was underpinned by his belief in the power of the reflective human subject. This belief itself

may have been spawned by his own triumph over personal adversity.

Gramsci's Early Life

Born in Sardinia, the son of a minor public official, Gramsci endured a miserable childhood. Mocked by other children because of his physical shortcomings (he was a hunchback of diminutive stature) and family scandal (his father was imprisoned for corruption), he compensated by becoming something of a bookworm. His academic prowess was sufficient to earn him a scholarship to the University of Turin, where he specialized in linguistics. While there, he became acutely aware of northern prejudice against southern Italians like himself, and his resentment soon transmuted into political activism. In 1913, he joined the Italian Socialist Party (PSI), which was then (at least officially) Marxist in orientation. Before too long, his literary gifts were recognized, and he became a frequent contributor to party publications. Inspired by the romantic intransigence of Georges Sorel and the neo-Hegelian spiritualism of Benedetto Croce, the young revolutionary displayed nothing but contempt for the scientific reductivism of the more orthodox Marxists. Indeed, he wrote a famous article after the Russian Revolution interpreting that event as a revolution "against *Capital,*" as a victory of will power over Marxist materialism.

Gramsci on Political Organization

If Gramsci's hostility to economic determinism was far from orthodox, his ideas on political organization exposed him to charges of treachery. By 1919, he had become a prominent figure in the Italian factory council movement, its theory elaborated in *Ordine Nuovo,* a dissident socialist publication, during the *biennio rosso* of 1919 to 1920. The central ideal of the *ordinovista* group was that the factory council structure, not the party, should be the main vehicle of revolutionary education, as well as the institutional framework of the future society. The *biennio rosso* was a period of considerable industrial strife, but the PSI seemed strangely reluctant to seize the opportunity for revolutionary mobilization. Gramsci explained their "betrayal" in terms of the logic of parliamentary electioneering, which encouraged the PSI to obey the rules of the game. Trade unions, he added, were no better, as they expressed a view of labor as a commodity. Factory councils, on the other hand, could transcend the logic of capitalism, embedded as they were in the quotidian work experience of the proletariat.

Gramsci and his colleagues thought that this recipe for "revolution from below" was impeccably Marxist, but they never resolved the central conundrum raised by their strategy: How can a reliance on the spontaneous insurrectionary instincts of the proletariat be reconciled with the discipline and coordination necessary for successful revolution? After some initial successes, the council movement petered out as the Italian industrialists, spurred on by a reformist government, made some timely concessions to the unions. Militancy gave way to resigned acceptance. Appalled by this development and alarmed by the growing threat of fascism, Gramsci abandoned the *Ordine Nuovo* strategy and adopted a more orthodox approach, proclaiming the primacy of the party. Along with a group of Leninists who were also disillusioned with the supposed reformism of the PSI, Gramsci helped to found the Italian Communist Party (PCI) in 1921. By now, the former *ordinovista* was spouting a standard Leninist line, routinely comparing revolution to war, and calling for rigorous direction from above by a revolutionary officer class. In 1924, with the blessing of Moscow, Gramsci became both general secretary of the PCI and a member of parliament. The shy and retiring scholar from the Sardinian backwoods, a man with a deformed body and a reedy voice, had somehow become a formidable politician. But survival in a political system where Mussolini was gradually consolidating his power could never be guaranteed. In 1926, Gramsci was arrested for allegedly conspiring to overthrow the government, and he remained a prisoner of the fascist regime until just before his death from natural causes in 1937.

Prison Notebooks and the Exploration of Doctrine

During his confinement, he produced his major theoretical achievement—a vast collection of

notes and (mainly unfinished) essays published posthumously as the *Prison Notebooks* (1929–1935). Despite their elliptical, labyrinthine, and often incomprehensible nature, the *Notebooks* secured Gramsci a place alongside Gyorgy Lukács as one of the great theoreticians of Hegelian and humanistic Marxism. Gramsci's earlier writings, while bearing the imprint of his capacious theoretical imagination, were basically the outpourings of a political polemicist and pamphleteer. The different stances he adopted usually reflected particular circumstances and events. The *Notebooks* offer a more considered exploration of doctrine, set within a more synoptic framework. Prison was for him the functional equivalent of an ivory tower, allowing the former communist functionary to let his mind roam freely. While focusing on politics and philosophy, the *Notebooks* explore an astonishing range of topics, including sociolinguistics and literary criticism. But their most striking feature is their relentless attack on every axiom of dialectical materialism. Like Lukács, Gramsci argued that the orthodox Marxists had wrongly interpreted Marx as wanting to substitute Matter for the Hegelian Idea. According to Gramsci, Marx was a materialist only in the sense that he gave priority to the economic organization of society—which, of course, incorporates conscious human action. In contrast to the orthodox Marxists, Gramsci refused to see people as nothing more than a material object, subject to the same dialectical laws that govern the world of nature. The materialist interpretation of consciousness, correctly understood, had nothing to do with physiological reductionism; it simply held that all things mental—emotions, feelings, ideas—are in some sense the products of social interaction.

Gramsci's emphasis on human subjectivity also led him to deny the common Marxist belief that knowledge was merely the passive reflection of a ready-made universe. The external reality we confront, says Gramsci, is not a pure objective datum, independent of cognitive activity or human purposes. Marxism, it follows, should not be viewed as a scientific description of an objective world, considered in the abstract. Marxism's validity, like that of any other doctrine, must ultimately be determined by practice, by the social functions it performs. Theoretical knowledge and practical activity are two sides of the same coin. Since truth depends on the successful mediation, as distinct from reflection, of reality, theory must constantly evolve to cope with historically modified human experience. Gramsci, therefore, derides the tendency to turn Marxism into a closed system, fitting the whole of reality into an abstract dialectical scheme. To the contrary, Marxism, as he conceived it, was a form of *absolute historicism,* capable of demonstrating its truth only through practical success. Neither Marxism nor any other worldview can claim to be true unless it wins mass acceptance and penetrates deeply into everyday life, he thought. The implicit relativism of his absolute historicism can be misleading; Gramsci explicitly upheld the independent validity of logical and empirical procedures. Perhaps he thought that such procedures could take us only so far when analyzing complex theoretical structures, as such structures usually combine judgments of fact (which can be evaluated rationally) with judgments of value (which cannot be so evaluated).

Because of his stress on "man-the-creator," Gramsci poured scorn on fatalistic conceptions of Marxism, which posited immutable laws underlying social evolution. More specifically, he rejected the notion that human liberation was an inevitable consequence of the internal dynamics of capitalism. Such iron-clad certainty about the future was a direct result of Marxism's fallacious claim to scientificity, he said. Not only was determinism false, in Gramsci's opinion; it was also a kind of bad faith, a culpable form of self-deception by means of which Marxists evaded their historical responsibilities. After all, it makes little sense to risk life and limb in pursuit of an outcome as certain as the rising of the sun. Gramsci was also adamant that economic determinism cannot adequately explain why capitalism persists despite its debilitating contradictions. By reducing thought to a reflex of the productive process, Marx's followers paid insufficient attention to the motivational power of myths and ideas in general. Physical domination, Gramsci insists, is not enough. The cohesion of advanced capitalist society depends primarily on the hegemony—that is, the spiritual and cultural supremacy—of the ruling class, which through manipulation of civil society (and especially the mechanisms of socialization, such as the media, the churches, the trade unions, political parties, educational institutions) manages

to instill its values and beliefs in the rest of the population. Although Gramsci always regarded himself as an historical materialist who explained ideas in terms of their role within a specific mode of production, his theory of hegemony calls to mind the Hegelian principle that any given society embodies a spirit or idea, firmly planted in the psychology of its inhabitants. Herein lies the key, Gramsci tells us, to capitalism's vexatious powers of endurance. Classical Marxists never dreamed of giving such weight to cultural or ideational factors. Their model of society was based on endemic conflict, kept in check only by state violence or the threat of it. For Gramsci, however, the moral and cultural integration of the masses into a system operating against their interests rendered physical coercion unnecessary, in all but the most extreme circumstances.

The theory of hegemony carries important strategic implications and enabled Gramsci to revise the classical Marxist-Leninist approach to revolution—then held as an article of faith. He lamented the fact that most Marxists, preoccupied as they were with economic laws of development, had lost sight of the *political* dimension in human affairs. As an admirer of Niccolò Machiavelli, he understood that Marxism was deficient in the tools of political analysis. Because his fellow Marxists assumed that the foundation of social order was force, they conceived the struggle for socialism as a paramilitary assault on the coercive apparatus of the state. Gramsci acknowledged that this approach was valid in the case of Russia in 1917, where the Tsarist regime lacked developed mechanisms of cultural organization and where social order was founded on a combination of apathy and repression. In modern capitalist states, however, where workers are integrated into the prevailing framework of bourgeois values, the revolutionary forces must engage in a "war of position," aiming to scrape away the whole system of bourgeois attitudes and narratives and to create a proletarian counterhegemony. In the West, revolution *presupposes* a peaceful and gradual transformation of mass consciousness. A military-style attack on the state's defenses will still be necessary (Gramsci called this the "war of manoeuvre"), but the decisive battles will already have been won. Insurrection is the final, rather than the initial act in the revolutionary process.

Gramsci's preoccupation with the battle of ideas encouraged him to analyze the role of intellectuals in shaping mass psychology. He divided them into two categories: (1) *traditional intellectuals* (artists, scholars, priests), who think of themselves as above economic or political imperatives and struggles, and (2) *organic intellectuals* (civil servants, political activists, managers, technocrats, trade union bosses), who are more closely tied to the classes they represent. Although the latter are not normally deemed to be intellectuals, Gramsci wants to make the point that they, as much as their traditional counterparts, are engaged—directly or indirectly—in the propagation of values and attitudes that either sustain or undermine the established order. For him, ideology is not simply something that we encounter in books or lectures or sermons; it is embedded in social and political practices and is expressed in behavior as well as words.

Although Gramsci never advocated a parliamentary road to socialism, proponents of Eurocommunism claimed him as a kindred spirit. One can understand why. His emphasis on persuasion and consent is an obvious source of inspiration to those who wish to integrate Marxism and liberalism. It is, however, his analysis of social order under capitalism that most excites political theorists, especially those on the left of the political spectrum, who are anxious to find an acceptable explanation for the continued acquiescence of the exploited masses. Gramsci's view that subjective preferences are not necessarily reducible to economic interests may seem obvious to most people, but it came as a revelation to Marxists.

Gramsci's Legacy

At bottom, Gramsci's reputation as a theorist stems from his belief that our perception of the world is, to some degree, socially and mentally constructed. By the 1960s, the materialism and positivism of the orthodox Marxists had become extremely unfashionable, and Gramsci's Hegelian leanings struck a responsive chord. He became a symbol for the hopes and dreams of all those who wanted to rescue Marxism from its deterministic associations and to stress instead the contingency of human action and the role of human subjectivity in the historical process. His almost legendary

status has caused some of his intellectual disciples to overlook the subtle nuances and historical limitations of his ideas. This tendency remains strong, although modern Gramscians (or neo-Gramscians) are often content to be labeled post-Marxists, a category of thinkers who refuse to be confined by the classic texts. Particularly significant have been recent attempts to align Gramsci with Michel Foucault's discourse theory, according to which social reality is symbolically constituted in conformity with existing power relations. Gramscian notions of hegemony have even been extended to the international system in an attempt to challenge the dominant assumption of realist international relations that existing categories of analysis (nation-states, permanent conflict) enjoy ontological primacy over alternative (emancipatory) constructions. Although such interpretations ignore Gramsci's insistence on the "facticity" of the external world, they testify to the enduring relevance and fecundity of the *Prison Notebooks*.

Green, Thomas Hill (1836–1882)

Thomas Hill Green is the leading philosopher of British idealism, the dominant strand in British political philosophy from the 1870s through the 1920s. Often characterized as a conservative communitarian, Green is more accurately understood as a radical republican of a liberal socialist cast. His philosophy was bound up with his civic and political activities, including his campaigning for franchise reform, the extension of university education to women, land reform, and, after 1874, temperance. Green was born on April 7, 1836; entered Rugby School in 1850, where he befriended Henry Sidgwick, before entering Balliol College at Oxford University in 1855. He graduated in 1859, eventually settling into an academic career in 1866. He was Whyte's Professor of Moral Philosophy at Oxford from 1878 until his death from blood poisoning on March 26, 1882.

Green held that normative philosophy, including political philosophy, should start from a critical appraisal of one's own world. His philosophy appropriated what he understood as the leading insights of the heterodox biblical criticism of Tübingen Hegelians such as F. C. Baur and the Christian socialism of F. D. Maurice, as well as scriptural sources, especially the Pauline epistles. He combined these insights with those found in romanticism, especially William Wordsworth and Johann Wolfgang von Goethe, and Thomas Carlyle's writings, among others. Green systematized these and other insights within his philosophy. He became increasingly skeptical about Georg Wilhelm Friedrich Hegel's response to Immanuel Kant (whom he admired greatly). His later writings, especially *Prolegomena to Ethics* and *Lectures on the Principles of Political Obligation* (both written between 1878 and 1882 and published posthumously), indicate the growing influence of Johann Gottlieb Fichte's early writings on the vocation of man and the scholar, although these two publications by Green seem to have reflected maturing convictions that predated serious study of Fichte.

As one might expect of an idealist, Green's political philosophy is founded on his theory of the will. He holds that all individual human beings have the potential to realize their higher capacities

and thereby to manifest God (the"eternal consciousness") more fully within their character and actions. (Green argues that Jesus was an exemplar of this realization, not a uniquely divine being.) The struggle to express these capacities helps to generate and sustain the institutions and practices that constitute the world in which we live. These social forms exist intersubjectively, being socially recognized determinations of broadly systematized concepts and values that, taken together, can make life meaningful and enable the individual to be free. It is unhelpful to analyze Green using Isaiah Berlin's confused category of *positive freedom*. For Green, individuals value most highly the freedom to engage in activities that they choose without external compulsion and which respect their potential as free rational beings with higher capacities. This is the heart of a "free life," with reference to which every institution and action should be judged. Hence, Green holds that "positive" or "true" freedom exists where individuals act on principles that respect their higher capacities and virtues and that they endorse on the basis of their own unconstrained conscientious judgment about what things are either intrinsically valuable or are means to the achievement of intrinsically valuable things. Hence, Green's positive freedom necessarily entails Berlin's negative freedom.

Green rejected social contract theories as misleading myths. Nevertheless, he endorsed Jean-Jacques Rousseau's and Kant's contention that social, political, legal, and economic orders can be compatible with individual freedom, and therefore legitimate, only to the extent that they are endorsed by the conscientious and practical judgments of the majority of those individuals operating within them. This applies both (at the level of virtuous action) to socially recognized systems of moral rights and duties and (at the behavioral level) to political and legal rights and obligations recognized by individuals as participants in the public sphere. Unfortunately, all conventional norms, institutions, and practices serve the interests of relatively powerful individuals and groups over relatively marginalized ones. Consequently, Green stresses that no one should be an uncritical participant in social forms. Through informed and conscientious reflection and, for those individuals with more abstract capacities as well, through philosophy, each individual should attempt to understand society's institutions as historically formed instantiations of Aristotelian virtues (wisdom, courage, temperance, and justice), at the same time to recognize the ambiguities and imperfections inherent within those institutions. As citizens, individuals should seek to honor and refine what their consciences tell them are valuable elements of their society and, just as important, to correct conventional imperfections. Green combines this culturally situated Aristotelianism with reverence for the Kantian categorical imperative to respect humanity and its potential for realization, wherever those are found. Consequently, he holds that any good society must have the formal structure of a "kingdom of ends." Good citizens work to bring this about, partly through their correction of the common good on the basis of which individuals interact as citizens. One such (inherently public) common good is living in a free society: A free society does not exist, for example, if free speech is enjoyed only by a section of the society or if it is enjoyed only due to someone's arbitrary will not to interfere; it can exist only collectively, securely, and for all.

For Green, the state exists to "hinder the hindrances to good life" faced by the individual (in Bernard Bosanquet's words), including illiteracy, ill health, lack of sanitation, and harmful drugs such as opium and alcohol. Yet, in contemporary terms, it is unhelpful to label Green a moral or aesthetic perfectionist, as he understands universal higher potentials as largely abstract and formal. Such potentials can win the individual's rational obedience and loyalty only when instantiated in that person's particular historical circumstances. Moreover, there is no single determinate way in which these capacities should be manifested (although it is possible to identify certain inherently imperfect practices, such as slavery). Green is also not a political perfectionist: As no individual can be forced to do good or improve, all responsible adults must be assured of significant spheres in which they can act on their preferences, as only they can know and act on their own conscience and character. Hence, Green worked for franchise reform, so as to bring as many experiences and perspectives into legislative and political debates at local and national levels. Similarly, Green follows Giuseppe Mazzini, stressing the importance of workers' cooperatives within a regulated

capitalist system. Green's thought continues to attract significant scholarly attention.

Green Political Theory

What constitutes green political theory is contested; at a minimum, it is a form of normative theory that has, as a central and defining focus, a concern for the protection of the natural environment. On this minimal reading, many forms of political thought that seek explicit environmental ends would count as "green." On a maximal account, green political thought has to be in pursuit of not merely environmental ends, but a fundamental restructuring of the institutional bases of economic and political life, along decentralized, deindustrialized, and participatory lines to bring about a truly ecological society. On this latter view, genuinely green political theory is *ecological* whereas the pursuit of more limited ends is merely *environmental*. This entry focuses on those streams of thought that have sought to present a radical challenge to the existing order. It examines the philosophical underpinnings of early radical green political thought, seeking what was distinctive in this, looks at the reactions that this generated, and moves on to assess the more recent integration of green political theory into mainstream political theory.

The Radical Challenge

Historically, many political theories have had something to say about the relationship between human beings and the natural environment. A distinctively *green* political thought, where this relationship is taken to be of crucial importance, can be seen to emerge in response to a relatively recent perception of global environmental crisis. In this view, industrialization has changed fundamentally the relationship between human beings and the nonhuman natural world, and this change threatens the very future of humanity or even all life on Earth. The commencement of this form of political theory is often traced to the 1960s and early 1970s, with the emergence of books such as Rachel Carson's *Silent Spring,* Barry Commoner's *The Closing Circle,* and the Club of Rome report, *The Limits to Growth*.

The first wave of green political theory that followed from these early texts can be divided into its philosophical and political dimensions and, in terms of the latter, between those who sought to bolster the role of the state, at least in the short term, to deal with environmental problems and those who sought the deindustrialization of contemporary society and the decentralization of political power. Philosophically, there are two related areas of importance: metaphysics, on the one hand, and axiology, or value theory, on the other. Some green thinkers sought what they saw as fundamental metaphysical and axiological change, challenging the entire basis of the dominant tradition of Western political thought. This ambition is closely associated with deep ecology, a doctrine given its most explicit outline by the Norwegian philosopher Arne Naess. For Naess, the deep/shallow ecology distinction tracked, roughly, the distinction noted above between ecological and environmental ends. Shallow ecologists seek piecemeal solutions to environmental problems and do not question the underlying economic and political order or the values on which that order is itself based. Deep ecology, on the other hand, is held to be radical in the sense that it seeks to get to the roots of these environmental problems and treat their causes rather than just the symptoms. Deep ecologists seek to foster an ecological worldview in

which human beings would see themselves as just one part of a web of life on Earth, through which any action on our part as human beings would have multiple, indeterminate, and unpredictable effects elsewhere. The warrant for this worldview was allegedly provided by the science of ecology, which deep ecologists took to overturn previously dominant Newtonian scientific frames, which saw matter as featureless and above all separable, for the purposes of analysis, into its smallest constituent components. The holistic science of ecology thus presented a fundamental challenge to the atomistic sciences, such as physics. As with many political theories, there was here an appeal to science to provide an empirical foundation for the underlying view of the world, and like many scientific perspectives employed in the political realm, it was a partial interpretation—of both ecology and Newtonian physics. As historians of scientific ecology have pointed out, there is a holistic strain to ecology, which, for example, sees ecosystems as having supervenient properties that are more than the sum of their parts, but there is also a more conventionally analytical scientific frame employed in ecology, and the latter is currently dominant.

The accompanying deep ecological value theory was one of biospherical egalitarianism—as all forms of life are just knots in an ecological web, we are in principle equally valuable, and so the differential treatment of different entities requires justification. This is not to say that human beings cannot pursue their essential interests at the expense of other species, but rather that those interests would have to be explicitly delineated and, more important, limited and then met in such a way as to minimize the impact they made on the rest of the planetary ecosystem. The interests of other natural entities would have to be considered on a prima facie equal footing with our own, and their vital interests would trump those of ours that were considered nonvital. This might, for example, imply a moral demand for vegetarianism on our part, in that we can meet our vital nutritional needs through a vegetarian diet, and this has less impact on the natural world than meeting these same needs through the consumption of meat products.

This value theory is related to another important set of distinctions that mark out different approaches to green political thought, and this relates to the *source* of the values that greens are seeking to protect. To the extent that deep ecology is a value theory, it is *ecocentric,* which is to say that it sees value residing in the nonhuman natural world, both independently of that world's instrumental value to humans, and also at a level beyond individual living entities. Entire ecosystems are taken to have value, including their nonliving components, and thus major disruptions to those ecosystems are likely to be value destroying. Although deep ecology is an example of ecocentric thinking, it does not exhaust it, and one could hold to an ecocentric value theory without adopting the particular metaphysics or psychological theory of deep ecology. An alternative to ecocentrism is biocentrism: Biocentrists also hold that value resides independently of instrumental value to human beings, but they locate the source of this value in living entities. Ecosystems may thus not have value in themselves, but in their capacity to support life for a variety of species, they do have an indirect but crucially important value. Finally, some green political theory remains resolutely anthropocentric or humanist, despite the fact that anthropocentrism is one of the main targets of ecocentric political theory. In this latter view, the problem with anthropocentrism is that it values natural objects only to the extent that they serve human interests, thus leaving their protection highly contingent and vulnerable to views about human need. However, as humanist green theorists point out, humanist ecologism does not have to be narrowly instrumental. In an appropriate view of what it means to live a fully human life, natural objects can have intrinsic, not merely instrumental value for us, and thus the moral imperative to preserve the natural world can be a strong one. It is worth noting that any of the above views can be objectivist or subjectivist about the sources of value. One may, for example, hold that values are intrinsic in nature but come into existence only in the presence of a being capable of conceiving of value. In the absence of creatures like human beings who can attribute value, value does not exist. Alternatively, one can hold that values exist in nature independently of any valuation by appropriately conscious entities: Neither view is incoherent. More recently, defenders of ecocentrism have tended to see a weak form of anthropocentrism as unobjectionable (human beings inevitably judge the world from the perspective of human beings)

and have turned their sights on *human chauvinism*—the unwarranted privileging of human interests over the interests of other species. Human chauvinism is in this view "species-ism," akin to racism or sexism in its unfounded prejudice.

The extent to which deep ecology is really a political theory as opposed to a moral or even psychological one is moot. Political consequences were, however, taken to follow from this metaphysical reconstruction, and the doctrine of bioregionalism is often taken to be the political corollary of deep ecology. According to this doctrine, political communities should be defined according to natural features such as watersheds and mountain ranges, rather than through mere human artifice. Once delineated, these bioregions should become, so far as is possible, autarkic, sustaining themselves from their own resource base, trading as little as possible, and being politically independent. Once people have adopted deep ecological metaphysics and values, there is no need for an overarching authority to keep bioregions in ecological check, in this view, as the root desire to behave in environmentally destructive ways will have been extirpated.

Eco-Authoritarianism

Eco-authoritarians such as William Ophuls and Robert Heilbroner were more concerned with what they saw as the immediate crisis of resource depletion, pollution, and human population than with views about the nature of reality. If deep ecology can be seen as a form of ideal theory, positing the complete transformation of the human worldview, eco-authoritarians were very much non-ideal theorists, seeking a short-term institutional fix to an impending catastrophe and taking much of the world as it already is. The severity of the environmental crisis allowed no time for long-term value change, in their view, and as the inhabitants of Western democracies showed no sign of changing their overconsumptive habits for the sake of the planet, democratic institutions would have to be suspended so that power could be placed in the hand of an enlightened, ecologically literate elite. No less than the immediate survival of humanity was at stake. Eco-authoritarianism was authoritarian in an often reluctant form, and the suspension of democracy was generally portrayed as a necessary but inevitably temporary phenomenon. In the longer term, value change was possible, and once it had been achieved, then authoritarian rule would no longer be necessary, but it was the only available means to resolve the current crisis.

The Reaction—Environmental Skepticism

This eco-doomsday literature brought a response from those who were skeptical about the entire idea of looming environmental catastrophe. In particular, economists such as Julian Simon emphasized the capacity of human ingenuity to overcome environmental problems and ridiculed the idea that one could merely calculate a stock of resources and a current rate of depletion to come up with a figure for when that resource would "run out." Instead of thinking like engineers, those concerned with resource depletion and overpopulation needed to learn to think like economists. Increasing scarcity would lead to rising prices and therefore increasing incentives to both find and exploit new reserves and to substitute alternative products using cheaper, more plentiful resources. Scarcity is not, thus, a function of physical reserves but of demand and supply, both of which can be made to change if the incentives are appropriate. Simon famously put his money in the position occupied by his mouth and won a bet with the demographer Paul Ehrlich on the future prices of commodities in 1990 from a 1980 base. The prices of all the commodities included in the bet fell between these two dates, making Simon's points that (a) past trends were the best indicators of future trends and (b) for the purposes of human welfare, these raw materials were less scarce in 1990 than they were in 1980. This economist's response to eco-authoritarianism is very much a forerunner of contemporary so-called skeptical environmentalism, associated in particular with Bjørn Lomborg, which also seeks to dismiss the claims of those who hold that environmental conditions are rapidly deteriorating and insists on the application of cost-benefit analysis before committing to substantial interventions to counter the effects of, for example, climate change.

"Eco-isms"

Other strands of green political theory have sought to adapt existing political ideologies to encompass

the environmental problematic. Green political thought has been considered instrumental in the resurrection of anarchism, an ideological perspective often taken to have strong affinities with green objectives, particularly when green is taken in the maximalist sense outlined at the start of this entry. The anarchist distrust of the state and its attendant institutions—as destructive of natural human cooperation—can be traced at least as far back as thinkers such as Petr Kropotkin, and the argument has been recycled by a number of contemporary green thinkers and activists. It is particularly associated with a school of thought known as social ecology, whose leading theorist was the late anarchist thinker and activist Murray Bookchin. States operate in support of major interests such as large corporations, and for their own institutional forms such as the military and the bureaucracy. The state is far removed, both ideologically and physically, from the environmental problems that emerge from current economic and cultural forms of life, and given its commitment to continuing economic growth to resolve distributional issues, it has no incentive to address them. Furthermore, if we scale up to the global level, then states pursuing their own interests have only very weak incentives to cooperate in resolving worldwide environmental problems such as climate change and biodiversity loss.

One strand of green political theory with some influence in activist circles takes this critique further, seeking to overthrow not merely the institution of the state but the entire edifice of civilization. Anarcho-primitivism, as it is known, holds that the only communities in which people have genuine freedom are those that predated the agricultural revolution, that is, hunter-gatherer societies. Once agriculture arrives on the scene, populations require fixed territory, which in turn needs to be defended from other populations, and so a military force of some kind is required, and we start down the slippery slope to the dominant ideology and hierarchical institutional forms of civilization. The division of labor is seen as the first important step down the road to the domestication of human beings by the state. It is not so much that anarcho-primitivists want to take us back to a pure form of hunter-gatherer society, as if the intervening millennia had never happened; they want rather to get people to question the benefits of civilization itself and see beyond a set of taken-for-granted assumptions and commonsense beliefs about the benefits that civilization brings.

Various other mainstream ideologies have also developed a recognizable eco-wing. Perhaps the most developed of these is the ecological reworking of Marxism, which takes two general forms. Either Marx himself is rediscovered as an environmentalist *avant la lettre,* a reading that usually draws heavily on the *Economical and Philosophical Manuscripts of 1844* (published for the first time in 1932), where Marx discusses the metabolism between humanity and nature and describes nature as man's inorganic body. Alternatively, the reading of Marx is more conventional, but the analytical toolkit that he supplied is adapted for environmental ends. In particular, the critical analysis of capitalism undertaken by Marx is given an environmental twist, and (in one version of eco-Marxism) capitalism is held to have a "second contradiction." Not only does its tendency toward crises of overproduction impoverish the very workers on whom it depends, thus "creating its own gravediggers" (first contradiction), it also fails to reproduce its own ecological conditions of production (second contradiction). In short, capitalism's commitment to never-ending economic growth entails that, ultimately, it will consume its own ecological resource base—it is inherently unsustainable.

More recently, attention has turned to the relationship between green political theory and the form of political theory that has been dominant in mainstream Anglo-American political philosophy in recent decades—liberalism. Green thought has often been taken as anti- or at least nonliberal in its overarching emphasis on the theory of the comprehensive (green) good. Eco-authoritarians were willing to suspend a host of liberal-democratic freedoms to overcome what they saw as an environmental crisis. Green politics can, however, be fleshed out in ways that are more amenable to conventional liberal norms. In particular, environmental goods can be attached to a set of constitutional rights in the classical liberal fashion, in that all citizens can be held to have a right to environmental conditions that are conducive to human flourishing. That said, it is difficult to overcome completely the tensions between the pursuit of environmental goals, on the one hand, and the

commitment (in many versions of liberalism) to autonomy and freedom to choose an individual lifestyle, on the other, leading some theorists to describe green political theory as a postliberal doctrine. In this context, postliberal implies that the commitment to freedom and autonomy that marks liberalism as a distinctive political doctrine is acknowledged and retained insofar as that is possible, but these commitments have also to be refashioned in such a way that they are cognizant of ecological limits. Autonomy is thus always partial and relative to a set of ecological constraints.

A concern with rights brings us to another recent development in green political theory, an attempt to articulate an environmental conception of citizenship. In relation to citizenship, rights owed by the state (and other citizens) tell only half of the story; at the same time, the citizen has a corresponding set of obligations. Contemporary green political theory in this area stresses the notion of the ecological footprint. An important environmental citizenship obligation would be to ensure that one's ecological footprint is not excessive and ideally is no bigger than that which could be enjoyed by all other human inhabitants of the planet (the Kantian sources of this view are evident here) such that we take merely our own share of ecological resources and do not invade the shares of others. This obligation would provide a strong stimulus toward "contraction and convergence," whereby citizens in the developed world reduce their ecological impact to a level that could be enjoyed by all, and as a result, their footprint converges with those of people in less developed countries, whose share is allowed to expand to the same level. This view of citizenship inevitably draws on a cosmopolitan view of that concept: We have obligations of citizenship not only to those with whom we share a nation-state, but to all people of the world.

That green political theory can be co-opted by so many different ideological positions (and we could add eco-conservatism, eco-fascism, or eco-feminism as alternative formulations that have their adherents or detractors) suggests that it may be politically hollow and so available for assimilation by any passing ideological carrier. Is it the case that green political thought can blend, Zelig-like, with ideologies of both right and left, with statist and anti-statist, authoritarian and libertarian forms of thought? Much depends, of course, on how much is packed in to any maximal account of what it is to be green. If it is to have a central concern with environmental protection, then this could be articulated from a variety of ideological positions, but it is also constituted by a very thin account of what it is to be green. If, on the other hand, it is stipulated that a green view must by definition insist on the anarchistic dismantling of the state apparatus, then nonanarchistic ideologies would be disbarred by fiat. This is unprofitable; it may be more fruitful to investigate the ideas and beliefs of those who have claimed the green label and to determine what elements unify them or distinguish them from each other.

Integration With Mainstream Theory

Recent years have seen green political theory move away from its former preoccupation with metaphysics and axiology; instead, it has become far more integrated into the mainstream of political theory. This has been a two-way process: As those with a central concern for environmental sustainability have moved into discussions of this in relation to democracy, justice, obligation, citizenship, liberty, political economy, and other conceptual discussions central to the theory of politics, so those working in these fields have themselves become more sensitive to the pressing environmental concerns of the day. It is less the case today than it once was that there is an identifiable subgenre of green political theory that operates in a sphere of its own, engaging in metaphysical reconstruction, the development of naturally grounded value theory, and disputes about the relative merits of anthropocentrism and ecocentrism. This does not imply that green political theory has disappeared; it has rather morphed into a set of questions far more closely related to the concerns of mainstream political theory.

This is particularly noteworthy in the field of social justice theory, where much recent work has been on the topics of:

- *Intergenerational justice:* What do we owe to future people in the light of deteriorating environmental conditions?
- *Environmental justice:* How are environmental goods and bads distributed within present-day human communities?

- *Ecological justice:* Do nonhuman entities have rights grounded in justice?
- *Global justice:* How far do the obligations of justice extend beyond national borders?

One of the central concerns of these debates, especially with respect to both intergenerational and global justice, has been climate change and its effects. This is one area where the works of those from within green political theory and those from a more mainstream approach have come together around an issue of fundamental importance. The expected effects of climate change have profound implications for human well-being, both intra- and intergenerationally, and they raise a series of questions about the obligations of those with historical responsibilities, about the application of discount rates to future welfare, and about whether we can be said to harm people who do not as yet exist.

In the field of democracy, green political theory raises questions about the extent to which existing forms of democracy are able to articulate the interests of those who are not represented (the nonhuman, future generations), about the ability of democracy to deliver solutions to large-scale collective action problems (the eco-authoritarian dilemma has not gone away), about the relationship between democracy and special-interest groups, and about the extent to which forms of direct-action protest should be tolerated in democratic societies. Resolving these dilemmas may involve rethinking contemporary understandings of democracy, and indeed, theorists coming to this question from a broadly green perspective have tended to seek to push democracy in a deliberative or discursive direction, seeing the democratic process less in terms of the aggregation of preexisting preferences and more as a structured field for the engagement of citizens in democratic debate. In its deliberative form, democracy is conceived as being more conducive to the realization of the general, as opposed to factional interest, and the preservation of environmental goods is taken to be the generalizable interest *par excellence*. Green political theorists would not claim that all of the questions they raise for democracy, justice, citizenship, and so on are entirely new. Rather, a green perspective gives a fresh urgency and a new dimension to some long-standing political questions, as well as raising new ones.

Post-Ecologism

A recent development in green political theory has been the positing of post-ecologism, which holds that green political theory was one of the final attempts to rescue modernity from itself; now that it has failed to change society, we are left with a system that seeks merely to "sustain the unsustainable." Post-ecologism is held to consist of four key ingredients. First, the most fundamental idea is the abolition of nature as a unified conception. The implication here is that ecologist politics sought to operate with a single, unified notion of the natural world, whereas nature is a contested concept that can be understood in a wide variety of sometimes contrasting ways. Implicit in the idea of the abolition of nature is the abdication of the subject, as the second element of post-ecologism. The conception of the unified autonomous self employed in modernist ecologist politics is replaced by a subordinated individual embedded in the structures of contemporary liberal capitalism. The third integral notion of post-ecologism is the end of eco-ethics and ecological rationality. This is closely connected to the abdication of the subject as eco-ethics demands an autonomous ethical agent capable of making moral choices, but such an individual does not exist. Finally, post-ecologist politics is taken to be post-problematic in that it is no longer centered on specific ecological concerns. Ecologist politics takes certain physical changes in the world as problematic in themselves, whereas post-ecologism recognizes the register of social construction behind this problem designation and repudiates the naïve connection between physical correlates and problem status.

Although it was never a unified phenomenon, green political theory stands today in a somewhat fractured and multifaceted condition. It might be said without too much exaggeration that the proponents of green political theory in its early days saw themselves as mounting a fundamental challenge to the existing system of values and institutional order, and even our very understanding of the nature of the universe. It might be thought that this very direct challenge has now run its course. Instead, we have theorists working on a diverse range of topics, such as democracy, citizenship, justice, rights, and climate change. For some, this marks a shift to a post-ecologist era. The question is whether this shift marks a loss of coherence and

confidence on the part of green political theorists or the increasing maturity of this form of thought and increasing rather than decreasing influence as green political theory becomes less isolated and is absorbed into the field of political theory more generally.

Grotius, Hugo (1583–1645)

Hugo Grotius (Dutch: de Groot) was born in Delft in Holland. His lasting fame is due to his *De jure belli ac pacis libri tres* (Three books on the law of war and peace) first published in Paris in 1625. It is commonly regarded as the founding text in the development of international law. Grotius also made significant contributions to neo-Latin poetry, classical philology, historiography, and theology.

From his earliest years, Grotius showed remarkable gifts. Enrolled in the University of Leiden in 1594, he studied humanities and law under some of the most eminent men of learning of that era, graduating at the age of 15 in 1598. In that year, he was a member of a delegation from the seven United Provinces of the Netherlands on a state visit to France. As a lawyer, he quickly gained high esteem, and in 1599, he was admitted to the Bar in The Hague.

In 1603, the captain of a ship belonging to the Dutch East India Company seized a Portuguese ship and its cargo in the Straits of Singapore and brought it back to Holland. The lawfulness of what might seem an act of piracy was challenged. The company asked Grotius for a legal opinion, but he gave them a major treatise, which set out principles for a theory of international law, as well as a legal

and moral justification of the seizure. This treatise, finished in 1606, was not printed, probably because it would be politically inopportune when a truce in the Eighty Years War with Spain (which at the time formed a united kingdom with Portugal) was on the agenda. Years later, Grotius could put much of the vast source material he had used for his argument to renewed use in his major work.

The existence of this treatise remained unknown until the manuscript was discovered about two and a half centuries later and published, in 1868, under the title *De jure praedae*. One chapter of the manuscript was, however, revised and published in 1609 under the title *Mare liberum*. It advocated the freedom of the seas and argued that except in coastal waters no one should be excluded from fishing. Its main message, however, was the emphatic rejection of Portuguese and Spanish claims to monopoly on shipping and commerce in the newly discovered lands east and west. Pope Alexander VI (the father of Cesare and Lucrezia Borgia) had granted these monopolies in 1494, but Grotius objected that you cannot give what is not yours. The *Mare liberum* was promptly put on the Roman Index.

Grotius in Dutch Politics

Grotius came to play a significant part in Dutch politics. His rise owed much to the political patronage of Johan van Oldenbarnevelt, the leading politician in the United Provinces. Grotius was made solicitor-general of Holland in 1607. As pensionary of Rotterdam from 1613, he was *ex officio* a member in the delegation of that city to the States (i.e., legislative assembly) of Holland, the most important of the seven United Provinces that eventually were to gain independence from Spain in 1648.

When the war against Spain was halted by the Twelve-Year Truce in 1609, the Dutch could, in the decade that followed, devote more of their energies to internal conflicts. One side, led by Oldenbarnevelt, preferred the United Provinces to be a confederacy of provinces rather than a federal state, and it favored the Arminian version of Calvinism. The other side, led by Maurice of Nassau, took the opposite view on both matters and prevailed in 1618. As civil conflicts go, this one was comparatively nonviolent, but Oldenbarnevelt was tried and executed in 1619, and two other leaders close to him were sentenced to life imprisonment: One of them was Grotius.

The years in prison were not wasted. Grotius prepared an *Introduction to the Jurisprudence of Holland* (1631), which remained in use for centuries. So did his best-selling book on the truth of the Christian religion (Dutch verse edition, 1622; Latin prose edition, 1627). It was translated into a vast number of languages. He also translated Stobaeus' Greek anthology into Latin. These literary activities were interrupted in March 1621, when he escaped from prison, thanks to his resourceful wife. He went to Paris, where he was granted a pension by Louis XIII. A French nobleman gave him access to his library. Supported in this way, Grotius wrote the major work on which his fame rests: *De jure belli ac pacis libri tres* (Three books on the law of war and peace), first published in Paris in 1625. He inserted corrections and additions in four subsequent editions. An English translation of 1738, which included translated notes from Jean Barbeyrac's French version of 1724, has been republished. There is also a more recent translation.

Significant Features of Grotius's Major Work

These biographical data throw light on various features of his major work. Grotius's mode of life was not one of scholarly seclusion. His profound knowledge of history was supplemented by his experiences in law and politics. He knew that the pretexts used by princes to start a war were often frivolous, that the conduct of war was abhorrently cruel—even among Christians—and that any attempt to urge perpetual peace would be futile. The best that could be done was to set limits, and the difficulty was to find the right balance between the desirable and the feasible.

His aim was, then, to formulate principles that determine what is a just war and what is just *in* war. These principles are, of course, of a general nature, but when Grotius states in the Prolegomena (the prefatory discourse) that his work will not refer to current events or controversies, the reason can be sought in his particular situation. Any such reference from him, as an eminent person in political exile, could easily give offense in his host country or at home. He wanted to avoid this, not least since he hoped and expected—as it turned out, in vain—that

his exile would be temporary. Moreover, controversial matters would divert attention from his main concern: to explain the grounds for a just war and to humanize the conduct of warfare.

Accordingly, he wrote that he would present general principles rather than particular cases, as mathematicians do. This passing reference to mathematics has given rise to a frequently repeated but totally groundless claim that Grotius adopted a mathematical method in this work. In actual fact, Grotius does offer many particular illustrations to his general principles—but they are at a safe distance, taken from the Bible and from ancient history and literature.

The law of war and peace that Grotius expounds is a higher law different from the legislated or customary law of one civil society or common to a number of civil societies. The leading idea is that it can be discerned by human reason when considering a higher law, the law of nature. He notes that many scoff at the idea—indeed, the number of despisers is so great that he appoints a spokesman for them, the *ancient* philosopher Carneades, who had once delighted his audience in ancient Rome with a speech in which he argued, with exquisite rhetorical skill, that if such a law exists—which is doubtful—only fools would heed it.

Morality and "Realism"

Who were the scoffers? An answer recently proposed is that Grotius had ancient or recent advocates of skepticism in mind. Doubts have been raised about this, and it has been suggested that his main target was rather people who rarely write books: the hard-headed, practical realists in business and politics, who think it foolish to let moral scruples constrain the pursuit of power, gain, or glory. Against the scoffers, Grotius argues that there are principles of justice that give rise to obligations. They have their basis in human nature, which is sociable, and in the essential commonality between all human beings, insisted on by the Stoics. God has created us in this way, Grotius thought, and this is why the principles would retain a degree of validity even if we were to grant (Latin: *etiamsi daremus*) that God does not exist or takes no interest in what we do.

This has been taken as a statement that morality is independent of religion. The appearance of this idea in Grotius was often thought to mark a decisive breakthrough in the history of ethics, by leaving space for a nonreligious, secular ethical theory. His "*etiamsi daremus*" was seen as a source of inspiration for a conception of "autonomy of ethics," which would sweep aside the moral authoritarianism inherent in theological ethics. This was an attractive interpretation for the many who wanted Grotius as an ally in their rejection of Roman Catholic moral doctrine, but it overestimates the distinctiveness of Grotius's outlook. The view that some moral distinctions are independent of divine will did not originate with him. As shown by several authors, a number of medieval thinkers had held that view, and he was well aware of this.

There is, however, a problem with a particular moral concept: obligation. The common view, shared by leading thinkers like Francisco Suárez and almost universally accepted, was that there can be no obligation without a superior authority. Later, the same view was held by Samuel von Pufendorf and Barbeyrac, who on this point disagreed with Grotius, notwithstanding their great admiration for his work. On this point, Grotius can plausibly be interpreted as deviating from the mainstream and holding that certain right actions, like keeping a promise, are intrinsically obligatory: The obligation is not imposed by a superior, but by the person who makes the promise.

The Autonomous Individual

Book 1 of *The Law of War and Peace* explains the notions of a law of nature (*jus naturae*) and a law of nations (*jus gentium*) and argues at length that the use of force is not absolutely prohibited for Christians. Book 2 explains the grounds for a just war. Book 3 discusses what is just in war.

The grounds for a just war are, for Grotius, the same grounds for the just use of force. In principle, the norms apply equally to individuals in a state of nature and to international relations. It is of great interest that his account does not seek recourse to the idea of a higher obligation-imposing law or to the Stoic idea of the community of all mankind. Instead, Grotius appeals to a different set of moral intuitions, involving two basic concepts: a person's *own*—in Latin *suum*—and *a wrong*—in Latin *iniuria*. There are two basic principles. One is that an action constitutes a wrong if and only if

it violates, invades, or transgresses on a person's *suum*. The other is that the use of force against a wrongdoer is permissible if and only if it satisfies one of the following four conditions: It must be intended to punish the wrongdoer, to obtain compensation or restitution, to defend oneself, or to prevent an imminent threat.

In this view, some things are one's own by nature. They are one's life, body, limbs, honor, reputation, *pudicitia* or chastity or modesty, and one's actions or, perhaps more precisely, one's power over one's own actions, one's freedom to act: *libertas*.

By nature, everyone is free; that is, we have a power over our own actions, and nobody has a power over another person's actions. But such a power can be acquired and is called a right (*jus*). One way of acquiring a right is through damage culpably caused by another party, which creates a right that the other party must make good the damage. Another way is by promises proffered and accepted. In these, those who make promises, by willing it, alienate a part of their liberty, that is, their power over their actions, to the receiver of the promise, who now has a right, that is, a power over another's action. This right belongs to the receiver as a part of what is his or her own. Concurrently, obligations spring into being, and failures to fulfill them are rights violations and belong to the list of wrongs. It is also by agreements (promises given and accepted) that private property comes into being and that one's property becomes part of one's own. Accordingly, theft, unauthorized use, trespass, and so on are also wrongs. If a label is needed, the theory outlined here might be called a theory of strict justice.

A similar story is also used to explain the authority of civil government. Again, people are seen as autonomous agents. Their rights and obligations depend on their own commitments (*ex voluntate jus metiendum est*), which result from their free choice. It may not be *the best* choice, but it is *their* choice. So when people decide to enter into a social contract and subject themselves to a ruler—in the early 1600s, social contract theories had become the standard way of founding political obligation—there is, in Grotius's view, wide scope to the possible terms of such a contract. It would be a contract of submission—the people would no longer be sovereign—but the terms could vary. The contract might contain clauses limiting the authority of a ruler. Or it might not: In some circumstances, people might be willing to grant absolute power to a ruler. Either way, the people would be bound by the consent given, in the same way that a woman entered into marriage freely but was then as wife subject to her husband. So some social contracts might leave scope for a right to resist a tyrant, but some might not. Subsequent writers protested: Jean-Jacques Rousseau did so in 1762 most emphatically.

Grotius applied this outlook, in terms of *suum, iniuria,* and the rights and obligations arising from promises or culpable damage, to the relations between sovereign princes and states. As between individuals in a state of nature, *iniuria* alone can justify the use of force, the purpose of which must satisfy one of the four conditions mentioned: punishment, restitution or compensation, defense, or prevention of an imminent wrong.

Sources of Norms

Grotius's theory has been called minimalist in the sense that all is well from a moral point of view as long as we commit no wrong. This is a misunderstanding. His view is that all is well from the point of view of "strict justice" as long as we commit no wrong. But Grotius certainly did not believe that justice is the whole of morality.

This minimalism—according to which an action is morally wrong if and only if it fails to respect individual autonomy—is at the core of anarchism and libertarianism. Grotius's outlook was different indeed. He recognized other sources of norms that affect the use of force and do not have implicit recourse to concepts of personal autonomy or state sovereignty. One such set is the law of nations (jus gentium), norms common to a number of nations—or at least the more civilized ones. To know whether a rule is part of jus gentium, one has to know what is usually practiced. There is a problem with this, in that a practice may be *merely* habitual. To think that a *merely* common way of acting is *eo ipso* obligatory, would be to argue from fact to right. Rousseau complained—unfairly, it would seem—that this is what Grotius was doing. In Grotius's view, the widespread adoption of certain practices could justify a probable inference that it was permissible or obligatory, by the law of nature or by tacit consent between peoples.

Another source of norms is the Stoic conception of cosmopolitanism: We are all citizens of a worldwide community. As members of a community, we are bound to help each other. This principle of solidarity implies that it is not wrong to use force to protect a fellow member of this community against an unjust aggressor. Also, in the absence of a civil court with appropriate jurisdiction, it is not wrong for us to punish a wrongdoer. John Locke called this a "strange doctrine" but endorsed it wholeheartedly in his *Second Treatise of Government*. At the level of international politics, Grotius's theory gives wide scope for humanitarian intervention.

These sources of norms, and others to be mentioned presently, take over when Grotius moves from the *jus ad bellum,* where "strict justice" plays a central part, to the *jus in bello,* where it does not. In addition to the jus gentium and Stoic cosmopolitanism, he invokes from time to time divine law, Mosaic law, the law of the Gospel, Roman law, the law of a particular society, the law of charity, the obligations of honor, considerations of utility, and various other virtues or patterns of decent behavior. He did not indicate any ranking of these sources of norms. In one essay of unknown date, in the past often bound with the major work, Grotius elaborates on the virtues of equity (adhering to the spirit, not the letter of the law), indulgence, and clemency. For instance, a creditor has the right to demand payment, knowing that this will ruin a poor but honest debtor, and yet, charity or some other virtue, such as common decency, makes it a moral duty for the creditor not to exercise this right. Grotius calls rights that cannot be exercised in good conscience external rights, in contrast to internal rights, and distinguishes similarly internal from external justice. (Francis Hutcheson was later to use the same pair of terms.)

Norms of all these different kinds are invoked in the third and last book of *The Law of War and Peace,* which discusses what is lawful in the conduct of a war. The early chapters give an account of standard practices, quite abhorrent in many instances. But at the beginning of Chapter 10, there is a notable statement. Grotius explains that in the preceding chapters many things have been called right and lawful without really being so. They have been so called only because they usually enjoy impunity or because courts of justice have authorized them. Or they have been called right and lawful even though refraining from them would be morally better and more commendable in the opinion of good men. From that point onward, he constantly reminds the reader of the contrast between mere impunity and external rights, on the one hand, and what can be done with a clear conscience, on the other.

Grotius's Legacy

In the centuries that followed, Grotius enjoyed high esteem. From 1625 to 1775, there were 73 editions of the Latin text and translations, and there has been renewed and growing interest since the late nineteenth century. By 1925, the number of editions had risen to 114, and it has increased since. As for publications discussing his work, in the seventeenth century, most were attacks on his theological writings by Protestant theologians. There was less from the Roman Catholic side because his major work had been placed on the Index in 1629, where it remained until 1900. The main reason why Rome took umbrage was that Grotius did not accept the papal claims to supreme authority. His own endeavors toward a reconciliation of the Protestant and Catholic churches received scant sympathy from either side.

Grotius's posthumous reputation was mainly created by a historiography that began with Pufendorf and became influential through Barbeyrac, in which Grotius was described as a pioneer who had broken free from the darkness of scholastic pseudolearning and who had done for moral science what Francis Bacon had done for natural sciences. This view of Grotius as an opponent of scholastic (read: Roman Catholic) obscurantism was widely held. Later scholars, however, have drawn attention to the scholastic precursors for whose writings Grotius had much respect.

Grotius is commonly styled the father of international law. The paternity has been disputed on the grounds that there were precursors such as Alberico Gentili and that large areas of that discipline are not covered in his work; but his seminal importance is indisputable.

Because of Grotius, many organs of international justice have their headquarters in the Netherlands, where in the twentieth century admiration reinforced by patriotic pride at times was excessive. The virtual canonization provoked

opposition. Dutch critics with leftist leanings pointed to the conspicuous absence of democratic and egalitarian sentiments in Grotius's writings.

There have also been objections to his heritage for other reasons. Some writers have felt that his theory in effect was confined to Christian Europe. Other readers of Grotius have arrived at the opposite view. In recent decades, the renewed attention to the youthful *De jure praedae* has led some historians to view him as an apologist for Western, and particularly Dutch, colonialism and imperialism. But if this is true of the young lawyer and politician, it may or may not apply to Grotius as a theorist of natural justice.

GUICCIARDINI, FRANCESCO (1483–1540)

Francesco Guicciardini, most famous for his historical writings, is nevertheless an important theoretical progenitor of modern representative democracy. A younger, but much wealthier and more prominent contemporary of Niccolò Machiavelli's, Guicciardini served over a long political career in roles as diverse as ambassador for the Florentine republic and administrator for Medici princes and popes. As Machiavelli's chief intellectual interlocutor, Guicciardini reflected on what he called "true and complete liberty" and "the civic way of life." Guicciardini was perhaps the first political thinker to endorse the institutional arrangements associated with modern republicanism: Members of the general citizenry, although discouraged in various ways from holding office themselves, elect public officials from a small pool of worthy, notable, and, in general, more wealthy candidates. Guicciardini's model relieves common citizens of most of the political duties they exercised in ancient democracies and many medieval republics, such as holding lottery-distributed offices, debating policy in large public councils, and deciding political trials in similarly sized assemblies. Instead, he proposes that average citizens apply their generally good judgment to the appointment of "virtuous and valiant" magistrates and that they approve or reject—but never help formulate or amend—laws proposed by those magistrates.

Guicciardini hoped that this novel political arrangement would defuse both the violent interelite conflicts and populist insurrections that threatened and often extinguished liberty in earlier republics. Furthermore, Guicciardini thought that electoral politics constrained and enabled a republic's magistrates in a novel manner: the desire to hold office deterred magistrates from corruption or usurpation, while still leaving them sufficiently wide discretion to deliberate over and make laws conducive to the common good. By devising institutions for

distributing offices that discourage violence among elites or between the latter and the people, Guicciardini hoped that liberty would flourish in republican regimes; by establishing the electoral interdependence of elites and people, Guicciardini expected more responsible behavior from both segments of society.

Guicciardini presciently anticipated that this model of republican government would allow the size of the citizenry to expand in unprecedented ways, securing the fruits of liberty for more and more individuals. In sum, Guicciardini's republicanism (a) makes possible democracies that are territorially larger than city-states, (b) consecrates election as the institutional centerpiece of politics, (c) pacifies competition among both notable citizens and prominent families, (d) enhances government deliberation by consigning it to small senatorial rather than large popular assemblies, and (e) facilitates wide discretion for public officials in the formulation and execution of laws. For these reasons, among others, J. G. A. Pocock's *Machiavellian Moment* in 1975 and Bernard Manin's *The Principles of Representative Government* in 1997 posit a direct line from Guicciardini to Federalist James Madison in the development of modern republican theory and constitutional practice.

Guild Socialism

During the first decade of the twentieth century, A. J. Penty reintroduced the medievalist guild idea into British political discourse. In a series of articles in A. R. Orage's journal, *The New Age,* in 1912, S. G. Hobson pioneered guild socialist theory. As a theory and movement in the United Kingdom, guild socialism built on the idea that workers in industry should collectively control production with significant autonomy from the state. Guild socialism had authoritarian and individualist wings, the former advocating far greater control by guildlike organizations over individuals within them. Writing from the individualist wing, G. D. H. Cole developed guild socialist theory and had come to personify the movement by the early 1920s. Nevertheless, guild socialism waned in both theory and practice later that decade.

Guild socialism was a radical alternative to the dominant political ideas of the era. Since the 1880s, when they began to challenge classical liberalism and Benthamite utilitarianism, Fabianism and idealism had been prominent theories of state ascendancy in British political thought. By the early twentieth century, Fabianism had strengthened its hold on British socialism. Being a radical alternative to both Fabianism and idealism, guild socialism was one of several challenges to state preeminence in the first two decades of the twentieth century. These challenges also included the pluralism of Harold Laski, J. N. Figgis, and F. W. Maitland; the conservative distributivism of Hilaire Belloc and G. K. Chesterton; and the syndicalist ideas developed by Fernand Pelloutier in late nineteenth-century France and later imported into the United Kingdom.

Guild socialism shared with syndicalism the idea that workers should collectively control their industries. Nevertheless, the guild socialists did not agree with the syndicalist doctrine that an implication of this would be some form of revolutionary removal of the state. The guild socialist thinkers recognized that the conditions that may have seemed to favor industrial class warfare against the state in the nineteenth century were certainly no longer present in the United Kingdom. Guild socialist theory aimed to inspire a less class-specific movement than that of syndicalism. The guild socialist movement

involved several key features: a gradual transfer of power from employers to trade unions; a guild system including all workers, whether manual, technical, or professional; and a broader economic policy controlled by machinery outside the guilds, on behalf of the whole community.

In 1906, Penty suggested that industrialism was the major problem of modern society, and he called for guilds to reintroduce craftsmanship in a largely agricultural economy. It is, nevertheless, Hobson who is usually recognized as the first guild socialist. In 1912, he began to portray capitalism and the wage system, rather than industrialism, as the factors that stifled human potential. He did not believe that state socialism would remove this problem. A more viable alternative, in his view, was for trade unions to form a system of cooperating national guilds in large-scale industry. These guilds would monopolize the supply of labor and take control of industry in cooperation with a state, which would act as a final arbiter of conflicts.

Authoritarian guild socialists such as Hobson and Ramiro de Maeztu believed that the guilds should not only control the workers but also interpret the interests of consumers. Hobson had been inspired in the late nineteenth century by the way in which workers were organized collectively but without state control in the workforces that built the Panama Canal.

More concerned than Hobson and Maeztu that each individual should be allowed to develop and flourish, Cole advocated the deepening of participatory democracy as an alternative to the representative model of democracy. Democracy would thus transcend the narrow political sphere and cover all associations in society. Democracy would no longer be undermined by social and economic inequality. Through a substantive democracy, people would enjoy real opportunities for the personal and social self-expression that Cole considered essential to freedom. Cole sought to employ Jean-Jacques Rousseau's general will theory, without its authoritarian connotations, as the basis for a socialist democratic system.

Cole believed that workers in the guilds should have substantive decision-making authority and power over collectively owned wealth. Although he did not consider that the guilds should interpret and control consumer interests, Cole wavered between suggesting that such interests be represented by a range of associations in a functional congress, on the one hand, and stressing that they be represented by the state or an inclusive body that should assume the state's responsibilities, on the other. After developing these ideas from 1913 in books and articles, in his 1920 book, *Guild Socialism Restated,* Cole designed an extensive institutional structure of producer and consumer organizations. Decisions would be made at various levels within this structure. *Guild Socialism Restated* was the high point of guild socialist theory.

By the end of the 1920s, as social democracy and Marxism became more popular, interest in guild socialism had largely disappeared among the British left. Although Cole cozntinued to see guild socialism as an ideal, he now stressed that his main concern was with what socialists could achieve in practice, given the conditions they found themselves in, rather than with what they might achieve in favorable circumstances. After decades of relative neglect, decentralist socialism attracted new interest in the 1970s, notably with the ideas of workers' control and industrial democracy promoted by writers including Ken Coates and Tony Benn.

H

HABERMAS, JÜRGEN (1929–)

After a brief look at Jürgen Habermas's background, the entry introduces the three most important parts of Habermas's work: his theory of communicative action and reason, his theory of discourse ethics, and his theory of deliberative democracy. In the final section, the entry gives an overview of Habermas's most recent work, where he applies the theoretical insights to pressing contemporary problems.

Life and Work

Habermas was born in 1929 and grew up in a middle-class family in the small German town of Gummersbach. In 1944, Habermas joined Hitler Youth and was sent to help at the western front. Although the experience of World War II itself does not seem to have influenced his life and writings significantly, the break with Germany's Nazi past and the postwar confrontation with the Holocaust had a significant impact on the young Habermas. This is so to the extent that his subsequent philosophical, sociological, and political work can be seen as attempts to answer the question: How can we guarantee that breaks with civilization such as Nazism and the Holocaust will never happen again? It is against this background that we can understand Habermas's defense of modernity, reason, and the Enlightenment in the form of an intersubjectivist philosophy as it is spelled out in his theories of communicative action and reason, discourse ethics, and deliberative democracy.

After finishing high school in 1949, Habermas studied philosophy at university, and he finished his PhD at Bonn University in 1954. From 1956 to 1959, he was Theodor Adorno's assistant at the Institute for Social Research at Frankfurt University, and it was during this time he discovered Marxist and post-Marxist critical theory and became radicalized. After jobs at other universities, Habermas came back to Frankfurt in 1964 to take up Max Horkheimer's chair of philosophy and sociology. The 1960s was the period of student protests and, for Habermas, also a period during which he laid the initial philosophical foundations for his later work. From 1971 to 1982, Habermas worked at the Max Planck Institute in Starnberg, whereupon he returned to his chair at Frankfurt, where he is now professor emeritus.

Habermas's work can be divided into three periods. During the first period, which runs from the 1950s to the early 1970s, Habermas lays the philosophical and epistemological foundations for his later work, and during this period he also does important work on student protests and the public sphere. From the 1970s to the mid-1980s, Habermas develops his theories of communicative action and discourse ethics based on a pragmatic theory of language. Finally, from the late 1980s onward, Habermas develops a theory of deliberative democracy.

What follows is a discussion of the second and third periods, as these are related to political theory. It is important to note, however, that there is

not a political turn in Habermas's work. From the very beginning, and even when written in the discipline of philosophy, his work has been full of political and sociological considerations. This is also testified by his frequent interventions as a public intellectual in debates in the media (see, for instance, Habermas, 2006, for the most recent collection of political writings).

Communicative Action and Reason

In *The Theory of Communicative Action,* published in 1981, Habermas developed a theory of communicative action and communicative reason. In the book, Habermas uses sociological theory and language philosophy to develop an approach to analyzing social action; in addition, he provides a critique of contemporary society. To understand Habermas's project in that book, it is necessary to go back to his critique of the philosophy of the subject (or consciousness) as he developed it during the 1970s.

Habermas's contention is that, throughout the history of philosophy, philosophers have put a subject at the center and have associated rationality with the consciousness of this subject. This is evident, for instance, in the work of René Descartes, but Habermas also finds it in philosophers that are closer to his own thinking. Thus, in Immanuel Kant's work, the clever individual imagines what the moral law is; in Georg Wilhelm Friedrich Hegel, and despite his emphasis on ethical life and hence intersubjectivity, we find a subject writ large, namely, the Prussian state as the foremost representative of history; finally, Karl Marx locates rationality in the revolutionary consciousness of the proletariat and its representatives.

Habermas argues that this way of thinking about rationality suffers from a number of flaws. First of all, we find in the philosophy of the subject a subject opposed to the rest of the world, whether the physical or the social world; as a result, rationality is associated with the subject getting its way with the world. Linked to this, Habermas believes that the philosophy of the subject does not have an adequate response to the problem of pluralism. When, as it is clear today, a rational society was not realized by the Kantian, Hegelian, or Marxian subjects in the ways these thinkers envisaged, we face a problem central to all of Habermas's philosophy: How do we coordinate action given that subjects do not see the world in the same way?

Habermas's solution to this problem of pluralism and to the problems he associates with the philosophy of the subject is an intersubjectivist paradigm. As such, he is part of the linguistic turn; for him, there is no unmediated access to the world, whether the physical world of objects or the moral world of norms. Because human beings are linguistic and communicating beings, philosophy, ethics, sociology, and political theory must start from this fact.

This is the reason for Habermas's focus on what he calls communicative action, that is, action oriented toward mutual understanding. When acting communicatively, we do not take an instrumental attitude to others, using them as means to an end, but rather we seek agreement and mutual understanding. That is not to say that we cannot, or should not, act instrumentally in relation to others. Habermas is making an analytical distinction between different kinds of action: instrumental action, strategic action (instrumental action in relation to others), and communicative action. This analytical distinction makes us able to use communicative action as a standard with which to criticize instrumental and strategic action when the latter enter into relationships that should be governed by communicative action.

Habermas links sociology and philosophy, in this case, action and rationality. He links instrumental and strategic action to instrumental rationality, where it is about the efficiency of achieving given goals. This kind of rationality is particularly dominant in the market and in bureaucracy, but it also governs much of our mundane lives as, say, when you consider how to get to work on time. Habermas distinguishes instrumental rationality from communicative rationality, which is linked to communicative action, that is, the process of reaching mutual understanding.

To understand the full force of this distinction and the link between action and rationality, it is necessary to look briefly at what Habermas says about language and communication. As human beings, what distinguishes us is the fact that we are language users. What raises us out of nature is the only thing whose nature we can know: *language*. Through language structure, autonomy and

responsibility are posited for us. Our first sentence expresses unequivocally the intention of universal and unconstrained consensus. We use language not just to achieve certain ends, for instance through threats ("if you don't eat your dinner, you'll have to go straight to bed"), but also to defend our validity claims with reasons, a process that may lead to agreement.

Habermas's point is that the aim of mutual understanding—and, hence, agreement and consensus—is built into the very structure of language. That is not to say that this promise of understanding and agreement is (always) realized, but it explains why we cannot reduce language and interaction to instrumental and strategic action and reason. There is something more to communication than getting one's way with others. This also links communicative action to communicative rationality: The latter refers to the promise to vindicate one's validity claims before the tribunal of the public use of reason.

In this way, Habermas believes that it becomes possible to talk about social action as rational—not just as instrumentally rational but, in a different fashion, as communicatively rational. And this makes us able to make judgments about the rationality of institutions and practices in a way that goes beyond asking about the efficiency of those institutions and practices. Habermas locates communicative reason in communicative action and in the fact that, as human beings, we are language users. So, communicative reason is not something specific to this or that community or historical period; rather, it has a universal application.

At this point, it is useful to compare Habermas's position to that of Adorno and Horkheimer from the first generation of the so-called Frankfurt School of critical theory. Whereas Adorno and Horkheimer were skeptical of modernity, Habermas is more optimistic. Adorno and Horkheimer saw the rise of instrumental reason and its problematic results everywhere, from advertising to the Holocaust, and they saw no alternative to this. Habermas argues that this is due to their limited notion of reason; he believes that we need a differentiated notion of reason that distinguishes instrumental and strategic reason from communicative reason.

With communicative reason we have something to hang our emancipatory hopes on. Communicative reason not only gives us hope of a better future, it also provides us with a basis for social critique. Because communicative reason is not implicated by relations of power, it provides us a perspective from which to criticize relations of power. Indeed, Habermas's argument is that we cannot reduce everything to power because we would then be unable to argue that our critique of power is not just another exercise of power. This forms part of his critique of Adorno and Horkheimer and of post-Nietzscheans such as Michel Foucault and Jacques Derrida, whom Habermas thinks reduce everything to relations of power. For Habermas such a move is self-defeating, something he sums up with the charge that they are engaged in a performative contradiction. You cannot, the argument goes, at one and the same time criticize power relations and claim that power is all there is.

This performative contradiction argument is another part of Habermas's argument for the unavoidability of communicative action and reason: We must presuppose communicative reason as agents who want to get something done together with other agents. This is so even if we may often (also) be engaged in instrumental and strategic action. There is no way not to presuppose something like communicative reason if we are to coordinate social action peacefully in the long run; it would not be possible to account for this from a perspective that reduces social action to the strategic action by agents facing one another as ends to their means.

Thus, Habermas's notions of communicative action and communicative reason serve as the basis for a sociological analysis of society as well as a critique of existing power relations. Communicative action and reason can, according to Habermas, be shown to be unavoidable facets of communication and social interaction while at the same time providing a critical corrective to contemporary society.

The Theory of Communicative Action is also known for Habermas's so-called colonization thesis. The argument is as follows. Society consists of a lifeworld of norms and institutions that are taken for granted by social agents; this lifeworld provides the background for communicative action and can be questioned in parts. In modern societies, there is a gradual differentiation of systems that become more or less independent of the lifeworld; the state and the market are good examples.

There is a differentiation between lifeworld and systems as well as a differentiation of systems into more and more complex systems and subsystems, for instance, within the state. Systems are governed by instrumental and strategic rationality through systems media such as power (the state) or money (the market).

Habermas does not criticize this differentiation as such; in fact, he believes it is necessary in any modern and complex society. Systems provide efficiency when it comes to coordinating action necessary for a modern society to function. For instance, in order to coordinate traffic in a modern city, it is not enough to rely on an implicit lifeworld background or on communicative action; here systems—state enforcement of laws, regulation of traffic with road tolls, and so on—are useful. The problem arises when systems "colonize" the lifeworld. This happens when power and money come to regulate what should really be regulated by communicative action; the result is anomie and alienation. An example would be the public sphere: if public debate is reduced to a matter of making money (by the media) or exercising power (by corporations influencing the media), citizens become alienated from the public sphere and retreat into their private domains.

Habermas does not propose a return to premodern society; rather, he argues, we must protect the lifeworld against intrusion from systems. Thus, the lifeworld/systems distinction and the colonization thesis provide Habermas with a way to criticize certain aspects of contemporary society, especially capitalism and bureaucratization. And unlike Marxist critiques of contemporary society, Habermas need not base his critique on a class analysis of society or restrict his critique to aspects of capitalism alone.

Discourse Ethics

Habermas's theory of discourse ethics follows closely from his theory of communicative action and reason. The term *discourse ethics* is, strictly speaking, a misnomer as it is rather a discourse theory of validity, that is, the validity of claims to truth, normative rightness, and truthfulness. Habermas developed his discourse ethics in a piece called "Discourse Ethics" in 1983, and it is supposed to provide an answer to the question: How, in pluralist societies, can we talk about something as true, right, and truthful?

For Habermas validity is not something inherent to a proposition or to a norm, but rather the result of discourse, that is, what was earlier described as the public use of reason. When discourses meet certain requirements of full information, equality among the participants, and so on, Habermas talks about "rational discourse." Earlier he used the phrase "ideal speech situation" to describe the same thing. The idea is that in a rational discourse only the forceless force of the good argument counts. In short, a rational discourse is a discourse devoid of power relations, bias, and exclusion.

The argument is as follows. When I raise a validity claim—for instance, "you should ride your bike to work today"—this claim can be taken up by others and problematized (e.g., "but it's raining!"). Validity claims may not be problematized and as such remain part of an implicit lifeworld consensus, but if they are problematized, then we enter the level of discourse and, insofar as the discourse meets certain requirements, we have a rational discourse. Validity claims contain the implicit claim that, if problematized, I am able and willing to test the validity claims in rational discourse and that, potentially, we may arrive at a rational consensus, the outcome of a rational discourse.

The gap between a de facto consensus and a rational consensus provides a critical perspective on any existing consensus. Just as communicative reason provides a critical corrective on existing power relations, rational discourse and rational consensus provide us with a way to point out deficiencies in the process through which society has arrived at a certain consensus, which, it turns out, is false and not truly universal.

Notice that Habermas links rationality to the process or procedure; it is the characteristics of the procedure that renders the outcome (the consensus) rational, not the outcome as such. Thus, it is not a correspondence theory of validity where a consensus should correspond to some external physical or moral reality in order to be rational. This is summed up in the discourse principle (D): "Just those action norms are valid to which all possibly affected persons could agree as participants in rational discourses" (Habermas, 1996, p. 107).

Habermas's discourse ethics is deontological; it does not give us norms, but a procedure for testing norms. This is expressed in the moral (or universalization) principle (U): "For a [moral] norm to be valid, the consequences and side effects that its *general* observance can be expected to have for the satisfaction of the particular interests of *each* person affected must be such that *all* affected can accept them freely" (Habermas, 1990, p. 120). Moral norms that have been tested in a rational discourse are equally good (or universally good) for all those possibly affected by the norms.

The moral principle also expresses a notion of autonomy as rational self-legislation: The subjects to the moral norms can understand themselves as also the authors of the norms insofar as they have given themselves the norms through a process of rational discourse. Notice the intersubjectivist twist Habermas gives to autonomy. It does not arise from the self-legislation of an individual or collective subject, but from the process of the public use of reason among participants in discourse.

That discourse ethics is a procedural theory of normative validity is particularly important given the fact that modern societies contain a plurality of ways of life. Again we see why Habermas wants to leave the philosophy of the subject behind: Society cannot be treated as a subject legislating for itself. Rather, modern society must be seen as consisting of individuals with different moral views, and therefore we need an *inter*subjective perspective. For Habermas, this perspective is discourse ethics.

Deliberative Democracy

From the late 1980s onward, Habermas developed a theory of deliberative democracy, which he laid out in *Between Facts and Norms: Contributions to a Discourse Theory of Law and Democracy,* published in 1992. Where discourse ethics was concerned with moral norms, deliberative democracy is, as the title of the book suggests, concerned with legal norms. The task Habermas set himself was to show how modern and complex societies can be integrated through the medium of law in a way that avoids the colonization of the lifeworld by systems, in this case, the state. In other words, how can we avoid citizens feeling alienated toward the law? In *The Theory of Communicative Action,* Habermas suggested erecting a dam against the encroachment of the systems. In *Between Facts and Norms,* he suggests a "sluice" model whereby legal norms (a systems phenomenon) become grounded in the lifeworld and in communicative action. The solution is deliberative democracy.

Like moral norms, legal norms must be rooted in discourse, that is, public deliberation. In this way, valid law, too, is linked to the discourse principle (D), and this is expressed in the democratic principle: "Only those [legal] statutes may claim legitimacy that can meet with the assent . . . of all citizens in a discursive process of legislation that in turn has been legally constituted" (Habermas, 1996, p. 110). Legal norms are valid insofar as those possibly affected by them have given their consent in deliberations that are characterized by full information, symmetry among the participants, and so on.

The result is legal autonomy. The "citizens [are] able to understand themselves also as authors of the law to which they are subject as addressees" (Habermas, 1996, p. 449). Because this self-legislation is rooted in rational deliberations, we can talk of rational self-legislation. The only difference with moral autonomy is that legal autonomy necessarily relates to a certain political community and is therefore not potentially universal in scope.

Habermas links this notion of legal autonomy to what he calls the co-originality thesis. This concerns the relationship between constitutionalism (individual rights) and democracy (popular sovereignty). Traditionally, liberals have given priority to individual rights over popular sovereignty, whereas republicans have given priority to popular sovereignty over individual rights. Habermas argues that the two things—constitutionalism and democracy—are two sides of the same coin and co-original. Constitutionalism and democracy imply one another and should not be seen as competing principles, at least if understood in terms of deliberative democracy. Deliberation will lead to the expression of popular sovereignty, but the deliberations must also be conditioned in certain ways. This is what constitutionalism does: It guarantees that everybody is free and equal. The content of constitutionalism is, in turn, the outcome of democratic deliberations. Habermas's argument is that you cannot have legitimate law without deliberative democracy, and, in deliberative democracy,

constitutionalism and democracy are united and mutually supportive. Only if you have both constitutionalism and democracy can the subjects to the laws (including constitutional laws) understand themselves as simultaneously the authors of the very same laws.

It should be clear by now that the public sphere is absolutely central to deliberative democracy; autonomous law is rooted in the citizens' public deliberations. However, in modern complex societies, direct democracy is not possible, so we need some system of representative democracy. In this respect, deliberative democracy has two institutional implications.

First, representative institutions must be organized according to the principle of the public use of reason. Thus, for instance, public deliberation is central to the parliament, but we can also think of institutions such as citizen juries as ways to institutionalize deliberative democracy.

Second, representative government must be rooted in the public sphere. Habermas distinguishes between, on one hand, the formal political system (the core), consisting of representative institutions, the courts, and the executive and, on the other hand, the informal political system (the periphery), consisting of civil society and the public sphere. The latter—the deliberations in the periphery—must feed into the formal system so that decisions emanating from the formal system can be led back to citizens' deliberations in the public sphere and civil society. Here we have again the "sluice" model where communicative reason is sluiced into the political system, which is in turn thought of as porous and receptive to communicative inputs.

Pluralism, Religion, and the Postnational Constellation

Modern societies consist of a plurality of different ways of life or what Habermas, following Rawls, calls *ethical conceptions of the good life,* for instance, religions. As a result, society cannot be integrated at the "ethical" level because that would inevitably mean imposing one way of life on others. Law must therefore be distinguished from any particular ethical view. This is reflected in Habermas's distinction between the ethical level and the political level of societal integration. We can, so Habermas argues, integrate the plurality of ethical conceptions of the good life at the political level:

> The ethical integration of groups and subcultures with their own collective identities must be uncoupled from the abstract political integration that includes all citizens equally. . . . The neutrality of the law vis-à-vis internal ethical differentiations stems from the fact that in complex societies the citizenry as a whole can no longer be held together by a substantive consensus on values but only by a consensus on the procedures for the legitimate enactment of laws and the legitimate exercise of power. (Habermas, 1998, p. 225)

Laws may reflect political but not ethical values.

This idea of political integration is also fleshed out in Habermas's notion of "constitutional patriotism." Citizens may share allegiance to certain political values, for instance, equality and freedom of religion—what Habermas in the previous quote referred to as "a consensus on the procedures for the legitimate enactment of laws and the legitimate exercise of power." What the content of that consensus is will differ according to time and place; it is not a given, but rather the outcome of deliberations among the citizens.

Understood in this way, constitutional patriotism can therefore be distinguished from nationalism. The latter is problematic insofar as some countries may consist of more than one nation and insofar as nationalism often consists of certain ethical values, such as a particular religion. Nationalism, being "a substantive consensus on values," will not do for pluralist societies; only a constitutional patriotism will do.

During the past few years, Habermas has been increasingly preoccupied with the place of religion in contemporary Western societies. Although he is a nonbeliever, he thinks that religion should be allowed a place in the public sphere. However, religious reasons must be translated into political reasons before they can be allowed to influence law. (The distinction between religious and political reasons corresponds to the one between ethical and political integration.) That is, in the process of moving from the informal to the formal political system, religious reasons must be presented in an idiom that everybody can understand, including nonbelievers and people of different faiths.

Habermas refers to such as society as "postsecular" to stress that, although there is this requirement to translate religious into political reasons, there is, nonetheless, a place for religion in the public sphere and civil society.

Linked to this, toleration must not be understood as a hierarchical relation of a tolerating party bestowing toleration upon a tolerated party as an act of benevolence and from a position of power. Deliberative democracy, Habermas believes, can help us here. If we think of the norms of toleration as the result of deliberations among equals, then the asymmetry between the tolerating and the tolerated disappears. This reflects another aspect of Habermas's postsecular society: We must treat religious persons as equal partners in deliberations about the norms of society, including the norms of toleration. This is so even if, when it comes to legal norms and the regulation of what we have in common as a society, these things must be justified on the basis of political rather than religious reasons.

The nation-state is challenged from within by ethical pluralism. It is also challenged from without by globalization, whether in the form of global capital, terrorism, or pollution. This is another reason why, for Habermas, it is necessary to go beyond the nation-state. The nation-state does not, and should not, necessarily disappear, but, according to Habermas, we need to focus on regional (European) and global (cosmopolitan) levels in search of solutions to problems such as the regulation of greenhouse gases. This is what Habermas refers to as the "postnational constellation."

We need more integration in the European Union, including a common foreign policy. This in turn requires the development of an EU-wide public sphere in order to root EU policy in opinion- and will-formation among the citizens of the European Union (Habermas 2006, Part II). We must also develop global organizations, especially within the framework of the United Nations. The aim of cosmopolitan government is partly to tame global capitalism and partly to enforce human rights.

Thus, for Habermas, the nation-state becomes less and less capable of solving political problems. At the same time, it is necessary to develop political organizations at a higher level that may intervene against national sovereignty. This is the case with environmental policy where decisions within a nation-state can have important consequences for people outside the borders of the nation-state. Given Habermas's notion of autonomy as the identity of those subject to laws and decisions with the authors of those laws and decisions, it is necessary to lift some of those laws and decisions out of the nation-state context and onto a higher level, whether regional or global. When it comes to human rights, we need organizations that can intervene against national sovereignty. It is no longer sufficient to refer to national sovereignty or (democratic) self-determination because the latter must be mediated by human rights. Self-determination that does not take place among free and equal citizens is not self-determination (autonomy) proper, according to Habermas.

Habermas moves beyond the nation-state and beyond nation-state sovereignty with this multilevel form of governance, which is at all levels supposed to be rooted in the public use of reason among those affected by the laws and decisions. This notion of autonomy linked to the public use of reason appears throughout Habermas's work, from his critique of the philosophy of the subject through communicative action, discourse ethics, and deliberative democracy to his recent writings on constitutional patriotism, religion, toleration, and cosmopolitanism.

Happiness

Giving a precise definition of happiness is difficult because of the different substantive conceptions of happiness that people hold; still, it is universally agreed that happiness is a characteristic of good life. Happiness often refers to a pleasant state of mind, but good fortune and moral virtue may also be considered elements of happiness. Although all seem to agree that happiness is what all human beings desire, it is open to debate whether happiness has intrinsic moral value. The role of happiness within a liberal society is a further domain that deserves our attention; apart from the obvious question regarding the attitude that a liberal society should adopt toward its citizens' different conceptions of happiness, there is also a challenging question regarding the possibility of the society's overall happiness and, if such a notion of happiness exists, its relation to the happiness of individual citizens. This entry first contrasts subjective conceptions of happiness with ones that emphasize objective criteria for a happy life. Next, it explores the question of whether happiness has intrinsic value or merely instrumental value. Lastly, it examines the role of the state in providing conditions necessary for happiness and considers the notion of a happy society.

Varieties of Happiness

The linguistic distinction between a happy/lucky person and happiness exists in several languages: *fortuna* and *beatitudo* in Latin, *chance* and *bonheur* in French, *Glück* and *Glücksgefühl* in German. There seem, however, to be exceptions, as in the ancient Greek language, where *eudaimonia* refers to a state of the world that is blessed with good fortune, by virtue of which an individual who leads a "good" life is also in a happy state of mind. Conceptually, happiness may refer to a psychological state of mind of the happy person (a subjective standard linked to a person's desires) or to the virtue or well-being exhibited by persons throughout their lives (more objective standards).

The notion of psychological happiness, familiar to the modern ear, is described by John Stuart Mill as pleasure and the absence of pain, while the contrary state of mind is understood as unhappiness. Its extreme version requires only the experience of pleasant episodes or sensations. The extreme and moderate versions share the idea that a subjectively defined state of mind is sufficient for happiness.

Still, cheerfulness and contentment are not sufficient for a truly happy life. A proponent of the extreme version of happiness defined as pleasure could consider an unending state of hedonic illusions due to a science-fictional hedonic experience machine, even though objective criteria for happiness are not met. Utilitarianism attempts to block illusory pleasures by claiming that the maximum utility is a necessary constituent of happiness; lower pleasures—under which the illusory hedonic episodes would fall—cannot match the utility of higher pleasures, which are so much more valuable and desirable to the extent that no amount of the former could outweigh them. Although we could distinguish between degrees of happiness with reference to how intense and extensive our lower pleasures are, we would never reach the level of happiness that higher pleasures bestow; or as Mill states it, it is better to be Socrates dissatisfied than a pig satisfied. Thus, according to the more moderate utilitarian conception of happiness, pleasure depends not only on the degree and duration but, more importantly, on the quality, of the subjective experience.

A view of happiness as based on objective criteria is not far from what we call well-being and is usually associated with Aristotle's definition of

eudaimonia as "living well and doing well" (*Nicomachean Ethics,* I.4, 1095[a]19–20). The emphasis here is on the state of the world that suffices for a happy life: what objectively constitutes happiness from a standpoint that evaluates life as a whole. Although pleasure is typically considered to be one constituent of happiness in the objective sense, it is possible to dissociate it entirely from pleasant episodes of the mind; in this context, Plato praises eudaimonia even when it is accompanied by no pleasant feelings.

This distinction is also related to a worry that classicists raise regarding the incompatibility of eudaimonia with a view of happiness that can exist independently of pleasure. However, one can argue that the person who is happy (*eudaimôn*) in the classical sense will have a qualitatively significant preference to exercise the peculiar human capacities. The pleasure that is attached to eudaimonia is qualitatively different from the mere experience of hedonic episodes: The former results from satisfying articulated preferences, which are well-defined and epistemically accessible, whereas the latter relates to the satisfaction of nonrational desires. The former represents what is objectively appropriate and satisfying for human beings, whereas the latter is limited to subjective contentment. Still, there is an important difference: Eudaimonia traditionally refers to contemplation as the peculiar capacity for human nature, whereas modern objective conceptions of happiness allow a variety of appropriate capabilities that different human beings may have and a multiplicity of happy states of the world when these capabilities are actualized.

The Moral Worth of Happiness

We all agree that we want to be happy; does this imply that happiness is the ultimate value of human life? Does happiness have intrinsic value? Is happiness the ultimate good, or is it complementary to other, moral or external, goods? The different varieties of happiness would offer different answers: Objective notions of happiness typically characterize it as a final good, containing the remaining goods or as not being increased by the addition of other goods. In contrast, the agent's contentment and cheerfulness are central in subjective concepts of happiness. Still, determining whether happiness is universally desired would be instrumental to the question of its value.

The thesis that happiness has absolute intrinsic value entails that other goods, moral as well as external, would either (a) be means to happiness, as in utilitarian views of pleasure or (b) constituent parts of happiness. The Socratic tradition, by identifying happiness as the only morally significant good and by denying any role to external goods for the happy life, is an example of the latter thesis. Plato asserts that, owing to its ultimate intrinsic value, only happiness is desired for its own sake. He presents those who desire external goods as being plainly mistaken, and in his *Republic* he depicts the virtuous person as being inevitably happy even under the most unfavorable circumstances and the vicious as fatally unhappy even when they enjoy every advantage.

Aristotle puts forward a moderate alternative concerning the value of happiness, one that focuses on the significance of virtue, but he also admits the necessity of external goods for the happy life. Starting from the universal claim that happiness is the most desirable good, he concludes that it has also to be the final good. There is a debate on whether the finality of the good indicates comprehensiveness (i.e., including all goods) or perfection (i.e., being the good *par excellence*); this exegetical debate would also determine whether there is a unique or a multitude of happy states. The utilitarian "greatest happiness principle" takes the comprehensiveness side; it maintains that happiness incorporates all desirable goods. Still, desirability is not constituent of the value of happiness, because it would have value even in a counterfactual scenario where it was no longer desired. To put it differently, both Aristotle and utilitarians hold that the universal desire for happiness plays a justificatory role of happiness, without being a constituent part of it.

A disavowal of the intrinsic value of happiness is offered by Immanuel Kant when he proposes rightness as the exclusive and ultimate moral value, the only unqualified good. For Kant, agent-based happiness is an obstacle to the objective moral obligation that is binding on the will of every member of the human species. Although Kant admits that happiness is universally *desired,* he denies that it is *desirable* for two reasons: (1) Our desires for happiness often conflict with

our obligations, which should always take priority and (2) even if there were not a conflict between happiness and obligation, our duty, not our desire for happiness, ought to motivate our actions. Still, Kant agrees promoting the happiness of our fellow humans has moral significance insofar it is purely altruistic and in harmony with the general will. Kant ascribes only instrumental social value to happiness and suggests that the best that happiness could offer is a hypothetical, as opposed to a categorical, imperative—one that is absolute and binding in all circumstances.

The Politics of Happiness

By stating that all human beings have an unalienable right to the pursuit of happiness, the American Declaration of Independence ascribes a central political role to happiness. On the other hand, an ancient Greek tradition of thought starting with Socrates and followed by the Cynics and the Stoics dissociates happiness from the political domain by denying the necessity of external, material or relational, goods for human happiness; instead, happiness, defined as self-sufficiency, is fully up to individuals and cannot be compromised by anything beyond them.

Liberalism also breaks the connection between happiness and the state by putting the emphasis on fairness; as John Rawls puts it, although the right and the good are the main moral concepts, justice has priority over goodness in the political domain. Moreover, liberals deny state intervention in the formulation of citizens' conceptions of happiness, because the odds are that the state would interfere wrongly. Accordingly, the state is restricted to providing equal opportunities for the pursuit of citizens' happiness, by similarly protecting their basic liberties and equally supplying them with the material necessities for satisfying their private conceptions of happiness.

Still, the liberal commitment to equal opportunities for happiness is exposed to some of the difficulties faced by the currency of equality debate. To start with, the liberal state would be committed to value equally any preferences or desires that are, objectively or subjectively, constituents of someone's conception of happiness, even when they are evidently unfeasible or expensive. In addition, state neutrality is arguably an illusion, as it adopts freedom as its central good in the same way that Mill explicitly endorses liberty as the specific conception of happiness that the society should promote. Hence, even the liberal state endorses in practice a substantive, albeit minimal, definition of happiness, which is installed in people's minds by the means of public education, the health system, and similar institutions intended to further public goods. Such a conception also serves as a norm for the evaluation of citizens' requirements for their private pursuit of happiness; for example, the equality of opportunities for materializing the variety of citizens' conceptions of happiness would have to be restricted if some of those conceptions conflict with the liberal ethos. These difficulties suggest that the public domain, even in its liberal version, has to admit a substantive conception of happiness, which would also provide some objectively necessary standards for human happiness. Martha Nussbaum, who has admitted this possibility, argues that the state should aim to provide a social content in which all its citizens can actualize their human capabilities, a substantive list of which she provides.

Other political ideologies that explicitly endorse a conception of the common good would have to openly give their approval to civic happiness. Totalitarianism, religious as well as secular, certainly presupposes a strong version of objectively defined happiness. Karl Marx may be a more difficult case, as he explicitly denies essentialism, but we could identify an underlying objective conception of happiness as a state of human beings that is contrasted with the state of alienation. Socialism and communism affirm a notion of civic happiness.

A final dilemma is whether the happiness that a majority enjoys, and/or the government endorses, could entail the existence of the happiness of the society as a whole. We often speak meaningfully of a happy society, association, or relationship, so there must be something to which such expressions refer. This type of happiness might simply constitute a systemic societal feature: Plato infamously holds that the happiness of society is beyond, and independent of, the happiness of its citizens, taken individually or aggregately. Aristotle deprecates such systemic happiness in favor of an intrinsic relation between society and its citizens by arguing that a happy society is not like an evenness that can belong to a society as a whole but not to any of its parts. It seems closer to our intuitions, which

are tuned with the greatest happiness principle, that the happiness of the society is sufficient—albeit not necessary—for the happiness of (at least some) of its citizens. Granting that the aim of society is to provide security and happiness to its members, a happy society with only unhappy citizens would be inconceivable; even so, citizens have a variety of options for pursuing happiness, even independent of—or within—an unhappy society. Still, despite the relation between individual and social happiness, it seems that the existence of the latter is conceptually possible.

Hart, H. L. A. (1907–1992)

Herbert Lionel Adolphus Hart was the foremost legal philosopher and one of the foremost political philosophers of the twentieth century. Born to a Jewish family in Yorkshire, England, Hart pursued his undergraduate education at Oxford and went on to qualify as a barrister. After practicing law for several years, he worked for the British intelligence service MI5 during World War II. When the war ended, he returned to Oxford to take up a fellowship in philosophy at New College. He subsequently became professor of jurisprudence at Oxford (and a Fellow of University College), and still later became principal of Brasenose College. During the closing years of his career as an active scholar, he devoted much of his time to editing and interpreting the works of Jeremy Bentham.

Hart is best known for his contributions to legal philosophy generally and to legal positivism specifically. At the same time that he acknowledged his intellectual debts to his great positivist predecessors Bentham and John Austin, he severely criticized their theories for obscuring the normative dimension of law (i.e., law's orientation toward what ought to be). At the same time, he emphasized that the normativity of law is not necessarily moral; throughout his jurisprudential work, he maintained a legal-positivist insistence on the separability of law and morality. In his classic 1961 book *The Concept of Law,* and in a number of essays written approximately contemporaneously, he presented a hugely influential account of the ways in which different types of norms combine to form the structure of a legal system. He laid particular stress on what he designated as the "rule of recognition"—namely, the array of normative presuppositions that underlie the behavior of legal officials (especially judges and administrators) as they ascertain the existence and contents of the laws in their system of governance. Under the prevailing rule of recognition in a jurisdiction, legal officials are both authorized and obligated to follow specific criteria in determining which norms possess the status of laws. Those criteria typically fix upon familiar sources of law such as legislative enactments or adjudicative rulings or administrative regulations or constitutional provisions.

Although *The Concept of Law* is principally a work of legal philosophy, it contains some important discussions of topics in political and moral philosophy. Hart's first major contribution to political philosophy occurred in his 1955 essay "Are There Any Natural Rights?" In that essay, Hart briefly introduced a theory of political obligation that has come to be known as the "principle of fair play" (a principle later elaborated by his friend John Rawls). That is, he contended that anyone who benefits greatly from the presence of some institution is morally required to bear a commensurate share of the burden of sustaining that institution's existence. Although the principle

of fair play has often come under attack in the four decades since Hart fleetingly propounded it, it continues to be espoused by some present-day political philosophers.

Hart's most sustained entry into political disputation occurred in 1963, with the publication of his *Law, Liberty, and Morality*. Hart wrote in the liberal tradition of John Stuart Mill in arguing that homosexual intercourse between consenting adults should not be legally proscribed. Invoking and defending Mill's "harm principle," which maintains that no activity can legitimately be outlawed unless the activity causes nontrivial harm to somebody other than the participant(s) in it, Hart submitted that consensual intercourse between adult homosexuals does not cause any detriment that would suffice to satisfy the harm principle. In particular, the mere fact that unorthodox sexual practices cause offense to some people who are aware of their occurrence does not constitute harm of any kind that would render legitimate the prohibition of those practices.

In several writings included in his *Essays on Bentham* and *Essays in Jurisprudence and Philosophy,* Hart made noteworthy contributions to debates over the nature of rights and justice. He joined Rawls and Robert Nozick in rejecting utilitarian rationales for sacrificing the vital interests of some individuals in furtherance of the interests of others, but he likewise assailed the extreme individualism of Nozick's libertarian principles of justice. Generally sympathetic to Rawls's ideas, Hart nonetheless challenged Rawls's remarks about the overriding priority of liberty. (Among other things, he queried Rawls's unexplained shift from speaking about the priority of *liberty* to speaking about the priority of *liberties*.) What Hart impugned was not really the priority of certain liberties but instead the claim by Rawls to have derived that priority from a situation of pure rational choice—the "original position"—in which each choosing agent seeks to promote his or her own interests optimally. Hart declared that, instead, the only tenable basis for Rawls's prioritization of certain liberties is a liberal ideal of human personality.

Hart further exhibited his liberal allegiances in his analysis of the nature of rights. He contended that the holding of a legal right by any person *P* always involves the vesting of *P* with legal powers to waive or demand the enforcement of the legal duty that is correlated with the right. Hart adopted this analysis precisely because he believed that no alternative conception of right-holding would capture the role of rights in enabling individual self-determination. His account of rights, like his other political stances, was grounded on liberal values.

Hate Speech

Hate speech is speech or expression that denigrates a person or persons on the basis of (alleged) membership in a social group identified by such attributes as race, ethnicity, gender, sexual orientation, religion, age, physical or mental disability, and others. Typical hate speech involves epithets and slurs (e.g., "nigger," "faggot," "bitch"), statements that promote malicious stereotypes ("Mexicans are lazy"), and speech intended to incite hatred or violence against a group ("Kill all the Muslims!"). Hate speech can also include nonverbal depictions and symbols. For example, Jews and others might label the brandishing of the Nazi swastika as hate

speech, and some feminists consider pornography to be hate speech against women. Critics of hate speech argue that it not only causes psychological harm to its victims, and physical harm when it incites violence, but that it also undermines the social equality of its victims. This is particularly true, they claim, because the social groups that are commonly the targets of hate speech have historically suffered from social marginalization and oppression. Hate speech therefore poses a challenge for liberal societies, which are committed to both freedom of expression *and* social equality. Thus, there is an ongoing debate among liberals over whether and how hate speech should be regulated or censored.

The traditional liberal position regarding hate speech is to permit it under the auspices of freedom of expression. Although liberals who take this position acknowledge the odious nature of the messages of hate speech, they maintain that state censorship is a cure that causes more harm than the disease of bigoted expression. They fear that a principle of censorship will lead to the suppression of other unpopular but nevertheless legitimate expression, perhaps even of the criticism of government, which is so vital to the political health of liberal democracy. They argue that the best way to counter hate speech is to demonstrate its falsity in the open marketplace of ideas.

Proponents of censorship argue that the traditional liberal position wrongly assumes the social equality of persons and groups in society and neglects the fact that there are marginalized groups who are especially vulnerable to the evils of hate speech. Hate speech, they argue, is not merely the expression of ideas; it is rather an effective means of socially subordinating its victims. When aimed at historically oppressed minorities, hate speech is not merely insulting but also perpetuates their oppression by causing the victims, the perpetrators, and society at large to internalize the hateful messages and act accordingly. Victims of hate speech cannot enter the "open marketplace of ideas" as equal participants to defend themselves because hate speech, in conjunction with a broader system of inequality and unjust discrimination that burdens these victims, effectively silences them. Despite these arguments, the American court system, on the basis of the First Amendment, has generally ruled against attempts to censor hate speech. Some universities, however, have controversially enacted campus speech codes aimed at eradicating hate speech.

Hayek, Friedrich von (1899–1992)

Friedrich August von Hayek was an Austro-British economist and political philosopher who helped to inspire a shift from Keynesianism to neoliberalism in the late twentieth century. In 1974 he shared the Nobel Prize for economics, and in 1991, he received the U.S. Presidential Medal of Freedom. He wrote scathing critiques of totalitarianism and planning, arguing that liberty as well as prosperity depended on a free-market economy. His early work, most notably *The Road to Serfdom,* concentrated on diagnosing what he saw as the failings of totalitarian and social democratic societies. Later, in books such as *The Constitution of Liberty,* he offered his vision of the ideal, capitalist society.

Hayek's views on socialism and markets reflect his theories of knowledge and society. In *The Sensory Order,* Hayek identified what he saw as the limits of reason. In his view, the mind is incapable of standing outside of society and understanding

how society influences its perceptions. Human beings simply cannot know all the details of the social processes. They necessarily abstract from concrete details in order to make models of their environment. Thus, all social knowledge is partial and imperfect. For Hayek, the limitations of reason undermined what he thought was a common rationalist assumption that the mind could master reality. He argued, to the contrary, that the partial and imperfect nature of our knowledge meant we could never know enough consciously to control or redesign our environment. Hayek thus rejected as impossible the rationalist dream of a designed social order. Instead he championed the idea of a spontaneous order. In his view, spontaneous orders arose accidentally as segmentations and conglomerations of individual actions. Equally, however, as a spontaneous order arose, so it was always tested by experience and by trial and error. Spontaneous orders were thus subject to a kind of natural selection.

The distinction between designed and spontaneous orders supports the claim that we ignore society's rules and institutions at our peril, but it does not necessarily lead to a defense of any particular set of rules and institutions. Here Hayek echoed David Hume's argument that there are no universal or objective morals, so social and political norms and rules can take different forms. He condemned rationalist attempts consciously to change or design social rules and institutions, attempts that he thought undermined the natural selection of rules and institutions. Socialism was, in his view, the paradigmatic example of such rationalism.

Hayek viewed socialism as a rationalist attempt to direct economic activity in accordance with an abstract idea of social justice. It was, he argued, the greatest threat to modern civilization, destroying the basis of morals, personal freedom, and responsibility, and impeding the production of wealth. Even mild forms of government intervention led to totalitarianism and impoverishment.

For a start, Hayek argued that whereas socialist ideals of altruism and solidarity may have been appropriate for the hunter-gatherer phase of civilization, they are inappropriate for modern societies precisely because we cannot know the needs of every individual. Socialism increases social dependency and decreases self-reliance; it undermines the freedom and responsibility needed to sustain society. According to Hayek, even if socialism made the state responsible for people's lives, it opened the way to corruption and eroded people's independence, self-reliance, and moral integrity. Socialism led inevitably to totalitarianism.

In addition, Hayek argues that socialism impedes the production of wealth. He offered a range of reasons for believing socialist economies to be inherently inefficient. He drew here on an argument made earlier by Ludwig von Mises: Socialism misallocates resources because without a decentralized price mechanism, the subjective preferences of individuals cannot be identified and fulfilled. He also argued that socialism undermines the competition that drives forward the processes of innovation that increase production. More innovatively, Hayek drew on his own view of reason and knowledge to argue that because people's preferences cannot be measured, socialism more or less necessarily has to end up reflecting special interests. Finally, he suggested that redistribution alters the dynamics of the economy within which they operate so that their outcome is always uncertain.

Hayek believed that, given imperfect knowledge, the only effective way to organize human activity was through a free market. The market coordinates the actions of individuals who have dispersed, decentralized, and fragmented knowledge. The market is a discovery process that matches wants and goods, enabling individuals to coordinate their economic activities in accord with their preferences. So, unlike many economists, Hayek focused on the process that the market sustained, not on the equilibrium to which it gave rise. The market means we do not have to know every element of society to secure coordination.

For Hayek, liberal government was vital to defend the market and the freedom it instantiated. Liberal rule protects personal freedoms from the arbitrary interference and coercion of others. Personal freedom, in turn, facilitates the coordination and discovery of knowledge through a market. Liberal rule consists here of personal freedoms protected through the rule of law. In order to be just and to protect freedom, laws must be abstract, universal, and impartial. Hayek believed, in particular, that the key to freedom is a legal system that protects private property. However, he accepted that coercion legitimately may be used to prevent even worse coercion, and he thus defended conscription and taxation.

Throughout his life, Hayek emphasized the importance of liberty in a market economy under a liberal government. This concept of liberty differs significantly from that of liberty as democratic self-rule. Hayek remained broadly supportive of democracy. But he argued that democratic decision making was not an adequate substitute for the market. In particular, Hayek stressed the superiority of the market to democracy as a mechanism for generating a genuinely collective choice. The market simply aggregates the choices of individuals. Democratic institutions, in contrast, are subject to distortions that prevented them reflecting the genuine preferences of individuals. More generally, Hayek supported democracy not as an end in itself, but as a means of promoting and protecting a liberal market society. Because he recognized that democracy could be used to attack liberalism and the market, he insisted democracy should be restrained by bounds such as the protection of minority rights. Indeed, he suggested that authoritarian regimes could be preferable to democratic ones if they were more likely to protect liberal rights and the market economy.

Hegel, Georg Wilhelm Friedrich (1770–1831)

Georg Wilhelm Friedrich Hegel is one of the pantheon of "great dead political philosophers." To many, he is best known for his conservatism and his early critique of modern liberalism. For others, what makes him most distinctive is the social idealism that made him such an attractive target for Karl Marx. For neutrals on these issues, his permanent value rests on the distinctive contribution that he made to a wide variety of problems that are the meat and drink of political philosophy. This last is the spirit in which his work is introduced in this entry.

Life and Work

Hegel was born in Stuttgart, Germany, in 1770. His father was a civil servant at the court of the Duchy of Württemberg. At the Tübinger Stift, a Protestant seminary that he entered in 1788, he was a close friend of two outstanding fellow students, Friedrich Hölderlin (the poet) and Friedrich Schelling (the philosopher). His interest in politics and current affairs developed along with their common enthusiasm for the revolutionary events in France. After periods as a private tutor, in 1801 he followed Schelling to the University of Jena, working as a virtually unpaid tutorial assistant and later Extraordinary Lecturer until 1807. Following long spells as a newspaper editor in Bamburg and as a headmaster at the Gymnasium in Nuremburg, he took up his first fully professional university post as professor in Heidelberg in 1816 at the age of 46. In 1818 he moved to take up the philosophy chair in Berlin, Prussia, previously occupied by Johann Gottlieb Fichte. He remained in that post until his death in 1831.

As a philosopher, Hegel is best known for his grandiloquent metaphysical system of absolute idealism. But his work in social and political philosophy is more than just a supplement to this last great effort in philosophical system building. He thought hard about—and wrote about—ethics in its broadest sense throughout his intellectual career. His early theological works were driven by a concern for social improvement and for finding a place for religion as a vehicle of cultural reform. In Jena he finished an earlier essay on the German Constitution and published his critical (1802–1803) essay on natural law (*On the Scientific Ways of Treating Natural Law, Its Place in Practical Philosophy, and Its Relation to the Positive Sciences of Law*) in which he introduces criticisms of "individualist" systems of normative ethics, notably Kantian ethics and social contract theories of the

state. In his (unpublished) *System of Ethical Life,* and in lecture materials, the *Jena System Drafts,* he began to develop related concepts of spirit, mutual recognition, and freedom which he would elaborate in the magnificent *Phenomenology of Spirit* (1807; henceforth *Phenomenology,* cited at paragraph [¶] numbers). Hegel's ethics and political philosophy are sketched in the "Objective Mind" section of the *Encyclopaedia of the Philosophical Sciences* (1817) and then in much greater detail in successive drafts of the *Elements of the Philosophy of Right* (henceforth *PR,* cited at section [§] numbers), his fullest and most carefully articulated text in political theory, first published in 1820 as a handbook to accompany lectures. Additional material on social and political philosophy can be found in the *Lectures on the Philosophy of World History,* the *Lectures on the History of Philosophy* (both published after his death), and various essays, notably his 1831 essay "On the English Reform Bill."

Key Themes

Idealism

In Hegel's system the study of social and political philosophy—ethics in its broadest sense—is the study of "objective mind." Hegel is an absolute idealist, which is to say, at its simplest, that the world is ultimately constituted by reason. Although absolute idealism has fallen out of fashion in recent times and has always been philosophically controversial, it is grounded in strong intuitions and good questions: If the universe is not, at bottom, mathematical, how can the equations of the physicist disclose its nature? Were the natural world not rational or intrinsically intelligible, how could rational creatures have knowledge of it?

Particularly controversial, however, is Hegel's effort to generalize idealism into the realm of social philosophy (it was this effort that Marx hoped to turn on its head). It claims that social institutions such as families, firms, trade unions, legal systems, and states are structures of mind (or spirit—*Geist* is Hegel's term). The social world is a system of objective mind (as against subjective mind, exemplified in the mental life of individuals), constituted by such mental entities as intentions, expectations, decisions, beliefs, values, rules, conventions, and laws.

Spirit, Reason, and Freedom

Objective mind (henceforth spirit) has a history—indeed, for Hegel, nothing else has a history—with a distinctive theme: Reason works in history to develop patterns of rationality in the social world. Think of the history of spirit as a space-time worm—"Spirit emptied out into Time" (*Phenomenology,* ¶ 808)—moving from civilization to civilization, beginning in the ancient Chinese world and moving to the German (northern European Protestant) world of Hegel's day via India, Persia, Egypt, Greece, Rome, and medieval Christianity, and undergoing sequential changes in the process, all driven by the motor of reason. "This Becoming presents a slow-moving succession of Spirits, a gallery of images, each of which, endowed with all the riches of Spirit, moves thus slowly just because the Spirit has to penetrate and digest this entire wealth of its substance" (*Phenomenology,* ¶ 808). Thus social worlds which are irrational, say because the citizens are faced with tragic conflicts between the norms of family life as dictated by religious beliefs and the laws of the state as commanded by the sovereign—this is the ancient world of Antigone as famously described in Chapter 6 of *Phenomenology*—must collapse and go under. This distinctively "ethical shape of Spirit has vanished and another takes its place" (*Phenomenology,* ¶ 475). The modern social world exemplified in the Prussia that Hegel describes in *PR* is the product and culmination of reason at work in history, the historical dialectic that is sketched in the *Phenomenology* and described in detail in *Lectures on the Philosophy of World History.* As Hegel puts it in the notorious *Doppelsatz* (double-saying) of the preface to *PR:*

> What is rational is actual;
>
> And what is actual is rational.

This hard saying has been the source of reams of contending interpretations, but its essence is the claim that the modern social world that Hegel describes in *PR* is rational, a structure of reason to be disclosed by philosophical interpretation.

What does it mean to say that reason is both the motor of historical change and the structuring element of the social world? If we think of spirit as a structure of interpenetrating thought and will (for Hegel, as against Kant, these terms do not denote

discrete faculties of the mind), and if we understand the will to be essentially free (as Hegel does), we can understand the *history* of spirit as the story of its striving for freedom and the *actuality* of spirit as the embodiment of freedom in the institutions of the modern social world. The history of spirit encompasses two narratives: first, a speculative history of events and institutions, an account of how humans have learned by trial and error just which forms of social life realize freedom, entrenching those that do and jettisoning those that do not, as, for example, the social practices of slavery and authority-based religion do not; and second, a history of philosophy, an account of how humans have come to understand through philosophical reflection what freedom requires. Absolute freedom (the end point of the *Phenomenology*) is the circumstance wherein spirit is fully self-conscious, understanding that it is free and how it is so—"Spirit that knows itself as Spirit" (*Phenomenology,* ¶ 798). Spirit is thus truly free because there are no barriers or limits to its self-knowledge. Actual social freedom is the condition of social life wherein citizens live freely together and understand how the institutions that bind them secure this freedom. This latter understanding, Hegel believes, is charted in *PR*.

Recognition in the Phenomenology of Spirit

Mention of freedom of the will and a commonsense grasp of social freedom as negative freedom, the condition of individual agents who are not prevented by laws or other social conditions from getting what they want, may lead us to think of freedom as an individual possession, a state enjoyed by individual persons. For Hegel, on the other hand, freedom is as much a social achievement as a property of individuals. There could not be a stable, persisting, social world in which one, or some, were free while others were not, in which one, or some, are masters and all others are slaves. History has shown us that societies that are organized in this fashion must change or perish, but in *Phenomenology,* where Hegel first publishes the account of spirit that he has developed, he gives us a deeper argument to explain why this must be so.

Knowledge, he concludes at the end of the first chapter, cannot be a matter of a subject's acquaintance with, or perceiving, or theorizing, a world of independent objects. Consciousness, he argues, requires self-consciousness or self-understanding, and he asks in the chapter on self-consciousness: What do we understand ourselves to be? First, we take ourselves to be living, desiring creatures, but this conception of ourselves is incomplete and unstable, itself consumed, he tells us, in the consummation of desire. We can demonstrate to ourselves that we are not just desiring creatures by distancing ourselves from the pressing urgencies of the living, desiring self—that is, by risking our lives in challenging others to a life and death struggle. This strange kind of self-knowledge discloses to the protagonists that they are both free in the sense that they can cast off natural urges and instincts. Both are willing to give up their lives, after all. Moreover, there is a strong dialectical advance in that both parties to the struggle present themselves and recognize the other as free agents. But this, too, is partial knowledge, of its nature incomplete—brief and passing for the protagonist who does not survive and transient for the winner of the fight, the sad survivor who no longer has an opponent who can recognize him as free. So a further dialectical advance is made into the master-slave dialectic, when the outcome of the struggle is not death but enslavement for the loser who clings to life. The master achieves recognition of his mastery and liberation from the need to work to satisfy his desires; the slave secures his continued existence as a living creature who exists to serve his master.

Next, in a dialectical *bouleversement* that has proved enormously influential, Hegel demonstrates that the project of mastery is a failure and that the true advance in self-consciousness and liberation is taken by the slave. Echoing and amplifying some famous remarks of Jean-Jacques Rousseau in the *Second Discourse on the Origins of Inequality,* Hegel maintains that in becoming dependent on the work of the slave to satisfy his desires, and in seeking recognition from an inferior being whom he dominates, the master loses his freedom and fails to secure recognition. Contrariwise, through the self-discipline exerted in the processes of skilled and thoughtful labor, together with the identification and recognition of his intelligent self in the products of his labor, the slave acquires a glimmering of freedom as self-knowledge that is denied to the master. The lessons of the master-slave dialectic are that one-sided recognition fails as a strategy for developing self-consciousness, that the creation of dependents cannot secure true independence, and, crucially,

that personal freedom necessitates relationships of equality between persons who are free.

The insights developed through this bizarre sequence of emblematic figures have been an inspiration and resource for theorists of liberation and social equality ever since: for philosophers and ideologists supporting workers in their struggle against oppressive capitalist owners of the means of production, for the leaders of colonized peoples seeking independence from imperialist domination, and for feminists striving for the equality of women against the hegemony of men. Wage slavery, colonialist exploitation, the subjection of women—all such strategies of domination and subordination—are bound to fail, or so it is claimed on the basis of Hegel's master-slave dialectic. True independence is the mutual interdependence of the "'I' that is 'We' and 'We' that is 'I'" (*Phenomenology,* ¶ 177), true recognition is mutual recognition wherein the parties "*recognize* themselves as *mutually recognizing* one another" (*Phenomenology,* ¶ 184), and true freedom is equal liberation for all.

These appropriations of Hegel's ideas should not blind us to the fact that Hegel was an enthusiastic supporter of burgeoning nineteenth-century capitalism, that he believed that colonialism was an important strategy in the elimination of poverty in the industrialized world, and that the proper place for women was the home. Controversy has surrounded the issue of how far these insights of the *Phenomenology* are developed or compromised in Hegel's later work.

Freedom in the Modern Social World: The Philosophy of Right

In *Philosophy of Right,* Hegel articulates the system of objective spirit that is actualized in the modern social world. In the first section, he writes, "The subject-matter of *the philosophical science of right* is the *Idea of right*—the concept of right and its actualization" (*PR,* § 1). That is, he will describe the social world and its constitutive values (the "actualization" of right) in terms of a philosophical articulation of its inner logic. This gives *PR* a structure that has mystified many readers. For Hegel, this rational or logical structure—of universality, particularity, and individuality (basically the Aristotelian concept of an *individual* substance as a *particular* instantiation of a *universal*)—has a validating or justifying power. This claim can be bracketed off if the institutions and their constitutive norms or values can be defended as having an independent cogency, which they may well have. If they do not, then the system stands or falls with one's acceptance of Hegel's metaphysics.

The Will

The key thought, already latent (albeit in a highly compressed form) in the introduction to *PR,* is that the social world is a structure of freedom because it fully actualizes the free will. The free will combines two elements—(1) the (universal) power of abstracting any (particular) determinate content of the will (as when one holds back from acting to satisfy a desire and considers whether this is the sort of thing one ought to be doing) and (2) some (particular) desire that one seeks to satisfy—into a synthesis of universality and particularity when one decides to act (say, to satisfy this particular desire rather than that). So free agency combines the Hobbesian element of acting from desire and the Kantian element of distancing oneself from otherwise determining desires. One acts freely when one acts to satisfy desires that one has independently validated.

How is this achieved? The basic idea is that one acts freely when one acts in accordance with values (social rules, laws, or norms) that are endorsed as rational. Suppose Adam wants to eat the apple that he sees hanging from the tree. Then he reflects that the tree and its fruit belong to Bill, who is the owner of it and has a right of exclusive possession to it. Because Adam endorses a regime of private property and rights of ownership as necessary for persons to be free, he acts freely when he restrains himself from taking the apple. If, on the other hand, he had (correctly) judged that the apple belonged to no one and that he was within his rights to take it, Adam would have acted freely when he picked and ate it. These are models of free agency, as Hegel understands it. This is *positive,* as against *negative,* freedom on one understanding of the distinction drawn by Isaiah Berlin.

The Argument of the Philosophy of Right

The values engaged when agents act freely are encoded in structures of social norms. How are

these (correct or valid) norms to be identified? Hegel's distinctive story explains that they are constitutive of conceptions of the self with which modern agents have learned to identify. Allen Wood dubs this a *self-actualization* theory. It specifies that agents are free when their actions are guided by a nested series of normative systems, within each of which there is a range of self-descriptions that agents recognize and endorse and thus apply to themselves and their fellow citizens. These self-descriptions are ethically potent in that those who identify with them will acknowledge the constitutive norms of behavior that they encode or actualize. This is a *communitarian* ethic insofar as the moral norms that direct the behavior of free persons are the norms that are actualized by, or embedded within, the communities they inhabit, and it is ultimately the historically formed community—Hegel's rational state—with which persons identify which gives them their ethical life.

Abstract Right

Thus (to follow the sequence charted in *PR*) in Part I, "Abstract Right," we see ourselves and others as *persons,* a technical term denoting the discrete atomic units of agency who are bearers of rights, making claims of right against others and recognizing the reciprocal claims on themselves that other persons make in turn. This is a primitive ethic of individual rights, traceable to Protestant claims on behalf of the integrity of the individual soul in its relations with God and the associated morality of natural rights that was developed in the fifteenth and sixteenth centuries. Seeing ourselves as persons, we make claims of right to personal integrity, individual conscience and religious faith, and private property. As persons, we freely contract with others and develop a retributive conception of punishment as the legitimate enforcement of these rights. Modern persons, Hegel insists, are ineluctably individualists, separate persons as Rawls claims, governed by rights that operate as side constraints in the fashion described by Robert Nozick (*pace* the modern communitarian who says such a person is a fiction). But Hegel differs from this style of contemporary liberalism in insisting that this minimal self-ascription cannot represent the whole truth about our moral personality because an ethics of personal rights would be impoverished to the point of contradiction. Persons would claim enforceable rights but would be unable to establish a stable system of just rights enforcement. A state of nature regime of rights enforcement would descend into a nightmare of revenge and vendetta in the way John Locke describes in the *Second Treatise of Government*.

Morality

We are persons, but more than persons. In the following chapter, "Morality" (*Moralität*), Hegel explores the possibility that we might establish a set of moral norms to which all might subscribe on the basis of an understanding of ourselves as moral subjects. This of course was Kant's project and throughout this chapter Hegel stalks Kant, gathering insights concerning the nature of human agency but finally rejecting Kant's moral psychology (with its dichotomy of duty and inclination) and Kant's normative ethics (with its employment of the categorical imperative as the definitive test of any proposed moral principle). "From this point of view, no immanent theory of duties is possible" (*PR,* § 135), Hegel concludes.

It would be a mistake to dismiss Hegel's critique of morality as entirely negative. A crucial insight which he endorses is the "*right of the subjective will* [which] is that whatever it is to recognize as valid should be *perceived* by it *as good*" (*PR,* § 132). If we take this as the claim that neither priests nor princes can dictate to us how we should behave (as Kant equally insisted), that norms of conduct should be understood and endorsed by all those to whom they apply, we can see Hegel as accepting a crucial thesis of modern liberalism in its broadest sense. It is a matter of great dispute how far Hegel respects this important right in the details of the argument to follow. It is also important that one recognizes that this right is entirely formal. It does not tell us what the good is. It does not deliver "an immanent theory of duties." For that we have to investigate Ethical Life (*Sittlichkeit*), Hegel's distinctive name for the actual norms of the rational state, that is, the community he inhabits.

Ethical Life

The English idealist F. H. Bradley (1846–1924) described the subject of ethics as "My Station and Its Duties." This gives a clear sense to the difficult term *ethical life*. Our duties are furnished by our

ethical location (our station in life) in communities of sentiment fashioned in history. If this sounds like subjection rather than freedom, Hegel emphasizes that the opposite is the case. "A binding duty can appear as a *limitation*. . . . The individual however finds his *liberation* in duty" (*PR,* § 149). Rather than constrain us, we shall find that our duties make us free: Once we understand and endorse the requirements, we find our natural desires tamed and controlled. We understand that the institutions of ethical life, including notably the state, enable us to realize personal capacities that would otherwise fail to find an adequate expression.

Thus, when we understand the nature of life in the modern nuclear family (the first element of ethical life that Hegel studies)—a life grounded in mutual love but structured by duties to parents, spouse, and children—we will agree that only in this form of domesticity can the human capacity for love and long-term commitment be adequately realized. There is much truth in Hegel's account, but modern readers may find it dated and ethically unacceptable—not least in respect to Hegel's description of the role of women. Hegel's writings are a good target for feminists, but a focus on the passages where Hegel insultingly compares women to plants and tells us that "when women are in charge of government, the state is in danger" (*PR,* § 166A) will miss the nuances of his position.

In the second element of ethical life, civil society (a curiously abstracted construction, gathering together the major nonpolitical institutions of the modern state), Hegel explains how economic, legal, and administrative structures enable "concrete persons" (chiefly, male family members) to satisfy the particular self-interest of themselves and their families. Guided mainly by the writings of British economists, notably Adam Smith and David Ricardo, Hegel developed strong and interesting views (which curiously Marx never discusses directly) on how the capitalism of his day is a liberating force, how the ever more productive forces released by rapid industrialization enable humans to satisfy their increasingly sophisticated demands, and how social classes form in the different segments (agricultural, business, and bureaucratic) of economic life.

The administration of law protects the citizens' rights, enforces contracts, and corrects the deficiencies of state of nature punishment systems, as these were explained in Hegel's concept of abstract right. Two further elements of civil society are the "police," all those social agencies designed to provide regulative and infrastructural support to the system of production, including public education services, and the "corporations," a strange confection of medieval guilds, employers' associations, and trade unions. All these institutions effect, in their fashion, a transformation of self-interest into a common will as individuals associate together to serve their particular purposes more efficiently. But one problem of modern social life obdurately resists solution. He portrays poverty as a deforming scar on the face of modern civilization caused not so much by idleness and stupidity as by the structural problems of market capitalism when, for example, markets collapse or technological change makes ancient skills redundant. The state is evidently necessary to fashion remedies. He mentions redistributive taxation, compulsory work schemes, and even colonization as policy alternatives but shows little enthusiasm for them and does not discuss the issue further when he moves on to discuss the state, the final element of ethical life.

The State

Hegel speaks of the state in two senses. In the first, the rational state, we are to understand the modern system of social freedom that wraps up in a harmonious construction all the normative systems encountered in the modern world. Thus the rational state is the integration of the ethical demands of personal rights, moral subjectivity, family life, civil society, and the political institutions of the state. These ethical demands are harmonious in the sense that individuals can recognize and respect moral rules that derive from all these sources without finding themselves in circumstances of tragic conflict wherein rules conflict and the complex identity of the modern self is torn apart. If there are conflicts, they will be resolved by ordering principles, most conspicuously by obeying the laws of the state. Because the state is rational, there will be no modern Antigones, no moral rebels.

To paraphrase *PR* § 260: The state is the actuality of concrete freedom. As members of it, persons should be able to develop all their capacities and satisfy all the interests they have as individuals, as

family members, and as members of civil society. But they should not and do not live as private persons alone. They recognize their universality, their ties with others. And these ties bind them to serve a common purpose, a universal end that they freely acknowledge as they perform the duties incumbent on them in their particular stations in life, as determined ultimately by the state.

The second sense of the term *state* denotes the "political state proper" or the "strictly political state" (*PR,* § 267). This is a political system with a constitution that Hegel describes in some detail. The political state is a ramshackle, bodged edifice. Hegel's presentation of it disobeys the logical principles that he advanced as constituting the rational structure of all reality. At its head is a monarchy which has a symbolic personal role, dotting the "i"s and crossing the "t"s (*PR,* § 280A), yet also has formidable and decisive political powers. The second element of the constitution is the executive, a civil service owing allegiance to the monarch, who appoints the senior ministers. The third element is the legislative power. This includes the monarch and the executive who oversees its operations. In addition, there are two Estates (roughly assemblies): one a collection of wealthy landowners, the other appointed from the corporations (and not elected by universal suffrage).

As one state among others, states may find themselves at war, which "should not be regarded as an absolute evil" (*PR,* § 324) as good may come of it. It may quicken otherwise dormant and degenerating sentiments of patriotism. Some have found Hegel's views on war abhorrent. Others insist that a full nuanced account should be given and this should be acceptable to sophisticated nonpacifists. Hegel ends the *Philosophy of Right* by locating the rational state in the space of international law (of which he gives a Hobbesian account as consisting of nonmandatory rules and agreements that states should try to keep so long as their own interests are not compromised), and the time of world history, which he summarizes in half a dozen pages.

Is Hegel a Liberal or a Conservative Political Theorist?

Many believe that Hegel's political position shifts from an early radicalism to a later conservatism. There are biographical reasons for accepting this view. As Pinkard explains, Hegel felt forced to accommodate his published views to the critical eye of the reactionary censor after 1818. There are textual grounds for believing that he compromised his political-philosophical beliefs, as reported by K.-H. Ilting in his edition of *Vorlesungen über Rechtsphilosophie.* But the sensible reader will not take a position on the general question without the most careful evaluation of Hegel's writings.

These are the conclusions that are safe to draw: Hegel's method commits him to a unique style of conservatism. "When philosophy paints its grey in grey, then has a shape of life grown old. By philosophy's grey in grey it cannot be rejuvenated but only understood. The owl of Minerva spreads its wings only with the falling of the dusk" (*PR,* Preface). We cannot tell the world how it ought to be; we are locked into the ethical world we inhabit and seek to comprehend. But this doesn't bar all change. The reality of the world in its fine detail may not reflect the ethical principles that underlie it, so there is space for an immanent critique. Furthermore, the grounding principles of liberalism—doctrines of human rights, the right of the subjective will, as well as associated concrete political freedoms (freedom of conscience and worship, freedom of the press, freedom to find one's own career path, among many others)—are all entrenched *within* Hegel's rational state. They are not moral luxuries or indulgencies, they cannot be rejected; they are as much a feature of the modern political world as Hegel (mistakenly) takes a constitutional monarchy to be. In these respects Hegel is a liberal, but this is not the whole story.

There are many critical questions the reader can target at the detail of Hegel's political settlement: Is Hegel right to dismiss all varieties of social contract theories as individualistic and prescriptive, because he believes them to be historically false? How far does the crucial political sentiment of patriotism, which holds the state together as love unites the family, occlude a properly critical spirit on the part of citizens? How far does the education of citizens, in which religion has a part to play, undermine their rational independence? It is a measure of Hegel's greatness that the probing reader will not find simple answers to questions such as these. And even where it is obvious that Hegel's descriptions-cum-prescriptions

for the rational state are desperately out of date, the intelligent scholar may well find modern equivalencies for the institutions that Hegel falsely believed to be a permanent feature of the ethical and political landscape.

HEGELIANS

Hegelians, or members of the Hegelian School, are students or adherents of the philosopher Georg Wilhelm Friedrich Hegel (1770–1831), who lectured at the University of Berlin from 1818 until his death. The Hegelian School represents the development and critique of Hegel's project of asking how free and rational action is possible within the framework of contemporary social institutions. After Hegel's death in November 1831, this project confronted new challenges. In the disunited German territories of the 1830s and 1840s, questions of religious, political, and social freedom were sharply posed. The authors who comprise the Hegelian School sought to find, by adapting and criticizing Hegel, resources for grasping central theoretical issues of the modern world. Their thought identifies questions about freedom and citizenship that still retain their urgency today.

The Hegelian School

The Hegelian School was always a very loose association, comprising shifting political and geographic alliances. Intense controversy often raged among its members, much of it over the proper interpretation of Hegel's work, which was still being digested, collected, and edited in the 1830s. These disagreements were first given a systematic expression in 1837 by David Friedrich Strauss (1808–1874). Strauss distinguished between right, center, and left Hegelianism, each adopting a different view of the relation between reason and religious faith. According to Strauss, right Hegelians saw Hegel's philosophy as an affirmation of Christianity, left Hegelians challenged or reformulated Christian doctrines, and center Hegelians indecisively straddled both camps. These labels quickly took on wider political meanings, and can serve as rough guidelines, although the individual positions represented in the school were far more complex and variable than Strauss's sketch might indicate.

The evolution of the Hegelian School was conditioned by ambiguities in Hegel's philosophy, and by political conditions in the *Vormärz,* the prelude to the German Revolutions of March 1848. The Hegelian idea of the unity of thought and being, the core of his idealism, implies the historical realization of reason in the world. In his *Philosophy of Right* (1820–1821), Hegel asserted that the real is rational, and the rational is real. This infamous copula is however ambiguous: Does it refer to an accomplished fact or rather identify a tendency, still incomplete? To what extent, that is, do the prevailing forms of religion,

politics, and society correspond to the standards of reason and freedom? Depending on how one answers this question, Hegel's philosophy can be seen as basically legitimating the status quo, or as criticizing institutions and social relations that were still inadequately rational. The Hegelian left took up the latter option.

It did so in response to specific historical factors. Under Napoleonic pressure, the Prussian state had achieved significant agrarian reforms (including abolition of serfdom) in the early years of the nineteenth century, as well as military and educational modernization; Hegel had obtained his professorship at the recently founded University of Berlin through the efforts of the reformers. Resistance to further reforms grew after Napoleon's defeat in 1815. The king of Prussia, Friedrich Wilhelm III, reneged on his promise of a constitution. In the 1830s, the crown prince (who succeeded to the throne as Friedrich Wilhelm IV in 1840), led efforts to eradicate Hegelian influence from the state and universities, viewing Hegelianism as incompatible with political order and religious observance. Conservatives accused Hegel of pantheism, the heretical doctrine that God and the natural cosmos are one and the same entity. They stressed instead the separateness of God and the world, with Christ as the unique mediator between the human and the divine. This in turn implied a political theology of personal monarchical rule and the assertion of a mystical bond between king and people, one that cannot be captured in any written constitution or body of explicit rules. In response, whereas the right Hegelians simply denied that unorthodox conclusions could be drawn from Hegel's system, the Hegelian left initiated its religious criticism by rethinking the relation of the divine with the human. Religious and political motifs were closely connected on both sides of the ideological divide.

The Hegelian Left and Right

Leading the charge on the Hegelian left was Strauss. His *Life of Jesus, Critically Examined* (1835–1836) contended that the essential Christian message is the *unity* of the human and the divine, but that the gospels had presented philosophical truth in the form of a myth about the birth of Christ, a figure who symbolically represents that unity. The myth was not a deception but was the product of the early Christian community's reflection on its own origins and historical significance. For Strauss, the genuine truth of this doctrine could be retrieved philosophically if the unity of the human and divine were understood—in Hegelian terms—to mean the realization of reason in the world, through the collective work of the human species in time. In its context, this theological argument was politically charged, despite Strauss's caution in the political arena. It offered an analogy to the decisive political question of the day, the contested locus of sovereignty in the state: Does it reside exclusively in the person of a monarch, or is it diffused throughout the democratic community? This analogy was clearly grasped at the time, and conservative authors like Heinrich Leo loudly proclaimed the dangers posed by Hegelianism to the existing state and religion. In 1841, Bruno Bauer (1809–1882), by then one of the recognized leaders of the Hegelian left, savagely parodied these criticisms in his anonymous and quickly banned work, *The Trumpet of the Last Judgement Against Hegel, the Atheist and Antichrist.* Yet Bauer's position remains distinct from, and critical of, Strauss's.

After being associated with the Hegelian right in the mid-1830s, Bauer was radicalized by the tightening conservative grip on the Prussian state. However, he rejected Strauss's conception of a collective mythic consciousness. For Bauer, the question was how individuals, not anonymous collectivities, responded to the problems and possibilities of their time. For Bauer, this meant that the origins of Christianity were literary or fictional rather than mythical. Bauer rejected Strauss's idea that the Christian unity of God and mankind symbolizes the generic perfection of the human race. He contended instead that it expresses the idea that individuals are each capable of *rational* freedom, transforming themselves and irrational objective conditions, to promote progress and the general good. As Bauer's critique of Christianity intensified, he described religion as passivity and self-loss, impeding freedom in personal, social, and political life. Writing on Jewish emancipation, he contended that the real solution was to renounce religion in general and to repudiate the so-called Christian state of Restoration Prussia in particular. In the 1850s, Bauer became vocally

anti-Semitic, describing an immutable racial divide between Jews and Christians. In the 1840s, however, he advocated a comprehensive republicanism. In this theory, freedom and rationality are not simply natural properties distributed or shared among its bearers (as, Bauer thought, Strauss's position implied) but must be consciously and actively affirmed by individuals if they are to be realized. Mobilizing Hegelian terminology, Bauer described this act of self-definition as infinite or universal self-consciousness. Bauer criticized the idea of God as a transcendent absolute being and retained a notion of universal interests that could direct republican citizens in the construction of a new political and social order, suffused with justice and reason. Particular interests had to be subjected to criticism, to test their compatibility with universal emancipation. Failure to self-criticize would lead to stagnation and the conformism of mass society. Bauer's defense of a critical individualism anticipates John Stuart Mill, though unlike Mill, Bauer identified the agency for historical progress not in the competition among particular interests but in the ability to transform them consciously.

Others on the Hegelian left, like Max Stirner (1806–1856) and Edgar Bauer (1820–1886), came to reject republicanism and political democracy as insufficiently radical. In Stirner's concept of "ownness" or uniqueness, individuals are self-made shapers of their own personalities, unconstrained by the opinion of others or by conventional morality. Whereas Hegel viewed the state as an ethical community and an essential forum of freedom, Stirner's anarchism viewed it as a dispensable impediment to self-affirmation and to the free play of interests among liberated egoists. This anarchism does not require active resistance to the state but permits evasion of any political impositions. Edgar Bauer, Bruno's younger brother, advocated even more active opposition to political and ecclesiastical authority. He has been described as an originator of the modern theory of individual or group terrorism. Inspired by radical-populist movements in the French Revolution, he rejected the Hegelian idea that opposites can be reconciled, and he stressed uncompromising struggle against the existing order, including political violence. And, unlike his brother, Edgar Bauer was a socialist, advocating freedom *from* private property.

Freedom and Alienation

In the face of modern competitive individualism and disharmony, Ludwig Feuerbach (1804–1872) sought to restore the wholeness of the human personality and to view social connections as a source of fulfillment, not of limitation. Radicalizing Strauss's arguments, Feuerbach suggested that the attributes of God are a projection of the powers of the human species as a whole; religious orthodoxy turned these powers into a fetish or object of worship, treating them as a transcendent, divine person. The task was to reclaim them and to recognize their human character. In *The Essence of Christianity* and other writings of the 1840s, Feuerbach attributed the failures of modern society to egoism and dualism, the split between mind and body, self and nature. Finding Hegel's idea of spirit too abstract to solve these problems, he turned to a sensualistic naturalism or materialism. Feuerbach located the Hegelian unity of thought and being in sense-perception and material interaction with the world. Through this interaction, humans solve problems, improve their consciousness, and overcome egoism and natural propensities to aggression. Describing himself as an anti-Hegelian by 1842, he nevertheless remained a significant figure in left Hegelian circles. Among others, Feuerbach's work influenced Karl Marx (1818–1883), Friedrich Engels (1820–1895), Moses Hess (1812–1875), and even the composer Richard Wagner (1813–1883), who participated in the Revolution of 1848 and, in later life, wrestled with the contradictions between Feuerbach's humanism and the pessimism of Arthur Schopenhauer.

For the Hegelian left, the emergence of capitalism and new forms of urban poverty symptomatized the inner tension and dualisms of modern society. In the late 1830s, Eduard Gans (1797–1839), who took over Hegel's course on political philosophy at the University of Berlin, launched a distinctive new style of Hegelian social critique. Gans saw, in the concentration of economic power, the decisive problem impeding the progress of freedom. Facing emergent industrial urbanization, he revised Hegel's account of poverty and political and social exclusion from *Philosophy of Right,* drawing on French social thought, including Saint-Simon's ideas about association. Foreshadowing the ideas behind modern trade

unionism, Gans argued that the combined power of wage workers could counteract the monopolistic bargaining position of capital owners and lead to a more equitable distribution of wealth. Retaining Hegel's linkage of private property, individuality, and freedom, however, Gans rejected socialist ideas of collective property. He also developed Hegel's theory of the state, stressing the importance of institutionalized opposition to hold government to account.

Following Gans, ideas of opposition, struggle, and social exclusion were central to left Hegelians' understandings of progress toward a more rational society. These ideas were central to otherwise divergent visions of the Bauers and the young Marx. Arnold Ruge (1802–1880) was another influential Hegelian critic whose work reflects Gans's influence. After a 6-year imprisonment for republican political activities in the 1820s, Ruge worked to organize the Hegelian left, editing the *Halle Annals for Science and Art* (1838–1841). In the 1830s, Ruge acted as the conscience of the Prussian state, recalling its more progressive Enlightenment heritage, which (he feared) was being forfeited to advancing conservative forces. As the state proved increasingly intransigent to reforms, Ruge's polemics sharpened. He attacked Romanticism as a handmaiden of the regime, arguing, in an echo of Hegel's critique of abstract ideals of liberty, that it trivialized freedom, reducing it to caprice and arbitrariness. Ruge's primary target remained religious and secular conservatives, who repudiated constitutionalism, national representation, and other liberal reforms. Like Bruno Bauer, he considered Hegel an irresolute republican, whose political thought had to be pushed in the direction of popular sovereignty. When in 1841 stricter censorship regulations prevented publication inside Prussia, Ruge moved the renamed *German Annals* to neighboring Saxony, and in 1843 he emigrated to Paris. He sought collaboration with leading French socialists like Louis Blanc and Pierre Leroux; and, with Karl Marx, he edited a short-lived publication, the *Franco-German Annals*.

The young Marx had attended Gans's lectures in Berlin and, by autumn 1843, had outlined his own socialist theory. Marx described "abstract right," the right of ownership that Hegel and Gans considered essential to personhood, as the ideological expression of capitalist property relations. He concluded further that republicanism offered an inadequate response to the new social problems of industrial capitalism. Marx argued that no merely "political" program of reform could abolish the competitive egoism of civil society, whereby workers were alienated, reduced to instruments of others' wills for purposes of accumulation. The only genuine solution lay in transforming capitalist social relations root and branch. By 1843 Marx had begun his lifelong collaboration with Engels, whose 1845 text, *The Condition of the Working Class in England,* attributed the emergence of urban poverty and resistance to capitalism and the Industrial Revolution. Engels's text is markedly Feuerbachian, invoking the overcoming of alienation and egoism through humanity's retrieval of species-consciousness or general interest. Religious and political motifs remained intimately linked.

The historical importance of the Hegelians lies in their diagnosis of problems of freedom and alienation in modern life, including the political meanings of religion, and questions of economic power and exclusion. These questions have been foremost on the agenda for political and social thought ever since.

HEGEMONY

Customarily, hegemony is used in association with its dictionary meaning of supremacy. A hegemonic

group is understood as a powerful group that exercises its dominion over others against their will. This view is antithetical to the meaning of hegemony as originally suggested by Antonio Gramsci. Hegemony involves force, but it is used minimally and at the last resort; and when force is exercised, it is applied with the consent of the ruled. Others use the term in a context of international relations in which multiple nation-states are involved. In this case, a nation-state is considered to be hegemonic when it implements a disproportionate amount of cultural, economic, and political power over others. Again in its Gramscian sense, hegemony is possible when certain international conditions commence. However, Gramsci used the term to refer to relations between social groups within a nation-state in which a dominant class creates a "historic bloc" under its leadership. Hegemony, thus, is both a "spatialized" and a "historicized" concept that allows us to understand power relations between social groups within a specific politicosocial landscape.

The Concept

An important feature of hegemony is that it is multifaceted. Hegemony is not merely a rule exercised through a discursive process, as it is often taken to mean. A hegemonic group does not exert its power by simply superimposing its ideology over society at large. Hegemony involves nondiscursive processes, but most importantly it is the ruling of society in its entirety. A hegemonic class is one that has succeeded in bringing about an accord of varied aims. Hence, hegemony is an all-encompassing mode of leadership that manifests itself in ideological, political, and economic realms. Ideologically, the outlook of in-establishment groups is entrenched to the extent that it assumes the "common sense" of society in general. In this case, ideology is not merely a worldview imposed on the ruled. According to Gramsci, ideology is a lived discursive routine encompassing varied dimensions of social institutions and experiences. Politically, under hegemony the state assumes an expanded role. More exactly, it becomes an "integral state." Not only is its educational and ethical role accentuated, but it creates an aura of residing above and beyond social fissures. Mostly through the medium of congressional institutions, the public is provided with a good reason to believe that the state is a social arbiter. Economically, a hegemonic class actively seeks to transcend a corporatist orientation. By making scarifies of a lesser degree, a fundamental social group constructs a compromised social equilibrium. The sacrifice, however, does not go beyond its "essential" interests.

Clearly, Gramsci's concept of hegemony is not intended to shatter the fundamentals of Marxist theory. Yet it involves a good deal of theoretical reconstruction. First, the notion of hegemony contradicts economic determinism. Conferring the economic system a critical role, economic determinism considers the superstructure of society as epiphenomenal, playing a minimal role in the social-historical process. Gramsci, like Max Weber, saw that politics, idea systems, religion, and the state are more than mere reflections of the economic structure. Consequently, to give ideational and related institutions their proper place, Gramsci made a distinction between two levels of superstructure: civil society and political society. Civil society refers to an ensemble of social relations commonly called "private" and at which hegemony is exercised. Political society, in contrast, refers to "the state," a level at which "coercive power" resides. However, the relationship between the two is much more intricate than a simple dichotomy suggests. Sometimes Gramsci refers to the state as an institution in which elements of both civil and political societies are incorporated.

Second, the concept of hegemony undermines a simplistic approach to constructing an alternative social order. Among other things, it dispels the illusion of transforming society by just conquering the state, especially under circumstances where civil society has become a formidable social terrain and where the state vigorously maneuvers to win the active consent of the ruled. Borrowing military metaphors, Gramsci, accordingly, spelled out two distinct strategies: "war of maneuver" and "war of position." Whereas war of maneuver refers to the process of conquering political power, war of position is a multidimensional course through which civil society is reconstructed before political power is seized. What makes war of position noticeably distinct is that it is a dynamic process conducted both before and after power is assumed by a new leadership. Simply put, war of position is a "total war" intended to transcend failed hegemony,

incorporating war of maneuver as one of its moments.

On the basis of the distinction between the two strategies, Gramsci suggested a reasonable hypothesis why postcapitalist revolution took place in the East and not in the West as envisioned by Marx. The 1917 Russian Revolution was made possible because in Russia, political society largely preponderated over weak civil society, and it was relatively easy for the Bolsheviks to conquer political power. In the West, where there is a proper relationship between political and civil societies, to simply conduct war of maneuver amounts to engaging the outer perimeters of a social order without confronting the bulwarks of civil society on which hegemony rests.

Gramsci's argument may also be extended to explain the cases of failed revolutions. The concept of hegemony suggests that a social revolution is not a swift rupture in continuity; rather, it is a process that begins within "old" hegemony and continues after an alternative hegemony unfolds. Revolutions in the East and other, less-developed nations were wasted in part because the reconstruction of civil society took a stunted direction and political society became a bulky institution that left no space for the development of an autonomous civil society. In regard to the understanding of these "revolutions," Gramsci's concept of "passive revolution" is helpful. Passive revolutions are "revolutions" from above that institute economic and political changes without resulting in a qualitatively distinct social order. Measures are taken by the state to prevent an "organic crisis" that may occasion cataclysmic results. More specifically, these measures are intended to neutralize organized counter-hegemonic forces and even to respond to public grievances before they coalesce into an organized dissent. Hence, passive revolutions are nonrevolutionary revolutions, because society is made to change in certain degrees—not to alter its fundamental structures but to maintain its essential features. Failed revolutions are, accordingly, passive revolutions insofar as they merely involve the elite and thereby disallow a sweeping restructuring of society.

Counter-Hegemony

Hegemony is dynamic and expansive, but it is by no means total. Within any hegemonic order, there is always a set of conditions that cause counter-hegemony. From a Gramscian perspective, the most serious counter-hegemonies are those that creatively react to contracting hegemony to totally transform society. Total counter-hegemony ensues when a historic bloc breaks down due to a failed "compromised equilibrium." The unfolding of a total counter-hegemony entails that a dominant class has gone wrong in coordinating its interests with those of society. This "crisis in hegemony" manifests when the dominant class begins to rely on coercion, and gradually unmediated control of the ruled becomes the rule rather than the exception.

A crisis in hegemony does not mean that the days of "old" hegemony are numbered. There is always a possibility for existing hegemony to reconstruct itself. Moreover, the very existence of crisis does not necessarily imply that an alternative hegemony is fully born. Rather it means the advance to slowly but surely expand and transform civil society has begun. This process is an intricate one, in part because, by virtue of their economic, intellectual, and political power at their disposal, fundamental groups are, as Gramsci notes, with some speed and agility, able to control precarious situations. Besides, the "rupture of the equilibrium of forces" could be permanent or temporary. In cases where the challenge against the system is resolvable within existing hegemony, the rupture is temporary. If the demand is sustained and hegemony fails to reconstruct itself anew, the rupture signals the need for a radical break in intransience.

Afterward, hegemony unfolds in a long and multifaceted process, and this process occurs before crisis proper is revealed. During the heydays of hegemony, a fundamental group enjoys the "active consent" of the public, dissent being conjectural and partial. The basis of active consent is the belief that the social system is inherently open to change. However, as facts contradicting this premise emerge, active consent wanes and "passive consent," marked by contradictory appraisals of social reality, takes form. At this point, counter-hegemony assumes dissent in spite of organized action because individuals undergoing consciousness transformation have not made a decision between the ideology that they have internalized and the emergent perspective that they personally

entertain. In fact none of these outlooks decisively preponderates over the other until an anomalous situation that clearly shakes the foundation of the people's disposition asserts itself.

Alternately the dilemma may be resolved if the integral state that has showcased itself as the defender of universal interest, despite current crisis in hegemony, unequivocally opts in favor of the powerful. At this point, those directly affected by existing organic crisis, and those who articulated its causes, become movement participants. This is the moment when "skepticism with regard to all theories and formulae" followed by "socio-historical criticism" abounds. The emergent social frame grounded in the personal experiences of movement participants takes precedence over hitherto prevailing ideological hegemony. Consequently, counter-hegemony participants withdraw their consent and prepare themselves for a new social order. If, after a long process, they are successful in this endeavor, they create a different social system in which the role of political society has diminished significantly and civil society has expanded considerably.

Application and Extension

The heuristic value of hegemony is not limited to the understanding of the dynamics of counter-hegemonies previously outlined. Social researchers have also used the concept to analyze varied forms of social existence. Cultural study is one of the areas where the concept bore fruitful results. Sociologist Stuart Hall made the most out of hegemony in his analysis of the interchange between representations and ideologies within a cultural milieu. In contrast to the Althusserian notion of ideology, he saw in hegemony a flexible concept that allows one to see social actors as active agents who are not duped by hegemonic strictures. Culture in this sense is not a transpolitical realm merely determined by extradiscursive processes; rather, it is an autonomous site that constitutes social history. Culture is also an arena in which consent and resistance, incorporation and defiance, are played out.

It was on the basis of the foregoing premise that Hall conducted his analysis of "Thatcherism." His main focus was a political anomaly that hardly makes sense if one's attention is concentrated on policy analysis. The anomaly was that during the 1980s the British working classes supported Thatcher's Conservative Party when her economic policies were antithetical to their interests. Using a Gramscian perspective, Hall was able to explain how the Conservative Party ascended to and stayed in power despite its unsuccessful economic policies. According to Hall, the party was triumphant because by making them see "politics in images" it appealed to people's "collective fantasies." To use a Gramscian language, the Conservative Party, with the assistance of the media, waged a "war of position" outside the realm of political society both before and after the seizure of state power. Thatcher and her party, accordingly, were able to win the hearts and minds of the citizenry. It was a different kind of "passive revolution" in which the Conservative Party stayed in power, not by way of economic transformation but by successfully interlinking political and civil societies.

Despite the foregoing notable applications, the concept of hegemony had its share of critics. One of the most serious criticisms was made by political scientist James Scott. On the basis of his studies of peasant resistance, Scott noted that there are certain aspects of dominant–dominated interaction that the concept of hegemony fails to reveal. Because the concept encourages a surface reading of the experiences of the ruled, it does not help capture the hidden weapons of the weak against the ideological establishment. Hegemony is more about the ability of the ruling to exercise their dominance on the ruled, and it treats the latter as though they are passive recipients. The creative, albeit hidden, reactions of the ruled are given scant attention. Three further problems arise as a result of this presupposition. First, the ruled are seen as incapable of cleansing their false consciousness. Left to their own devices, the ruled are unable to demystify dominant ideology. Trans-hegemonic consciousness can hardly arise in sites where people are caught by the strictures of hegemony. Second, the concept of hegemony does not encourage researchers to discriminate between "what is just" and "what is inevitable." Pragmatic submission on the part of the ruled is taken to mean unconditional subordination. Finally, Gramsci assumed that it is at the realm of behavior that the radicalism of the ruled is manifest. In fact it is in their interpretations of their reality that the ruled break from the official definition of the situation. This break does not take

place within the purview of dominant groups, and the ruling do not exercise control or expect submission from the ruled at this level.

On the other hand, Ernesto Laclau and Chantal Mouffe are more sympathetic to the concept of hegemony than is James Scott. Where Scott sees in hegemony a concept that hinders the understanding of the full range of social conflict, Laclau and Mouffe embrace the notion of hegemony both because of its relevance in the analysis of diverse forms of resistance and its political significance to the project of radical democracy. Yet they quickly note that Gramsci's concept of hegemony cannot be adopted in toto, for Gramsci has not fully extricated it out of a Marxist "monist inspiration." Indeed, according to Laclau and Mouffe, Gramsci's theory marks an important watershed in the history of political thought. His idea of ideology as a material practice, his relational approach to group interaction, his emphasis on the political, intellectual, and moral nature of rulership, and his treatment of political subjects as "collective wills" resulting from the articulatory processes of varied social groupings mark a significant departure from Marxist orthodoxy. Yet Gramsci hardly took the implication of his perspective to its ultimate conclusion. He, accordingly, failed to disengage hegemony from essentialist assumptions. His notion of "hegemonic formation," for instance, is premised on a single unitary principle, although he treats the identity of social elements relationally. Consequently, his theory privileges class position over subject positions (positions related to gender, race, nationality, sexuality, and others).

HERMENEUTICS

From its early beginning in eighteenth-century German philosophy, modern hermeneutics has addressed the linguistic mediation of experience, the roots of human agency in intersubjectivity and practice, and the historical situatedness of reason. However, over the past 30 years or so, the meaning of the term *hermeneutics* has been significantly broadened. Today the term refers to anti-foundationalist positions of all stripes and makes its presence felt within practically all subdivisions of the human sciences. In this entry, hermeneutics designates a theorizing of the first-order practice of, and second-order conditions of possibility for, interpretation and understanding of symbolic expression and action.

In the works of Johann Gottfried Herder, Alexander and Wilhelm von Humboldt, Friedrich Schleiermacher, the Jena romantics, and Georg Wilhelm Friedrich Hegel, modern hermeneutics tackles the most basic epistemological problems of the human sciences, including the question as to what kind of knowledge these sciences can and should aspire to. However, with the ontological turn of Martin Heidegger and his student Hans-Georg Gadamer, the epistemological paradigm is left behind and hermeneutics is reshaped in light of concerns deriving from a broader, phenomenological analysis of human existence. A third branch of hermeneutics, the so-called school of suspicion, develops in the work of Friedrich Nietzsche, Karl Marx, and Sigmund Freud. In various ways and configurations, these theoretical paradigms argumentatively inform and structurally shape contemporary hermeneutic discourse.

Interpretation and Validity

Although the history of hermeneutics stretches back to ancient Greek philosophy and the textual theories of the Middle Ages, it is only in the second half of the eighteenth century that it emerges as an independent, philosophical discipline. Hermeneutics is no longer a philological response to practical problems arising from the encounter with a specific kind of textual material (often, but not always, epitomized in biblical and ancient sources) but becomes a theoretical discipline that addresses

the universal conditions of possibility for understanding as such. Herder, Schleiermacher, Hegel, and, a bit later, Wilhelm Dilthey ask how interpretation can be ascribed with a dimension of validity: How can the interpreter know that she is not infusing the meaning of an utterance with illegitimate prejudices? This question gains cogency against the background of a new theory of meaning as being linguistically, culturally, and historically mediated and an attempt to carve out a common denominator that unifies the diverse and diverging life forms of different cultures and linguistic communities. (The young Herder appeals to nature, Schleiermacher to humanity, Hegel to spirit, Dilthey to life, and so forth.) Texts and actions from cultures that are temporally or geographically distant from that of the interpreter no longer appear to be immediately accessible through the mediating work of tradition and its authoritative scholarship—indeed, even texts or speech from the interpreter's own culture now figure as objects of hermeneutic scrutiny. The question, for the critical-reflective interpreter, is not "Do I understand utterance x, y, or z?" Rather, the interpreter asks how she can *justify* her interpretation of utterance x, y, or z. There is more to this question than mere epistemic worries. Confronted with temporally or culturally distant literatures and artifacts, the interpreter recognizes and reflects on the ramifications of the situatedness—hence also the potential parochialism—of her own intellectual powers. This motivates the wish to develop nonpartisan standards or criteria in light of which the interpreter can critically reflect on and gradually rid herself of prejudices and cultural bias, thus also lay tentative claims to valid interpretation. Through the appeal to such critical standards, the interpreter suggests that others, regardless of their historical and cultural background, should arrive at identical, similar, or overlapping results by following the same hermeneutic procedures.

The appeal to critical standards in interpretation grows out of a commitment to Enlightenment ideals such as tolerance, plurality, and a celebration of cultural manifold. It is expressive of a will to understand other agents on their own terms and without judging them in light of the ethical, political, and cultural vocabularies of the interpreter. Whether it is grounded in original context, authorial intention, or a criterion such as consensus among interpreters, the appeal to critical standards in interpretation does not exclude such classic humanistic ideals as *Bildung* (education in and through culture), the ongoing expansion of the interpreter's own horizon, and the mutual enhancement of understanding and self-understanding. Per se, the appeal to critical standards does not imply that the interpreter abstracts from or overlooks historical situatedness. On the contrary, it reflects an awareness of the historical conditions of understanding: It is *because* the interpreter is historically situated that critical-reflective procedures are needed, and, conversely, the appeal to such procedures is not due to a repression of historicity in the name of idealized research conditions.

Thus the philosophical territory gained by modern hermeneutics is twofold. First, unlike its predecessors in classical philology, modern hermeneutics does not list the rules for understanding of one subgroup of texts or actions but pitches interpretation as a global enterprise encompassing speech, action, and symbolic expression across the board. Second, it argues that the conditions of possibility for validity in understanding can only be articulated by reference to the a priori conditions of possibility for understanding as such. These conditions, though, are not couched as transcendental concepts, but relate to the nature of ordinary language, intersubjective practice, and the constitution of meaning through individual application of shared and historically developed symbolic-semantic resources.

The Hermeneutic Circle

The notion of the *hermeneutic circle* holds a central place within modern theory of interpretation. It refers (a) to the circular movement between the understanding of the parts and the understanding of the whole, that is, the way in which the interpreter gradually improves her critical hypotheses by moving between the level of the action or text as a whole (perhaps even the action or text in context) and the various steps or sections of which it consists. Through systematic comparison, the interpreter's grasp of the former is assessed in light of the latter, and vice versa. Furthermore, the hermeneutics circle addresses (b) the back and forth movement between text and interpreter. Unlike the inductive generalizations of the empirical natural

sciences and unlike, also, the deductive reasoning of the theoretical sciences, hermeneutics depends on a dialectical interaction through which the interpreter gradually purges herself of false preconceptions or beliefs and obtains a more valid conception of the meaning-content or problem at stake as well as her own situatedness within a given tradition and culture. No positive closure is afforded though this procedure, but only a negative movement of the interpreter freeing herself of illegitimate prejudices and gradually obtaining a deeper self-understanding.

Whether the meaning to which the interpreter seeks access is understood in light of a *contextualist* reference, authorial *intention,* or *consensus* oriented theories, the appeal to critical standards in interpretation has lived on in modern hermeneutics and is represented in objectivist positions such as Emilio Betti's, or, in modified and philosophically more challenging forms, in the work of critical theorists like Karl-Otto Apel and Jürgen Habermas and their orientation toward the validity dimension of speech and understanding. These latter positions, however, are also indebted to the hermeneutics of suspicion and Gadamer's account of the dialogical structure of understanding.

The Ontological Turn

From the 1920s onward, the young Martin Heidegger would question the epistemic orientation in hermeneutics. Properly understood, he claims, hermeneutics, as a philosophical discipline, is not a matter of assembling the adequate conditions of validity in understanding. Understanding, in his view, is not an attitude that rational agents deliberately adopt while analyzing symbols and actions in a scholarly way. It is, rather, a distinctive mode of existence, a way of life that is unique to human beings: beings who are characterized by their capacity for self-reflection and self-understanding. In exploring the human condition, hermeneutics is not a method or theory choice. Nor is it a subdivision of philosophy. It *is* philosophy—period.

According to Heidegger, the world is disclosed to human beings as a field of meaning. We are beings who *understand* the world, and things present themselves to us, at a prereflective level, as already imbued with meaning. Things do not appear to us through bare impressions that are then, at the level of reflection, conceptually determined and categorized. Most originally, I see a hammer *as* a hammer, a shoe *as* a shoe, a tree and a child *as,* respectively, a tree and a child. This initial as-structure is highlighted through *interpretation* and, finally, given full articulation in the form of *assertion.* The hermeneutic structure of experience poses a challenge to the traditional correspondence theory of truth. Truth, Heidegger claims, does not only or most primarily consist in a correspondence between mental content and matters of fact in the world, but rests with the original disclosure of the world as a field of intelligibility in which things appear in the first place. This disclosure, in turn, is only meaningful when seen against the background of what is not disclosed, what is not or not yet within the pale of meaning. Any search for objectivity in understanding, any appeal to validity in interpretation risks losing from sight this original tension between disclosure and what remains undisclosed, focusing only on the present. What matters to Heidegger is not the approximation of interpretative certainty, but the capacity of the interpreter to take into consideration the interplay between disclosure and the nondisclosed dimensions of being that characterize his or her historical lifeworld context.

As developed in *Being and Time,* Heidegger's ontological turn would prove decisive for a whole host of twentieth-century thinkers. Jacques Derrida, Michel Foucault, and Pierre Bourdieu all learned from, and further expanded, Heidegger's analysis of the distinctively human being-in-the-world and his critique of the metaphysics of presence.

The Dialogical Structure of Understanding

Yet it is Heidegger's student Gadamer who remained faithful to the concerns of the young Heidegger. In his magnum opus, *Truth and Method,* Gadamer presents his work as fundamentally Heideggerian in spirit. Yet he is sensitized to the problems pertaining to Heidegger's jargon and critical of his teacher's political naïveté during and after World War II. (Heidegger took up a position as a university rector during the Nazi era and later failed to apologize for his tainted political sympathies during this period.) Wishing to align himself with the legacy of Aristotle, Hegel, and the humanist theory of judgment, tact, *Bildung,* and tradition,

Gadamer launches a hermeneutic thinking that has been characterized as an urbanizing of the Heideggerian province.

In Gadamer's work, the vocabulary of world-disclosure is rephrased as a matter of recognizing the situatedness of reason in history and tradition. The human sciences, he argues, embody a particular possibility of self-understanding: that of the interpreter broadening her horizon through the encounter with works and utterances that are at one and the same time familiar (part of the tradition through which the interpreter is constituted) and other (to the extent that they stem from a temporally distant period). However, this can only be realized if hermeneutics rejects the ideal of the value-neutral interpreter and views understanding as a dialogue or even play in which the interpreter participates (and thus helps realize). The meaning of the eminent works of the tradition does not reside in authorial intention, reference to original context, or consensus among interpreters, but in its realization in ever new and changing contexts. No distinction can be drawn between interpretation and application; to understand is to apply the work within a unique, historical-cultural context. Application, furthermore, is a question of judgment, of a practical skill acquired through training rather than something obtained through the reference to a critical standard against which the interpreter measures his or her hermeneutic hypotheses. In Gadamer's hermeneutics, the effort to understand *better* is replaced by the historical imperative of understanding *differently*.

Although Gadamer has later acknowledged that his original picture of a critical hermeneutics is biased and polemical, his turn to tradition, *Bildung,* dialogue, and judgment has been a source of inspiration for a whole generation of philosophers. Alastair McIntyre, Charles Taylor, John McDowell, Robert Brandom, Richard Rorty, and perhaps even the late Donald Davidson should be counted among that number, and so should critical theorists as led by the later Habermas, Richard Bernstein, Georgia Warnke, and Seyla Benhabib.

The Hermeneutics of Suspicion

If critical theory, shaped by the second and third generations of Frankfurt School philosophers, is susceptible to Gadamer's emphasis on the dialogical structure of interpretation, it also, as mentioned, takes impulses from another direction in hermeneutics—the works of Marx, Nietzsche, and Freud, the nineteenth-century trio that Paul Ricoeur has aptly characterized as representative of a hermeneutics of suspicion. Although none of these philosophers use the term *hermeneutics* as such, they address a wide range of issues in interpretation. Ricoeur's characterization sheds light on the sustained relevance of their work, while also illuminating the critical-political potential inherent to theory of interpretation. Furthermore, as developed in the work of Ricoeur, the introduction of a critical turn in hermeneutics serves to question central aspects of the ontological philosophy of understanding.

Even though there are obvious differences between the philosophies of Marx, Freud, and Nietzsche, Ricoeur's description targets a novel insight into the double or even multiple meanings of symbols and actions. Cultural and political symbols are never what they appear to be. Whereas both Heidegger and Gadamer describe language as a familiarizing factor—"the house of being," in the phenomenological lexicon—Marx, Freud, and Nietzsche insist that language is systematically distorted and that words always mean something other than what they manifestly say. The activity of interpretation—at least Freud and Nietzsche deliberately speak about interpretation and engage in textual exegesis—is one of unmasking the deeper structures of power, will, and desire that motivate seemingly innocent symbolic expressions. At stake is no longer the restoration of lost meaning (be it of a given text, author, or entire tradition), but the tearing down of the chief ideologies of modernity. Hermeneutics, on this program, is a process of demystification; it testifies to the ability of human reason to take responsibility for itself—by acknowledging its own limits.

Heidegger and Gadamer criticize the representational model of truth by insisting on Dasein's being in the world. Decades earlier, Marx, Freud, and Nietzsche, with their hermeneutics of suspicion, implied that the world, as a web of human meaning and practice, is saturated by illusions and systematic self-deception. If human being is self-interpretative by nature, the aim of interpretation is not simply to disclose the

possibilities for a more authentic existence but to uncover the systemic or social mechanisms through which the logic of self-deception is sustained. The self-deception of intellectual and collective consciousness is the ultimate target of the hermeneutics of suspicion.

The interpretative philosophies of Nietzsche, Marx, and Freud always figured—and still figure—in the background of critical theory. They also motivate the critical-genealogical project of Foucault, the deconstructive readings of Derrida, as well as Ricoeur's own effort to synthesize ontological and critical hermeneutics. More recently, the hermeneutics of suspicion funnels into and informs strands of postcolonial theory and philosophy of race. Diverse as they are in theory choice and orientations, these contributions all seek to articulate and bring to awareness unreflected relations of dependency and power, thus emancipating the subject, individually or collectively, cognitively or in terms of social institutions, from hypostatized power structures. The Nietzsche-Marx-Freud–inspired theorists insist that the role of critical hermeneutics is to liberate the subject from unwanted power structures by bringing unreflected prejudices to a level of reflection, thus facilitating critical assessment and more autonomous decision making—or at least reflection on the very limits of enlightened autonomy.

In its various forms and shapes, hermeneutics informs political theory, history, sociology, anthropology, and so forth. However, in its multifarious and discipline-specific permutations, hermeneutics, spanning a plurality of different method choices, remains indebted to its conceptual roots in the post-Kantian tradition of European philosophy. Only to the extent that these roots are illuminated and brought to the fore can hermeneutics, as a method choice and critical apparatus across the human and social sciences, be responsibly appreciated and its relevance—and problems—be highlighted, affirmed, and further debated.

Herodotus (c. 480–429 BCE)

Herodotus was a Greek historian from Halicarnassus. With his one great work, which he called his "research" (in Greek, *historia*), he both established the discipline of history and composed the first substantial European prose work. He was recognized in antiquity as both the "father of history" and as the teller of "innumerable fictions" (Cicero, *On the Laws,* 1.1.5). His exact dates of birth and death are not known; the best evidence is the latest event he mentions, which occurred in the winter of 430–429 BCE. Some inferences can be made about his life from references in his history to places he visited, but further biographical details are speculative, including the late story that he was exiled and was one of the colonists of Thurii.

His main subject is the Persian Wars—invasions of the Greek mainland in 490 and 480–479 BCE. His work contains numerous digressions into earlier history, especially the hostility between

Greeks and *barbarians* (non-Greeks) and the rise of the Persian Empire, which are neatly woven into the narrative structure through a form of ring composition. His research favors eyewitness reports—he makes a point of distinguishing what he saw himself from what he ascertained from witnesses. He appears to have traveled widely in Asia Minor, Egypt, and the Greek mainland, and he reports local traditions and wonders, taking an interest in ethnology, anthropology, geography, and geology, but above all in the great achievements of people, Greek and non-Greek. In reporting what he has heard, Herodotus does not restrict himself to what he believes. In his narrative he likes to dramatize events, with both public and private scenes recreated for the reader. While his reliability as a historian has long been questioned, it has been shown that in developing the genre of history Herodotus used traditional storytelling techniques passed on from the oral traditions which he drew upon.

Although he was a part of the Greek intellectual enlightenment of the second half of the fifth century, Herodotus retained a belief in the importance of traditional customs and law (*nomos*). He addresses the issue of causation in a sophisticated way. While repeating traditional motifs of revenge and reciprocity on human and divine levels, he takes up the idea of *hybris:* Mortals go beyond the limits set for human greatness and so are destroyed. In addition, he recognized imperialism as a dynamic force that drove the Persian Empire to keep expanding.

Hierocratic Arguments

Hierocratic political theory covers questions of papal sovereignty, the relationship between spiritual and temporal powers, and the legitimacy of absolutist papal monarchy. At their most extreme, hierocratic arguments give the pope supreme political and spiritual authority as God's direct representative on earth. As vicar of Rome, the pope is the head of an ordered political body. At the top of this hierarchy is the pope, followed by his church, followed by secular authorities and the laity.

Between the ninth and the fourteenth centuries CE, papal government increased in strength and developed its own political theory, both to explain the theoretical basis for this hierocratic form of government and to illustrate the practical functioning of papal government. Starting in the fifth century CE, Pope Gelasius I (?–496 CE) created a genre of arguments that explained why the pope had a special spiritual link with God and a responsibility to govern other political authorities. Hierocratic arguments limit the authority of secular and national forms of government and thus conflict with medieval imperial and monarchical theories of government. As well as emphasizing the ultimate authority of the pope, hierocratic arguments conceive of a particular kind of ordered Christian society, united and governed by a universal Christian church. In the history of political thought, hierocratic arguments have acted as a catalyst in the development of theories of sovereignty, jurisdiction, and rights. Key hierocratic writers include Pope Gregory VII (c. 1020/1025–1085 CE), Hostiensis (1200–1271 CE), Augustinus Triumphus (c. 1270–1328 CE), and Giles of Rome (c. 1243–1316 CE).

Hierocratic Literature: Groupings of Hierocratic Writers

Papal Theorists

Early hierocratic argumentation centered around the "two swords" theory, a dualistic theory of sovereignty developed by extended glossing of a slight passage in the Gospel of Luke. The theory attempted to balance the sword of spiritual authority with the sword of temporal power. Variations of the two

swords doctrine either handed one sword to papal government and one to secular princes (a dualist position), or tried to hand ultimate control for both swords into the hands of either the pope or a secular prince (a universalist position).

The popes themselves were key originators of two swords literature, with the hierocratic position being successively clarified by popes Gregory the Great (c. 540–604 CE), Gregory VII, and Boniface VIII (c. 1235–1303 CE). Papal bulls and works were amplified by papal theorists such as Anselm (c. 1033–1109 CE) and the canonists. Such literature rejected the dualist position that God had given a temporal sword to lay rulers and a spiritual sword to the papacy. For example, the Decretalist Tancred (1185–1235 CE) argued that the two swords had both been left to the Apostle Peter and his successors the popes, leaving the papacy with the power to confirm, crown, consecrate, judge, and depose of the emperor.

Canonists

Medieval canonists developed a juristic science out of the law of the church and thus produced hierocratic arguments based on the actual practice of the church and the papacy. Canonists, such as Rufinus (c. 1150–c. 1190 CE), argued that the pope exercised supreme and undivided jurisdiction over the universal church. This assertion of judicial authority was a key means of securing papal political authority.

Bernold of Constance (c. 1054–1100 CE) underlined the authority of the pope not only to apply old church law but to make new papal legislation—provided such legislation was not contrary to reason or biblical and apostolic authority. This echoed Pope Gregory VIII's belief expressed in his *Dictatus papae* (Papal Claims; 1075 CE) that only the pope has the right to make new law in accordance with the needs of the times.

In the eleventh and twelfth centuries CE, the papal *curia* (papal court) became the supreme body for judicial appeals, with judicial functions being delegated to bishops. Pope Gregory IX (?–1241 CE) issued the *Decretales* (Decretals; 1234 CE) as a comprehensive canon law handbook, in which the hearing of appeals is emphasized as an important demonstration of papal judicial supremacy. In cases of major importance and for certain important institutions, the papal court was in fact the court of first instance in any judicial dispute, a position justified by the canonist Huguccio (Hugh of Pisa; ?–1210 CE) as reflecting the right of the Holy Roman Church to judge all. Using the terminology of Roman law, Huguccio argued that the pope had a jurisdiction by right to act as the universal ordinary who can act as though there are no intermediaries. Gratian's *Decretum* (early twelfth century CE) describes the pope as "lord of the decrees," able to make and abolish law and extend privileges and dispensations.

The Publicists

The papal publicists approached the problems of public law, sovereignty, and office from the perspective of the pontificate. As a group of writers, the publicists are particularly prevalent in the period 1250 to 1350 and while sharing a technical vocabulary with canonist lawyers, they also ranged more widely in their political theory. The works of papal publicists such as Augustinus Triumphus, Giles of Rome and his pupil James of Viterbo (c. 1260–1307 CE), and Alvarus Pelagius (c. 1280–1352 CE) are discussed more fully later in the entry.

The Historical Context

The Political Context (1): Papal–Imperial Conflict

The rise of national monarchies posed a strong challenge to papal supremacy, particularly because medieval ideas of secular kingship redeployed and subverted many of the hierocratic arguments used to support papal monarchy. Thus national kings became a competitor for the role of representing Christ's vicariate on earth.

In the eleventh century Investiture Controversy, the Holy Roman Emperor Henry IV (1050–1106 CE) struggled with Pope Gregory VII over the control of church appointments within his empire. Gregory excommunicated Henry and withdrew his papal support for his investiture, provoking military conflict between imperial and papal forces. The emperor's successor, Henry V (1081–1125 CE), was received back into spiritual communion by the papacy only after renouncing some of his investiture rights over church officials at the Concordat of Worms (1122 CE). The concordat recognized the right of the emperor to invest bishops with secular but not spiritual authority.

The tense political competition between secular monarchies and the popes in the twelfth and thirteenth centuries CE produced a considerable body of hierocratic and anti-hierocratic political literature. The arguments between Philip IV of France (1285–1314 CE) and Boniface VIII over papal interference in national affairs resulted not only in the pope's imprisonment by the king, but also political works, for example by Dante (c. 1265–1321 CE), questioning the hierocratic position. An extreme exponent of papal supremacy, Boniface VIII issued the *Unam Sanctam* (Papal Bull on Primacy) in 1302, which declared that it was essential for salvation that every human creature be subject to the Roman pontiff. A centralizing figure, Philip IV wished to tax the clergy within his kingdom. Pope Boniface VIII explicitly forbade the taxation, justifying his authority by the placing of the pope over kings and kingdoms by God.

The Great Schism (1378–1413 CE) saw two rival popes elected: one based in Avignon, the other in Rome. Each was supported by different secular powers, and the existence of rival papal powers challenged the abstract theorizing about a universal church contained within papal hierocratic theory.

The Political Context (2): Conciliarism

The second profound political challenge to the papacy's political role came from the conciliarist movement. In the fourteenth and fifteenth centuries CE, Catholic reformers argued that the community of the Christian faithful should be represented by a council of Christians rather than be headed by the pope. According to the conciliarist account of early Christianity, the Apostles governed the church as a council and Peter was not specially selected as the vicar of Christ. This represented a considerable theoretical challenge to the supreme sovereignty of the pope in spiritual and temporal affairs.

The Foundations of Hierocratic Thought

Platonic Political Thought

Platonic realism ascribes a real existence to abstract universals, positing that although sensory contact with universals is not possible, they nonetheless still exist in an ideal form. When applied to a Christian context this means that the Christian community exists, in a realm independent of time and space, as an abstract universal that is not dependent on the material existence of actual individual Christian believers. The political ramifications of this metaphysical position explain the theoretical discounting of the individual within early medieval hierocratic political theory.

Pauline Political Thought

In his writings such as the *Letters to the Corinthians* (c. mid–first century CE), Paul made an analogy between the undivided human body of Christ and the universality of the Christian Church. The church represents the body of Christ, composed of individual believers governed by the headship of Christ. The church is one, and no part can function separately. In hierocratic theory, the pope continues the headship of Christ over the body of the church.

Political Augustinianism

Augustine's major political work, the *City of God* (413–427 CE), describes two cities: one heavenly and one earthly. The earthly city is motivated by self-interest, whereas the heavenly city is a community of true believers. Although Augustine was very clear that the City of God could not be identified with any human institution and that the church contained elements from both the earthly and the heavenly cities, later Augustinian theory used the idea of a kingdom of God to justify the belief in an *ecclesia* (universal church) uniting all Christians into one spiritual community. Augustinian thought lends itself for use in absolutist political theory and was quickly implemented into descriptions of the absolutist power of papal monarchy.

Major Themes of Hierocratic Theory

The Petrine Commission and the Papal-Divine Link

According to the Petrine theory accepted by the majority of orthodox papal theorists, the pope stands as the successor to the Apostle Peter, whom they argue was divinely ordained as the head of the early Christian church in Rome after Christ's death. Biblical authority for this was taken from the Gospel of Matthew, where Peter is described as the rock upon which the church will be built. One

passage describes the keys of heaven being given to Peter, so that whoever he binds or loosens upon earth will be treated the same way in heaven. The text was interpreted by later papal theorists, such as Augustinus Triumphus, as demonstrating the universal, semi-divine and comprehensive power given to Peter and inherited by the popes. The church represents a spiritual community of belief, which, in the same way that Christ assumed a human form, requires a visible earthly representation in the form of the papacy.

Papal Infallibility

The Middle Ages sees the beginnings of a doctrine of papal infallibility, which is the idea that the pope is incapable of error when expressing doctrinal positions. The canonist Terreni (c. 1260–1342 CE) included a discourse on papal infallibility in his commentary on Gratian's *Decretum* (c. 1336–1339 CE). Terreni argued that the church possessed two keys: one of knowledge and one of power. The exercise of ecclesiastical jurisdiction united those two keys, and the doctrine of papal infallibility is recognition of the immutability of doctrine produced by authorities in possession of those two keys.

Church Hierarchy

Bonaventure (1221–1274 CE) defined the pope as having a threefold plenitude of power over the universal church. First, only the pope alone has supreme power over the church conferred by Christ. Second, the pope holds this authority in all churches, not just his own Holy See. Third, it is only from the pope that authority flows to inferior clergy in the church. Such a hierocratic position denies the right of mendicant priests to administer sacraments independently of the ecclesiastical structure. According to hierocratic arguments, the power to remit sins via the sacrament of penance is a power that flows directly from Christ to the pope and is then transmitted downward to his bishops and his priests—a strong curtailment on decentralized church sovereignty.

Hierocratic Historical Theory

Hierocratic arguments make frequent reference to ancient biblical history in order to bolster their position, for example, by interpreting the Jewish kings and prophets of the Old Testament as pre-Christian popes. Abraham carried out the same function as the pope, leading the children of Israel in the same way that the pope leads the Christian congregation of the faithful.

The Universal Church and the Roman Law of Corporations

The *ecclesia* (universal church) in hierocratic theory is the universal body of Christian believers and thus encompasses both clergy and laity. Papal theorists frequently refer to this body as the congregation of the faithful. For hierocrats, the church is the only possible political body and it represents the whole spiritual and civil body of Christians.

Hierocratic explanations of the universalism of Christian society make use of the Roman law theory of corporations, which dealt with associations of persons in public and private law. The church embraces the whole of a hierarchy of interdependent lesser corporations. Both the head and the members of a corporation have rights and duties—protected by doctrines of counsel, consent and reparation—and the corporation as a whole has a juridical personality. Such corporative attitudes are often expressed in hierocratic literature by organic metaphors, with, for example, the pope as the head of the church body.

Church–State Relations

The crucial practical issue for hierocratic theory is the relationship between the temporal and spiritual powers. The medieval supernatural sanctification of kingship through the ceremony of consecration gave the papacy a political tool, particularly in relation to the crowning of the emperors of the Holy Roman Empire. In crowning the emperors, papal theorists felt that the popes were actually constituting imperial power and creating papal defenders.

Historiographical Approaches to Hierocratic Theory

Hierocracy and Ascending and Descending Political Power

The Austrian-English medieval historian Walter Ullmann conceptualized the hierocratic and anti-hierocratic debates of the late Middle Ages in terms

of ascending and descending views of political power. On this model, hierocratic arguments represent a descending view of power in which sovereignty is imposed down a hierarchy from pope to laity. Ultimate power is held by God, and it is transmitted downward from his vicegerent on earth on the basis of faith rather than consent. From Ullmann's perspective, until the hierocratic framework was challenged by anti-hierocratic writers like Ockham, Marsilius of Padua, and Dante, there was no possibility of an ascending model of political power based on popular sovereignty. At the same time, Ullmann also argued that medieval political thought contained lingering remnants of populist republican political thinking, which were bolstered by the underlying contractualism of feudalism. This combination of popular will and feudal political thinking explain the ready acceptance of Aristotelian naturalism and the flourishing of anti-hierocratic political thought in the late medieval period.

The English historian Francis Oakley criticizes Ullmann's model for being too rigid. Oakley suggests that Ullmann is forced to overemphasize the influence of Aristotelian naturalism, because his model requires some kind of innovatory factor to explain the shift away from descending theocratic political thought and the late medieval return to the populist-ascending theme. For Oakley, many medieval writers are less purely theocratic or purely populist in their orientation. Thus the papalist James of Viterbo (c. 1255–1308 CE) accepted both the naturalist Aristotelian state (commonly an anti-hierocratic position) and the supremacy of spiritual power over the temporal in order for nature to be perfected (a hierocratic position).

Hierocratic Arguments and Theories of Sovereignty

The British historian of political thought M. J. Wilks categorizes the papal hierocrats Augustinus Triumphus and Giles of Rome as theorists of sovereignty, who argue that the lay ruler has no intrinsic power but develops it by the grant of the pope and that, accordingly, the papacy is the exclusive source of temporal authority. By contrast the German historian W. Kölmel does not interpret papal hierocratic theory as containing such a doctrine of absolute papal sovereignty. Instead, according to Kölmel, the pope confirms temporal rulers in the use of their powers and that temporal authority comes to a secular ruler from the human law and those over whom he rules.

The Canadian historian W. D. McCready takes a compromise position that the papal publicists recognized the intrinsic value of temporal power but accorded it a limited sphere of authority. McCready identifies two incompatible influences within the work of the papal apologists: an Aristotelian acceptance that society and civil government are the inevitable result of man's sociability versus a spiritualized conception of the political in which temporal power is completely absorbed into the supernatural via the pope's sovereignty. McCready argues that rather than conferring complete power to the pope, the papal hierocrats attributed to the pope a plenitude, or fullness, of power.

Early Medieval Hierocratic Theories of Kingship

Early medieval theorizing about kingship tackled the key question of the relationship between monarchical and papal authority and the extent to which ecclesiastical rule should have precedence over secular authority.

Gregory the Great (c. 540–604 CE)

In his *The Book of the Pastoral Rule* (c. 590 CE), Gregory emphasized the tutelary role of the emperor in Constantinople as indispensable to Christendom's development. The emperor was charged with a supervisory role over the church, and Gregory aimed for an intimate union between the papal sovereign and the emperor. By encouraging the emperor to be more Christian, Gregory minimized the boundaries between the two forms of authority and suggested their possible alliance.

Pope Gregory VII (c. 1020/1025–1085 CE)

By contrast, Hildebrand (Pope Gregory VII) argued for ultimate papal authority over the emperor, arguing that he could both make and depose kings and denying the emperor's right to choose his own bishops. In turn, the emperor argued that the papacy's temporal authority derived from secular rulers.

Gregory VII developed Augustine's metaphor of the two cities to explain the difference in origin and purpose of ecclesiastical institutions as opposed to secular ones. Because secular government is ordained by God as a remedy for man's inherent sinfulness, secular princes cannot be allowed to be the final judges in their own cases. The papacy is thus a divine provision to ensure that justice is truly universal. Even the Holy Roman Emperor is subject to justice, and to not recognize this is sinful pride.

Innocent IV (Papal Reign 1243–1254 CE)

Commonly seen as an extreme exponent of papal supremacy and hierocratic arguments, Innocent IV asserted the papal prerogative power in Christendom. Innocent IV went so far as to claim that as vicar of Christ, the pope could elect a monarch to fill any vacant kingdom within Christendom.

Late Medieval Hierocratic Philosophy

Hostiensis (Henry of Segusio; 1200–1271 CE)

Hostiensis provides one of the most comprehensive accounts of medieval hierocratic thought. At the same time, the English historian J. A. Watt has identified an ambiguity in Hostiensis's writings over the power relations between secular and religious authorities. Hostiensis is a key developer of the phrase *papal plenitudo potestatis* (the papal remit of power), which implies both the totality of the papal jurisdiction and the hierarchical relationship between lesser ecclesiastical jurisdictions and the papacy. However, canonist thought as a whole also contained a clear theme of the distinction between secular and temporal power, and both dualist and monist positions can be found in Hostiensis's writings.

Hostiensis draws on earlier hierocratic sources and explores familiar themes such as the unity of Christian society and the temporal kingly role of the pope over Christendom as vicar of Christ. What Hostiensis adds in particular is detailed canonist examples of how spiritual power operates in practice in relation to temporal power. For example, Hostiensis provides an analysis of when spiritual power can legitimize in the temporal sphere. Hostiensis disagreed with the dualistic position that the pope legitimizes in the spiritual order and the emperor in the temporal, arguing instead that only the pope had the power to legitimize in the domain of marriage and heirship. Confusingly, this sole papal right of true legitimization was balanced against an immediate imperial jurisdiction in property matters, such as hereditary succession. Hostiensis developed a distinction between public and private interests and set out a principle that the pope could not intervene in temporal affairs to the prejudice of another party.

Augustinus Triumphus (1243–1328 CE)

A member of the Augustinian order, Augustinus Triumphus wrote his major political work *Summa de potestate ecclesiastica* (Summa on Ecclesiastical Power; 1326 CE) in order to defend papal supremacy. According to Augustinus Triumphus, the pope is the human representation of Christ and the immaterial church. The pope personifies multiple entities, being simultaneously the image of God, the City of God on earth, Christ, and the universal church. Drawing on the text in the Gospel of Matthew describing the keys of heaven being given to the Apostle Peter, Augustinus Triumphus emphasized that the pope's actions during his vicariate bind in heaven as well as on earth and that he therefore exercises a divine will. The pope is therefore a ruler in heaven, on earth, and in hell. Souls in purgatory can be moved at the pope's command; he therefore holds immense spiritual power over individual Christians.

By emphasizing the mixed human-divine nature of papal power, Augustinus Triumphus also developed a distinction between the office of pope and the human officeholder. The pope wields his power by virtue of his office, rather than as a result of his personal ethical and religious characteristics. It is the office of pope that achieves a mystical union between God and church, and thus the pope personally is not to be honored more than the saints and angels.

Alvarus Pelagius (c. 1280–1352 CE)

Drawing on arguments from Hostiensis, James of Viterbo, and Augustinus Triumphus, Alvarus Pelagius set out a strongly papalist view in his *De planctu ecclesiae* (1330–1340 CE), but it was a view marked by conflicting and contradictory

viewpoints. Alvarus's position as a Thomist and a supporter of episcopal autonomy introduced potentially incompatible concerns into his hierocratic arguments.

Alvarus continued an earlier hierocratic theme that the hierocratic system of government is based on belief. Acceptance of the pope's command and his status as an infallible representative of the divine is an act of faith. Alvarus's pope is more than a mere man, but Alvarus uses a Thomist distinction between "potency" and "act" to describe the pope's real power. By virtue of the Petrine commission, the pope has potential power over temporal authority; however, in actuality this is only a latent power.

Aegidius Romanus (Giles of Rome; c. 1250–1316 CE)

A theologian of the Order of Augustinian Hermits, Giles of Rome probably studied under Aquinas in Paris in the 1270s and became an established Aristotelian scholar. Despite this Aristotelian background, Giles's major hierocratic work, *On Ecclesiastical Power* (c. 1302 CE), takes an extreme hierocratic position that all legitimate power derives from the pope, who then delegates certain temporal power to earthly rulers. Giles presents the pope in a quantitative role, ordering all people and things in the hierarchy beneath him according to their number, weight, and measure. For Giles, the Petrine doctrine shows a clear divine handing of office to the papacy, and there is no matching evidence to show that any lay ruler has ever been similarly chosen by God. Therefore, temporal power must be derived from Peter's successors in Rome. However, papal intrusion into temporal affairs should be so exceptional that Giles calls it the equivalent of a miracle. This delegation of legitimacy also extends to property rights, which are not natural but formed by human agreement and remotely authenticated by papal power. The pope's directives are universally binding and form the common law of the universal Christian society.

In contrast, in his work *On the Abdication of the Pope* (1297–1298), which argues for the legitimacy of the abdication of Boniface VIII's predecessor, Giles emphasizes that although the papacy is a divinely ordained office, any particular pope is only elected by the human intention of the cardinals. Although there is no authority superior to the pope to depose him from office (following the standard hierocratic position that the pope has no superior on earth and can only be judged by God), any individual pope can reverse the process of consent to his election by the cardinals and abdicate from the papacy. Because any individual pope can fail practically in his role, the universal church remains the true source of faith and jurisdiction. Thus, under natural law, in most circumstances the lay ruler has a normal right to rule without papal interference.

James of Viterbo (c. 1255–1308 CE)

Written at the height of the conflict between Philip IV of France and Pope Boniface VIII, *On Christian Government* (1301–1302 CE) contains arguments similar to those of Giles of Rome. James rejects any idea of dualism, insisting that the pope wields both temporal and spiritual swords of authority. However, James gives a greater preeminence to the church in his hierocratic arguments than does Giles of Rome, arguing that Christ has given priestly and royal, spiritual and temporal power to the church but that the whole is held by the pope.

The Weakening of Hierocratic Arguments: 1200–1400 CE

Opposition to Hierocratic Theory (1): The French Publicists

John of Paris (c. 1255–1306 CE) developed aspects of the theory of corporations to place constitutional limits on papal power. John equated the relationship between the pope and the church with that between a bishop and his chapter, placing the pope under the same constraints of the corporative doctrines of counsel, consent, and representation. In addition, John argued from Aquinas's theory of mixed constitutions that there should be a wider participation in ecclesiastical government, with ecclesiastical elections choosing those who should serve under the pope.

Opposition to Hierocratic Theory (2): The Aristotelian Renaissance

The rediscovery of Aristotelian political theory in the thirteenth century CE posed a considerable

challenge to hierocratic arguments, as Aristotle argued that government and law were natural features of man's sociability rather than divinely given institutions. The Aristotelian view of property, for example, was that it was a preexisting natural right. This was in contrast to the hierocratic position that property rights are man-made agreements that need to be sanctioned by the church for validity.

Opposition to Hierocratic Theory (3): Theories of Popular Sovereignty

Marsilius of Padua (c. 1275–c. 1342 CE) undermined the universalism of the papacy and questioned its hierocratic authority by denying the whole theory behind the Petrine commission. In *The Defender of Peace* (1324 CE), Marsilius asserted that papal authority was not given by God via Peter but, like any other office, was transmitted by the decision and will of men. The papacy, therefore, like civil forms of government, relied upon popular sovereignty. Contemporary civil strife was in Marsilius's view caused by the papacy's illegitimate assumption of a universal jurisdiction. Such anti-hierocratic positions were to be pursued more fully in the fifteenth and sixteenth centuries, as the Reformation challenged both the practical reality and theoretical basis for papal hierocratic government.

Epilogue: Hierocracy in Modern Political Theory

Weber

The idea of hierocracy continues to be used in modern political and sociological theory in order to understand church-state relations, and sociologists have drawn upon medieval history in order to develop typologies of religious and secular power. In his typology of church-state power relations, Max Weber described a hierocracy as a rationally and bureaucratically streamlined religious and clerical power, exhibiting the following four characteristics: (1) a professional priesthood, (2) with a rationalized body of doctrine, (3) organized bureaucratically into an institution withdrawn from the secular world, and (4) claiming universal dominance.

Weber used the term *caesaropapism* to explain the phenomenon of religious authority being subordinated to the political. Weber distinguished hierocracy (the domination of priests over the political) from caesaropapism (the complete domination of the priesthood by a secular ruler) and made this one of his fundamental dualisms of Western culture. For Weber, independent vertically organized religious hierocracies in the West—alongside feudal aristocracy and the bourgeoisie—have been an important challenge to caesaropapist political practices.

Hindu Political Thought

The science of politics *(arthaśāstra)* has very early roots in classical India. With its theories, analyses, and classifications, it tried to show the most effective way for a king to arrange his administration, to make his state flourish, and to expand it if possible. Its aims were thus practical; unlike in Western antiquity, philosophical utopias were not included in the political theory of classical India. This entry first examines the origins of statehood in India and then describes the development of political science in this period, as described in the *Kauṭilīyārthaśāstra* (KAŚ).

In ancient India, the science of politics was known under several Sanskrit names derived from its different aspects: *artha* "profit, goal, usefulness" (*arthaśāstra* "the science of artha"); *nīti* "leading, administration" (*nītiśāstra*); *daṇḍa,* originally a "stick," then the "stick for guiding an elephant (*ankus*)," also "punishment, administration of punishment, administration" (*daṇḍanīti*); and rāja(n) "king" (*rājanīti* "the conduct of the king" and *rājadharma* "the duties of the king," rarely *rājaśāstra*). In religious thought, politics were connected with the three aims of life (*trivarga*): *kāma* (enjoyment), *artha* (profit), and *dharma* (religion).

The Roots of Statehood

In the Vedic period (c. 1500–500 BCE), the society consisted of small nomadic tribes, who wandered around with their cows and horses, fighting and robbing other tribes. Their society had a simple order, mainly concentrated on the organization of warfare. This tradition continued in later tribal oligarchies (the *gaṇas* or *saṁghas*), although they were no longer nomadic, but ruled their own territory. These were not republics in the modern sense, although the word is often used of them. In both cases, the so-called king (*rājan*) was mainly a war leader, elected by the male members of the tribe. For practical matters there was also a council of elders (*sabhā*). Youngsters often formed separate sodalities more or less uncontrolled by the tribe. This form of government continued into the early centuries CE in peripheral areas.

The settled state developed only with urbanization, which took place around 500 BCE in the Gangetic plain. The society now became more organized, with separate professions, trades, and guilds, and also with more control and administration. This also led to established kingship and succession through inheritance. Towns developed forms of more or less autonomous local government. The following period of the regional *janapada* kingdoms ended in the late fourth century with the rise of the first imperial dynasty, the Mauryas. In later history, the periods of strong central power (such as the Guptas in the fourth and fifth centuries) and of numerous petty states

involved in more or less continuous warfare with each other alternated until the arrival of Islam in the Middle Ages.

Candragupta Maurya created the first large empire in India. It was enlarged by his son, and his grandson Aśoka is the first real personality in Indian history with his royal edicts or proclamations carved on pillars and rocks in different parts of his wide empire. In fact, it seems that this was the first appearance of writing in India. The Mauryan period was the time of strong economic and technological advancement. The merchants in towns introduced coinage, while the countryside maintained a barter economy.

It has been suggested that when building an empire, the Mauryas were influenced by the model of Achaemenid Persia or Alexander the Great. In any case, the idea of a universal emperor (*cakravartin*) became an acknowledged ideal in Indian political thought. The development of the royal title illustrates this. The Mauryas were still content with the traditional *rāja(n)* "king," but a few centuries later, the Persian titles "the great king" (*mahārāja*) and "the king of kings" (*rājātirāja*) had become common, and in the Middle Ages, every petty ruler was calling himself the great king. The mere *rāja* was finally reduced to a kind of honorific title.

Theories of the Origin of Statehood

In ancient Indian opinion, as it is transmitted in texts, the existence of the king as the head of the state was absolutely necessary; otherwise, there would be the condition of fish: The stronger eat the weaker (this is the so-called *matsya-nyāya* "the maxim of fish"). There were two competing theories about the origin of kingship: divine origin (the Hindu view) or social contract (Buddhist and Jaina view). In the first theory, the argument was religious. The king was the earthly representant of Indra, the king of gods, representing the eternal order of things. Various elaborate rituals defined his status and esteem. He was an absolute ruler but also responsible for the welfare and happiness of his subjects. In principle, he was a Kṣatriya by birth, but in fact many dynasties originated from some other class and were subsequently given a Kṣatriya status.

The second theory constructed a primeval golden age, when everyone lived in peace and happiness because nature freely produced food and other necessaries. But as time went on, conditions worsened, people had to work for their living and to compete with each other, and soon violence and sin spread. To have a settled basis for life, they arranged a great meeting and elected the best man as their king to rule them, to make laws, and to settle disputes.

Both theories thus had a clear foundation for the duties of the king. However, the developing science of politics was more focused on the might and success of the king than in his duties and the welfare of his subjects.

Political Science

In classical antiquity, as well as in China, the theory of politics was closely connected with the study of history. History was rather neglected in classical India, but politics developed early as an independent subject. However, the beginnings of the formal science of politics in India are lost. Its early roots are only known from the references in the KAŚ, which names a number of lost predecessors (especially Bṛhaspati and Uśanas). The fundamental work of political theory is thus the *Arthaśāstra* of Kauṭilya (or Kauṭalya), the KAŚ. Its date is a long-disputed problem. The author is traditionally identified with the minister of Candragupta Maurya (late fourth century BCE), also known as Cāṇakya or Viṣṇugupta, but the text is unlikely to have come from the Maurya Empire. Instead of one large empire, the text supposes a smaller kingdom in the middle of others. In this form, the text probably hails from the period after the fall of the Mauryas (early second century BCE), although some parts of it may originally come from the Maurya period. The whole was probably composed in the early centuries CE. It is quoted in several works of the first millennium; by then, it was already commonly regarded as the most authoritative work on politics.

An idea of the early Mauryan society is found in the Greek fragments of Megasthenes, who visited the Maurya capital as the envoy of Seleucus at the end of the fourth century BCE. His account contains a description of the Mauryan government, with its various departments and officials, including the local government of towns. Additional information is obtained from the

edicts of Aśoka. Here the king explains the shock he experienced early in his reign when he saw the cruelty of the war of conquest. He proclaims that from now on, he will only make conquests through righteousness (*dhamma*). To achieve this, he appointed special dhamma officials in his empire and sent envoys to explain his ideas to the neighboring kings. He obtained an important position in Buddhist legends as a royal saint, but his system of government died with him.

Later works on politics did not contribute much; the KAŚ remained the standard text. Among the later works, the most popular was Kāmandaki's compact *Nītisāra* "The Essence of Nīti" (perhaps eighth century CE), a metrical summary that almost superseded the much longer KAŚ. The material in this work is rearranged in 20 chapters, omitting some of the themes of the KAŚ and adding some new ones. The author's ambitions seem also to be literary rather than practical. Somadevasūri's *Nītivākyāmṛta* "The Nectar of Nīti Sayings" (tenth century) leans heavily on the KAŚ (without naming it), but it also has Jaina moralistic tendencies. He is less practical than the KAŚ and omits many details, but he loves proverbs and similes. Other important works are King Bhoja's *Yuktikalpataru* "The World-Tree of Practical Methods" and Kṣemendra's *Nītikalpataru* "The World-Tree of Nīti" (both eleventh century). Some Purāṇa texts such as the *Agnipurāṇa* and the *Garuḍapurāṇa* contain a nīti section, which is also often included in the Nibandhas or legal digests.

During the Islamic period, the interest in political science diminished, although there are some modern (nineteenth-century) works such as *Śukranīti* and Vaiśampāyana's *Nītiprakāśikā*. In the Middle Ages, even the KAŚ was almost forgotten. It was presumed to be lost, until one manuscript was found in South India and promptly published in 1909. Later on, some further manuscripts and fragments of four old commentaries were found. There are also manuals of the sports and pastimes of the king (e.g., King Someśvara's *Mānasollāsa*).

There is another, quite different tradition of teaching the science of politics. The famous collection of narratives, the *Pañcatantra,* of which numerous critical revisions and translations exist (including medieval versions in Near Eastern and European languages), professes to be a textbook of politics. In the frame story, three lazy and stupid princes have had the usual royal education but have not profited by it at all. Then the wise Viṣṇuśarman promises the king to teach them everything and does this with the means of educational fables and narratives. As the name, "The Five Books," indicates, the stories are divided into five books titled "The Loss of Friends (or Causing Dissensions Among Allies)," "The Gaining of Friends," "War and Peace," "Losing What Was Gained," and "Hasty Actions." Each book has a frame story in which the actors tell a number of subordinate stories to illustrate their ideas of wise politics. The *Hitopadeśa* "Useful Advice," by Nārāyaṇa, is another version of the same.

In addition, there are many short poems and maxims dealing with worldly wisdom and politics. There are several collections of them, which often go under the name of Cāṇakya. A series of 100 poems on nīti was composed by the poet Bhartṛhari in the seventh century, and many were also included in the anthologies of "good sayings" (*subhāṣita*).

Principles of Politics According to the Arthaśāstra

The *Arthaśāstra* is presented as a collection of advice for the king, divided into 15 long chapters or books. All is written in the compact sūtra style. The first book contains a general introduction and discusses the selection of high officials, the arrangement of the secret service, and the education of princes. The second introduces the various departments of administration, their heads, and their tasks and duties. The third book discusses civil justice, and the fourth covers criminal justice (called "the removal of thorns"). The fifth briefly explains some aspects of dealing with emergencies and the sixth, also brief, of wise rule and the ideal state. The seventh explains the six methods of policy, while the eighth takes up some errors and difficulties in relation to these methods. The next five books are devoted to warfare. The ninth describes the preparations for war, the various troops, and the effective use of them; the tenth, the actual battle; and the eleventh, the ways of dealing with oligarchies. The twelfth book gives advice to the king who is weaker than his opponent, and the thirteenth discusses the besieging of fortified towns

and the rule of the conquered territory. The fourteenth is the so-called secret doctrine and is mainly magical in content, and the last book forms a sort of summary of the others.

In many respects, the KAŚ is pragmatic in the extreme. The king should arrange everything to support his rule as effectively as possible. In doing this, he should not let any moral considerations interfere. What is good for the king is also good for the state. And what was good for the king was power and conquest, the continuous striving for expansion, ultimately leading to the universal emperorship. Indeed, the repeated term for the ideal king is *vijigīṣu* "the one desirous of victory or conquest." But this was not an easy task. The daily routine for the king is defined in detail in KAŚ 1, which leaves him hardly any free time. Four hours were considered sufficient for resting. In theory, every citizen had the right to appeal to the king, and the daily receptions were important occasions. Although the king had a minister, a general, and a council of advisers to help him, he was supposed to supervise everything himself. Theoretically, he was simultaneously the head of administration, the highest judge, and the commander in chief. To be safe, the king must never trust anybody.

The idea of the divine origin of kingship and the divinity of the king was useful because of its propaganda value. Thus the king was called a god (*deva*), and the text suggests various ruses to give his subjects the impression that the king has supernatural powers. However, in India the idea never gained the same dimensions as in the Hellenistic monarchies and China. It emphasized his absolute power rather than any real divinity, and there was usually no formal cult of the king as god. The author of the KAŚ was obviously a Brahman and his ideal kingdom was one that wholly supported the traditional class hierarchy and upheld the Brahmanical religion, but at the same time the king was also entitled to use religion—even religious fraud—in politics.

Different types of classifications are typical of classical Indian scholarship. Thus, KAŚ 6 reveals the definition of the seven foundations (*prakṛti*) of the state: the king, minister, land, fort (or fortified capital), treasury, army, and ally. An ideal state consisted of a directly governed (and strictly controlled) central area, whereas the more distant parts, especially the forest regions, were often ruled by vassal princes. The state also controlled the economy, and several key industries were state monopolies (e.g., forest products, mines, pearl fisheries, the salt industry, and the manufacture of weapons). These were often run using forced labor.

The vassals could be royal princes, nominated governors, receivers of a donation, or even former independent rulers of a conquered territory. The position was often hereditary, and a vassal had his own administration and army, although he was obliged to pay taxes, send troops for military expeditions, and participate in the state ceremonies arranged by his overlord. There was always the danger of mighty vassals turning rebellious. To avoid this, they were controlled through spies, and often their children were invited to be educated at court. They were hostages, true, but the idea was also to develop ties of loyalty and friendship between the future king and his vassals. Especially in the second half of the first millennium CE, vassalage developed into a system that much resembled the contemporaneous European feudalism.

The methods of foreign policy were also carefully classified (KAŚ 7). Peace is only one of six possible conditions or methods (*guṇas* or collectively *ṣāḍguṇya*) of politics—and it is recommended only when the enemy is clearly stronger. The other five methods are war, neutrality, readiness for march, alliance, and the dual state, where peace is made with one opponent in order to carry on war with another. A basis for foreign politics is the so-called maṇḍala or circle theory. The immediate neighbors of the king were his natural enemies, and if he was strong enough, he should strive to conquer these enemies. The kings living beyond these enemies were his natural allies, and those beyond these allies were the natural allies of the enemy, and so on. When all went well—the king conquered his enemy in collaboration with his ally, and the enemy kingdom was divided between the victors—the situation was rearranged: The former natural ally became the new natural enemy.

Conquest was thus one of the major aims of the king. Detailed advice is given on how to rule the conquered country and how to win over the population. It was possible that the former king retained his position as a vassal. The ultimate goal of the victorious king was to become a *cakravartin* "universal emperor."

Foreign relations were conducted with the help of envoys as there were no standing embassies. Brahmans and monks were preferred as envoys because their religious authority gave them immunity. This was important, as the envoys were also used for intelligence and the KAŚ recommends the collaboration of envoys and spies. In a society where the kings were usually polygamists, marriages were an important method for confirming political alliances. The harem was often a nest of intrigue, and strict control was recommended. Among the wives, one usually had the status of the head queen. Women normally had no share in male politics, although history records a few dowager queens ruling in the name of their minor sons.

Another important topic in the KAŚ is the selection of high officials. Various tests of their ability, and especially of their loyalty, are recommended. The most capable are recommended for office, but in practice the positions of ministers, counselors, and provincial governors tended to become hereditary. The arrangement of the administration with its various departments is described in detail.

The royal council of advisers consisted—in theory, at least—of 7 to 37 members. The meetings were private. The council discussed matters, but the final decision always belonged to the king. In later times, there are cases where hereditary prime ministers were ruling, while the king remained only a symbol of power (as in Nepal in the nineteenth and early twentieth centuries). Classical poetry often mentions kings who spend all their time absorbed in amusements and harem intrigues, leaving the governing to the ministers. This is supported, to some extent, by epigraphic evidence.

The counselors had different areas of responsibility: the prime minister (*mahāmantrin*), the court priest (*purohita,* in Hindu states, while Buddhist and Jaina monarchs often included eminent monks in their council), the treasurer, the high collector of taxes, the high judge, the high secretary, and, of course, the commander in chief. These all had the status of minister (*mantrin*), but a number of high officials (*amātya* or *saciva*) were also members of the council (*pariṣad*).

The various state departments were headed by inspectors (*adhyakṣa*) who may also have been counselors. The departments of the royal lands and royal cattle, of state monopolies such as forest and forest products and mines, of royal spinning and weaving houses, the tax department and the treasury were important. Other inspectors were responsible for commerce, customs, goldsmiths, harbors, and seafaring. The preparation and retail of intoxicants, the gambling houses, and prostitution were also important and tightly controlled. To be fair, the KAŚ also includes the care of orphans, the sick, women, and old people among public duties. Especially in later periods, these tasks were often carried out by guilds and castes, who also looked after the quality of their crafts and tried to control prices. In all fields, the KAŚ goes into details, carefully explaining the organization of various crafts; the ideal plans for towns, villages, and fortifications and the best ways for maintaining them; the systems of weights and measures and their control; the examination of jewels, and so on.

The transfer of power often involves problems. In classical India, the king was usually succeeded by his eldest son, if he was capable of taking over. If he was a simpleton or physically disabled, a younger prince took his place. Much emphasis is put on the education of the crown prince and his brothers. The texts warn against dividing power, but an adult crown prince was often nominated as subordinate co-regent (*yuvarāja* "the young king"). In a large empire, he was often sent to govern some distant province to get practical experience and to be far from the court intrigues. If the prince lived in the capital, there was always the danger that he would try to hasten things and overthrow his father. But there were also cases where the old king voluntarily abdicated in favor of his son and became an ascetic or committed a ceremonial suicide. The latter custom seems to have its origins in the Dravidian South; the KAŚ does not mention it at all.

The authorities of political theory fully understood the importance of the economy. The royal treasury was one of the foundations of the state. Taxation was explained and justified as a quid pro quo for the protection offered by the king. Another theory saw all land as royal property and the farmers paying rent as tenants. Both in theory and in practice, the revenue from the land was the main form of public income. But according to the KAŚ, all forms of professional activity were taxed and strictly controlled by the state. Merchants paid duties for their goods on entering a town. The text suggests a sixth part as the proper tax for crops, a

tenth part for goods. A major part of the taxes were received in agricultural products and stored in public storehouses. The KAŚ gives detailed advice on how to arrange tax collecting in the most efficient way.

Usually the taxation was not very oppressive, but sometimes the continuous wars and the swelling court led to excessive taxation. Kāmandaki lists five dangers threatening the subjects: the officers, thieves, other rascals, the king's favorites, and the king's own greed. If the king protects his subjects from these, the king himself will be able to squeeze more profit out of them. Especially in later times, the custom of donating the income from certain areas to high officials (as salary) or to religious institutions (as charity) placed a heavy burden on the state economy because it was deprived of these sources of income. Such donations were recorded on copper plates, which have been preserved and form an important source of historical information. Especially in South India, large temples were important economic forces. Among public expenses, the maintaining of a strong army was one of the most important (and most expensive) items. The general maintaining of the administration took also a major share: The scale of wages was incredibly long. According to the KAŚ, high officials received thousands of times more than laborers and servants. Other public expenses included dams and irrigation works, building and maintaining roads, the running of state industries, and the often very high costs of the court and royal family.

Espionage was important, both in one's own country and in the enemy's. Officials and vassals were controlled and tested in many ways, both openly and secretly. Spies were enlisted from all strata of society—the KAŚ particularly mentions the usefulness of prostitutes and innkeepers in obtaining secret information, whereas the more pious were likely to speak freely to monks and priests. Cooks, barbers, actors, and musicians had their own uses. The main task of the spies was to get people to reveal rebellious thoughts before rebellion took place, but the spies were also testing public opinion and spreading propaganda for the king.

The methods of warfare were ruthless. They included assassination (also used to prevent war or rebellion), the poisoning of the earth and water, the spreading of diseases, and the destruction of harvests. Starvation, thirst, and fire guaranteed the success of sieges, although various siege machines and stratagems were also used. The forest tribes were employed in guerilla warfare. The army was divided into four branches: infantry, cavalry, chariots, and elephants. In early times, the chariots were the most important, but they were soon superseded by elephants. Although conquerors from Alexander to the Muslims soon learned how a well-trained cavalry could easily beat the elephants, Indian princes valued them highly until the coming of firearms.

The text defines three different types of conquest: The "pious conquest" reduces the enemy into vassalage without causing much damage, the "avaricious conquest" seeks for riches and territorial gain, and the "demoniac conquest" ends with total conquest and annexation. A partial pacifist such as Aśoka was a rare exception among monarchs.

A less scientific side of political theory is met in the fourteenth book of the KAŚ, which discusses the use of magic and witchcraft for political aims. Numerous recipes for potions for obtaining various results and their counter-measures are given. The book instructs readers how to destroy an enemy (causing death, blindness, various illnesses, etc.) and how to deceive people with apparent miracles. Some miracles were taken as true. Potions give invisibility, clear vision in darkness, and the ability to walk long distances or fast long periods of time without exhausting oneself.

The KAŚ has often been compared to *The Prince* by Niccolò Machiavelli. Both works indeed share concentration on the king and his interests. In the same way, they consider that the end justifies the means, which may thus be extremely unscrupulous. But Machiavelli was a historian, and his text abounds with instructive historical examples, whereas his Indian colleague almost completely ignores the teachings of history.

Idealistic Tendencies

Despite its often practical approach, the KAŚ is a theoretical work, defining the ideal king and the ideal structure of government as they should be according to the political theory. From inscriptional evidence, it becomes clear that the practice could be different and that there were also important local differences. At the same time, there was

also another type of an ideal model for kings, created in religious circles. The politicians, though often Brahmans, were definitely nonreligious, and the KAŚ often advises the king to make use of the religious feelings of his people, to emphasize his own divinity, to employ Brahmans and wandering monks as spies, and so on. It is no wonder, then, that the philosophical school of materialism, called *lokāyata* or *cārvāka,* had close ties with politics. The ancient sage Bṛhaspati was honored as the founder of both.

In opposition to the pragmatism of the political science, there was the idealistic Rājanīti or Rājadharma, explained in dharma works such as Manu or the *Mānavadharmaśāstra,* the great epic *Mahābhārata,* and others, more or less representing the ideas of religious Brahmans about the right conduct of kings. Much importance was laid on religion, on arranging great state rituals, on maintaining the traditional hierarchical order of the society, and on being liberal to Brahmans. It was said that the two highest classes, Brahmans and Kṣatriyas, must be allies in upholding the hierarchy (and thus maintaining the subordinate position of others). It also seems that usually these two classes held all the high offices between them. A classic example of the different approach is criminal justice: When other evidence fails, the KAŚ recommends torture, whereas the Dharmaśāstra suggests ordeals as the best method of ascertaining the truth.

According to the Rājanīti, the happiness of his subjects was one of the main duties of the king and he was held personally responsible if he failed in this. Some authorities even accepted the dethronement of a bad king. The existence of a king, however, was essential in the texts of dharma as well as of artha. When Somadevasūri claimed that a kingless state would be better than one ruled by a stupid king, he was just using rhetorical exaggeration to emphasize the importance of good education of the king.

There was also a set of knightly ideals somewhat similar to those of medieval Europe. This code of chivalry appears as early as the *Mahābhārata* (where it is also repeatedly violated), but especially in the Middle Ages, some Indian princes (such as the Rājpūts) strongly believed in these ideals and earnestly tried to turn them into reality. When the rules were followed, war turned into a sort of tournament between the opposing kings. Theoretically, the civilian population should not be touched by warfare, but there was no arranged maintenance and the army had to live off the land.

It was certainly hard work to be a king, but in compensation, the king was usually surrounded by great luxury. One result was that the court tended to grow until it became a serious burden to the treasury. The king relaxed in his harem. Other common recreational activities were hunting, drinking, and the game of dice. Many were also patrons of literature and art while others donated money to religious institutions.

Historical Understanding

Historical understanding (*Verstehen*) has to do with grasping the intentional content attached to human actions. It is a distinctive approach to the human sciences, typically based on the idea that the meaningful nature of human action requires a distinct epistemology in the form of historical understanding. Philosophers who study historical understanding have generally focused on three interwoven but analytically distinctive concerns. The first concern is to articulate the ontological conditions for the possibility and grounds of historical understanding. The second is to clarify the epistemological nature of historical understanding itself: What does it mean to understand actions that took place in the past? The final concern is to specify the role of understanding in historical explanation: Does understanding have to be accompanied by additional explanatory operations in order to secure its empirical validity?

It is important to dispel two myths about historical understanding. The first myth is that it is just a method for the production of historical facts. The second is that it is an intuitive, quasi-mystical operation that resembles the work of an artist more than that of a scientist. These myths should be replaced with recognition of the philosophical content of historical understanding conceived as an analysis of what it means to base the human sciences on recognition of the meaningful character of human action.

Hermeneutics and History

In the last decades of the nineteenth century and the first decades of the twentieth, German philosophers drew on the rich, multifaceted traditions of German idealism and hermeneutics to discuss the philosophical foundations of the human sciences and their relationship to the natural sciences. These discussions produced some of the classical statements on historical understanding. Wilhelm Dilthey's work had a profound impact on approaches to the human sciences within the hermeneutic tradition. Max Weber's work became a starting point for many subsequent debates on the matter within the social sciences. What is more, the German discussions helped to inspire similar ones throughout Europe, including, by way of the Italian Benedetto Croce, the work of the British philosopher, R. G. Collingwood.

Wilhelm Dilthey

Given that historical understanding concerns the intentionality of human action, it is not surprising that discussions of its philosophical principles arose against the background of idealism and hermeneutics. The idealists stressed (albeit in different ways) the primacy of mind over matter in human existence and so attempted to understand that existence. Hermeneutics was preoccupied with questions of understanding externally given linguistic formations (mainly written texts but also spoken communication and even entire grammatical structures and literary genres) by grasping the mental content expressed within them.

Dilthey was the first major thinker in both the idealist and hermeneutic traditions to attempt a systematization of the theory of historical understanding. Dilthey anchors both the possibility and the necessity of historical understanding in ontological arguments. According to his ontology, human life differs from the rest of the natural world in that it consists of an inner world that gets expressed in outer manifestations such as gestures, words, music, poetry, churches, and universities. Understanding, he adds, is the process of grasping the inner content to which outer expressions refer back. It is only by such understanding, moreover, that humans are able to live, act, and communicate in a society. Understanding is a fundamental presupposition of individual and social life. This ontology leads Dilthey to define the human sciences in terms of historical understanding. He concludes that the human sciences, like human life as such, are about understanding expressions; they are about grasping the inner content of outer manifestations.

The process of understanding is important for Dilthey's epistemology. It leads him to raise a question that remains prominent in many later discussions of historical understanding: How can historical understanding be objectively valid? On what grounds can a mental process occurring within the subjective experience of the historian be recognized as a valid interpretation of a given historical phenomenon? Dilthey treats this question of objectivity as one not of methodology but of philosophy. He does not answer it by offering a procedure that if followed by historians would secure the validity of their interpretations. He answers it by an ontological argument that, in his view, guarantees the validity of the re-created past experiences of others in a historian's mind. Dilthey posits the identity of the subject and object of knowledge. In this view, understanding is a universal mode of cognition that is actualized in the historical flow of lived experience, and in that respect the subject and the object of historical interpretation are identical.

Although Dilthey's response to the problem of the validity of historical understanding, and even his theory as a whole, can seem vague, underdeveloped, and even quasi-mystical, his work did much to raise issues that still concern philosophers interested in historical understanding.

Max Weber

Dilthey's philosophy of history was part of a wider debate, raging in Germany at the turn of the twentieth century, about the nature of the human sciences, their difference from natural science, and the methodologies appropriate to them. The camp siding with a more historical and interpretive view of the human sciences included, besides Dilthey, the neo-Kantian philosophers Wilhelm Windelband and Heinrich Rickert and the sociologists Georg Simmel and Max Weber. These thinkers shared the conviction that the human sciences differ fundamentally from the natural sciences in that they require historical understanding. Beyond this shared conviction, however, they each had their own view of the human sciences and of historical understanding. The most influential for the social sciences has proved to be that of Weber.

For Weber, a valid scientific explanation is a causal one, but in the human sciences, causality has to assume a peculiar form in that it requires an interpretive dimension. The importance of interpretation follows, for Weber, from the fact that the human sciences are concerned with psychological and intellectual phenomena, and, more specifically, from the fact that social action arises from the subjective intentionality of the actor. Hence causal explanation in the social sciences depends on demonstrating a concrete relation between a specific action and its subjective motivation, not on formulating general causal laws. Weber's argument is part of his attempt to distance himself from the naturalist conflation of the natural and the social sciences on the basis of a nomothetic epistemology. Yet he establishes this distance, not by Dilthey's ontological arguments, but by a neo-Kantian, epistemological distinction between the natural and the social sciences of the kind made by Windelband and Rickert. The neo-Kantians argued that the natural sciences are nomothetic (they are concerned with formulating general laws and abstract concepts), whereas the social sciences are preoccupied with the individual and unique aspects of reality.

What is the role of understanding within this causal epistemology? For Weber, the meaningful nature of social action implies that understanding constitutes an indispensable part of any historical explanation. Understanding is not merely one way among others of generating hypotheses. To the contrary, it is built into the logic of the human sciences. Nonetheless, Weber also argued that a merely subjective, empathetic understanding of the motive of an action could not by itself constitute an empirically valid explanation: Understanding must be supplemented by causal analysis. The validity of an interpretation thus depended on its satisfying two criteria. First, an interpretation must be subjectively adequate; that is, it must be amenable to empathetic reproduction. Second, it must be causally adequate; that is, there must be a reasonable, demonstrable probability that the hypothesized motive will normally yield the observed action.

How, then, does the scholar go about satisfying this double requisite of subjective and causal adequacy? Weber advocates the deployment of ideal types. Ideal types are conceptual constructs that do not necessarily have any direct correlate in reality. Rather, when the actual course of action deviates from the ideal type, the social scientist can arrive at a causal explanation of the deviations by appealing

to factors such as misinformation, strategic errors, logical fallacies, and personal temperament.

An Alternative to Positivism

Within Anglophone philosophy, hermeneutic themes and the idea of historical understanding became prominent in the mid-twentieth century as an alternative to positivism. For a while, Collingwood seemed to be almost a lone voice in Oxford, drawing on an elder idealism to address hermeneutic themes. By the 1960s, however, a distinctive Anglophone approach to historical understanding appears in Britain, Canada, and the United States. Philosophers such as William Dray, Peter Winch, and Charles Taylor began to draw on Collingwood, Ludwig Wittgenstein, and a range of hermeneutic and phenomenological thinkers to insist on the interpretive nature of the human sciences.

This second wave of theorizing about historical understanding arose in reaction to the neopositivist attempt to reunify the natural and human sciences on a naturalist basis. The neopositivist project consisted of an attack, led by Carl Hempel and also Theodore Abel, on the idea that historical understanding could be a legitimate, scientific form of explanation. Neopositivism relegated historical understanding to the status of a prescientific source of hypotheses and viewed meanings as no more than intervening variables in causal sequences. The neopositivist challenge provoked a lively debate over historical understanding within Anglophone social sciences, and a number of scholars rose to defend its importance. The most systematic rejoinders came not from social scientists but from philosophers such as Dray and Winch.

Anglophone Hermeneutics

Dray, following Collingwood, insisted that historical explanation depends on making sense of the inner world of actors. Dray departs from Collingwood's perspective, however, in his attempt to integrate causal explanation and historical understanding. In particular, Dray argues that the causal explanation of any action requires an understanding of the purposive reasoning, whether conscious or unconscious, articulated or latent, that caused the actor to perform that action. In his view, the historian has an initial expectation as to what a "normal" course of events would look like in a given situation. A deviation from that expectation prompts the historian to piece together those elements of the actor's reasoning that differed from those we would have expected. The investigation is then completed once the accumulation of knowledge of the actor's reasoning is sufficient to account for the "deviant" course of action. The reconstruction of the inner reasoning of historical actors is thus not an arbitrary, intuitive product of pure empathy; rather, it is built up from the evidence.

Winch argues that social life is fundamentally different from the rest of the natural world in that social relations are "internal relations." Social relations exist through ideas held in people's minds rather than through the external, physical aspects of human interaction. Thus all human behavior is meaningful. Winch adds, following Wittgenstein, that all meaningful behavior is a matter of applying intersubjective, socially established rules within specific social contexts. For Winch, this view of human society is logically incompatible with the kinds of explanation associated with natural science. Historical explanation is not the application of generalizations to particular instances but rather the tracing of internal relations. Explanation is a matter of understanding the social actors' own understanding of their reality.

Winch, like Dray, restores the constitutive role of meaning in social life and in our knowledge of it. But, unlike Dray, he rejects any association of historical inquiry with causal analysis. He particularly attacks Weber's view that, in order to attain scientific validity, historical understanding needs to be supplemented by a probabilistic or statistical kind of causal analysis. Statistical operations, according to Winch, can never get us closer to understanding social action. Winch also rejects psychological forms of understanding directed at grasping internal mental processes. In his view, again following Wittgenstein, all understanding (of oneself, of one's reality, of the objects of historical inquiry) is mediated by socially established concepts. All understanding occurs within an intersubjective linguistic medium rather than in private, unarticulated experience.

German Philosophy

While Anglophone philosophy was breaking new ground in theories of historical understanding,

German philosophy also showed its unabated vibrancy. The most prominent late twentieth-century German theories of historical understanding represent two approaches. First is Hans-Georg Gadamer, whose thought is situated, like Dilthey's, within the hermeneutic tradition. Second is Jürgen Habermas, who seeks to revive Weber's project of synthesizing historical understanding with causal explanation.

According to Gadamer's ontological hermeneutics, we are all inescapably born and immersed within tradition. This tradition is present and alive in us in the form of our prejudices. Our prejudices are the fore-understandings through which we understand the world. They constitute the condition for the possibility of all historical understanding. Historical research forms an indissoluble part of the ontological process of our continuous encounter with tradition. It is integral to our ongoing effort to understand that tradition and thereby understand ourselves as historically situated beings.

Habermas partially accepts Gadamer's conception of historical understanding as an indispensable aspect of the human sciences, but he rejects the drive to model the human sciences in their entirety on hermeneutic foundations. Such a hermeneutic claim to universal scope, they argue, elides the fact that society is actually a complex composite of meaningful and linguistic aspects, on one hand, and the constraints of natural forces and social structures of power, on the other hand. These latter aspects of social life generate social patterns that exhibit quasi-natural characteristics. Therefore, causal explanation is needed in order to penetrate and render visible those aspects of social existence that are impermeable to understanding. Nevertheless, Habermas still views hermeneutic analysis as indispensable for making sense of the meaningful aspects of life. Hence the human sciences need to combine causal explanation with interpretive forms of inquiry.

Current Directions

Many contemporary theorists of historical understanding have been greatly influenced by the different varieties of the linguistic turn in philosophy. They, like Gadamer, often consider beliefs to be embedded in language or tradition. In addition, however, they often conceive of philosophy—especially if, like Winch, they have been influenced by Wittgenstein—as an elucidation of our language or the grammar of our concepts. Hence philosophers today tend to conceive of the process of understanding in terms of the way our concepts lead us to make sense of action by attributing beliefs to people. In this view, the grammar of our concepts is such that we make sense of actions by attributing beliefs or intentions to people. Understanding consists, in other words, of our attributing intentionality to people rather than in our re-creating or re-enacting their thoughts.

Historic Injustice

Claims to material reparations and symbolic restitution for historical injustices are based on the lasting impact of the deeds of previously living people on the well-being of currently living people and the moral quality of their deeds, respectively.

These two grounds for claims to redressing historical injustices differ and raise different questions of interpretation.

The Lasting Impact of Historical Injustices

People can make claims to compensation for harms they have suffered. According to the most common interpretation of harm, a person can be understood to be fully compensated for an act or policy when he or she is as well off as he or she would be if the act had not been carried out. As a modern-day descendant of slaves, has African American Robert been harmed owing to the injustices suffered by his ancestors under this interpretation of harm? Robert's existence is the product of a certain genealogical chain not being broken. Hence, the initial kidnapping in Africa, the transporting to America, and the enslavement of his ancestors are (very likely) necessary conditions for Robert's having come into existence at all. Had his ancestors not been kidnapped and enslaved, Robert would most likely not exist. Thus, Robert cannot be said to have been harmed by the kidnapping and enslavement of his ancestors, for had his ancestors not been kidnapped and enslaved, he would most likely not exist. Also, he would not have been better off had his ancestors not been badly wronged. Thus, we cannot rely upon this interpretation of harm and its accompanying interpretation of compensation to ground the claim that Robert has been harmed and should be compensated. The required state of affairs implies the nonexistence of the person claiming compensation. This is the so-called non-identity problem as it arises in the context of providing measures of compensation to indirect victims of historical injustice. In his work *Reasons and Persons,* Part IV, Derek Parfit has analyzed and discussed the problem in depth.

One way to respond to the problem is to allow for a second, namely, identity-independent notion of harm. Under this interpretation of harm, a person can be considered to be fully compensated for an act or policy (or event) if she or he does not fall below a specified standard at a particular time. Robert can be understood as having incurred harm because his ancestors were kidnapped and enslaved. Whether Robert has been harmed due to the way his ancestors were treated depends upon whether the way they were treated has led to Robert's falling below the specified standard of well-being. However, whether or not this is the case will turn on his current state of well-being.

Injustices committed against people in the past may not give rise to claims to reparations today if such claims can be understood to presuppose an indefensible interpretation of property entitlements. David Lyons and Jeremy Waldron argue that the view that once we acquire entitlements, they continue until we transfer or relinquish them is indefensible because there are reasons of principle for holding that entitlements and rights are sensitive to the passage of time and changes of circumstances. Generally speaking, entitlements are sensitive to background circumstances, and they are vulnerable to prescription.

Further, if legitimate entitlement is sensitive to changes in background circumstances, it is possible that the ongoing effect of an illegitimate acquisition and, more generally, of unjust violations of rights of others can become legitimate when circumstances change. This is what is meant by the thesis that historical injustices may be superseded. However, even if supersession of injustice is possible, the claim that it has occurred in any given situation depends on two claims. We have to determine, first, on the change of what circumstances the possibility of supersession depends and, second, that these circumstances have changed in the case under consideration.

The Moral Status of Past Victims of Historical Injustice

Even if we held the view that the non-identity problem excludes the possibility of currently living people being indirect victims of past injustice or that the historical injustice under consideration has been superseded, we will not wish to deny that past people were wronged. We need to inquire into the question of what we owe to the dead victims of historical injustices. One could defend the claim that we are obliged to the past victims of injustices by attributing rights to them. Alternatively we can attempt to show that currently living people can have duties toward deceased persons even if we assume that dead people cannot be bearers of rights today. Joel Feinberg has argued for the possibility of posthumous harm: The interests of people while alive can be harmed with respect to

posthumous states of affairs. This view requires the harm to have occurred before the death of the person, which presupposes a deterministic understanding of the occurrence of the harmful event. Others have argued that currently living people can stand under imperfect duties toward dead people without there being correlative rights of the deceased people. Especially with respect to dead victims of historical injustice, currently living people might be said to stand a general imperfect duty to bring about the posthumous reputation that people deserve. Commemorative acts of symbolic reparation, for example, a day of remembrance, can be understood as aiming to fulfill this duty toward dead victims of injustice.

Accepting Duties Owing to Historical Injustice

First, people will accept the duty of providing measures of symbolic restitution only if, as members of ongoing societies, they can identify with the public inheritance of their society in such a way that they will want to respond to what they consider inherited public evils by participating in public acts of symbolic reparation. Second, transgenerational legal persons (usually states) in whose name previous members committed crimes against others can be thought to accept an obligation to provide indirect victims with compensation. If so, currently living people as members of such entities can accept a (civic) duty to support their legal person in carrying out its policies of reparation that aim at providing just compensation today in light of both the lack of (sufficient) measures of compensation to the direct victims of historical injustices and their lasting negative impact on the well-being of currently living people.

HISTORICISM

The word *historicism* (*Historismus* in German) was probably first used by the German literary critic Friedrich von Schlegel in 1797 when praising the art historian Johann Winckelmann for his awareness of the "immeasurable distinctness" of antiquity when compared to the present. Less than half a century before David Hume (1972) had still claimed that "mankind are so much the same, in all times and places, that history informs us of nothing new or strange in this particular" (p. 83). Apparently, somewhere between Hume and Schlegel a revolution had taken place in how the West related to its past. The term *historicism* is ordinarily used for referring to this revolution, which was characterized by Karl Mannheim, in what still is the best account of historicism, as the exchange of a "static" for a "dynamic" conception of the world. So not standstill but *change* was now seen as the normal condition of sociopolitical reality.

Self-evidently, this is not to say that (historical) change was unknown to the West before historicism. But there's a difference. Prior to historicism, (historical) change was believed to leave the "substance" of the changing thing itself unaltered. Think of how we may say that a table, in spite of its having undergone change, "substantially" remained the same table it always was, even after we painted it in a different color. This substantialist conception of historical change had its philosophical foundations in natural law philosophy, with its belief in an eternal and unchanging (Stoic) *recta ratio* determining the behavior of all things. And though this belief in a recta ratio is now a universally abandoned curiosity of the past, it still determines how we intuitively conceive of (historical) change.

Historicism replaced this commonsense, substantialist view of change with the view that there are no limits to change and that change may also affect the *substance* of things. This is the historicist "antisubstantialist" view of (historical) change. It

created a number of difficult logical and ontological problems. For example, if nothing is excluded from change, not even a thing's substance, what will then still legitimate us to speak of a "changing *thing*"? What then is the (*un*changing) subject of change to which change is attributed?

Unfortunately, the early nineteenth-century philosophical vocabulary used by the advocates of historicism prevented them from dealing with this problem satisfactorily. But, alas, the problem is no closer to a solution than 200 years ago, mainly because twentieth-century philosophers of language and science (actually possessing the philosophical vocabulary required for dealing with the problem) always unquestioningly accepted the substantialist account of change.

Antisubstantialist Change

Johann Gottfried Herder (1877) was arguably the first advocate of antisubstantialist change:

> The more someone descends into his own self, into the nature and origin of his noblest thoughts, the more he will cover his eyes and feet, and say: "I am, what I have become. I have grown like a tree; the seed was there; but air, earth and all the elements, that I did not pose around me, contributed to developing the seed, the fruit and its structure." (p. 198)

The idea is that something *is* what it *has become* and, hence, that the nature of a thing lies in its history. This is the basic historicist claim. It will be clear that the equation of "being" and "becoming" is a codification of antisubstantialist change, for what remains the same during change (and functions as subject of change in substantialist change) is eo ipso of no interest to the historicist. Next, it is hard to see how anyone can be a historian without agreeing with it: If the historian hopes to have some unique contribution to make to our understanding of the world—a contribution unrivaled by those of other disciplines—only the historicist's equation of "being" with "becoming" will sustain it.

But, once again, if there is change, there must be *something* that changes—and that is itself (presumably) exempt from change. In order to see how Herder deals with the problem, we should focus on his biological metaphor of a tree growing out of a seed. This calls to mind the Aristotelian conception of entelechy, according to which a principle of growth is present already in the acorn, determining how this puny acorn may develop into a mighty oak, while leaving nothing unaltered of the original acorn. Observe, furthermore, the close similarity of Aristotelian entelechy and the Leibnizian notion of the monad as developed in the latter's *Monadology* of 1714. In both cases change and development are accounted for in terms of a principle of growth logically *different* though not separate from *what* grows (oak or monad). Gottfried Leibniz's *Monadology* was all the more important for the emergence of historicism by dividing up the universe into "windowless" individual monads. The notion of individuality, which was to become so central in historicism, has here its most solid philosophical foundation.

For Herder the term *nature* had the same connotation as its Greek equivalent *phusis* (from *phuein* "to grow"): Nature was for him essentially *biological* nature. This effected, for him, a contiguity of the natural and the historical world, as the growth, development, and death of plants, animals, and human beings seem to have their analogues in the emergence and fall of historical entities, such as states or civilizations. This invited Herder to include natural reality into his historicist conception of the world. He thus begins his major work *Ideen zur Philosophie der Geschichte der Menschheit* with a lengthy (and remarkably up-to-date) exposition of the coming into being of the solar system and the earth.

Though such crossovers between the natural and the historical world were never wholly abandoned—think of Jakob Burckhardt's habit of discussing historical development in terms of metamorphoses (*Verpuppungen*) and of the biological metaphors of birth, blossoming, and death so popular in, for example, Spengler's and Toynbee's speculative philosophies of history—this soon became the exception in the course of the nineteenth century. J. G. Droysen was the first advocate of so-called methodological dualism, claiming that the methods adopted by scientists and historians are basically different. The commonsense intuition behind this view was best captured by Wilhelm Windelband's distinction between the nomothetic natural sciences (interested in what is recurrent in this world's phenomena permitting of subsumption

under general laws) and the idiographic historical sciences (focusing on what is unique in these phenomena). So the imperialism of the natural sciences claiming that there should be only one reliable method (the one adopted in the sciences) is answered by the historicist's more relaxed view that we should leave both the natural scientist and the historian to their own devices.

Four Meanings of Historicism

Though the word *historicism* has been given many different meanings, it is possible to discern four meanings from which most of the others can be derived. The first and most important meaning is the one according to which the essence, or identity, of a phenomenon is to be found in its past. A second one can easily be inferred from it: In case of nonsubstantialist change, a thing (nation, state or culture) must at each phase of its development substantially differ from what it was before and from what it will be later on. This is why nonsubstantialist change endows each such phase with a uniqueness, or individuality of its own, with the implication that it will be the historian's task to bring out this uniqueness—as Herder had realized when stating that each historical epoch "has its center of bliss (*Mittelpunkt der Glückseligkeit*) in itself," or, as the same idea was most famously expressed by Leopold von Ranke (1795–1886): "*jede Epoche ist unmittelbar zu Gott*" (each epoch is immediate to God). In both cases the idea is that each historical epoch should be considered on its own terms—and not as the condition or as the outcome of any other. Observe, furthermore, that both Herder and Ranke speak of *each* epoch, thus achieving a seldom noted reconciliation of universality with historical uniqueness.

Third, the condemnation of anachronisms immediately follows from this second conception of historicism. The historian can effectively avoid anachronisms by identifying with the people from the past whose actions and thoughts he or she investigates. This brings us to (variants of) hermeneutics, such as that of R. G. Collingwood (1994), according to which historical thought is "the re-enactment of the past in the historian's own mind" (p. 282). That is to say, the historian should carry his or her thought back to the past, see the world of the past from the point of view of the historical agent in order to come to an adequate understanding of both. As opposed to Collingwood, German hermeneuticists such as Wilhelm Dilthey and Hans Georg Gadamer emphasize the importance of the so-called hermeneutic circle, insisting on a perennial shuttling from the historian's present to the past and backward again.

Fourth, for Karl Popper historicism denotes the belief—as exemplified in the speculative philosophies of Hegel, Marx, Spengler, and Toynbee—that a pattern can be discerned in humanity's past which can be extrapolated into the future. Popper successfully discredited any such aspirations to predict the future on the basis of the past. A much similar argument was given by François Lyotard, though here the emphasis is on the past rather than on extrapolations to the future. This meaning of the word *historicism* stands somewhat apart from the other three, as is clear from the fact that it was always vehemently rejected by adherents of the second and third meanings of the word, while the adherents of the first meaning can afford to remain indifferent to it.

"Historical Ideas"

Historicism's heart is nonsubstantialist change raising the problem of what is to count as subject of change, if nothing is excluded from change. Herder then appealed to Aristotelian entelechy—but this has the disadvantage that entelechies always are species-specific, which is at odds with the historicist's insistence on uniqueness. This problem was solved with the notion of the "historical idea," as proposed by Ranke and Wilhelm von Humboldt: each historical "thing" (nation, epoch, civilization, etc.) is argued to possess a historical idea, an entelechy, so to say, that is wholly specific for itself and for itself alone. Ranke and Humboldt made the following claims for the historical idea:

1. No philosophical analysis or deductive argument will ever present us with the historical idea: Only the most careful and scrupulous empirical historical research of documents and of whatever the past has left us may tell us how to conceive of the historical idea for one specific topic of investigation. Such proposals will continuously be revised on the basis of new evidence and will result in better insights. Hence results historicists' relentless promotion of the professionalization of history.

2. A nation's or an epoch's historical ideas express what is unique or characteristic of them (e.g., think of associations that accompany terms like the *Renaissance* or the *Enlightenment*). Next, what is unique or characteristic of them is their essence, or identity, best captured by their history or an account of how they could come into being.

3. By presenting the nation's or an epoch's historical idea, the historian has, in a way, *explained* the nation's history. The historical idea is, basically, a claim about how a nation's or an epoch's most important features hang together. Think again of how a notion as the Enlightenment succeeds in giving meaning to an infinite number of phenomena of eighteenth-century Europe—and thus explaining them. Historical phenomena are explained by relating them to the historical idea defining a nation's or an epoch's uniqueness or identity, just as a person's actions may be explained by relating them to the person's character.

4. Humboldt explicitly leaves room for causal explanation apart from explanation in terms of historical ideas even though he is no less explicit about the hierarchy obtaining between them: The former is always subservient to the latter. Causal relationships deal with what are merely the *components* of a nation's or an epoch's essence or identity; the historical idea expresses this essence or identity *itself*.

In fact, Ranke's and Humboldt's historical idea is similar to what William Walsh had in mind with his "colligatory concepts," that is, concepts, such as that of the Enlightenment, colligating many aspects of the period in question. The only difference is that Walsh did not doubt that these colligatory concepts are the *historian's* construction, whereas Humboldt situated them in the *past itself*, as entelechies to be discovered by the historian. This is where Humboldt still was under the spell of the idealist philosophical vocabulary of his time.

Historicism's Demise: The Crisis of Historicism

Historicism was a German invention. From Germany it spread to Switzerland (Jacob Burckhardt), Belgium (Henri Pirenne), France (Lucien Febvre), the Netherlands (Johan Huizinga), Spain (José Ortega y Gasset) and Italy (Benedetto Croce). A "light" variant of historicism slowly made its way even to England and the United States, where resistance to historicism was, and still is, strongest. Finally, the professionalization of history, which was also part of the historicists' program, conquered all of the historical world.

In spite of the popularity of historicism for one and a half centuries, few historians will nowadays still call themselves historicists, even in Germany. This has several causes, most important being the so-called crisis of historicism, which arose from the confrontation of historicism with the neo-Kantianism *en vogue* in most German universities at the end of the nineteenth century. Most variants of neo-Kantianism had inherited from Kant the conviction that values must be eternally valid. This is obviously at odds with what history has on offer. This caused the greatest confusion and despair in the minds of the neo-Kantians (and of theologians such as Ernst Troeltsch who also sought absolute and time-transcendent moral and theological truths)—and historicism was accused of having been the source of the neo-Kantians' discomforts.

A number of comments are appropriate. In the first place, each historian, whether historicist or not, will know that no (moral) values are valid for all times and places. So if the neo-Kantian (or the theologian) prefers to remind blind to this fact, he or she will have to abolish all of historical writing—and not just historicism. Next, if there is a conflict between plain historical fact and the neo-Kantian's dreams of eternal moral truths, had we then not better awaken from these dreams? Moreover, what's wrong with norms and values that are not universally valid? As we know from legislation, values and norms can be perfectly rational and acceptable, though it would be ridiculous to claim a universal validity for them.

Hobbes, Thomas (1588–1679)

Thomas Hobbes is one of the most prominent political theorists in the English language. His many texts, but most prominently his *Leviathan* (1651), established him as one of the key theorists of sovereignty, political authority, and social contract theory.

Life and Works

Although *Leviathan* is his most famous book (and will be the focus of this entry), Hobbes wrote many other important works as well. Many of these other works, particularly *The Elements of Law* (1640) and *De Cive* (1642), serve in some ways as precursors for *Leviathan*. Another important book, *Behemoth,* was an account of the English civil war and came out posthumously, in 1681. Taking his opus as a whole, Hobbes is often regarded as a "protoliberal." Although he wrote before the true advent of liberalism as a social and economic practice, Hobbes is said to have produced many of the fundamentals of the liberal order. Hobbes's designation as a "proto" liberal may also indicate a certain discomfort that many contemporary liberals have with what they see as Hobbes's harsh and authoritarian doctrines. Over the following centuries a variety of thinkers finessed liberal doctrine on sovereignty, law, and political authority, but Hobbes is often given pride of place for having largely conceptualized the founding narratives of the liberal world we live in today (although not in a straightforward or unproblematic manner).

Hobbes lived and wrote during a time of tremendous upheaval in his native England. Years of conflict between the kings of the Stuart dynasty and the English parliament culminated in the English civil war during the 1640s. The war was fought over questions of political centralization as well as over questions of religion. The Stuart kings headed the Church of England, whereas many of the parliamentarians were Puritans, a loosely affiliated religious movement that sought a decentralization of English religious practices concomitant with the decentralization of the state. The war culminated in the capture and eventual execution of Charles I in 1649, leading to the establishment of the Commonwealth of England under the Puritan leader Oliver Cromwell. Because of the war, Hobbes, a lifelong Anglican and a royalist, went into exile in Paris along with the remainder of the court (including Charles's son, Charles II) and Anglican leadership.

For most contemporary Hobbes scholars, the publication of *Leviathan,* 2 years after the execution of Charles I, is understood as Hobbes's reaction to the war and regicide (although, as already stated, *Leviathan* also reflects a lot of the work Hobbes had already written and published years before). Scholars today argue that in *Leviathan,* Hobbes saw that, given the general breakdown in English society, traditional sources of authority were no longer sufficient. In writing *Leviathan,* they say, Hobbes sought nothing less than to create a new rationale for political authority and obedience.

Given this contemporary assessment of Hobbes, it is worth noting that in his own lifetime, when *Leviathan* was published, Hobbes was regarded as a traitor to the crown and the state church. Royalists objected strenuously, for example, to his claim in that book that political subjects have the right to change allegiance to a new sovereign if their existing one is defeated militarily (in other words, the very situation that the subjects of England found themselves in after the war). Anglican clergy also objected to some of Hobbes's claims about the state church in that text; whereas in practice the Anglican bishops had a fairly extensive amount of autonomy from the state, Hobbes insisted that the king have absolute power over all matters of liturgy and scriptural interpretation. He also promoted quite a few unorthodox theological ideas such as a repudiation of the idea of hell.

Following the publication of *Leviathan,* the degree of antipathy toward Hobbes became so great that he came to fear for his life in Paris and returned to live under Cromwell's government. This only sealed his reputation among the Anglicans and royalists for being a turncoat. For the rest of his life, Hobbes suffered from a bad reputation among the very group that he claimed to fervently support (although over time that antipathy lessened somewhat). Some of his most vociferous critics included the Anglican theologian John Bramhall, who accused Hobbes of preaching atheism, and Edward Hyde, Earl of Clarendon, who objected to what he saw as Hobbes's treasonous notions of political loyalty. Robert Filmer, the author of *Patriarcha,* felt that Hobbes's notion of the social contract diminished the role of Adam and Eve in founding human societies. Other critics held that Hobbes evinced an anarchistic tendency. Hobbes's 1668 republication of *Leviathan* in Latin—in which various offending passages were omitted or altered—was likely intended to improve his reputation. Although he was always held with some mistrust (so that *Hobbism* became a term of suspicion by supporters of the Crown long after the Stuarts were restored to power in England), Hobbes managed to outlive many of his critics and thereby end his days in relative peace.

In terms of his reputation, there is thus a great paradox about Hobbes. While he was alive, Hobbes was accused of being an anarchist, an atheist, and a subversive radical. Today, Hobbes is often considered to be an arch-conservative. Hobbes thus has the odd distinction of being generally disliked as a theorist (without being any less influential) even though the reasons for this dislike have changed diametrically. That one thinker could have elicited such extremely divergent viewpoints at various time points both to Hobbes's immense complexity as a thinker and writer as well as to certain tensions which can be found in most of his work, but especially in *Leviathan.* In that book in particular, we see a tension between Hobbes's own political conservativism and the often radical (and possibly subversive) implications of much of his theory of language, his epistemology, and his views about religion. The remainder of this entry will consider both the way that Hobbes is conventionally read in the present time as well as some of the ways his own text might lend itself to being read otherwise (as it was during his own lifetime).

As already mentioned, most contemporary scholars read Hobbes as proposing a fairly stern version of sovereignty as the answer to the problem of political authority. Most famously, in *Leviathan,* Hobbes describes the social contract, a hypothetical moment when human beings emerged out of the anarchic state of nature in order to avoid the dangers and uncertainties of a world without any kind of central authority.

Nature and Sovereignty

For Hobbes the state of nature is not tenable because it always threatens to turn into a state of war. Without some overarching form of authority to bind us, we tend to turn against one another. In his famous description of this danger (arguably the

most famous passage in all of *Leviathan*), Hobbes (1996) tells us that life in the state of nature is "solitary, poore, nasty, brutish, and short" (p. 89). Without being able to trust one another, people cannot build a future, cannot engage in farming or commerce or other aspects of human life that assume a stable future.

In order to escape this woeful condition, by forming the social contract, each person agrees to submit her- or himself to a common power (which could be one person, some committee, or even everyone in the form of a democratic, representative government), who sets and enforces the laws that bind all equally. Hobbes (1996) tells us that we must submit all of our individual wills to "one Will" (p. 120), the will of the sovereign. The sovereign, he tells us further, is an "*Artificiall person*" (p. 111) who acts on behalf of the people that have authored the social contract. Hobbes offers that in giving power to the sovereign, we bind ourselves so that we in effect "will" whatever the sovereign does (even if we don't actually like the sovereign's actions). The sovereign is not itself bound by the social contract; it may have an interest in keeping the community under its responsibility relatively content, but it has no particular contractual obligations to the people per se. Yet Hobbes does not expect that the sovereign will be overly onerous. He tells us that the sovereign gains nothing from hurting the subjects and that it is reasonable to hope that the sovereign will treat the people relatively well. Yet he also tells us that even if our sovereign is terrible, any harm that it can inflict on its population pales in comparison to what happens to people in the state of nature. Thus the specter of the state of nature (and the danger it poses of perpetual war) serves (Hobbes hopes) to get us to appreciate the government that we have, even if it is a government we don't necessarily like all that much.

If the sovereign has few checks on its power, the duties of the people to the sovereign are, by contrast, vast; the sovereign has the last word in determining laws, adjudicating conflicts, and defining the meaning of terms and measures and other matters of public interest. For Hobbes, where the sovereign is silent (the "silence of the laws"), people are able to think and do as they please. People can choose their own line of work, raise their children as they see fit, and things of that nature. Yet, for all of these "liberties of the subject," we can see that for Hobbes the definition of what the subjects can and cannot do depends on the sovereign's own decision (an insight Carl Schmitt takes from Hobbes in his own analysis of sovereignty). The only rights that the citizen has that are not up to sovereign decision come from the fundamental right to protect one's own life. Because the initial rationale for coming under sovereign authority in the first place is to avoid the dangers and anarchy of the state of nature, if the sovereign cannot protect the subject's life, the subject is no longer bound by the social contract. This is why Hobbes argued that if a subject's sovereign is defeated by war, they have the right to give their allegiance to a new sovereign. Similarly, a subject has the right to pay someone else to fight for him if that subject is too fearful to do so. Finally (however odd this may seem for such a seemingly conservative writer), a subject who is subject to the death penalty by the sovereign has the right to fight for his own life (in practice this may not be such a concession, given that the condemned subject will be fighting against the entire state apparatus).

Many writers have taken issue with Hobbes's sovereign, seeing it as too harsh, too absolute, and not in any way "representing" the people that it purportedly serves. Later writers like John Locke distinguish between the "sovereignty" of the people as a whole and their government, which he saw as subservient to the people's interests. Later still, Jean-Jacques Rousseau argued explicitly against Hobbes that the people themselves were sovereign and therefore were not bound by some outside, unbound political authority. Such attempts to ameliorate or relocate the form of sovereignty that we receive from Hobbes are an ongoing feature of political theory to this day. For example, in relatively more recent writings, both H. L. A. Hart and Ronald Dworkin have argued against a Hobbesian notion of political sovereignty (i.e., one in which the government or executive branch is sovereign in a way that excludes or limits popular participation).

For Hobbes, however, the absolute authority of a sovereign is necessary; anything short of giving the sovereign the last word on every major decision (save the decision to save and protect one's own life) would be to reduce this key political figure to the very forces that it protects us from. Without a singular will to serve as the last word on

all matters of importance, we would be torn apart by our (inevitable) disagreements.

Above all, Hobbes believed, we need the sovereign to counteract each individual's tendency to consider his own judgment to be superior to that of all others. Hobbes's understanding of the state of nature can be read as a kind of allegory that reveals what this tendency, taken to its logical conclusion, would look like. For Hobbes the English civil war could be blamed, in large part, on the kind of interpretive chaos that ensued when vast numbers of sects and individuals set out to interpret scripture as they saw fit (especially given the fact that they were willing to fight and die for their interpretations).

Hobbes believed that we are readily deceived because of the basic instability and fluidity of language itself. We can use different words to describe similar events with vast consequences for how we think about things. Hobbes suggested, for example, that an act of regicide becomes labeled "tyrannicide" and therefore justified. Without a common way to agree on meaning, we tend to favor our own understanding and interpretation (or, more often than not, the interpretation of some other, influential person).

In the face of the interpretive chaos that such a state of affairs threatens, the sovereign serves for Hobbes as the last word in deciding on the meaning and use of terms. The sovereign's linguistic determinations allow for a widespread and regular public coordination of meaning, thereby providing a basis for a stable political authority as well. Hobbes is effectively arguing that it doesn't much matter what decisions the sovereign actually makes. Although Hobbes (1996) concedes that the sovereign is an "arbitrary government" (p. 471), he argues that we need such government to avoid civil war. Given that an older model of political authority based on divine truths and royal prerogative seemed no longer to function, Hobbes saw sovereignty as serving to replace that prerogative with an appeal to the basic need to make sense to one another, to minimally agree and thereby to survive (and perhaps even thrive).

Hobbes's Conservatism

Although this political view accords with what seems to be Hobbes's own political conservativism, there are ways that his text sometimes seems to undermine his own orthodoxy. For one thing, although it serves as a basis for his notion of sovereign power, Hobbes's radical skepticism seems to make for an inherently unstable basis for that authority. A more conventionally conservative figure might not proclaim the sovereign to be arbitrary and self-motivated as Hobbes does (and such claims did not go unnoticed by Hobbes's peers).

Such an ambivalent epistemological basis for sovereign authority is reinforced by the religious doctrines that Hobbes promotes throughout his work, but especially in *Leviathan* itself. In that book, Hobbes offers two genealogies for the rise of political authority. One is the story of the social contract and the production of human sovereignty. The other is a story about the rise of political authority based on God's own sovereignty on earth. Although Hobbes insists that the religious basis for the political authority he describes is fully in accord with his narrative of the social contract, this other genealogy sets up a rival (and potentially subversive) counter-narrative about the genesis and nature of authority. Whereas the first story is ahistorical and hypothetical, the second story is eschatological and theological in nature. In this other version, political authority is established by what Hobbes calls the first "kingdom of God," in ancient Israel.

In this kingdom, Hobbes tells us that God was actually king of the Jews (with Moses acting as God's "lieutenant"). This kingdom was an iteration of God's earlier covenant with the Jews (made with Abraham). After Moses's death, God's authority was interpreted by a series of prophets and judges, as well as by the people themselves. When the Israelites elected Saul as their king, Hobbes tells us, they effectively displaced God as their monarch, breaking their end of the covenant. This act ended the period of divine rule and ushered in the modern period of human sovereigns that we live in today. For Hobbes the rule of human sovereigns will not end until the establishment of the second kingdom of God, when Christ rules on earth in God's name.

This alternative genealogy is important because of the ways that God is a very different kind of sovereign than the human sovereigns that follow. Although God is the king of an actual human kingdom (ancient Israel), God remains utterly

mysterious. God does not speak to the Israelites except through the mediation of Moses, and even then, God speaks to Moses through visions. Hobbes (1996) tells us it is "a more cleer [*sic*] Vision" than any other prophet ever received (p. 293).

More generally, for Hobbes, God remains a kind of cipher that not only permits but even requires a widespread and public conversation about what God may or may not require of us. Hobbes (1996) tells us that we don't understand anything about God except "*that he is*" (p. 271). Rather than try to determine what is true about God, we can only attribute to God those things that we honor among ourselves. In this way, by seeking to honor God we are also, in effect, determining our own collective interpretations about the good.

Such notions serve as a necessary reservoir of collective decision making that is independent of sovereign judgments; whereas in the time of Moses, we have a case of God speaking more or less directly to a political leader, in our own time we have lost such clarity. Although elsewhere in *Leviathan,* Hobbes approves of the sovereign serving as the last word on virtually all matters, when it comes especially to religious questions, we see the sovereign in a more problematic light. For Hobbes (1996) the religious opinions of our terrestrial sovereigns are only "superstructions of Hay, or Stubble" (p. 413). Human sovereigns offer *an* opinion about God and truth, but certainly what they believe is not any truer than the general consensus about the good that comes out of more collective and decentralized decision-making processes.

Hobbes even sometimes implies that the sovereign opinion is *worse* than the collective opinion. He tells us, for example, that during the time of the Apostles, their own interpretation coexisted with the interpretation of the people. In the absence of any kind of real divine authority (whether in the form of God or Jesus), the ability of people to interpret and think for themselves is a crucial aspect of the conveyance of authority. This, Hobbes (1996) tells us, is just as true in our own time and will remain the case "till Kings were Pastors, or Pastors Kings" (p. 356). In contrast to the time of Moses (a pastor king if ever there was one), contemporary sovereigns are not capable of effectively replacing public conversations about the good with an actual, undeniable truth.

Two Forms of Sovereignty

When we look at the two forms of sovereignty depicted in *Leviathan* side by side (i.e., God's sovereignty and human sovereignty), human sovereigns suffer from the comparison. Whereas terrestrial sovereigns, as we have seen, are not bound by promises, God is bound by covenant. (Hobbes tells us that even after the Israelites break their end of the contract, God remains bound by it.) Whereas terrestrial sovereigns turn their opinions into an unquestionable basis for law and meaning, God's judgment not only permits but requires popular interpretation. And whereas terrestrial sovereigns are arbitrary and random, God is not. Although Hobbes repeatedly insists throughout *Leviathan* that there is a continuity of sovereignty stemming from God's reign in Israel down to the Stuart monarchs of his time, the religious basis of authority that he portrays seems to undermine the authority and relevance of terrestrial sovereigns rather than serve as a basis for their own rule.

If God's kingdom were forever banished, this contrast would not be relevant; if we are effectively stuck with human kings forever, then we had best learn to respect their authority (insofar as we would have no other options). But Hobbes tells us that God's kingdom is to return with the reign of Jesus Christ on earth; our own time remains sandwiched between the two iterations of God's kingdom, and so the contrast between divine and terrestrial forms of sovereignty remains pertinent and troubling.

This sense of the earthly sovereign's nonrepresentativeness and nonresponsiveness is only further reinforced by Hobbes's understanding of language and metaphor. In *Leviathan* Hobbes (1996) repeatedly inveighs against what he calls the "Error of *Separated Essences*" (p. 466), an idolatrous approach to language wherein metaphors and other rhetorical figures come to supplant what they are meant to represent. Such an error leads to an entirely false (and metaphysical) sense of reality, producing what Hobbes calls a "Kingdome of Darknesse" (the subject of Part IV of *Leviathan*). Here, symbols are given a life of their own, independent of their referent.

To illustrate this concept of separated essences, Hobbes gives the example of the soul, a figure of speech originally meant to represent people (such

as when we say "there is not a soul in sight"). For Hobbes, far from remaining a mere marker of personhood, the soul has become a rogue metaphor; it has become immortal and superior to the person(s) that it originally stood for. By making an analogy between the semiotic and the political (an analogy Hobbes frequently makes), one could argue that the sovereign, which similarly is meant to represent the people (but does not) is a "separated essence," an idol that has replaced the people with its own inflated conception. Hobbes (1996) lends support to this reading when he calls the sovereign the "Soule" of the commonwealth (p. 153). Today this comment is usually read as a compliment—a testament to sovereign centrality and vitality—but it could just as easily be the opposite, given what Hobbes has to say about the soul as an idolatrous figure of speech.

To point out how subversive some of Hobbes's inferences about religion, language, and epistemology can be is not necessarily to suggest that Hobbes was a secret radical (although he was accused of being one in his own lifetime). But it does seem fair to infer that taken as a whole, *Leviathan* is less conservative, less straightforward than the sum of its parts. Paradoxically, this author who cared so much about the control and value of meaning penned a work whose scope is so vast and complex that its own "meaning" is a kind of battleground, open for interpretation.

Given his complex theology and radical skepticism, at the very least it seems clear that Hobbes is not the perfectly orthodox thinker he claims to be. *Leviathan,* in particular, is replete with passages that directly challenge religious and political orthodoxy even as Hobbes frequently claimed in that book to be strictly following the sovereign's will on all matters. The very fact that a private citizen such as Hobbes was dictating the proper sovereign powers to the court and clergy can be read as a kind of usurpation of a power that he attributes solely to the sovereign itself.

For all of this complexity, Hobbes's contemporary reputation is fairly straightforward. As a rule, much more attention is paid to his political writings—and in particular his depiction of the state of nature and the social contract—than his lengthy religious and linguistic expositions. (There are of course important exceptions, such as J. G. A. Pocock's work on Hobbes's religious writings.) In the general consensus on Hobbes over the past century, whereas most acknowledge his huge influence, few writers openly defend him. Schmitt is one prominent exception to this tendency (although he too is a fairly controversial figure). Mostly, Hobbes receives a mixture of admiration for having founded much of the modern order and criticism for having done so in such a harsh and unbending manner.

Hobbes's enduring legacy comes from the forms of political, social, and economic organization that have been attributed (at least in part) to his name as well as from an ongoing appreciation of the depths of ideas that come out of writings such as *Leviathan*. In their erudition and breadth, and even in their seeming contradictions, his texts will continue to underlie many of our contemporary political practices and supply the means for fresh readings and rereadings of the question of sovereignty, government, and political authority for generations of scholars to come.

Hobhouse, Leonard Trelawny (1864–1929)

Leonard Trelawny Hobhouse, liberal political theorist and journalist, is best known today for his 1911 *Liberalism,* which became the quintessential statement of British new liberalism. Having begun his studies at Corpus Christi College, Oxford, in 1883, Hobhouse was elected a fellow of the college in 1894. He left Oxford in 1897 for Manchester, where he began a long association writing for C. P. Scott's *Manchester Guardian*. He resigned writing for the *Manchester Guardian* on a regular basis in 1902, subsequently also contributing to *The Nation* and other radical liberal publications. In 1907, he was elected to the Martin White Chair in Sociology, the first ever chair in sociology in Great Britain, at the London School of Economics. He held this position until his death in 1929. His writings are marked by three periods.

Early Oxford and Manchester Writings

Hobhouse's first book, *The Labour Movement* (1893), defended trade unionism, cooperation, and state socialism, repeating various Fabian arguments with which he had adopted early in his career. *A Theory of Knowledge* (1896) followed and was very different in its thrust. Much less polemical, it tried to combine Oxford idealism's holism, especially T. H. Green's, with greater deference to evolutionary biology. It therefore represents Hobhouse's first sustained attempt to explore the relationship between mind, morality, and evolution, which preoccupied him throughout his life. Just before resigning from the *Manchester Guardian* in 1902, Hobhouse published *Mind in Evolution* (1901), which was the first of a trilogy devoted to synthesizing philosophy and sociology in keeping with themes which he first began exploring in *A Theory of Knowledge*.

Liberalism Through the End of World War I

Hobhouse next published *Democracy and Reaction* (1904), in which he began working out new liberal themes that he hoped both radical liberals and moderate socialists would find appealing. But Hobhouse's seminal statement of the new liberalism was his *Liberalism* (1911). Contemporary liberal theorists are typically unfamiliar with the new liberals, who include D. G. Ritchie and J. A. Hobson, though some at least know about Hobhouse's *Liberalism*. In *Liberalism,* Hobhouse argues that one can be harmed directly by force or fraud or indirectly by being denied equal opportunities or by being robbed of one's share of socially created value. The right to a living wage, unemployment insurance, and state "tenantry" of land assured all citizens meaningful opportunities to flourish, which Hobhouse happily conceded amounted to "liberal socialism."

Morals in Evolution (1906) was followed by *Development and Purpose* (1913) as the second and third volumes of his trilogy, which had become Hobhouse's venue for working out what he had begun referring to as "orthogenic evolution." For Hobhouse, much like Ritchie, the evolution of human consciousness invests the blind struggle for survival with direction and purpose. Mind and morality are unprecedented orthogenic events allowing humanity to tame the haphazard flow of natural selection. With the evolutionary emergence of humans, methodical cooperation gradually begins replacing random competition. Reason has slowly been replacing instinct, rationalizing and systematizing human moral conventions as societies advance.

Moral Philosophy After World War I

At the end of World War I, Hobhouse published *The Metaphysical Theory of the State* (1918), which attacked Bernard Bosanquet's *The Philosophical Theory of the State* (1899) for its statism and for infecting British political philosophical thinking with German idealism, especially that of Georg Wilhelm Friedrich Hegel. Next followed Hobhouse's second trilogy: *The Rational Good* (1921), *The Elements of Social Justice* (1922), and *Social Development* (1924).

The Rational Good is fascinating for how it reveals just how indebted Hobhouse was to nineteenth-century classical utilitarianism, particularly John Stuart Mill's version. Hobhouse was just as much a liberal utilitarian as Mill is often now characterized, as he was a new liberal inspired equally by Green. And he did not hesitate to acknowledge these intellectual debts, conceding that his moral theory stood closely to Mill's utilitarianism, on one hand, and Green's ethical idealism, on the other. Indeed, Hobhouse's very definition of rational good exhibits just how dedicated he was to accommodating Mill's conception of happiness and Green's conception of self-realization. Viewed as feeling, "rational good" was happiness, whereas viewed as the object of this feeling, it was self-realization. In other words, for Hobhouse, self-realizing lives were simultaneously happy lives. Happiness is the "feeling tone" that accompanies or marks self-realizing lives. Together, self-realization and happiness constituted rational goodness. Because happiness moved in tandem with self-realization, promoting happiness promoted self-realization too, making Millian-improved utilitarianism a perfectly satisfactory substitute method of practical reasoning.

Hobhouse's new liberalism mimicked Mill's liberal utilitarianism in more ways than one. *The Elements of Social Justice,* like his earlier *Liberalism,* defends "prima facie" rights, both negative and positive, as the best *indirect* strategy for promoting rational goodness. By securing meaningful equal opportunities for all, basic moral rights promoted without guaranteeing the "development of personality" in each community member. Genuine liberty, therefore, was each citizen enjoying the greatest possible opportunity for making the "best of himself." And when each person flourished, all flourished even more because each of us is an interdependent social nexus, a "transpersonal reference." Hobhouse's new liberalism, and indeed Green's, Ritchie's, and Hobson's as well, owed much more to Mill than the received view of them acknowledges, which strongly suggests that the new liberalism was more a modification of classical utilitarianism than a rejection of it.

Household

The household held a central place in ancient conceptualizations of power, governance, and community. Although there was no single model of the household in antiquity, Greeks, Romans, ancient Jews, and early Christians shared several presuppositions about its elite form. Within an ancient Mediterranean context, the term *household* (Greek: *oikos;* Latin: *domus;* Hebrew: *bêt'ab*) referred simultaneously to persons and property. As a social unit, most ancient households were centered upon a nuclear core, but they might have also included extended family members (e.g., a widowed mother, unmarried siblings, adopted children), as well as slaves and other dependents. As property, an ancient household comprised the collective lands, buildings, animals, and slaves owned by its members. In ancient Mediterranean societies, which were agrarian based and largely dependent upon human labor, households were

the primary economic unit of production and reproduction. In fact, the English word *economy* derives from the Greek word for household management (*oikonomia*).

Ancient households were largely patriarchal in their organization, with the oldest living male typically (though not always) occupying the position of head of house. Women were closely associated with domestic space and activities, and in most ancient societies there were social and legal barriers preventing their direct participation in political activity. However, the ancients emphasized the fact that the household generated a state's citizens, soldiers, and sustenance. They identified first and foremost not as individuals but as members of households, and they valued wealth exclusively in terms of property ownership. For them, the private household and the activities of its female members were not marginal to public life or political power but constitutive of them. In many respects, modern binary categories of "public" and "private" inadequately express the fluid and dynamic relationship between the domestic and political spheres in antiquity. Indeed it was precisely the household's inextricable relationship to larger social, political, and religious communities (the city-state, the empire, the church, the divine cosmos) that fascinated ancient thinkers.

The Classical and Hellenistic Greek Household

Scholars had once posited a decline in the political significance of the household with the rise of radical democracy in cities like Athens in circa 500 BCE, when aristocratic rule dominated by a few noble families was replaced by democratic rule by an entire male citizenry. However, it is now widely believed that the household remained both empirically and theoretically significant in classical Greece. Membership in an Athenian household, for example, was a requirement for Athenian citizenship: A young Athenian man could not register in a *phratry* or *deme* (the two official subdivisions of Athenian society based, respectively, on kinship and place of residence) and hence could not be counted as a citizen without proof of parentage. And after 450 BCE, Athenian citizenship was a precondition of property transmission: Only the children of married Athenian citizens could inherit or own land. More informally, private wealth (generated by households) enabled Athenian citizens to assert their political status via the patronage of public works, religion, military campaigns, and civic events. Women, who were categorically denied access to political offices, law courts, and the citizen assemblies, also continued to participate in political life through their leading roles in public religious rituals and in household activities, which, scholars now emphasize, were never spatially sequestered within a special women's quarters. Thus, although the emergence of radical democracy unquestionably sharpened the distinction between the domestic and political spheres, it hardly bifurcated them.

Fifth-century Athenian playwrights like Aeschylus and Sophocles explored some of the tensions that developed between the household and the city-state with the emergence of a radical democracy, whereas subsequent thinkers like Plato (429–347 BCE), Xenophon (430–356 BCE), and Aristotle (384–322 BCE) variously analyzed the household and its proper relationship to a more mature city-state. Plato first articulated an idea that became axiomatic in Greco-Roman thought: The household, organized around the core relationship of marriage, was the starting point of the city-state (*Laws,* 720e–721a). The procreative partnership between husband and wife, in other words, was not only the central relationship around which a household formed but also the elemental building block of the larger political community. Elsewhere in *The Laws,* Plato drew parallels between the governance of household and the city-state, positing that the leaders of both institutions governed their subordinates not through force but through their innately superior position, as a father, husband, or slavemaster in the household and as a noble, wise, and strong leader in the city-state (*Laws,* 690a–b). To what extent Plato rejected the household in *The Republic* is moot: Although Plato's utopian city-state eliminated many of the core features of a traditional Greek household (e.g., private property and wealth management, the rearing and education of children in the home, monogamy), Plato also imagined it as a single, organic family. Aristotle in fact criticized Plato on this precise point: The city-state, Aristotle argued, was not simply a household writ large but a community comprising individual households, and as such it was the more

complete form of human organization (*Politics,* 1252a–1263b).

Although Aristotle privileged the state over the household, he nevertheless stressed a synecdochic relationship between them. As the most elemental "part" of the larger whole, the household encompassed the most essential relationships and activities for the achievement of the good life; hence, its management was crucial to the constitution of the city-state. For Aristotle, households and city-states shared the same goals: self-sufficiency (*autarkia*) and the provisioning of a good life for its members. Aristotle's analyses of household management (*oikonomia*) in *The Politics* and *Nicomachean Ethics* included discussions of what Aristotle identified as the three primary domestic associations (husband/wife, father/child, master/slave) and the proper means of acquiring wealth for the household's daily needs. While criticizing those who believed household management was itself a political activity, Aristotle used the language of politics to characterize the householder's mode of rule. Whereas a master ruled his slaves despotically, wives and children were free; hence, a husband governed his wife in the manner of a statesman (*Politics,* 1259b) or aristocrat (*Nicomachean Ethics* [*NE*], 1160b), and a father governed his child in the manner of a king (*Politics,* 1259a–b; *NE,* 1160). Like Plato, Aristotle believed that these domestic relations of power were "natural" because the deliberative faculties of women, children, and slaves were incomplete, underdeveloped, or absent (*Politics,* 1254a–1255a, 1260a). Regarding property and the household, Aristotle privileged a limited form of wealth acquisition that was geared exclusively to a household's ideal self-sufficiency. Hence the good householder was to eschew all commercial enterprises, which Aristotle believed encouraged an unlimited accumulation of wealth (*Politics,* 1256a–1258b).

Xenophon's *Oeconomicus* (*Oec.*; "the household manager"), the earliest extant Greek treatise on estate management, was also extremely influential in the development of ancient ideas about the household. Structured like a Socratic dialogue, the *Oeconomicus* presents an idealized blueprint of domestic relations and activities on an aristocratic estate. For Xenophon, household management was a specific branch of knowledge (*episteme*) associated with the "true gentleman" (*Oeconomicus,* 6.8). Although he clearly envisioned an agricultural estate, Xenophon focused less on the mechanics of farming and more on the ethics of power that structured the household. For Xenophon, order (*taxis*) was the guiding principle of estate management. The ideal household was a delicately balanced institution, where husband and wife had complementary responsibilities: He was in charge of activities outside of the house, and her domain was within it (*Oec.,* 7). In contrast to Plato and Aristotle, who focused on the male householder, Xenophon underscored the reciprocity of domestic activities and the interdependence of household members, emphasizing marriage as a partnership and slavery as a more nuanced mode of labor. In accordance with them, Xenophon underscored the interconnections of household and city-state by drawing analogies between the ordering of the domestic and the public sphere (*Oec.,* 8.3–9; 9.14–5).

Hellenistic thinkers inherited the ideas of Plato, Xenophon, and Aristotle, recalibrating them to fit new geopolitical realities. By the late fourth century BCE, the independent, democratic city-state had been replaced by large central states, formed by Alexander and his generals, which controlled extensive networks of cities. Although democracy perhaps existed on the local level, the dominant government throughout the Mediterranean world was monarchy (with Rome as an important exception). Among the many consequences of these geopolitical changes was a shift in cultural sensibilities: Hellenistic thinkers often pondered the morality of the individual as a distinct subject rather than as a citizen of the city-state, and his actions were placed within a much broader sphere of action: the divine cosmos. Within this new existential context, the household came to be seen less as generative of, or analogous to, the city-state and more as a microcosm that mirrored the larger order (or disorder) of the empire or cosmos. Discussions of the household by Peripatetic, Stoic, and Neo-Pythagorean philosophers emphasized the centrality of family relations, especially the reciprocal association between husband and wife, in both the formulation of community and the maintenance of cosmic order. For the Stoics in particular, family relationships were among the most essential forms of social bonds, and the life of a well-born, "good" man was only completed

through marriage and procreation. Moreover, Hellenistic thinkers widely perceived estate management as a distinct area of practical, personal ethics. According to a passage preserved by Arius Didymus in his Stoic anthology, the wise man is "both skilled in estate management and the acquisition of wealth" (Stobaeus, II.7, 11g). Consequently, the Hellenistic Mediterranean witnessed a fluorescence of treatises on household management, and the subject "concerning household management" became a popular *topos*. Xenophon and Aristotle remained influential (Aristotle's name and the title of Xenophon's treatise were attributed to three Hellenistic handbooks on household management, known collectively as the *Oeconomicus*). But the Hellenistic treatises charted new ground in their emphasis on the reciprocity of spousal relations, their focus on the perspective of the wife, and their presentation of household management as an expression of the householder's self-mastery (*sophrosyne*).

The Roman Household

Like the Greeks, the Romans conceived the household as a set of social relations organized around the nuclear family and its dependents and as an economic unit of production and reproduction. They also inherited many classical and Hellenistic ideas about the household, from its generative role as a building block of political society to the cosmic importance of its careful management by the householder, his wife, and their slaves. Not only did the late Republican statesman Cicero (106–43 BCE) translate Xenophon's *Oeconomicus* into Latin, but he also reiterated what had become a cultural axiom when he proclaimed that the household was the foundation of civil government and "the seedbed . . . of the state" (*On Duties,* 1.17.54). The *topos* "concerning household management" inspired distinctly Roman agronomical treatises (such as Cato's *On Agriculture* and Varro's *On Rural Matters*), while also influencing additional genres, like forensic oratory, where it came to function as a mode of political praise and invective (cf. Cicero, *Pro Caelio*). The Stoic moralization of household management was also phenomenally influential in Roman thought. To an even greater extent than their Greek counterparts, the Romans perceived household management as an index of the householder's moral status and, as such, a barometer of his ability to perform in the public sphere.

However, whereas the Greeks surely venerated ancestry and certainly perceived domestic life as inextricably linked to politics, the Romans arguably placed an even more explicit emphasis on the household in their formulations of power. Rome was not only a commonwealth (*res publica*); it was also "the fatherland" (*patria*), a nation of people who mythologized themselves as an ancient race of austere farmer-soldiers. "When our elders praised a good man," Cato the Elder (234–149 BCE) wrote, "'good farmer and good cultivator' is how they praised him" (*On Agriculture, praef.* 2). The cardinal Roman virtue of individual duty (*pietas*) was understood to have three overlapping domains: the state, the household, and the gods. In terms of cultural practice, the Roman household was perceived not as a refuge from public life but as a theater for its performance, and public officials regularly used their private homes as venues for the conduct of politics. The household was so central to the Roman worldview that it could be deemed sacrosanct, as it was the place where families worshiped their ancestral gods, who simultaneously watched over household and state (Cicero, *On His House,* 109, 144). For the Romans, the domestic sphere was neither merely parallel to nor (only) generative of the state, but continuous and coterminous with it.

For the first half millennium of its existence as a state (509–31 BCE), Rome was a republic, a quasi-democratic government organized around several citizen assemblies. However, in reality it was a state controlled in large part by a relatively small number of property owners and aristocrats. During the time of the republic, there were property qualifications for entrance and placement within one of Rome's assemblies (the *comitia centuriata*); military service also required a minimum net worth. The Senate, the primary political body in the republic, had no property qualifications for admission in this period, though such requirements would have been, in large part, redundant. Rome's richest households had long dominated the Senate, while the achievement of major public offices depended upon a great deal of personal wealth. Birth was also significant; senatorial families cited (real and fictive) aristocratic genealogies stretching back for generations. Although no single set of families ever monopolized

Rome's political institutions (indeed there was considerable turnover in this regard throughout Roman history) and the aristocracy was always in flux, aristocratic identity was effectively a requirement for senatorial membership. Ancestry was paramount in the Roman understanding of political authority: Lacking a codified constitution, the Romans typically invoked the "custom of the elders" (*mos maiorum*) as the litmus test for the legitimacy of political action or thought.

In conjunction with their emphasis on property ownership and family connection, the Romans had a unique legal and cultural understanding of the father and paternal authority. Many a Roman father was also a *paterfamilias* ("father of the family"), the term Roman legal sources used to denote the oldest male ascendant in a particular family, who theoretically exercised legal, social, and economic power over his descendents. "Paternal power" (*patria potestas*) technically gave a paterfamilias legal control over all property generated by, or bequeathed to, dependent family members, including, in some cases, their wives. Although Roman women could own and inherit property, their marriages during the republic were often conducted in a manner that legally transferred their dependence from their fathers to their husbands. (However, during the imperial period, this changed and most married women remained dependents of their fathers.) Paternal power also technically permitted a father to sell or abandon his children and, according to anecdotal traditions, to kill insubordinate children and immoral wives. Paternal power endured for the duration of the father's lifetime and thus applied to adult children who possibly had households of their own—a facet of social life that ancient observers perceived as peculiar to the Romans. However, given the relatively low age of death for Roman men, most adult children did not have living fathers to wield power over them. Moreover, while this authoritarian characterization of the paterfamilias is authentically Roman, recent studies have emphasized that the ancient sources more typically envisioned the paterfamilias as an estate manager, and not as a domestic despot. His domestic power was in essence legal and economic. Nevertheless, given the Roman privileging of the law and property ownership, patria potestas was a primary expression of authority for elite Roman men.

Rome's transition from republic to empire in the late first century BCE brought important changes in the conduct and conceptualization of political life, but the household remained central. Rome's first emperor, Augustus (31 BCE–14 CE), consistently drew upon domestic images, structures, and practices in order to present his autocratic power as "traditional" and hence legitimate. For example, Augustus reached back to the republican era and resurrected the office of the censor, a magistracy that was in part created by the Roman state to police the moral habits of its elite families through sumptuary laws. In addition to commissioning public monuments that portrayed him surrounded by family members (e.g., *Ara Pacis*), Augustus promoted himself as the ultimate guardian of the Roman household by legislating the severe punishment of adulterers in public courts, penalizing men and women who refused to marry, and offering financial and social rewards to households that produced many children. In many respects, his administration was an extraordinarily large, wealthy, and powerful household: He used his own slaves as his palace officials and created a successor by adopting Tiberius as his son and appointing him as heir. Toward the end of his reign Augustus received the epithet *pater patriae* ("father of the fatherland"), a title that all subsequent Roman emperors claimed. The emergence of a monarchical government thus produced a new Roman expression of domesticity, which presented the emperor as the world's householder and the empire as his household.

The Ancient Jewish Household

Like the Greco-Roman household, the Jewish household was experienced and perceived first and foremost as a socioeconomic institution, composed of people and property. Throughout the pre-exilic period (1200–586 BCE), most ancient Israelites lived as members of multigenerational, patrilocal households oriented around land ownership and agriculture. Households interrelated by blood and marriage in turn formed small settlements comprising members of a larger tribe or clan, who traced their lineage back to a single (real or fictive) common ancestor. Property was held by individual families and passed down through inheritance, preferably along the male line. Daughters could

inherit property only if they vowed to marry within the tribe. In fact, inheritance is the only legitimate form of property transmission described in the Hebrew Bible. Nevertheless, these family settlements were economically, socially, and religiously interdependent, often with their own priests and ancestral religious practices oriented around worship of Yahweh. To a certain extent, the rise of a centralized monarchy under David (c. 1000 BCE) discouraged extended family settlements and encouraged nuclear-familiar connections and religious worship oriented around the royal temple in Jerusalem. However, in terms of the ideological formation of ancient Jewish religious identity and theology, the household remained central.

Kinship affiliation (reckoned exclusively through the male line) and land were paramount in shaping how the early Israelites saw themselves as a distinct and divinely favored race. Genesis opens with a description of a primordial household (a man and woman), which gave rise to the myriad races that together make up humanity. Among them, God chose the household of Abraham and formed a covenant between him and his descendents (Gen. 15–22). Significantly, this covenant was expressed in terms of patrimony: In return for obeying God and moving his family to Canaan, God promised Abraham and his descendents the land before them, a promise that God fulfilled following the exodus of Moses and his household from bondage in Egypt (Gen. 24; Ex. 3:7–10; Duet. 15:4, 19:10, 25:19–26:1). In stark contrast to Greco-Roman conceptions of property ownership, ancient Jews believed that God—and not the individual householder—was the ultimate "owner" of all earthly land (Lev. 25:23). Consequently, the Israelites saw themselves as God's tenants, the heirs of a gift owned by God, which God could revoke if they proved faithless (Ps. 37; Jer. 2:7; Ezek. 38:16). Thus the Hebrew Bible frequently describes God as a father (or even a mother) and a householder, who procreated, nurtured, and educated his child Israel (depicted variously as both son and daughter). In this respect, ancient Jews conceived their religious identity in domestic terms, as the "household of Israel" (*bêt yisreal:* Ex. 16:31; Num. 20:29; Isa. 5:7; Hos. 1:4–6; 5:1) or the "house of God" (Ps. 67).

After 586 BCE, many ancient Jews were members of diasporic communities and typically lived in cosmopolitan cities scattered throughout the Mediterranean world. Consequently, they were exposed to other cultures, especially to Hellenistic practices and habits, which influenced their understandings and experiences of the domestic sphere. Philo of Alexandria (20 BCE–50 CE), for example, echoed Platonic traditions when he argued the politics and household management were virtually interchangeable (*Questions and Answers to Genesis,* 4.165), and his views about the gendering of household activities, with women in charge of its indoor administration, have their roots in the writings of Xenophon (*Special Laws,* 3.169–3.171). Flavius Josephus (37–c. 100 CE) clearly reflected Hellenistic and specifically Stoic ideals when he averred that the ideal statesman must be an expert in household management, "for a house is a city compressed into small dimensions, and household management may be called a kind of state management" (*The Life of a Statesman,* 38–39).

However, a diasporic experience meant that the Jewish conception and experience of the household remained varied. One of the most radical experimentations in ancient domestic life took place among ultra-ascetic Jews known as the Essenes. Although their precise living arrangements cannot be reconstructed, the comments of contemporary observers like Josephus suggest that some Essenes engaged in marital relations solely for the purposes of procreation (presumably maintaining continence for much of the time), whereas others seem to have rejected marriage altogether. There is some precedent for their attitudes toward marriage in Pythagorean and Cynic traditions, but their own texts show that the Essenes' rejection (or recalibration) of marriage was motivated by strong eschatological beliefs. Late antique rabbinic texts reveal stark differences in the ideology of marriage in various regions of the diaspora. On one hand, Palestinian rabbis, who were culturally Greco-Roman, presented a view of marriage that closely followed a Hellenistic paradigm, which posited marriage as the creation of a household that brought social respectability to the husband/householder and enabled him to participate in the larger civic body; on the other, Babylonian rabbis, who lived in more Persian-influenced areas, held a more ambivalent view of marriage, seeing it as "necessary evil" and as a means for men to channel their sexual urges so that they could focus their attention on the study of Torah.

The Early Christian Household

To a certain extent, early Christian households were products of these preexisting Greco-Roman and Jewish traditions. In the New Testament, the household represented the relationship between man and God. Jesus was not only a new Moses and the true teacher but also, in the words of the author of Hebrews, the "son in the house of God" (Heb. 3:1–6; cf. Mk 3:7–12; Lk 6:17–19). Paul and his later imitators pushed this image further still, by describing the Christian community as "the house of God" (*oikos theou*), characterized by social and spiritual unity (Eph. 2:19; I Peter 2:4; I Tim. 3:15). As historians have long noted, many of the earliest Christian communities actually assembled in households, though in certain respects this was more incidental than deliberate; as a foreign religious group, the followers of Christ had little choice but to meet in private spaces like houses or storefronts. Nevertheless, Paul (and his followers) frequently drew on the relations of the domestic sphere to forge what anthropologists call relations of fictive kinship: Paul commonly addressed his followers as "brothers" (I Cor. 1:10; Rom. 10:10) or as his "spiritual children," and in one passage he referred to himself as their "father through the gospel" (I Cor. 4:14–15). More importantly, Paul proclaimed that Christians were both "Abraham's offspring" and God's "adult heirs," who would legitimately inherit the promise of the covenant (Gal. 3:24–4:8; Rom. 4:13–16). This particular formulation exemplifies the manifold influences of Hebrew theology and Roman legal culture on the construction of the early Christian community as a household.

While Paul clearly envisioned the early Christian community as a spiritual household, his views on its earthly counterpart were far more ambivalent. In the Gospels, Jesus had proclaimed that all those who wished to follow him must leave their family and possessions behind—reject, in other words, the persons and property that traditionally constituted domestic life for most Jews, Greeks, and Romans (Mt. 10:34–9; Lk 14:25–33, 18:18–30). The eschatological orientation of both the Jesus movement and the Pauline communities of the mid–first century CE seems to have encouraged some early Christians to heed Jesus's call and renounce certain aspects of the household, especially marriage, marital relations, and the holding of private property. However, Paul's response to this radical social experimentation was inconsistent. Whereas he sometimes encouraged men to embrace continence within marriage and privileged celibacy (I Cor. 7:1, 6–7), he also reinscribed conventional Hellenistic codes of household conduct, such as the importance of reciprocity in the marital relationship, the subordination of wives to husbands, and the need for slaves to obey their masters (I Cor. 7:2–5, 14:34–5; Phil.; perhaps Col. 3:18–4:1, which may not be authentically Pauline).

Paul's ambivalence with regard to the household created the conditions for centuries of debate over precisely what constituted an ideal domestic Christian community: a version of the Greco-Roman model or a new form of society, based not on procreation and property ownership but on a mutual love of Christ and an ascetic commitment to the control of the passions? Proponents of the former penned the early second-century deutero-Pauline letters I Timothy, Titus, and I Peter, which present the traditional Greco-Roman household as the crux of the Christian community. Combining the Greco-Roman conceptualization of the household as a microcosm of society with the Judeo-Christian idea of the church as God's house, the authors formulated a series of household codes (the so-called *Haustafeln*). These codes were directly modeled on the Hellenistic ethical treatises "concerning household management." Using paraenetic language, the codes directed wives to be submissive their husbands, children to be dutiful to their parents, and slaves to be obedient to their masters (Titus 2:1–3:1; I Peter 2:18–3:7). They also rooted Christian clerical authority in household management: "For if a man does not know how to manage his own household, how can he care for God's church?" (I Tim. 3:5, on bishops). By presenting the Christian community as a well-ordered household, the writers endeavored to defend a fledgling Christianity from attacks that its members subverted the hierarchies of the household and consequently upset the ordering of the city, state, and cosmos.

Their anxieties were not unfounded. Like the Essenes, some early Christians experimented with alternative living arrangements. These ranged from a complete renunciation of private property

and domestic relations (especially sexual) to a more graduated balance between a traditional household and a more definitively ascetic institution. The second- and third-century *Apocryphal Acts of the Apostles* were influential in this regard. Many of these fictional narratives feature apostles who preach the rejection of marriage and sex and who encourage men—and especially women—to abandon their domestic roles and seek a new life as a disciple of Christ. By the fourth century, Christians could elect to live in a monastery instead of a classical household, where property was typically held in common and sexual relations were strictly forbidden. However, to a significant extent, these early monastic communities remained entwined with traditional domestic life. For example, many of the earliest female ascetic communities, such as the one founded by Gregory of Nyssa's sister Macrina (324–379 CE), were organized around the structures and rhythms of a typical aristocratic household. This alternative Christian domesticity became integrated with the traditional Greco-Roman value system of honor and status, wherein the household functioned as an index of its members' moral standing. Thus Jerome (347–420 CE) could boast that a young girl's perpetual virginity enhanced her family's nobility and public renown (*Letter,* 130.6). Moreover, early Christian fathers redirected the goals of household management: Traditionally aimed at the creation of self-sufficiency (for either the individual household or the larger community), *oikonomia* became linked in Christian discourses to the proper administration of ecclesiastical property, which was in turn to be used for assisting the poor (Basil, *Homilies on Wealth;* Jerome, *Letter,* 152.9).

Humanism

Although the terms *humanist* and *humanism* are relatively recent (500 and 200 years old, respectively), humanist ideas, broadly understood as involving a positive approach to human existence and an appreciation of human endeavor, are much older, stretching as far back as the naturalist philosophers of ancient Greece and the Islamic Renaissance, as well as featuring in ancient Chinese thought, particularly that of Confucius. The basic principles of humanism—the recognition of the worth of all human beings and their thoughts and actions—have thus existed for as long as human civilization has existed. Although often used in vague or dismissive ways, an understanding of the term *humanism* is crucial for political theory: All forms of political philosophy and social organization depend explicitly or implicitly upon a theory of human nature and some idea of what human beings have in common and what they value. There have been many varieties of humanism, both religious and secular, although contemporary humanism is more frequently associated with atheism than with any particular form of religious belief. Debates about humanism in the twentieth century have caused, and continue to cause, much controversy, particularly in Marxist thought and European philosophy more broadly conceived. Although the term *humanism* has dropped out of favor for the most part, many thinkers continue to hold humanist ideas, regardless of whether they describe them as such. These ideas include believing in the moral worth of every human being, being committed to the idea that human beings can solve environmental crises through the application of science and technology, and demanding equality through the enforcement of human rights. On the other hand, others would describe themselves as antihumanists, either because they think that science has actually "de-centered" the human in favor of more fundamental entities, such as genes, or because humanism has been responsible for some of the more disastrous political projects of the past few centuries, for example, that human hubris has created threats to its own well-being through the invention of the atom bomb. Nevertheless, it is difficult to find a political theory that doesn't invoke a theory of human nature, regardless of how it conceives of that nature.

Ancient, Renaissance, and Enlightenment Humanism

The earliest kinds of humanism tended to stress the relationship between human beings and the natural world. Ancient Greek Atomism sought to place human beings in a naturalistic or protoscientific setting that made any resort to superstition or religion unnecessary. The life and death of human beings were understood to be part of a larger natural process of the coming together and dispersal of atoms, and death was nothing in particular to be feared, as it would merely involve a change in the arrangement of atomic particles. However, unlike in later forms of humanism, human beings were not the central focus of Atomist thought. Nevertheless, there was an ethical dimension to Atomist materialism and determinism that involved an idea of living in harmony with and understanding nature that prefigures certain later ideas of ecological and secular humanism. The work of many other Greek and Roman writers also contained humanist ideas, moral and scientific, and this tendency is often referred to as classical humanism. The Greek philosopher Protagoras (c. 490–420 BCE) claimed that "man is the measure of all things" while 500 years later, in the first century CE, the politician and philosopher Seneca declared, "Let us cultivate humanity." The naturalist approach of the ancient Greeks and the ethical imperatives of the Romans were to prove a valuable resource for later humanist thinkers, who often revisited and celebrated their ideas, in various scientific, educational, or ethical ways.

After a long, if not entirely bleak, period in which humanist ideas were mainly sidelined in favor of Platonic and Christian notions of the soul and the subordination of humanity to divine rule, the Renaissance saw a concern with mankind moved center stage, both cultural and intellectually. Although Renaissance thinkers did not use the word as we understand it today, core humanist ideas emerged in this period that express what we currently mean by the term. Renaissance humanism can be characterized by its overall optimism about human capabilities and a desire to strip religious and monarchical authorities and institutions of their supposedly divine power. Renaissance humanism took much of its cure from the Roman thinker Cicero (106–43 BCE) who had argued that *humanitas* (humanity) should involve the art of

living well through the study of the fine arts. Renaissance humanism should not be understood as a philosophy or as a coherent ideology, but rather as a cultural movement based on a particular kind of study. Those who had an education based on Greek and Latin classics were undertaking *studia humanitatis* (the study of the humanities). This is where we get the understanding of the discipline of humanities that persists in higher education to this day. As opposed to *studia divinitatis* (the study of divinity), humanities during the Renaissance involved an education in the following five areas: grammar, rhetoric, poetry, history, and moral philosophy.

The ideas of Renaissance humanism came to penetrate the wider culture, coming to influence the outlook of many professions, including law, science, and medicine. Many Renaissance humanists were perfectly happy combining their scholarly interests with an ongoing commitment to religious beliefs, so that one could be a "Christian humanist," for example, without contradiction. The broad influence of Renaissance humanism in turn filtered back to philosophical and political thought, where various ideas of human reason became the main focus of theoretical speculation.

The capacity or ability of humans to speculate about and come to understand themselves and the world through the power of thought is a very old idea. Ancient Greek philosophers were among the first to depend upon the idea that human beings could logically work through a claim about the world to test its veracity. From the end of the fourteenth century, notions of reason came to be seen as the best way to uncover the truth about the universe and to structure human communities. Among the first political thinkers to wrest the organization of society away from the grasp of religious and traditional authorities was Thomas Hobbes. Although Hobbes had a rather dim view of human reason, imagining that human beings in their natural state would behave like more like selfish animals that noble ethical beings, he nevertheless paved the way for the idea that human beings would use rational calculation in deciding how best to protect their interests. In doing so, he inaugurated the tradition of contractarianism, in which subjects of a state give up certain natural rights in favor of state protection and rights enshrined in law. Other contract theorists, such as John Locke and Jean-Jacques Rousseau, had a more optimistic notion of human nature, believing that rationality was a key feature in the way in which human beings organized themselves, with or without state intervention. Locke promoted the idea that unjustly treated subjects had a "right to rebel" if their reason was being insulted.

Alongside the increasing importance of reason for theories of political organization, philosophy, in general, came to place more emphasis on the link between reason and human nature. The scientific and intellectual revolutions of the sixteenth and seventeenth centuries gave much more prominence to humans and their abilities to manipulate, control, and understand the world. The Enlightenment thinkers of the seventeenth and eighteenth centuries sought to further stress the role of reason in their conceptions of human beings as autonomous, political, scientific, and moral agents. The French *libertins* and British freethinkers were increasingly skeptical toward anyone who claimed religious or preexisting moral authority, and even if they did not explicitly refer to themselves as humanists, their ideas shaped the practical consequences of the French Revolution, in which a republic that stressed the universality of mankind was established. The German philosopher, Immanuel Kant, was also keen to stress the importance of rational critique to the Enlightenment, calling on his readers to dispense with "immaturity" and take up the challenge of daring to know for oneself. It should be noted, however, that for many of these thinkers, their humanist ideas were compatible with certain kinds of religious commitment. Many Enlightenment thinkers were Deists, which meant that they saw the natural world as separate from God and thus comprehensible according to its own laws, which were potentially discoverable by humans. Thus one could be committed to strong notions of human reason and capability while at the same time believing in a higher power. It is not until the nineteenth century that a clear link is made between humanism and secularism, even though we can see elements of this tendency from the very beginnings of ancient thought.

Ludwig Feuerbach: Father of Humanism

The word *humanism* came into its own in the nineteenth century and began to take on many of the

meanings, both negative and positive, associated with it today. German thinkers in the 1830s and 1840s, following Georg Wilhelm Friedrich Hegel, who tried to systematically reconcile religious, political, and conceptual elements of human existence, were concerned almost exclusively with questions concerning man's anthropological status, his reason, and his political organization. It is in these thinkers, the so-called young and left Hegelians, that humanism began to be seen as diametrically opposed to religion and as a strong alternative philosophical and political position. Ludwig Feuerbach (1804–1872) argued, extremely influentially, that man had alienated his own capacities and abilities into a perfected image of divinity, namely, the Christian God.

It is Feuerbach who first articulates the eminently human origins of religious belief and describes the processes by which mankind alienates itself from its real, practical concerns. It is Feuerbach, too, who breaks with the idea that philosophy must defend the status quo, whether it be the stranglehold of church authority or the dead weight of tradition. He places man at the center of his thought, not in order to assert our dominion over nature but to unite us in our shared identity as a thinking, living, creative species. Feuerbach's most important idea, as simple as it is ingenuous, is that, as he puts it, "the true sense of Theology is Anthropology." In other words, instead of looking to the heavens and the vagaries of religious belief in order to understand religion, we need to turn the question around: What is it in us that needs to believe? Why do we hanker after immortality? Why do we project all those things we admire in ourselves—the capacity to forgive, to create, to love—onto something transcendent we cannot see and cannot prove? Feuerbach's answer lies in demonstrating that every aspect of what we call God corresponds to some feature or need of human nature. We project human capacities on to something beyond because what we imagine is possible goes far beyond what we as individual mortal beings can achieve. As individuals we cannot possibly hope to achieve everything we can imagine, argues Feuerbach, but instead of assuming there must be an entity that is a perfect form of man (immortal instead of mortal, infinitely benevolent instead of petty, all-knowing instead of ignorant), we should reclaim these qualities from religion and understand them in their rightful place—as human ambitions, not godly attributes.

The publication of Feuerbach's major work, *The Essence of Christianity* (1841), which was translated into English by George Eliot (Mary Anne Evans), caused a scandal in Europe and helped many young atheists, anarchists, and communists (including the young Karl Marx) to formulate their opposition to church, state, and philosophical dogma. Feuerbach remained committed to his radical thesis and became even more practical in his later years as he attempted to prove that even the loftiest sentiments have their origins in more practical, human concerns, such as eating and the need for affection. He advocated a combination of rationalism and sensualism that took as its object not the fevered brain of the philosopher nor the fantasies of religion, but real living human beings, understood as a species, as a collective social and political subject. What Feuerbach ultimately proposes is a thorough examination of human nature, its needs, successes, and desires. It is only then, he argues, that we will have a complete "philosophy of the future." Feuerbach's ideas, and their incorporation and later rejection in the work of Marx, set the conditions for twentieth-century discussions of humanism and antihumanism. Even before these later attacks on humanism, and although he shares much of the content of Feuerbach's attack on religion, Friedrich Nietzsche (1844–1900) argued that humanism was just a new kind of religion, a belief in "Mankind," and should itself be overturned. Max Stirner (1806–1856) made a similar argument against humanism, arguing that terms such as *mankind* and *humanity* did not correspond to real entities and that we should begin instead with our *ego,* our individuality.

Twentieth-Century and Contemporary Debates Concerning Humanism

Following Feuerbach and other nineteenth-century figures, humanism is strongly associated with the denial of God and the criticism of institutionalized religions. Marx's claim that "religion is the opium of the masses" points to a more general suspicion that belief in another world prevents people from seeing this one clearly. Humanism thus takes on a political and often educational dimension—actively confronting superstition in all its dimensions and

seeking to establish the best possible life for as many people as possible, whether this be through science or policy. The rise in popularity of humanist weddings and funerals points to a growing interest in celebrating human life without reference to the divine. It should also be noted that humanists tend to affirm the equality of the sexes, which also accounts for some of their antipathy toward organized religion.

Nevertheless, in the twentieth century, various antihumanist streams emerged. Some of these concerned the use of terms such as *mankind* and *species-being* in the work of the early Marx. Louis Althusser argued in the mid-1960s that Marx's later writings, *Capital* in particular, did not take the autonomous human being as its primary social agent and that Marx was instead writing about larger, structural forces. Coming out of a different tradition, that of phenomenology, Martin Heidegger (1889–1976) argued that humanists failed to conceive of man profoundly enough, and humanism was too superficial a way of understanding man's mode of being. These various strands of philosophical and political antihumanism are influential today, and various mutations of the humanism-antihumanism debates of European thought of the 1960s and onward are still with us.

Human Rights

Human rights entail two important types of claim: moral and political. Morally, they reflect the idea that all persons are (should be treated as) free and equal. Politically, they entail the demand that society be organized and power exercised in ways consistent with freedom and equality for all; in particular, they demand a society in which freedom and equality are realized through institutionally protected rights. One way in which human rights are protected is through law (and the rule of law); in this sense, human rights claims can also be legal claims, appeals for redress when institutionally recognized rights have been violated.

To characterize human rights principally as moral and political claims is to acknowledge their protean nature. Who counts as a "person"? What kinds of social arrangements are necessary to ensure the freedom and equality of those persons? Theorists and activists have given sometimes radically different answers to these questions over the past four centuries, and there remain no definitive answers. The origins, universality, philosophical foundations, nature, and content of human rights are all contested.

Origins

However changeable, human rights have, from the outset, been promethean in spirit. They originated in early modern Europe against the backdrop of a rigid feudal social order whose natural hierarchies of birth and status assigned each individual a relatively fixed place in society. Human rights were crucial in leveling these hierarchies, functioning as what Kenneth Minogue (1979) called "the leading edge of the ax of rationalism" (p. 356). That rationalism, articulated by thinkers in what is now identified as the liberal tradition and epitomized in the Enlightenment, began from the radical supposition that all men are naturally free and equal. There was no basis in nature for moral or political hierarchy. For Locke and for many of the philosophes, this radical notion, which would foment revolutions and topple monarchies, was expressed through rights—natural rights or the rights of man. By the end of the eighteenth century, world-shaking revolutions in British North America, in France, and in Haiti demonstrated vividly the power of this simple idea to upend the established order of things.

Human rights were subjected to significant criticism in the nineteenth century. Utilitarians and other legal positivists denied that there could be

any such things as rights that existed apart from the law. Conservatives in the Burkean tradition rejected the rights of man as too radical and socially disruptive, emphasizing the evolution of rights in particular social and cultural traditions. Karl Marx and many communists questioned what they called the "bourgeois" nature of rights, arguing that the illusion of political emancipation promised through rights fell far short of the human emancipation that would attend the overthrow of capitalism. Yet human rights did not wholly disappear from the political or philosophical landscape: Feminists, abolitionists, and others continued to appeal to and develop the idea. Moreover, human rights evolved in new directions through humanitarian projects like the International Committee of the Red Cross and the Geneva Conventions.

In the latter part of the twentieth century, after two horrific world wars, the idea again took up an important place on the world stage, thanks largely to the incorporation of human rights into the UN Charter. On December 10, 1948, the UN General Assembly proclaimed the Universal Declaration of Human Rights; since then, human rights have developed rapidly into the dominant normative discourse of world politics.

One challenge to this story of origins has been mounted by defenders of human rights who see their origin in the West as an embarrassment for a doctrine with universal pretensions. They have argued that human rights ideas have antecedents or analogues in all of the world's cultures and traditions, that every society has an inherent notion of human dignity that makes human rights truly universal. Although human rights express a vision of human dignity, they cannot be equated with human dignity. Human dignity is an idea that comes in widely divergent forms: The medieval European idea of human dignity, for instance, was anchored in a divine world view that assigned everyone a place in a fixed hierarchy. Human rights express a particular vision of human dignity, one anchored in the idea that all people are free and equal. It is precisely because these notions conflict with most traditional social arrangements that human rights have proven so socially transformative.

Universality

Questions about the significance of human rights' Western origin also manifest in debates about their supposed universality. One significant criticism of human rights has been that they reflect a particular set of values that conflicts with many norms and traditions around the world. As an empirical claim this is certainly correct. The question is what to make of that fact. Cultural relativists take the moral position that a culture can only be judged according to its own values and standards, so they reject human rights as alien and therefore inappropriate outside the West. This view was vigorously expressed throughout the 1990s by defenders of the so-called Asian values thesis, which asserted in essence that Asians value community over individuality and are happy to sacrifice personal freedoms for the greater well-being and harmony of the whole.

Cultural relativism as a moral doctrine is problematic; as many critics have noted, it can quickly become self-contradictory (asserting, as a universal truth, that there are no universal truths) or self-defeating (asserting that cultural relativism is the one universal truth). More fundamentally, cultural relativist claims seem to rest on a category mistake, confusing human rights as moral and political claims about how things ought to be with descriptive claims about how things are. The conflict between existing social norms and arrangements—in early modern Europe as much as in contemporary Asia—results precisely from the promethean character of human rights.

It is a separate question altogether whether the values expressed in particular accounts of human rights are desirable and worth defending. What is not clear, however, is what the origins of human rights have to do with this question logically or morally. Clearly emphasizing the Western origins of human rights plays well politically for authoritarian leaders keen to justify their repressive regimes by denouncing human rights as the continuation of colonialism through other means—a charge not without some merit. And, as with most moral questions, there is room for serious debate about the values human rights express. It is reasonable to ask, for instance, whether human rights overemphasize individual freedoms to the detriment of community and collective well-being. But the mere fact that human rights attach or belong to individuals does not prove that they are destructive of community. On the contrary, every community has norms and rules governing relations and interactions among

its members. Conceived this way, human rights are an expression of the values of a democratic community, one that values freedom and equality for all its members. Whether these values are "universal" in an anthropological sense is, again, morally and politically independent of whether they have global appeal. There is little doubt that this transformative promise resonates globally, explaining human rights' wide appeal.

Philosophical Foundations

Questions about the universality of human rights are frequently confused with questions about their philosophical foundations, that is, with questions about the grounding or justification of human rights. Originally human rights were rooted in the natural law and natural rights traditions, justified by what looks to many contemporary critics like mere assertion: claims about reason, self-evidence, and the like. Today human rights are justified in many different ways—through moral constructivist arguments (Jack Donnelly, John Rawls), through interest-based theories (Joseph Raz), through appeals to autonomy (Alan Gewirth) or human capabilities (Amartya Sen, Martha Nussbaum) or through discourse ethics (Jürgen Habermas, Seyla Benhabib). This diversity of philosophical foundations can be seen as a weakness or a strength of the human rights idea. To some prominent scholars, the idea of an "overlapping consensus" on human rights, one in which different people endorse rights and the values animating them for their own reasons, is the best type of justification to be hoped for in a diverse world. Furthermore, as Jack Donnelly has argued, there is plenty of room within a "universal" concept of human rights for flexibility in their interpretation and implementation in different times and places. Still, disputes about the nature and content of rights remain politically important.

Some critics have gone so far as to question whether it really matters how human rights are justified; the lack of settled definitions or agreed foundations has not prevented real progress toward their realization. Indeed, Richard Rorty argues that human rights are not the kind of idea one can "get underneath"—they are useful and appealing in their own right, not because of some additional concept or principle separate from the values they express.

The Nature of Rights

The ontology of human rights is debated not just among moral and political philosophers but also among anthropologists, sociologists, and critical theorists, all of whom, in different ways, are concerned with the uses of human rights in the world—what Richard Wilson has called "the social life of rights." Sociologists and anthropologists tend to view rights from a social rather than a moral constructivist perspective, looking at how rights actually operate in particular societies. Often, they find, discourses of rights are deployed in ways that reaffirm powerful actors and interests and stabilize the existing social order. Similarly, some critical theorists see the operation of human rights internationally as an exercise of power, the iron fist of imperialism concealed in the velvet glove of rights talk. Still other critics view human rights as a form of "biopower" that invokes human need or powerlessness to trump or bypass politics.

Each of these approaches is useful in highlighting how rights operate in the real world of politics. Yet, proponents of these approaches have a tendency to ignore the normative appeal of human rights. Again, many of these critics make a sort of category mistake, jumping from the observation that rights can function in a certain way to the conclusion that the moral and political claims associated with rights are merely rhetoric or ideology. It is perfectly consistent—logically and with much of what we observe about the world—to argue instead that people find the moral and political values expressed through human rights appealing even though the discourse of rights is frequently abused in practice. That appeal consists in the promise of a decent life and represents another important fact about the social life of rights.

Content

That promise of a better life is linked to the protections against abuses of power, discriminatory treatment, and dependency that human rights prescribe. Yet the precise content of human rights remains a subject of controversy. Traditionally rights have been conceived as negative or positive. Negative rights supposedly require only that an actor—typically the state—refrain from violating them; positive rights supposedly require (extensive)

action on the part of the state for their realization. So, for instance, the right to be free from arbitrary arrest seems only to require that the government not arrest people arbitrarily, while the right to an education requires that the government set up and fund schools. Libertarians have long argued that only negative rights—traditionally civil and political rights, plus protection for private property—can be adequately justified, whereas positive rights—traditionally social and economic rights—violate the principle of individual self-ownership. In the context of the cold war, this distinction became conflated with Isaiah Berlin's idea of negative and positive freedom, which tendentiously associated the latter with totalitarianism. The notion was further entrenched in the quasi-historical language of "generations of rights," which identified civil and political rights as the first generation, social and economic as the second, and communal rights, including environmental rights and the right to development, as embryonic third generation rights.

The purported distinctions between positive and negative rights are difficult to maintain, though they have been slow to fade from popular and scholarly discourse on rights. Civil and political rights, such as the right to vote or to receive a fair trial, require precisely the types of affirmative government action supposedly unique to positive rights. Some critics have maintained that social and economic rights are not justiciable (translatable into law); this is false, although it is true that states have been slower to incorporate social and economic rights into law. Others have argued that it is more difficult to identify who bears the obligations corresponding to social and economic rights; this too is false—which is not to say that identifying the relevant obligations is easy. It is simply no harder than in the case of civil and political rights. My obligations in connection with your right to a fair trial are as obtuse as yours with respect to my right to adequate shelter. The solution to puzzles of this kind is typically to view the obligations associated with human rights as social or institutional obligations rather than interactional ones. Society has the obligation to see to your trial and my shelter, and it does so by creating institutions to secure rights and by spreading the burden of those rights on all the members of society in some equitable fashion.

The distinction between negative and positive rights is slowly being replaced by a common understanding of human rights as indivisible and interdependent. This view, affirmed in the 1993 Vienna Declaration on Human Rights, emphasizes that the protection of each right is essential to the secure enjoyment of the others, both conceptually and practically. Working in this vein, scholars like Sen have stressed, for example, the importance of civil and political rights to successful, human-centered economic development.

Challenges

Today globalization raises important questions about the extent of human rights obligations. Are they limited to compatriots, or do they extend globally? Why? How can any global obligations be met effectively when world politics remains normatively and institutionally underdeveloped? Are human rights adequate to the challenges of the twenty-first century—globalization, terrorism, climate change? None of these questions has clear answers, though human rights figure prominently in debates about all of them and many others. The protean and promethean nature of human rights makes it likely that they will remain salient as humanity tackles these new problems.

Humboldt, Wilhelm von (1767–1835)

Wilhelm von Humboldt was an eighteenth-century Prussian political theorist and statesman. He is best known for his influence on John Stuart Mill, particularly Mill's third chapter of *On Liberty* (1869) and its discussion of the vital importance of liberty in relation to the cultivation of the ideal of individuality. A number of figures famous among the German Enlightenment of the period, including Goethe, Schiller, Gentz, and de Stael considered themselves to be friends of his, and his writings were influenced by them.

What is distinctive about Humboldt's liberalism? All liberal theories take seriously the notion of individualism—noting the physical separateness of persons, they consider individuals to be the appropriate unit of analysis from which to begin their analyses. However, individuality denotes something more than individualism, something special: It describes the *unique* qualities that combine to create a particular person in their most individual—unique—form. Achieving individuality was the ideal to which Humboldt devoted his life, propagating a romantic vision as he cultivated the development of his own free, beautiful, many-sided personality. In fact, one of the striking facts about Humboldt's life is that he lived according to the ideals that he espoused. Individuality he understood in terms of the notion of *Bildung*—the complete and all-around development of a person's inner capacities and inclinations, which, for Humboldt, represented the highest humanist aspiration. A polymath, Humboldt had a keen interest in numerous subjects, including ancient philosophy, linguistics, aesthetics, travel, history, politics, and education. Such breadth of learning was entirely consistent with his theory and he lived as an exemplar of it.

Humboldt's type of liberal political theory is variously described as aesthetic liberalism or romantic liberalism. It combines an ambitious and comprehensive moral or aesthetic theory with a cautious political theory. Containing perfectionist and expressive ideals, it shares elements with aristocratic liberal theories insofar as it encourages the pursuit of excellence thorough the cultivation of heroic virtues and strenuous actions. However, Humboldt, like Mill after him, maintained that it was an ideal that was open to all, albeit to varying degrees.

The theory is grounded in a certain view of human nature. Humboldt (1969) maintained, "To inquire and to create—these are the centres around which all human pursuits more or less directly revolve" (p. 76). And "the highest ideal . . . of the coexistence of human beings seems to me to consist in a union in which each strives to develop himself from his own nature and for his own sake" (p. 13).

But it is not an antisocial ideal—far from it. In *The Limits of State Action* Humboldt (1969) describes how individuality is cultivated alongside other many-sided personalities: "Men are not to unite themselves in order to forgo any portion of their individuality, but only to lessen the exclusiveness of their isolation; it is not the object of such a union to transform one being into another, but to open communication between them" (pp. 27–28).

Humboldt's ideas, and especially his antipathy to excessive state control, have sometimes caused him to be characterized as an "unpolitical political theorist" or even as some sort of anarchist. However, this does him a disservice. He was not an anarchist theoretically or professionally. (In fact, he spent many years in public service as a diplomat and later as an administrator, creating the University of Berlin.) At the same time, he did not believe that political activity was conducive to the cultivation of individuality. Rather, one's development occurred under the protection of the state but otherwise apart from it, within civil society. Humboldt was an idealist who championed a variety of human flourishing that required

maximal freedom and therefore a strictly limited role for the state (a "night watchman state") for its achievement.

Unlike many contemporary classical liberal and libertarian theorists, J. W. Burrow says Humboldt was less concerned about the state's incompetence than its ability to turn men into one-sided, machine-like slaves, robbed of their "vital energies," creativity, and multifaceted personalities. In other words, he feared its denial of individuals' true nature, as he saw it. This is because the state operates through procedures of formal rationality, so it will always do violence to the complexity and richness of human experience. According to Humboldt (1851/1969), "A State, in which the citizens were compelled or moved . . . to obey even the best of laws, might be a tranquil, peaceable, prosperous State; but it would always seem to me a multitude of well-cared-for slaves, rather than a nation of free and independent men, with no restraint save such as was required to prevent an infringement of rights" (p. 79).

Humboldt is best known for the short book, *The Limits of State Action,* but he also wrote a piece on constitutions, "Ideas on the Constitutions of the States, Occasioned by the New French Constitution" (1789). Although he tended to focus his attention on ideals rather than institutions, Humboldt mentioned in *The Limits* that he preferred monarchical government to republics. This is because throughout history, monarchies had treated the state as a means to secure freedom, whereas republics had considered the state to be an end in itself.

Hume, David (1711–1776)

David Hume was a British philosopher, historian, and essayist. He wrote no single treatise on political theory; his views on that subject appeared instead throughout his works on philosophy (*A Treatise of Human Nature, An Enquiry Concerning Human Understanding,* and *An Enquiry Concerning the Principles of Morals*); economics, morals, and other subjects (the *Essays, Moral, Political, and Literary*); and history (the multivolume *History of England*). An older view of Hume that exaggerated his skepticism—real enough in Hume's writings on religion and, more ambiguously, epistemology, but absent from his political writings—has yielded in recent decades to a fuller picture that stresses Hume's original and lasting contributions to jurisprudence, theories of political legitimacy, the analysis of political party and faction, and what would come to be called coordination. This entry stresses those areas, although Hume's contributions to other fields—economics, the philosophy of religion, epistemology, esthetics, ethics, cultural anthropology, and English historiography and biography—were substantial.

Jurisprudence

Hume's most systematic treatment of political theory occurs in his *Treatise of Human Nature* (recast, with greater clarity but some loss of detail and sophistication, in *An Enquiry Concerning the Principles of Morals*). This work aims to treat the "science of man," that is, the nature and origin of humans' understanding, passions, and moral sentiments, and its treatment of substantive political questions are often meant to illustrate these larger theoretical issues. Hume's treatment of political justice is concerned above all with its origins or

foundations. For Hume, family feeling and other private sentiments such as gratitude are natural—in an empirical rather than a teleological sense; we observe them everywhere. Justice, however, is not natural but artificial, as are two other crucial political and social virtues, fidelity to promises and allegiance to government. Although Hume's argument is complex, a few aspects may be highlighted. First, justice (which, for Hume, like many of his contemporaries, meant almost exclusively the laws and conventions surrounding property and its transference by consent) does not track our sentiments of natural virtue. By nature we are partial—we favor ourselves, our friends, and our near relations over strangers—and the result of these naturally partial sentiments is not justice but the opposite: clannish parochialism and, at the extreme, social strife. John Rawls has stressed this part of Hume's argument ("limited benevolence"), but Hume equally stresses justice's collective and systematic character, which renders it contrary to our benevolent sentiment in many individual cases. For example, when we return property to a rich miser instead of bestowing it on a virtuous pauper, the immediate act rewards badness. But the overall system of property and contract laws is advantageous to both society as a whole and every individual living under it—the latter being the original motive, the former an aftereffect that we can see in hindsight. (Many different systems of property law will do equally well, provided that we choose one that tracks our likely mental patterns, allowing for its easy, habitual adoption.)

Hume argues that the "interested passion" for acquisition—our "interest," for short—is, on an "enlarged" or sophisticated understanding, better served by observing the laws of property (and supporting their enforcement against others) than by flouting them. Our interested motives for recognizing systems of justice are further extended through sympathy—in early Hume this means a tendency to adopt others' sentiments; in late Hume, something more like humanity, a sentiment that leads us to promote human happiness generally—through which, in either case, we identify with the usefulness of these virtues to others. Although the role of sympathy in Hume's argument is not fully consistent, he most commonly and most persuasively portrays it as too weak and contingent to motivate individual acts of justice (especially since such are not publicly useful), but strong enough to reinforce our attachment to systems of justice—as well as fidelity and political allegiance—once they are already in force. Wise political rulers and writers will work on our sympathy to reinforce these attachments and the artificial virtues that arise from them.

Unlike some predecessors who stressed justice's artificial quality (e.g., Thomas Hobbes, who thought sovereigns defined justice through their will, or Bernard de Mandeville, who thought politicians' "artifice" could easily manipulate sentiments to the public advantage), Hume recognizes serious limits to what political manipulation could durably accomplish. The objects of human passions are diverse, but their limits are durable. The artificial virtues are "laws of nature" in the sense of being everywhere useful and formally similar. Every peaceful and prosperous society must have some form of property, promising, and political allegiance. Magistrates over time are able to enforce rules of justice and allegiance only to the extent that these plausibly track our individual and common interests. They can "extend the natural sentiments beyond their original bounds; but still nature must furnish the materials."

Hume never portrays human beings as acting on narrow self-interest. Despite occasionally using the language of selfishness, self-interest, or self-love, Hume much more consistently attributes our need for justice to our natural *partiality* rather than egotism. And he writes extensively and with scorn against reductionistically egoistic theories of human nature. To be sure, from the perspective of contemporary metaethics, Hume's account of partiality may make him seem egoistic in comparison to accounts that start with impartiality (and Hume would not have contested that assessment: He believes that impartiality must be promoted by institutions and education and is not among our natural motives). It is on the level of political and historical explanation that the difference between Hume's account and an egoistic one becomes clear. The triumph of justice requires the transcendence not of atomistic individualism but of substate political allegiances: clan, religion, feudal ties.

For Hume, the virtues of justice, fidelity, and allegiance vindicate not natural rights but a triumph over natural deficiencies. They alone provide the "security," "ability," and "force" that let us

accomplish more than animals. By force Hume means the large-scale projects made possible by collective effort; by ability he means, much before his friend Adam Smith developed the idea, the specialization that "partition of employments" enables. The practice and praise of these virtues do not require much in the way of self-sacrifice or altruism, because the resulting social system enables us all to acquire and keep much more property than we would hold in their absence (i.e., in a purely hypothetical "state of nature"). In his *Essays* and *History,* Hume suggests that even apparently noninstrumental goals, like military glory and artistic expression, are far easier to achieve in a prosperous and ordered regime in which the fruits of one's endeavors can be preserved and improved upon on an ever larger scale.

Authority and Legitimacy

Hume wrote that all government was founded on opinion—even tyrannies, on the opinion of the tyrant's guards. In his time, two theories of legitimacy were prevalent: the Tory doctrine of passive obedience to government and the whig social contract doctrine. Hume opposed his own theory, that is, that the reasons for allegiance involved common and universal advantage, against both—though spending much more time on the whig doctrine as more popular and more theoretically serious.

That the social virtues are artificial and instrumental leads Hume to the conclusion that they cease to be virtues when they no longer serve individual or collective interests. In a famine we neither do, nor should, observe laws against stealing grain. Likewise, under an "egregious," "grievous," or "flagrant" tyranny (which Hume never defines and of which he gives very few examples, but his implied standard is that the tyranny must be so severe as to render the presence of governmental authority less advantageous to subjects than its absence), subjects rightly regard their allegiance as dissolved. Tory passive obedience culpably ignores this, which is why even Tories abandoned it, Hume notes, in the Glorious Revolution. However, because Hume thinks that cases of egregious tyranny are both very rare and obvious to ordinary political actors when they do occur, extended treatment of the exceptions will, Hume thinks, distract from the project of stressing government's usual and immense advantages. Hume therefore deliberately and explicitly refrains from discussing the case—a stance that Henry Sidgwick will later endorse, adopting Hume's reasons.

Whig social contract theory is the more extended target of parts of Hume's *Treatise,* of his *History,* and of his influential essay "Of the Original Contract." Although he admits that primitive societies might originate in explicit consent, Hume doubts the normative relevance of this (because fidelity to promises is just as "artificial" and social a virtue as allegiance); questions the extent to which political arrangements, or changes in such arrangements, can be said to involve consent in large, complex societies; and stresses the elements of manipulation and propaganda in all existing claims to govern by consent. All existing governments must rest their claim to rule on their advantages as compared to actual and achievable alternatives. Because predictably stable alternatives to existing regimes are rarely on offer—the path toward them involving extreme uncertainty and likely civil war—almost all governments, including modern legal or "civilized" monarchies as well as well-designed republics, are legitimate. Toward Britain's mixed form of government in his time, Hume's stance is equivocal. He prizes the exceptional liberty it allows but doubts its stability.

Problems of disputed or uncertain legitimacy (succession disputes or arguments over constitutional precedent, prerogative, and parliamentary privilege) raise special problems for Hume in his *History* and his essay "Of the Protestant Succession." In such cases, both parties of a dispute can claim to be observing settled customs and to be maintaining the established government against those who recklessly risk losing its advantages. When neither side's claim (based on heredity, long possession, present possession, popularity, or other customary sources that subjects durably and in large numbers find plausible) clearly predominates, the question is genuinely difficult and civil war may be the result; this is a large part of Hume's explanation for both the English Civil War and the Wars of the Roses. Once such struggles have been settled with the clear victory of one regime or claimant, that victor—along with the accustomed allegiance to that claimant or regime that grows along with that long possession—eventually settles the issue given the disruptions likely

to follow upon any challenge. Thus the Jacobite (Stuart) challenge to the Glorious Revolution settlement of 1689, though not implausible right after the revolution, was wholly irresponsible by the late 1740s. Likewise, Cromwell was a usurper in his time, but if he had founded a dynasty, it would later, and in retrospect, have been legitimate.

Hume's theoretically consistent but politically flexible doctrine—which both excuses those who hold to regimes or orders that seem customary at the time and advocates acceptance of new regimes once they prove stable and long-lived—causes him to take a complex, dynamic approach to political ethics and historical interpretation. It leads him to praise, for instance, both Charles I's character in defending the legitimate royalist order as he saw it and the constitutional changes forced through by his parliamentary opponents, which in the event proved salutary and consistent with a changing society. From Hume's time to the present, these subtleties have often escaped, not to mention frustrated, those hoping to apply to politics' moral or partisan standards less dependent on circumstance.

Party and Faction

While the pernicious effects of party (or interchangeably "faction") and their management are a pervasive theme in Hume's *Essays* and *History,* his overall conclusions are hard to summarize. Hume distinguishes between personal factions, that is, alliances among pure power seekers, and "real" factions involving some substantive difference of interest, principle, or affection. Hume regards factions of interest as understandable and forgivable and the proper subject of institutional design to mitigate their effects. (Hume's short remarks on this almost certainly influenced Madison's fuller treatment.) Parties from affection, based on attachment to particular leaders, are in a sense irrational given that these figures cannot possibly be the intimately known, personal friends that we imagine them to be, but Hume admits that party feelings arising from such grounds are both common and durable. Parties of principle Hume regards as a modern invention, unknown in the ancient world and initially arising out of sectarian religious strife and its aftereffects. Where political struggles involve such parties, Hume apparently sees no simple method for disarming them (except, perhaps, a withering of the underlying religious or quasi-religious doctrines for which their partisans wage offensive and defensive strife). Several scholars, especially Jennifer Herdt and Donald Livingston, have noted that Hume's treatment of these matters anticipates later ages' vicious clashes of mass ideological parties and movements.

Hume stresses the tendency of party conflicts, regardless of origin, to spin out of control through the effects of redoubled group sympathy and lack of cross-party social ties. Over time, conflict itself hardens animosities, and partisans' judgment of the other party's intentions or motives becomes warped; each side comes to fear spurious (but self-fulfilling) threats from the other. Hume's concern with these phenomena must cast doubt on attempts to associate him with strong versions of the "rational choice" claim that humans act rationally and instrumentally—though he clearly adhered to, and help found, a milder version of this school.

Coordination

Several commentators on Hume—David Gauthier, F. A. Hayek, David Miller, and most recently and thoroughly, Russell Hardin—have noted, for the most part independently and using different theoretical languages, that Hume's account of politics represents what we now call a theory of coordination (in Thomas Schelling's language, roughly though not fully equivalent to what David Lewis calls convention). Because the social and political institutions that we have an interest in supporting are advantageous not individually but collectively, which institutions deserve our support depends on which institutions everyone else believes, or can be brought to believe, deserve *their* support.

Seeing Hume's theory in coordination terms brings together many aspects of Hume's political thought that have often been noted but have proven hard to explain or situate within other theoretical frames. These include Hume's conviction that a variety of regimes are equally legitimate if perceived as such; his determination that different religions are best suited to different regimes; his short and sketchy treatment of magistrates and sovereigns, which play much less of a role if society is a coordination problem than if it is a prisoner's dilemma requiring outside enforcement; his stress

on custom, long possession, and the presence or absence of "settled" or "established" regimes as crucial criteria of justified allegiance; his dynamic theory of political ethics, which can be seen as reflecting shifts from one coordination or focal equilibrium to another; his foundation of political authority on passive (but willing) acquiescence to already imposed settlements rather than active consent to new ones; and his embrace of second-best solutions and suspicion of "projectors" who seek to maximize public good at the cost of stability.

This approach also explains why those who see in Hume's conventions a proto-Burkean deference to tradition or ineffable cultural *Volksgeisten* are probably wide of the mark. Hume defends adherence to current equilibria on broadly utilitarian—but nonmaximizing—grounds. Tradition, in the nonmystical sense of broadly (and perhaps falsely) recognized precedent, plays a strong role in coordinating our actions but is only one source of coordination among many. Hume is perfectly willing to embrace new settlements, even those involving quite radical change, once they have proven themselves a substantive improvement on the old ones and have won general support.

Political Positions

In his own time, Hume's critique of "true" or "old" whig doctrines (the social contract, the ancient constitution) led him to be labeled a Tory; as a defender of constitutional liberty, he called himself a skeptical whig. Current scholars variously label him a conservative or a moderate liberal, depending on how they choose to define those anachronistic terms. As noted earlier, his constitutional conservatism is based on utility rather than mystical reverence for the past (a reverence which his *History* mocked at length and with glee). On matters of sex, social custom, and rank, Hume is largely conventional but, again, utilitarian, and often irreverent toward those who adduced religious or traditional grounding for social conventions. He judges a wide variety of social conventions equally acceptable where they are—and provided that they are—commonly understood and accepted, as long as their consequences were not naturally and predictably contrary to our interests. He suggests that fornication is always a poor idea but that adultery may be another matter; his infamous defense of a double standard toward female chastity is clear enough but probably inconsistent with his nonchalance toward French gallantry. In foreign policy, Hume is a consistent advocate of peace, a critic of the anti-French (and later, anti-Scottish) bigotry common in England in his time, and an unusually fervent opponent of the public debt that Britain had incurred through its wars.

Reception and Significance

Hume's reception in his time differed greatly from his appropriation by political philosophers in modern times. John Rawls and his school have stressed Hume's theory of how moral sentiments develop and may be "modified and corrected" through reasoned critique; these topics, though certainly present in Hume's *Treatise* and other works, were tangential to his main arguments and barely noticed by either Hume's supporters or his critics. Hume's irreligion, expressed both in occasionally explicit jibes against Christianity and indirectly through his secular, nonprovidential theoretical perspective, was much more striking in his day than today, to the point of doing Hume demonstrable professional and social harm (most notably, his being denied a chair at Edinburgh). His refusal to attribute cosmic purposes to historical processes strikes some even now as bearing too little consolation. Hume's refutation in the *History* of the ancient constitution theory of English liberties was of great importance in his time, but his conclusion that liberty requires modern, uniform systems of law and their efficient application by strong states seems, except perhaps in the United States, unexceptional today.

Hume's method and conclusions set him off sharply from the rest of the Scottish Enlightenment, histories of which often resort to naming Hume an embarrassing exception. Hume's antiteleological and antiprovidential approach to both morals and politics directly contradict (and, historically, offended on moral grounds) moral sense theorists such as Francis Hutcheson with whom casual scholars often associate Hume, as well as Scottish natural law theorists before and after Hume's time. As for political and historical explanation, Hume stresses the important role of circumstance and social and political context in evaluating individual choice, but never embraces determinism

and eschews easy doctrines of progress. The "four-stage" theory of progress from savagery to commercial society, common in many Scottish Enlightenment writers, and sometimes considered a hallmark of their work, is all but absent from his work.

Whereas Hume's influence on utilitarian thinkers and reformers from Bentham forward is undoubted, Hume is almost certainly not a utilitarian in the sense of seeking a single aggregative and hedonistic metric for evaluating states and actions. This has resulted in Hume's relative neglect among those who look to utilitarianism to provide such a metric. On the other hand, Hume's reasoned disbelief in anything approximating Christian—or proto-Kantian—accounts of autonomy and of intellectualism in practical philosophy have led him to be treated as a merely transitional figure by historians of ethics who see Kant as a necessary stage of progress or who see the task of theory in Kantian terms. Immanuel Kant, while famously admitting that Hume's skeptical treatment of cause and effect "interrupted [his] dogmatic slumber" and profoundly altered the direction of his metaphysical inquiries, took essentially nothing from Hume's moral and political thought. Likewise, Adam Smith, Hume's great friend, drew inspiration from some of Hume's economic ideas but differed profoundly with Hume on questions of morals, law, and social order.

For these reasons—as well as the lack of a single volume containing Hume's overall political theory and the strong role that coordination theory (little understood until recent decades) plays in his explanations—Hume's political theory has never been as canonical as his philosophy. As coordination theories receive further attention, and matters of party and religion continue to frustrate the theories of many prevalent schools, this status may be changing.

HYBRIDITY

Hybridity refers to a composite form of existence and new mode of being resulting from processes of physical, cultural, or geopolitical mixture. It derives etymologically from the Latin word *hybrida,* meaning the offspring of a wild boar and a tame sow. The discourse on hybridity originated in eighteenth-century botanical studies, became central to nineteenth-century zoological analyses, and entered subsequently into human debates concerning biology, the origin of the species, colonial desires, and social Darwinist arguments surrounding racial difference.

The resurgence of discussions on hybridity developed in the second half of the twentieth century with the rise of postcolonial studies and critiques of globalization, cultural imperialism, and the nation-state. Instead of locating hybridity within a biological framework of fixed races and ethnicities, theorists reconfigured hybridity as a political notion and rejected essentialist ideas of race in favor of cultural explanations for multiple influences on an agent. Homi Bhabha's essays and his book *The Location of Culture* (1994) marked a pivotal shift to this latter understanding.

Hybridity provides an integral conceptual intervention that cuts across three prominent intellectual currents in contemporary political theory: the politics of identity, the politics of difference, and the politics of recognition. The politics of identity is associated with post–second wave feminism, critical race theory, gay and lesbian rights activism, and movements seeking to ascertain the essential meaning of the "I" and the individual's place in late modern societies. Iris Marion Young's introduction of the politics of difference emerged as a postmodern tendency aiming to theorize difference and justice among oppressed groups without collapsing

into either essentialist identity politics or the distributive paradigm of John Rawls. Charles Taylor, Axel Honneth, and scholars promoting a neo-Hegelian politics of recognition articulate an alternative third category in order to devise strategies for increasing the public inclusion of groups disavowed within hegemonic cultures. Multiculturalism is exemplary of this turn.

Theorists of hybridity, including Bhabha, Stuart Hall, Édouard Glissant, Paul Gilroy, Nestór García Canclini, and Gayatri Spivak, incorporate perspectives from the aforementioned currents. However, they contend that hybridity pertains to areas beyond those models. Creolization, *métissage, mestizaje,* subaltern studies, and border life are also components of hybridity. Morever, hybridity allows for what Dipesh Chakrabarty calls the provincializing of Europe—a postcolonial mode of thinking that simultaneously brackets Enlightenment universal conceptions of reason and culture and acknowledges ongoing cross-cultural forms of mixture and subjectivity formation inside, as well as outside of, Europe. Postcolonial political theory and the burgeoning field of comparative political theory utilize the idea of hybridity to de-center, reorganize, and expand the boundaries of canonical thought and action.

Critics of hybridity argue that the term has a rhetorical cosmopolitan appeal while failing to address the continued existence of racism, homophobic violence, xenophobic nationalism, and antifeminist initiatives. Supporters respond that it is only by embracing an agent's multiple influences that any single or composite identity and social movement can gain leverage in the political realm.

I

Ibn Khaldūn (1332–1406)

The name Khaldūn (meaning eternal or immortal) seems fitting for a scholar who immortalized a theory of world history, its vicissitudes and its connection with ancient Arabia. Ibn Khaldūn was not just an intellectual. He pursued many careers, from being the official document signer (*Ṣāḥib al-'Alāma*) and a secretary under the Ḥafsid dynasty, to heading political missions for the Marīnids and working as a Mālikī judge and professor in Egypt. He was even interviewed by the great fourteenth-century Tartar Emperor Tamerlane. As is the case with most great intellectuals, the verdict on his scholarship has been mixed. While some referred to Ibn Khaldūn as *walī al-dīn* (guardian of the religion), the prominent fourteenth-century Mālikī judge Muhammad ibn Arafa al-Warghamī apparently stated that he lost all respect for the office of the jurist when Ibn Khaldūn was made one (Rosenwald, 1967, p. lvi). We might wonder if such contempt for Ibn Khaldūn came from his creative development of traditional sciences and political categories, which called into question the work of prior historians, as well as scholarship in the Islamic sciences.

Integrating Philosophy and History to Correct Mistakes in Intellectual and Religious Sciences

In his work the *Muqaddima* (or *Introduction*), Ibn Khaldūn develops what he calls a new science for discerning why dynasties rise and fall. Whereas Aristotle argues that *logos* distinguishes man from other animals, Ibn Khaldūn finds that it is man's sciences (which he cultivates through using logos) that make him unique. Drawing on his own unique human capacity, Ibn Khaldūn introduces a new science that bridges philosophy with history in the *Muqaddima*. In the *Muqaddima,* Ibn Khaldūn argues that history must be joined with philosophy to uncover the inner meaning of history. He develops this approach and offers evidence to support it in several volumes, called the *Kitab 1-'Ibar* (or *The Book of Evidence*). He begins the *Muqaddima* by criticizing existing works of history. Ibn Khaldūn argues that historians have misunderstood the underlying basis for world events because they have not analyzed how and why events occur. He suggests that this new science, in which philosophy uncovers the meaning of history, will help historians to stop blindly copying the work of earlier scholarship. Such reproduction leads historians to confuse the essential and accidental conditions for world events. Ibn Khaldūn argues that:

> . . . They presented historical information about dynasties and stories of events from the early period as mere forms without substance . . . as knowledge that must be considered ignorance, because it is not known what of it is extraneous and what is genuine. (Rosenthal, 1967, p. 7)

This criticism, however, is not just an attack on historians. It is leveled at commentators of the

Qur'an and ḥadīth transmitters (those who transmit the sayings and actions of the prophet) also, who do not analyze what they translate. Like earlier historians, these scholars did not use philosophy to challenge their historical assumptions or insights. In this way, they strayed from the truth and committed numerous errors based on false assumptions. This concern about rote replication of preexisting ideas relates to Ibn Khaldūn's broader statements about social decline, which arises (in part) from a lack of innovation and a trend toward imitating the ideas of earlier figures without questioning their positions. This decline is part of a cyclical theory of world history that Ibn Khaldūn develops, in which he transforms Qur'anic terminology and infuses new meaning into political concepts.

Fraternity (*'Aṣabīya*) and Political Authority (*Mulk*) in World History

In Ibn Khaldūn's theory of history, there is a tension between the human traits of fraternity, communal altruism, and solidarity on one hand, and those of individual desires for personal political authority, the acquisition of luxury goods, and a life of ease on the other. These different sorts of traits, from altruism to narcissism, correspond with different phases in the life span of a dynasty. A dynasty lives for three generations, roughly 120 years. One generation is equivalent to the life of a person. Like a person, the dynasty ages from the vitality and purity of a child to the senility and fatigue of a geriatric. Ibn Khaldūn contrasts the early members of a dynasty (a nomadic, Bedouin population concerned with the survival of its community) with those in the later phases of a dynasty (a sedentary group preoccupied with luxury goods and superficial desires).

He presents the early population, the Bedouin or Arab population, as the essence of Arab civilization. To Ibn Khaldūn, the Bedouins represent the purest and most natural form of Arab civilization that is the closest to being *good*. He likens their nature to that of the soul of a child, untarnished by age or experience. These individuals are motivated by feelings of *'aṣabīya* (characterized as fraternity, or a desire to help one's community).

As members of the dynasty age, they acquire greater authority or *mulk* and wealth. With its wealth and power, the group settles in a given location and builds a grander civilization, equipped with a system of law that insures the protection of the people. They build a military that provides for the defense of the community, which people no longer need to provide for themselves. Ibn Khaldūn suggests that these laws and the military prevent people from thinking and acting for themselves, engendering laziness and decreased vitality for the community. The leader becomes progressively concerned with his own well-being and less so with the needs of his people. Mulk, which Ibn Khaldūn depicts as the *telos* of *'aṣabīya*, comes to supplant the altruism that the leader once felt for his people. Members of the dynasty grow to forget about the meaning of *'aṣabīya*, and as a result, the dynasty grows weaker in its senility.

Ibn Khaldūn depicts *'aṣabīya* as the foundation for Arab civilization. *'Aṣabīya* is the normative glue that unites members of a dynasty. It is also what causes nascent dynasties to rise up and conquer those that are in decline. This understanding of *'aṣabīya*, however, goes against more traditional notions of the term. In the ḥadīth, *'aṣabīya* is a pejorative concept of tribalism, linked with the tribes of pre-Islamic Arabia. It is depicted as antithetical to Islamic notions of justice and fraternity. Ibn Khaldūn renders this concept compatible with Islamic notions of community and solidarity. Relating to the Greek notion of friendship or the Christian notion of love, *'aṣabīya* is an altruistic willingness to fight and die for one's community, to insure its survival. Ibn Khaldūn presents *'aṣabīya* as the conceptual antinomy of mulk or secular authority that leads to dynastic demise.

A scholar who articulated a new science that welds history with philosophy, who declared the foundation for Arab civilization, and who articulated a theory of world history, Ibn Khaldūn challenges us to expand our understanding of political theory: For him it was more than just a contest between tradition and innovation or between history and philosophy. Political theory emerges as a posture toward politics, where we consistently ask what perennial trends exist in a world so characterized by historical flux and uncertainty.

Ideal Type

The *ideal type* is a strategy of concept formation for the social sciences formulated by Max Weber at the beginning of the twentieth century. An ideal type is not a direct reflection or description of empirical reality. Instead, it is an abstract analytical construct that individual empirical cases approximate or diverge from in different ways and to varying degrees. The description and explanation of individual empirical cases is aided by comparing those cases to the ideal type, identifying the points of their divergence, and accounting for this divergence. Since its formulation by Max Weber, the ideal type has been the subject of many philosophical and methodological debates, as well as manifold applications in empirical research. In its basic characteristics, however, the ideal type has not undergone any significant changes since Weber's time.

The ideal type methodological strategy embodies a distinctive philosophical position regarding the character and limitations of the human or social sciences. Specifically, the ideal type emerged out of Weber's attempt to strike a middle path between nomothetic and idiographic conceptions of scientific inquiry and concept formation. In the methodological and epistemological debates at the turn of the twentieth century, the nomothetic approach understood social as well as natural science to be concerned with formulating general laws and abstract concepts embodying those laws. The idiographic approach, by contrast, claimed that social science has to do with the individuality and uniqueness of historical reality, and advocated the construction of concrete, unique historical narratives. Beyond these differences, both approaches shared the belief that a wholly objective, direct representation of social life in concepts or narratives is possible. Max Weber rejected both the nomothetic reduction of all individual phenomena to general concepts or laws and the idiographic insistence on the historical uniqueness of social phenomena. And he rejected the claim that social science concepts (or narratives) can be direct representations of social reality. His alternative was the ideal type: A strategy of concept formation that acknowledges the historical individuality of social phenomena, but at the same time deploys abstract conceptual constructs to highlight certain significant aspects of empirical reality and enable comparison across cases; without, however, claiming to offer a direct representation of that reality.

For Weber, the most important task of ideal-typical concept formation was to sustain a distinctively social-scientific mode of causal analysis. In contrast to events in the nonhuman natural world, Weber maintained, social action always involves and arises from the subjective intentionality of the actor. Hence, causal explanation in the social sciences depends on demonstrating a concrete relation between a specific action and its subjective motivation. In order to arrive at this kind of causal explanation, Weber advocated the deployment of ideal types that would be neither simple narratives comprising unique individual actions, nor general laws under which individual actions are subsumed. Instead, the ideal type would be an artificial conceptual construct without any direct correlate in reality, serving as a yardstick against which the empirical cases would be compared, described, and ultimately explained. Political scientists, for example, can construct an ideal type of what a purely rational political actor (that is, one acting out of purely rational motives) would do in a certain kind

of situation. They would then compare the actual course of action with this ideal type and attribute observed deviations from the ideal type to factors such as misinformation, strategic errors, logical fallacies, or personal temperament. In this way, even though the ideal type is an abstract conceptual construct, it is not geared to resolving individual phenomena into general classifications, but rather to aiding the description and explanation of these phenomena in their unique particularity.

In addition to deploying ideal types individually, scholars can also combine two or more ideal types to create more complex conceptual systems. A well-known example of such an ideal-typical system is Weber's threefold typology of traditional, legal, and charismatic authority or "legitimate domination." What is distinctive about ideal-typical conceptual systems such as this is that they do not constitute rigid classifications where any given empirical case has to be subsumed under just one type. Rather, ideal-typical systems can capture the fluidity and complexity of individual empirical phenomena in at least two important ways. First, concrete empirical cases can contain a mixture of attributes belonging to two or more of the ideal types involved. One might find, for example, political systems resting on a mixture of traditional, legal, and charismatic forms of legitimation. The ideal-typical typology of legitimate domination offers the conceptual tools for identifying and analyzing this empirical heterogeneity. Second, ideal-typical systems can be helpful in identifying historical movements from one type to another. Thus, Weber discusses cases of historical transition from charismatic to legal forms of domination.

In its attunement to the complex individuality and historical fluidity of empirical social phenomena, the ideal type is more than a method of concept formation. It embodies (at least implicitly) philosophical assumptions about the character of social life, its distinctiveness vis-à-vis the rest of the natural world, and the epistemological exigencies that this distinctiveness imposes on the human sciences. It thus challenges, not only more traditional modes of concept formation, but more broadly, all naturalist and positivist conceptions of the human sciences that attempt to arrange the knowledge of social life in the form of lawlike generalizations or purportedly objective narratives. Within political science, ideal types have, not surprisingly, been deployed mainly by historically minded scholars such as Ernst Haas in his analysis of European integration, Philippe Schmitter in his work on corporatism, and Roger Griffin in his study of fascism.

IDENTITY

Identity refers to the fundamental defining characteristic of an individual or group. Having a sense of identity—of being oneself and not another or of belonging to one group and not another—would appear to be intrinsic to human communities, and there is no reason to suggest it matters more to us than it did to our ancestors. Yet the practice of reflecting on identity, of opening it up to critical examination, is a hallmark of our period and points to the existence of a specifically modern set of problems relating to the constitution of selfhood. Where people remain bound by rigid kinship systems and status hierarchies they generally have no cause to address themselves with the question: "Who am I?" Their sense of self and of where they belong is more or less built into the social order. It is only when these traditional ways of ascribing identity break down that the issue of who we are and what we might become starts to present itself. Identity now emerges as something to be achieved, rather than something given, and this

simultaneously gives rise to new possibilities and new risks. The newfound freedom to fashion an identity characteristic of modernity goes hand in hand with the threat of alienation, disorientation, and misrecognition.

Much of the history of modern democratic states could be interpreted as an attempt to release people from their social bonds and give them an equal chance of realizing their identity. The ideal underpinning the revolutionary struggles against domination in the political domain and exploitation in the economic realm was an individuality freed to reach its full potential. Through the universal extension of civil and political rights, on one hand, and the redistribution of income and resources, on the other hand, individuals were to be liberated from the chains of caste and class and given an opportunity to develop their unique talents and capacities. Incorporated in the nation-state as citizens, they were at once similar and dissimilar. No longer discriminated against on the basis of class, gender, religion, or race, they shared a range of common entitlements that gave them the wherewithal to create their own unique identity. In principle, at least, citizenship denied their differences in the name of emancipating their individuality. Yet, as feminists were among the first to point out, the model of the universal citizen was built on an unreflected (male, white, heterosexual) identity that worked to exclude those differently situated.

One of the things that differentiates contemporary politics from this earlier horizon is the attention given to cultural or symbolic forms of domination. Increasingly, the modern preoccupation with the pursuit of individuality and the conditions that could enable it has given way to a far more group-oriented politics based around identity markers such as nationality, ethnicity, race, religion, gender, sexuality, and language. In an effort to overcome residual forms of discrimination and affirm the right to be different, identity groups have sought and won political concessions, exemptions, and privileges, which challenge democratic commitments to common citizenship and universal rights. Precisely how, and indeed if, this new *identity politics* is articulated with a broader project of emancipation is now deeply contested. In their efforts to determine the progressiveness of identity politics, theorists have taken quite different positions, both in relation to the process of identity formation and its political implications. In the course of these debates, the democratic ideal of equality has been extended in new and interesting ways and difficult questions have arisen about the homogenizing force of democratic values themselves.

Critical responses to the new identity claims have inevitably taken their cues from certain underlying philosophical or ontological assumptions about identity formation. Two broad views are discernible here. According to one approach, exemplified in the work of Charles Taylor, identity formation is best understood as a process of self-realization conditioned by intersubjective relations of recognition. Becoming an individual, a distinct human personality, entails a search for authenticity, for that which is uniquely one's own. According to this view, identity finds its measure of success in the extent to which individuals either deviate from or remain true to who they really are. The work of identity is, then, a work of self-discovery, but it is not one undertaken in isolation. Because individuals are always located in communities of language or "webs of locution," as Taylor once put it, the formation (or deformation) of their identity depends on their relations with others. Where individuals are properly esteemed or recognized, their identity is assured. By contrast, where they are forced to confront a reduced, demeaning, or contemptible image of themselves, they can suffer real psychological damage and be saddled with crippling self-hatred.

The second approach, exemplified by the work of William Connolly, tends, by contrast, to highlight the relational and contingent nature of identity. From his perspective, identities are not so much formed through a process of self-realization, as constructed through a process of self-differentiation. Individuals and groups acquire a sense of their distinctness, not by working toward an authentic selfhood that can only be what it is, but by differentiating themselves from others in specific and ever-changing contexts. Every identity is thus implicated in and conditional on difference. By twining identity/difference in this way, Connolly throws doubt on both the possibility and the desirability of an authentic identity, necessary and sufficient unto itself. From his perspective, the idea of authenticity merely works to obscure the contingency of identity—the choices, accidents,

and circumstances that make us one kind of person rather than another—as well as the underlying interdependence between self and other. To assert such an identity (apparently a perennial temptation) is tantamount to trying to overcome contingency and incompleteness by suppressing, excluding, or denying the very differences upon which the self relies for its distinctness.

These contrasting approaches to the process of identity formation or constitution have quite different implications for political thought and action. Where identity is conceived as a form of self-realization conditioned by intersubjective relations, attention is inevitably drawn toward political practices of recognition. If, as Taylor claims, the esteem of others is central to the achievement of a positive self-identity, there are good grounds for granting recognition a central place within an extended theory of democratic justice. The measure of a good society would then turn, not simply on the extent to which it distributes resources fairly, but on the extent to which it recognizes identity groups. In some cases, this would entail little more than the elimination of residual forms of discrimination and disrespect (as, for instance, with the removal of the ban on marriage for gays and lesbians). In others, more controversially, it would involve differential rights that protect identities at risk of marginalization or assimilation (as, for instance, with the provision of collective self-governing rights to indigenous communities). It is by no means the case, however, that all those who subscribe to this conception of identity formation are in agreement as to the appropriate political remedy. Judgments are divided in relation to which identities are worthy of recognition and what forms this recognition should take.

In his key essay, "The Politics of Recognition," Charles Taylor makes a powerful case for recognition as a tool of cultural survival. His starting premise, based on the ethic of authenticity, is that cultures as much as individuals have a way that is uniquely their own. Not all of them, however, are equally secure. In complex multicultural societies where power is unevenly distributed, the identity of nondominant cultural groups such as the Quebecois and aboriginal peoples in Canada (to use Taylor's examples) is constantly under threat. This means that the members of these cultures, despite their formal equality, are at a disadvantage relative to other citizens. The function of recognition in this context is to create a sufficiently robust legal shield to guarantee the existence of these distinct cultures into the future. Taylor is thus supportive of Quebec's attempt to ensure its survival as a "distinct society" by prohibiting francophones from sending their children to English language schools. In taking this approach, Taylor is careful not to allow cultural protections to override fundamental liberal rights to life, liberty, free speech, and so on. But less essential legal privileges and immunities, like the right to choose a language of instruction, can be set aside in order to give threatened cultures a chance of survival.

Taylor's willingness to set aside individual rights for the sake of cultural survival has troubled democratic theorists and led them to reassert the primacy of moral autonomy over collective identity. According to Seyla Benhabib, Amy Gutmann, and Nancy Fraser, for instance, the aim of recognition should not be to prevent cultural demise, but to broaden and deepen the democratic project of eliminating oppression. From their perspective, the public recognition of collective identities is to be encouraged where it works to break down entrenched forms of social exclusion, hierarchy, and inequality. Conversely, it should be resisted where it works to insulate identity groups from critical scrutiny and enables the perpetuation of internal forms of oppression. Thus, the extension of group-specific rights, such as maternity leave for women, would be acceptable because it constitutes a precondition of their inclusion in the public sphere as social equals. By contrast, the extension of full sovereignty to indigenous peoples would not be acceptable, because it makes it possible for inherited cultural practices, such as the unequal treatment of men and women, to continue unchallenged. As Benhabib points out, the underlying aim of recognition should not be to preserve minority cultures, but to expand the circle of democratic inclusion. Differential rights for identity groups are justified only insofar as they extend the moral autonomy of their individual members.

Although the approach taken by these democratic theorists is consistent with the project of emancipation as it is conventionally understood, it is open to the criticism that it presupposes a certain, culturally specific understanding of justice. Democratic principles of freedom and equality are

taken as universal norms against which to assess the claims of identity groups for recognition in the form of collective rights. This means there is limited capacity to draw into question the meaning of oppression and engage with the possibility that minority cultures do not understand their own ostensibly oppressive, hierarchical, or exclusionary practices in the same way as the dominant culture. The issue is particularly manifest in the case of indigenous peoples, but it applies to other ethnic and national minorities as well. At the same time that it has enriched and extended the meaning of equality, therefore, identity politics has also brought the limits of democratic politics sharply into focus. Liberal democracy has emerged as a fighting creed, capable of being more generous in relation to nondominant identities, but attached to certain substantive values that it is unwilling to compromise.

The alternative conception of identity construction as differentiation does not necessarily avoid these problems, but it does open up new perspectives on them. By emphasizing the relational and contingent nature of self-constitution, Connolly makes it possible to bring the limits of identity into question, to explore the boundary that separates the legitimate from the illegitimate, the acceptable from the unacceptable, and the normal from the deviant. As he sees it, there is a "polemical temptation" built into the very dynamic of identity, to translate differences into moral failings or abnormalities. Our dependence on the other for our own sense of distinctness constantly frustrates our desire for self-identity, and this sense of lack translates into outward hostility. The more we seek to secure our identity, to render it necessary rather than contingent, integrated rather than fragmented, the more likely we are to demonize those who are different. The pursuit of identity therefore bears an intimate relationship with the designation of certain behaviors, practices, and modes of being as deviant and abnormal. It is easy to see here how the politics of identity lends itself to strategies of normalization and correction.

In the face of these temptations to demonize and normalize, Connolly calls for a more generous "ethos of engagement" that models ethical relations between self and other. The key to this lies in those "arts" or "practices" of the self that, working at a deeply visceral level, allow us to acquire some critical distance on our own entrenched habits, dispositions, and attachments. These practices of the self are fundamentally designed to disturb our identity rather than reinforce it, but their precise impact will vary depending on the circumstances. At times, according to Connolly, the cultivation of an ethical sensibility will require us to affirm what we have become and resist the desire to find scapegoats for our suffering. Because our relationships with others can be poisoned by envy and resentment, it is important to come to terms with our own failings and limitations. At other times, being ethical will require us disaffirm aspects of our identity, to loosen the grip of strongly held beliefs and convictions and open them up to question. This is not simply a matter of acknowledging the contestability of our beliefs in the eyes of others, but of seeking to make them contestable to ourselves. At no stage, however, does Connolly assume that identity is infinitely malleable. His point is rather that a greater receptivity to identity disruption and disturbance is important to the creation of respectful identity/difference relations in the democratic state.

The ongoing currency and intensity of these debates about the need for recognition and the threat of normalization are revelatory of the extent to which group identity has become a focus of political mobilization and political vision. In the "postsocialist age," as Nancy Fraser termed it, identity has emerged as the new political imaginary. It sets the terms within which justice is imagined, and the sometimes competing, sometimes overlapping theories of recognition and deconstruction sit firmly within its compass. Whether this preoccupation with difference is a symptom of the exhaustion of utopian energies or a sign of a yet uncrystallized new pluralist utopia is still difficult to discern.

IDEOLOGY

The concept of ideology has been vigorously contested and, at certain points, radically reconstructed in accordance with the interests and actions of those who have used it. We can go right back, for example, to the thinker who is often credited with first employing the term ideology in the late eighteenth century, Antoine Destutt de Tracy. *Ideology* is the name that Tracy gives to describe a scientific method, a "science of the formation of ideas," which, in line with prevailing enlightenment aspirations, he believed could promote social progress and the common good.

However, Tracy's initial conception of ideology did not survive unchallenged for long. Napoleon Bonaparte, for instance, engaged in a series of polemical attacks against the "shadowy metaphysics" of Tracy and the school of thought he represented. Deriding Tracy and others in his circle as ideologues, Napoleon complained that they indulged a fanciful and doctrinaire speculation entirely innocent of the practical realities of politics. Napoleon's attack on the ideologues was politically motivated; it was part of a campaign to consolidate his power and discredit ideas that might have threatened his ascendancy. Thanks in part to Napoleon, the word *ideology* suffered a dramatic fall from grace: What had begun as an idea with impeccable enlightenment credentials quickly evolved into a term of abuse.

As this example from its early history shows, the meanings carried by the concept of ideology have shifted over time and cannot be separated from the concrete political struggles through which they emerged. As a result, efforts to pin down the notion of ideology are necessarily provisional and historically specific. Its definition and conceptualization will always be irreducibly anchored in the social-historical context in which it is used.

Despite this historical variability, we can nonetheless discern two broad tendencies in the way the concept of ideology has been deployed. On one hand, the term has often been used in a *descriptive* sense, as part of an effort to explain the terms of social and political life empirically—Tracy's early efforts being a prime example. On the other hand, theorists interested in challenging relations of power and domination have used the term in a *critical and evaluative* sense. Useful as this distinction is, it is important to keep in mind that these are not necessarily exclusive tendencies: Many thinkers have combined both within a single theoretical framework.

Ideology in the Descriptive Sense

Tracy's scientific notion of ideology aimed to explain the empirical conditions under which certain concepts, belief systems, moral ideals, and religious and scientific ideas become socially influential and in turn affect the course of human affairs. Two aspects of Tracy's project deserve emphasis. First, his notion of ideology is *ethically neutralized* in that it does not necessarily imply value judgments about particular ideological commitments. For example, any suggestion that certain social phenomena can be criticized as merely *ideological* in a sense that implies some sort of deficiency is entirely absent from Tracy's approach. Second, he understands ideology in a way that is also *politically neutralized*. That is, for Tracy, the formation and evolution of socially influential ideas and forms of consciousness are not necessarily tied to the sectarian agendas of any particular political constituency. Nor did he think of ideology as a field of study intended to serve the interests of any such political agenda. Instead, Tracy conceived it as motivated by a desire to serve a more generalized, even universal, interest in the progress of society as a whole. This double neutralization has

been an enduring theme throughout the history of the concept, and it continues to figure prominently in the work of key theorists of ideology today.

The recent work of the influential contemporary theorist Michael Freeden is a case in point. Although he occupies a very different cultural and intellectual milieu from that of Tracy, Freeden's effort to approach the concept of ideology from a descriptive point of view nevertheless falls recognizably in the same tradition. To be sure, Freeden rejects Tracy's enlightenment positivism in favor of a more hermeneutically grounded approach that aims to interpret the meanings of conventionally recognized traditions of thought (such as socialism, liberalism, and conservatism, for example). What Freeden would call the shape or *morphology* of any given ideological perspective on the social world is conditioned by the political concepts (for example, conservatism's stress on being sensitive to the wisdom of tradition, or feminism's stress on the prevalence of patriarchy in our gendered political culture) through which it is articulated. The student of ideology, in this regard, needs to acquire a sympathetic understanding of how political concepts function within these larger frameworks. By so doing, she is in a position to decode the meanings around which political consciousness revolves at particular times and places and within specific traditions of thought. Ideologies like socialism or liberalism thereby become available for analysis as systems or bodies of thought that successfully mobilize and legitimize certain politically significant ideas. Consider, for example, the way in which socialist ideology legitimizes the idea that the symbolic meanings we attach to things in social and political life are predominantly determined by economic and class relations.

In mapping out the relations within and between the competing ideologies, Freeden avoids judgments of their relative merits. He is not concerned, for example, to establish that conservatism is somehow superior to eco-feminism, or that socialism is ethically superior to liberalism. Nor does he assume that these ideological complexes can be explained just as crude reflections of the political interests or agendas of their advocates. His point would rather be that they inflect the way in which interests and agendas are themselves actually understood by agents in the political world, and that a close hermeneutical study of ideologies enables theorists to understand exactly how this happens. Like Tracy, then, Freeden's use or theory of ideology implies both an *ethical and political neutralization* of the concept. It refrains from invidious judgments about the relative value of ideologies and refuses to reduce them to the partisan political interests of those who claim to be committed to them.

Ideology in the Critical-Evaluative Sense

The thought of Karl Marx and Friedrich Engels provides the paradigmatic example of a theory that mobilizes a notion of ideology in the second, critical, sense. Writing in the mid-nineteenth century, Marx and Engels employ the term in a resolutely polemical fashion, as part of the effort to challenge the forms of domination they discerned within prevailing economic and political structures. For Marx and Engels, the student of ideology cannot rest content with a stance of neutrality in the manner of Tracy or Freeden. Marx and Engels thought this because they did not conceive of ideology just as a field of conventionally recognized partisan antagonists (like socialists, libertarians, radical ecologists, etc.). Rather, they considered ideology to be a form of cognitive distortion that operates at a far deeper level. According to Marx and Engels, conventional notions of socialism, libertarianism, and so forth are merely superficial labels attached to various patterns of ideas that develop at different times, but they do not capture the essence of ideology. In their path-breaking work, *The German Ideology,* Marx and Engels famously liken the operation of ideology to the *camera obscura,* suggesting that to be under the sway of an ideology is, in fact, to see the world in an inverted or upside-down fashion. Ideology here comes to refer to any systematic set of delusions or distortions that arise in agents and that conceal the true nature and operation of the social world within which they find themselves.

The distortions involved in ideological forms of understanding are not simply a matter of faulty reasoning or feeblemindedness on the part of those caught in their grip. According to Marx and Engels, it is not merely difficult, but in some sense impossible, to escape false forms of consciousness—at least insofar as we remain under conditions of social and economic domination (like those they

associate with modern capitalism). Until material human liberation is actually accomplished, we are, Marx and Engels want to argue, inevitably caught up in forms of consciousness that, on one hand, shape the most intimate and basic modes of thinking, feeling, conceiving, and reflecting, and, on the other, systematically misrepresent the actual circumstances of social reproduction. Of course, what Marx and Engels have in mind here is the role economic organization plays in shaping the development and exchange of ideas in social life. As they see it, then, the function of ideology is to give intellectual, moral, and political currency to a distorted vision of social reality. The distortions are symptoms of class domination and will pass away only when the domination of one class by another is itself somehow abolished.

Marx and Engels's view of ideology and their view of its systematic infiltration of ordinary consciousness is provocative. But whether or not one accepts it, it is undeniable that their view entails that the student of ideology is necessarily in part a social critic, seeking to document the ways in which social and economic relations cause agents to lose touch with the reality in which they find themselves.

Not surprisingly, subsequent commentators have disagreed about how best to understand their legacy. Throughout the twentieth century, the Marxist theory of ideology came under attack, even among sympathizers. For example, a Marxist and Frankfurt School thinker such as Theodor Adorno complicates and renders problematic the very idea that we can critique and evaluate ideology in the way Marx and Engels initially seem to suggest. For Marx and Engels, it is imperative that the social critic distinguish between ideology, on one hand, and the social reality they uncover on the other. Where ideology is a form of false consciousness, social reality is understood by the critic to be determined by the economic structure and organization of social relations. Important then, the critic of ideology must have access to, and an understanding of, this social reality, and she must be able to view the operation of ideology from a sufficiently distanced vantage point. Simply put the critic of ideology must be able to stand outside or at a critical distance from the ideology being evaluated.

Adorno questions this very assumption by arguing that there is no critical space or vantage point outside ideology precisely because ideology is always already at play in the discourse the critic uses to evaluate it. Adorno's own critique of what he and Max Horkheimer called "the culture industry" can help clarify this suggestion. In *Dialectic of Enlightenment,* Adorno and Horkheimer argue in broadly Marxist terms that the culture industry (here culture industry means what we would now call mass media forms, such as film, radio, television, etc.) is an ideological form that reproduces the economic structure of what they call late capitalism. They argue, for example, that the culture industry makes us slaves to endless consumption: It gives us the "freedom," as they rather ironically and caustically put it, "to choose an ideology of economic coercion."

Against the consumptive and thoroughly ideological logic of the culture industry Adorno holds out the possibility that modernist artworks or artists (Samuel Beckett would be one such artist for Adorno) can challenge the ideology of late-capitalist society; providing a glimpse, perhaps, of a society that is free from the almost totalizing and dominating logic of the market. Adorno thus entertains the idea that certain forms of art or culture can become autonomous or stand outside and beyond the ideological rough-and-tumble of social-political life. In this way, art and its experience can occupy the place that Marx and Engels reserved for the critic of ideology.

And yet, almost as soon as he suggests that the modernist artwork or artist can somehow stand outside and shine a critical light on ideology, he rejects this as impossible. "It is impossible to conceive of the autonomy of art," says Adorno, "without covering up work." What Adorno means is that it is impossible to find a conceptual vocabulary or a form of discourse with which to talk about what stands beyond ideology (in this case, the modernist artwork) precisely because the language being used (the language of autonomy) is itself filled with ideological meaning (where the very discourse of autonomy itself ideologically reflects and reproduces historical developments in late capitalism). In other words, the very concept of aesthetic (or indeed political) autonomy actually covers up or hides the fact that the economic structure of late capitalism fundamentally shapes it from the very first instance.

To be sure, with Adorno, the critical-evaluative conception of ideology takes a somewhat

paradoxical and rather depressing turn as the very prospect of engaging in a critique of ideology seems to be rendered so thoroughly problematic. At this point, and by way of conclusion, it is worth briefly comparing Adorno's pessimism to the more optimistic outlook of his most famous student and second-generation Frankfurt School thinker: Jürgen Habermas.

One of the key arguments that Habermas makes in perhaps his most ambitious work, *The Theory of Communicative Action,* is that the forms of dominating ideology in contemporary social life (what he calls the "instrumental rationality" of "money and power") can be critiqued from the outside and from a more or less impartial perspective. Habermas challenges the instrumentalizing logic of money and power because he believes that it runs counter to the basic and fundamental form of communicative action (what he famously calls "communicative action oriented to mutual understanding") through which our social and political life is reproduced. Crucially, for Habermas, this form of communicative action universally commits social actors to a certain moral-political or normative outlook that stands beyond or outside the instrumental rationality of money and power. In this way, Habermas advocates a normative critique of ideology, where normative critique suggests the possibility of critically evaluating the ideological for failing to live up to the moral norms (here Habermas thinks in terms of norms of equality, of social reciprocity, and individual autonomy) that are presupposed in and through those forms of "communicative action" that are "oriented to mutual understanding."

Imaginary, The

The imaginary is the set of meanings, symbols, values, narratives, and representations of the world through which people imagine their existence. The concept entered the political-philosophical debate when, after the linguistic turn, political theorists started to point out that our relationship to the world is always linguistically mediated. Then, the problem emerged of the way in which the set of meanings and representations that are deposited in every language influences our political experience. This, in turn, raised crucial issues, such as that of the autonomy of the individual vis-à-vis the power of such imaginary significations, which often operate at the subconscious level as they are internalized through the very first contacts with language.

In order to show the relevance of the concept of imaginary for political theory, this entry will first discusses the definition of imaginary and then move on to explore its political implications and contemporary transformations.

From Imagination to Imaginary

The conceptual move from the earlier focus on imagination to the current one on the imaginary reflects a passage from a view of human beings as a sum of single individual faculties to an emphasis on the contexts in which they live, as this also emerges in the passage from the concept of reason to a more context-oriented rationality (Johann Arnason). Putting more emphasis on contexts means pointing to the constraints within which the free imagination of individuals operates.

Among the different conceptions of the imaginary, there are those which, drawing inspiration from psychoanalysis, put emphasis on the deep psychological structures of the psyche (Jacques Lacan), others that primarily focus on the social

background (Charles Taylor), and finally those that look at the same time at both (Cornelius Castoriadis). All of them share the idea that there exists a more or less subconscious set of meanings, symbols, values, narratives, and representations of the world that influence the way in which people experience their political world.

Differences remain as to the ontological status of the imaginary significations. For some, such as Lacan, who distinguishes the imaginary order from both the symbolic and the real, the imaginary dimension is distinguished from, if not opposed to, the real one. In this view, the imaginary domain is systematically associated with illusion, distortion, and alienation. For others, such as Castoriadis, the imaginary dimension comes before the very distinction between what is real and what is not, because every society defines in its own way what must count as real in the first place.

Political Implications and Contemporary Transformations

The various ways in which the concept of imaginary is portrayed also has clear political implications. The first and more important is the issue of the autonomy of the individual vis-à-vis the overarching power of the imaginary dimension. While some underline the impossibility to step out of the deep imaginary significations within which we have been socialized, others underline that there always remains the possibility to question them. Castoriadis, for instance, argued that the instituting social imaginary is also at the same time instituted: If individual human beings cannot exist outside the imaginary significations that are internalized through language, it equally holds true that the latter cannot exist without the individual human beings who continuously sustain and recreate them.

The problem of autonomy is further increased in the contemporary conditions of globalization. The diffusion of new media, such as television and the Internet, on the global scale and the increasing role that they play in our lives have determined both a quantitative and a qualitative change as a result of which the imaginary has become much more pervasive and powerful than it has ever been in the past (Chiara Bottici). In quantitative terms, the increase in the number of images that mediate our political life is such that politics has become inconceivable outside of the continual flux of images that enter our screens every day. This has saturated our imaginary, so that only those images that can strike people's imagination by playing on the register of spectacle prevail. The result is the increasing personalization of politics and the prevalence of the register of spectacle over the content of political campaigns.

The qualitative change concerns the role of virtuality. Virtual images are not created once for all, but are processes of perpetual maintenance. Therefore, what is typical in virtuality is that we have no criteria to determine the status of the reality of images themselves.

Finally, together with the issue of the autonomy of individuals, the emergence of globalization has also exacerbated the problem of the borders of the social imaginary. While some authors underline that, because they are transmitted through language, there are as many social imaginaries as there are languages, others point to the deeper commonalities among them and speak of the imaginary in the singular, as if there existed only one deep psychological imaginary common to all human beings. If the former have the problem of explaining how communication is possible between the different social imaginaries, the latter must face the problem of radical diversity persisting even in a world that has become one from many points of view.

IMMANENCE

Immanence is the attribute of being internal or remaining within, free from external conditioning. Immanence is opposed to transcendence, which concerns what is above, beyond, or outside. In theology, an immanent conception would hold God to be a divine spirit infusing the world, rather than one that lies beyond and independent of the world. The ancient Stoics assert such an immanent divinity, as does the early modern philosopher Baruch Spinoza, whereas Augustine's God is transcendent. Phenomenology, the science of appearances, aims to isolate what is immanent to consciousness through a phenomenological reduction that brackets off and eliminates anything that conditions consciousness from outside. Following this idea, Jean-Paul Sartre argues, against Edmund Husserl's phenomenology, that the ego, being an organizing principle extraneous to appearances themselves, is transcendent to consciousness, rather than immanent. An immanent critique would be one that derives its standards from within the domain being evaluated, rather than one appealing to transcendent standards, such as Platonic ideas. Immanuel Kant's critical philosophy is an attempt to perform an immanent critique, whereby reason criticizes itself, although thinkers like Gilles Deleuze hold that only with Nietzsche is Kant's aspiration to immanent critique achieved.

The distinction between immanence and transcendence also applies to ontology, the science of being. Georg Wilhelm Friedrich Hegel's dialectical philosophy can be seen as an attempt to achieve a fully immanent ontology. Hegel seeks to show, first, that every identity negates itself by being constituted by its relations to everything it is not, and, second, that this negation is negated and sublated into a higher unity of differences. For Hegel, this synthetic unity, the Identity of identity and difference, signifies the nature of Absolute Knowledge. It achieves immanence because this Absolute does not depend on anything beyond its own unity. Whatever might transcend this Absolute would be negatively related to it—in being beyond, it would be *not* the Absolute—but this negativity is precisely what dialectics recuperates into unity. Many contemporary theories, particularly *difference theories* of the poststructuralist variety, challenge the success of this attempt to secure dialectical unity. They maintain that the idea of dialectical negation does not account for a kind of difference or Otherness that leaves Hegel's Absolute incomplete. However, the status of this difference reopens the issue of immanence versus transcendence. Some hold this difference to be best understood as a multiplicity immanent to being that shows Hegel's to be a false Absolute. Others hold it to designate a kind of impossible fullness beyond Hegel's Absolute—a fullness that does not exist in any positive form and is certainly never encountered in experience, but that still pervades experience as a kind of specter promising a fullness to come.

Some contemporary political theories unabashedly embrace the sort of transcendence found in traditional Judeo-Christian monotheism. Most, however, either aim to build on starting points that are secular and immanent to this world or seek out an alternative form of transcendence that does not rest on a particular faith. Many contemporary liberal theorists, for example, denounce appeals to notions of human nature or the human good, maintaining that these invoke transcendent standards linked to teleological or theological world views, and try to rest their claims instead on what they consider to be minimal standards of rationality or empirical evidence. Many communitarians, who are often accused by liberal theorists of relying on transcendent standards, seek to ground their goal of a reinvigorated community in society's shared history and traditions, sometimes using this shared history to suggest a kind of quasi-transcendent source for moral agency. Debates between liberals and communitarians do not directly thematize the idea of immanence, but focus instead on metaphysics, the various participants accepting that political theory today cannot rely on the kind of premodern metaphysical positions that invoke a ground that conditions this world from beyond.

However, immanence and transcendence are explicitly thematized in contemporary debates among difference theories and particularly theories of radical democracy. Deleuze is a key figure in these debates for theorists who affirm an ontology

of immanence. Deleuze holds transcendence to be an illusion generated by immanent forces of becoming, and he makes it a political and philosophical task to challenge the transcendent standards that seem to organize political and social life from above. Conversely, many theorists of transcendence, while rejecting the existence of positive transcendent standards, maintain that collective political and social life require that something of this world be raised to the level of a transcendent organizing principle. Often the concept of *hegemony* is invoked to explain the logic of the struggles by which particular standards assume this sort of universal function. Jacques Derrida and Jacques Lacan are frequently used in the radical democracy theories that support this idea of a necessary transcendence. This is often understood as an *immanent transcendence,* as it does not see transcendence as a positive, existing form, but rather as the promise of something forever absent that underpins worldly attempts to reach it. Because this transcendence is both necessary and impossible to finally realize, politics in these theories becomes a struggle to create always temporary forms of transcendence.

IMPERIALISM

Imperialism is generally understood to be the policy of extending one's rule over foreign societies leading to the establishment of an empire. Imperialism has recently experienced an unexpected revival. The unique position of the United States in the post–cold war international system has encouraged prominent authors to advocate an open and unapologetic imperialist foreign policy (sometimes in conjunction with other Western states)—whereas their critics identify such policies as dangerous. Because such judgments are based on competing interpretations of historical imperialism, this entry will first provide a historical overview, followed by a brief introduction to theories of imperialism.

Historically, empires have existed across time and space: from the Assyrian, Persian, and Chinese Empires in Asia through the Greek and Roman Empires, and from the Islamic Caliphates around the Mediterranean to the Aztec and Inca Empires in America.

Imperialism is now most commonly associated with the European colonial empires. In the fifteenth and sixteenth century, the Dutch and Portuguese established trading empires in Asia and Africa, and Spain extended its rule over vast stretches of South and Central American land and numerous indigenous peoples, swiftly followed by the Portuguese, and in North America predominantly by the English and French. Africa and South East Asia were divided up by the major European powers toward the end of the nineteenth century. In a rush for colonies, the old colonial powers were now joined by Germany, Italy, Belgium, the United States, and Japan. By the beginning of the twentieth century, almost the entire world was directly ruled by a handful of powerful, mostly European, states.

The early trading empires consisted largely of the establishment and monopolization of trading posts and routes. In contrast, the Spanish and Portuguese colonies in America were based on

conquest and subsequently ruled directly by the imperial power, whereas the English and French colonies in North America, and later in Australia and New Zealand, were based on the displacement of the indigenous population by European settlers.

Whereas sections of the indigenous population occasionally cooperated with the imperial powers, resistance was widespread. This resistance gained momentum during the first half of the twentieth century and eventually led to systematic struggles for independence. By the end of the 1960s, almost all former colonies had become independent states, and imperial rule had lost its moral, political, and legal legitimacy.

Theories of imperialism explain it by focusing on a variety of driving forces. Economic theories hold that economic interests lead to expansionist policies. Thus, profits made from trade led the Dutch and Portuguese to establish their trading empires; the Spaniards extracted gold and silver from their colonies and exploited the labor of the indigenous population, while the English appropriated indigenous land. In addition, it is argued either that falling profit rates in the industrialized European countries drove capitalists to invest abroad or that industrialized countries suffered from overproduction and thus required colonies as captive markets for their products. In either case, economic actors went abroad first and asked for the protection of their government only if and when they met with local resistance or international competition.

Political theories argue that imperialism is either a means to establish domestic stability or to ensure international security. Domestic stability can be furthered by imperialist policies, first, through the *export* of potentially destabilizing sections of society, such as the Puritans or large numbers of poor and unemployed people in the case of early British settlements in America, or convicts in the case of Australia. But even privileged classes who, due to social change, had lost their traditional occupations could be provided with a *playing field* in the exploration and administration of colonies. Second, imperialist policies can function as unifying goals for otherwise fractured political communities, as was the case in Germany before World War I. Finally, imperialism has been seen as a means to increase the geopolitical power of a state and thus to ensure its international security; a prominent consideration underlying the late-nineteenth-century rush for colonies by previously nonimperial states.

Cultural theories highlight the important role of ideas and ideologies in the motivation and justification of imperialism. The prospect, or even obligation, to convert indigenous populations to Christianity thus played an important role in Spanish as well as early English imperialism in America. This religious mission was gradually replaced by the (in)famous *civilizing mission*—the *white man's burden* to bring law, order, and civilization to *barbarian* peoples—so prominent in nineteenth century imperialism.

Which of these theories—economic, political, cultural—best explains imperialism is contested. Ultimately, however, these three dimensions of imperialism can neither historically nor theoretically be separated. In practice, modern European imperialism always combined economic, political, and cultural elements. And theoretically, while economic interests may trigger imperialist policies, these will in turn have political repercussion and require cultural justifications—and vice versa.

The use of the term *imperialism* today implies some continuity with its historical manifestation. Economic theories argue that the inequalities of the global economic order, established during the period of imperialism, are still in place today. And these inequalities explain the continuing economic gap between the Global North and the Global South as well as the resulting political dependency—or neoimperialism. Similarly, centuries of a hierarchical cultural construction of colonizers and colonized—first as Christians and heathens, then as civilized and barbarian peoples—find some continuity today in the juxtaposition of a progressive, secular, and democratic West with a backward, religious, authoritarian Middle East or Africa. Lack of democracy or human rights are used to legitimate interventions and thus lead to what is either endorsed or criticized as an imperialism of human rights. And inasmuch as the pursuit of military and economic security drive today's expansionist policies, even political theories of imperialism may well be applied again.

What is beyond doubt, however, is that centuries of modern European imperialism have deeply influenced the economic, political, and cultural identity, not just of the former colonies, but of the West

itself. From Hugo Grotius and Francisco de Vitoria, through Emmerich de Vattel to the League of Nations, modern international law developed in the context of imperialism; from John Locke and Adam Smith through the Enlightenment, John Stuart Mill, and Alexis de Tocqueville to Vladimir Lenin and Joseph Schumpeter, imperialism lies at the heart of European political and economic thought; and from Michel de Montaigne, Thomas More, Tommaso Campanella, and Voltaire through Rudyard Kipling to Joseph Conrad, European culture is shaped by the imperial imagination. And it is reflection on these entangled cultural identities—and the possibility of overcoming their hierarchical nature—that has given rise to postcolonialism as a new theoretical approach in the humanities and social sciences.

Indian Political Thought

There are diverse strands of political thought in ancient India, and this diversity is not premised merely on different understandings of the nature and purpose of polity but also on the philosophical underpinnings of such understandings, such as the significance of the transhuman domain in human affairs, the nature of the self, conception of the world, goals, and purposes of life, and the nature of understanding as such. Some of these strands of thought have a remarkable continuity over time, although their autonomy as a defensible body of thought or even their role in sustaining allegiance to the political order and defending its legitimacy did not remain the same. Sometimes opposition to a dominant strand of thought led to the reconstruction of certain other streams of thought that led to alternative political striving. Existing evidence suggests that there was much contestation within and across strands of thought, and institutions developed even to manage and regulate opposition. Such opposition was not always bound in a binary axis and employed a complex grid to express itself. Eventually the great diversity and complexity of Indian social formation was partly shaped by such dissent and protest. In encounter with modernity, specifically in its colonial version, a large body of this thought was threatened with oblivion, although much of this tradition reasserted itself, often reinventing the modern in its own distinctive way. The nonviolent, open-ended, and mass-based character of the Indian national movement and the liberal-democratic foundations of Indian postcolonial polity helped sustain much of this tradition. For the purpose of presentation, we use the following periodization to engage with this body of thought:

1. The ancient period (to the thirteenth century CE)
2. The medieval period (from thirteenth to the eighteenth century CE)
3. The nationalist phase (from eighteenth century CE to the 1947)
4. Contemporary reflections and enquiries (from 1947 to the present)

The Ancient Period

In the ancient period, there are distinct strands that can be classified as follows:

- *Brahmanical thought*. There is much diversity and variation over time in this strand of thought, although it upheld a framework of shared concepts and concerns throughout to regulate and direct social life.

- *Sramanic (Buddhists and others of similar vein) thought.* This mode of thought expressed a deep disenchantment with the social institutions and ways of life of the world, highlighted individual agency and responsibility, and held out the promise of perfection to discrete seekers.
- *Other traditions,* such as those highlighted in classical Tamil texts.

It is, however, to be noted that often texts were overwritten freely to subserve many purposes, as the reason of the text itself was internal to tradition. There was also much interaction across these strands of thought alongside valiant attempts to guard their distinctiveness, as can be seen in the early Buddhist attempts to draw up a canon, insertion of ideas and viewpoints in schools of thought such as Arthasastra, and setting up *peethas* (seats or centers of learning), as was done by Shankara (788–820 CE), the great exponent of the Advaita perspective. On the scope of political thought and the domain of the political there were significant differences, as highlighted by the terms employed to grapple with them, such as *rajadharma* (duty of king), *Rajyasastra* (science of the state), *Dandaniti* (policy of rewards and punishment), *Nitisara* (a course on leadership and direction), and *Arthasastra* (science of acquisition, protection, and governance) demonstrate.

Brahmanical Body of Thought

The first formulations of political thought in this vein can be found in the Vedas and in the great epics of *Ramayana* and *Mahabharata*. In the *Rigveda, rta/rita* (cosmic law) and *dharma* (social order) are closely connected, and by sustaining the social order, the king helps in the reproduction of the cosmic order as such. The Mahabharata bears witness to the great complexity of life with beings and humans at different levels and stages of life, while at the same time related in a larger cosmic embrace. The king is ascribed a nodal role in the reproduction of this life.

Manu, to whom *Manusmriti,* the masterly text on law and jurisprudence, is ascribed, and a majority of the proponents of the *smriti* school of thought believe that human beings have the capacity of transcending the world of necessity and pursuing the realm of freedom while the other creatures are caught in the realm of necessity. The attributes of responsibility and agency are identified as the specific propensities and attributes of the human world. Though humans do not know the working of natural necessity, nor can they ensure the results of their actions, they were autonomous with regard to their motives and reasoning. One of the hallowed formulations of the relation between necessity and freedom is expressed in the moral norm, *niskama karma* (i.e., performance of action that is not premised on its outcome), propounded by *Gita,* a subtext that is woven into the larger text of *Mahabharata*.

The basis of polity is dharma, the sustenance of the social, political, and even cosmic order. The king is the protector of dharma, and gods too are deployed to protect it. Also, by protecting dharma one becomes god or godlike. While there is a universal agreement on the foundational basis of this value, and even the oppositional *Sramanic* Buddhist thought employed a closely rhyming concept *dhamma* in its place, the meaning of the term remained quite elastic and acquired diverse connotations depending on the context. In its predicative sense, it meant "to protect, to uphold, and to be beholden to." In its substantive sense, its connotations were constantly refurbished and referred to a set of core characteristics and dispositions of the social order—as well as of the discrete entities that constituted the world, connected in turn to the cosmic order. In an ideal action, one takes into account the totality in view alongside the distinctiveness of the action one is called on to perform here and now, while at the same time the acting subject is aware of oneself and through his action lends oneself to the realization of the purpose of everyone and everything. The only known strand of thought that pitched itself in opposition to this overarching vision was the *Lokayata,* which decried the assumptions and presuppositions of such a view of life and sought to base itself on the ongoing processes of life, conceiving man as closely bound with nature.

In Brahmanical thought, the polity is seen as the fusion of two powers: *brahma* and *kshatra,* knowledge and power, embodied in the Brahmin and Kshatriya respectively. The duties and responsibilities of the later two classes are foregrounded in this conception. They were expected to work together to sustain an order, dharma, embodying social

roles specified in terms of *varnashramas, purusharthas,* and *gunas*. The four *varnas,* or classes, were Brahmanas, Kshatriyas, Vaishyas, and Shurdras, whose tasks were pursuit of knowledge, virtue and teaching; protection and rule; goods and wealth; and service of the rest respectively. Although Manu normatively binds this social division into a hierarchy, even the earlier literature lends itself to such a formulation. This is in spite of the fact that many defenders of this literature in modern times read in it functional division of labor, rather than stipulations of a ranked order. The *ashramas* that paced the successive stages of life of the first three of the four *varnas* mentioned were: *brahmacharya,* the early years of learning and grooming; *grihasta,* the state of the householder; *vanaprastha,* a stage of predisposition to the next stage of *sanyasa* (i.e., renunciation). Every social calling was bound with its own duties. There was, however, a great deal of tension between such a normative stance and the actual life, prescriptions, and practices. Boundaries across social classes remained porous to an extent, although guardians of the existing order increasingly asserted the principle of birth to defend it. Eventually social arrangements that expressed this conception of life came to be trumped by the principles of heredity. The functional division of labor within the family also made the woman dependent on man and servile to him, while eulogizing the virtuous wife and mother at the same time. The four *purusharthas,* or hallowed pursuits, were *dharma* (pursuit of one's duty), *artha* (wealth, welfare, and prosperity), *kama* (love and gratification), and *moksha* (liberation/salvation). The three gunas or attributes that informed men were *satva* (truth), *rajas* (spiritedness), and *tamas* (inertness/blandness). The king, therefore, had to be guided by those who had reflected on and knew the relations across these complex variables and the considerations accorded by the scriptures and customs to them. The role of the Brahmins, therefore, became singularly important as advisers to the king.

In this conception of the political, state/power came to be acknowledged as singularly important because without it the social order cannot be sustained and there would be anarchy. The coronation ceremony, *rajasuya,* symbolically represented the great powers wielded by the king. There are two reasons that are generally suggested for the origin of kingship: divine origin, wherein the Supreme Being, Brahma, himself begot the king to protect the world and social contract. Valmiki in his *Ramayana,* for instance, advances two variants of the second reasoning on the origin of the state. It arose from the desire to escape from anarchy, where might was right and the big fish ate up the small ones, a state of affairs described as *matsyanyaya* (principle of justice among fish). There is also the second explanation, which suggested that state emerged in order to reconcile between different people whose claims and interests led to conflicts and wars. The purpose of the state is primarily to protect, provide justice, and uphold dharma. While these purposes were not wholly coalesced into one, and the protective and welfare role of the state remained a persistent theme, priority was laid on dharma. Emphasis however varied. Manu makes protection the overriding duty of the king. Sometimes justice was seen as integral to dharma. However, the dictates of justice need not be unproblematic. The context, therefore, becomes important in explaining the nuances of a term. The *Mahabharata,* for instance, upholds the principle of expediency, if demanded by the conditions of times, so long as it is for the attainment of public good and not for selfish ends. The path trodden by great men becomes a guide in contexts when principles advanced by scriptures and embedded in customs are in contestation or do not proffer a choice.

This elaborate and complex framework was spelled out in a corpus of legal injunctions in the *smriti* literature, such as *Manusmriti.* As can be seen, such an order, in spite of a great deal of variation in it, could deeply arrest and restrict its elasticity and fluidity. Often the necessity of securing existing arrangements led to an overt emphasis on power, even at the expense of dharma conferring great autonomy on the king/state and marginalizing other elements that kept power within limits. Many of the texts celebrate the role of coercion and punishment, *danda,* as the key function of the state. *Manusmriti* explicitly makes *danda* the precondition for the sustenance of dharma.

The autonomy of the political realm came to be highlighted much more emphatically in the distinct school of *Arthasastra,* epitomized in Kautilya's great text on *Arthasastra.* This school elaborated the institutions and processes of government by

resorting to reasons of state (i.e., modes of its acquisition, preservation, and expansion), rather than to injunctions of scriptures and the legal tradition, while paying lip service to the latter. The concept of sovereignty is a problem in the Brahmanical framework of thought, in spite of the celebratory nature of kingship, although the *Arthasastra* literature inches closer to it.

Often we find a substantive description of the different elements of the state that are required for the effective working of a state, and kingship is seen as the most important of them all. The "Shantiparva" of the *Mahabharata* enumerates seven such constituent elements: *swamin* or king, *amartya* or the officials, *janapada* or the territory, *durga* or the fort, *kosha* or the treasury, *danda* or the army, and *mitra* or the allies. It is interesting that these elements continued to be the enumerations in strands of thought that were not necessarily Brahmanical.

Texts such as Kautilya's *Arthasastra* and Sukra's *Nitisara* emphasize the importance of discipline to the prince and build up a strong typology of princes around the notions of *satvikas, rajasikas,* and *tamasikas,* the first being constant in their duties and protecting their subjects, the courageous and valorous being the second, and the third concerned about their own personal interests, respectively.

This strand of political thought guarded much privilege and ranking but also allowed a place for the contender and the dissenter. However, the position and status of the latter was accepted only in the longer run. At the extreme, this system could become deeply abusive, exonerating certain sections from any social responsibility while endorsing a graded order of dependency and servitude to the rest. While it was quick to notice a countervailing viewpoint, it left little room for reason to shape the system as a whole. In fact, reason itself was graded very low as a guide to action. At the same time, it has to be noted that this arrangement was often internally challenged through arguments and satire and led to rearranging the position and relations across social groups. The ideology of the system placed power in the service of a moral order, but in the process provided a pervasive and decisive place for it. It made room for great learning, toleration, and achievements while reproducing the despicable conditions of those who lived accepting its central tenets. Conceptions of time, history, and change found specific attenuations in the order and design of this thought.

Sramanic Thought

This stream of thought stands in marked opposition to the Brahmanical thought while sharing a worldview and certain categories of understanding in common. By and large, the Sramanic thought redefined the relation between perfection and power differently. It valorized individual perfection and did not hold social institutions and the ways of the world in great esteem. Its partisanship against certain types of privilege and rank, its considerations toward human dignity and what modern language describes as rights, and the place it accorded to diversity and to the dissenter made it the precursor to a specific strand of thought in modern times that emphasized on human dignity, equality, and freedoms. While there are numerous streams in this current of thought, two of them stand out: Buddhism and Jainism.

Buddhist thought counterposes the life of a renouncer to that of the king and court while according priority to a life of *sama* (equanimity/quietude) vis-à-vis that of indulgence and power. There is considerable diversity in different schools of Buddhist thought and changes over time with regard to political ideas. In general, it suggests that the periodic evolution of the world is the backdrop for the formation of social and political institutions. Political authority or kingship is the product of the degeneration that set in the relations between individuals on account of the rise of the institution of property. At the same time, early Buddhist thought acknowledges the existence of republican forms of rule while highlighting their strengths and weaknesses. Unlike brahmanical thought, the various social classes that it enumerates are not the product of divine will but the outcome of voluntary selection of occupations by the concerned classes.

Righteousness (*dhamma*), whose connotations are expansive and are redefined, is the foundational principle of political institutions. It is counterposed to the Arthasastra tradition of kingship, called *khattavijja,* or Kshatriya science, which is derided for upholding the interests of the state or the ruler at the expense of everything else. Righteousness as an attribute of political authority

calls for shunning wrong courses of life, performing a set of duties, and sustaining popular consent through activities worthy of their approval. Reason, which enables one to make right choices and judgments, is suggested as the guiding norm for political authority. Buddhism also developed the concept of *Chakravartin,* the universal ruler, who is seen as the temporal counterpart of the universal teacher, the Buddha.

While there are many things in common between Buddhist and Jain thought, there are some distinctive emphases of the latter. Jainism held that the world is a bondage. It sought *nivritti,* or withdrawal from the world, as its central value, and social institutions including political authority could only facilitate such a process. It subscribed to a much more substantial principle of *karma,* or action. The soul gets inebriated by the consequences of karma binding it in the cycle of birth and rebirth. It subscribed to the ideal of liberation, the right knowledge, or *kaivalya jnana,* through one's own effort. It developed the theory of *anekantavada* (i.e., many sided nature of truth, which suggested that one should try to understand truth in its totality), which requires understanding different points of view. Nonviolence becomes imperative for the purpose.

The *sramanic* thought did not appreciate the autonomy of public life and the role that political authority plays in its reproduction. It tried to reduce the *desiderata* of public authority into a system of dos and don'ts, and given its nonworkability, asked the seeker after perfection to distance oneself from power and the affairs of the world. While it had a positive notion of the human person and his or her capabilities and subscribed to essential human equality, it deployed this understanding toward the search after perfection, rather than in enriching sensuous and lived ways of life.

Other Traditions

There are other traditions of thought that distanced themselves from the two major strands previously highlighted, while incorporating some of their insights and ideas. There are also strands of materialistic thinking, such as the *Lokayata,* which denied the existence of God, soul, and afterlife, and saw human beings as closely bound with the processes of nature, and human mind and intellect as their complex expressions. In a different vein, *Thirukkural,* a classic of Tamil literature composed by Tiruvalluar in the second century CE, argued that the king's office is the foundation of the security of the subjects and celebrated prosperity and this-worldly life guided by wisdom. Tiruvalluar attempted to relate ideas expressed both in the Arthasastra and Buddhist tradition. This tradition of thought, however, eventually became didactic rather than argumentative, celebrating the wise man and the great ruler, holding them aloft as exemplars.

The Medieval Period

Islam reached India through different routes. But soon many of its adherents came to wield political authority.

Thinking Through Islam

Two authoritative texts written during the Muslim rule in India stand out with regard to the reflective consideration they bestow on the conception of political authority, *Fatwa-i-Jahandari* and *Ain-i-Akbari,* the first written by Khwaja Ziauddin Barani (1285–1357) and the second by Abul Fazl (1551–1602). The early Muslim thought in India, particularly the work of Barani, is deeply influenced by Plato and Aristotle. Barani argued that the king is the representative of God on earth and is the source of all power and authority. Royal power is divinely instituted, and he called it *farri izidi* (the divine light) and *kiyan khwarah* (the sublime halo). What is interesting to note, however, are the limits to such authority that he suggested and the kind of autonomy that he granted to reasons of state. He argued that in this wicked world, governance of men is not possible without a strong state endowed with might, prestige, and power of kingship. But at the same time he spoke of moderating such power, making the distinction between regimes that elicit consent to their rule and those who resort to tyrannical methods. He saw the dispensing of justice as an essential function of a sovereign. Further, he regarded justice as a necessary condition for the pursuit of religion, and religion of justice. He also introduced the concept of rights although he had no conception of equal rights. This concern for justice and rights is

reflected in his understanding of law. Therefore, to the four accepted sources of law (*Shariat*), the Qur'an, the *Hadish* (traditions of the prophet), the *ijma* (opinions and ruling of the majority of Muslim theologians), and *qiyas* (speculative method of deduction), he added state law, or *Zawabit,* as an important source of law, although it cannot necessarily contradict the *Shariat*. Needless to add, Barani suggested interesting possibilities of the exercise of political power in the context of religious pluralism.

Fazl accepted that royal authority is divinely instituted. There is no intermediary between God and the king, and therefore there is no place for independent customary and regulatory authorities between the king and the people. The king himself is expected to judge and interpret the holy law. But he made a distinction between true ruler and a selfish king, the former not so much concerned about himself and his power but people's well-being. Both centralized authority and well-being of the people became important considerations in his works. While Fazl stipulated no clear limits to monarchical power, he had contempt for tyranny. He classified society into four tiers with their distinct propensities: rulers and warriors, learned people, artisans and merchants, and laborers, a classification that helped to integrate non-Muslim population in a benevolent conception of rulership, embodied in the rule of Akbar, the Great Mogul Emperor, in whose court Fazl was a minister.

Muslim political thought therefore left behind a twofold normative legacy in India: the primacy of Islam and under it the authority of the human ruler, and primacy of the ruler without any intermediary between him and the people. Social institutions were accordingly adjusted, rather than wholly revamped. While rulers were conceded the power to radically alter such institutions, tyranny was looked down on and consent of the ruled became an important consideration.

The Bhakti Tradition

There are powerful literary and devotional currents in the medieval period that stress equality and equal consideration be extended to others in spite of their differences. A part of the impetus to this development can be traced to the philosophical strands of the past that uphold the equal relationship of the devotee to the Supreme Being or one's equal entitlement to access the divine. Kabir (1455–1517 CE), one of the great saint-poets of the period, argued that it is possible for everyone to approach God directly, with or without any mediation of mosque or temple; all human beings are brothers to one another and there is a fundamental unity to the strivings of all religions. Thinkers of the Bhakti tradition who were generally poets threw scorn at religious ritualism, priest craft, and creedal barriers to access God. Most of them invoked a personal God and spoke of his or her relation to him. What is interesting is the participation of numerous women saints in this movement who were deeply conscious of being women. There is a strong interface between this devotional trend and the articulation of the Sufi trend in India. This tradition cutting across religious, sectarian, and gender divide helped in fostering the value of equality and human dignity.

The Modern Period

The colonial intervention in India was at least partly shaped by the conception of the Orient in general and India in particular that it carried overboard. In the process, there was a selective appropriation of political ideas and traditions in India that were seen as appropriate to the organization and consolidation of power. Elements of the Brahmanical and the elitist Muslim thought and the traditions of the martial races became quite handy to British consolidation of power around which a specific colonial modernity came to be spelled out. Modernity also brought with it a specific conception of reason, rule of law, public good, rights, and public authority. These elements, however, were defined in terms of practical dictates of governance, rather than as principles informing political authority.

The nationalist thought and the kind of modernity that it proposed, therefore, was largely shaped by a twofold axis:

1. The contradictions and possibilities inherent in colonial thought
2. A critique and alternative partly grounded in considerations of the traditions of the past

This twofold axis provided a great deal of complexity to the nationalist thought in India as it had to negotiate through the contradictions of the thought currents of modernity, as well as the challenges posed by cultural inheritance. It led to certain distinct strands within the nationalist thought. The largely nonviolent character of the Indian national movement and massive public participation in it particularly during certain phases provided popular platforms to critically test ideas and viewpoints in open debate and discussion.

Social Reformist, Egalitarian Perspective

This perspective was much influenced by nineteenth century British liberalism and had deep roots in the oppositional stances of ancient and medieval India. It stressed equal rights of human beings and decried the existence of hereditary gradations and rankings epitomized by the caste system in India. It also advanced an incisive critique of colonial modernity for not being true to itself and for continuing an illiberal rule in India. It attacked the widespread superstitions, ritualism, and priest craft prevalent in India and appealed to reason, science, and freedom of choice. It pointed out the internal inconsistencies of colonial rule in India that justified itself on grounds of reason, rule of law, and freedoms but denied the same to Indians. It also pointed out the great gulf that existed between political equality on one hand and social and economic inequality on the other in the modern West and from this standpoint not merely criticized colonial modernity but the very embodiment of modernity in the West and the moral right of those societies to rule over others. These general positions often could become creative in several directions, as they could be confined to liberal snobbery with a narrow understanding of equal political and civil rights. Some thinkers in this line of thought became highly critical of certain traditions of thought in India while upholding other traditions. For instance, Bhimrao Ambedkar (1891–1956) valorized Buddhism and its egalitarian impulse, its moral grounding, and denounced Brahmanism for fostering ritualism, superstitions, and defense of a system of privileges and ranking. Some of them noted other cleavages, such as the domination of Aryan and Vedic-Brahmanical traditions over Dravidian, non-Vedic, and non-Brahmanical traditions. While this perspective attracted a significant section of Muslim intelligentsia, they at the same time raised concerns regarding the rights of minorities in a majoritarian order and the safeguards to their beliefs and distinct practices in an order dominated by a social majority. Sometimes their critique of colonial modernity went hand in hand with an assessment of their own cultural traditions, and at other times they drew attention to the threat that modernity posed to diversity and alternative conceptions of life. Overall, this perspective ardently argued for constitutional democracy with safeguards to minorities, representative institutions, religious freedoms, and equal rights.

Culturist Perspective With Emphasis on Nationalism

The culturist perspective stressed the difference between India and colonial modernity, the latter being an expression of the West. Therefore, colonial modernity was an affront to culture, and it called for forging a unity grounded on culture. In this perspective, constituting India as a nation, as an authentic expression of its culture, was the first and foremost task. This perspective could supply several specific orientations and truly did so. One of them argued that Indian culture need not necessarily be inimical to modernity and its pursuits, but it is the nation constituted around its cultural identity that will eventually decide which aspects of modernity would be acceptable to it. Such a position was upheld by scholar-politicians like Bal Gangadhar Tilak (1856–1920). There were others who saw certain features of the cultural domain in India as the essence of the nation and argued the case for nationalism built on the foundation of such an essence, weeding out or subordinating elements that did not conform to such features. Hindu nationalists such as Vinayak Damodar Savarkar (1883–1966) and Madhav Sadashiv Golwalkar (1906–1973) advanced this orientation. There were a few who argued that modernity cannot be equated with a set of specific developments in the West. Other cultures also held out such possibilities, which came to be nipped in the bud with the onset of colonialism.

Critique of Modernity

This position did not primarily pitch colonial modernity against cultural belonging, nor made social reforms central to its agenda, but it rejected some of the central premises and substantial claims of modernity as unwarranted, undesirable, and even pernicious. Mohandas Karamchand Gandhi (1871–1948) was the central figure arguing out this position, which, in turn, had a bearing on culture, communities, and human dignity as well. Gandhi subscribed to the principle of *swaraj,* autonomy of the self and self-regulation, and he thought that such a pursuit became wellnigh impossible under modernity. There were other critical modernists such as Rabindranath Tagore (1861–1941) who closely equated nationalism with modernity and argued that it "trims minds" and "clips freedom," and through its educational apparatuses regulates thoughts, manufactures feelings, and polices human action. Against nationalism with its trappings in modernity, Tagore called for a dialogue and mutual learning across cultures and civilizations that, he thought, would be truly ennobling.

Diversity, Difference, and Pluralism

In the process of nationalist consolidation, the deep diversities informing India registered themselves glaringly in the pubic domain. While such diversities had existed earlier, contact and interaction with them was either minimal or occasional, and unforeseen contacts were ritually negated, if need be. But in the coming together of the nation, this proved to be quite impossible, and various resolutions for the resettlement of such differences were advanced. There were also a variety of types of differences based on religion, culture, language, deprivation, exclusion, and discrimination. All these constituencies were mobilized during the nationalist phase and in the post nationalist democratic upsurge in India. While there was no single solution to accommodate and respond to this diversity, a mix of the ideas of development—political, religious, and cultural autonomy; equality and nondiscrimination; and preferential considerations under constitutional democracy—came to be suggested as the best solution by mainstream nationalist discourse. It was this mix of ideas that that came to inform the specific brand of secularism in India. The Muslim league that thought that such a mix will not be able to withstand the onslaught of Hindu majoritarianism on Muslim minority went ahead with the demand for a separate nation, Pakistan.

In spite of these differences, many believed that modernity, sooner or later, will replace traditional institutions, beliefs, and ways of life. Soon such verdicts were proved wrong as tradition came to articulate modernity in its own distinct ways, leading to diverse faces of modernity in India.

Postnationalist Thought

Postnationalist thought in India, in the context of a vibrant liberal democratic institutional complex, has relooked at some of the themes of the nationalist discourse, often drawing heavily from contemporary thinking in the West. It is important to note that there is a vibrant feminist position that qualifies most of these themes. Some of the important concerns that were highlighted in the process are the following:

The Modern and Its Other

Political thought in postcolonial India is deeply shaped by an unease with a singular understanding of modernity, its relation with power and domination, and its implications to differences and otherness. Given the contested understanding of modernity and the alternative versions advanced in this regard, this critique remains highly diffused. Environmental concerns and deprivation of the livelihood of communities have added fuel to this critique. While this critique has not necessarily advanced an alternative, it has qualified certain hallowed relations underscored by modernity between man and nature, human agency and philosophical perspectives on understanding and belonging. There is an implicit critique of the modern nation-state that informs it. One of the principal philosophical anchors of this critique is the rejection of a teleological perspective and philosophy of history that is so central to mainstream modernity. Such rejection has led to the appreciation of tradition and modernity cohabiting the same space and myriad ways of exploring their relationships.

Secularism

Secularism remains an important theme in the contemporary debate in India, particularly in the context of its association with modernity, the continuing hold of religious affiliations in a multireligious society, and the appeal to religious majoritarianism under conditions of representative democracy. One of the earliest arguments of mainstream Indian nationalism has been the possibility of differences cohabiting the same sociopolitical space. Such a possibility was pitched against the widely held belief that nations are, by and large, homogenous terrains where people accept their belonging on the basis of a set of shared bonds. In contemporary India, the debate has ranged from rejecting secularism as the foundational principle of Indian polity to its qualified defense.

Democracy

Democratic upsurge is a vibrant presence across the social topography of India and something unique in a post-colonial society. While several explanations are suggested for this upsurge, mainstream political thinking in India (including the left) has rallied in its defense, advancing their distinctive elaborations of the same. Only a section of Maoists have rejected institutions of representative democracy in India, promising in its place a substantively different version of democracy. A great deal of political thinking in India, however, has concentrated on the limitations of Indian democracy: the looming presence of state apparatuses; diverse modes of dominance restricting its reach; and its failure to include and empower large sections of the masses. At the same time, the departure of Indian democracy from a universal version of liberal democracy and its specific articulation in the cultural context of India remains a favorite theme of exploration.

Nationalism, Cultural Domain, and Diversity

Nationalism continues to be one of the central fascinations in the postcolonial thought in India. Several of its facets are held aloft for reflective considerations. One of the popular theses proposed in India is that nationalism is not merely a universal moment but is informed by cultural difference marking it off from others. While cultural nationalism based on religious majoritarianism has acquired much political mileage, secular nationalism informed of differences and diverse kind of identities is pitched against it. Concerns of rights and good and the ways of negotiating across their contentious claims in a democratic polity have been issues of immediate political interest in India. It has given a significant turn to feminist thinking that rested on claims of equal rights. In the context of globalization, nationalism has rebounded back, invoking culture and autonomy quite centrally.

Social Justice and Preferential Considerations

India has had one of the most complex regimes of preferential considerations reaching out to diverse disadvantaged constituencies. What is significant, however, are the sort of justifications offered in this regard. Some of the important arguments in defense of justification of preferential considerations and their relationship to equal rights, democracy, and a conception of selfhood and agency were developed by Bhimrao Ambedkar during the nationalist phase, and provisions for the same were institutionalized in the Indian constitution. Some of the major conflicts between the Judiciary and Parliament and reasons for political cleavages in India's body politic have revolved on this issue.

Some features of Indian thought clearly stand out: It has constantly invoked its own past to redefine itself, although such invocation has bred plurality of interpretations and emphases. While the social history of India is writ large with hierarchy, privilege, and ranking, they have been forcefully countered as well. Demands for equality, respect for agency, and widely shared belief in freedom of worship had engendered an atmosphere conducive to egalitarian values in India even prior to the intervention of colonial modernity. The central concerns of nationalist thought in India, while being receptive to a range of liberal and socialist ideas from the West, are strongly embedded in its distinct cultural legacies. Postcolonial political thought in India, although engaged with some of the significant concerns of political thinking worldwide today, is deeply marked by its cultural context.

INSTITUTIONALISM

Institutionalism is a general approach to social science that studies institutions using inductive, historical, and comparative methods. No matter how one defines political science, from its inception it has put much emphasis on the study of institutions. Institutions have often been understood as formal organizations governed by written laws or rules: examples of formal institutions include Parliament, the United States presidency, the courts, government departments, and parties. Yet, the concept of an institution can easily be stretched to include informal organizations; for while informal organizations often lack written rules, they still exhibit patterns of behavior that we might unpack in terms of loose norms. Examples of informal institutions include community groups, voting coalitions, and policy networks.

Institutionalism generally uses inductive, legal, historical, and comparative methods to study formal and informal institutions. The inductive and legal methods are mainly concerned with generating adequate accounts of the way an institution operates. Induction relies on observation to provide such descriptions. A preference for induction leads some institutionalists to express skepticism about more general theories of politics. They prefer, in their own terms, to grasp the particular features of each case, and even to let the facts speak for themselves. The legal method is closely associated with the study of formal institutions. It relies on the study of documents and cases to get at constitutional and administrative laws and norms. The historical and comparative methods are arguably more concerned with explaining institutions. The historical method seeks to explain our current institutions by reference to the past. It is widely seen as a way of explaining the unique features of an institution in a way more general laws cannot do. The comparative method is used in part to identify those features of an institution, such as parliament, that are unique to it and those that are found in other legislatures. It also offers a way of trying to explain the common features by reference to other institutions that the relevant states have in common. Of course, these various methods are not incompatible. To the contrary, most studies of institutionalists rely on a combination of them.

Old and New Institutionalisms

Most of the original nineteenth-century works of political science were broadly institutional. They

concentrated on the formal rules defining state institutions, notably the legislature, bureaucracy, and judiciary. In the twentieth century, behavioralism, rational choice theory, and neoliberalism all challenged this institutionalism. The behavioralists paid more attention to actual activities than to formal rules; they produced studies of voting behavior, political parties, interest groups, and policy networks that suggested the activity of politics often had little to do with formal constitutional laws. Rational choice theorists suggested that political action should be explained in terms of the preferences and interests of the relevant actor, not the formal rules governing the role of that actor. Neoliberals argued that the administrative state with its strong institutional framework needed to be dismantled and replaced with markets and networks that broke down the barriers between state and civil society.

Instiutionalists responded to these critics largely by accepting them and seeking to encompass them under a broader concept of institutionalism. So the 1990s witnessed the dramatic rise of a "new institutionalism." To some extent, the new institutionalism rests on a caricature of the old institutionalism: the old institutionalism is associated with the study of formal institutions, so that the new institutionalism can be identified with a novel concern with informal norms and symbols. In addition, however, the new institutionalism clearly arose as a response to behavioralists, and especially—given that we are talking about the 1990s—rational choice theory and neoliberals.

Rational choice theory deduces models of social life from assumptions about individual behavior. It poses the question: how can we unpack accounts of institutions by reference to individual behavior. Much of the new institutionalism arose in part to answer this question. The new institutionalism pays far more attention to the ways in which individuals both affect and are affected by institutional settings, and, in doing so, it grapples with the inner workings of institutions, the sources of differences between institutions, and changes within any given institution.

Just as the institutionalists reworked their approach, some began to study the more diffuse patterns of governance that flourished under neoliberal regimes and their successors. The greater emphasis on informal institutions helped the new institutionalists to claim as their own the study not only of formal bureaucracies but also of networks. They examined the new governance as a further hollowing out of the state through the spread of policy networks. The attempt to bring markets into the public sector weakened the central state. It had further segmented the executive branch of government. And it had thereby made the state more and more dependent on other organizations within a growing number of networks. Many institutionalists concluded that, under the new governance, the state had to rely less on commands or rules and more on indirect management based on negotiation and trust. Ironically, large parts of the new institutionalism thus came to champion networks against not only the markets but also hierarchic bureaucracies.

So, the new institutionalists retain an elder focus on rules, procedures, and organizations: institutions are composed of two or more people; they serve some kind of social purpose; and they exist over time in a way that transcends the intentions and actions of specific individuals. But, equally, the new institutionalists adopt a broader concept of institution that includes norms, habits, and cultural customs alongside formal rules, procedures, and organizations; they look at informal networks as much as more structured administrative and democratic organizations.

Varieties of Institutionalism

There are a number of ways of dividing the new institutionalists into competing factions. The most common is to distinguish between a rational choice institutionalism, a sociological institutionalism, and a historical institutionalism. These different varieties of institutional theory suggest different answers to questions about the nature of institutions, how institutions influence behavior, and how institutions change.

Rational choice institutionalism is best understood as a response to a particular problem within rational choice theory. The problem is that if we assume that people act to maximize their own satisfaction, we are likely to conclude that they will defect from an agreement whenever honoring it will not serve their interests. The continual likelihood of defection appears, in turn, to make it awkward for rational choice theorists to explain

stable coalitions and institutions. Some rational choice theorists appeal to institutions to solve this problem. They argue that institutions, such as rules of procedure, structure the information that individuals have and thus choices that individuals make. In this view, then, institutions are a solution to collective action problems. Institutions influence behavior by providing the settings within which individuals then seek to maximize the satisfaction of their preferences. And institutions change because people's preferences change.

The sociological institutionalism draws mainly on organizational theory, and it tends to unpack organizations in informal and cultural terms rather than formal and legal ones. Sociological institutionalists thus define institutions primarily by reference to rules, norms, symbols, and beliefs. They argue that institutions influence behavior precisely in that institutions give an individual the beliefs and identities on which he or she then acts. Sociological institutionalists explain changes in an institution by reference to the rise and fall of new symbols and beliefs within the wider cultural environment. New identities arise in society, and as these acquire legitimacy, they begin to spread across institutions where they open up the possibility of contest and change.

Historical institutionalism is more difficult to explain clearly. The difficulty arises because historical institutionalism is, in large part, just a flag of convenience adopted by diverse social scientists, all of who want to continue to undertake fairly broad social inquiries without addressing the microlevel issues about individual behavior that are raised by rational choice theory. If we look for the historical institutionalist view of the relation of institutions to behavior, we find vague metaphors, confusion, or oscillation between rational choice institutionalism and sociological institutionalism. Still, historical institutionalists often define institutions as formal or informal procedures, routines, and rules. Some of them adopt a calculus analysis and others a cultural analysis of the way in which institutions influence behavior. The calculus approach echoes rational choice theory: It holds that institutions inform individuals' expectations about how others' will behave and thus their calculus of how best to attain their ends. The cultural approach, in contrast, echoes sociological institutionalism: It holds that institutions provide familiar patterns that individuals rely on in their attempt to attain satisfactory outcomes. Finally, historical institutionalists explain changes in institutions in terms of "critical junctures" and "path dependency." These metaphorical terms suggest that institutions generally fix their own development apart from at key moments when crucial decisions are made. The main attempts to give more analytic content to these terms have drawn heavily on rational choice theory.

Future Prospects

The rise of the new institutionalism appears to have fended off—or just simply absorbed—some of the criticisms of behavioralists and rational choice theorists. It is arguable, however, that the new institutionalism has done so at the expense of becoming rather vacuous. When contemporary institutionalists make bland assertions along the lines that institutions matter, they do not answer the question of the microlevel so much as displace it. Rational choice institutionalism is a clear exception: It is clearly rooted in the conceptual assumptions of rational choice theory more generally. The sociological and especially the historical institutionalism, in contrast, appear to leave unanswered the theoretical questions of how and to what extent institutions determine the behavior of actors.

Considerable ambiguity thus remains as to how we should conceive of institutions and what explanatory power we should grant them. On one hand, institutions appear to have a strangely reified form. They are defined as fixed rules or procedures that limit or even determine the actions of the individuals within them. Political scientists are thus able to ignore the contingency, inner conflicts, and construction of institutions. Yet they can do so only by implicitly reifying institutions in a way that neglects the questions of the microlevel. On the other hand, therefore, institutions are sometimes opened up to include cultural factors or meanings in a way that suggests they themselves do not fix meanings, nor thus the beliefs and actions of the individuals who are within them. If we open up institutions in this way, however, we cannot treat them as if they were given. We have to ask instead how meanings and actions are created, recreated, and changed in ways that produce and modify institutions.

The problems of reification have led to an increasing emphasis on the social and ideational construction of institutions. From a constructivist perspective, institutions are the products of actions informed by the varied and contingent beliefs and desires of the relevant people. While this constructivist view does at least address important theoretical questions, we might wonder whether or not we should still think of it as institutionalist in any significant sense. All the explanatory work appears to be done not by given rules, but by the diverse ways in which people understood and applied conventions. Appeals to institutions thus appear to be somewhat misleading shorthand for the conclusions of explorations into the beliefs and desires of the people who acted so as to maintain and modify the institutions in the way they did.

INSTRUMENTALISM

Instrumentalism is the view that the value of scientific concepts and theories is determined not by whether they are literally true or correspond to reality in some sense, but by the extent to which they help us to make accurate empirical predictions or, as Larry Laudan has argued, help us to resolve conceptual problems. That is, instrumentalism is the view that scientific theories should be thought of primarily as tools for solving practical problems, rather than as meaningful descriptions of the natural world. Indeed, instrumentalists typically call into question whether it makes sense at all to think of theoretical terms as corresponding to external reality. In this sense, instrumentalism is directly opposed to scientific realism, which is the view that the point of scientific theories is not merely to generate reliable predictions, but to describe the world accurately.

Instrumentalism is a form of philosophical pragmatism as it applies to the philosophy of science. The term itself comes from John Dewey's name for his own more general brand of pragmatism, in which the value of any idea is determined by its usefulness in helping us adapt to the world around us. Instrumentalism is thus also sometimes more broadly used to refer to the view that public policy should be judged only on the basis of whether it helps us to achieve social goals.

Instrumentalism in the philosophy of science is motivated at least in part by the idea that scientific theories are necessarily underdetermined by the available data, and that in fact no finite amount of empirical evidence could rule out the possibility of an alternate explanation for observed phenomena. Because in this view there is no way to determine conclusively that one theory more closely approaches the truth than its rivals, the main criterion for evaluating theories should be how well they perform. Indeed, if no amount of evidence can decisively show that a given theory is true (as opposed to merely predictive), it begs the question of whether it actually means anything to say that a theory is "true." It is thus not that instrumentalists do not believe that some theories are better than others, but rather that they doubt that there is any sense in which a theory can be said to be true or false apart from the extent to which it is useful in solving scientific problems.

In support of this view, instrumentalists commonly point out that the history of science is replete with examples of theories that were at one time widely considered true but now almost universally considered false. We no longer accept, for example, the theory that light propagates through the ether, or even that there is such thing as the ether at all. While realists argue that as our theories

become progressively better, they come to more and more closely approximate the truth, instrumentalists argue that if we have come to discard elements of even our best theories so completely, there is no reason to suppose that the most widely accepted theories of our own day will hold up any better. Nor do we necessarily have any reason to believe that our best current theories approximate the truth any more than the ether theory approximated special relativity.

There may nevertheless be a sense in which the instrumentalist and realist positions are not as far apart as they sometimes seem. For it is difficult to say precisely what the distinction is between accepting the usefulness of a theoretical statement and actually believing it to be true. Still, even if the difference between the two views is in some sense only semantic, or one of emphasis, the fact is that most people intuitively do make a distinction between the truth and practical usefulness of scientific theories.

Intergenerational Justice

John Rawls famously declared that the concept of *intergenerational justice* "subjects any ethical theory to severe if not impossible tests" (Rawls, 1999, p. 251). Taking *justice* to be concerned with the fair distribution of benefits and burdens across some domain, the first problem encountered is what exactly is a generation? Is it the group of all people existing at the same time, or all people whose life spans overlap at some point, or all people enjoying a particular stage of life? Focusing on moral claims of particular people who do not yet exist, rather than the various generational entities to which they belong, much of the recent literature on intergenerational justice addresses theoretical and practical barriers that block, or at the very least complicate, any temporal extension of familiar notions of justice, rights, and obligations. The most important of these are: nonexistence, uncertainty, nonreciprocity, and nonidentity.

Nonexistence

At first glance, considerations arising from the formal nature of justice and rights bar nonexisting entities, whether dead or as yet unborn, from being valid sources of moral claims. Entities that do not yet exist, that is, cannot be welcomed into the circle of justice, as this would involve conceptual incoherence. This claim is made quite explicitly by Hillel Steiner, whose "choice-theory of rights" maintains that a person possesses a right not because of any benefit she might derive from others being constrained from its violation, but rather because she is in a position to claim (or waive) the performance of the duty with which it is associated. The choice-theory's insistence that right bearers be active, choosing agents means that ascribing rights to entities incapable of making choices in the present, or of transferring this role to a third party, is a conceptual mistake. The nonexistence objection does not commit its proponents to the view that existing people have *no* duties to protect the environment that future people will eventually inherit. Such duties may exist, but they are not explicable in terms of an appeal to justice or rights.

Despite its philosophical elegance, both the choice-theory and the nonexistence objection to which it is connected lose their attraction once we realize that (a) justice involves the protection of the interests of future people independently of their (in)ability to function as active, choosing, agents and (b) justice contains ethical categories that cannot always be reduced to the discourse of rights and correlative obligations. In terms of notions of harm and interest, the rival, and far

more intuitive, "interest-theory of rights" holds that an agent, X, having a right implies that "other things being equal, an aspect of X's well-being (his interest) is a sufficient reason for holding some other person(s) to be under a duty" (Raz, 1984, p. 183). There is no obvious reason for excluding the not yet born from possessing such rights. As Joel Feinberg, Robert Elliot, and other interest theorists have argued, it can be assumed that there will be people who exist in the future; these people will possess interests vulnerable to intervention in a similar way to our own; and the environmental activities of existing people will have profound effects on these interests. In terms of non–rights-based conceptions of justice, Onora O'Neill and others have suggested that existing generations possess wide-ranging duties of environmental preservation to their distant successors, even if these duties have no counterpart rights and do not plausibly pick out particular people at risk. Intergenerational justice, for O'Neill, is instead based on the *imperfect* duties we have toward as yet unspecified, and possibly unborn, agents whom we can assume will feel the impacts of our actions and policy choices. The crucial question is not whether a member of a distant generation can logically be said to possess the essential properties to be regarded as a right holder, but rather whether we already make assumptions about them in our actions, practical reasoning, and social institutions.

Uncertainty

According to the second objection, no generation possesses sufficient or reliable information about the long-term impacts of human activities to realize moral aims beyond securing the interests of existing people and possibly their offspring. So, unlike the case of our contemporaries, we have insufficient information on which to base our duties to remote future people, even if these duties exist in ideal form. This is not to say that we have no predictive ability with regards to the future, but that we have insufficient epistemological grounds to discriminate between alternative hypotheses about the impacts of our actions on future well-being to service claims of intergenerational justice.

At first glance, this may seem to be a strong argument—at least for consequentialists, who evaluate the *in*justice of acts and policies in terms of their tendency to produce valued outcomes. In nearly every current human endeavor, we encounter huge uncertainties complicating attempts to determine the welfare impact of social and individual choices. Areas of human life subject to gross uncertainties are human health, demography, resources usage, warfare, tastes and values, and environmental adaptive capacity. For nonconsequentialists, of course, the issue is more complex, as they focus on intrinsic wrongness of adopting reckless acts or policies rather than the harmful consequences for the victims.

So do the problems associated with predicting the future impacts of acts and social policies deal a fatal blow to intergenerational justice? Should discussion of justice be limited to contemporaries on epistemological grounds alone? One problem with the uncertainty argument is that it overstates the level of outcome certainty that consequentialist justice requires. Relationships among contemporaries, compatriots, and family members are subject to significant uncertainty in terms of tastes, values, and outcomes, and yet we do not question the role of justice in such relationships. A second problem is that, even in the most unclear contexts, we usually know enough about the future to know that it would be a great injustice to adopt policies that threaten the most vital and predictable of future interests, such as access to unpolluted air and water, shelter from the elements, or access to an environment unmodified beyond any reasonable limit of human adaptive ability. Any theory of intergenerational justice rests on the assumption that the relevant duty bearers possess enough knowledge and expertise to identify the key risks to future well-being posed by any given policy. But this requires far less precision than the uncertainty argument would have us believe.

Nonreciprocity

According to the next objection, intergenerational justice is incoherent because justice only binds agents that enjoy mutuality of communication and physical interaction. Existing people will never meet or cooperate with those whose existence postdates their own, with the result that we have

no duties of justice to them. More formally, the following argument arises:

> Premise 1: Reciprocity exists only between people who can affect each other's interests.
>
> Premise 2: A person cannot affect the interests of people belonging to past generations.
>
> Premise 3: Requirements of justice are owed only among those who reciprocate.
>
> *Conclusion*: Acts or social policies that threaten the interests of future people are not unjust.

What can we say about this argument? First, the major premise is highly controversial. Most writers in the liberal egalitarian tradition, for example, deny that reciprocity has any connection to the scope of justice. For them, justice is "subject-centered" in the sense that "basic rights to resources are grounded not in the individual's strategic capacities but rather in other features of the individual herself" (Buchanan, 1990, p. 231). Second, those sympathetic to reciprocity-based justice rarely hold that an entity's lack of threat advantage means that we can do anything to them without treating them unjustly. We might not be obliged to relinquish resources so that nonreciprocators enjoy a full share of society's wealth, but we would not be permitted to kill or wound them.

Third, the argument as a whole restricts reciprocity to a direct and aggressive form of interaction and thereby promotes the interpretation of justice usefully labeled "self-interested reciprocity" by Allen Buchanan (1990, p. 229). The result is that the argument neglects a subtler form of reciprocity based on the provision of benefits for logical intermediaries, where a lack of direct contact renders impossible any direct exchange of benefits. This "justice as fair reciprocity" approach not only generates a more sophisticated and intuitive distributive outlook for contemporaries, but also opens the path to intergenerational justice. Two main possibilities have been explored in the literature. The first—the "Chain of Concern" approach (defended by John Passmore and Richard Howarth)—argues that the existence among human beings of a near-universal sentimental concern for their nearest descendants means that it is rational for each successive generation to treat the well-being of the next as a public good that all should protect. Here, the reciprocity exists between contemporaries, but the requirements of justice to which it is attached are discharged by promoting the well-being of future people. The second—the "Stewardship" approach (defended by Lawrence Becker)—proceeds from the assumption that many of the benefits enjoyed by present people were produced by past people with the overt or tacit intention that they be preserved either indefinitely or for a specified amount of time. The upshot is that the duty to pass on such benefits to future generations is analogous to the duty to reciprocate for benefits received from contemporaries via social institutions, such as blood banks and organ donation schemes.

What should we make of these two responses? One issue worth noting is that the directionality of the duties in each is quite different. The former proposes that present people discharge their duties to each other by providing benefits to future people; the latter proposes that present people discharge their duties to past people by providing benefits to future people. A second issue is that the approaches have different strengths and, especially, weaknesses. The backward directionality of the duties defined by intergenerational stewardship means that the protection of the biosphere is placed at the mercy of benefits that were unintentionally bequeathed and involuntarily accepted. The Chain of Concern approach, by contrast, is subject to problems associated with establishing the duties of nonprocreators, those who do not share the relevant sentimental concern for at least one biological descendant, and the apparent blindness of the approach to the risks of activities that pose a threat for remote generations while being harmless to intermediary generations.

Nonidentity

Consider the following choice between two international approaches to manage the risks posed by global climate change. The example is hypothetical, but draws to a certain extent on recent debates concerning the appropriate successor to the Kyoto Protocol after it expires in 2012. The first approach, "Business as Usual," sets voluntary targets on carbon emissions with the goal of reducing the carbon intensity, but not the overall emissions, of participating states. "Contraction and Convergence," by

contrast, aims to secure each existing and future person fair share of the absorptive capacity of the atmosphere by establishing a global safe ceiling for greenhouse emissions and distributing the burdens of remaining below this level according to a fairly negotiated allocation procedure. The predictable consequence of choosing Contraction and Convergence over its rival would be that, after a century or so, the quality of life enjoyed by the average world citizen would be significantly higher. Would it not be wrong to adopt Business as Usual under these circumstances on grounds of intergenerational justice? The problem is that adopting Business as Usual does not involve any obvious violation of justice for the simple reason that it is almost impossible for any act or policy to harm a particular future person as a result of the extreme contingency of human genesis. This "non-identity problem" (NIP), introduced by Derek Parfit and Robert Schwartz, can be put in more formal terms:

> Premise 1: An act or social policy is unjust only if it makes people worse off than they would otherwise have been.
>
> Premise 2: If any particular person had not been conceived when he or she was in fact conceived, he or she would never have existed.
>
> Premise 3: Adopting Business as Usual or Contraction and Convergence would result in entirely different sets of people coming into existence in the future.
>
> *Conclusion*: Adopting Business as Usual is not unjust to future generations.

How might we rebut this argument? The first thing to note is that in a number of cases, it does not need to be rebutted. That is, there are limits to the argument that question its relevance for scholars of intergenerational justice. First, the argument does not affect our duties to people not yet born, so long as the act or policy choice under evaluation will not affect that person's identity. Second, the argument does not have clear implications when the act or policy in question will predictably render many people worse off than any intuitive understanding of a life not worth living. These people may not be worse off than they would have been, but they may still be said to exist in a state of avoidable agony thanks to the actions of past generations. Third, the argument has no relevance at all for theories of intergenerational justice that seek to promote valued outcomes irrespective of how particular people fare. Following Parfit (1984, p. 393–394), these are known in the literature as "person-affecting" theories.

Despite these limitations, nonidentity poses a profound challenge for theorists of intergenerational justice as the interests and rights and interests of particular people are highly prevalent in the way a host of legal, moral, and political problems are discussed. One interesting response to the problem is to distinguish between "general interests" and "specific interests." James Woodward, for example, argues that Business as Usual would threaten the specific interests of future people (which are connected with their dignity, self-respect, and interest in being born into a safe environment), even if it could not possibly damage their overall quality of life. In effect, what is unjust about Business as Usual is that it brings people into existence possessing rights that could not possibly be fulfilled, even though their bearers are not thereby made worse off than if they had never existed. One problem with this approach is that we might expect the people who later live to waive their specific rights not to be born into a damaged environment, so long as it can be predicted that they will lead decent lives all things considered, though it remains disputed whether such rights can be waived retroactively.

An alternative approach, proposed by Lukas Meyer, rejects the major premise of the NIP on the grounds that it ignores an additional sense in which a future person may be harmed by an act predating their conception. That is, while the NIP presupposes the "subjunctive-historical" sense of harm (according to which, an act harms a person if it makes them worse off than they *would* have been), it ignores the "subjunctive-threshold" sense of harm (that an act harms a person if it makes them worse off than they *should* have been according to some nonarbitrary measure of a decent life). The problem with this otherwise ingenious approach is that it seems at best to finesse, rather than solve, the NIP. For one thing, the subjunctive-threshold understanding of harm could only be used to criticize reckless policies once it is supplemented by an underlying theory of distributive justice that can explain what amounts to a "decent life" that does not appeal to standard understandings of personal

harm. For another, it would have to explain how to resolve conflicts when the two alternative senses of harm support alternative policy choices.

A third possibility is found in the thought that intergenerational justice is primarily concerned with preventing wrongs, rather than harms, to future people. The distinction is a subtle one, but the idea is that reckless acts or social policies are unjust as they culpably fail to comply with any reasonable standards of due care to existing and future people, even if they do not render their victims worse off in any tangible sense. Mankind's rush to pollute the planet, deplete the absorptive capacity of the atmosphere, and exhaust nonrenewable resources is unjust in involving a huge transfer of risk to those unable to protest as a result of their futurity. Reminiscent of O'Neill's focus on imperfect obligations, this *nonconseqentialist* approach traces intergenerational injustice in cases such as the previously mentioned to the negligence and moral failure of the adopters of unsound policies and not to the actual adverse outcomes of their choice.

Interpretive Theory

Interpretive theory poses a set of answers to the question, how do we know what we know about the social world? Interpretive theory has had a long and multifarious history, which can be summarized as an orientation, approach, or method in political studies that arose in opposition to various positivistic, empiricist, in short, natural scientific outlooks within the human sciences. Interpretive theory has drawn from many sources and traditions, and its history and current practice are open to interpretation.

Interpretation and Knowledge in Political Studies

Interpretivists typically go beyond the accepted view that everyone interprets to gain understanding and give explanation, or that interpretation is one among several approaches or types of methods by which human scientists can acquire knowledge. They stand out in arguing that the objects studied by human scientists are themselves interpretations, and therefore require us to grasp the meanings they embody. This concern with meanings, however, equally sets interpretive theorists apart from

one another, as they differ on what meanings are, how they are communicated, and how they relate to actions. The focus on meanings has centered on such diverse entities as beliefs, intentions, discourses, or symbolic systems of signs. Moreover, different interpretive approaches explain differently how meanings operate within society, for instance, through logical progression, structural links between concepts and power, or in terms of individual dispositions.

Beyond Positivism and Interdisciplinary Techniques

Interpretive theories are often clustered negatively, by virtue of their antipositivist presuppositions or methods or both. Positivism, also known as scientific empiricism, began with David Hume's account of causation as the operation of empirical laws, whereby knowledge about the world is justified only by the testimony of the senses, that is, by observation and experiment. Logical positivists, largely associated with the Vienna Circle, extended this idea to the principle of verification, according to which utterances that could be neither verified nor falsified by experience were literally and cognitively meaningless. Knowledge, strictly speaking, was held to be devoid of all speculation, concerned only with what can be positively given, and thus confined to correctly delineated scientific methods of verification. Positivism denoted great optimism about the unity of scientific method and faith in the power of formal logic, both to permit the definition of abstractions and to describe the structures of permissible inferences. While it may be disputed whether the natural sciences have been characterized by logical, cumulative progress through a purely objective science of observation and deductive explanation, such has been the self-conscious aims and techniques in the "hard" sciences. Since the early decades of the twentieth century, emerging trends within the human and social sciences endeavored to be "scientific" in broadly the same sense that the term is applied to physics, chemistry, biology, and so on. The objective was to uncover laws or regularities that govern social and political life.

Political studies in the last 60 years have witnessed the gradual ascendancy of behavioralism, structuralism, and rational choice theory, all of which embody the assumption that the methods and categories recognized in the natural sciences constitute the proper mode of inquiry about the social and political world. Behavioralists made use of scientific techniques of data collection and stressed the use of quantifiable variables to analyze observable relationships. The proliferation of ahistorical conceptual frameworks—such as decision theory, group theory, systems theory, structural-functional theory, political economy, public policy, and voting behavior—all evidence an aim to generate a purely descriptive "value-free" vocabulary. Varieties of structuralism like neo-Marxism and critical realism focus on discovering the unobservable structures that guide or determine events, irrespective of the beliefs of individuals or the meanings of actors. Rational choice theory, while it appears to take individual preferences seriously, relies on deductive models and theoretical parsimony to highlight alleged causal laws operating between atomized units divorced from their subjective and historical situations.

Interpretive theorists across a number of disciplines reject various positivist directions toward crafting a "science of politics," according to which the methods and categories recognized in the natural sciences constitute the proper mode of inquiry for the human sciences. Interpretivists often define themselves in opposition to approaches such as behaviorism, structuralism, and rational choice, whose positivist presuppositions or methods or both suggest that human actions can be fixed in their meanings under lawlike operations. But to regard interpretive theory as primarily a critique of positivist techniques is to miss its claims to rival, if not surpass, explanations of social and political phenomena.

In positioning themselves away from positivist ambitions, interpretive approaches have drawn inspiration from idealist philosophical traditions—notably hermeneutics and phenomenology—and from postmodernist and poststructuralist philosophies. Hermeneutics developed initially as a method of interpreting texts in connection with biblical criticism and expanded as a theory of understanding applicable to the whole social, historical, and psychological world. In his major writings, Hans-Georg Gadamer accounted for the depth and ineluctable subjectivity entailed by the interpretation process. He argued that interpretation

necessarily engages the presuppositions of the interpreter because an object of interpretation can only be understood in terms of the meanings of its parts, which in turn depends on the meaning of the whole. This view of interpretation implies at least three basic premises for interpretive theory: First, in order to be understood, human action and social practices cannot be divorced from the meanings people attach to them. Second, all observers are affected by their social context, so none can give purely "objective" descriptions of facts. Third, knowledge is thus an inescapably practical and historically situated enterprise, not a technical project in abstraction.

In his classic statement "Interpretation and the Sciences of Man" (1971), Charles Taylor argued that the nature of human beings makes the natural science model fundamentally inappropriate for the human sciences. Scientism about human and social affairs fails to incorporate intersubjectivity in conceptualizing meanings and thus fails to give adequate account of the nature of their objects of inquiry. Human beings are self-interpreting agents who think and act for reasons of their own, but these meanings are formed and understandable only against the shared background of concrete contexts of social practices also available to others. Thus, the proper mode of social scientific inquiry neither assumes an objective nature to social reality nor reduces the world to subjective personal experience, but takes seriously the intersubjective dimension of socially constitutive meanings. Interpretivists have posited a deep internal connection between language and practice. Political practices, for instance, are not only expressed in but are constituted by the language embedded in them, and that language also gets its sense and significance from the political practices within which it develops. Thus, both the objects of investigation and the tools by which investigation is carried out inescapably share the same pervasive context that is the human world. Interpretive approaches oppose the idea that there is a separate political reality that exists and that in principle can be discovered that is independent of the language of that polity. Conceptualizing human behavior by way of deductive models and atomistic correlations between categories is to fundamentally misunderstand the nature of human subjects and their relation to their social context, and not least, their relation to social scientific practitioners.

Interpretive approaches that emphasize the construction of knowledge in the human sciences in particular challenged the behavioralist and rational choice theory's claims to objectivity. Relativists like Peter Winch argued that different cultures and ways of life each generate its own standards of rationality, which is sufficient for evaluating its internal practices. Interpretivists influenced by poststructuralist and postmodern philosophies went further and denounced reason altogether. For Michel Foucault, all modernist projects of redefining concepts for uniformity of measurement and elimination of their evaluative dimensions is hubris and, in all likelihood, sinister. It masks and seeks to control the essential contestability and value-laden nature of political life as well as all our concepts. Moreover, historians and other practitioners should not understand subjects as occupying a realm of subjective intentionality because they are only the scripted products of contingent discourses. Interpretive methods inspired by antifoundational ontologies thus hold that the relevant meanings within cultural discourses and complex systems of signification are coextensive with practices. These interpretivists seek to depict and uncover these meanings by delving into the discordant practices of political life, which are fundamentally irreducible to the products of mind or to self-consciousness.

Interpretive ideas are long standing in the human sciences. As a general category of theory, interpretive theory is a diverse set, including hermeneutics, ethnography, symbolic interactionism, cultural anthropology, poststructuralism, and decentered theory, to name a few. They not only break with established research traditions, but also transcend appeals to interdisciplinarity, and can be thought of as a set of distinctive approaches in political science. Interpretive approaches offer narrative accounts of social and political life and emphasize the meaning-laden and even contingent nature of its subject matter. Interpretivists view human practices as so constituted by webs of intersubjective meanings that giving account of these meanings, which may be tacit or inchoate, requires a depth hermeneutics. Although interpretivists do not, in principle, reject the use of statistics and quantitative measurements, they see their interpretive

analysis as necessarily and appropriately extending beyond the data supplied by empirical inquiry.

Today, interpretive theorists continue to draw on diverse philosophical positions, including hermeneutics, phenomenology, poststructuralism, and pragmatism. These philosophies inform many approaches to the human sciences, including ethnography, symbolic interactionism, and cultural anthropology. Interpretivists in sociology and anthropology, influenced by phenomenology, favor textual approaches and ethnography. Ethnography focuses on the different forms of everyday common sense knowledge and practical reasoning that provide the ontological bases of experience. Cultural anthropologists like Clifford Geertz have called for "thick descriptions" in the study of social contexts. The ethnographer proceeds by recording the meanings that particular actions have for social actors, and interprets the social discourse and its symbols to understand the webs of meaning and significance that operate within those practices. The ethnographer generalizes by guessing at meanings and draws explanatory conclusions from best guesses. The hermeneutic aim, thus, is not just to measure, correlate, systematize, and settle, but to formulate, clarify, and appraise cultural meanings and social practices, acknowledging that because they result from interpretation, the results are always incomplete and open to challenge. A focus on meanings has led some interpretivists to view the task of the human sciences not as explanatory but appreciative; they argue that the human sciences aim solely at a deeper understanding of the rich texture of the cultural objects they study. But many other interpretivists argue that it is a mistake to think that interpretive theory is appropriate only for understanding and not suited for explanation giving in the social sciences, and they reject casting understanding and explanation as alternative goals of social scientific inquiry. They insist that greater understanding is an integral part of explanation giving in the human sciences and argue that we can explain actions and practices only by interpreting the beliefs or meanings that inform them.

INTERVENTION

Intervention is a topic of great normative controversy within the field of international/global political theory. Conceptually, intervention presupposes a society of distinct units with separate spheres of agency, authority, and responsibility. Intervention paradigmatically entails an external agent acting within the preserved domain of another agent or unit. Conventionally in the study and practice of world politics, intervention as a concept refers to coercive acts by states that violate or displace the sovereignty—that is, the political independence or territorial integrity—of another state. This definition of the concept is generally favored by theorists of the English School or "international society" tradition, but is disputed by international "realists," who typically adopt a narrower conception, and cosmopolitan theorists, who endorse a more expansive account that goes beyond a state-centric view of global politics. Debates between and within these theoretical perspectives also center on the legitimacy of intervention as a practice, especially if carried

out for the purpose of protecting human rights or welfare.

In the society of states, intervention is fraught with normative, legal, and political controversy. The twin normative pillars of international society, enshrined in the United Nations Charter, are state sovereignty and the duty of nonintervention. First, all states enjoy equal sovereignty, or a claim to supreme authority within their territorial and political jurisdictions. Second, a natural corollary to equal state sovereignty is the duty of all states to refrain from intervention in the domestic affairs of other states. Coercive acts by states that affect the political independence or territorial integrity of another state are therefore generally considered illegitimate. According to the international society tradition, these norms combine to deter aggressive, powerful states from imperialistic enterprises and to ensure a pluralistic international society of self-governing political communities.

Increasingly, however, these rules of international society have been challenged by the ascendancy of the global human rights movement. The doctrine of human rights asserts universal standards of treatment owed to all people by a political society. Against the pluralist strand of the English School, solidarists within the international society tradition endorse human rights doctrine, and have argued for an international right to intervention against states that fail to protect their members from severe human rights violations, such as genocide, ethnic cleansing, and other large-scale crimes against humanity.

Cosmopolitan thinkers push the theoretical and institutional implications of the global human rights movement even further. They note that as the agents and structures of global governance have become increasingly diversified and complex. It has become intelligible to conceive of intervention more broadly, as a concept and practice that pertains not only to states and their relations, but also to international and supranational organizations, as well as to global civil society actors. For example, associations of states (the North Atlantic Treaty Organization), international organizations (the United Nations), supranational political unions (the European Union), and economic institutions (the International Monetary Fund), as well as organized religions (the Catholic Church), global human rights advocacy groups (Human Rights Watch), and humanitarian aid organizations (Médecins Sans Frontières) can all be agents as well as objects of intervention. Many cosmopolitan theorists envisage the development of global regulatory regimes and institutions that would regulate states, as well as individuals and transnational actors (multinational corporations), in areas such as the use of force, environmental protection, global economic order, human rights, transnational social rights, and immigration. With the development of such a postsovereign global order, in circumstances of noncompliance with global norms in these areas, international and global organizations may have not only a right, but an obligation, to intervene to enforce compliance.

In the contemporary international order, cosmopolitan theorists have argued against absolutist conceptions of state sovereignty as unrestricted internal autonomy, emphasizing an alternative conception of sovereignty as responsibility to protect human rights and welfare. Intervention to address human rights violations is most controversial when the form of intervention proposed involves the use of military force. In much of the international relations literature, and especially within the realist tradition, intervention is synonymous with one form of coercive action—the use of military force—against a sovereign state, and humanitarian intervention as a concept is restrictively defined to refer solely to the use of force within another state's jurisdiction for the purpose of human protection. Not surprisingly, debates about the ethics of humanitarian intervention employ the structure and content of just war theory.

Despite the endorsement of a responsibility to protect doctrine by the community of states in 2005, controversies abound regarding the authorization and operationalization of humanitarian interventions. Should the United Nations Security Council be the sole authorizing body for such interventions, or can regional organizations or ad hoc coalitions of states be legitimate authorizing bodies? How can the United Nations (UN) reconcile its twin roles as a guardian of equal state sovereignty and as an enforcer of universal human rights? Can humanitarian interventions succeed in resolving humanitarian crises? In practice, the vast majority of states are reluctant to commit their military resources to UN-mandated humanitarian interventions or peace support operations. At the

same time, the use of force by the most powerful states tends not to track humanitarian interests. While realists are skeptical about the motivations of powerful states when they do intervene for declared humanitarian reasons, idealists worry that the practice of humanitarian intervention may reveal deeper failures of global governance to address the root causes of politically induced humanitarian catastrophes. The persistence of the non-ideal makes intervention a thorny and enduring topic of normative political theory.

Islamic Modernism

In Islamic regions, modernism took many forms, one of which has been termed *Islamic modernism,* signifying the trend's desire to reconcile the Islamic faith with values associated with modernism. The trend is alternatively referred to as *modernist Islam,* drawing attention to the desire of its advocates to use Islamic discourses as a means of pursuing what was seen as the achievements of modernity.

Islamic modernism emerged in the nineteenth and early twentieth centuries as many Muslim majority states sought to address the conditions of the modern world. Many Muslim intellectuals had reached the conclusion that the Islamic world had fallen behind relative to the West, and they had begun to question the effectiveness of traditional systems in addressing the gap. The question of the relationship between Islam and modernity was not merely abstract, but engendered concrete social, political, and theological significance in the guise of Europe's imperial expansion into Muslim regions.

The modernism of this intellectual movement distinguished it from earlier Islamic reformist and revivalist movements that did not explicitly identify with modernity, from traditionalists who rejected innovations in thought, as well as from secular trends that either downplayed or denied the role of religion in their modernizing schemes. Central to Islamic modernism was the project of ongoing rational interpretation (*ijtihad*) of Islamic texts and principles, which was contrasted to passive imitation (*taqlid*) of tradition and acceptance of dogmas from religious authorities without proof. Islamic modernists were confident that modern scientific thought could be appropriated without harming Islam. Modern values could be translated into Islamic terms, and Islamic values could be translated into modern terms. Reinterpretation was undertaken with a dual purpose: both to make relevant the Islamic faith in the modern world and to provide justification for their worldly ambitions. These seemingly contradictory impulses—the one religious, the other secular—were due to two competing discourses that challenged the Islamic modernist project. Against those who argued that religion was ill-suited to modern social and political reform, Islamic modernists argued that rather than religion holding society back from progress, it is the failure to practice religion properly that is to blame for the relative weakness of Islamic regions vis-à-vis the West. Islamic modernists sought to establish modern humankind's need for religion, offering evidence of humanity's natural impulse toward religion, arguing that shortcomings in the human intellect necessitated religious guidance and the greater utility of religious law over human laws commanding the loyalty and appealing to the conscious of the people. Against those who argued that modern values constitute an accretion to Islam, they argued that modernism was in fact a return to Islam's true spirit of dynamism, and that the modernization of religion promised to increase,

not decrease, religion as a comprehensive facet of human existence.

Islamic modernists were pioneers in educational reforms and in establishing periodicals, publishing houses, and translation projects. Many Islamic modernists also acted as central architects of political reform, contributing to the construction of legal frameworks and governing institutions. Among the movements chief figures was Rifa'a al-Tahtawi (1801–1873), a leading Egyptian education officer; Khayr al-Din al-Tunisi (1810–1889), who held position as higher minister in reforming the Tunisian state; Muhammad Abduh (1849–1905), who as Egypt's Grand Mufti pursued reforms in Islamic law, education, and administration.

Some Islamic modernists, like Tahtawi, had traveled abroad and studied European constitutions and sought to appropriate institutions (such as parliaments and elections) and values (such as freedom and equality) that were deemed compatible with Islamic law (*Shari'a*). Equivalences were asserted between the European concepts of "democracy" and the Qur'anic notion of consultation (*shura*), just as Arabic and Islamic terms were equated to the public interest (*maslaha*) and consensus (*ijma'*).

In their quest to reform, Islamic modernists also addressed a number of social issues, such as the status of women and relations between Muslims and non-Muslims. Qasim Amin (1863–1908), an Egyptian judge, called for an end to women's seclusion and for the general improvement of their status in society, including education and participation in public life. The concept of the citizen (*muwatin*) as one who shares with others in ties to a homeland (*watan*) are developed in ways that seem more inclusive of non-Muslims than earlier notions of community (*umma*) of the faithful.

Although modernization remains a goal for many in Islamic regions, the decline of Islamic modernism was apparent by the 1930s, as secular ideologies, such as nationalism, socialism, and fascism gained force and religious revivalist movements began to distinguish themselves by placing greater emphasis on the Islamic element and often explicitly fought or rejected what they considered to be foreign accretions.

Islamic Political Philosophy

Political philosophy is the attempt to replace opinion about political affairs with knowledge. For sound rhetorical reasons, it may adopt and adapt the speech and images of the dominant religion. Even so, it remains independent of religion. Thus, political philosophy in the medieval Arabic-Islamic tradition of the Middle East differs from that in the medieval Arabic-Jewish or Arabic-Christian traditions mainly in this rhetorical aspect. Political thought, always limited by the opinions that dominate the setting and time, replaces political philosophy in the modern and contemporary eras.

Background

Political philosophers in the medieval Arabic-Islamic tradition agree that Plato and Aristotle achieved the highest level of knowledge about the universe and its parts. That the revealed religions known through Moses and Muhammad also claim to possess ultimate truth about these very things poses no conflict. As Abu Nasr al-Farabi (870–950 CE) points out, the meaning of philosopher, lawgiver, imam, and king is one. Their goals and activities are identical. His successors argue similarly, each in his own fashion. Averroes (1126–1198 CE),

holding Aristotle in the highest esteem, even as he carries out his duties as judge and jurist, insists that truth cannot contradict truth. If a philosophic teaching appears to conflict with a scriptural one, interpretation of the latter will reveal the basic agreement between the two.

Al-Farabi and his successors rely mainly on Plato's *Republic* and *Laws,* plus Aristotle's *Nicomachean Ethics* and *Rhetoric* in their expositions, but are conversant with Aristotle's works on logic, natural science, the soul, and being (the *Metaphysics*). They investigate lawgiving to understand the political goal of prophecy. Indeed, Avicenna (980–1037 CE) lauds Plato's *Laws* as the best explanation of prophetic lawgiving. Particular differences notwithstanding, all insist on what becomes clear to unaided human reason as the touchstone.

With Avicenna, a conversation among these philosophers begins—each taking note of his predecessors and explicitly agreeing or disagreeing with them. It continues unabated until Ibn Khaldun (1332–1406 CE), then starts again with al-Afghani (1837–1897) in the nineteenth century. Philosophy moved west to Andalusia, Spain, after Avicenna, where it flourished. Ibn Khaldun brought it back to Cairo, but it disappeared with his demise never to return. The theosophy and mysticism so prevalent in the fifteenth to nineteenth centuries abjure political reflection.

Al-Kindi and Al-Razi

Al-Kindi (800–870 CE) initiates philosophical inquiry among the Arabs. But his numerous writings are primarily theological and moral, and his fame now derives from a treatise on metaphysics. A minor work on Socrates, one of two writings on ethics, and two other treatises contain only the germs of a political teaching. He fails to provide a rational account of human existence or its end and thereby ground political inquiry. Even his charming *Treatise on the Device for Driving Away Sorrows,* with its delightful allegory of human existence, ends in aporia—offering strategies for personal coping without seeking to alter the milieu in which we live. Balancing the claims of pagan Greek philosophers and the faithful followers of a new, apparently more readily accessible, wisdom to investigate how the two complement one another with respect to individual well-being, he fails to address its political significance.

Al-Razi (864–925 CE), famed as a physician and teacher of medicine, was also an advisor to rulers and composed over 200 works. His philosophical writings defend asceticism and present justice as control of the passions. Key for him, yet never explicitly defended or spelled out in detail, is the assumption that divine providence permits some creatures to serve others. He therefore distinguishes among humans in terms of how they advance the community's well-being and embraces a hierarchical political order in which it is normal and just for weaker and less valuable humans to serve stronger and more valuable ones.

Al-Farabi to Averroes

Via commentaries on Plato and Aristotle plus probing essays, al-Farabi reaches to the core of their thought and presents it so as to bring politics to the fore. He deems the end of human life—attaining perfection or ultimate happiness—the central theme for these two great philosophers as for any lawgiver, religious leader (imam), or king. Good ones are distinguished from bad in terms of what they view as happiness, how they seek to bring it about, and whom they assist in enjoying it. Mindful that his analysis counters prevailing opinion, al-Farabi constantly points to its flaws and shows how his view accords with the world around us.

His language is simple and direct, as are his teachings. Though they evoke the sense that al-Farabi has Islam and Muhammad in mind, he says nothing precise about either. Muhammad's name never occurs in any of his writings, and he uses the term *prophet* only when enunciating the opinions of dialectical theologians or adherents to a religion. Al-Farabi focuses instead on the question of the best human life, which was central to the teaching of Plato and Aristotle, for why their solution is suspect in his age as well as how such doubt can be overcome. He returns to the perennial questions of human perfection and how it may be attained to show why pursuit of them—the quest for wisdom about them—remains the most important human task. His renown was such that he was esteemed as the "second teacher"—second after Aristotle.

Avicenna's massive and encyclopedic *Healing* comprises four parts: logic, natural science, mathematics, and divine science or metaphysics. He presents the work in the introduction as devoted solely to theoretical philosophy or science and is silent about practical philosophy or science. Not until the end of the section on metaphysics does he speak of ethics and politics, claiming he has placed a summary statement of them there until he will be able to examine them comprehensively in a separate book. Yet his fuller teaching reveals that ethics and politics belong after divine science intrinsically, not provisionally. The human manifestation or practical proof of divine science, they testify to divine providence and the truth of revelation. Because the correctness of their teaching can be verified by Aristotelian or pagan reasoning, it must be seen as consonant with the revelation accorded Muhammad.

His description of Plato's *Laws* as a treatise on prophetic lawgiving indicates how interrelated he deems philosophy and revelation. Moreover, his inquiry into prophecy and divine law explains the nature of law, purpose of political community, need for sound moral habits among citizens, reasons for marriage and divorce, conditions for just war, considerations that lay behind penal laws, and end of human life. Although he does not address the origin of private property nor explain how to train successors to the prophet-lawgiver so that they have the moral habits and character traits suitable to the position, he raises these issues when introducing political science and thus affirms the affinity between the politics of pagan philosophers and the exceptional individual whose prophetic qualities rival or surpass philosophic virtue.

Ibn Tufayl's (c. 1110–1185 CE) philosophical novel, *Hayy Ibn Yaqzan* (Living the Son of Awakened), purportedly sets forth "the secrets of the Oriental wisdom mentioned by" Avicenna and exemplified in Hayy's life (p. 95). It outlines the mysterious state attained when one discerns the workings of the universe and communes with the divinity. But it does so indirectly as a means of encouraging the interlocutor to inquire on his own and not be content with a lower degree of insight. Hayy, who is perhaps self-generated, grows up on a deserted island. During seven periods of seven years each, he discovers his natural surroundings and the way they interact via induction. He embraces physics, mathematics, and astronomy; and he discerns the creator plus his messenger or prophet, Muhammad—all without language. Only when he encounters the inhabitant of a neighboring island troubled about the way his fellow citizens practice religion does Hayy learn speech. They voyage to that island intent on demonstrating the correct practice, but fail miserably and return to the desert island resolved to end their days in meditation. Apparently, something more than knowledge and mystical union is needed for sound political rule.

Averroes, revered for his commentaries on Aristotle, also wrote a commentary on Plato and treatises with a view to reconciling Muslim jurists and theologians with the philosophers. For him, the best regime respects the natural order among the virtues and practical arts by privileging the theoretical virtues or by ensuring that opinions and actions accord with the theoretical sciences. He faults the regimes of his day for aiming at the wrong end or failing to respect the natural order among the human virtues. Thus, democracy unduly emphasizes the private and is not able to order the citizens' desires.

He views philosophy and revelation as agreeing that citizens must embrace a good that transcends their immediate well-being. He finds this evident in the way the Qur'an addresses people with different levels of learning in speech suitable to them and the use philosophy makes of rhetoric. Because religion and political philosophy take the whole citizen body into account, they employ different kinds of speech and even practices. Such insight is key to understanding the working of the revealed law and its purpose, as well as the core teaching of Plato and Aristotle.

The Disappearance of Political Philosophy

From Averroes's death in 1198 CE to the advent of Ibn Khaldun almost 200 years later, political philosophy gives way to mysticism and theosophy. It is a period of great political upheaval. In the East, there are the Crusades plus the onslaught of the Mongols, who take Baghdad in 1258 CE. And Andalusia becomes fragmented by internecine strife, even as Christian forces gain greater strength and strive to retake land seized centuries earlier. Yet whereas political philosophy flourished earlier

amid similar unrest, it now falters and, upon Ibn Khaldun's death, vanishes forever. To be sure, faint echoes resound here and there in Persian and Turkish "mirrors of Princes'" literature that offers particular advice to rulers and focuses on remedies to help them preserve their reign. But not until almost 400 years later, when al-Afghani bursts on the scene, is any serious kind of political writing to be found. It is, however, necessary to speak of the last great instance of political philosophy preceding the great drought just noted.

Best known for the lengthy *Introduction* (*Muqaddima*) to his extensive philosophical history of civilization, Ibn Khaldun spent much of his life in political activities. At age 50, he moved to Cairo to serve the Mamluk Sultan Barquq as judge and chief judge, professor, and university president, but, above all, to revise his history and compose its *Introduction*. The latter consists of six lengthy chapters that explore human civilization in general and Bedouin civilization in particular, political association, sedentary civilization, the arts and crafts by which humans gain their livelihoods, and, finally, the different human sciences. His goal is to seize on the "inner meaning of history" or "the truth, subtle explanation of the causes and origins of existing things, and deep knowledge of the how and why of events" (vol. 1, p. 2). An understanding of these matters will permit him to expose "the principles of politics, nature of existent things, and differences among nations, places and periods with regard to ways of life, character, qualities, customs, sects, schools, and everything else . . . plus a comprehensive knowledge of present conditions in all these respects . . . complete knowledge of the reasons for every happening and . . . [acquaintance] with the origin of every event" (vol. 1, p. 43). That, in turn, will allow him to explain the nature of civilization and its accompanying accidents. It promises to provide a comprehensive account of human social organization, its beginnings, as well as its ends. As sweeping as it is audacious, the undertaking calls the transmitted or positive sciences central to the Islamic community into question as much as the practical sciences of politics and rhetoric.

Yet, while explicitly criticizing the political philosophers who precede him, Ibn Khaldun manages to apply their teachings in place of those gathered from the transmitted or positive sciences when analyzing issues most important to the Islamic community. He thus grounds his new science fully in political philosophy. Deeming it "a deep root of wisdom" (vol. 1, p. 2) that provides an explanation of the "causes and reasons for the beginning of dynasties and civilization" (vol. 1, p. 5), he joins his undertaking to that of the historians and the philosophers who went before him. As he explains the way Bedouins become sedentary and then develop new ways of life, ways that decline even as they have flourished, the constants in human social organization come to light: how people come together in social organization, strive to make a living, ascend from necessary tasks to finer ones discovered by means of discerning thought, and eventually seek for the cause of things.

Among the Arabs, his book passed into obscurity as his successors focused on communing or achieving union with the divinity and reduced political inquiry to issues of personal morality or counsel to potentates. Fortunately, it found such favor among the Ottomans that numerous copies were made and preserved.

Political Thought and Political Action

Only with the advent of Jamal al-Din al-Afghani is there a return to the larger questions raised by al-Farabi, Avicenna, Ibn Tufayl, Averroes, and Ibn Khaldun. Al-Afghani writes out of deep concern over the weakness that characterizes the Islamic world in his day. Dominated by Western imperialist powers, even in their own lands, Arab and Muslim rulers seem to have lost all memory of the grandeur and greatness that were once theirs and to have no idea of how they might regain their former rank. His challenge to thoughtful Muslims, first formulated in lectures to university audiences and then distributed in occasional articles read by an educated few, won him the sympathy of Muhammad Abduh (1845–1905); and these two eventually joined forces to launch—from Paris, because no Arab or Muslim country would tolerate al-Afghani's presence—a short-lived journal known as *al-'Urwa al-Wuthqa* (The Most Solid Link).

In it, they argue vigorously for independence from foreign domination but see no reason to replace monarchic rule with popular government. They are persuaded that Arab and Muslim peoples

are not sufficiently disciplined to govern themselves well and thus still need the tutelage of a ruler who will train them in the skills needed for self-government. For them, the issue of future self-rule is less important and surely less urgent than overcoming the economic lethargy and uncritical traditionalism that they discern as hindering Muslim peoples everywhere. Thus, in his famous debate with the renowned and ever so positivist Ernest Renan (1823–1892), al-Afghani generously concedes that because philosophy and religion are and must always be in conflict, and Middle Eastern peoples are not nor will soon be ready to forsake religious guidance, it makes good sense to postpone democracy. Unfortunately, such a concession did not dampen the suspicions of the Ottomans. While enjoying their enforced hospitality, al-Afghani came to a mysterious end.

Muhammad Abduh develops this same theme, albeit with a slight twist, as he bases his own political teaching on an attempt to explain the reasonableness of guiding political life by Islamic precepts. His famous *Risalat al-Tawhid* (Treatise on Unity) presents a coherent exposition of how Islam can assist human beings to live together in society and eventually attain the happiness intended for them by the Creator. Abduh focuses on the assistance God offers people by sending prophets who show us how to get along in political community. Drawing our attention to something higher than self-preservation or immediate gain, these messengers teach us how to work together without harming one another or causing evil. In learning to honor a higher being, we are prompted to love one another as His fellow creatures, control our desires, redirect our passions, and regulate our actions. Almost like another al-Farabi, Abduh explicates what prompts the opinions prophets ask us to accept and the actions they urge us to perform.

Whereas al-Afghani addresses his explanations to anyone who will listen, even to the supremely self-satisfied readers of the *Journal des Débats* in his debate with Renan, his primary audience is learned Near and Middle Easterners, Muslim or Christian, who suffer the degradation of imperialist rule. His references are primarily Muslim, and the past age of glory he invokes is one of Muslim hegemony. That tendency is taken further by Abduh, with his emphasis on the soundness of living according to Islamic precepts; but the audience is still a learned one.

With Hasan al-Banna (1906–1949), however, and Abu al-A'la al-Mawdudi (1903–1979) before him, the audience and the teaching change radically. Both speak to the masses, al-Mawdudi in order to defend Islam and show how easily it can be applied to multiple problems of daily life, al-Banna in order to reform Muslims and awaken them to what they can be as self-reliant and fully conscious followers of their faith. The change in audience and in goal is reflected in the quality of the arguments both offer (i.e., ones far more rhetorical and hortatory than analytical or measured).

Each sees a need for founding an Islamic political regime. Al-Mawdudi considers it the only rule under which Muslims can live freely and fully as Muslims and thus deems it essential that the Qur'anic provisions for personal and communal virtue be implemented. For al-Banna, it makes no sense to deny Muslims the right to national liberation natural to all people; moreover, only a Muslim regime can fight against the atheism, pursuit of pleasure, self-centeredness, and relentless profit seeking that he believes will destroy all of Western society. So powerful was their rhetoric that each spawned groups intent on carrying out their teachings. Yet whereas the Islamic groups patterned on al-Mawdudi's teaching arose almost accidentally, al-Banna founded the Muslim Brotherhood from the very beginning so that his call to other Muslims could be spread more readily and efficiently.

The spokesmen for Islamic government who succeed al-Mawdudi and al-Banna share with them the desire to speak to a larger audience and the willingness to make popular arguments. Rather than rail against non-Muslim and Western colonial or imperialist powers, these spokesmen denounce the Muslim rulers who have come to power after Near and Middle Eastern peoples were moved to act on the teachings of al-Afghani, Abduh, al-Mawdudi, and al-Banna. Whereas al-Mawdudi and al-Banna simply ignore the philosophical teachings of the distant tradition on which al-Afghani and Abduh are only too happy to rely for guidance as well as for evidence of a rich cultural past, new spokesmen—most notably Sayyid Qutb (1906–1966) and Ruhollah Khomeini (1902–1989), but many others as well—dismiss the older philosophers as having been too influenced by a

foreign tradition to be of assistance in an authentic Muslim undertaking. Though they thereby demonstrate how little they have learned from the way al-Farabi, Avicenna, Averroes, and other political philosophers of the past showed such an understanding to be in error, they are not in the least concerned. Their goals are to defend Islam against the aspersions cast on it by Westerners who have failed to understand its merits, to bring about a thorough moral change in Muslims themselves, and to achieve a truly Islamic self-rule rather than an imitation of socialism (as in the Egypt of Nasser combated by Qutb) or an unbridled capitalist consumerism (as in the Iran of the Shah as portrayed by Khomeini).

Qutb's power as an interpreter of Islam and ability to persuade fellow Muslims of the need to renew their religious commitment cannot be underestimated. His popular political teaching is all too simplistic and stark, but purposely so. For him, Islamic political rule is grounded in the Muslim's testimony that there is no god but God, that is, that God is one and that rulership in the life of the individual is centered on God's unity. By so testifying to God's being, rulers will be just and the ruled obedient. Moreover, acknowledgment by the rulers and the ruled that God alone has real power permits consultation between the rulers and the ruled. Consequently, no Muslim government can claim that its authority comes from heaven. A Muslim ruler rules only by the choice of the community of believers, and his authority derives from his observance of divine law. Thus he has authority only so long as he remains faithful to that law. Further, apart from his justifiable claims on the obedience of the subjects and right to ask for their advice or help in enforcing the law, a Muslim ruler has no rights other than those of the common subject. He has no special privileges and certainly no right to oppress others.

Qutb aims his message at Muslims intent on deepening their awareness of Islam and insists that they have nothing to gain from Western learning. He admits the necessity of accepting the results of Western technology and of science generally, but sees no reason to allow philosophy, literature, history, or law to be taught according to the Western or European fashion. In an Islamic society, such subjects should be taught on the basis of Islamic concepts. Instead of teaching history based on the premises that spiritual factors have little or no effect on what happens and that Europe has greatly influenced events while Islam has done so only slightly, teaching it from an Islamic viewpoint privileges the role of spiritual factors and accords Europe no more than its just share of credit. If history and all other learning repose on nothing but interpretations, the Islamic one should be accorded its place.

While still in exile, Khomeini meditated on the governance best suited for current times—one that is Islamic because it is grounded in the divine law. The only acceptable ruler is a jurist who knows divine law and is just. Today, ignorance reigns about governance by the jurist and the need for it. Yet, because the divine law remains valid, the need for someone to administer it is as real now as in the days of the Prophet. Its comprehensiveness shows the need for someone who can devote full attention to its administration.

Now, especially, such a government is urgent: Muslims have for too long been subject to the rule of foreign interlopers who know nothing of the divine law or to fellow Muslims who neglect it in order to rush after foreign laws and customs that are not really suited for such a community. Thus, to help Muslims return to God's rules and abolish injustice, it is necessary to put those rules into effect.

Islamic government, based on the Qur'an and the Sunna, has no need of a legislative body. In its place stands a planning council to coordinate the activities of the various ministries and executive agencies and to advise the ruler. Persuaded that ultimate authority for the administration of the laws should reside in the hands of one man, Khomeini insists on the qualifications of the ruler (knowledge of the divine law and personal justice) and on the principle that no privileges attach to this position. An independent judiciary will be needed to ensure that the divine law is implemented correctly and to permit the people redress for grievances against one another or against government officials. Given the principle that the sole task of Islamic governance is implementing the divine law, it should be considered as nothing more than a means to an end. Thus, no one should seek office for its own sake.

Addressing himself to young students of the divine law, he calls for numerous, varied

propaganda campaigns directed toward the goal of informing the people about how those now in power permit foreigners to distort or discredit the Islamic faith, while themselves failing to live according to its prescriptions. At the same time, the people must be taught about the fundamentals of the faith and apprised of the merits as well as of the possibility of Islamic government. Moreover, because the existing Christian, Jewish, and Baha'i religious centers have goals opposed to these and sometimes even engage in missionary activity, they must be forced to close. Finally, an attempt must be made to reach those who attend colleges and universities in order to inform them of the harmful character of the Western ideas they so innocently adopt.

Before Khomeini returned to Iran to found the Islamic Republic, Ali Shariati (1933–1977) had come to prominence as a teacher and daring critic of the Shah's regime. Sent by the Iranian government to Paris to study sociology and become a university professor, he spent more time in prison or compulsory retirement than teaching. Particularly incensed about the lack of attention paid to Islam in Iranian society and convinced that his fellow citizens neglect Islam out of the erroneous belief that Western science and philosophy respond more directly to their problems, he tries to derive an understanding of history or sociology from Islam. For him, it is not due to chance, determinism, or the efforts of a great man that change occurs, but—as indicated in the Qur'an—due to the people. Yet, given the importance of the Prophet in Islam, Shariati includes him along with the people as a primary factor in social change.

Numerous others—such as Egypt's Abd al-Salam Faraj (1952–1982) and Lebanon's Muhammad Hussain Fadhlallah (born 1935)—follow the lead of Qutb and Khomeini. Tunisia's Rached Ghannouchi (born 1941) can pursue his goals only in exile, while Shaykh Ahmad Yassin (1937–2004), the founder of Hamas in Palestine, was silenced by an Israeli bomb. These, along with Egypt's Shaykh Kishk (1933–1996) and Mustafa Mahmoud (born 1921), as well as Sudan's Hasan Turabi (born 1933) and Morocco's Nadia Yassine (born 1958), share in the desire to improve the material and spiritual well-being of fellow Muslims through encouraging their closer adherence to Islamic precepts and replacing rulers who ignore Islamic law. There are also jurists—Yusuf al-Qaradawi (born 1926), Taha al-Alwani (born 1935), and Khaled Abou El-Fadl (born 1963)—who, by drawing attention to the *maqasid,* or intentions of the law, seek to influence the actions of individuals and direct political policy.

Yet others seek consciously to free themselves as Muslims from the constraints against Western learning imposed by Qutb and Khomeini. Abdol Karim Soroush (born 1945), also in exile of sorts from his native Iran, seeks to make Islam responsive to the issues of the day by showing how the reflections of Western philosophers such as Kant, Hegel, and Heidegger help elucidate the basic texts and beliefs of the religion. Muhammad Arkoun (born 1928), an Algerian who has spent most of his life in Paris, has written much about the need to see Islam through the lenses of Michel Foucault. Yet others, Muhammad Imara of Egypt and Muhammad Abid al-Jabiri of Morocco have turned back to Averroes in attempting to demonstrate the soundness of Islamic teaching in the contemporary world.

Finally, there now exists a number of institutions devoted to showing that Islam is compatible with democracy or with a market economy and seeking to help committed Muslims find ways to navigate ever-more-insistent demands for conformity to secular standards without having to sacrifice their core beliefs. Now, more than ever before, there is desire to know about Islam and its teachings. These institutions and several of the thinkers surveyed in this entry help to ensure the accuracy of what non-Muslims learn about Islam.

Islamism

At its core, the term *Islamism* refers to the use of Islamic doctrine as a basis of political ideology and mobilization. Broadly speaking, Islamists believe that the Islamic faith has an important role to play in the political realm. This being so, Islamism challenges the rationalist assumptions that place politics squarely in the realm of the secular and treat religious doctrine with its attendant transcendent aspects as beyond the political realm. Straddling as it does this religious versus secular divide, Islamism presents a challenge to these existing assumptions that form the analytic frame of social scientific inquiry into the subject. With its ability to question the pertinence of applied categories, political theory has an important role to play in re-envisioning social science's engagement with Islamism as a substantive dialogue that goes beyond the replication of existing frames. This entry summarizes some of the challenges inherent in this project as well as the vast variety of ideological and political variations that the term attempts to capture.

Literalist or Fundamentalist Islamism: The Legacy of Colonialism

The genealogy of contemporary Islamism is best understood in relation to its complex relationship with colonialism and the ideas and forms of government that accompanied the expansion of colonial powers during the eighteenth, nineteenth, and early twentieth centuries. The ideological spectrum of Islamism includes at one end fundamentalist iterations that attempt to return to the scriptural foundations of the religion, remaking and reinterpreting these traditions for application to contemporary cultural, social, and political life. On the other end, Islamism can be understood in relation whether they follow majority Sunni schools of thought or Shi'ite schools of thought.

Sunni Islamism

Sunni Islam is numerically the largest denomination in Islam, its name deriving from "*sunnah,*" which means words, actions, or the example of the Prophet Muhammad. In historical terms, Sunni Muslims are those that believe that Ali, the grandson of the Prophet, was the fourth and last rightly guided Caliph, while Shi'a Muslims believe that he should have been the first. There are four major Sunni schools of thought, each named after the jurist who founded them. Examples of notable Sunni Islamist fundamentalists include Sayyid Abul A'ala Maududi (1903–1979) of the Indian subcontinent and Sayyid Qutb (1906–1966) of Egypt, both of whom wrote and organized in response to colonial powers and whose ideas have influenced Islamist political mobilization in Pakistan, Egypt, and many other parts of the world.

Maududi is notable for a number of reasons. First, he was instrumental in developing a political reading of Islam that both opposed the British colonial presence in India and also presented a political plan of action to mobilize the subcontinent's Muslims. In his writing, he created an elaborate theoretic structure for the Islamic state, giving coherence to the ideas of many preceding thinkers who had been unable to articulate a complete vision for what a polity based on Islam would look like. Writing in a political context where Muslims competed with Hindus to curry

favor with British colonialists, Maududi conceptualized Islamist identity as a competitor both to secular nationalism and also traditional Muslim identity that was relatively apolitical and against pulling religion into the political sphere. It was Maududi, arguably, who gave a modern iteration to the concept of the "*ummah*" or faith community of Muslims as one that was separate and distinct from a secular-national community. Maududi's ideas were the basis of the formation of the Jamaat-Islami, whose platform was the creation of the Islamic state envisioned by Maududi at the heart of which lay the ummah or faith community of Muslims.

While Maududi laid the foundations of Islamism in the Indian subcontinent, his contemporary Qutb pursued a similar project in Egypt. Influenced greatly by the writings of Maududi himself, Qutb penned his iconic text "Signposts along the Road" or "*Ma'alim fil Tariq,*" which has since been translated widely and become the manifesto of Islamist movements around the world, including the Islamic Salvation Front in Algeria, Hamas in Palestine, and Islamists in Egypt, Syria, Jordan, Turkey, and Lebanon. It was Qutb's ideas that led to the formation of the Egyptian Islamist group the Muslim Brotherhood under the leadership of Hassan al-Banna (1906–1949).

Building on the work of Maududi and that of other Islamist thinkers before him, Qutb argued that Muslims were in embroiled in a deep moral crisis in which their allegiance to the Qur'an and Sunnah had decayed and they had devolved into a state of ignorance or "*jahilliyya*" similar to the pre-Islamic world. The basis of both Qutb and Maududi's Islamist revivalism thus was to "cure" this problem by a rejection of the materialism and secularism they felt pervaded their societies through Western influence and mobilize them for the actualization of a just Islamic community. Writing in the postcolonial context, Qutb had been a witness to the failures of liberal and socialist regimes in Egypt and was able to provide a political interpretation for these failures as located in their inherent authenticity as departures from the true Islamic way. His execution in August of 1966 by the Nasser regime on charges of alleged conspiracy entrenched his status as a martyr both within the Egyptian context and in the larger Muslim world.

Shi'a Islamism

If Maududi and Qutb were the vanguards of Sunni Islamism, Shi'a Islamism is best identified with the work of Ali Shariati (1933–1977), the Iranian thinker whose work is credited as being the ideology behind the Iranian Revolution of 1979. Shariati, a sociologist trained at the University of Paris, used Islamist ideas to galvanize the Iranian population against the Shah's corrupt regime. While allegedly influenced by the thought of Qutb, it is important to remember that Shariati's work focused strongly around the Shi'a paradigm and hence had crucial theological differences from the Sunni Islamism of Maududi and Qutb. For example, while following the same general paradigm of locating authenticity in a return to Islam, Shariati used familiar themes from Shi'a rather than Sunni religious observance and gave them contemporary significance. A notable instance is his casting of the epic struggle of Hussain, the grandson of the Holy Prophet against the Caliph Yazid ibn e Mu'awiya, as the iconic struggle of the weak and upright warrior of Islam against the corruption and moral depravity of the evil usurper of the Imamate and the paradigm for the struggle of the Iranian people against the Shah's regime. Shariati's ideas and rhetoric was appropriated by Khomeini and eventually became the basis of a populist political mobilization that led to the overthrow of the Shah. The common theme between Shi'a and Sunni Islamism is thus their ability to make Islam politically relevant and recast political action as transcendent duty imposed by faith and having meaning beyond this life.

Modernist or Integrative Islamism

Maududi, Qutb, and Shariati inhabit the fundamentalist end of the spectrum of Islamist ideology; the "modernist" end of the Islamist ideological spectrum includes Islamist thinkers who have developed integrative rather than literalist approaches to the question of Islam's role in the political sphere. Thinkers like Sayyid Ahmed Khan (1817–1898), Amir Ali (1849–1948), Sayyid Jamal al-Din Afghani (1839–1897), Mohammad Abduh (1849–1905), and Qasim Amin (1865–1908) all presented different versions of Islam's role in the political sphere, emphasizing plurality, tolerance, and reform as their version of the role

Islam should play. Sayyid Ahmed Khan, dejected by the intellectual decline of the subcontinent's Muslims, argued that the ulama were ill-equipped to deal with the intellectual problems that he saw besieging Islam. However, unlike Islamist fundamentalist thinkers, Sayyid Ahmed Khan believed in and argued for intellectual pluralism, writing exegesis of the Bible as well as the Qur'an. Sayyid Ahmed Khan's modernism was followed by Amir Ali, a Shi'a Islamist modernist who used a comparative approach in understanding Islam using examples from other religions. Most notably, Amir Ali also tried to reconcile the Shi'a notion of apostolic leadership and the pontifical basis of the Sunni Caliphate, saying that the two could coexist. Similarly, Qasim Amin's work on the liberation of Muslim women represented one of the most systematic efforts to justify gender equality using Islamic doctrine. Much of Amin's interpretation of Islamic doctrine to demonstrate its inherent gender equality was in direct response to colonialist critiques of Egyptian women as backward and traditional Egyptian society as inherently patriarchal.

Like Maududi and Qutb, the ideas of these Islamist modernists were also formulated under the colonial period and in response to the challenges of Western notions about political life. Yet their proclivity toward interpreting Islam as a source of intellectual pluralism, religious tolerance, and gender equality present an interesting counterpoint to Islamist fundamentalist readings presented earlier. One crucial difference between the two was that while the work of Maududi, Qutb, and Shariati all translated into actual political movements, few Islamist modernists were able at that time to organize political parties around their ideas in the same ways as was done by Islamist fundamentalist thinkers. This has changed in recent years with the emergence of moderate Islamist parties in countries like Turkey, Morocco, and Egypt, which eschew the fundamentalist positions of Qutb and Maududi and employ a conciliatory approach.

Political Ideology and Political Practice

An exploration of the nexus between Islamism as political ideology and Islamism as practiced politics allows us to appreciate the impact of local political contexts and institutional interaction on Islamist ideas. The platforms used when Islamists participate in electoral politics, the coalitions formed in parliamentary systems of government, as well as the inherent compromises required while working through the democratic process often result in a different vision of Islamism than appears through reading Islamist doctrine. Perhaps as a result of this dynamic, moderate Islamist parties like the Moroccan Justice and Development Party and the Turkish Justice and Development Party all exclude radical strategies as options for political change and have charters committed to democracy, the rule of law, and human rights. These parties would never describe their politics as "secular" or drop the rhetorical emphasis on the teachings of Islam as the basis for all political action, because such a focus maintains the distinction of religion-based political action often at the root of their popular appeal.

On the other hand, Islamist groups like Hamas and Hezbollah present greater challenges to the typology of moderate Islamist political parties, because they have both active militant branches and also active political branches that have participated in democratic politics within their national contexts. Hezbollah has been fielding candidates for the Lebanese Parliament since 1992. Hamas also took part in the Palestinian municipal elections in 2005 and won a clear victory in Gaza and the West Bank. The alacrity of Islamist parties to participate in the political process should not be mistaken for an espousal of democratic processes, however, because unlike moderate Islamists, these groups have not agreed to abide by the rule of law or sworn off violence.

A mention must also be made here of militant transnational Islamist groups that go beyond the bounds of territorial politics and see the Islamic community as a nonterritorial entity and the establishment of an Islamic state as a transnational project that transcends national and territorial boundaries. Hizb-ut-Tahrir (Party of Liberation) is one such Sunni Pan-Islamist group whose chapters exist in over 40 countries and whose goal is to combine all Muslim countries into a single Islamic Caliphate. Their envisioned state would institute Islamic law as the basis of governance and be led by a Caliph that would be elected by all the Muslims. There has been some

controversy regarding the group's support of violence as a means of achieving its political aims: Members of the group have condemned violence, but some commentators suggest the group treads a thin rhetorical line by preaching engagement with violence if not violence itself. Other groups like al-Qaeda have been directly influenced by the work of Islamist thinkers like Sayyid Qutb. Ayman al-Zawahiri was a follower of Sayyid Qutb during his resistance struggle against the Nasser regime in Egypt. Formed during the late 1980s, al-Qaeda also seeks to establish the Islamic Caliphate but has routinely employed violent means to do so, including claiming responsibility for the terrorist attacks on the World Trade Towers on September 11, 2001.

Alternate Conceptions of Islamism

While the discussion of Islamism as a force existing solely within the political sphere dominates its discussion within the social scientific realm, some recent work in feminism and anthropology explores Islamism as an arena of agency and resistance where women are able to use Islamic doctrine to expand their mobility and acquire status, influence, and authority within the mosque structure. These discussions suggest an alternate conception of Islamism as a pietist movement centered around mosques and the expansion of feminine autonomy within it. In consciously engaging with the insufficiency of binary categories, such as agency and action, liberation and oppression, in understanding the experience of Islamist women within these movements, such work draws attention to the required re-evaluation of social scientific categories and their application to the understanding of Islamism.

Similar attention to the application of rationalist categories to Islamism has been explored by recent work in political theory. Roxanne Euben for example, argues that there has been an inordinate focus on structural or functionalist explanations of Islamism that seek to locate the appeal or the success of Islamism in structural or functional explanations. Without an investigation into the theoretic content of Islamism, a project that would require a necessary re-evaluation of rational categories that is at the foundation of Western political theory, it is impossible to understand the substantive appeal of Islamism as an idea. Arguments such as these call for a deeper engagement with Islamism that prioritizes the expansion and necessary re-evaluation of modes of understanding and categorization that she sees at the heart of what political theory is supposed to do. These debates within political theory encourage an understanding of Islamism beyond essentialist or reductionist conceptions that see it as simply a reaction to modernity or a reversion to an archaic or medieval form of religiosity and governance.

The value of Euben's argument to the larger project of defining and understanding Islamism is crucial. It is undoubted that since the events of September 11, 2001, Islamism has come into sharp focus. This focus, framed as it has been by two military incursions and the consistent and constant attachment of terrorism to Islamism, has imposed a moral cast on the evaluation and study of Islamism. Due attention must be paid, therefore, to these moral frames, which search for "good" and "bad" Islamisms or the ability of denominators like "moderate" versus "fundamentalist" Islamism to become indicators of ethical normativity and what is politically and morally acceptable. The theoretical consequences of these imprimaturs that deign certain Islamisms as benign and others as virulent can exercise a heavy cost in terms of the ability of theorists to engage with their substantive arguments.

Yet, the conscious disavowal of contemporary politics as a frame for the theoretic understanding and engagement with Islamism should preclude neither critique nor normative arguments regarding the substantive content of Islamist ideology. It should instead promote a healthy skepticism both of the ubiquity of existing rational paradigms as well as substantive arguments made by Islamist thinkers. This move away from reductionism to theoretically engaged critique is thus likely to both expand the boundaries of political theory and also enrich our understanding of Islamism. Finally, it is important to note, as with all projects that involve definition and categorization of political phenomenon which are continually evolving, that this attempt at capturing the core, the ideological genealogy, the political iterations as well as the theoretical and disciplinary challenges in understanding Islamism is at best an intermediary

attempt to provide a window of understanding into a complex phenomenon.

JACOBINISM

The Jacobins were the most radical and egalitarian group involved in the French Revolution. They led the government from June 1793 to July 1794, the most politically radical year of the revolution and also the year of the Terror. During their time in power, they attempted to create a "republic of virtue"—that is, a republic that attempted to purify its citizens of moral corruption. The Jacobins fell from power with the overthrow of Maximilien Robespierre. They were never to achieve power in France again. But they left a long legacy, particularly within France itself, where there continued to be a tradition of Jacobin politics on the left, while on the right the memory of the Jacobin republic has been abhorred.

The origins of the Jacobins lay in the Breton club, which was founded shortly after the outbreak of the revolution in 1789 by deputies to the new National Assembly. It became a focus for patriots (supporters of the revolution). The membership of the club rapidly widened, and it moved into the premises of a former Jacobin monastery in the Rue St. Honoré in Paris. It took the name Society of the Friends of the Constitution but soon became known as the Jacobin club. A network of affiliated clubs sprang up throughout France—as many as 1,544. They maintained connections through correspondence with the mother club in Paris and through the circulation of pamphlets and speeches. The Jacobins were mostly from the middle and professional classes, although a few former nobles were members in the early years.

The Jacobins acted as a debating club and political pressure group rather than as a formal political party. The French revolutionaries were opposed to the idea of political parties, thinking that parties would be used to promote particular interests rather than the good of all. In the early years of the revolution, the Jacobin club was dominated by relative moderates such as Antoine Barnave, Adrien Duport, and Alexandre Lameth who were committed to a constitutional monarchy and a limited franchise. Following the attempted flight of Louis XVI in June 1791 and the gradual unraveling of the constitutional monarchy that followed, the moderates left the club. In late 1791, the club came under the domination of Jacques Pierre Brissot and the group later known as the Girondins, a group that spearheaded the drive to war over Robespierre's objections.

In the summer of 1792, when the monarchy was overthrown and the first French republic founded, the Jacobins moved decisively to the left. The Girondins abandoned the club in the autumn of 1792. It was now under the domination of radical revolutionaries, prominent among them Robespierre, Georges Danton, Louis de Saint-Just, Jean-Paul Marat, and other members of the "mountain" (Jacobin deputies in the National Convention). In September 1792, the Jacobins changed their name to the Society of Jacobins, Friends of Liberty and Equality. In June 1793, the *sans-culottes* (the poorer working-class members, so named because they wore full-length trousers instead of the more

fashionable knee-length culottes) ousted the discredited Girondins from the convention, and the Jacobins came into government.

The Jacobins were hard-liners, prepared to enforce the aims of the revolutionary government and make a concerted effort to gain victory both in the war with foreign powers and with the many counterrevolutionaries within France. To do this, these hitherto idealistic and humanitarian men adopted the tactics of terror. They formed the first government to enlist terror in the cause of a political ideal. The terms *terrorist* and *terrorism* were invented retrospectively in late 1794 to describe the Jacobins and their methods. The Jacobins proved to be cautious about implementing the economic measures desired by the *sans-culottes* and were made uneasy by the violence of the *sans-culottes,* even though the threat of that violence had been enlisted to put the Jacobins into power. The Jacobins curbed the political autonomy of the *sans-culotte* movement, and the *sans-culottes* became disaffected. In the coup of Thermidor (July 1794), Robespierre and Saint-Just were overthrown by other Jacobins, who feared that Robespierre was planning to move against them. The Jacobin government fell with them. The Terror itself began to wind down almost immediately afterward. In November 1794, the Jacobin club was closed down, and many Jacobins fell victim to reprisals in the so-called White Terror.

The ideology of Jacobinism, as it has since been interpreted by political theorists, has inevitably been seen as being closely bound up with the Terror, but Jacobinism was not solely about terror. Indeed, historians have long debated the extent to which the Terror during the Jacobin republic was inherent in the universal principles of liberty and equality of 1789, or whether it was a contingent and pragmatic response to war and civil war in 1793. Jacobinism was founded on the strand of optimism in Enlightenment thought that held that mankind was basically good and that human society could be made better in the here and now, rather than in an afterlife. Jacobins believed in open and transparent politics. They were radical democrats, supporting popular sovereignty based on the vote for all men. Their conception of politics was a moral as well as a democratic one: They believed that it was the responsibility of politicians to consider only the public good—that is, to be politically virtuous. Political leaders should reject financial corruption and refuse to profit personally from their public office. The Jacobins were politically rather than socially egalitarian, although they were opposed to extremes of wealth or poverty. Their social ideal was that of a republic of small producers, peopled by landed peasants and independent artisans.

Japanese Political Thought

Political thought emerged in a coherent form in Japan in the Tokugawa era (1600–1868), when Confucian-trained thinkers sought to make Chinese Confucianism more relevant to their own political environment. Thus began what was to become a fundamental preoccupation in Japanese political thinking thereafter, namely the relationship between ethics and politics. Throughout modern Japanese history, the pendulum has swung between attempts to entangle these two spheres and attempts to separate or differentiate between them. A second central theme in Japanese political thinking has been the imperative of national identity formation in the age of modernization, imperialism, and war, especially in the late nineteenth and twentieth centuries. Tensions between ethics

and politics, and the universal and the particular, enable Japanese political thought to resonate with and enrich the international body of ideas about politics.

Ethics and Politics

The commencement of Japan's modern era is sometimes equated with the arrival of Westerners in Japan in 1853, which resulted in the forced opening of Japan to the world after more than 200 years of national isolation. The threat of foreign invasion encouraged the Japanese to develop a national consciousness and was a catalyst for centralization of political authority as well as regime change in 1868. But the rationale for the associated developments in political consciousness was nurtured in the preceding century.

As Masao Maruyama (1914–1996) has famously argued, modern political thought became evident in Japan in the midst of the semifeudal reign of the Tokugawa shogunate (1600–1868), when scholars associated with the School of Ancient Learning (*Kogaku*) dismantled the logic underpinning of Chu Hsi Confucianism. In Chu Hsi philosophy, personal morality and public life were linked by a metaphysical logic, where essential continuity between ethics and politics, and mankind and nature, packaged social and political stability as an ethical imperative and presented history as a moral lesson for humanity. Ancient Learning thinkers such as Jinsai Ito (1627–1705) and Sorai Ogyu (1666–1727) conceived of the relationship between mankind and heaven in ways that severed this normative continuity. Whereas Jinsai shifted the emphasis within Chu Hsi metaphysics toward the purification of morality by distinguishing between "the way of heaven" and "the way of man," Sorai veered in the other direction. For Sorai, highlighting the practical function of political order assumed primacy in his thinking. Sorai argued that politics was man-made (what Maruyama called *invention*), so it could change dramatically without any impact on moral order. In their different ways, Jinsai and Sorai freed the political realm from moral prescription and opened up a new conceptual space for political thought.

The conceptual opportunity that had been created by Ancient Learning thinkers was exploited with quite different outcomes by members of the School of National Learning (*Kokugaku*). Whereas Ancient Learning scholars took China as their model, National Learning scholars applied a particularistic reading of history to create an ethnocentric and somewhat literal historical philosophy. For instance, Norinaga Motoori (1730–1801) argued that only the Japanese past was a legitimate model for Japanese sociopolitical life. Moreover, in Japan's case, the gods were real beings who were the ancestors of the emperors. The pull of the past was just as powerful in National Learning, but the explicit rejection of foreign models and the advocacy of particularistic religion (Shinto) in place of Confucian cosmology helped consolidate nationalistic thinking in modern Japan. In this way, the Confucian reverence for heaven was seamlessly transformed into reverence for the emperor of Japan. In conceptual terms, emperor worship was only a heartbeat away.

This Japan-centered ideology was given significant philosophical underpinning by the scholars of the Mito fief. As Western ships threatened on the horizon in 1823, they published a manifesto elaborating the organic and historical Japanese spirit binding emperor and nation: *kokutai*. The New Theses (*Shinron*) by Seishisai Aizawa (1782–1863) thereby created the rationale for practical political action that could be legitimized if it was expressed as loyalty to the ethical center of Japan past and present, the emperor. In effect, as Tetsuo Najita points out, this led to a dualism in government whereby the realm of ethics (the emperor) could be quarantined from the realm of political action (government), establishing a circle of legitimacy unburdened by accountability attaching to power (or what Maruyama called "the system of irresponsibility"). Aizawa had sought to arm Japan spiritually and politically against the West, but ultimately, his logic was used to overthrow the Tokugawa system. His ideas also planted the seeds of what in the 1930s and 1940s would become distorted into an ideology endorsing racial supremacy and aggression, the Emperor System.

The Meiji era (1868–1912) saw the political utility of the past and the logic of loyal action confirmed in the shape of a formula for conservative revolution, known as restorationism. As the slogans and ideologies of this tumultuous period reveal, political change was deemed more readily acceptable—and legitimate—if it was justified in

historical terms. *Sonno joi* (revere the emperor, expel the barbarians) equated the intrusion of foreigners with violation of the imperial will and justified the overthrow of the Tokugawa. At the same time, the advent of a new government was justified in terms of imperial agency: The new government would, like the Tokugawa before them, rule on behalf of the emperor. The opportunism of the *sonno joi* slogan was exposed as the transitional rulers presided over the opening of the country to the barbaric West. The notion of restoring imperial rule, implying a return to past practice, became the linchpin of political ideology thereafter, until it was discredited by total defeat in 1945. It made a violent appearance in the 1930s in the Showa Restoration movement, as young officers in the Japanese Imperial Army sought to restore their version of the imperial will through a campaign of assassinations and a failed coup d'état.

The Universal and the Particular

The dualistic logic of ethics and government that was first articulated in the late Tokugawa era acquired institutional form in the 1899 Meiji constitution. The state builders of Meiji Japan knew that to survive in a hostile world and retain national independence, Japan needed to embrace modernity. This meant, among other things, the acquisition of modern institutions such as a constitution and a parliament and the construction of a modern democratic society. The constitution was a hybrid document that confirmed the emperor as head of state and, at the same time, established the emperor as a transcendental entity in political terms. In this sense, Meiji constitutionalism was more than just an institutional arrangement; the locus of the emperor in this institution also made it an expression of national identity.

The Meiji oligarchs who drafted this constitution needed to associate the new modern state with the emperor to borrow the logic of restorationism, namely to ensure that popular loyalty would accrue to the new government and its institutional identity through the emperor and to constrain popular participation in politics to forestall the revival of loyal action against the new government. In the 1889 constitution, the popularly elected parliament was made accountable to the emperor; rights were bestowed on the people by the emperor rather than being inherent; and the constitution itself was framed as a gift from the emperor to the people. Transcendentalism was established as the operative principle of Meiji constitutionalism by declaring the emperor to be both sovereign and sacred and inviolable. In addition, transcendentalism was institutionalized through omission: The military bypassed parliament and cabinet and was directly responsible to the emperor alone; the appointed cabinet was not accountable to parliament; and the wielders of actual power—the oligarchs—were not mentioned in the document at all.

The ideological building blocks that eventually congealed to underpin the Emperor System enhanced the logic of the Meiji constitution by using a combination of myth and force. The 1890 Imperial Rescript of Education led to all school children citing a loyalty oath to the emperor daily, while the 1925 Peace Preservation Law criminalized criticism of the emperor. The 1937 ideological tract entitled Cardinal Principles of the National Polity (*Kokutai no Hongi*) shrouded imperialist expansion in myth and packaged aggression in north and southeast Asia as "co-prosperity" and racial destiny.

Despite the overriding official concern with particularism that accompanied Japan's modernization from Meiji onward, there is ample evidence that many Japanese embraced the promise of universal ideas such as democracy and Marxism in the decades following the Meiji Restoration of 1868. Even the challenge of modernity was reformulated in universal terms by leading popular thinkers. The rendering of modernity as something universally attainable and therefore accessible to all cultures and races was first put forward with massive popular impact by the Meiji prophet of civilization and enlightenment, Yukichi Fukuzawa (1835–1901). In his best-selling book, *Outline of a Theory of Civilization* (published in 1875), Fukuzawa set out to dismantle the historicist logic underpinning restorationism. The imperial institution was valuable in Fukuzawa's eyes not because it was ancient but because it had facilitated the retention of Japan's national sovereignty and independence. What really mattered in the modern age, according to Fukuzawa, was that Japan acquire the spirit of civilization. This did not mean Westernization, necessitating an emasculation of identity; rather it meant that Japan needed to

acquire "science in the material sphere, and a sense of 'independence' in the spiritual sphere." By separating the emperor from national identity formation in political and social terms, Fukuzawa was continuing the trajectory of modern intellectual deconstruction that Sorai and Jinsai had propagated before him.

The pendulum swung back toward accommodation of particularistic concerns with the advent of the Taisho era (1912–1926), also known as the era of Taisho Democracy, when party political cabinets were installed and universal manhood suffrage was implemented. The political theorist of democracy who exemplifies this stage of modern Japan's political thinking is Sakuzo Yoshino (1878–1933). Yoshino invented a new word in an attempt to reconcile the particularistic totem of the emperor with modern democracy in Japan. *Democracy* had been translated into Japanese as *minshushugi* (government by the people). Yoshino's idea of *minponshugi,* which we can loosely translate as "government *for* the people," addressed the unspoken fear that democracy might be culturally incompatible with Japan's polity. It also sought to create an accommodation between emperor and nation that removed the official perception of threat that attached to popular participation in government. Acutely aware of the official aversion to popular political movements such as the Protect the Constitution Movement of 1912–1913 and the Rice Riots of 1918, Yoshino tried conceptually to bring the notion of imperial rule and popular political activism together by presenting democracy as a universal trend that would connect the nation to global progress. Yoshino thereby rationalized democracy as something that served the national interest.

Particularism tainted radical affection among Japanese for another universalist thought system, namely Marxism. Marxism was a powerful intellectual presence in Japan before and after World War II. The tension between universal and particular impulses in Marxism led to the emergence of two antagonistic schools of Japanese Marxism in the 1920s. The Koza (Lecture) group was ultimately judged the orthodox variant by the Soviet Union-based leader of international communism, the Comintern. The Koza theorists regarded Japan as not yet ready for socialist revolution, based partly on their assessment that the presence of the emperor, an essentially feudal economic and ideological force, showed Japan to be poised only for bourgeois revolution, not socialist revolution. The Rono (Labor-Farmer) group, on the other hand, regarded the emperor as an essentially peripheral entity whose presence was not linked to the substructure of Japanese capitalism. To the Rono theorists, the emperor was merely a feudal remnant whose power had already been appropriated by the bourgeois classes. Therefore, Japan was ready for socialist revolution.

In the postwar period, the Koza variant assumed predominance in the academic world, buoyed by the perceived historical implications of Japan's incomplete modernity, which had ended Emperor System fascism. The postwar Marxist movement was plagued by recriminations concerning the wartime failure to resist the Emperor System, and its theoretical coherence would eventually be further undermined as Japanese embraced "miracle" economic growth in the 1960s.

In the reinvigorated debate culture of postwar Japan, the focus of political thought switched to the viability of democracy after 1945. A core idea that emerged out of vehement disputes between Marxist and so-called progressive thinkers like Maruyama was that of *shutaisei* (autonomy). Particularism emerged here once more, as intellectuals sought to base their view of democratic viability in Japan on their analysis of Japan's wartime polity. Maruyama's theory of the state's appropriation of social autonomy during the war led him to argue that democracy in postwar Japan depended on the development of *shutaisei,* meaning autonomous value definition on the part of individuals, who could then act freely on those values. Marxist philosophers were tormented by this interpretation, as it smacked of an individualist worldview instead of historical laws leading to capitalist collapse. Even so, leading Marxist philosophers like Katsumi Umemoto (1912–1974) argued that people who were expected to conduct revolution needed to know why it mattered, earning himself the negative label of revisionist.

As the postwar era unfolded in the shadow of the cold war, pacifism and neutralism emerged as manifestations of the very *shutaisei* that thinkers had advocated in the late 1940s. Perhaps here we can see the coming together of particularistic and universal concerns, alongside a belated reconciliation between ethics and nonstate politics.

The potency of postwar Japanese pacifism as an ethical performance on the part of society against the state remained a dominant antiestablishment political ethos until the first Gulf War in 1991. In the twenty-first century, peacekeeping as a valid use of state power vies with the bogey of neonationalist revival in contemporary Japanese political thought, with the universal and the particular once more competing for ethical primacy in the popular imagination.

Judicial Review

Judicial review refers to the power of a court to refuse to enforce statutes or administrative rules that, in the opinion of the judge or judges, conflict with the letter or the spirit of the constitution. Judicial review can serve to legitimate and facilitate the enforcement of limits on government and on majorities in constitutional democracies, but the practice of judicial review is controversial because it typically allows unelected judges to override majority preferences. Judicial power, then, is tenuous, and judges must rely on their power to persuade to maintain their authority.

There are two basic models of judicial review: a European model, largely built on a foundation developed by Hans Kelsen, and the American model. In the European model, judicial review is practiced by a specialized constitutional court, often ruling on abstract questions or deciding on the constitutionality of laws before they have been promulgated. By contrast, the American system is applied only in concrete cases involving real disputes between interested parties, and it can be applied by state courts as well as any federal court. Although the European model has proliferated in the years since World War II, and particularly since the fall of the Soviet Union, judicial review achieved its greatest prominence in the United States.

Constitutions define and limit the powers of the government. To be meaningful, these limits must be defined, articulated, and enforced. Independent courts are well designed to take on this function, and many have argued that it is a responsibility they cannot logically avoid. Constitutions are understood to represent a higher law than ordinary legislation; that higher law is the expression of the sovereign people themselves. Ordinary legislation is the product of the agents of that sovereign. Thus, it is impossible to imagine a court sworn to preserve and defend the constitution enforcing the inferior statute and ignoring the superior constitutional provision.

Judicial review has a long history, and early examples include *Dr. Bonham's* case, decided by the Court of Common Pleas in England in 1610, in which Sir Edward Coke ruled that statutes contrary to right and reason cannot be enforced by a court. In the United States, judicial review was first exercised by the U.S. Supreme Court in the 1803 case of *Marbury v. Madison,* in which Chief Justice John Marshall insisted that the U.S. Constitution was a superior law and could not be changed by ordinary legislation. Where there is a conflict

between ordinary legislation and the superior constitutional provision, Marshall argued, the Court was bound to enforce the superior provision and disregard any conflicting ordinary legislation.

Judicial review serves various purposes. By having the authority to say what is *not* law, the courts can enhance the legitimacy of government action by providing an independent assurance that the government has not exceeded the limits and boundaries of the constitutional compact. Judicial review offers investors and citizens alike assurances that even the government itself is bound by law, that their investments are secure, and that commitments will be kept. Judicial review also can serve to ease the transition of power; those losing power can protect their interests and will have the opportunity to contest for and regain power in the future. It also can provide a way to balance and resolve disputes that arise in federated and consociational systems in which power is divided or shared among various institutions and levels of government. Strong judicial review is also often embraced in societies interested in protecting deep normative commitments against the possibility of majority tyranny and often particularly in states emerging from totalitarian regimes. The European Convention on Human Rights represents a broad and deep set of normative commitments, and the enforcement of these commitments has actually led to the exercise of strong judicial review even in polities—such as France, Germany and Great Britain—with a deep traditional commitment to parliamentary sovereignty.

Every government official is bound to abide by and support the provisions of the state's constitution, but independent courts are institutionally well designed to take a leading role in the interpretation and enforcement of constitutional bargains. Protected from the vicissitudes of partisan politics, and often serving long and even life-tenured terms, judges are free to enforce the constitutional bargain in ways that elected officials may not. But lacking the tools of enforcement (neither the force of arms, nor the ability to print, raise, or spend funds) judges must rely on their power to persuade and are often restrained in the application of the power of judicial review by the concern that their own authority is tenuous.

Judicial review is not universally embraced. There is great resistance in democratic polities to rulings by unelected judges that override the preferences of majorities. Judges often exercise self-restraint out of a concern that overreaching could undercut their own institutional power and authority. Some suggest that the best way for judges to minimize this concern is to enforce the language of the constitutional bargain strictly and in strict accord with the meaning of those who wrote and ratified these commitments until such time as a new constitutional provision is substituted for the existing provision. Others insist that judges ought to limit the exercise of judicial review to making sure that the political process is functional and open to all interested parties and individuals. If the process is fair and consistent with the constitutional provisions, then (and only then) should courts defer to majority preferences. But for those who insist that constitutions include deep normative commitments and clear protections for minority preferences, limiting judicial review to procedural issues is simply not an acceptable option.

With the spread of constitutional democracy and the growth of supranational governmental bodies and organizations such as the European Union, judicial review is likely to extend, deepen, and become increasingly significant—and so too will the concerns about the risks of judicial overreach. From the European Court of Human Rights to the Constitutional Court of South Africa, from the Supreme Court of India to the U.S. Supreme Court, judges and judicial review are increasingly central players in constitutional systems—but players whose grip on power is tenuous and relies heavily on their ability to persuade, explain, and give reasons.

JURISPRUDENCE

Jurisprudence has three distinct meanings. Primarily, it is the philosophy of law, that is, speculative thought about law. It can, however, be used to refer to the study of legal systems. It can also be used to designate judicial precedents as a whole or, more narrowly, case law. It is interesting to observe that these secondary meanings can be respectively mapped onto two fundamental traditions of modern legal thought. Legal positivist jurisprudence is dedicated to theorizing law as a system of rules, and legal realist jurisprudence develops out of a concentration on the judicial process and case law.

Legal positivism originates in the nineteenth century with the jurisprudence of John Austin and Jeremy Bentham, and it is conceived in opposition to the natural law tradition. For natural law jurists, a valid law must conform either to the law of nature (in Stoic and ancient philosophy), to divine law (in Jewish and Christian philosophy), or to certain universal human ends and needs (in secular and humanist philosophy). For positivists, by contrast, the criterion for a law's validity is its source or pedigree, not its content. Positivism establishes a strict separation between what it calls censorial jurisprudence, which aims to reform law, and analytical jurisprudence, which seeks to understand the logical or formal structure of a legal system. In this sense, positivism is critical: It establishes precise limits within jurisprudence by delineating two branches of investigation. A major aim of positivism is to grant censorial jurisprudence its place but to insist that it should not be confused with analytical jurisprudence. In analytical jurisprudence, a law is held to exist, to be valid, if it is posited according to certain formal criteria—whether, for example, it is commanded by a sovereign who is habitually obeyed (Austin), flows from a higher order norm (Hans Kelsen), or is derived from a fundamental rule of recognition, such that whatever the queen enacts is law (H. L. A. Hart). Positivist jurisprudence, therefore, analyzes law as a system of rules, in which each rule (with the single exception of the highest order norm or rule) finds its condition of existence.

Legal realism developed in the first half of the twentieth century in the United States. Inspired by the philosophical pragmatism of William James and John Dewey, the foremost exponents of realism include Oliver Wendell Holmes, Jr., Benjamin Cardozo, and Karl Llewellyn. It is noteworthy that Holmes and Cardozo were also judges. The main object of analysis for realist jurisprudence is the judicial process. Its position can be negatively and positively stated. Negatively, realism argues that law is indeterminate and that the principal modes of legal reasoning, such as syllogism and analogy, do not account for how judges, in fact, decide cases. Realism opposes legal formalism or mechanical jurisprudence, that is, the belief that rules automatically dictate their own application and that the judge's role is simply to ensure that the case is treated by the appropriate rule. Positively, realism argues that judges reach their decisions by evaluating human goals, practical necessities, and even political and ideological commitments. As Cardozo states in *Ostrowe v. Lee* (1931), "The soundness of a conclusion may not infrequently be tested by its consequences." This pragmatic vision of law and judgment—that judges decide cases and hence law according to what is necessary and useful—leads to controversial conclusions. On one hand, law is nothing other than what officials do about disputes. And, on the other hand, the basis for official decision is no longer (never was) a judgment of logic but one of value. As such, realist jurisprudence raises a persistent controversy of jurisprudence: whether judges apply or create law.

Two compelling perspectives on this controversy can be found in contemporary French thought. In "Force of Law," Jacques Derrida articulates the paradoxical condition for a just judgment. On one hand, law aspires to equal treatment such that decisions must be stable and calculable; but, on the other hand, law must also provide singular responses to unique situations, such that judgment cannot be reduced to mechanical application of rules. In *Negotiations,* Gilles

Deleuze outlines a concept of jurisprudence in response to his critique of human rights as abstract and ineffective. For Deleuze, jurisprudence designates the conjunction of a legal concept (for example, freedom of expression or privacy) with a case. Deleuze's claim is that the concept does not simply cover and treat the case at hand; instead, the two undergo a mutual determination. For example, someone has a sealed drink bought for her that, it so happens, contains the decayed remains of a snail (*Donoghue v. Stevenson* [1932]). She sues and wins, but at the time, no law specified a duty of care to parties without contract. How does that happen? For Deleuze, a new right was created when a concrete problem led the judge to extend a duty of care wherever harm could be reasonably foreseen. Two consequences flow from his concept of jurisprudence. First, the case is seen as formative of law. Here, law develops from singularity to singularity, and cases are not mere instances to be covered by a self-same rule. Second, creativity is viewed as an intrinsic power of judgment, not as an accident or act of will. Deleuze is not recommending creativity on the part of judges; rather, he proposes a jurisprudence that sees creativity as inherent to the operation of law.

Justice, Theories of

Justice, on the classical view, is a virtue; specifically, it is a disposition to give each person his or her due. Naturally, there has always been some difference of opinion as to what, exactly, is due to whom under which conditions. The most influential account has probably been that offered by Aristotle in his *Nicomachean Ethics*. Distinguishing justice in distribution from justice in rectification, he argues that in the former case, goods are justly distributed according to the proportionate merit of the recipients, and that in the latter case, just punishments and compensations are proportionate to injuries caused. The virtue of justice can thus be understood as a state of character that disposes people to act justly and wish for what is just, so defined.

It is important to observe that this duty of justice (as it is now often called) does not cover the whole range of our practical obligations. It does not, for example, include any obligations we might have to ourselves (prudential obligations) or to the natural world. Arguably, it does not even include all of what we owe to other human beings. The former is obvious, as can be seen from any number of examples. People subject to tyrannical governments often face tragic choices between self-preservation and justified resistance—that is, between giving priority to their prudential or to their justice obligations; similarly, there are many difficult public policy choices that pit important environmental aims against the demands of justice. But when it comes to our obligations to other human beings specifically, justice sometimes seems to have an imperialistic tendency to engross the whole of morality.

Aristotle himself observed the ambiguity this causes: When we describe a person as *just,* do we simply mean to say that he or she is virtuous or moral in general; or do we mean that he or she has some specific virtue or moral disposition in particular? The latter view is better. Sometimes, for example, strict justice demands punishments that, in the nature of the circumstances, would be inhumane. This was supposed to be one of the lessons in Shakespeare's *Measure for Measure*—that justice should be tempered with mercy. This tension is most naturally described as a conflict between

competing moral obligations: our obligations of justice, on one hand, and our humanitarian obligations, on the other. For this conflict to even arise, justice cannot constitute the whole of morality.

If, then, we do not take justice to constitute the whole of morality, what best characterizes its special or distinctive features? Here is one view. Humanitarian obligations are obligations we have to other people simply by virtue of the fact that they are (fellow) human beings; it does not matter who they are, for example, or what their relationship to us happens to be. Justice is not like this. It is rather a set of obligations that arise specifically when we share political, social, or economic institutions and practices with others. Very roughly, we might say that the duty of justice is the duty we have to "play fair" and observe the rules of our common institutions and practices. When Aristotle described justice in distribution and rectification, he was in effect describing the accepted norms of fair dealing in the societies with which he was familiar—namely, Greek communities of the fourth century BCE. When there are rewards to be doled out, it was expected that they would be distributed according to merit; when promises were made, it was expected that they would be kept; and so on. The just person plays fair and observes the norms, whereas the unjust person tries to get ahead by cheating and evading the norms. The importance of the duty of justice should thus be clear, for a functioning society is not possible except on the basis of common institutions and practices. So too should be the fact that justice obligations may compete with other important moral obligations and thus cannot constitute the whole of morality. We might say, schematically, that morality includes obligations of justice, humanitarian obligations, and any other obligations we have to our fellow human beings. Ethics, in turn, includes our moral obligations, together with any obligations of prudence, obligations to the natural world, and so on.

If the duty of justice is roughly our obligation to observe the rules of shared institutions and practices, then it has to be asked—will any set of shared institutions and practices do? On this question turns the essential difference between the classical and the modern approach to the problem of justice. Classical political and moral thinkers (like Aristotle) for the most part took the institutions and practices they were already familiar with as given and addressed themselves to such related problems as these: Why should we be just? Can our justice obligations and our prudential obligations be reconciled? Where does justice come from? What is its ontological status? For the moderns, by contrast, these are often peripheral concerns, and the core difficultly is taken to be determining precisely which set of institutions and practices is the right one. (Communitarians are an exception here: They follow the classical view in refusing to answer the latter question, or—which amounts to the same thing—in answering it only by saying that the right institutions and practices are the ones that a given society happens, in fact, to have embraced.)

This brings us to the idea of *social justice:* A theory of social justice is simply a theory about what the right institutions and practices would be. In other words, social justice is the referent of the duty of justice. Aristotle said that the just person not only acts justly but also wishes for what is just; given the shift in emphasis from justice to social justice, it is only natural to regard the duty of justice as including some obligation to realize social justice. Hence, we arrive at John Rawls's definition, which can be taken as the standard modern view, of the duty of justice as the obligation "to support and to comply with just institutions" so far as they exist, and "to further just arrangements not yet established." Because they are the focus of modern discussions of justice, the remainder of this entry will discuss theories of social justice.

The Architecture of Social Justice Theories

In the usual parlance derived from Rawls, let us define the "basic structure" of society as the complete set of political, social, and economic institutions and practices that constitute the relatively stable background conditions or expectations against which the members of a given society live out their lives. Every society has a basic structure. Presumably, at any given time, every society also faces some set of feasible alternatives—many only slightly different, others entirely different than their existing basic structure. At the core of any theory of social justice is a principle or set of principles whose function it is to rank-order existing and feasible alternative basic structures. If the

existing basic structure of society is ranked at or near the top, then we might describe that society as reasonably just (according to that theory); if not, then we might describe it as relatively unjust. In the former case, the duty of justice would constrain the members of that society to support and comply with the existing basic structure; in the latter case, it would direct them to work toward establishing one of the more just alternatives.

Utilitarianism—one of the most powerful and influential modern theories of social justice—provides an illustrative example. According to utilitarianism, there is only one principle of social justice, roughly as follows:

> Societies are just to the extent that their basic structure tends, in expectation, to maximize the sum total happiness of those persons affected by it, counting the happiness of each affected person equally.

There is an extensive debate, of course, concerning the relevant meaning of the term *happiness* in this theory, which I will largely ignore. On what is probably the standard contemporary view, we may simply say that a person is happy to the extent that his or her preferences are satisfied, whatever the content of those preferences happens to be.

Suppose that society *S* has basic structure *B*. If there exists for *S* some feasible alternative *B** that would, in expectation, tend to produce a substantially greater sum total happiness, then, according to utilitarianism, we should regard *S* as an unjust society to that extent. Other theories are more complicated. They might, for example, have more than one principle of social justice, in which case priority rules are needed to generate coherent rankings. But the function of a principle or principles of justice is always the same: namely, to rank-order feasible basic structures. Considered in themselves, these ranking principles are often referred to as *conceptions* of social justice—that is, conceptions of what it means for a society to be correctly regarded as just. Thus, on the utilitarian view, what it means for a society to be just is that its basic structure maximizes sum total happiness.

Conceptions of social justice are constructed, so to speak, out of various parts or modules that fit together in a particular way. Again, taking utilitarianism as our example, we can see that it is built from three logically independent modules. The first is the claim that what matters, from a justice point of view, is the happiness of individual human beings. This module is often called *welfarism,* and it appears in conceptions other than utilitarianism as well. The second is the claim that basic structures should aim to maximize the sum total happiness (rather than, say, maximize equal happiness or something else). The third is the claim that everyone's happiness should count the same—this is intended as an expression of our commitment to the moral equality of all human beings. Utilitarianism is constructed through the precise conjunction of these three components; different theories can be generated by substituting different modules. For example, substituting an equality module for the maximizing module would generate an "equality of welfare" conception of social justice; such theories have been proposed by Richard Arneson, John Roemer, and others. Alternatively, we might substitute aggregate wealth, artistic and cultural development, or something else for the welfarism module, while retaining the maximizing module. And so on. Each of these different conceptions must be assessed on its own distinctive merits.

The principle or principles of justice form the core of any theory of social justice—its conception of what it means for a society to be described as just. There are, of course, many different and competing conceptions of social justice. It follows that a complete theory should offer both a conception of what it means for a society to be described as just and some line of argument purporting to show that, in some relevant sense, this is the *best* or *right* conception. We might think of this aspect of a theory of social justice as a selection mechanism or decision procedure for choosing among the possible competing conceptions.

To be fully effective, this decision procedure must provide some sort of argument for each of the various modules used in constructing the relevant conception. Theories of social justice are not always (indeed, rarely are) worked out so thoroughly. To give one notorious example, John Stuart Mill's argument for utilitarianism turns out to offer an argument only for the welfarism module and not the others: even if he is right that happiness is what counts, it must still be shown that happiness should be maximized and that

everyone's happiness should count the same. The model case of a thoroughly worked-out decision procedure is, of course, Rawls's original position argument. His conception of justice as fairness, as is well known, has two principles:

1. Each person has the same indefeasible claim to a fully adequate scheme of equal basic liberties, which scheme is compatible with the same scheme of liberties for all.
2. Social and economic inequalities are to satisfy two conditions: first, they are to be attached to offices and positions open to all under conditions of fair equality of opportunity; and second, they are to be to the greatest benefit of the least advantaged members of society (the difference principle).

Compared with utilitarianism's bracing simplicity, justice as fairness is clearly a cumbersome conception. Unlike utilitarianism, however, justice as fairness has an exceptionally detailed and sophisticated justificatory apparatus. Roughly speaking, the argument is that reasonable people in an original position behind a veil of ignorance would select the two principles of justice as fairness over any of the leading competitors, utilitarianism included. Each of the various working parts of the conception, according to Rawls, can be given support through the original position argument.

The Diversity of Contemporary Theories

There is no agreed-on standard typology of the theories of social justice discussed in the contemporary literature. One possibility is to characterize theories of social justice according to their professed relationship with what are called "conceptions of the good." A conception of the good is, roughly speaking, an account of what makes a human life go better or worse; a complete theory of the good would thus be a complete account of human flourishing.

Some theories start from the assumption that the principles of justice derive their validity independently of any particular conception of the good and thus that the former have a certain sort of priority over the latter—that justice limits or constrains the acceptable conceptions of the good, perhaps. These sorts of theories are generally called *deontological* theories. Rawls's theory of justice as fairness is one example. By contrast, other theories start from the contrary assumption that the principles of justice must derive their validity from some independently established conception of the good and thus that the latter has a certain sort of priority over the former. These are generally called *teleological* theories. Among the latter, some specifically define social justice as the maximization of some independently established good and so might be called *strictly teleological* theories. Other teleological theories might define the right as the honoring of an independently established good in some way other than by maximizing it. Utilitarianism is a strictly teleological theory, insofar as it starts with an independently established good (happiness) and then goes on to define social justice as the maximization of that good. Equality of welfare, by contrast, is teleological, but not maximizing: The best way to honor the importance of happiness to individuals, it might be argued, is to ensure that everyone has an equal opportunity to achieve it. A nonwelfarist example of a good-honoring theory might be Ronald Dworkin's ethical liberalism: In his view, societies are just to the extent that their basic structures are designed so as to honor a specific liberal conception of the good.

Theories of social justice also make assumptions about how a complete conception of the good itself ought to be worked out. One might, for example, assume that there is one best or most excellent sort of human life for everyone: Theories based on this assumption are generally called *perfectionist* theories. Two examples frequently discussed in the contemporary literature are civic humanism and liberal perfectionism. According to civic humanism, the best human life is one of active citizenship and civic virtue in a broadly democratic community; according to liberal perfectionism, the best human life is one based on autonomous self-reflection. (It is not always clear from the literature whether these goods are supposed to be promoted or honored, but both theories are usually taken to be teleological.) Traditional Stoic and Christian theories are also perfectionist, insofar as they are based on a conception of human excellence as moral or religious virtue. Indeed, historically speaking, perfectionism has more or

less been the norm. Many contemporary theories, however, are not perfectionist: That is to say, they are to some extent agnostic toward differing conceptions of the good, at least as a matter of principle. Such theories are variously called neutral, impartial, or antiperfectionist, although each of these terms can be seriously misleading. This is because perfect neutrality or impartiality toward all possible conceptions of the good is impossible, and in any case, it is not always (or even often) the direct aim of such theories. The best term might simply be *nonperfectionist*.

These two issues are sometimes confused with one another. For example, it is frequently assumed that perfectionist theories are necessarily teleological. This is an easy mistake to make, for it is natural to think that if a theory holds one sort of human life to be the most excellent for all, then it must also define the right as the promoting or the honoring of this particular sort of excellence. But the traditional Stoic and Christian theories provide clear counterinstances: Both start with an independently derived conception of the right as moral or religious virtue and then go on to define a good human life as one lived in accordance with those particular virtues. In other words, they are deontological, but nevertheless perfectionist theories. Conversely, teleological theories need not be perfectionist. Utilitarianism is an example of this because it defines the good in a way that is (within limits) agnostic toward what makes people happy: It directs us to satisfy the preferences that people have, regardless of what those preferences happen to be.

Some further groups of theories have not yet been discussed. The first are libertarian theories of social justice, which hold that societies are just to the extent that their basic structures respect the natural rights of individuals. These are deontological, insofar as the relevant schedule of natural rights is generally assumed to derive its validity independently of any particular conception of the good and thus operate as a side-constraint on the latter; and also nonperfectionist, insofar as they are agnostic as a matter of principle toward the conceptions of the good individuals happen to hold. The second are deliberative-democratic theories of social justice, according to which societies are just to the extent that their basic structures realize some form of political equality. These theories (in contrast with civic humanism) are not perfectionist, but whether they are deontological or teleological depends on how the value of political equality is understood. The third are functioning-based theories. These are teleological theories that start with an independent account of human flourishing as consisting in various dimensions of basic functioning. (Among these is assumed to be the freedom to develop individualized life plans, ensuring that functioning-based theories will be nonperfectionist.) Most are not strictly teleological, however, insofar as they usually go on to define a society as just to the extent that its basic structure secures a sufficient level of functioning for everyone.

A final major contemporary theory is communitarianism. Communitarians hold that a society is just to the extent that its basic structure reflects, in some respect, the shared values of its members. It is thus impossible to classify the theory because the shared values of different communities obviously differ widely.

An entirely different way to divide up the contemporary field is with respect to the various decision procedures one might employ. There is not nearly such diversity at this level as there is at the level of principles of social justice themselves. Moreover, many of the traditional decision procedures have been thoroughly discredited, leaving the current field rather narrow indeed. Prominent among the discredited views we find various theological arguments and arguments from nature. The former hold that the correct principles of justice are those that best reflect God's will, either as expressed in Scripture or as rationally deduced from assumed theological premises. These sorts of arguments have been abandoned for obvious reasons. Arguments from nature hold that the correct principles of justice are those that, in some sense, reflect or imitate what we observe in the natural world. Naturalistic arguments were discredited in large part through the efforts of G. E. Moore, who showed that normative conclusions cannot be derived from strictly naturalistic premises. (Does it follow from the fact that malaria is a part of nature that we have no reason to combat it? Of course not.)

In place of these sorts of traditional views, Moore, W. D. Ross, and others in the early part of the twentieth century advanced a crypto-Platonic

doctrine of *intuitionism,* according to which we can apprehend an independent order of (nonnatural) moral facts merely by consulting our intuitive evaluations. Although not without some contemporary sympathizers, intuitionism too has largely fallen by the wayside.

For all intents and purposes, then, only three sorts of decision procedure currently command a significant following. The first proposes that the best conception of social justice is the one that would most advance the prudential self-interest of the people who would live under its guidance. On this view, we can think of the principles of social justice as representing terms of mutual cooperation to which a group of self-interested and prudential bargainers would agree, those terms then presumably deriving their normative justification from some version of ethical egoism. Theories of social justice relying on this sort of justificatory apparatus are often described as *mutual advantage* theories. Justice as mutual advantage has a distinguished pedigree: Versions of the argument were discussed in Plato's *Republic,* later defended by Epicurus, and finally given a sophisticated exposition by Thomas Hobbes. In contemporary political theory and philosophy, mutual advantage arguments have been advanced for utilitarianism and a version of justice as fairness, but they are most often employed on behalf of libertarian conceptions of social justice.

Mutual advantage theories are subject to a number of serious objections. The first is that they would, in their operation, merely replicate whatever imbalances of power exist prior to the terms of agreement: This is because the prudential self-interest of all the parties dictates that they separately make the best use of their respective bargaining power in securing terms favorable to themselves. The second (related) objection is that mutual advantage can give no account of our obligations to people from whom we have no reason to expect benefits—for example, the members of future generations. These are, of course, external complaints. The third objection is internal to the mutual advantage theory itself. Suppose that a group of self-interested and prudential bargainers agree on terms of social justice that would be mutually beneficial if compliance was common. The question remains: What reason does any given member of that group have to comply with those terms on the occasions when unilateral defection would happen to promote self-interest? Within the mutual advantage framework, no workable answer to this last question has yet been supplied.

The second and perhaps currently most popular sort of decision procedure derives from the moral philosophy of Immanuel Kant and holds that the best conception of social justice is the one that reasonable people would choose under fair conditions. This decision procedure retains the idea that we should think of social justice as representing terms of mutual cooperation, but it replaces self-interested and prudential bargainers with reasonable people and adds that the circumstances of their deliberation must be fair. In this context, reasonable people are generally understood to be those who are suitably motivated to find terms of cooperation acceptable to all; and fair conditions are generally understood to be (at a minimum) conditions of equal bargaining strength. Theories of social justice relying on this sort of justificatory apparatus might be called *consent-based* theories. The most influential consent-based theories are Rawls's aforementioned original position argument; the contractarianism of T. M. Scanlon, Brian Barry, and Thomas Nagel; and Jürgen Habermas's "ideal speech situation" argument. Consent-based arguments have been advanced for utilitarianism, but they are usually employed on behalf of liberal theories broadly similar to Rawls's.

There are, of course, difficulties with consent-based arguments as well. These revolve around what might be called the Euthyphro problem—namely, the ambiguity as to whether the claim is supposed to be that the principles selected express the right account of social justice because they (and not others) would be chosen by reasonable people under suitable conditions; or whether the argument is that reasonable people under suitable conditions would choose those principles (and not others) because they express the right account of social justice.

This brings us to the third and last decision procedure with significant contemporary adherents, also (interestingly) proposed by Rawls: the method of *reflective equilibrium.* On this view, the best conception of social justice is the one that sits well with all the moral (and other) intuitions we have, on reflection, decided to keep. The idea

is roughly to first propose a conception and then test it against a range of cases. Assuming that our intuitions regarding some of those cases (specifically, whether they capture our sense of what justice demands) do not correspond with the results generated by the proposed conception, we will have to make adjustments to the former, the latter, or both. In making these adjustments, our judgments are guided by the relative strength of our various intuitions and by the power and utility of alternative conceptions: Roughly speaking, one conception is better than another if it captures more of our stronger intuitions with greater conceptual efficiency. After an iterated process of testing and adjusting, we eventually arrive at a result we are happy with—in other words, we end up with a conception that rests in equilibrium all the intuitions regarding social justice that we have, after reflection, decided to keep. Relying primarily on the value of coherence, the reflective equilibrium method need not invest initial intuitions as such with unwarranted metaphysical significance; however, it does leave the ontological status of social justice something of a mystery. Thus, no one decision procedure has yet carried the field.

The Frontiers of Social Justice

A theory of social justice is a theory about what would make the basic structure—the institutions and practices of a society—just. As usually formulated, however, such theories are often incomplete. They do not, for example, address justice between present and distant future generations, between the victims and perpetrators of past injustices, or between the members of one society and the members of others. Considerable effort in recent years has been directed at extending the boundaries or frontiers of our theories into these important areas of intergenerational, transitional, and global justice. (These *extensions* are distinct from *applications* of social justice: among the latter we might include the topics of distributive, political, or legal justice.) Unfortunately, space permits only a brief discussion of each.

The question of justice between generations is among the most interesting and the most philosophically challenging topics. Some of the difficulties arise from "time's arrow"—the fact that each successive generation is absolutely power*less* with respect to its predecessors and absolutely power*ful* with respect to its successors. This means that accounts of intergenerational justice cannot rely in any obvious way on notions of mutual reciprocity: We have nothing to fear but also nothing to hope from future generations. Other difficulties arise from the complicated interaction of the problem of resource consumption and the problem of population. How many people should live may depend, in part, on how many resources will be available, and how many resources the present generation should leave for future generations may depend, in part, on how many people will live. There exists a fascinating and highly sophisticated literature that aims to puzzle through these various problems.

Theories of social justice are designed for more or less stable ongoing societies; thus, we have no reason to expect that such theories will work equally well when the continuity of social and political institutions or practices has been decisively broken. The literature on transitional justice addresses the special set of problems that arise in the wake of a transition from a substantially unjust society to a relatively more just one. Most discussions are focused on the transition from autocratic to democratic forms of government specifically, but we might also consider other major transitions, as for example from a slave-holding to a non-slave-holding society. Notice that the issues here are fundamentally issues of the present—namely, what justice requires of us here and now with respect to the fact that, in the recent past, our social or political institutions were substantially unjust. The difficulty is that, in the wake of a transition, there are likely many people around who were complicit in the earlier injustice and indeed who engaged in conduct that, under the new dispensation, is prohibited and (perhaps) punishable. The temptation is very strong, especially on the part of those who suffered under earlier injustice, to call these people to account. But against this must be weighed both pragmatic and principled considerations: Pragmatically speaking, the resistance to justice is likely to be stronger if it is known that all injustices will be punished; and in principle, it is sometimes unclear whether one should be punished for conduct that, at the time performed, was not fully understood to be wrong.

International actors, like individual people, have rights and obligations arising out of a duty of justice. They also, again like individuals, have (potentially) competing prudential and moral obligations. An example of the former might be the obligations of a state to pursue its security interests; an example of the latter might be the duty of any international actor to relieve suffering in humanitarian disasters around the world. The duty of international justice is distinct from these: It is, roughly, the obligation of international actors to further just global institutions and practices. The latter—which might be referred to as the basic structure of global society—include the rules governing the recognition and autonomy of states; the complex nexus of international trade agreements, global capital markets, international lending institutions, and so on; the various practices and conventions of just war; and so on. Different configurations of this global basic structure might be regarded as more or less just, and international actors must have some obligation to bring about and maintain just configurations, so far as they are able. In other words, a conception of global justice is the international analogue of a conception of social justice—that is, it is an account of the referent of the duty of international justice, much as a conception of social justice is an account of the referent of the individual's duty of justice. Global justice has emerged in recent years as one of the most dynamic and productive areas of contemporary research.

Justice in Medieval Thought

Throughout and well past the Middle Ages, justice remained a malleable concept that could connote general ideas of right or express subjective claims to compensation or retribution for injury. In concrete situations, disputants could and did exploit royal judicial institutions, or act outside of them, to achieve justice as they understood it. Nevertheless, by the end of the period, justice itself, as a specific duty and function of government, had come to reflect a divine and hence royal responsibility to uphold order in the public interest by determining guilt for offenses against the public interest and imposing the appropriate punishment. This entry describes the Roman roots of the medieval concept of justice and then explores its evolution during the Middle Ages. Although a view of justice as personal and subjective persisted throughout the medieval period, Christian models of justice also had an impact, particularly when rulers in the early Middle Ages claimed to act on God's behalf. The concept of justice as a responsibility of the state became increasingly important in the high and late Middle Ages. The emergence of these themes is traced in this entry.

Objective and Subjective Concepts of Justice

Justice was essential to both the theory and the practice of medieval rulership. A king or prince, because he acted on God's behalf, had to provide justice to those whom he ruled. This duty provided rulers with a powerful way to legitimate their actions when their circumstances permitted them to try to control or interfere in the business of other political actors.

At the same time, however, the way that justice was understood for much of the Middle Ages helps explain the behavior of a wider range of people. For many if not most medieval people, justice was not something objective that was provided or imposed from the top. It was instead something very personal and subjective. Justice was closely connected to the concept of right, as in "my right." To see justice done meant not simply to execute the dictates of the law or reach a judicial decision but rather to restore the—subjectively perceived—right order of things.

Roman Roots

The word *justice* derives from the Latin *iustitia,* a word that in classical Roman usage could also express concepts such as equity, righteousness, or moral rectitude. It was related semantically to *ius,* which at its broadest could designate anything from the binding or obligatory, to right, duty, power, authority, or permission. *Ius* also, however, had a set of specific meanings associated with the law and the judicial authority of the state. *Ius* could refer to a body of human law (although a formal statute or piece of legislation was called *lex*) as distinct from divine law (*fas*—although this word, too, could take on general connotations of right, proper, lawful, etc.). Roman judges or magistrates spoke the law (*ius dicere*), that is, rendered judicial decisions; to get their decisions one went to a judicial court (e.g., *in ius ire*). *Ius* could also mean the legal right to do something, as in *ius eundi,* or "right of way." The relationship between *ius* and *iustitia* was expressed in the great compilation of Roman law commissioned in the sixth century by Emperor Justinian; the part of the compilation designed for students, the *Institutes,* begins with the statement that "justice (*iustitia*) is the constant and perpetual desire to render to each his due (*ius*)."

A similar understanding of *iustitia* appears in the work of the early seventh-century scholar Saint Isidore, archbishop of Seville. In his *Etymologies,* a massive encyclopedia that became the most popular and long-lived reference work in medieval Europe, Isidore placed justice among the ethical concepts defined by philosophy. Whereas prudence had to do with distinguishing bad from good, fortitude with bearing adversity, and temperance with reining in passion and desire, justice (*iustitia*) dealt with giving to each his own through right judging.

Justice in the Early Middle Ages

In the centuries following Isidore, Roman legal traditions survived in Europe for the most part in collections of local or "vulgar" Roman law maintained by churches and monasteries; indications of how these collections were used are sparse. Much of the evidence for how Europeans understood justice in this period, therefore, comes from documents of practice, that is, charters or other texts that describe disputes. These texts show people operating with what Paul Hyams has called an undifferentiated sense of wrong, that is, a sense of wrong that was not divided between criminal offenses against the state and civil injuries to individuals; rather, it was overwhelmingly personal and subjective. This attitude, which drove those with grievances to seek "their justice," appears, for example, in the pervasive assumption that an individual or relatives could wield violence on their own behalf to avenge an injury or insult. It also appears in the equally pervasive practice of paying a blood-price, or *wergeld,* for physical injury and homicide. Both practices aimed at compensating the victim or family for any physical loss or injury and for the lost honor and standing that the injury entailed. A subjective sense of justice is similarly visible in the well-attested phenomenon of negotiated compromise between disputing parties. Accounts of such compromises (often contained in charters for property transfers made as part of dispute settlements) use language and describe ritualized public actions in ways that reveal deliberate efforts to balance the honor and material claims of each side, which were thus each able to claim to their respective support groups that justice had been done.

Both documents of practice and prescriptive texts such as the early barbarian law codes attest to courts headed by authority figures such as counts or judges, as well as by men of local communities versed in legal tradition. These courts served as arenas in which injured parties could raise complaints before members of their communities and appeal for the help of constituted authority; they also served as fora for the negotiation of compromises. That the justice pursued in such courts was nevertheless personal emerges, for example, in the earliest barbarian law code, the Law of the Salian Franks (*Pactus Legis Salicae* [*PLS*]) attributed to the sixth-century Frankish king Clovis. The single use of the Latin word *iustitia* in this text involves a count pursuing someone who had defaulted on a promissory note to "exact justice" for the creditor, that is, to force the debtor to pay the creditor what he owed (*PLS* 50/4).

Early medieval Europe also inherited models of justice with the Christian Bible. These models pointed in different directions. On one hand, the Old Testament frequently recognizes a personal right to revenge. On the other hand, the New Testament in particular asks Christians to requite wrong with love and leave justice and its interpretation to God.

Some early Christian authorities had argued that constituted authority could legitimately wield justice on God's behalf. In the later eighth century, a European ruler tried to institutionalize this claim on a large scale. The Frankish king and emperor Charlemagne, who was emperor from 800 to 814, assembled through wide-ranging conquests what was then an unprecedented amount of power and military prestige. Charlemagne took his responsibility for the Christian salvation of those living in his realm seriously; this responsibility included promoting God's justice. In decrees transmitted via written lists organized into subheadings or chapters (hence, their label, capitularies), Charlemagne sought to limit the personal resort to violence and to bring disputes into courts overseen by his officials. *Iustitia* still fundamentally meant what was "right" (e.g., infractions should be settled *secundum iustitiam*); *iustitia* still inhered in a person or a group (e.g., the "justice" of churches, widows, and orphans); *iustitia* still depended on particular issues under dispute (e.g., "let him be compelled to do justice concerning that for which he was sued"). At the same time, the "most Christian emperor" took direct responsibility for seeing justice done. Royal judges had to make sure that churches, widows, and orphans received justice from their courts; royal legates (*missi*) were sent to the provinces to do justice, to inquire into the king's justice as well as that of other groups, and to compel counts and other local officials to give justice to all. The capitularies also, however, defined a set of offenses, such as harming churches, widows, orphans, or the weak, as injuries to the king as well as to the immediate victim; justice in these cases consisted of paying to the king a fine, or *bannum*.

Charlemagne's vision of justice remained alive in theory after his empire dissolved, but in many parts of Europe, it was submerged by the personal one (which had never lost its strength despite Charlemagne's pronouncements). Given the right opportunities, however, it could be revived. Perhaps paradoxically, it emerges from the so-called Peace of God and Truce of God councils attested in France from the last decades of the tenth century. The councils united clergy and local or regional lords in sworn pacts to uphold peace and justice, which many of the clergy, at least, saw as abandoned by a failing kingship. For the most part, peace and justice in this context meant the peace and justice of the churches, the monasteries, and the defenseless (i.e., widows, orphans, the peasantry, and the poor, merchants, etc.), that is, their freedom from violence and from the arbitrary and uncompensated seizure of persons or property—all of which, for example, the council gathered at Charroux in 989 sought to defend with the aid of divine justice.

However, secular princes were quick to seize the opportunity provided by such councils to legitimate their own authority. For example, Duke William V "the Great" of Aquitaine summoned a council in Poitiers (1000 or 1014) to restore *pax et iustitia*. The council's first decree required disputes over property in the counties governed by the assembled princes to be brought for *iustitia* before the prince or a judge. Should a party refuse to submit to the court's *iustitia,* the prince or judge was to enforce it. Should the prince or judge be unable to compel the recalcitrant party's obedience, he was to appeal to the princes and bishops of the

council as a collective, who would set out to "destroy and trouble" the party until he returned "to the rectitude of justice (*iustitia*)."

Justice in the High and Late Middle Ages

As kings, emperors, and princes throughout Europe asserted themselves in the rapidly evolving economic and political climate of the eleventh and twelfth centuries, they continued to broadcast the image of the Christian ruler as the guarantor of God's justice. In the East Frankish or German realm, kings and emperors adopted the traditions of the sworn peace to issue *Landfrieden,* or land peaces, first on a regional and then on an imperial level. As the twelfth and thirteenth centuries progressed, the German *Landfrieden* increasingly projected justice as a matter for courts and judges who derived their authority from the king. Moreover, they required that violators of the peace, that is, those who violated protections and rights granted to certain places and classes of people by the king, be punished. In England, the Angevin kings, eager to restore the authority of the English kingship after the disruptions of civil war, aggressively exploited their theoretical duty to provide justice for all to insert royal officials into local affairs. After the Constitutions and Assize of Clarendon (1164/66), juries of presentment provided Englishmen and women with a way to charge others before royal judges with violations of a set of royally defined infractions that constituted breaches of the king's peace. Justice for these violations likewise consisted of violent punishment, including maiming and/or execution. Although such punishment was often carried out by the winning party or his (or her) kin, it reinforced a growing tradition that it was a matter for royal judicial institutions.

The idea that justice was a matter for the state was strengthened by the recovery of the complete corpus of Justinian's great law compilation, the *Corpus iuris civilis,* and the revival of Roman law studies in the eleventh and twelfth centuries, first in Italy and eventually throughout Europe. As legal scholars sought to adapt Roman law to the realities of their world, they also tried to work out more precisely how justice related to law and to secular and divine power. Similar efforts were made in treatises on church, or canon law, which had likewise become the object of systematic organization and study. The great twelfth-century canonist Gratian, for example, wrote in his *Concord of Discordant Canons* that what was right (*ius*) was immutable because it derived from divine law, whereas human law (*lex*) could change. The validity of a law depended on equity, for equity was the "mother of justice" (*mater iusticiae* [sic]). Following him, the canon lawyer Huguccio or Hugh of Pisa similarly argued that equity and justice were inseparable, for both sought to give to each his due. Unlike Gratian, however, Huguccio distinguished between natural and positive justice. Natural justice, Huguccio wrote, arises from natural human affections and is thus divine. Positive justice is human in origin; it aims to punish offenders as well as to make good the losses victims had suffered. In contrast to Gratian and Huguccio, the thirteenth-century canonist Hostiensis (or Henry of Segusio, d. 1271) separated justice from equity. He argued that justice *per se* was the strict effort to secure retribution for wrongs; it was justice influenced by compassion that brought about equity.

Justice and Kings

Ultimately, justice, both through punishment and with compassion, came to be associated with kings. In France, King Louis IX, who ruled from 1226–1270, became Saint Louis in part because of his visible concern for justice. According to his friend and biographer, Jean de Joinville, Louis manifested this concern not only in person, but also through his subordinates who ran royal courts throughout his kingdom. Although the king's judicial servants bore the royal responsibility for maintaining order and promoting the common weal, the king himself could intervene in cases on behalf of mercy. As in France, so, too, elsewhere in Europe, justice became a matter for trained professionals acting on the ruler's behalf; at least in theory, royal judges pursued what was beginning to resemble a public justice that did not depend on personal or subjective perceptions of wrong or injury.

In England, for example, royal justices from the thirteenth century on can be seen acting on behalf of an evolving royal common law that eventually came to distinguish between wrongs done to the interests of the kings (i.e., felonies or crimes) and

civil claims for damages (i.e., torts). Justice in the former category of cases meant determining guilt and imposing the appropriate punishment without regard to the claims of victims. In Germany, the earliest systematic compilation of customary law, Eike von Repgow's *Sachsenspiegel* (c. 1235, and widely copied throughout the rest of the Middle Ages and later), traces justice (in the middle Saxon vernacular, *recht,* a very broad word that depending on context could connote law or the specific actions of a court as well as more general ideas of right) from God through the king or emperor, then through regional and local nobles and judicial officials. The *Sachsenspiegel* also emphasizes punishment as a function of justice to a degree that would have been foreign to its early medieval counterparts.

Just War Theory

The term *just war theory* may relate to two distinct theories of the laws of war. The first theory explores the current positive and customary regulations that govern warfare, as well as the convictions and principles that underlie it. The second is a theory of the morality of wars, investigating which wars are moral, what is the moral behavior within wars, and in particular the extent to which the contemporary laws of war reflect morality. The first section of this entry provides a brief overview of the main themes in contemporary international laws of war, while the second describes the heated philosophical debate concerning the moral standing of this legislation.

The Laws of War

The international laws of war have two branches: (1) *jus ad bellum,* a code that specifies the circumstances in which states are permitted to initiate or respond to armed attacks, and (2) *jus in bello,* a code that specifies what one might legally do *in* war, thus complementing the *just ad bellum* code, which generally ignores the important question of *how* armies may engage in armed conflicts.

The Jus Ad Bellum Code Post-World War II

The history of the *just ad bellum* code has undergone a dramatic shift in the twentieth century. Sovereignty in the Westphalian world (following the peace of Westphalia in 1648, which established an international system of states) involved a right to resort to war: States and rulers could initiate armed attacks without violating any positive legal norm and without bearing any duty to provide legal justification for their decision to do so. The 1928 Kellogg–Briand Pact was a first step toward a different legal treatment of wars. As Yoram Dinstein observes, for the first time, the participating states in this treaty condemned the use of warfare to resolve international disputes. The post–World War II Nuremberg tribunal completed this reform; it universalized the prohibition legislated in the Kellogg–Briand Pact and strengthened it by criminalizing all wars of aggression, condemning them as evil in essence,

and renouncing them as international law's equivalent of capital crime.

In interpreting the legal treatment of wars after World War II, theorists usually appeal to the analogy between the international law and a liberal law that governs domestic societies. The international law prohibits the use of force as a choice of conduct toward another state in the same way that, domestically, the criminal law forbids individuals from inflicting violence on one another. According to John Yoo, in domestic society, the government controls the legitimate use of force in the same way that in the international realm, the monopoly on legal uses of force is held by the supranational organization—the United Nations—and not by individual states.

The domestic analogy is also the principle from which exceptions to the prohibition on waging war are deduced. Subject to the constraints of necessity and proportionality, a private individual in domestic society is entitled to eliminate an imminent threat by harming the aggressor posing it. As Yoo observes, Article 51 of the UN Charter adopts in full the rule of self-defense used in the domestic system in cases where governmental power fails to prevent illegal violence. The article thus states that "nothing in the present Charter shall impair the inherent right of individual or collective self-defense if armed attack occurs against a member of the United Nations." In accordance with the analogy between states and individuals, the definition of the crime of aggression alludes to the value of territorial integrity: "Aggression is the use of armed force by a State against the sovereignty, territorial integrity or political independence of another State."

To be legal, a war must satisfy several conditions. The first and most basic condition is *just cause;* and, as we have noted, aggression—that is, armed intervention in the internal affairs of another state—is the clearest just cause for war. Additional conditions are all extrapolated from the limitations to which the right of self-defense in domestic societies is subject. These include:

Necessity (or last resort). States are required to demonstrate, in the words of U.S. Secretary of State Daniel Webster (criticizing the 1837 attack of the American steamer *Caroline* by the British), "necessity of self-defense, instant, overwhelming, leaving no choice of means and no moment for deliberating."

Imminence. According to Dinstein, an aggressive threat justifies war only if that threat is imminent.

Proportionality. National self-defense must not be unreasonable or excessive because, Dinstein posits, the necessity of self-defense justifies such acts only insofar as it is limited to the attainment of that necessity and does not exceed it.

Right intention. The objective of the war should be restricted to national defense and may not include objectives that are unrelated to the just cause of the war.

Probability of success. As Daniel Statman contends, otherwise illegal acts may be justified under the right of national defense only if they are likely to guarantee defense from the perceived threat.

The Jus in Bello *Code*

The international law treats the *jus in bello* and the *jus ad bellum* codes as entirely independent systems; the *in bello* code applies to soldiers, whereas the *ad bellum* code applies to states and statesmen. Strikingly, a state that initiates an aggressive war is condemned by the international law as having committed a crime; but this condemnation finds no echo in the *in bello* code with respect to the soldiers who carry out the war. Rather, legally speaking, soldiers' acts of killing within armed conflicts are permissible insofar as they follow the *in bello* regulations. These regulations are designed to apply to soldiers independently of the cause for which they are fighting. In constructing an *in bello* code, the legislator asks how the duties of belligerents, fighting in accordance with rules of just military practice, are to be determined irrespective of the justness of their cause.

The most fundamental *in bello* rule is noncombatant immunity: Individuals retain their immunity from direct attacks during war if they do not contribute to the furtherance of the war. Michael Walzer identifies this group of individuals as usually being civilians. Noncombatant immunity is further explicated by the rule of *in bello* proportionality,

which regulates permissible collateral damage to civilians: Notwithstanding civilians' presumed innocence, armies have the legal right to harm civilians indirectly or even kill them if and only if the collateral harm inflicted on these civilians is not excessive, given the military advantage gained by it, as observed by Walzer, Judith Gardam, and Thomas Hurka.

A different set of *in bello* provisions regulates the use of force by soldiers against their enemy counterparts. Soldiers are allowed to harm their opponents directly, but they ought not to inflict suffering on them beyond necessity. The law implements this general idea, by, for example, prohibiting the use of expanding bullets (i.e., "dum-dum") while permitting explosive shells. Both cause damage exceeding that of standard rounds, but because the explosive shells also incapacitate a larger number of victims, their use may further a legitimate military objective more efficiently. A final important rule, observes Eric Posner, regulates the treatment of prisoners of war; once they surrender, combatants on both sides regain immunity from attack and from criminal prosecution during and after the war.

The above sketch of the *jus in bello* code suggests that the international law considers soldiers fighting for victory to be exercising the right of self- and other-defense. In effect, the law institutes victory as the only legitimate objective of the fighting troops. It thus makes a clear distinction between the ultimate military objectives of the warring armies—that is, victory—and the final political end at which the warring states aim—the enforcement of their claims (just and unjust alike). Indeed, for states, the victory is only a means to other ends. In the calculation of proportionality, combatants ought to measure the value of a specific military action on the assumption that it is exhaustively determined by the extent to which it furthers their victory. Collateral damage to civilians is proportionate if the military gain—which soldiers are entitled to take as the good effects of a military action—justifies it. This plausible interpretation of the law implies that the ethic of self-defense underlies the limitations and regulations to which combatants are subject within war. Put roughly, combatants are not allowed to target civilians directly, in the same way that potential victims are not allowed to kill an innocent bystander directly to eliminate a lethal threat posed to them by an aggressor. And potential victims should use the minimal force necessary for eliminating the threat posed to them; they have no right to cause excessive suffering to the attacker.

Morality and the Laws of War

Jus ad Bellum: *The Debate between Statism and Cosmopolitanism*

The current debate over the morality of the UN-based *jus ad bellum* code focuses on Walzer's widely studied statist analysis of the accepted post-World War II *jus ad bellum*. Statism defends the paradigm that underlies international law in the name of the right to self-determination: A legitimate state is "owned" by a nation (or a community) whose conception of the good life is protected by the sovereignty of this state. Indeed, the right of collectives to self-determination—a right that emerges from the right of individuals to their common conception of good life—is a *moral* value, which is justifiably the main concern of international law. The value of territorial integrity entails a moral prohibition on interference in the internal affairs of other national communities—hence, the criminalization of wars of aggression. This legalist paradigm is not purely anti-interventionist. There are exceptional circumstances in which such violations are permissible: State-sponsored mass murder, expulsion, or enslavement of a people by its own government undermines the "fit" between the state and the community that owns it. Intervention is *prima facie* permissible also if a community within a particular set of boundaries that clearly contains two or more communities engages in a large-scale military struggle for political independence.

Cosmopolitans like Charles Beitz and David Luban vigorously criticize Walzer's statist apology of the morality of the laws of war. They deny that statehood and national borders have fundamental moral significance. The morality of wars should not be addressed in terms of sovereignty and territorial integrity because, they argue, the relevant moral category is, rather, that of human rights. From this anti-statist perspective, the UN Charter–based *jus ad bellum* is both too restrictive and too broad. It is too restrictive in the sense that it prohibits morally permissible humanitarian interventions in the name of the right of political autonomy and self-determination. It is too broad

in the sense that it permits the disproportionate killing of individuals in defense of territorial integrity. According to Luban's cosmopolitan version of *jus ad bellum,* just wars defend basic human rights. This new definition implies that, subject to the constraints of proportionality and necessity, a military intervention in the affairs of another state, if its aim is to protect the basic rights of its citizens, is morally justified. David Rodin's critique of the Article 51's doctrine of national defense presents it as excessively permissive: Wars of national defense are disproportionate and hence morally impermissible unless they can be justified in terms of the right of self-defense of individuals. But only wars that respond to a genocidal aggression are wars in which individuals are literally fighting for their lives. Only such wars can be understood within the conceptual scheme of individual rights.

Jus in Bello: *The Debate Between Statism and Cosmopolitanism*

The *in bello* code treats soldiers as legal equals. Walzer takes legal equality of soldiers to be a reflection of their moral equality. In his eyes, combatants must be treated on the assumption that they each believe themselves to be right. Walzer appeals to ordinary moral intuitions: A soldier who kills other soldiers in battle is not considered a murderer, even if the soldiers he killed were simply defending their homeland. Walzer points out that even the killer's enemies do not consider him to be a murderer. The reason for this is that although a war of aggression is a crime, culpability for this crime lies with the political leader; war is not the soldiers' crime, and they are not responsible for its perpetration.

The above convictions are articulated in a famous scene from Shakespeare's *Henry V*. The king, disguised as an ordinary soldier, is conversing with soldiers shortly before the battle of Agincourt. The king says: "Methinks I could not die anywhere so contented as in the King's company, his cause being just and his quarrel honorable." Yet, one soldier then replies, "That's more than we know," whereupon a second says, "Ay, or more than we should seek after; for we know enough if we know we are the King's subjects: if his cause be wrong, our obedience to the King wipes the crime of it out of us." A modern version of an argument for the irrelevance of the cause of the war to the moral standing of the participating obedient combatants would run as follows: States have a right to protect their political independence by using *obedient* armies. The right of states to control obedient armies entails, in turn, a right of soldiers to be obedient, that is, to follow orders, *irrespective of the cause of the war in which they are fighting*. Soldiers have, therefore, a moral right to participate in a war of aggression, and this right constitutes the basis for the moral equality of just and unjust combatants.

It should come as no surprise that cosmopolitans, who find statehood to be devoid of any fundamental moral value, deny that soldiers hold a moral right to be obedient and, therefore, also to participate in a war of aggression. From the cosmopolitan perspective, the flawed *jus ad bellum* theory grounds a flawed set of rules of war (*jus in bello*): Soldiers have no moral right to follow a sovereign's order to go to war without attending to the justness of the cause for which they are fighting. After all, Jeff McMahan contends, in the paradigmatic case, a war of aggression is initiated by a surprise attack against individuals serving in a standing army deployed on its home territory without preparing for war. Clearly, this initial attack on the standing army constitutes a violation of the right to life of the targeted soldiers, who are innocent by any standard. Furthermore, soldiers who participate in a just defensive war do not lose their right to life, in the same way that a guard who uses force to protect a bank from an armed robbery retains his right not to be attacked by the robber. Thinkers who developed this line of thought include Thomas Nagel and Elizabeth Anscombe; yet, as McMahan observes, it can be found in classical jurists like Hugo Grotius, Emmerich de Vattel, Francisco de Vitoria, and Francisco Suárez.

A similar argument undermines the independence of the *jus in bello* and the *jus ad bellum* codes. First, it should be noted that there are historical reasons for the independence of the two codes: Although war was a rule-governed activity well before 1928, up until then, states initiating an aggressive war were not yet officially recognized as wrong. Therefore, in the regulation of warfare, no legal distinction was made between the two sides of

an armed conflict. Consequently, the *in bello* provisions had to apply without making any distinction based on the responsibility for initiating the armed conflict. Unfortunately, under current international law, the independence thesis and the moral equality of soldiers that follows from it are simply incoherent. Rodin asserts that the just war doctrine is committed to what seems like a paradoxical position: Considered as a whole (from a *jus ad bellum* perspective), war is a crime; yet each of the individual acts composing an aggressive war is completely lawful (from a *jus in bello* perspective).

A Responses to the Cosmopolitan Critique of the Jus in Bello

We shall conclude with two responses to the critique of the contemporary *in bello* code. The first response is pragmatic, advancing a distinction between law and morality. Legislators have the power to equalize morally *unequal* soldiers, and they have decisive pragmatic reasons for doing so. After all, the legal rights granted to just combatants by the international law prior to the Kellogg–Briand Pact are still valuable. These rights will not be respected unless the contemporary legislation secures the same benefits to unjust combatants; typically, each side to a war claims that the other side is the unjust one. Hence, were soldiers given a license to deny *in bello* benefits to their enemies, states would never pay heed to international humanitarian law. Thus, an egalitarian regulation of warfare is justified by the mutual advantage its acceptance secures: In the absence of rules that govern combat, Christopher Kutz contends, states might be forced to fight until one of the sides is destroyed, rather than seeking strategic surrender. From this perspective, the independence between the two codes is extremely useful.

The second response is contractarian. It denies the strong distinction between pragmatic and moral considerations. As the pragmatic response pointed out, in constructing a *jus in bello* code, states seek restrictions that apply to all belligerents equally, irrespective of the justness of their cause. The moral equality of soldiers follows from another fact: Combatants alienate their right not to be attacked by the unjust combatants as part and parcel of a set of norms governing combat; these are mutually beneficial to just and unjust combatants alike. It is, then, the tacit acceptance of the fair and mutually beneficial egalitarian law of war that generates the moral equality of soldiers: No combatant wrongs another, provided that they all accept the war convention.

K

KANT, IMMANUEL (1724–1804)

Kant is the philosopher of freedom. All of his contributions to political theory can be understood as consequences of his consistent, if sometimes obscure, commitment to realizing human freedom. Taken in its historical context among other late eighteenth-century efforts at Enlightenment, Kant's work aims at human emancipation—from the institutions of the old regime, from social and political domination generally, and even from traditional patterns of thinking. "*Sapere aude!*" Kant exhorted his readers, "Have the courage to make use of your *own* understanding!" (8:35; 17.)*

Early Years

Kant achieved his philosophy of freedom despite rather difficult personal circumstances. He was born in 1724 in the Prussian city of Königsberg (now Kaliningrad) into a harness-making family whose fortunes declined over the course of his childhood. Educated in mediocre schools before his entry to university, Kant later supported himself by teaching large numbers of students in popular lecture courses and secured an appropriate university professorship only in 1770. He never married, communicated with the world outside his native region by post rather than travel, and maintained famously moderate and regular habits.

Although Kant never visited Britain or France, he read about Isaac Newton's physics, David Hume's philosophy, Adam Smith's theory of moral sentiments, and Jean-Jacques Rousseau's political thought, among many other European writers. Rousseau proved particularly essential to the development of Kant's thinking about ethics and politics. Kant's early achievements were in astronomy (he argued that the solar system originated from a rotating nebula of gas, a view now called the Kant-Laplace hypothesis), and in the philosophy of mind. Describing himself as an "inquirer" who once valued only the search for knowledge, Kant credited Rousseau with showing him that even ordinary human beings have innate dignity. This fundamental insight about the inviolability of basic human rights forms the core of Kant's philosophy of freedom, whether it is expressed in Kant's ethics (as humanity as an end in itself), or in Kant's politics (as a limit to coercive force).

Types of Freedom

Kant distinguishes among several types of freedom in his different works, covering metaphysical freedom (the opposite of determinism) in *Critique of Pure Reason* and elsewhere; addressing moral freedom (the opposite of heteronomy) in *Groundwork for a Metaphysics of Morals* and elsewhere; and leaving political or external freedom to an assortment of essays and books, the most important of which is the first part of the *Metaphysics of Morals* (the *Doctrine of Right*). He defines this kind of freedom as "independence from being constrained by another's choice" (6:237; 393). The opposite of this kind of freedom is despotism. Kant opposes

despotism in all its forms, including the despotism of paternalistic government, social despotism, and the despotism of having one's will determined by material rather than ideal considerations.

Although he never wrote a "critique" of politics as he did for knowledge, morality, and judgment, Kant does apply his famous critical method to the question of political freedom. How, Kant asks, is freedom possible? What are the conditions of possibility for human freedom? This question leads Kant to coercion under the rule of law almost as soon as he posits freedom as the only innate human right. For everyone to enjoy freedom in the sense of independence from others' determination, we need to be able to prevent people from exercising unilateral force on one another. But coercive force is required to stop people from interfering with one another's legitimate exercises of freedom. How can coercive force be reconciled with freedom as independence from another's determination? Legitimate coercion, Kant responds, can be exercised only on behalf of a universal will. Law, and not any one person or group, must determine the limits within which free citizens interact. Thus, the answer to Kant's critical question about the conditions under which political freedom is possible is this: Only under the republican rule of law is human freedom possible.

For Kant, many different kinds of states can qualify as republican (by which Kant means something like what we, in present-day political language, would call "democratically accountable"). The crucial test of republican legitimacy is whether the state's laws reflect the universal will of the people. Laws that reflect any partial will, whether the will of a societal group like the clergy or the aristocracy, or the will of a single despot, always subject individuals to determination by another and are thus illegitimate. Kant mocks the so-called mixed constitution of Great Britain, for example, because the royal house can decide whether or not to go to war, and thus real legislative power lies with the king and not with the people. However, Kant does not expect actual unanimity or even actual majorities to support laws before they can be viewed as legitimate. Instead, he argues that the test of legitimate legislation is whether a whole people could have reasonably supported it. Kant also suggests that any policy that depends on secrecy for its success is necessarily illegitimate.

The problem of realizing freedom as independence from determination by another's choice also motivates Kant's insistence on the separation of powers. Here and elsewhere, Kant makes it difficult to understand his reasoning by adopting a familiar structure from mainstream republican thought while giving it an entirely new justification. Like baron de Montesquieu and other advocates of the separation of powers, Kant argues for a three-branch style of government, including executive, legislative, and judicial authorities. Unlike them, however, Kant uses this structure only to ensure that citizens are insulated from unilateral will (that is, from despotic power). He is interested not in checks and balances but in making sure that the exercise of coercive power always represents the united will of the people and not the private will of some individual or group. The executive branch, according to Kant, must never treat the state as a private holding, but rather perform the universal will of the people as best as this can be understood. Kant illustrates this norm with the example of the absolutist but relatively progressive Prussian King Frederick II, who "at least *said* that he was only the highest servant of the state" (8:352; 325). Concern with preventing despotism by means of a strict separation of powers also motivates Kant's many critical remarks about despotism in ancient direct democracies; present-day representative democracies, if they preserve the separation of powers, would not come in for the same criticism.

For Kant, then, if we are to enjoy freedom as independence of determination by another's choice, we must be subject to a state that enforces the universal rule of law. In this regard, Kant joins the social contract tradition by arguing that everyone is obliged to leave the state of nature and submit to common adjudication of disputes. However, here as elsewhere, Kant's innovative use of familiar terms can be misleading. Only under conditions of universal law is freedom possible. It is wrong, therefore, to refuse to enter into lawful relations with anyone with whom one might interact. Kant does not argue for the entry into the civil condition on any of the usual grounds: for protection of prepolitical rights to one's body or the fruits of one's labor, for instance, or in the service of a rational interest in peaceful coexistence, to take another example. Material considerations could never

ground a Kantian general obligation because they would be not universal but different for everybody. Instead, the idealized Kantian reasoner would leave the state of nature for the rule of law, the only condition under which the exercise of human freedom is possible.

Social Contract

Of course, there is in fact no such reasoner. For Kant, the social contract is important as an idea, not as a historical reality or as a personal obligation. Kant calls the original contract a norm for all actually existing states; he means that real states can be judged according to how well they achieve the standards entailed by the idea of original contract. The norms represented by this idea serve to realize human freedom; another way Kant glosses freedom as independence from another's choice is to say that freedom means obeying laws of one's own making (however indirect that lawmaking may in fact be). Kant argues that the idea of original contract has "undoubted practical reality" just because it functions as a norm for states, in particular binding legislators to make only laws "in such a way that they *could* have arisen from the united will of a whole people" (8:297; 296).

Thinking of the original contract as a norm rather than a reality clarifies Kant's otherwise mysterious insistence that subjects must not investigate the origins of the state that rules them. Kant remarks that investigation into the origins of actual states would certainly reveal illegitimate coercion, adding that such an inquiry would likely be futile because "savages draw up no record of their submission to law" (6:339; 480). Rather than seek critical leverage in the material and historical origins of their particular state, citizens should compare their states with the principles derived from the idea of original contract as a norm. Acting only in the public sphere, critics of the state ought to expose duplicity, artifice, and other failures of the regime to conform to republican principles of accountability. To do more than this, Kant argues, would undermine the rule of law that makes their very freedom possible. The exercise of freedom of the pen, of participation in the public sphere unconstrained by social or political hindrances, should according to Kant be the driving force that moves regimes from despotism to freedom without risking revolutionary setbacks.

No Right of Revolution

Kant's steadfast opposition to any right of revolution has occasioned much comment, most of it calling attention to the ironic contrast between Kant's philosophy of freedom and his admonition to obedience. Some of Kant's arguments are formal, such as his point that to succeed, any revolutionary activity would have to be kept secret and would thus violate the norm of publicity. Others are really empirical hypotheses, including Kant's claim that quick transitions cannot effect the substantive social changes that are required to make progress toward genuine republicanism. Kant's most consistent and substantial argument against revolutionary activity is that it undermines the conditions of civil freedom itself. Thus, he concludes that the kind of gradual reform that is possible through public critique is both more likely to succeed and more legitimate (because it depends on potentially universal arguments, rather than unilateral force). In his late writings, Kant expresses sympathy for the goals of the French Revolution; in fact, he cites the daring of Prussian partisans of the French revolutionaries as indirect evidence of the empirical reality of moral reason itself. He does not deny that revolutionary activity, viewed historically, can promote progress toward freedom. However, Kant consistently advocates gradualism and the public sphere over revolutionary action in the streets or on the battlefield.

Perpetual Peace

"Now morally practical reason pronounces in us its irresistible *veto: there is to be no war*" (6:354; 491). Kant famously argues that human beings can move toward peaceful coexistence in the international sphere as well as the domestic one. Just as the idea of an original contract justifies the surrender of lawless freedom to a state that guarantees the rule of law, so the idea of perpetual peace ought to move states to enter into lawful relations with each other. The analogy is imperfect; the danger of global despotism leads Kant to recommend a pacific federation rather than a world state. Otherwise, however, the logic is the same:

The idea of perpetual peace, like the idea of original contract, functions as a norm to which everyone ought to conform. Kant does not expect states to make themselves vulnerable by behaving as if the peaceful norm were already reality. He does not expect war to disappear entirely. Instead, he argues that even in war, states ought to "always leave open the possibility of leaving the state of nature among states . . . and entering a rightful condition" (6:347; 485).

Kant's view that republican governments will tend to establish peaceful relations with each other has inspired scholars to investigate—and, in the main, to confirm—the so-called "democratic peace hypothesis." Kant provides a series of arguments for the idea that what we would call democratic accountability under the rule of law on the domestic front leads to peace internationally. First, he claims that under republican governance, the people's will would be reflected in policy decisions, and the people, he thinks, will not support costly aggressive wars. By contrast, the incentives facing despotic heads of state would tend to encourage them to opt for war. Second, he argues that republican governments' peaceful examples will serve as a kind of focal point for an expanding and commercially profitable pacific league. Finally, Kant offers both an idealized picture of peaceful international relations and a set of principles that should promote its realization. We should not expect real-world politics ever to achieve some permanent state of perpetual peace (unless, Kant jokes, the peace of the graveyard would count as such). However, "we must act as if it is something real, though perhaps it is not," and always work toward, or at least maintain the possibility of, its attainment (6:354; 491).

This peaceful, republican constitution ought to regulate interaction domestically, internationally, and at the cosmopolitan level (for interactions not governed by states). How can actual human beings work to achieve progress toward such ideal, even unreachable conditions? At the international level, Kant suggests a number of norms to which principled heads of state ought to adhere, including bans on such practices as debt-financed military adventure and the use of assassins as weapons of international intrigue. Because these things undermine the possibility of future peaceful relations among states, they ought to be shunned. However, Kant does admit the possibility that some practices that conflict with right, such as the maintenance of standing armies, might under the right circumstances promote rather than prevent eventual peaceful international relations. In these cases, he argues, they are provisionally acceptable.

Political Progress

Kant also applies the idea of provisional right to domestic politics. Well aware of the enormous gap between the near-feudal reality of much of contemporary politics and the republican ideal of political freedom, Kant argues that real-world leaders ought to consider whether their actions promote or retard the possibility of progress. Discussing the case of existing hereditary privileges, for example, Kant notes that his standard test for legitimacy—whether a people could have decided such a policy for itself—rules out any rightful role for inherited nobility. Rather than proposing active resistance or revolutionary change, however, Kant writes that "the only way the state can then gradually correct this mistake it has made, of conferring hereditary privileges contrary to right, is by letting them lapse. . . . It has a provisional right to let these titled positions of dignity continue" (6:329; 471). Here and elsewhere, Kant is much more interested in preventing actual despotism than in reproducing the ideal forms of republican governance; if public opinion values ancient formalities, Kant supports their continuation, so long as the real distribution of the power to decide becomes steadily more rightful.

"Two things fill the mind with ever new and increasing admiration and reverence, the more often and more steadily one reflects on them: *the starry heavens above me and the moral law within me*" (5:161; 269): The elements of human existence most relevant to political freedom are our physical location on what Kant called the *globus terraqueus* and the fact that we all apply moral norms to political reality. Given our residence on a round Earth connected by waterways, we are always at least potentially interacting with everyone else: "a violation of right on *one* place of the earth is felt in *all*" (8:360; 330). Even if we do not always agree about the nature of such violations, we can all recognize wrongs by comparing reality with norms of rightful relations. In Kant's vision of

politics, we are on the way to a civil condition under which human freedom is possible. Freedom from determination by another's choice is the innate right of individuals; freedom to decide to make progress toward enlightened self-rule is the "highest right of the people" (6:327; 470).

Philosophy of Freedom

Kant's philosophy of freedom has shaped the modern world to such a great extent that its influence can be mistaken for that of natural reason. The governing doctrines of international criminal courts, human rights conventions, and many other global and local institutions all presume, with Kant, the principle of inviolable human dignity. His influence on modern political theory has been just as critical, but more varied. Nineteenth-century German idealists such as Georg Wilhelm Friedrich Hegel, Johann Christian Friedrich Hölderlin, and Friedrich Wilhelm Joseph von Schelling, were most interested in the consequences of Kant's transcendental idealism for metaphysics, but they also used Kant's concept of human freedom as the starting point for influential theories of society. The two great twentieth-century political philosophers, John Rawls and Jürgen Habermas, both claim Kantian origins, with Rawls centering his *Theory of Justice* around Kantian abstraction and respect for individual choice, while Habermas's theory of the public sphere starts with Kant's concept of publicity. Kant's legacy for contemporary political thought is broader even than the very influential account of freedom outlined here. Kant's aesthetics, for example, inspired Hannah Arendt's theory of political judgment, while Kant's ethical theory and the Rawlsian theory drawn from it form the basis for contemporary theories of global justice such as those of Thomas Pogge and Charles Beitz. Through all these differences of emphasis and interpretation, however, Kant's insistence on the priority of justice remains: "All politics must bend its knee before right" (8:380; 347).

KAUTILYA

Kautilya's *Arthashastra* is one of the great political books of the ancient world, but it is little known outside of India. Kautilya (300 BCE) was the key adviser and the genius of the strategy undertaken by the Emperor Chandragupta Maurya (c. 321–298 BCE), who unified the Indian subcontinent in empire. Chandragupta Maurya's grandson was the great Emperor Ashoka (268–233 BCE), who was strongly influenced by Buddhism, ruled in a benevolent but paternalistic manner, and is one of the great kings in world history.

What does the word *arthashastra* mean? Literally translated, it means "science of material wealth," but arthashastra is routinely translated as "science of politics." Says Kautilya, "The source of the livelihood of men is wealth [*artha*], in other words, the earth inhabited by men. The science which is the means of the attainment and protection of that earth is the Science of Politics [*arthashastra*]." The most important element of government is the treasury. "From the treasury the army comes into being. With the treasury and the army, the earth is obtained." Kautilya wrote his *Arthashastra* so that a ruler might "conquer the earth up to its four

ends"—really, the known world of the Indian subcontinent—and become a *cakravartin,* what Indians called a "world conqueror" or "universal ruler."

Kautilya assumed that a monarch would rule, and the king must keep law and order by using punishments (literally, "the rod") and awards appropriately. If the monarch is too lenient, the kingdom will fall apart, and the country will fall into a war of all against all, or what Indian thinkers called "the law of the fishes," that is, a world in which the big fish eat the little ones. If the monarch is cruel, then he or she will be hated and the people will desert or turn on their leader at the first opportunity. Social justice is in the king's best interest.

What are the duties of a king? Kautilya believed that a king must uphold the system of caste (really, class) and subcaste. "The observance of one's special duty leads to heaven and endless bliss. In case of its transgression, people will be exterminated through the mixture of duties and castes." Therefore, a king who ensures that all adhere to their caste duties will find "joy after death and in this life." In addition, a well-ordered kingdom will offer its people what Kautilya rather traditionally saw as the three good things of this life: "material gain, spiritual good, and pleasures."

A monarch must live a disciplined life, enjoying the good things of this world in moderation; a king must avoid becoming addicted to gambling, wine, or women because any of these addictions can compromise a king's judgment. If the monarch rules well, then his or her policies will promote the general good, and here, Kautilya became probably the world's first advocate of something like a welfare state. Paternalistic in almost a literal sense, the king "should favor the stricken subjects like a father." Whereas the king himself, by means of his administration, should "maintain children, aged persons, and persons in distress when these are helpless," judges in the kingdom should concern themselves with the affairs of "women, minors, old persons, sick persons, who are helpless [even] when these do not approach the court."

Kautilya also gave probably the first comprehensive theory of the state; he listed seven key elements of a state: "The king, the minister, the country, the fortified city, the treasury, the army, and the ally." It is probably no accident that he omitted religion because religion, in Kautilya's mind, should be secondary to politics.

Kautilya outlined an astonishingly vast and detailed bureaucracy that would carry out the functions of the state and manage the economy. Historian Stanley Wolpert has appropriately called Kautilya's empire a "socialized monarchy." The state owned all the land but leased it to farmers for life, as long as the family was productive, and farmers generally paid about one sixth of their crop in taxes. In addition, the state administered industry, mines, forests, and harbors. Who else would make swords and shields, chariots and ships? Who else would store grain for times of drought, sickness, or famine? Again, the state treasury is of primary importance. We see this in a passage that says fishermen should pay, as rent for their boats, one sixth of their catch to the state. In dismay, one realizes that the state built and then rented boats!

One can begin to understand the size and scope of the state bureaucracy in reading just a partial list of state officials: director of stores (who stored supplies, food, weapons, and so forth), examiner of coins, director of mines, salt commissioner, superintendent of gold, director of trade, director of forest produce, superintendent of the armory, superintendent of measurements (who standardized weights and measures), collector of customs and tolls, controller of spirituous liquors, superintendent of courtesans, supervisor of elephants, and supervisor of chariots. Kautilya even specified a specific salary for each official.

Kautilya wanted to prescribe suffocating regulations for the people of India; to take a few examples, he wanted rules to stipulate that people should bathe horses twice a day, not throw dirt on a road, and wash clothes only on boards or smooth stones. In addition, Kautilya advocated a spy state. "When [the king] has set spies on the high officials," wrote Kautilya, "he should set spies on the citizens and the country people." It is true that Kautilya saw spies as reporting public opinion, especially popular discontent to the monarch, so he or she could correct injustices, and it is also true that Kautilya insisted that the king should have an assembly hall and "allow unrestricted entrance to those wishing to see him in connection with their affairs." In short, spying reported public opinion to the king, but it was still oppressive. Kautilya also talked openly about arrest on suspicion, as well as torture and the assassination of enemies, the so-called "weeding of thorns."

Kautilya is perhaps best known for his mandala theory of foreign policy, a variation on the principle that an enemy of my enemy is my friend. In discussions of foreign policy, Kautilya advocated attacking any state that is weak, signing a treaty that a king is willing to discard at the moment it is no longer useful, making good use of secret agents and assassins, and winning wars with any kind of deception that might help, including propaganda, invocation of the gods, and disinformation. He outlined three types of war—open war, concealed war (what we call guerilla war), and silent war (a war being carried out against another kingdom without either population being aware of it.) When advocating the generous treatment of captured soldiers, he recognized that the empire needed new citizens. In effect, Kautilya recognized almost no international rules or laws in foreign policy, and he ruthlessly advocated conquest and the unification of India as the way to minimize conquest and killing. To some extent, it worked.

Kautsky, Karl (1854–1938)

Karl Kautsky was the intellectual powerhouse of the German Social Democratic Party (SPD) from the 1890s until the outbreak of the World War I in 1914, as editor of the party's theoretical journal, *Die Neue Zeit*. He was also, along with Eduard Bernstein and August Bebel, coauthor of the party's *Erfurt Programme* (1891), which influenced all the other European social democratic parties. Seen as successor to Karl Marx and Friedrich Engels and known semi-ironically as the pope of Marxism until World War I, Kautsky was dubbed a renegade by Vladimir Lenin in 1918, after Kautsky had challenged the Marxist credentials of the October Revolution. Kautsky was, in effect, the first Marxist ideologist of the first Marxist mass political party and was expected to offer a worldview in keeping with the aspirations of the late Engels. In particular, consonant with the *Communist Manifesto,* he saw his job as enlightening the proletariat, making it aware of its historic mission to become a ruling class. His working assumption, in line with the *Manifesto*'s call to "win the battle of democracy," was that the nexus between democracy and socialism was created by capitalism: The logic of democracy was socialism, once capitalism had made the proletariat the majority of the working population.

Kautsky's Marxism reflected the conditions surrounding the birth of the SPD and its continued existence. German Marxists found themselves at the head of an emerging labor movement committed largely to trade union activity and piecemeal economic, social, and political reforms. Retrospectively, this reformism was very much an expression of modernity: a developing, sophisticated division of labor; the growth of parliamentary democracy and large-scale political organizations (whether in the form of state or party); and the emergence of economic organizations (whether trade unions, companies, or employers' organizations). In other words, there existed a potential discrepancy between revolutionary Marxist theory and working-class reformist practice. The SPD, established in 1875, sought to represent the *whole* of the growing German proletariat embodied this dilemma. It was an amalgam of reformists and revolutionaries. *The Erfurt Programme* (1891) gave simultaneous expression to these potentially contradictory maximalist and minimalist aspirations, which Kautsky sought to reconcile. This task helped form the basis of his centrism.

This attempt to maintain a middle ground was even more understandable given the situation faced by the SPD. The German state, its bureaucratic machine, and its army were the most formidable in the world. Socialist activity had been outlawed between 1878 and 1890, with SPD members suffering from different forms of persecution. A background fear was that calls for militant action could again drive the party underground. Thus, winning the battle of democracy had to take account of the fact that the German army could not be confronted head-on but would have to be subverted through the democratic process itself, rendering it "faithless to the rulers." Thus, Kautsky followed the late Engels in holding that working-class attempts to overthrow the capitalist class through violence, as occurred in France in 1848 and with the Paris Commune of 1871, ended only in defeat and were therefore things of the past. Kautsky also argued that as political culture became more democratic and consensual, a massive working-class parliamentary majority would induce the capitalist class to give up its rule relatively peacefully.

Yet, the power of the German state was not the only reason for Kautsky's advocacy of a parliamentary route to socialism. It was a key process by which the working class would develop the political maturity to become a ruling class, along with activities in trade unions and local government. Although objective, economic preconditions were necessary for socialism (socialization of production and so on), subjective ones were equally vital. The working class had to have the organizational cohesiveness and skills to become a ruling class, to become a fully fledged proletarian dictatorship.

Kautsky also justified parliamentary democracy because it was a manifestation of the growing division of labor in modern society, with its division between executive and legislative functions. Given what he saw as the obvious benefits of an increasingly sophisticated division of labor he wanted to minimize the effects of any revolutionary rupture. The danger of violent revolution was that the productive base required for a socialist economy would get destroyed, producing a "crippled capitalism." Again, this was one of the virtues of a parliamentary transition, enabling socialism to be introduced in a relatively orderly manner.

Kautsky's centrist and parliamentarist positions put him at odds with many in the SPD. He opposed the party's revisionist right wing in the early 1900s, not merely because it assumed that the contradictions of capitalism could be eliminated within capitalism, but also because it threatened party unity. Eduard Bernstein, in calling for an alliance with middle-class parties, blatantly challenged the theoretical raison d'être of the SPD, of alerting the proletariat to its historic mission. Kautsky held that the German middle class was by and large conservative and nationalistic. He also opposed electoral and governmental coalitions between the SPD and bourgeois parties because of the fundamental conflict of interests between them. In 1910, Kautsky campaigned against the party's left wing, led by Rosa Luxemburg, who had been inspired by Russian workers in 1905, over the mass strike tactic aimed at broadening the Prussian franchise. Kautsky contrasted the relative strengths of the Russian and German states and feared the response of the German military-bureaucratic machine; he thought the tactic could only harm the SPD's prospects in the forthcoming elections.

Kautsky was not opposed to the mass strike in principle but held that it was not an alternative to electoral activity and should be employed only in the final phases of a revolutionary process, when workers had every chance of winning against the capitalists. During the German Revolution of 1918, his centrism and parliamentarism led him to refuse to opt for either parliament *or* workers' councils as the institutional embodiment of proletarian dictatorship, preferring parliament *and* workers' councils.

The need for party unity and Kautsky's parliamentary strategy also induced him not to oppose Germany's participation in World War I, the beginning of what Lenin regarded as apostasy. While the war lasted, the social and economic issues that could bring the SPD to power through the electoral process were marginalized. In calling for a democratic peace without annexations, Kautsky was prepared to ally himself tactically with the middle classes. His theory of ultra-imperialism supported this electoral strategy in suggesting that World War I did not constitute the final crisis of capitalism because capitalist powers could cooperate in exploiting the economically underdeveloped regions of the globe.

From Lenin's viewpoint, Kautsky's opposition to the Bolshevik Revolution consummated his

apostasy from the Marxist cause. Kautsky's case against the Bolsheviks was grounded on his parliamentary strategy and his appraisal of Russian and world conditions. He rejected Lenin's "weak link" hypothesis—that a proletarian revolution in Russia would detonate revolutions in the West—and he was hostile to the Bolshevik dictatorship, which started with the disbanding of the democratically elected Constituent Assembly in January 1918. Kautsky insisted instead that a democratic parliamentary path was the only viable one in fostering the ruling skills of the proletariat—a vital subjective precondition for socialism. Furthermore, in the absence of imminent world revolution, only one conclusion could be drawn: Economic and social conditions—a numerically small proletariat, a large peasantry, and underdeveloped productive forces—rendered Russia unripe for socialism. Kautsky was also appalled by the denial of full civil and political rights to the former bourgeoisie, demonstrating the Bolsheviks' unwillingness to raise the "whole of humanity" to "a higher plane." He rejected Lenin's idea of proletarian dictatorship, which consisted of a tyrannical form of government, rather than a political condition naturally arising from the proletariat constituting the majority in a capitalist and democratic state. Kautsky characterized the Soviet Union as state capitalist, with the state and capitalist bureaucracies merged into one system.

Kautsky, a Marxist Renegade?

Does Kautsky deserve the opprobrium heaped on him by his critics? Whatever the slight tactical changes during World War I, Kautsky was remarkably consistent, both strategically and theoretically. Thus, if he was a renegade, he had been so throughout his long political career. Indeed, Lenin between 1914 and 1917 made the greater theoretical changes in seeing World War I as representing the terminal crisis of capitalism and the Russian Revolution as the beginning of a global workers' revolution.

The differences between Kautsky and his critics partly reflect various tensions within Marxism itself, either inherent in the theory or arising from the practical difficulty that any political ideology has in adjusting to specific economic, social, political, and cultural circumstances. Thus, on the question of socialist transition, he could claim that he was merely echoing Marx's and Engels's optimism about the efficacy of universal suffrage as an instrument of working-class self-emancipation, of winning the battle of democracy by using the weapons that the bourgeoisie itself had created, as expressed in the *Communist Manifesto*. Marx had also alluded to the possibility of relatively peaceful parliamentary change in such countries as Britain, the United States, and Holland. Marx also, unlike Lenin, made no distinction between bourgeois (that is, parliamentary) and proletarian (that is, direct) democracy. In addition, the later Marx extolled the productive virtues of the division of labor, which Kautsky then, like Max Weber, extended to the operation of the modern state with reference to the legislature, executive, and bureaucracy. Furthermore, Kautsky could rely on the late Engels's observation that street-fighting days were over, given the organization and weaponry of modern armies. Lenin, on the other hand, could refer to Marx's anti-statism, his emphasis on the need to "smash" the state because it reflected the existence of a class society and impeded workers' self-emancipation. Marx also maintained that parliaments concealed the real power of the executive arm of the state. Ultimately, the choice of which Marx or Engels to cite was the product of different conditions in which Kautsky and Lenin were operating. Kautsky's wish to avoid violence almost at all costs meant that he had little to offer to a Russian society, which was in deep crisis and subject to rapid change. Likewise, Lenin was unable to appreciate the depth of the Western working-class's attachment to parliamentary democracy.

The differences between Kautsky and his neo-Hegelian critics, especially Georg Lukács and Karl Korsch, who held that Kautsky's political failure was the result of his philosophic failure, reflected another kind of tension within Marxism. What was the actual status of Marxism? Was it a positivistic and deterministic science of society and history, concerned with historical laws and capitalist structures, or was it a dialectical tool enabling the working class to emancipate itself? Was it structure- or agency-centered? Again, the relevant quotations could be plucked out of Marx's texts. Yet, contrary to these critics' assertions, Kautsky did attempt to overcome this tension. Thus, he distinguished between the determined nature of a *social* revolution (the effects of economic development),

and the will needed to create a *political* revolution (party organization, the level of class consciousness, and political mobilization). As with Marx, Kautsky was keener to insist on economic, political, and social conditions as *limiting* what sort of society and action was possible, rather than to posit a determining relation. Moreover, although he talked about the inevitability of socialism, which the neo-Hegelians claimed encouraged working-class passivity, so, too, did Marx. In both cases, *inevitability* was in a propagandistic register, aimed to inspire the proletariat to take political action rather than induce retreat. And Kautsky's awareness of the unpredictable consequences of using political violence, as demonstrated by the nature of the revolutions in France in 1789, 1848, and 1871, provide the background understanding of his caution on this issue. Indeed, the reluctance to advocate a violent revolution sprang less from his philosophy than from his analysis of the concrete conditions needed for socialist transition.

We should also note that the neo-Hegelians were wrong to assume that Kautsky was a positivist intent on using natural (Darwinian) laws to understand society. Although he was strongly influenced by Darwin in his early years, he later explicitly held in *The Materialist Conception of History* that natural and social laws were different and that human history could not be explained solely in terms of human survival. Finally, the neo-Hegelians claimed that Kautsky divorced Marxist theory from working-class (revolutionary) practice. What we have seen is that Kautsky's theorizing was definitely practice laden but also that his conception of revolution was fundamentally different from the Soviet model. In a sense, Kautsky was an evolutionary revolutionary: He sought to achieve revolutionary ends through evolutionary means.

In sum, Kautsky was a far more complex and sophisticated thinker than he is often portrayed. He was sensitive to some of the tensions within Marxism, but he was also attempting to grapple with the concrete problems of a nascent working-class movement when faced with a state machine that was militarily well organized. Retrospectively, we can see that his model of socialist transition was closer to the limited aspirations of the European working class, but perhaps, he failed to see precisely *how* limited they were. Ironically, when Communists fully embraced the parliamentary road to socialism in the 1970s, they did not turn to Lenin's old adversary for inspiration but to Antonio Gramsci, who was deeply critical of the Second International Marxism as represented by Kautsky.

KEYNES, JOHN MAYNARD (1883–1946)

John Maynard Keynes is not generally considered a political theorist but rather an economist whose

theories have influenced political discourse well beyond his practical contributions as a statesman. In the final chapter of his major work, *The General Theory* (1936), he outlines the elements of a radical English liberal social philosophy. This includes a monetary policy of low interest rates leading to "the euthanasia of the rentier" together with "a somewhat comprehensive socialization of investment" and the redistribution of income and wealth by taxation to achieve full employment. Nevertheless, he was not a socialist in the usual sense and strongly supported free enterprise and individual freedom. He regarded these policies, set down in the wake of the Great Depression and the growing influence of the Soviet Union, as the best means to save the free market from itself and to preserve a free society. It is an irony of history that Keynesian policies have come to be understood mainly as the use of fiscal policy (government spending financed by borrowing) to prevent temporary unemployment. Such public works policies long predate Keynes, although he was perhaps the first to justify them by coherent theory.

Keynes was a privileged member of the English Edwardian elite. His father (John Neville Keynes) was a distinguished academic in the University of Cambridge and his mother (Florence Ada née Brown) became the mayor of Cambridge. He was educated at Eton and King's College, Cambridge, of which he subsequently became a fellow after a short period in the civil service from 1906 to 1908. He made his name after resigning his position as principal British Treasury representative at the 1919 Paris Peace Conference, writing his best-selling *Economic Consequences of the Peace,* correctly predicting that German reparations were unpayable. He was a key adviser to the British government throughout most of his career and principal negotiator with the United States over war finance and the creation of the Bretton Woods institutions, including the International Monetary Fund (IMF) and the World Bank.

To understand Keynes's political views, it is essential to have some understanding of his economic theory. *The General Theory* seeks to demonstrate that neoclassical economics is a special case, much as Isaac Newton's theory is a special case of Albert Einstein's. The power of neoclassical economics is its mandate for the political doctrine of laissez-faire, the belief that market forces (competition) will deliver optimal outcomes, in the long run if not immediately, including full employment. Keynes argues, by contrast, that a market economy has no automatic tendency toward full employment and that it is quite possible for high unemployment to persist indefinitely. At the root of neoclassical economics is the idea that the rate of interest keeps consumption and investment demand in line with full employment production capacity. A fall in investment reduces interest rates and saving, with an offsetting increase in consumption, so that overall demand is maintained, at least over time. The rate of interest strikes the balance between the productivity of investment and the thrift of savers. Keynes argues that the rate of interest simply cannot play this balancing role and is in fact the price required, not to reward thrift, but to overcome the tendency to hoard money: Interest is the price of overcoming *liquidity-preference*. For this reason, he writes favorably of the usury laws and of mercantilist theory. Consumption demand is mainly a function of income, and investment demand is mainly a function of the state of expectation and confidence. Expectation is uncertain, and confidence is inherently volatile because of our ignorance of the future.

Keynes's policy prescriptions follow directly. There is no natural reason for a positive rate of interest and the corresponding scarcity of produced capital assets. A policy of cheap money will lead to high investment and employment, together with the elimination over time of the scarcity and return to produced capital: the euthanasia of the *rentier* (someone who lives on interest or dividend income alone). To the extent that the private sector is reluctant to make investments with a positive economic return (Keynes was thinking in particular of housing and other infrastructure), the state should undertake and finance them by borrowing in the same manner as a private corporation: Here we have the socialization of investment. If consumption remains insufficient to provide full employment when all viable investment opportunities have been exhausted despite zero interest rates, income and wealth should be redistributed so as to increase consumption. Nevertheless, Keynes's proposals are heavily qualified by his commitment to the advantages of a free enterprise system in terms of efficiency and

freedom, provided that full employment can be secured by the necessary intervention.

Between 1941 and 1946, Keynes worked toward the reconstruction of the postwar global economic and political architecture and sought to embody his theoretical insights in the Bretton Woods institutions. His main concern was to establish an international monetary system that promoted international trade, employment, and development, partly by avoiding a return to the gold standard and by ensuring that monetary policy was conducted with a view to full employment. Key proposals of his that were not adopted were the need for the IMF to act as a global central bank and for there to be an onus on surplus countries as well as deficit countries to adjust their balance of payments. It is likely that, on account of these omissions, Keynes would have predicted the eventual downfall of the Bretton Woods system of fixed exchange rates in 1971 and that he would not have favored the regime of financial liberalization and floating exchange rates that followed. His concern, in the words of Winston Churchill, was always to see industry more content and finance less proud.

KIERKEGAARD, SØREN (1813–1855)

Søren Kierkegaard was born in Copenhagen, Denmark, where he spent most of his short but productive life. Kierkegaard intended to bring his readers to a realization of the importance of becoming a Christian—an imperative he thought lost on his fellow residents of Copenhagen, who were contented to sublet this task to the formalities of the established Danish church. Although Kierkegaard's thought is sometimes tarnished by his patriarchal and reactionary views, this does not outweigh his wider pursuits: combating the twin dangers of the hubristic influence of Hegelian ideas in Danish life and the demeaning and dehumanizing relations created by democracy, liberalism, and the demands of equality. Thus, although he was not a political theorist in the restricted sense of the term, Kierkegaard's highly idiosyncratic writings develop a challenging view of the contours of the relationship between the individual and the community as a whole.

Before any examination of Kierkegaard's thought can begin, it is important to note the nature and purpose of the authorship as a whole—a point that Kierkegaard himself makes in the essays contained in *The Point of View*. Kierkegaard produced works both in his own name (signed) and under pseudonyms. In his signed works, Kierkegaard presents his reader with an explicitly Christian position, often in the form of a discourse on a biblical quotation. In the pseudonymous works, Kierkegaard explores aesthetic, ethical, and philosophical positions. These pseudonymous works are not correctly understood as Kierkegaard's *definitive* position: They should be understood as illustrations and explorations of worldly and philosophical positions that Kierkegaard is attempting to encourage his reader to reject. Once rejected, the reader is in a position to make the so-called leap of faith and start the upbuilding work explored in the signed authorship, which is involved in becoming a Christian.

Central to Kierkegaard's thought is the idea that selfhood is not a given but something that individuals must strive to achieve. Kierkegaard explores this idea most clearly in the pseudonymous work, *The Sickness Unto Death*. For Kierkegaard, *true* selfhood (being a Christian) can be achieved only when individuals relate correctly not only to themselves but also to the power that established those selves: God. Although Christian selfhood is normative, it is nonetheless far from routinely accomplished. Indeed, for Kierkegaard, most individuals fail to achieve true selfhood and are mired in the condition known as despair. This is the case because just as an individual can relate

to God, an individual can also relate to any number of other ideas, ideals, projects, or people. These relations (unless underpinned by the central spiritual relation) are in fact misrelations. Despair should not be thought of as manifesting in misery or unhappiness. On the contrary, Kierkegaard maintains that many individuals are not aware of their despair (their misrelation to God) and are even self-congratulatory about their position, role, and achievements in society.

Central to Kierkegaard's account of the political, then, is the need for individuals to recognize their individuality and to set out on the task of becoming Christians. This involves becoming aware of the need to form a correct relation between themselves and God and from there to other individuals. In *Two Ages* (perhaps his most overtly political work), Kierkegaard uses the occasion of a literary review to press home his own conclusions about "the present age." Whereas the previous age (the age of revolution) saw the possibility of individuality and passion, the present age sees the nullification of action in abstract thought. In this way, Kierkegaard condemns the tendencies of both democracy and liberalism. Democracy sacrifices a commitment to the truth to the power of majorities and treats individuals as equals only in the sense of interchangeable units. Moreover, it creates the "anonymous phantom" of the public, which has no fixed direction or ideals and which enables individuals to avoid responsibility by merging their individuality with that of others. For its part, the tendencies of liberalism are to replace the need for commitment and action with endless chatter and procrastination. Under such conditions, passionate commitment to an idea or ideal is made impossible and "envy becomes the *negatively unifying principle.*" Caught in reflection and inaction, individuals cease to be stimulated by the admiration of individuality and instead are further discouraged and devalued by the example of others and so tend to undermine, ridicule, and trivialize achievement. Under such conditions, individuality and the possibility of becoming a Christian are greatly reduced.

For Kierkegaard, individuality was something more than the dehumanizing individualism of economic man. It is also something more than playing a part in society and acting as if one were a Christian. The individual must break away from the demoralizing and leveling influence of "the crowd" and engage with truth. For Kierkegaard, only when an individual has a relationship with God can there be a reforging of their relations on the basis of true spiritual equality with others. Individuals must recognize that others are equal before God and that God commands them to love their neighbor as *spiritual* equals. Duties and obligations to others, then, come not from philosophical reflection but from a commitment to the truth. A community built on such a relation would be a community of individuals who recognized each other as spiritual equals and who found mutual edification in their relationships.

KINGSHIP

Kingship provides a distinctive political philosophy that mediates between mundane political realities and the demands of the divine. Key early models of kingship are provided by Hellenistic, Hebrew, and Persian culture. As a governmental

form, kingship had evolved in the classical period to become the dominant form of European statehood by the High Middle Ages. The body of the king came to represent more than his individual personality and to stand symbolically for state sovereignty. In both the east and the west, monarchy took multiple forms, ranging from small family kingdoms to powerful empires, but several general trends are observable. From the seventh to the twelfth centuries CE, kingship becomes increasingly sacralized and absolutist, followed from the fourteenth century CE by an increasingly scientific, juristic approach to kingship. Classical and medieval ideas of sacred kingship continued to have influence in the early modern and modern periods via theories of the divine rights of kings and absolute royal power.

Different justifications for monarchy are apparent in classical and medieval political thought. Pragmatic accounts of kingship emphasize that kingship is a reward for military prowess. Philosophical accounts contend that kingship is the most efficient way to achieve the common good and that the king is an embodiment of reason. Religious accounts of kingship point to the divine selection and ordination of kings and the particular virtues of the king. Legalistic accounts of kingship base the legitimacy of monarchy on either natural or positive justice. Dominating all these accounts are two characterizations of kingship offered by Plato and Aristotle: the philosopher king and the Great King. Specific questions addressed in classical and medieval theorizing on kingship include: the king's relationship to the natural or divine order; the nature and limitations on a king's pastoral and legislative roles; and the king's relationship with other members of the kingdom. The descriptions of good kingship in classical and medieval literature are partnered by the figure of the tyrant and the question of what obedience is owed to a monarchy that has degenerated into tyranny.

Classical Ideas of Kingship

Persian

Kingship was the defining political form of pre-Islamic Iran. Iranian kings held lordship over the Persian tribal aristocracy and supreme law-giving powers over their subjects as a whole. The title "king of kings" signaled their inheritance of the preceding kingdoms of Babylon and Assyria. The king was not divine but belonged to a family chosen to represent the gods on Earth, and monarchical legitimacy could be determined by the merit displayed hunting or fighting. The king had to fulfill three roles: warrior, divine intercessor, and farmer. A successful king would protect Persia from invaders, gain divine assistance, and add to the prosperity of the land. The Achaemenid king Darius (522–486 BCE), like his Hellenistic successor, Alexander, provided a role model of kingship for later Byzantine, Islamic, and European kingdoms and was particularly adept at exploiting the ceremonial and courtly aspects of kingship.

The interaction of political and religious institutions was complicated in the Persian context by a de facto, but unformalized, connection between the monarchy and Zoroastrianism. As a result, the Persian religious and political system contained a tension between the absolutist character of the monarchy, with a king who insisted on being the arbiter of truth, and Zoroastrian doctrine, which required every individual to pursue the truth.

Hellenistic

In *The Republic* (360 BCE), Plato set out the character of the philosopher king as an ideal form of government. Philosophers alone are able to appreciate unchanging and eternal truths and therefore can rule with reason. Such a philosopher king will be noble, gracious, truth-loving, just, courageous, and temperate. Plato envisaged an elite band of philosopher kings ruling in an authoritarian manner in order to maximize the happiness of the whole state.

Contemporaneously with Plato's philosophical vision of philosopher kingship came the establishment of Macedonian kingdoms. With the use of a highly trained army, Philip of Macedon (382–336 BCE) defeated the southern Greek city-states, which had abolished kingship centuries earlier. Alexander the Great (356–323 BCE) then followed an aggressive military strategy that secured an empire stretching to India. Loyalty to this autocratic monarchy was secured by the representation of the king as a supreme warrior and hunter. Alexander, in particular, modeled himself on the Homeric hero Achilles. In addition,

Alexander used the claim of divine parentage to embellish his authority, but in turn, this claim to divinity entailed an obligation to provide benefaction to his followers.

The Alexandrian model of kingship used the establishment of cities and tribute networks to maintain the king's authority. Although Philip and Alexander both enjoyed kingship as a form of reward for their prowess, the later Hellenistic model of kingship is dynastic, with power consolidated through conspicuous royal palaces and a centralized power structure around the king. This centrality of the king completed the move from the city-state to the royal residence as the dominant political forum.

Aristotle (384–322 BCE) distinguished three different forms of government: rule by one (monarchy or tyranny), rule by many (aristocracy or oligarchy), and rule by all (polity or democracy). Kingship is not an ideal form of government for Aristotle, although he portrays kingship that aims for the common good as a good alternative to tyranny. Aristotle describes the *pambasileus* (Great King) as a supreme king with unlimited authority. The existence of such a king effectively destroys the political city because it removes the sharing of offices and speech. Aristotle prefers a law-based system that respects the equal authority of men to monarchy. Aristotle argues that a ruler must rely on the friendship of his advisers and officials, trusting that they genuinely implement his will, but that the inequality inherent in kingship prevents a king from being able to rely on friendship. Only in the unlikely circumstance that one kingly family excels all other individuals in virtue would kingship be preferable to the law-based rule of many.

In his historical writings, Polybius (c. 203–120 BCE) set out a cyclical theory of government. Kingship emerges as a form of benign government under the aegis of a wise and good king. Inevitably, this kingship will degenerate into tyranny, once the throne is inherited, and the king's successors will abuse their monarchical position for their own gain. Weary of this abuse, aristocrats will intervene to establish an oligarchy before the eventual establishment of a democracy. Once this democracy has in turn degenerated into an *ochlocracy* (rule by the mob) dominated by demagogues, the cycle will start again with the reestablishment of the monarchy.

Roman

The early Roman experience of kingship founded a strong philosophy and legend of antimonarchism. The myth of Romulus and Remus produced an iconography of shepherd kingship and the sense of the king as a chief elected by the people for life to provide care for them as a flock. This relationship between people, elected king, and senate lasted for seven reigns, according to the legend, until Tarquin the Proud (who reigned 534–510 BCE) was exiled by the Senate in response to his son's alleged rape of the wife of a nobleman. The mythology of the overthrow of the monarchy created a powerful republican narrative and led to the dominance of the Roman republic, led by consuls, for the next five centuries.

The reestablishment of Roman imperialism by the Emperor Augustus (63–14 BCE) engendered a new strand of monarchical practice and theory. Roman emperors were both lord and god; their divinity was worshipped by adherence to the imperial cult during their lifetime and divine status after their death.

In the later Roman Empire, the image of the emperor changed with the introduction of Persian ceremonial elements. The early Byzantine pagan writer Themistius (317–c. 387 CE) described the emperor as a copy of Zeus on Earth, and his rule mimicked the heavenly kingdom. This theme of the emperor reflecting divine rule and virtues was later developed by Christian theorists of kingship. Emperor Diocletian (244–311 CE) is notable both for his introduction of ceremonial prostration before the emperor in the ceremony of *adoratio* (adoration) and his iconographic linking of his imperial image to the gods Jupiter, Hercules, Mercury, and Apollo (imperial/divine imagery that under the Christian Byzantine Emperor Constantine would transmute into Christ).

Early Germanic Kingship

Germanic kingship has gained mythological status in later political theory as a form of popular sovereignty that protected common-law freedoms. Nineteenth-century historians in particular were keen to emphasize that Germanic kings were chosen by popular tribal election. More recent historiography has been more cautious due to the lack of detailed source material, and the Roman nature of

later Germanic kingship (from the period after the first century CE) is now increasingly emphasized by historians.

Monarchy and Monotheism

Hebrew Kingship

Two attitudes toward kingship can be found in biblical writings. On one hand, there are descriptions of the emergence of Hebrew kingship with the figure of Saul and the key examples of Old Testament rulers such as Samuel, Solomon, and David. All owe their authority to divine selection and have a special relationship and means of communication with God. However, there is also a tradition of bad kingship in the Old Testament writings, with the Book of Samuel suggesting that the appointment of kings is a form of idolatry because God is the one true king.

The later better-documented Jewish kingship of the Hasmonean (140–37 BCE) and Herodian (37 BCE–92 CE) dynasties united ancestral biblical traditions with Hellenistic forms of kingship. King Herod of Judea (73–3 BCE) exemplifies a particular type of client-kingship. As described by the Roman-Jewish writer Josephus (37–100 CE), Herod maintained his kingdom via complex power brokering with the occupying Roman forces, as well as using family intermarriage to control his court.

Islamic Models of Kingship

Different dynastic phases of Islamic imperialism can be separated out, starting with the early Medina polity, followed by the Umayyad Caliphate (661–750 CE) and the Abbasid Caliphate (749–1258, 1261–1517 CE). A progressive evolution of the idea of a caliphate can be seen, based on the *Qur'an* and the *hadith* (prophetic teachings), but also with independent elements of a regal culture.

Muslim kingship draws heavily on the standard tropes to be found within Hellenistic, Persian, and Byzantine models of kingship. Nevertheless, it also functions as a new political formulation. The medieval Islamic king is God's *khalifa* (vicar), acting as a shepherd for humanity. The caliph is a figure reminiscent of the divinely omnipotent Byzantine *basileus*. According to a Muhammedian saying, a king is God's shadow on Earth. Divinely ordained, he presides over the *Shari'a* (Islamic religious law), demonstrating his *siyasa* (craft of politics). The sovereignty of the king is indivisible, reflecting the monotheistic belief in the one God, and the direct relationship between the caliph and God provided scope for the development of royal absolutism.

Christian Kingship

Along with Old Testament models of kingship provided by figures like David and Solomon, the figure of Christ in the New Testament became important as an example of kingship. For example, the Frankish kings of the eighth century CE invoked the soldier-like qualities of Christ and linked their kings to him via the hallowing of weapons, standards, and the king himself.

Christian political thought developed within an imperial context and, as a result, contained a fundamental assumption that Christian government involved monarchy. Christianity was a radical and threatening sect for its first three centuries, but the unexpected conversion of the Emperor Constantine (c. 272–337 CE) started the evolution of Christianity into a state religion and associated it with one of the most powerful and stable political units, the Byzantine Empire. Moreover, even the Byzantine Empire's enemies were monarchical. Besides the Persian king, the Germanic tribes establishing new kingdoms in the remnants of the western Roman Empire were Christian kings, albeit heretical Arians. The articulation of Christian political thought was, therefore, intertwined with political theorizing about the figure of the king.

Eusebius (c. 263–c. 339 CE)

The Christian writer Eusebius wrote panegyrics for the Emperor Constantine and an explanation for his role as a Christian king (*basileus*). Eusebius combined Hellenistic and biblical themes of kingship. Thus, the familiar classical theme of the king as a representative of the divine on Earth is merged with the portrayal of Constantine as the fulfillment of the Abrahamic prophecy. Eusebius christianized pagan ideas about the relationship between the earthly and the divine. On Eusebius's explanation, Earth reflects the heavens, but rather than being an earthly divinity, the emperor is God's representative on Earth. The emperor could make a special

claim to sagacity through the special guiding relationship that he enjoyed with God via the divine word. This also provided the emperor with a potent political argument derived from monotheism (the belief in one God). Just as there was only one God in the heavens, so there should only be one emperor on Earth. A drive toward conquest and the enforcement of orthodoxy was thus implicit within this Christian conception of kingship.

Augustine's major political work, *The City of God* (413–427 CE), describes two cities: one heavenly and one worldly. The earthly city is motivated by self-interest, whereas the heavenly city is a community of true believers. The cities represent a spectrum of the best and worst human behavior, and the heavenly city is a guiding symbol for Christian rulers as to the kind of society they should create. The Augustinian king rules because of his love of justice rather than for glory. God alone has the power to grant kingdoms and to give power to an individual. Christian rulers are happy if they: rule with justice; are not inflated with pride; put their power at the service of God; are slow to punish, but ready to pardon; punish wrongdoing to direct and protect the state rather than for personal animosity; grant pardon to encourage the wrongdoer's amendment; compensate for severe decisions with the gentleness of their mercy and the generosity of their benefits; restrain their self-indulgent appetites; and act for the love of eternal blessedness and offer to God their humility, compassion, and prayers.

The Augustinian theory of kingship was highly influential in two respects. First, later writers such as Isidore of Seville use the Augustinian idea of the two cities to set out theories of the interrelationship of secular and spiritual power and the extent of the king's authority in relation to the pope. Second, Augustine's work provided an early example of a body of medieval literature called the *mirror of princes'* genre, which sets out the appropriate beliefs, attitudes, and behavior of a monarch.

After the deposition in 476 CE of the last western Roman emperor, the Byzantine emperors in Constantinople lay claim to be the true continuation of the Roman imperial legacy. Emperors such as Justinian (c. 482–565 CE) provided a model of kingship that was pious, legalistic, and ceremonial-minded. Central to this form of kingship was an emphasis on military victory and conquest. The temporal coincidence of the establishment of the Roman Empire by the Emperor Augustus with the birth of Christ was interpreted in Byzantine political theory as a divine signification of the Byzantine Empire's legitimacy and as justification for a mission to unite the world under one Christian ruler.

The *De Administrando Imperio* (948–952 CE) by the Emperor Constantine Porphyrogenitus (905–959 CE) described a hierarchical world family of kings over which the emperor was a father king. Ceremonial and display were central to this model of kingship because non-Byzantine inferiors needed to be intimidated by the splendor of the Byzantine court.

Western Medieval Kingship

The English historian J. M. Wallace-Hadrill identifies a change in emphasis in European kingship in the seventh century CE, arguing that at this point kings moved into an ecclesiastical atmosphere.

Merovingian Kingship

Merovingian kings such as Dagobert I (c. 603–639 CE) viewed their mandate as being to further justice and equity and to protect the church. Royal piety involved the protection of doctrine and morals, of the poor, and of the possession of the churches. The biblical ideals of David and Solomon were used to urge kings to listen to their bishops and to follow the Christian duties as interpreted by the church.

Thaumaturgical and charismatic power began to be ascribed to Merovingian kings in a way that was considerably developed by the later Frankish dynasties of the Carolingians and Ottonians (751–1024 CE). As an example of this, the French historian Marc Bloch traced the history of the belief that kingship conveys healing properties. The kings of England and France, due to their descent from the saintly King Edward the Confessor (c. 1003–1066 CE), were considered able to cure victims of scrofula (a tubercular skin condition) by their touch.

Carolingian Kingship

The Austrian-English historian Walter Ullmann describes the Carolingian monarchs (c. 750–919 CE)

as exercising a co-regency with Christ. Hincmar of Rheims (806–882 CE) provides a detailed contemporary description of the developing Frankish royal consecration rites of the ninth century, which underline this anointed role of the king.

The ideal Carolingian king was a military protector of the fatherland, whose strength crushed heathens and rebels. The imperial court functioned as a great household in which order and purity must be maintained. Piety was a central Carolingian political concept; faithfulness was considered to bind lords to their king in the same way as religious faithfulness. Kingdoms were the personal property of the emperor and the Carolingian Empire was repeatedly divided on the death of individual emperors into its constituent kingdoms. Equally, the Carolingian Empire as a whole carried no centralized monarchical law, and subjects carried their customary law with them.

Alcuin (c. 735–804 CE) urged the Carolingian Emperor Charlemagne (742–814 CE) to be a scholar as well as a leader. Alcuin developed the Platonic idea of a philosopher king in a Christian context to urge kings to pursue Christian wisdom and study and to create a new Christian community—attributes and attitudes that Alcuin also ascribed to Charlemagne. The king's authority demonstrates: *potestas* (power), *sapientia* (wisdom), and *praedicatio* (preaching). The church retains its priestly functions, but the king is both its instructor and protector.

Anglo-Saxon Kingship

Bede (c. 673–735 CE) presented kingly rule as a moral occupation devoted to Christian aims. In his *Ecclesiastical History*, Bede identified two categories of good king: the warrior-convert and the monk-king. Piety and humility were essential attributes of kingly behavior. The church required the king to provide protection, endowment, largess, and the means for Christian warfare. Bede's writings also reveal the cults that developed after the death of several Anglo-Saxon kings and how the development of royal saints could add to the prestige of a royal dynasty.

Alfred the Great (847–899 CE) merged the West-Saxon and Mercian kingdoms to form an English polity. Besides promoting military reorganization and education, Alfred introduced a new legal code, the Deemings (Book of Laws). The idea of the three orders required the king to have praying men, fighting men, and working men and the means to support all three classes of men in terms of gifts, weapons, food, ale, and clothing.

Although keenly Christian in outlook, the primary emphasis of Alfred's writing is on secular power. The British historian J. L. Nelson suggests that at the heart of Alfred's political ideas is a belief in the active compatibility of wisdom and worldly well-being. Alfred conceptualized his kingdom both as a geographical territory that should not be divided and as an abstract authority over men. As a form of patrimonial kingship, land is leased from the king by the three orders and is manned ultimately for his benefit. Those who served special positions for the king (his *thegns*) entered into his friendship, and a culture of service required the king's lords to prefer the temporary deprivation of their wealth to the loss of the king's friendship. Alfred's ideal officeholder is both learned in book culture and capable of applying that learning to the common benefit. In return, officeholders can legitimately expect to be rewarded with wealth. Plotting against one's lord's life provokes the death penalty, although Alfred accepted that there is a right of resistance to unrighteous rulers who damage their realm.

Hierocratic Theories of Kingship

A central problem for Western medieval theorizing about kingship was the relationship between monarchical and papal authority and the extent to which ecclesiastical rule should have precedence over secular authority. Using the metaphor of two swords, Pope Gelasius I (492–496 CE) ascribed distinctive functions to church and state, with the pope exercising a sacred priestly power while the emperor has temporal power. At the same time, the pope is under the temporal jurisdiction of the emperor, while the emperor's spiritual well-being remains the concern of the pope. Because, under this model, neither party operates in an entirely autonomous sphere, the potential for an ongoing theoretical battle over sovereignty and precedence was established.

In his *The Book of the Pastoral Rule* (c. 590 CE), Gregory the Great (c. 540–604 CE) emphasized the tutelary role of the emperor in Constantinople

as indispensable to Christendom's development. The emperor was charged with a supervisory role over the church and Gregory aimed for an intimate union between the papal sovereign and the emperor. By encouraging the emperor to be more Christian, Gregory minimized the boundaries between the two forms of authority and suggested their possible alliance.

Using an Augustinian and Roman law background, Isidore of Seville (c. 560–636 CE) set out an influential theory of kingship that also reveals Visigothic attitudes to kingship (the Visigoths had established their kingdom in the former Roman Iberian territories). Isidore emphasized the harmonious operation of clerical and secular authority. Secular princes are subject to the religious discipline of the church, but in turn they also have a pastoral obligation over the church. The ideal king exercises *potestas* (power) over his people and within his national church. The king exercises a *ministerium* (office) within the church and in administering his power must show *humilitas* (humility). The king is predestined to serve by God as the head of a Christian body, which included the church. The king is God's minister, dispensing justice with complete authority over the health of the kingdom, including the supervision of clerical matters. A king who fails in his duties is a tyrant, but the church must accept such a tyrant as a punishment for sin.

Pope Gregory VII (c. 1020/5–1085 CE)

Hildebrand (Pope Gregory VII) argued for ultimate authority over the emperor, arguing that he could both make and depose kings and denying the emperor's right to choose his own bishops. In contrast, the emperor argued that the papacy's temporal authority derived from secular rulers.

Gregory VII developed Augustine's metaphor of the two cities to explain the difference in origin and purpose of ecclesiastical institutions as opposed to secular ones. Because secular government is ordained by God as a remedy for man's inherent sinfulness, secular princes cannot be allowed to be the final judges in their own cases. The papacy is thus a divine provision to ensure that justice is truly universal. Even the Holy Roman Emperor is subject to justice, and not to recognize this is sinful pride.

In the *Monarchia* (1309–1313 CE), Dante (1265–1321 CE) made an argument for the one monarch, arguing that the well-being of the world requires one secular monarchy. Human potential can be achieved only in peaceful conditions, and peace can be achieved only by the rule of one emperor. Rehearsing the early medieval arguments about papal and imperial spheres of autonomy, Dante argued that human beings pursue two ends: earthly happiness and eternal life. It is the emperor's job to ensure humanity's earthly happiness, whereas the pope has responsibility for humanity's eternal life. For Dante, the emperor and the pope operate in entirely separate spheres, and he strongly rejects the hierocratic arguments made by those such as Gregory VII about the temporal powers of the pope.

The King as Law Maker

The disintegration of the Carolingian Empire in the ninth and tenth centuries CE led to a reconceptualization of kingship within the context of smaller territorial kingdoms, known as feudal monarchy. Writing about the Anglo-Norman (1066–1154 CE), Capetian (987–1328 CE), Angevin (1154–1216 CE), and Plantagenet (1154–1485 CE) monarchies in England and France, the French historian Charles Petit-Dutaillis sets out a picture of monarchy establishing itself within feudalism. Sacral monarchy and feudalism contained latent competing principles, and the regrowth of royal centralized administration and justice caused kings to attempt to curb the feudal aristocracy. Feudalism implied an ability to withdraw allegiance, a freedom that was abrogated by the growth in the royal prerogative. The view of the king as a lawmaker became increasingly prominent by the thirteenth century, with the English jurist Ranulf de Glanvill (?–1190 CE) referring to the king as the "people's shield." Increasingly, the abstract entity of the Crown (an abstract bundle of inheritable royal rights and powers) came to be important.

Bracton (c. 1210–1268 CE) took a legalistic approach to kingship, arguing that a king was rightly so-called only if he came to power legitimately. In Bractonian theory, the king has no equal, but he rules under both God and the law.

In his *De regimine principum* (1267 CE), Thomas Aquinas (1225–1274 CE) emphasized the naturalness of monarchy as a form of government. Aquinian kingship is based on natural law, rather

than merely positive justice. Using Aristotelian principles, Aquinas argued that the king ruled for the common good and that subjects were not bound by unjust or inequitable rules. Aquinas suggests that monarchy need not be hereditary; the king should be put in charge because of his virtue and can therefore be chosen from the people. Also, monarchy is democratic in the sense that various virtuous men should also participate in government with the king.

Giles of Rome (c. 1243–1316 CE) expressed a common view of thirteenth- and fourteenth-century political philosophy, that the power of the king should not be limited because he acts for the common good. *De regimine principum* (1277–79 CE) contrasted regal regimes with political regimes, preferring the former because kings are more natural and rule for the good of the people. Rightful rule comes from the king being directed by right reason. The king directs society by his legislation in the same way that the archer controls the direction of an arrow. As a result, the king is a form of living law, who is bound himself by natural law but above the particulars of the justice he administers.

Marsilius of Padua (c. 1280–1342) argued in the *Defensor Pacis* (1324) that imperial power is the sole guarantor of peace. However, Marsilius also viewed the whole citizenry body as a legislator that had ultimate authority over the monarch. Marsilius's views mark the beginning of a new abstract conceptualizing of the state as represented by the citizen body rather than the person of the king.

Early Modern Kingship

Ernst Kantorowicz suggests that kingship was transformed during the period from the twelfth to the sixteenth century, becoming de-sacralized under the impact of scientific jurisprudence. Kingship moved from being Christ-centered to being law-centered.

Machiavelli (1469–1527 CE)

In *The Prince* (1513–1532 CE), Niccolò Machiavelli describes a form of kingship in which force is combined with prudence. Machiavelli approaches the problem of how a new prince, who has not inherited his position, can obtain and maintain his power. Such a new prince needs to combine public morality with private immorality. Although he draws on the classical ideas of Plato, Aristotle, and Polybius, Machiavelli has a different aim in writing about kingship. Instead of approaching kingship in terms of its relationship to the ideal form of government, Machiavelli sets out the conditions for monarchical power and its maintenance via patronage structures.

The Divine Right of Kings

Despite the development of models of kingship based on realist and natural law theories, the medieval theories of sacred kingship continued to influence early modern political theory. The French biblical scholar and political theorist Jacques-Bénigne Bossuet (1627–1704 CE) argued for the divine right of kings in his *Politics Derived From the Words of Holy Scripture* (1679 CE). Bossuet's autocratic argument was that ruling by virtue of God's authority legitimized the absolute authority of the king and precluded all opposition to his rule.

Kyoto School

The Kyoto School was first identified as a coherent approach to philosophy by the Marxist intellectual, Tosaka Jun (1900–1945), in the early 1930s. The school is particularly noteworthy because it represents the first genuinely philosophical school of thought in modern Japan; the members developed original philosophical positions by drawing on both European philosophy (especially German idealism) and the intellectual traditions of Japan (and East Asia). Indeed, they were the first generation of Japanese thinkers with access to European philosophy and the last to receive a thorough schooling in the Confucian and Buddhist classics. Whether this synthetic approach makes the Kyoto School a "modern" school of philosophy is the subject of much debate.

During the early 1940s, members of the Kyoto School itself argued that their unique ability to draw on both European and Asian traditions of thought actually meant that they had passed through modernity, while the Western nations (which remained unable or unwilling to assimilate Asian thought) were trapped with all the parochial problems of the modern age (including imperialism). In this way, the Kyoto School is perhaps the first non-Western school of philosophy to resist Western colonialism and imperialism through a narrative of assimilation and progression beyond the modern West. Historically, this appeal to a "world historical standpoint" and the model of "overcoming modernity" coincided with imperial Japan's own attempts to colonize Asia.

Tosaka used the label *Kyoto School* politically to distinguish a group of bourgeois philosophers who creatively (and sometimes critically) developed the work of the school's originator, Nishida Kitarô (1870–1945). The name refers to the fact that the original members of the school each spent significant periods at Kyoto Imperial University in the years between 1911 and 1945, usually under the guidance of Nishida. For Tosaka, the key members of the school were Tanabe Hajime (1885–1962), Nishida's junior colleague; and Nishitani Keiji (1900–1990), Nishida's leading student. Today, the group identified with the Kyoto School is wider: In the second generation, it usually includes Kôyama Iwao (1905–1993), Kôsaka Masaaki (1900–1969), and sometimes Hisamatasu Shinichi (1889–1980); in the third generation, Abe Masao (1915–2006) and Ueda Shizuteru (b. 1926); and some commentators would now include a left wing of the (second generation of the) school in the form of Miki Kiyoshi (1897–1945) and Tosaka himself. The exact constitution of the school remains contested, at least partially because the central characteristics of the school's thought have not yet been crisply defined, but also partly because of the controversial political legacy of the school in the twentieth century.

Political Legacy

The political legacy of the Kyoto School is complicated on a number of levels. Despite Tosaka's initial assertions about the school, the ostensible political positions of the various members of the school do not always coincide with each other. Also (and more interestingly), the political significance of the school's philosophy remains deeply contested. Indeed, during the 1930s and early 1940s, while Japan was at war, Nishida and his colleagues were viewed with great suspicion by the authorities and strongly criticized by the right wing for being too liberal and too sympathetic to

Western philosophical positions. However, after the end of the war (which coincided with Nishida's death), the Kyoto School met with severe criticisms (especially from the left), and key members such as Nishitani were purged from their university positions until after the end of the occupation. Perhaps as a result, the postwar work of the Kyoto School moved markedly away from politics and toward the philosophy of religion.

For many commentators, the legacy of the Kyoto School has some parallels with the case of Martin Heidegger in German history. Indeed, interest in the political thought of the Kyoto School was reinvigorated in the late 1980s, following the new revelations about Heidegger's alleged involvement with the Nazi regime. The parallels between the Japanese philosophers' contested relationship with an aggressive and oppressive ideological regime and Heidegger (with whom various of these philosophers were personally acquainted) were enticing. By the 1990s, there was also a resurgence of interest in the Kyoto School in the West, as part of the search for alternative, sophisticated political visions following the end of the cold war and the apparent hegemony of liberalism.

The controversy of the Kyoto School revolves around their formulation of a conception of the East Asia Co-Prosperity Sphere (*tôa kyôeiken*) and their moral endorsement of the idea of transnational political units at a time when the Japanese state was aggressively pursuing colonial policies in Asia. The question is whether the political thought of the Kyoto School should be interpreted as a criticism of Japan's policies (formulated as the failure of Japan to meet the cosmopolitan ideals mapped by the school) or as a philosophical justification of the trajectory of the state's actions. Opinion remains divided, but there is an increasing trend toward exploring the theoretical potentials of Kyoto School politics as resources for the solution of contemporary problems, as well as the relationship between these theoretical positions and other mainstream traditions of political thought.

A second and powerful aspect of the political legacy of the school centers on questions of the politics of knowledge and the challenge that the Kyoto School presents to the Eurocentric narrative of the history of political thought. In particular, its sophisticated and properly philosophical challenge to the assumptions of modernity (as envisioned in the European Enlightenment) through a process of *passing through* modernity into a global era represents an important contribution to contemporary debates about decentering global history. In fact, the first moments in the postwar rejuvenation of the Kyoto School came in the increasingly confident atmosphere of late 1970s Japan, when Takeuchi Yoshimi published a critical reappraisal of the school's high-profile 1942 symposium, "Overcoming Modernity." The political implication that overcoming modernity was allied to overcoming the West was as clear in the 1970s as in the 1940s.

Political Ideas

For most commentators, the central philosophical concern of the Kyoto School is the concept of absolute nothingness (*zettai mu*), which underlies much of their thought. This foundation is often politicized as being in contradistinction to Western philosophy, which (according to this generalization) finds its origins in ontology and hence in the question of being. Hence, we find a rather vulgar (and ideologically charged) contrast between nonbeing and being (East and West), in which nonbeing is represented by the Buddhist-derived notion of *mu* (nothingness) rather than by *hiu* (the negation of being or *meon,* Gk). The affinities between this idea of nothingness as a foundational place and Heidegger's notion of *das Nichts* (which opens a place in which beings can show themselves) are intriguing, and they appear to provide for similarly controversial implications in the fields of ethics and politics. Of course, Heidegger was not the first European philosopher to explore a space of nothingness, and the identification of absolute nothingness with Oriental nothingness is more political than philosophical.

One of the key consequences of this foundation is an ambivalent sense of individual subjectivity and agency. On one hand, Kyoto School thinkers (and especially the early Nishida) seem to emphasize that the world is self-productive and, hence, that it does not rely on the actions of individual agents to shape it—indeed, there is a sense here that individual agents exist only in relation to the self-production of the world in which they appear. In a manner of speaking, individuals are generated by (or emanate from) the world, rather than vice

versa. This has clear implications for notions of political and ethical responsibility.

On the other hand, particularly in the later Nishida, individuals appear to be granted active agency and the ability to shape the historical and political world in which they appear. However, there is always a sense in which this agency is self-contradictory (or perhaps dialectical): Individual agents are generated by and in return generate the historical world around them. Indeed, Nishida's particular concern was to model agency in such a way that it could be retained by various levels of actors simultaneously, beginning with the individual, moving through different levels of community (society, nation-state, etc.), and even including the world as a whole. The result is an interesting and radical deprivileging of individual agency in a political world that contains a series of other sources of agency and subjectivity, including the nation and the world itself (and ultimately nothingness). Members of the Kyoto School deal with this problem in importantly different ways.

One of the important corollaries of this multilevel model of subjectivity is that the levels are linked by the ethical imperative toward the self-actualization of greater levels of unity (and thus of subjectivity or personality). These greater levels (e.g., the nation as a level greater than the individual) are mutual activities and should not (must not) be coerced from either side, making them contradictory self-identities. This means that the nation is essentially an ethical category, rather than an institutional one.

For the Kyoto School, the process of history is toward the realization of greater levels of identity (and agency) and, in practice, this means that the school identified the twentieth century as an age of global awakening, in which nations would (and should) be replaced by transnational groupings as the highest level of agency. For Nishida, these transnational groups were known as "particular worlds," and they would evolve mutually from historically familiar regions (i.e., without coercion). Eventually, both Nishida and other members of the school would use the language of the "co-prosperity sphere" to describe these regions, and the East Asia region in particular. Such spheres should take on personalities drawn mutually from their constituent units—that is, they do not replace lower levels of agency but contradictorily unify them into an additional level. In some ways, members of the Kyoto School identified themselves as representatives of this kind of global unity between Western and Eastern traditions of thought.

The pivot of the controversy about the politics of the Kyoto School is whether this sense of transnational subjectivities is buoyed by a kind of cosmopolitan vision, in which all nations respect the integrity of the others and hence join into a form of international federation voluntarily, or whether the universalism implied in this model is actually fueled by a sense of mission among particular nations, and hence whether such a federation is actually a form of empire. In the end, this tension is not resolved by the school as a whole, and its members differed in the extent to which they were willing to endorse a special role for particularity and power. Recent literature suggests that while the logic of the political system of Nishida himself tends toward a cosmopolitan worldview, during the war years, he made sufficient references to a special place for Japan in the new world order to undermine this tendency in the minds of many observers.

Latin American Marxism

Much like other third world Marxisms, Marxism in Latin America has during most of its history been forced to navigate the treacherous strait between capitalist colonial powers and the imposition of Comintern doctrine from the Soviet Union.

Origins

Latin American Marxism enjoyed only a brief period of autonomous development prior to the Russian Revolution in 1917 and the 1919 founding of the Comintern. In 1895, Marx's *Capital* first appeared in the region, in a translation by Juan B. Justo—one of many radical physicians to emerge from Argentina—who founded the Argentine Socialist Party (PSA) the following year. But the PSA, like other pre-communist parties in Latin America, embodied a tension expressed in the coexistence of both minimum and maximum (i.e., Marxist) programs, seeing a 1917 split over World War I, which gave rise to the later-renamed Communist Party.

However, as the newly formed Latin American Communist parties were quickly incorporated into the nascent Comintern, local concerns soon took a backseat to directives issued from the Soviet Union, and these official Latin American Marxists had to contend both with their domestic struggles and with the Comintern's sometimes unpredictable lurches, from initial radicalism to the conservatism of the late 1920s and, after 1929, back to an aggressive ultra-leftism.

Mariátegui: Latin America's "First Marxist"

In this context—with most Communists torn between the domestic struggle against capitalism and imperialism and the imposition of an international dogma by ostensible allies—the Peruvian José Carlos Mariátegui intervened. A diminutive and sickly autodidact, enamored of poetry, Mariátegui was an unlikely candidate for the title later bestowed upon him: that of Latin America's first Marxist. While Mariátegui was not chronologically the first Marxist in Latin America, this is not what is meant by the phrase. Rather, by successfully charting a third way between capitalist imperialism and Communist dogma, Mariátegui can be seen as the first Marxist to deal with and formulate his theories on the basis of the concrete reality of Latin American life.

When the Comintern was forming, Mariátegui was scarcely 24 years old, but he had already been engaged in journalism for a decade, providing support first for the student movement and later the burgeoning labor movement. In his vociferous support for the 1919 general strike in support of the eight-hour workday, Mariátegui ran afoul of the Peruvian government, and tensions continued to rise until the new government of Augusto Leguía offered the young radical a stark choice: prison or voluntary exile. Mariátegui accepted the latter option, traveling in 1919 to Paris, before arriving in Italy less than a year later, where he was exposed

to both the radical praxis of the Italian factory councils as well as such thinkers as Bendetto Croce, Giovanni Gentile, and Georges Sorel. Mariátegui was present at the historic Livorno Congress of 1921, during which the future adherents of the Italian Communist Party—Antonio Gramsci, also a Sorel devotee, included—walked out, and it has been suggested that he knew Gramsci personally.

If Mariátegui had left his native Peru in 1923 as a radicalized democrat, he returned a communist. But this new faith notwithstanding, Mariátegui soon accepted the invitation of Víctor Raúl Haya de la Torre to participate in the latter's newly founded, broad-based populist movement known as APRA (Alianza Popular Revolucionaria Americana). In joining APRA, Mariátegui found himself embroiled in the Comintern controversy that he had effectively escaped with his 1919 exile, but initially at least, the tone was less than confrontational as the then-moderate Third International sought to convince Haya and APRA to join up. However, after the massacre of Chinese Communists at the hands of the Kuomintang in 1927—with which Haya identified—the distance between APRA and the Comintern, and as a result with Mariátegui, grew. Mariátegui finally broke with APRA and Haya in 1928, founding the Peruvian Socialist Party (PSP), but he devoted the remaining two years of his short life to resisting the dogmatism of imposed Comintern orthodoxy.

Developmentalism and Indo-American Socialism

Mariátegui's battle on two fronts—against Haya on one side and the Comintern on the other—is perhaps the most decisive conflict in the history of Latin American Marxism, revolving primarily around the concept of imperialism. Haya had distinguished himself from Vladimir Lenin by insisting that imperialism—defined as foreign control of capital—was not the *last* but rather only the *first* stage of capitalism. Seeing colonized countries as predominantly feudal, Haya in effect emphasized the positive, beneficial role of an initial imperialist stage, and APRA was then constituted as an anti-imperialist coalition that sought to bring together the newly empowered national bourgeoisie and domestic capital, as well as the Peruvian masses, under middle-class leadership.

If Haya thereby privileged the *national* element of imperialism—in Quijano's words—Mariátegui would come to privilege the *class* element through an unprecedented understanding of capitalism as a global system. When colonized countries appear on the scene of capitalist development, the global structure is already in place, and for Mariátegui, capitalist penetration of colonized societies did not have the effect predicted by those linear histories we later called developmentalism or modernization theory. As a result, both Haya and Mariátegui recognized the colonial distortions present in the Peruvian economy: Capitalism, the bourgeoisie, and the proletariat had not developed here as in Europe. But the lesson for each was different, and whereas Haya argued for the linear development of capitalism on the European model, Mariátegui responded that due to the structure of the global capitalist system, such development was impossible. While Haya later dismissed Mariátegui's directly socialist program as Eurocentric—implying that the latter mistakenly saw Peru as occupying the same economic level as the European nations—the reality of the situation was quite the opposite, and Mariátegui's socialism responded instead to a deeper recognition of the developmental blockage posed by the global capitalist system.

Against APRA's developmentalist program, Mariátegui developed his own through a concrete excavation of Peruvian history but in so doing ran afoul of Stalinist orthodoxy. During the period prior to the Comintern's 1929 ultra-leftist turn, the strategy imposed by Moscow was not entirely distinct from that of APRA: an antifeudal, anti-imperialist alliance with the national bourgeoisie. But unlike both APRA and the Comintern, Mariátegui was acutely aware that to be antifeudal was not the same as to be anti-imperialist or anti-capitalist. In other words, a variety of classes were willing to replace the landed aristocracy as liaisons of international capital, a willingness that was rooted in large part in the racial divisions that divided Peru.

But here, Mariátegui faced a serious problem: Of all the social classes constituting the Eurocentric Marxist imaginary, he could see none as potential revolutionary agents. Given the lack of capitalist development, the growth of proletariat and bourgeoisie was stunted, and intermediate sectors like the so-called middle class and petty bourgeoisie

were as apt to side with imperialism as the capitalists themselves. Mariátegui's response to this difficulty began in his historical studies of Peruvian society, published in 1928 as *Seven Interpretive Essays on Peruvian Reality*. There Mariátegui began to develop the understanding of a new revolutionary subject and social formation suitable for Latin American, and specifically Peruvian, conditions: Indo-American socialism. Rather than making a straightforward appeal for the revolutionary nature of the peasantry, Mariátegui instead identified Incan communism as a traditional Peruvian communal structure (like the Russian *obshchina* recognized in Marx's famous 1881 letter to Zasulich) that could serve as the basis for a modern socialism.

Mariátegui's appeal to local conditions was more than mere expediency but instead constituted a direct criticism of the Eurocentric importation of Marxist theses. This tension with Comintern strictures is evident from the fact that Mariátegui vacillated for nearly a year before forming his own party; and when he did, it bore *not* the prescribed name *communist* but was instead dubbed the Peruvian *Socialist* Party. It was not associated officially with the Comintern until a month after Mariátegui's death.

Popular Fronts to *Foquismo*

In 1935, the Comintern swung wildly to the opposite extreme once again, moving from a policy of ultra-leftism, which denounced all non-communist social-democratic forces as "social fascists," to a popular front alliance with these same forces (including Peru's APRA). Responses to this strategy varied, but the period immediately after World War II was marked by a disintegration of Marxist forces, as critiques of official party and Comintern line proliferated and alternative strategies were sought. Trotskyite sects were proliferating, and local militias emerged beyond Communist control. No single event shook the categories of Latin American Marxism as profoundly as did the 1959 Cuban revolution.

The unexpected revolutionary success of a small and ill-prepared group of revolutionaries confounded official Marxism for a number of reasons. First, this was not a Marxist revolution, but rather a national popular rebellion led by petty bourgeois students under the influence of such Cuban thinkers as José Martí. Moreover, the official representatives of Cuban communism played no role in the rebellion. Finally, if the strategy adopted by the rebels could be interpreted as an extension of Leninist voluntarism, the revolution occurred without the help of a party but rather through the disciplined engagement of a small number of guerrilla fighters. This last element proved explosive—both in the positive and negative sense—creating both high hopes and severe disillusionment.

The transformation of the Cuban revolutionary experience into an exportable doctrine occurred—not coincidentally—through the intervention of a European, specifically the young French philosopher Régis Debray. In his *Revolution in the Revolution,* Debray sought to self-consciously create a Cuban model of revolution, one in which the party (and indeed politics) was replaced by a small unit of guerrilla fighters, or *foco;* hence, the name the doctrine became *foquismo*. Disciplined and highly mobile—and hence organically detached from local communities—the *foco* was seen as the veritable creator of the subjective conditions necessary for a revolution through its daring attacks, which revealed the vulnerability of the state. While the radical voluntarism of *foquismo* was understandably liberating compared to Communist Party popular-frontism, its very intoxicating nature led Debray and others both to misrepresent what actually happened in Cuba and to lead the continental revolution astray.

Inspired by the Cuban example and *foquista* theory, young Latin Americans neglected their own local conditions and took to the hills. From the Dominican Republic to Venezuela, they learned their lessons quickly, and after a series of crushing defeats and setbacks, they began to think more critically about existing models. Many, taking inspiration from the Chinese and Vietnamese struggles—later bolstered by the development of Maoist and pro-Chinese currents—adopted a more long-term strategy of prolonged popular war, which entailed more substantial roots in the popular masses and the development of liberated zones. In fact, the Colombian FARC guerrillas, whom Debray had severely criticized for their strategy of holding zones of militia-type self-defense such as Marquetalia, came to represent the most stable and effective of Latin American guerrilla armies. In

other countries like Nicaragua, experimentation with both *foquismo* and prolonged popular war led to a sort of hybrid strategy, which eventually found success in the 1979 overthrow of Anastasio Somoza.

Alongside this critical development of *foquismo,* the popular front strategy had its greatest successes and greatest defeats within a few short years in Chile. The Chilean Popular Front, the showcase of the success of a prior era of Comintern dictates, catapulted the socialist Salvador Allende to the presidency in 1970. However, if the neglect of the military factor was endemic to popular frontism, this too was Allende's downfall, as his refusal to rupture the military's monopoly on violence and arm his popular support base eventually ensured that there would be no organized resistance to the expected 1973 coup.

Toward the other extreme, the same period that saw Allende's election also saw the birth and development of various urban guerrilla movements, most spectacularly Carlos Marighella's National Liberation Action in Brazil and the Uruguayan Tupamaros. Attempting to come to terms with the demographic transformations of certain Latin American countries—Uruguay was the most urbanized country in Latin America—urban guerrilla movements rejected Debray's rural focus while nevertheless maintaining many of his tactical prescriptions.

From Dependency to Coloniality

As Marxist-inspired political movements were flourishing in Latin America against the straitjacket of Comintern orthodoxy, so too were certain theoretical currents engaged in the effort to provide a new understanding of capitalism, more relevant to the Latin American experience. Most notably, a number of economists centered around the Raúl Prébisch and the CEPAL/ECLA in Santiago de Chile began to develop what would come to be termed *dependency theory*.

Although they were not explicitly Marxist in orientation, the Cepalistas sought in many senses to transpose Marxism onto the global capitalist system, a sort of updating of Lenin and Rosa Luxemburg's theses on imperialism. Identifying the economic circuit by which raw goods were extracted from less developed countries, shipped to wealthier nations for manufacturing, and resold to the poor countries at a premium, dependency theorists had identified the source of the continued impoverishment of the third world. Such a view opposed the linear developmentalist models of so-called modernization theory by arguing (as had Mariátegui) that more capitalism led to more inequality, and not vice versa.

This early work on dependency theory fed into several later currents, most notably the world-systems theory pioneered by sociologist Immanuel Wallerstein, in which dependency theory's binary core-periphery model was supplemented with an intermediary category of semi-peripheral zones. Later work, such as that of Quijano, further developed these theses in a manner inspired by Mariátegui, arguing for the centrality of colonialism in developing a complex of domination known as "the coloniality of power," which comprised economic, racial-ethnic, sexual, gender, and other elements and cross-cut the periods of formal colonization and decolonization.

These currents have combined with many others, including several strands rooted in liberation theology. A number of philosophers have filtered these strands of theology through a specific form of Marxism and the Mariáteguista demand for autonomous Latin American thought to give rise to what has become known as philosophy of liberation, whose best-known figure is Enrique Dussel.

Post-Soviet Marxism

The period immediately following the dissolution of the Soviet Union was challenging for Marxist-inspired movements worldwide, and Latin America was no exception. Most immediately, the triumphal end of the cold war facilitated President Ronald Reagan's crusade against the Nicaraguan Sandinistas, removed electorally in 1990 through a combination of Contra war and CIA intervention.

The first new movement to emerge in the aftermath of the death of Soviet communism was the Zapatista rebellion in Chiapas, Mexico. Established secretly in 1983 by Maoist-inspired supporters of a prolonged popular war strategy, the Zapatista Army for National Liberation (EZLN) sought to integrate with indigenous peasant communities to construct the basis for a popular revolutionary army. Both through the geopolitical events in the

Soviet Union and the process of fusing with indigenous communities, however, this plan was eventually altered: Socialism and Marxism were not openly discussed, and political hierarchies were deconstructed and replaced by direct, indigenous-led democracy. Exploding into the public view in 1994, the Zapatista movement has since become a symbol of a new form of subtly Marxist-inspired politics, but one that has broken significantly with all official doctrines.

The years since 1994 have seen something of a rebirth of Latin American Marxism, liberated from the yoke of Soviet orthodoxy and free to plow new terrain. The first large-scale movement to openly embrace socialism has been the Bolivarian Revolution in Venezuela. Elected in 1998 as a moderate, Venezuelan President Hugo Chávez Frías has since shifted to the left, driven in large part by a long history of Venezuelan revolutionary movements. Supporters of the Venezuelan process have announced their goal as the construction of a twenty-first-century socialism—in many cases explicitly invoking Mariátegui's Indo-American variety—but the content of this socialism remains to be determined.

LAWGIVERS

Ancient societies traditionally refer to a stage in their history when laws were created and written down. They ascribe it to mythical or historical lawgivers, prophets, or charismatic figures, who played an important part in resolving political or social disputes and in creating a national identity. The Near East produced the Code of Hammurabi (nineteenth century BCE), and Mosaic law preserved in the Torah/Pentateuch (traditionally dated to the early thirteenth century BCE, but probably much later). Some Greek city-states recorded similar phenomena. The best-known Greek lawgivers were Lycurgus at Sparta (date unknown), Draco and Solon at Athens (late sixth/early fifth century), Zaleucus and Charondas in South Italy and Sicily (respectively, seventh and sixth century). They produced clusters of laws rather then full-scale codifications, but these set the basis for a state-enforced legal system and a constitutional framework. However, Greek laws remained rather limited in their scope and impact, in comparison with Roman law and Jewish law (Mishnah, c. 200 CE; Talmud, c. 200–500 CE).

Roman law is one of the most enduring creations of antiquity, as it shaped most modern legal systems. Its development can be attributed to various sources of law, the nature and importance of which changed over time without affecting the coherence of the system slowly emerging from it. Unlike its Near Eastern and Greek predecessors, Roman law emerged from the cumulative production of a large variety of lawgivers over a millennium. It was thereafter used as a source of positive law in many countries or as a model and inspiration in the so-called civil law tradition.

In a textbook (*Institutiones*) that miraculously survived until modern times, the mid-second century CE law teacher Gaius lists the sources of law (*jus*) known to him: statutes (*leges*), plebeian decisions (*plebiscita*), the senate's resolutions (*senatusconsulta*), the emperor's enactments (*constitutiones*),

the magistrates' pronouncements (*edicta*), and the jurists' opinions (*responsa*). Gaius's lawgivers are thus easily recognizable and fall into four categories: the Roman people, gathered in assemblies, in various capacities, but excluding women, resident aliens, and slaves; the Roman Senate, an oligarchic body (composed of former magistrates) whose prestige and authority bore on political life throughout Roman history; the elected—later appointed—magistrates of the Roman people, on the basis of their right to issue edicts and of their competence in controlling judicial procedure, until the Roman emperors took over most of their powers; and, more surprisingly, private individuals (*prudentes*), who issued legal opinions, often at the request of judicial authorities, to fill the juristic gaps left by all other sources of law. These various lawmakers were not equally creative and productive in Gaius's time. Although it reflects Roman law as it had developed over the last half millennium, since the mid-republican period, Gaius's list conceals the changing status of authorities in charge of lawmaking. Conspicuously absent from the list are custom and court decisions used as precedents, the basis of common law and an important source of law in civilist systems.

In Gaius's time, statutes (leges), although still very much enforced, were a thing of the past, first the result of the kings' legislating activity (*leges regiae*), soon to be entrusted to popular assemblies (*comitia*), eventually under the responsibility of republican magistrates, who gave the various laws their names (e.g., *Lex Tullia de ambitu,* named after M. Tullius Cicero, consul in 63 BCE). Statutes were drafted and proposed (*rogatio*) by magistrates, debated in the Senate and subsequently voted by one of the popular assemblies (*comitia centuriata* or *tributa,* occasionally by the *comitia curiata*), publicly proclaimed by the magistrate in charge of the process, registered in writing on wooden or bronze tablets or on stones, and exposed in a public place for everyone to take notice of and to consult. This process of lawmaking could be interrupted at any time for religious reasons (*nefas*) or by a veto from a peer or ranking magistrate or from one of the popular tribunes (*tribuni plebis*). Despite the formal and public aspects of the legislative process, statutes were often very specific in purpose, occasionally retroactive, and altogether lacking in systematization. Roman statutes were not meant to constitute anything resembling a modern law code. They were devised as ad hoc, politically motivated responses to given problems or situations.

One exception is perhaps found in the so-called *Law of the Twelve Tables,* which the historiographical tradition (Livy) assigned to a mid-fifth century BCE committee appointed to provide the city of Rome with the kind of written law code that Greek cities ascribed to lawgivers (cf. above). The 10-member committee (*decemviri*) was expected to write down existing customary/oral laws and to supplement them on the basis of analogy with existing legislation found in various Greek cities at the time. In Roman minds, the provisions of the Twelve Tables constituted the foundation of the Roman civil law (*jus civile*) and were studied by law students until the first century BCE, at least. This code, far from comprehensive, retained great authority even later because some imperial jurists (e.g., Gaius) still commented on it. No more attempt at codification was made before the late third century CE. The text is preserved in a fragmentary form thanks to quotations by literary writers, historians, and antiquarians. Its inner organization is a matter of controversy, and its content deals with private and criminal/sacral law.

Because the voting arrangement of comitial assemblies heavily favored the upper classes, the Roman plebs eventually gathered into *concilia* to vote their own statutes, the scope of which was originally limited to the plebs. This was a natural outcome of the struggle of the orders that plagued the history of Rome from the fifth to the fourth/third century BCE, according to Roman tradition. A *Lex Hortensia* of 287 BCE extended the application of plebiscita to the whole of Roman society, and much of the later republican legislation was enacted as plebiscita (for instance, the *plebiscitum Claudianum* of 218 BCE restricted the right of senators to own freight ships of a certain size; and the so-called *lex Aquilia,* also a plebiscitum traditionally dated c. 286 BCE, provided the legal basis for civil liability up to modern times). The plebs lost most of its legislative powers at the same time as the other popular assemblies, with the transition to the Principate.

Plebiscita, unlike statutes (leges), did not require the formal approval of the Senate. But the senate could also make a resolution on its own, without

the participation of popular assemblies. The *auctoritas* of the senate was such that what the *Patres* considered adequate had a binding status on the whole community and was enforced by magistrates who belonged to the same social stratum. One famous example of this is known in the context of the repression of the Bacchanalia in 186 BCE. The text of the *senatusconsultum* was preserved both as part of Livy's narrative and in a bronze inscription found in south Italy (*Ager Teuranus,* Bruttium). It regulated the rights to form religious associations and had an influence on the later law governing professional associations (*collegia*).

Magistrates' Edicts

The main and most fruitful source of private law during the republican period was, undoubtedly, the magistrates' edicts or *jus honorarium*. As they assumed their yearly functions, Roman magistrates, mostly praetors, aediles, and provincial governors (*proconsules, propraetores*), were required to announce ahead of time the framework of their judicial activities. The edict was merely a list of legal principles that the magistrate took on himself to respect and enforce in matters of private law and civil procedure. It amounted to the promise to grant a legal remedy (*actio*) in given circumstances. Legal rights were inferred from the existence of an appropriate action. According to the famous jurist Papinian (early third century CE), the praetor was thus supposed to "assist, supplement, or correct the civil law (*jus civile*)." Inexperienced magistrates had a tendency to take over some or all of their predecessors' edicts, with the result that major innovations were left to a handful of enterprising magistrates and the edict became more or less fixed as time went by. The most creative phase falls during the last century of the republican period and the early part of Augustus's reign. Under the reign of Hadrian (c. 130), the jurist Salvius Julianus turned the (urban) praetor's edict into an *edictum perpetuum,* the organization of which is reflected in later compilations (Justinian's Code and Digest).

Imperial Enactments

After the reign of Augustus, Roman emperors, as holders of the bulk of political powers, were making judicial decisions (*decreta*) and sending out orders (*mandata*) to their representatives in various parts of the empire. They were also endowed with the right to issue edicts (edicta). Besides, as the highest judicial authorities, they were the recipients of numerous petitions from officials and private individuals to which they (mostly through their chancery) responded with binding decisions (*rescripta, epistulae*). These four types of imperial enactments are called constitutiones. All constitutiones were registered in the imperial archives (*ab epistulis, a libellis*), ready to be pulled out when a similar case arose. Over the centuries, these enactments piled up and became hard to manage without proper codification. A first attempt was successfully carried out under Diocletian (284–305 CE), with the making of the Gregorian and Hermogenian codes, a compilation (and its supplement) of imperial constitutiones from Hadrian (117–138 CE) to Diocletian. Both codes are now lost but were used by Justinianic compilers to make the Justinianic Code in 529 (second edition in 534). A second endeavor of the kind resulted in the making of the Theodosian Code (438), a compilation of imperial enactments dating from Constantine (306–337) to Theodosius II (408–450), by a team of civil servants and law specialists. Most of it has been preserved or could be reconstructed on the basis of later abridgments (*Leges Romanae Barbarorum,* especially the *Breviarium Alarici*). It was also supplemented with the legislation (*Novellae*) passed by Theodosius II and his joint emperor Valentinian III after the promulgation of the Theodosian Code. The last stage of codification was made by Justinian and consisted of a selection from the Gregorian, Hermogenian, and Theodosian Codes and *Novellae,* again supplemented by *novellae* later in his reign. These codifications provide us with a rich collection of imperial enactments in the field of private and public (criminal, administrative, fiscal) law spanning more than four centuries. Most interestingly for historians of Roman law, each *constitutio* is provided with a—sometimes inacccurate—date and provenance, and organized by subject along the same line as the *edictum perpetuum*.

So is Justinian's Digest (published in 533), which preserves an impressive collection of juristic opinions going back to the early first century BCE (Quintus Mucius Scaevola) through the late third century CE (Arcadius Charisius). The jurists of the

classical period (first to mid-third century CE) were the functional descendants of the early republican pontiffs officially in charge of preserving and interpreting the civil law, and ipso facto in control of it. By the first century BCE, some people, originating mostly but not exclusively from the upper classes, were willing to assist magistrates and judges in administering justice by providing technical support in legal matters on a friendly basis (*amicitia*), as members of a consulting group (*consilium*). According to Cicero, jurisconsults were instrumental in defining abstract notions such as "malice aforethought" (*dolus*), good faith (*bona fides*), or equity (*aequitas*). The evidence from the *Digest* suggests that they did much more, commenting on all aspects of private, criminal, and administrative law and engaging in debates on legal issues. The importance of the jurists in lawmaking derives from the lack of professional expertise of both magistrates and judges in charge of the judicial system.

We do not really know how individual juristic opinions fared in courts of law at the time they were issued, but we may presume that some jurists must have enjoyed a significant authority based on the fineness of their legal thinking rather than on their political or socioeconomic background. The second-century law teacher Pomponius wrote a textbook (*Enchiridion*) on the history of Roman political institutions, with due regard to the jurists and their contribution to lawmaking up to the time of Hadrian (117–138 CE). This work has been partly preserved in Justinian's *Digest*. Pomponius recalls the case of Massurius Sabinus: Before being considered the leader of one of two schools of thought (*Sabiniani* as opposed to *Proculiani*), Sabinus was living off his wages as a teacher and reached equestrian rank only late in life, after being promoted by the emperor with the grant of a *jus respondendi,* or permission to produce (legally binding?) juristic opinions, a grant said to have been extended to others but not attested otherwise in our sources. In the late republican period, however, most jurisconsults were part of the senatorial elite. With the change to the Principate, some (e.g., Antistius Labeo) were occasionally at odds with the new political regime but nevertheless could operate freely as consultants. By the second century CE, the jurists had been absorbed by the system and were often holders of high official positions, such as praetorian or Urban prefects, consuls, provincial governors, or civil servants employed in imperial services. The great lawyers of the late second and early third centuries CE, Papinian, Ulpian, Paul, and Modestinus, were very prolific, and remained standard reference for centuries to come, even more so because the strain of great jurists dried up in the mid or late third century CE. Their status as authority in lawmaking was enhanced in the early fifth century, when Theodosius II published his law of citations (426), whereby he gave preeminence to some jurists (those cited above, in addition to Gaius) over others in solving legal issues. The lawgivers of late antiquity were the emperors and their staff, mostly the *quaestor Sacri Palatii.* However, the jurists continued to be active as consultants, lawyers, judges, or teachers. Their opinions, as opposed to those of their predecessors, seem to no longer carry force of law.

Roman Customary Law

No legal system arises out of nothing or operates in isolation. Roman law developed out of Roman customary law and next to other legal systems, which it eventually absorbed or superseded. Many legal concepts and institutions cannot be ascribed to a law and go back to undocumented times and circumstances. This is what the Romans called *mos maiorum* or ancestral tradition. Lawyers and parties could refer to it in courts. Sometimes referring to it got them a hearing; but they got a hearing more by chance than because custom was recognized as a source of law on a par with the other sources already mentioned. Laws and customs from annexed peoples found their way into Roman law. We know from Cicero that written contracts (*syngraphai, cheirographai*) were borrowed from the Greek world and recognized as valid by magistrates. Likewise, the so-called *Lex Rhodia de iactu* governing jettison possibly originated in the customary maritime law of the island of Rhodes in the classical or Hellenistic period and was commented on by classical jurists and expanded by some second or early third-century emperor. Less specifically, the jurists occasionally refer to *mos regionis* to fill voids in Roman law. Contamination could result in a hybrid legal

system as evidenced in the papyri from Graeco-Roman Egypt, showing significant discrepancies between theoretical Roman law and its practical application in a multicultural society.

All the above concern mostly Roman civil law (*jus civile*). The Romans, however, were aware of the fact that they shared some of their legal institutions with other peoples, if not with the whole of mankind, or even the animal kingdom. Justinian opens his own textbook, published in 533, with a reference to "Nature" as a teacher of law: As animals instinctively develop a kind of *matrimonium* (*coniugatio*) with a view to procreating and rearing offspring, all men endowed with a *naturalis ratio* are bound to produce universal and permanently valid laws (*jus naturale* and *jus gentium*), guaranteed by "a certain divine Providence." These were out of reach for Roman lawgivers, who were to focus instead on the more volatile and adaptable *jus civile*.

Law of Nations

The *law of nations* was the old term for what is now called international law, which purports to establish rules and obligations of sovereign states. It is obviously a special kind of law or a quite imperfect law because no international authority can enforce this law in the same way that states enforce law on their own people.

In the history of political thought, however, this seeming imperfection made the law of nations an especially attractive model for general theories of law and justice. If each national government is obligated to honor the law of nations, then that law must have, in some way, a more fundamental status than national law. The law of nations was thus held to illustrate the fundamental principles of the law of nature. Some of the most influential writers on modern natural law presented their doctrines in treatises on the law of nations.

In late antiquity, manuals on Roman law referred to an *jus gentium*—literally, law of nations. Roman jurists regarded this law as embodying minimal standards of justice, standards by which a Roman court could settle disputes involving foreign merchants. Medieval commentators, including Thomas Aquinas, refer to jus gentium in this sense as a set of generally agreed standards, elaborating principles of natural law but still firmly bound by natural law.

The modern term *international law* was coined by the English reformer Jeremy Bentham in 1789 to emphasize that this law should be limited to "mutual transactions between sovereigns" (matters *between* nations or *inter*national). The new term was quickly taken up in all European languages (*droit internationale, derecho internacional,* etc.) because the idea was already quite congenial to nineteenth-century governments, busily establishing national legal codes to standardize their own domestic law.

Yet, the most influential thinkers of the seventeenth and eighteenth centuries did not reject natural

law—as Bentham, himself, did, in the name of the new doctrine of utilitarianism. The great texts of the early Enlightenment instead took the relations between sovereign states as illustrations of a new (although already more restricted) understanding of natural law.

Medieval thinkers had not given sustained attention to the relations between sovereign states. In medieval Europe, where the pope and the Holy Roman Empire still claimed vaguely defined governing powers over all Christendom, no local ruler conceived himself as entirely independent. Neither *sovereignty* nor *state* was a recognized term in medieval writings, let alone a familiar reality.

Modern ideas about the law of nations arose after the Reformation had broken the unity of Christendom, when energetic princes worked hard to fortify their own territories. The Dutch jurist Hugo Grotius (a nominal Calvinist) published his great treatise, *On the Law of War and Peace,* in 1625—in the midst of the Thirty Years War between Protestant and Catholic powers. He emphasized the rights of sovereign rulers against others, analogizing sovereign rights to property rights, exercised at the will of the owner. Grotius is often credited with providing the first systemized account of international law (in Bentham's sense of the term). Not coincidentally, Grotius was also the first to give a full and clear account of subjective rights—rights viewed from the owner's perspective, emphasizing the right to choose rather than what would be right from an outsider's perspective.

Grotius himself still invoked Aristotleian notions of human sociability to explain why sovereigns would feel obligated to obey the rules of the "great society" of rulers—what was later called the community of nations. Yet, Grotius insisted that non-Christians as well as heterodox Christian rulers could be part of this community and went to some lengths to show that rulers had no necessary obligations to their own subjects, so tyrannical rulers could also be part of this community. Almost all the rules of this very loose community rest on mutual undertakings to respect the rights of other rulers, so that, in the Grotian account, self-interest and consent—rather than older notions of natural law—play the central role in generating the law of nations.

In his *Leviathan,* Thomas Hobbes incorporated many conceptual innovations of the Grotian account and also took the Grotian setting for his starting point: The model for the "state of nature," according to Hobbes, is the condition of sovereign rulers, who remain in this natural state so long as they retain their sovereignty. John Locke's *Second Treatise* envisioned a state of nature in which there was already some natural claim to property and a duty to respect the property of others. But Locke, too, offered the relations between sovereign princes as the model for his state of nature, noting that property rights within each state rest ultimately on an agreement among rulers to respect each other's national domains. But Locke, like Hobbes, still emphasized the insecurity of the state of nature as an argument for consenting to a social contract to establish more reliable government at home.

Other writers held out more hope for international standards—if the rights of states were grounded on the instinct for self-preservation, which seemed such a reliable force in human affairs. The German jurist Samuel Pufendorf, a contemporary of Locke, published a massive treatise, *The Law of Nature and the Law of Nations.* This treatise purported to derive the law of nations from natural reason, where natural reason was associated with Hobbesian ideas about individuals acting to protect themselves.

In the following century, the Swiss diplomat Emerich de Vattel published an extremely influential treatise on the law of nations. It was studied by the American founders and may have inspired some of the phrasing in the American Declaration of Independence. Vattel tried to reconcile edifying rhetoric about rights with recognition of the hard realities of self-interest (as with the interest of neutrals to avoid resisting aggression against others) by giving priority to a voluntary law (established by the practice of states) as against the necessary law (purporting to follow the abstract logic of justice and rights).

In place of Vattel's compromises, Jean-Jacques Rousseau praised the idea of a European peace federation in his "Judgment on Perpetual Peace." The idea was elaborated more systematically in Immanuel Kant's famous essay on "Perpetual Peace." Both derided earlier writers for holding out false promises of security from a law of nations that depended on the self-interest of individual states. Both thinkers also proposed, in their other writings, an exalted vision of human freedom,

perhaps more edifying, certainly more abstract, than the natural law doctrines of their predecessors. As they sought to transcend the political necessities of the quest for security, both Rousseau and Kant ended by abandoning any notion of a natural law rooted in human nature.

The United Nations and various international human rights forums are often seen as contemporary applications of Kantian ideas. They have performed quite poorly in practice, but they continue to be sustained by a characteristic mix of cynicism and utopianism, which prevents participants from disowning institutions they do not actually respect. Early modern thinkers were less ambitious but perhaps more realistic about the sort of justice—and even the sort of peace—which the law of nations could deliver.

LEGITIMACY

Legitimacy can be broadly conceived as the acceptability of power relations. It is used in two different but not necessarily mutually exclusive ways. Those concerned with political science tend to treat legitimacy as depending on the beliefs of the individuals subject to authority. This approach is often called sociological (or attitudinal) legitimacy. It holds that an agent is legitimate if its subjects *perceive* that it possesses the right to rule. By contrast, normative legitimacy is largely prescriptive and favored by political philosophers. On this view, legitimacy is determined by moral considerations, such as whether an institution is democratic, has received its citizens' consent, and protects their human rights. Thus, an institution is legitimate if it has the right to rule and, on some accounts, if its subjects have a duty to obey its commands.

Sociological Legitimacy

Those interested in sociological legitimacy ask a number of central questions. These include: How is the legitimacy of an institution measured? Why do individuals believe certain institutions are legitimate? How many individuals need to support a regime for it to be called legitimate? In general, for a government to possess this form of legitimacy, what matters is not whether citizens like the government but whether they recognize its right to rule. A government can be unpopular among supporters of an opposition party but still be viewed as having the right to rule because it was elected in accordance with constitutional procedures and norms. Yet, if a government goes beyond its jurisdiction and contravenes the procedures and norms that are held to legitimize its rule (for example, by extending the maximum number of terms constitutionally permitted to hold office), then it may be viewed as lacking the right to rule by its population. In addition, if a regime becomes extremely unpopular, then its subjects may question the rules that are viewed as legitimizing it. For instance, citizens may question not only a particular king's rule but also the hereditary privilege of kings, arguing that this way of deciding who rules should be replaced, perhaps by a more democratic system.

Sociological accounts of legitimacy have been criticized for focusing on the individuals subject to an institution's rule rather than the institution itself. That is, an institution's legitimacy is determined by its subjects' beliefs rather than the characteristics of that agent. The problem for sociological accounts is that an agent can sometimes create and enhance its support by indoctrination and by playing on its subjects' fears and thus be supported by individuals with significant misperceptions. Indeed, a number of egregious governments throughout history have been perceived to be legitimate by much of their population.

It is important to remember, however, that strictly speaking, sociological accounts of legitimacy do not attempt to *justify* an agent's authority

by reference to the beliefs of its subjects. Rather, they attempt to explain and understand if, why, and how an institution is *perceived* to have the right to rule. For instance, the use of propaganda might mean that a government possesses sociological legitimacy, but this is not to assert that the use of propaganda is morally acceptable.

Normative Legitimacy

Normative approaches to legitimacy assert that an agent is legitimate if its rule coheres with certain moral considerations and is therefore morally justifiable. Among normative approaches, however, there is significant divergence about what constitutes a morally relevant consideration and, therefore, what is necessary for an agent to possess legitimacy.

A consequentialist approach to legitimacy holds that an agent is legitimate if it achieves good consequences. This approach itself has a number of variants. The most prominent is utilitarian: An agent is legitimate if it maximizes its subjects' (or overall) utility. Certain utilitarian approaches, however, run into difficulties with offering a convincing account of political obligation. This is relevant if we hold that legitimacy entails a duty to obey the authority's commands. In particular, direct act-utilitarian accounts struggle to explain why an individual should obey an authority's commands in situations where this would not directly maximize utility. For instance, they struggle to explain why an individual should obey traffic laws if there will be a direct benefit from disobeying them.

A leading consequentialist alternative that attempts to get around such problems is presented by moral and legal philosopher Joseph Raz. Two theses lie at the heart of Raz's account of legitimacy. First, according to the dependence thesis, a legitimate institution needs to serve the governed. That is, it must govern in conformity with the reasons that apply to its subjects (their dependent reasons). For example, a puppet government that makes decisions in response to the wishes of a foreign power, rather than the reasons that apply to its citizens, would be illegitimate. Second, according to the normal justification thesis, a legitimate institution needs to be effective at serving the governed. That is, the legitimacy of an institution depends on whether it successfully promotes its subjects' compliance with their dependent reasons. Together, the dependence and normal justification theses capture the intuition that legitimate authorities should, first, serve the governed and, second, do so effectively.

A third thesis, the preemptive thesis, entails that individuals should trust a legitimate authority's judgment on a number of issues, rather than questioning each of its commands. This is because letting a legitimate authority preempt our judgment can be the best way of securing what is important to us (our dependent reasons) in the long run. There are a number of potential reasons why this might be the case: A legitimate authority may be less likely to have a bias; deciding for oneself whether to obey the commands of an authority can cause anxiety and costs time and resources; and an authority can ensure cooperation among parties that disagree.

The main objection to consequentialist approaches to legitimacy is that, on such approaches, an agent can be legitimate because it effectively promotes its subjects' utility or dependent reasons, even though these individuals reject its rule. It seems odd to view an institution as legitimate that clearly lacks its subjects' support. For example, benevolent dictators may look after the interests of their citizens, but if these citizens clearly oppose their rule, it does not seem that the rule can be legitimate. This problem is sometimes claimed to stem from the fact that the consequentialist approach overlooks the moral significance of deep and reasonable disagreement among individuals about how society should be governed. In short, it is argued that a legitimate institution needs to be sensitive to individuals' judgments on the proper organization of society, yet this is not a requirement of the consequentialist approach.

For this reason, some prefer a democratic account of legitimacy. The argument runs as follows: There is reasonable disagreement among individuals about the correct organization of the governing institutions of society; second, given this disagreement, it is important that individuals can see themselves as being treated as equals in decisions made; and, third, democratic decision-making is the clearest way that individuals can see themselves as equals in decisions made.

These concerns about the consequentialist view also, to a certain extent, prompt the contractarian

account to legitimacy. Historically, this has been the dominant approach to legitimacy in political philosophy. The central concern of contractarians is how to reconcile individual autonomy and political coercion. In short, they assert that an agent is legitimate if the individuals under its jurisdiction have consented to its rule. Here the line between normative and sociological accounts of legitimacy can blur. Both contractarian and sociological accounts of legitimacy hold that an institution's legitimacy depends on the support or consent of its subjects. The two approaches differ fundamentally, however. The sociological approach asserts that an agent's legitimacy depends *conceptually* on the support of its subjects. By contrast, the contractarian approach holds that the consent of its subjects is necessary for an agent's legitimacy because this is *morally* required.

What form do contractarians think that this consent must take? Prima facie, express consent is most consistent with individual autonomy. An institution is legitimate only if its subjects have explicitly consented to its rule. But express consent is difficult to establish at the state level. It is rare for citizens to vote whether to belong to a particular state, and even when there are such plebiscites (such as a referendum on potential secession), the wishes of a minority may be left unsatisfied. This raises the problem of unanimous support: On a strict contractarian approach, express consent of all the individuals under the jurisdiction of a particular state is required for that state to be legitimate. This is unlikely, but without it, the state imposes its rule on one or many individuals without their permission and, therefore, in contravention of their autonomy.

One potential way around these difficulties is to turn to two other forms of consent. The first is tacit consent, whereby individuals tacitly convey their endorsement of an agent's rule. Potential indicators of tacit consent include: voting in democratic elections because by voting, citizens consent to the government's rule; not engaging in civil disobedience because by obeying the government's laws, citizens show their approval for its rule; and residing in a particular state because citizens consent to the government's rule by choosing to live under its jurisdiction. It is unclear, however, whether any of these potential indicators is reliable. To start with, citizens may abstain in elections. Alternatively, they may see their vote for a particular party as a way of securing their interests and, consequently, do not intend their vote to be an endorsement of the government's right to rule. In addition, they may not engage in civil disobedience for other reasons (e.g., to avoid punishment). Finally, individuals often have no choice but to reside in one state (e.g., they cannot afford to emigrate, and other states limit immigration).

The second alternative is hypothetical consent. Hypothetical contractarians determine the characteristics necessary for an institution to be legitimate by considering to what rational individuals would, hypothetically, consent. For instance, if asked, rational individuals would consent only to a democratically elected government with strong principles of distributive justice to limit potential inequalities. This approach places much weight on suppositions about to what rational individuals would hypothetically consent. The obvious problem is that such accounts may be mistaken. Indeed, there is substantial variation among hypothetical contractarians about what rational individuals would agree to and therefore what sorts of characteristics are necessary for an institution to possess legitimacy.

That said, the protection of basic human rights does seem to derive obviously from hypothetical consent. A government that violates the basic human rights of its citizens would not be able to win their support and therefore would be illegitimate. For this reason, the protection of basic human rights is viewed by most hypothetical contractarians as crucial for an agent's legitimacy. More generally, it is worth noting that most normative accounts hold that the effective protection of basic human rights is a necessary condition of legitimacy.

It is also worth noting that many theorists hold that a number of moral considerations are relevant for legitimacy. For example, in his generally consequentialist account, Raz allows some scope for consent and respect for the law in a secondary supportive role to the normal justification thesis, to help to meet the burden of proof required to establish legitimacy. Others hold that, in addition to the protection of basic human rights, democratic institutions are necessary for legitimacy. In a similar vein, although political scientists and political philosophers tend to draw a line between

legitimacy and legality, many normative accounts give weight to legal concerns in the overall assessment of legitimacy. That is, one factor in an institution's (normative) legitimacy is whether it governs in accordance with certain legal norms surrounding its rule. For example, a regime that illegally usurps rule may be held to be both illegal—because it contravenes the laws and constitutional provisions on the proper formation of government—and illegitimate—because these laws and constitutional provisions are morally valuable. A number of moral considerations may be relevant, then, when thinking about normative legitimacy.

Political Obligation

Normative legitimacy entails that the rule of a particular institution is justifiable because this institution meets certain moral standards. Some assert that it follows that individuals under the jurisdiction of this institution—its subjects—have a duty to obey its laws and commands. In other words, legitimacy entails political obligation. More specifically, individuals have at least a prima facie duty to obey the commands or laws of the authority, regardless of the content of these commands or laws—there exists a content-independent reason to obey. The point, then, is not that subjects are obliged to obey legitimate authorities because otherwise they will be punished or because the laws or commands are good ones. Rather, individuals are obliged to obey the directives of a legitimate authority *simply because* they are the directives of that authority. For example, we have a duty to obey the speeding laws of a legitimate state because these are the laws of the state, regardless of whether they are good laws or whether we will be fined if caught speeding.

Why might we hold that individuals have a duty to obey legitimate institutions? We saw above that Raz argues that because a legitimate authority effectively promotes its subjects' dependent reasons, the subjects will benefit from letting an authority preempt their judgment (legitimate authorities are better at getting their subjects to comply with dependent reasons than individuals are acting alone). Many contractarians also hold that individuals have a duty to obey legitimate institutions. For instance, Thomas Hobbes claims that we have given our consent to the sovereign and so are morally obliged to follow its commands in turn for its protection.

A number of theorists, however, doubt the possibility of political obligation and, as a consequence, legitimacy. These philosophical anarchists argue that individuals do not possess a content-independent duty to obey the commands of government (although they may still have a duty to obey stemming from other reasons, such as the possibility of punishment and the fact that the law is a good one). Governments do not achieve the moral standards required for legitimacy (some doubt whether such standards are in fact possible). Thus, the tying of political obligation to legitimacy leaves open the possibility that there may be no legitimate institutions.

Weaker versions of normative legitimacy, however, do not insist on a necessary connection to political obligation. They simply hold that an agent whose rule is morally justifiable is legitimate—individuals do not necessarily possess a content-independent duty to obey its commands. Such accounts may also lower the bar for the moral standards required for an agent to be legitimate.

Lenin and the Russian Revolution

The fall of the tsar in March 1917 made possible a wide-ranging struggle within Russian society that resulted eight months later in the Bolshevik Revolution. Lenin, the leader of the Bolshevik Party, navigated his way through the choppy waters of 1917 with a set of ideas that originated from a variety of sources. One such source can be called Old Bolshevism, that is, Bolshevism as it appeared in the years between the revolution of 1905 and the outbreak of World War I in 1914. In this earlier period, Bolshevism was primarily a Russian solution to Russian problems. A second source was the Left Zimmerwald movement, a current within European socialism that arose in 1915 as a radical response to the challenge of the war and the perceived betrayal of the majority socialists, who supported the war effort of their respective governments. Lenin was the foremost spokesman for the Left Zimmerwald movement. A third source was the hope that Russia, if led by a worker's government, could make "steps toward socialism," even in the absence of a European-wide revolution that would compensate for Russia's backwardness. This idea was an unexpected part of Lenin's 1917 program and appeared in his writings only after revolution broke out in Russia in February 1917. Yet, Lenin was careful to provide even this idea with orthodox Marxist underpinnings. Indeed, Lenin insisted on his own unoriginality. He emphatically asserted that he was merely drawing the tactical conclusions from positions accepted before the war by Europe's most prominent socialist spokesmen.

Old Bolshevism

Starting from its beginnings in the 1890s, the most urgent task facing Russian social democracy was the democratic revolution, that is, the overthrow of tsarist absolutism and the establishment of basic political freedoms. Social democrats regarded basic constitutional rights such as free speech, right of assembly, and right of association as "light and air" for the proletariat (the "light and air" metaphor was fundamental to social democratic rhetoric). Only with political freedom could the Russian proletariat follow the trail blazed by European workers, particularly the Germans, and build a large mass party that ceaselessly propagated the socialist message by all available channels.

The urgency of the goal of political freedom was something on which all Russian social democrats agreed. Also common coin was the assumption that the anti-tsarist revolution could succeed only if energetically supported by the Russian proletariat—indeed, only if the proletariat played a leadership role. In the years before 1905, Lenin had been a principal spokesman for this outlook, one that was particularly associated with the underground newspaper *Iskra*. Lenin had an almost romantic confidence about the revolutionary inclinations of the Russian workers. He was, therefore, hopeful that even a small and persecuted underground party could be the lever that would overturn Russia, as he put it in a famous passage from his book, *What Is to Be Done?* (1902). Lenin's platform in this period can by paraphrased by the exhortation: Let us build an underground party as much like the German Social Democratic Party (SPD) as is possible under tsarist absolutism, so that we can overthrow the tsar and institute the political freedom needed to build a party even more like the SPD.

As a distinctive strategy for accomplishing the urgent task of overthrowing tsarism, Bolshevism arose during the 1905 revolution and only took final shape in the following years. According to the Bolshevik analysis of Russian society, the peasantry was the only nonproletarian class that could be counted on to be thoroughly revolutionary and anti-tsarist due to the peasants' desire for land. The primary task of the Social Democratic Party was, therefore, to get the peasants to follow the lead of the revolutionary workers rather than the liberal bourgeoisie. As the Bolsheviks saw it, the liberals also wanted political freedom but were so afraid of revolutionary upheaval that they were perpetually ready to compromise with tsarism.

The Bolsheviks were so determined to carry out the democratic revolution "to the end" (*do kontsa*) that they were ready to assume governmental power in coalition with peasant parties. This readiness was a violation of the taboo felt by many social democrats against any socialist participation in a bourgeois government. The other main faction within Russian social democracy, the Mensheviks,

rejected the possibility of a "provisional revolutionary government" of this type. The Mensheviks also looked on the peasants as an unreliable and sometimes even a reactionary force. The Menshevik strategy, therefore, aimed at forcing the liberal bourgeoisie to act in a revolutionary manner. Despite the Menshevik claim to greater Marxist orthodoxy, the Bolshevik strategy received the imprimatur of two of the leading lights of European social democracy, Rosa Luxemburg and Karl Kautsky.

Left Zimmerwald

Zimmerwald is a small resort town 10 kilometers south of Bern, Switzerland. In September 1915, a small group of European socialists who opposed the war met in Zimmerwald to discuss ways of ending the war. Lenin and other Russian socialists such as Iulii Martov and Karl Radek were original members of this group. Lenin was dissatisfied with the outlook of the Zimmerwald majority, so he became the principal spokesman for the current known as Left Zimmerwald. Unlike the Zimmerwald majority, Lenin wanted no talk of peace as the overriding goal. Only socialist revolution could cut off the capitalist roots of war, and socialist revolution, in the short term, might require more fighting rather than less. Lenin also felt that the Zimmerwald majority was too easy on socialists who supported the war and consequently too sentimental about the possibility of resurrecting the Second International (the international organization uniting Europe's main socialist parties prior to 1914).

Lenin summed up the tactics of Left Zimmerwald with the slogan "turn the imperialist war into a civil war!" In other words, use the crisis that was sure to be caused by the war to foment socialist revolution. The *civil war* in this slogan was meant to contrast both with the imperialist war between nations, which pitted proletarian against proletarian, and with the *civil peace* within nations. Civil peace was a pledge to suspend class struggle against the capitalists for the duration. The most famous example was the *Burgfrieden* declared in Germany by the majority leadership of the SPD—a pledge that shocked many socialists, not only those on the far left.

The Left Zimmerwald slogan translated into three main tactical demands. The first of these demands was to work for socialist revolution in Western Europe. Lenin felt no need here to prove that the objective conditions in Western Europe were ripe for a socialist revolution; (he claimed) this had been admitted before the war by all influential socialists in all advanced countries. The war had created a revolutionary situation, and it was the plain duty of any socialist to take advantage of it. Of course, to work for revolution during wartime would weaken the war effort. Lenin accepted this consequence because an imperialist war was by definition an unjust war. He realized that to urge socialists in enemy countries to weaken the war effort would be transparently hypocritical. Therefore, Lenin insisted that working for the defeat of one's own government was a litmus test for a revolutionary socialist.

The second tactical demand of Left Zimmerwald was to found a new socialist international, free of the opportunism that had brought down the Second International. Underneath Lenin's political calculations was an emotional call for purification. He argued vividly in a letter of December 1914 that the European war had at least performed this service to international socialism: It had disclosed the whole extent of the rottenness, vileness, and meanness in opportunism, thereby helping to purge the worker movement of the dung that had accumulated during the decades of peaceful socialist work.

The third tactical demand was to support non-socialist democratic movements in Europe and around the world. Many of Lenin's Left Zimmerwald colleagues felt that national self-determination was yesterday's slogan: unattainable in the age of imperialism, unneeded in the coming age of socialism. Lenin felt strongly that this issue was a litmus test of a person's democratic convictions. National self-determination was one part of a global scenario that emphasized the interaction of socialist revolution in Europe with democratic national liberation all around the world.

Lenin's Left Zimmerwald program was based solidly on ideas that (as Lenin himself insisted) were admitted before the war by all influential socialists in all advanced countries. Particularly influential for Lenin were the prewar writings of Karl Kautsky. Lenin stated in 1916 that he and his fellow Left Zimmerwaldians completely agreed with what Kautsky had been arguing prior to 1914

but that Kautsky had shifted (as Lenin put it) from Marxism to the defense of chauvinism. Lenin's steadfastly high opinion of Kautsky's prewar writings is obscured by his obsessive polemics against Kautsky's wartime writings, in which he attacked something he called *kautskianstvo*. Although this term is translated *Kautskyism,* it does not mean the ideas put forth in the canonical prewar writings of Karl Kautsky. Rather, *kautskianstvo* is the use of high-sounding revolutionary phrases to smooth over contradictions and evade action, in the manner of Kautsky after 1914. A person did not have to agree with Kautsky or even be a Marxist to be guilty of *kautskianstvo*. Lenin's acknowledged debt to Kautsky helps explain why Kautsky and *kautskianstvo* occupy such a central, even obsessive, place in his writings after 1914. Lenin hated Kautsky because he loved Kautsky's books.

Although the majority of Lenin's writings and activities after the outbreak of war in 1914 focused on Europe, the revolution in Russia still remained close to his heart. Lenin's insistence on the impending socialist revolution in Europe did not mean he abandoned his long-held view that Russia was still approaching the democratic revolution for political freedom rather than the socialist revolution. In a crucial document written in October 1915, Lenin showed how he joined Old Bolshevism with Left Zimmerwald. Here he wrote that the task of the proletariat in Russia is to carry out the bourgeois democratic revolution in Russia to the end [*do kontsa*], *in order* to ignite the socialist revolution in Europe (Lenin's emphasis).

Lenin's article of October 1915 sketches out a possible scenario that later furnished the basis of the Bolshevik program in 1917. An anti-tsarist revolution in Russia brings revolutionary chauvinists to power, that is, revolutionaries whose motive in removing the tsar was that he was bungling the war effort. In this case, the Bolshevik slogan would be: "against the chauvinists, even if they are revolutionaries and republicans." The Bolsheviks strive for a second stage of the revolution, in which the proletariat assumes the leading role, supported by the "petty bourgeois peasantry" that had been pushed to the left by the burdens of war. This second stage of the revolution resurrects the soviets of 1905, acting now as the core of a new sovereign authority (*vlast*). Such a "revolutionary dictatorship of the proletariat and peasantry" would then "resolutely carry out the whole of our minimum program" and also propose a just peace. This peace proposal would not be made with any expectation of actually ending the war because the capitalist belligerents would never accept a policy of no annexations. But Russia would now be in a position to wage a just *revolutionary* war, aimed at socialist revolution in Europe and anticolonial revolution around the globe. Lenin was completely confident that a victory of the proletariat in Russia would create extraordinarily favorable conditions for the development of revolution both in Asia and in Europe, as shown earlier by the revolution of 1905 in Russia.

Thus, the idea that the highly democratic soviets created in the revolutionary storm of 1905 could become the basis of a new type of state authority was already part of Lenin's program two years before the Bolshevik Revolution in October 1917. Also derived from the experience of 1905 was Lenin's insistence on smashing the counterrevolutionary potential of the army, police, and the elite bureaucracy. Due to a rereading of Karl Marx and Friedrich Engels undertaken on the very eve of the outbreak of revolution in Russia, Lenin became convinced that these ideas had the posthumous blessing of the founders of Marxism. This conviction formed the basis of *State and Revolution,* written in 1917 and published in 1918.

"Steps Toward Socialism"

The combination of Old Bolshevism and Left Zimmerwald found in Lenin's theses of October 1915 is silent on one crucial question: How would the workers' government respond to the spiraling economic crises caused by the war? In the case of the European socialist revolution, Lenin had a ready answer to this question. He pointed to the centralized economic apparatus that had been created by advanced capitalism and then perfected and given vast powers by the wartime state, and he argued that a worker government would use this apparatus to move toward socialism. As he wrote in December 1916,

> If, for instance, Germany can direct the economic life of 66 million people *from a single center,* and strain the energies of the *narod* to wage a predatory war in the interests of 100 or 200 financial

> magnates or aristocrats, the monarchy, etc. then the *same* can be done, in the interests of nine-tenths of the population, by the non-propertied masses, if their struggle is directed by the purposive workers, liberated from social-imperialist and social-pacifist influence Expropriate the banks and, relying on the masses, carry out in their interests the *very same thing* WUMBA is carrying out in Germany!

WUMBA stands for *Waffen- und Munitionsbeschaffungsamt,* or Weapons and Ammunition Supply Department—a symbol of the massive state takeover of the economy caused by the war in Germany and in all the belligerent countries.

Any suggestion that this logic could be applied to backward Russia, even in the absence of a socialist revolution in more advanced countries, can be found in Lenin's writings only after the outbreak of revolution in Russia. In an unpublished draft penned on April 8, 1917, the day before Lenin boarded the sealed train that would take him from Switzerland to Russia, he called for measures of economic regulation that he believed would mark the transition to socialism. He granted that socialism could not be achieved in Russia directly, at one stroke, without transitional measures, but he insisted vehemently that socialism was quite achievable and, indeed, urgently necessary as a result of such transitional measures.

This new note was sounded publicly but tentatively in the famous April Theses set forth by Lenin as soon as he arrived in Russia. Although the idea of "steps toward socialism" in backward Russia was a new one, Lenin took care to justify it with traditional Marxist arguments. In the works that best set forth his program for 1917—*The Threatening Catastrophe and How to Deal with It* and *Can the Bolsheviks Retain State Power?*—he argues that trustification within the advanced sectors of the Russian economy, the power of the banks, and the regulatory institutions set up by the tsarist government during the war constituted a solid base for possible steps toward socialism. In fact, movement toward socialism was inevitable—*if* the government responded in a vigorous way to the economic breakdown that was destroying Russian society. But, in Lenin's view, the government's response depended entirely on its class basis.

Take the Power!

Ultimately, the success of Lenin and the Bolsheviks in 1917 was based on the success of the message they sent to the workers, soldiers, and peasants. This message can be conveyed with three words and a punctuation mark: "Take the power!" *Power* here translates *vlast,* a word that could also be translated as "sovereign authority," the ultimate source of legitimacy and decision making. Everybody in Russia realized that the key question that confronted the country after the abdication of the tsar was the identity of the vlast. Everybody realized that only a *tverdaia* vlast, a strong and tough-minded sovereign authority, could effectively respond to the multiple crises buffeting the Russian society.

The Bolsheviks insisted that "the nature of the class that holds the vlast decides everything"—and they meant *everything.* They told the Russian *narod* that as long as the vlast was controlled by their enemies—the landowner, the capitalist, the *burzhui* in whatever form—the imperialist war would continue, the economic collapse would continue, the postponement of radical land reform would continue. Troubles would cease only when the workers as a class took the power and fulfilled their historical mission of leading the *narod* to revolutionary victory.

The Bolshevik slogan of "take the power!" was in striking contrast to the political program of the moderate socialists, who felt that coalition with liberals and other bourgeois forces was necessary. This coalition strategy was embodied in the Provisional Government that was set up immediately after the fall of the tsar. At first, the socialists intended only to support the Provisional Government while remaining outside it, but the pressure of events forced them to take a more and more visible role in the various cabinets that came and went so rapidly in 1917. The moderate socialists became thoroughly discredited in the eyes of the masses by the manifest failure of the Provisional Government to put an end to the interlocking spiral of economic, social, and military crises.

Distinct from the Provisional Government, and more and more hostile toward it, were the soviets created almost immediately after the fall of the tsar. The Bolshevik slogan "All power to the soviets!" was a practical equivalent for "take the

power!" The soviets were class-based institutions that excluded the bourgeoisie by definition. As the year went on, many activists from the other socialist parties began to reject the idea of coalition and to subscribe to a program of soviet power, not restricted to any one party.

Lenin insisted that only a vlast based on the workers and peasants could respond effectively to the national crisis. His concrete policy suggestions were based on the three layers of his evolving political outlook. From prewar Old Bolshevism came the first, land to the peasants. Just as in 1905, Lenin now insisted that local peasant committees take over the land on their own initiative (and he added some thoroughly unrealistic assurances that the result would not be chaos but greater order).

From the layer of wartime Left Zimmerwald, Lenin took peace for the peoples. In accordance with Left Zimmerwald doctrine, the ultimate aim of his projected peace initiative was to spark socialist revolution in the advanced capitalist countries. When the war-weary population of the belligerent countries realized that their governments were actively preventing a just democratic peace, they would rise up in revolt.

Finally, from the most recent layer of "steps toward socialism" came the policy that can be called WUMBA for the people. Lenin convinced himself that the kind of wide-ranging regulation of economic life found in countries like Germany could solve Russia's gargantuan crisis—but only a truly revolutionary, truly democratic vlast would have the energy and nerve to carry it out. "Make a socialist revolution!" was therefore not the heart of the Bolshevik message in 1917, but rather: "create a vlast based on workers and peasants!"

Lenin's Wagers

In Bolshevik eyes, the October revolution represented the establishment of a truly proletarian vlast and the beginning of the long journey along the path to socialism. Lenin's program of 1917 represented a series of wagers on what a proletarian vlast could accomplish. For about a year and a half after the October revolution, Lenin remained confident that the wager would soon pay off. But as the months and years dragged on, Lenin was forced to defer many of his dreams. The introduction of the New Economic Policy (NEP) and the decriminalization of the previously underground free trade in grain in spring 1921 were only the most dramatic steps in a process of rethinking and retreat that began at the latest in 1919.

Out of the three sources of Lenin's 1917 program—Old Bolshevism, Left Zimmerwald, and "steps toward socialism"—the most successful wager was the one taken from Old Bolshevism. The wager that a workers' government could obtain enough peasant support to bring about a vast social transformation of Russia was put to the severest test possible during the civil war but was finally vindicated.

In 1917 and 1918, Lenin had ambitious hopes that the vast economic crisis would stimulate the peasants toward collective, and therefore "higher" forms of agriculture production. In 1919 and 1920, he was forced to admit the collapse of these hopes. In stark contrast to Stalin in 1930, Lenin responded to the failure of a voluntary move toward collective agriculture by insisting all the more strongly that violence could not be applied to force the peasants to adapt higher forms of production.

The Left Zimmerwald wager on revolution in Europe failed almost completely, forcing the Bolsheviks to seek trade relations with bourgeois governments and to foment revolution in what would later be called the third world. The wager on "steps toward socialism" also came up short, and the Bolsheviks were fully aware of the enormous compromises required by the civil war (contrary to a widespread misconception that the so-called "war communism" of 1919–1920 was viewed by the Bolsheviks as a "leap into socialism"). A massive underground market, highly inegalitarian incentive methods in nationalized industry, a growing "new bourgeoisie" made up of speculators and middlemen—these were some of the capitalist features of the Soviet economy, even before NEP.

While acknowledging all these bitter realities, Lenin believed to the end that the most fundamental wager had indeed paid off. "Proletarian power" had been established and successfully defended in Soviet Russia.

LEVELLERS

The Levellers agitated for social, political, and economic reform during the English civil war. They advocated a representative national government based on frequent elections and a broad franchise. They called for a written constitution that guaranteed freedom of conscience, banned trading monopolies, and prohibited military conscription, and they sought to eliminate the political power of the king and House of Lords. The Levellers did not describe themselves as democrats, liberals, or republicans, but they gave voice to essential aspects of each of these modern theories of government.

As a political movement, the Levellers were important for what they did as well as for what they said. They organized petitions that challenged the supremacy of Parliament. They mobilized soldiers and junior officers, disputing the authority of commanders. And they published pamphlet after pamphlet, hundreds in all, to educate and energize the English people. Although the Levellers did not use terms like *popular sovereignty* and *the public sphere,* they helped create the settings within which these concepts thrive.

The leaders of the Leveller movement—John Lilburne, Richard Overton, and William Walwyn—first became acquainted in 1645. Individually and then collaboratively, they argued for freedom of conscience and religious toleration. Starting from these spiritual and ecclesiastical concerns, they turned quickly to reconsider basic postulates of the English polity.

The official manifesto of the Leveller movement was the Agreement of the People. Distinct yet overlapping versions were issued in November 1647, December 1648, and May 1649. Ironically, the intellectual foundation for the Agreement was provided by the very government it sought to reform. In 1642, Parliament defended its decision to take up arms against the king by appealing to the politics of necessity. A "malignant party" surrounded the king, corrupting his judgment and threatening the nation's survival. The ancient maxim *salus populi suprema lex*—the good of the people is the highest law—justified extraordinary measures. According to parliamentary spokesman Henry Parker, "as some precedents ought not to be rules for us to follow, so none can be limits to bound our proceedings."

Parliament presented itself as the essence of the kingdom, "the very people itself artificially congregated, or reduced by an orderly election, and representation." Initially, the Levellers did not challenge this article of faith. But in the spring of 1647, conservative Presbyterians seized control of the government and threatened to end the war by imposing religious uniformity, disbanding the New Model Army, and restoring the king. The Levellers seethed with rage. Parliament could no longer be trusted to protect the common weal. For the first time, the Levellers spoke of returning to a state of nature; for the first time, they called for a movement of armed resistance; for the first time, they promoted their own "way of settlement." The "free Commons of England" was "the real and essential body politic," and it—"or any part of it"—was empowered to preserve the nation.

In this context, the General Council of the Army assembled at Putney to debate the first version of the Agreement of the People. Scholarly

attention has focused on a heated exchange over the franchise. Colonel Thomas Rainborough's riveting claim that "the poorest he that is in England, hath a life to live, as the greatest he," was met by Commissary-General Henry Ireton's equally commanding assertion that only those with "a permanent fixed interest" were entitled to vote. Broadening the franchise was of unquestionable importance to the Levellers. Other momentous issues included whether soldiers were free to disobey the commands of Parliament. The Levellers argued that "unlawful engagements" ought not to be kept. Ireton was unsettled by this claim and countered that if "covenants freely made" and "freely entered into" were not kept, then social order was not possible.

At stake in the Putney debates was not whether there would be constitutional change, but who had the right to define it. Ireton's devotion to the ethic of promise keeping contained an important premise: Soldiers should remain soldiers and allow crises to be resolved by their superiors. The Levellers, by contrast, advocated a broad distribution of political judgment. The first three articles of the Agreement called for frequent elections, a broader franchise, and more equal representation. The fourth and final article, in turn, imposed procedural and substantive limits on the powers of the government.

Contemporary scholars sometimes argue that liberalism and democracy are in tension with each other: The protection of rights appears to threaten the rule of the people. To the Levellers, however, self-government and limited government were inseparable: "the freedoms of this nation will never be secure, until the extent of the power and trust of the people's representatives, and the people's reservations to themselves, be clearly declared."

Leveller power rested on the weakness of others. As long as the leaders of the army and Parliament needed their support, they were able to advance their goals. By mid-1649, however, Oliver Cromwell successfully reasserted military discipline, and the Rump Parliament—having abolished both monarchy and House of Lords—held sway over the government. The Levellers were crushed. Memory of their vibrant ideas and daring practices was lost in the mists of history, only to be rediscovered in the late nineteenth century when transcripts of the Putney debates first came to light. The Levellers have been at the center of debates over the history and meaning of liberal, democratic, and republican ideas ever since.

LIBERALISM

Liberalism is the label for a diverse family of views and practices that began to take shape in England and Europe in the wake of the Protestant Reformation, emerged in several countries as a powerful force in the late eighteenth and nineteenth centuries, and now dominates political discourse throughout much of the world. The interests of this family's many branches extend into matters of government, the organization of society, and the nature of a good life for human beings. Although these branches are loosely united by shared commitments to a set of values and institutional arrangements, they are also susceptible to quarrels and even bitter estrangements.

Early History

The terms *liberal* and *liberalism* acquired their modern meanings gradually throughout Europe

over the first few decades of the nineteenth century, beginning with Napoleon Bonaparte's use of the phrase *idées libérales* in his Proclamation of the 18th Brumaire 1799. In 1810, a faction in the Spanish Cortes that opposed royal absolutism adopted the label as its own, and within a decade, liberalism had entered the English lexicon to signify the holding of liberal opinions in politics or theology. In the early years of the century, English writers often adopted the Spanish form *liberales* to give the label a pejorative connotation—ironically, because the Spanish advocates of liberalism had from the beginning invoked John Locke and other Anglophone authorities in support of their cause. Only in the 1860s did the radical wing of the whigs in British politics begin to call themselves the Liberal Party, about the same time as the Liberal Republicans began to use the label in the United States and a half-century before it was deployed consistently in American political discourse. Thus, the liberal tradition of political thought was originally constructed retrospectively by writers who discovered affinities between their own values and those of earlier thinkers who sought to limit the reach of political authority.

Liberalism emerged as the product of two intertwined developments in early modern Europe. The first was the creation of modern states with the concomitant emergence of semi-autonomous civil societies. The second and roughly contemporaneous development was the invention and spread of a set of values and priorities that broke with the religious traditions that had prevailed in feudal and clerical practice in medieval Europe.

In contrast to other political formations, including the manorial and feudal systems that prevailed in much of medieval Europe as well as earlier and contemporaneous empires, the modern state is characterized by authority that is centralized, extensive, and comprehensive to an unprecedented degree. Although the feudal system, which was based on a network of reciprocal relations in which superiors provided protection in return for obedience and service from those below them in a hierarchy, was arguably rather comprehensive by virtue of the obligations it imposed on vassals and villains, it was highly decentralized. While imperial authority was extensive, it was not at all comprehensive because regions or provinces normally retained considerable autonomy. The modern state, then, is a distinctive formation that deploys concentrated power and adopts standardized techniques to maintain order and extract revenues. At the same time, the modern state draws most of its strength and vitality from a flourishing civil society, which is made possible by a separation of the institutions, powers, and rights of property from those of sovereignty, a separation that was absent in the manorial and feudal systems that prevailed in Europe before the early modern era.

The gradual differentiation of state and civil society contributed to the formation of liberalism in two major ways. First, the standardized techniques and measures on which both modern states and modern long-distance systems of exchange depend included the adoption of uniform codes and rules. For both the state's newly extensive and elaborate structure of authority and extended markets to operate efficiently, a clearly defined and widely applied system of rights and obligations was required. The development of these systems, which came to maturity with the French Revolution and the collapse of the *ancien régime* toward the end of the eighteenth century, provided the intellectual basis for claims about the rights of individuals, which were commonly conceived as expressions of their formally equal civic status.

Second, the concentration of power that underpinned claims of absolute sovereignty in the seventeenth century, coupled with the growth of dispersed power in an emergent civil society, led to objections and resistance to abuses of power by states. Thomas Hobbes, the preeminent theorist of the early modern state, argued in 1651 that no state can be viable over the long term unless it includes some person or body of persons who possess "absolute and arbitrary" sovereign power, adding the deliberately provocative claim that there is no real difference between tyranny and sovereignty. Liberals from Hobbes's time onward have found this claim both preposterous and dangerous, and they have sought to refute it by counterposing inherent rights and liberties of individuals against the state.

The second development that helped spawn liberalism was a shift in religious values and priorities. In retrospect, the most conspicuous early sign of this shift can be found in the writings of the Protestant reformers, especially Martin Luther. Repudiating the prevailing teachings and practices

of the Catholic Church, Luther insisted that Christian faith involves a direct relationship between the individual and God, requiring no institutional intermediary, such as a priest or a church. Luther's own attitudes and assumptions were no more liberal than those of his Catholic antagonists. Like them, he believed that there exists a single correct set of beliefs about matters of ultimate importance and a single right way of life for human beings. His principal difference with Catholic orthodoxy lay in his insistence that each individual Christian should grasp and believe in these truths, rather than trusting to ecclesiastical institutions for spiritual guidance. This line of thought naturally encouraged the conclusion that nothing could be more important to a person than freedom of conscience and, by extension, the freedom to shape his or her own life in accordance with his or her beliefs.

Luther and other early reformers believed that once Christians were freed of the encumbrances of clerical authority and church traditions, they would find their way to the one correct interpretation of Christian scriptures and the one true way of Christian life. In fact, the Reformation spawned a rapid proliferation of doctrinal differences, the formation of a large variety of rival churches and sects, and ultimately protracted violent conflict among protagonists with deep religious and other differences. To avoid the resulting destruction and expense, rulers began, often grudgingly, to accept the coexistence of rival faiths within their own territories and in neighboring states. This policy of religious toleration began as an expedient. Only later would social critics depict it as required by moral and religious principle.

Even as an expedient, however, the policy of toleration signaled a shift in priorities from a value system that at least ostensibly placed highest priority on salvation and the world to come to one that, as a practical matter, treated the lives, liberty, and well-being of individuals as the preeminent priority of policy. As this shift gradually took hold, the Lutheran commitment to the idea of freedom of conscience came unmoored from Luther's assumption that this freedom would lead people ineluctably to embrace the one true way of life. The idea of freedom of conscience began to acquire a truly liberal character. It gradually became associated with the anti-Lutheran assumption that there is *no* one true way of life, at least not one that is accessible to finite human beings on this Earth. With this transformation, the central values on which liberalism rests had emerged.

Political Ideas

The theory of liberal constitutionalism was the first and most basic model of a liberal political regime. It seeks to arrange institutions so that they disperse power as widely as possible while preserving sufficient concentration of power to maintain the security of individuals and to enforce the law. This theory, which was developed by John Locke, the baron de Montesquieu, James Madison, and others, was a response to the theory and practice of royal absolutism. Four points, including accretions to the theory after Locke's time, constitute the framework of the theory. First, the power of rulers should be limited by clear definitions of the scope of their authority and by a division of governing authority into discrete functions performed by separate individuals or bodies of individuals (separation of powers). Second, rulers should be constrained by the rule of law. In other words, they should rule by promulgating laws that are knowable to all as well as general in form and universal in application, so that they apply to the rulers as well as to all other citizens. Third, the state must respect certain rights of individuals, including a right to religious freedom and a right to own and to transfer private property. Fourth and finally, the theory asserts that the authority of rulers rests ultimately on the consent of the ruled.

The Enlightenment produced a new branch of liberal thinking that soon came to compete with and sometimes overshadow its original growth. Although Locke and other early writers in the constitutionalist tradition often made bold claims, their objectives were limited, in part because they remained wedded to the assumption that the capacity of human beings to reshape their social world is quite modest. A century after Locke, many thinkers, inspired by the success of Newtonian mechanics, had cast this assumption aside. These thinkers believed that human beings are capable in principle of comprehending the social world, discerning the laws of nature that determine the ways in which it works, and, with this knowledge, designing institutions that would lead to the elimination of a host

of miseries and imperfections. The wary and essentially defensive stance of the early liberal constitutionalists was replaced in some quarters by a rationalist faith that envisaged the accomplishment of ambitious social objectives.

This more ambitious outlook led to the growth of two extraordinarily influential ideas. One of these was nurtured by liberal thinkers from its inception. The other was initially developed outside the tradition and was only gradually integrated into later liberal thought. The first idea is what Adam Smith called the system of natural liberty and later thinkers often call the market system. Smith argued that the primary engine for the generation of wealth is the division of labor and that it works most efficiently when it is based on a decentralized system of decision making by private individuals and businesses. He also argued that in this kind of economic system, human relations are based on equality and reciprocity instead of entrenched differences of status and privilege. In this vision, human relationships are thoroughly voluntaristic.

The affinity between this set of ideas and liberal values is clear. The idea of a system of natural liberty seemed to embody the liberal commitment to the freedom of individuals to shape their lives in accordance with their own values while at the same time securing the conditions of economic well-being. The principal political implication of this idea is that governmental power should be restricted to the provision of security and the enforcement of just laws, which enable people to engage in private planning and reach enforceable agreements with one another. This idea is central to the branch of the liberal tradition that is commonly called classical liberalism.

The second major idea that grew out of the Enlightenment is that of a state that is bureaucratically regulated to achieve defined social objectives. Originally developed by philosophical radicals like Jeremy Bentham and nonliberal thinkers such as Henri de Saint-Simon, the idea of a regulatory state was especially attractive to those liberals who feared that individuals' rightful entitlements might be threatened by social and economic inequality. As Adam Smith himself recognized, the system of natural liberty encourages the accumulation of private resources and private power. As a counterweight, many liberals have hoped that a powerful state that administers laws and regulations in a rational manner might combat the accumulation of private power as well as guaranteeing to all its members at least a minimal level of welfare. This line of thinking can be discerned in the work of such self-described liberals as T. H. Green, L. T. Hobhouse, and more recently, John Rawls.

The primary drawback of the regulatory state is that it concentrates power in the hands of politicians and administrators. This tendency is mitigated by democratic institutions and procedures, which force politicians to act with some degree of responsiveness to an electorate. As we have seen, the theory of liberal constitutionalism as envisaged by Locke already held that the authority of rulers rests ultimately on the consent of the ruled. Madison and the other drafters of the Constitution of the United States incorporated this principle into their constitutional design while imposing numerous checks on popular power, which they feared might otherwise lead to a tyranny of the majority.

During the nineteenth century, many liberals, led by James Mill toward the beginning and John Stuart Mill at mid-century, began to support some degree of democratic control of political leaders, and in the twentieth century, most liberals have consistently endorsed democratic political institutions in some form. But democratic institutions cut both ways, in some respects supporting while in others undermining liberal values. Although democratic institutions return some power to the people that would otherwise be wielded by political leaders responsible to no one except themselves, they return that power to the people as a collectivity, not as individuals. Liberals who believe that individuals should be as free as possible to shape their lives in accordance with their own values have reason to be troubled by the kind of concentrated private power that seems to be an inevitable consequence of minimally regulated market systems. But they also have grounds for deep concern about the concentration of power that is characteristic of modern regulatory states, even when their leaders are subject to democratic controls.

Social Theory

The notion of consent has played a significant role in legal and political thinking since ancient times.

The principle of *volenti non fit injuria*—where consent has been given, there is no injustice—was central to the Greek and Roman laws of contract, and in ancient Hebrew writings, the notion of consent played an important if ambiguous role in the conception of the covenant the Israelites received from their God. In the wake of the post-Lutheran emphasis on the freedom of individuals to shape their lives in accordance with their own beliefs and values, however, the idea of consent assumed a considerably larger role, one that came to dominate liberal social theory.

Thomas Hobbes's adoption of the idea of a contract as the centerpiece of his political theory in the mid-seventeenth century provides a robust preview of the role of consent in later liberal thought. To be sure, Hobbes was no liberal. He was a vigorous defender of political absolutism and a critic of the nascent theory of liberal constitutionalism, which had been used in his own day to justify parliamentary rebellion against the Crown. He was also, however, a highly unorthodox proponent of absolutism, who argued that political authority is based neither on a natural hierarchical order of things nor on a divine right of kings, but on a contractual agreement among free and equal human beings. Moreover, Hobbes applied the ideas of consent and contract to domains of social life that are far removed from politics as it is ordinarily conceived. Even the family, he argued, is based on a contract in which children consent to obedience in return for the protection they receive from parents. His wide application of the ideas of contract and consent prefigures the liberal social theory that flowered more than a century later.

The idea that social relations should approximate as nearly as possible to contractual relations among equals is at the heart of liberal social theory. We have already taken note of Adam Smith's idea of a system of natural liberty. One of Smith's arguments in favor of that system was that it would lead to unprecedented wealth. Of equal or greater importance to Smith, however, was the argument that the system of natural liberty is incompatible with relations of servitude—that is, of domination and submission. Along with Immanuel Kant, the philosophical radicals, and many others, Smith believed that entrenched differences of status and privilege are incompatible with human dignity. Most of these thinkers assumed that agents should enjoy the fruits of their own achievements and be held responsible for their own shortcomings, but they should not enjoy privileges or suffer deprivations that are unearned.

From a microcosmic point of view, the idea that humane social relations should ideally reflect consensual agreements among equals was appealing for two reasons. First, it can reasonably be assumed that in the absence of force, fraud, or gross misinformation, people will enter into contractual relations freely only when they expect to gain from those relations. This encourages the conclusion, drawn by many liberals, that social relations must be mutually beneficial to the extent that they are contractual. Second, the idea of contract was appealing because that idea seemed uniquely appropriate to a conception of individuals as free and responsible individuals. Kant gave special emphasis to this tight connection in his moral philosophy.

The history of liberal social theory can be told as the story of how the notion of human relations as contractual relations was applied in increasingly radical ways to undermine a succession of privileges and status inequalities, from inequalities of class to inequalities of gender and beyond. By the late nineteenth century, commentators often observed that the basis of social relations in the most highly developed societies had shifted from community to society, from being dominated by status relations that are inherited or ascribed to being dominated by relations of a contractual character.

Yet, the resulting vision of society as an immense network of contractual relations is bedeviled by difficulties with which liberals in the twentieth century and beyond have struggled, with limited success. First, in many instances, such as in numerous employment relations, the parties to contractual agreements typically are unequal with respect to bargaining power and information. Where this is true, contractual relations may protect rather than abolish relations of domination and dependency. This is no trivial issue, for it arises in some extremely important contexts—employment and marital relations, for example.

Second, even if a contractual relationship is beneficial to both (or all) those who are parties to that relationship, contractual agreements frequently have harmful effects—or *externalities,* as they are labeled in the economic literature—on people who

are not parties to the agreement. Examples include agreements among commercial and industrial parties that result in the dumping of undesirable by-products (pollution) and agreements that amount to collusion or monopolistic behavior. Many of these externalities can be and have been reduced or eliminated by regulation, but the fact is that those regulations limit and restrain the freedom to engage in contractual relations prized by liberal social theory.

Human Flourishing

Sometimes (particularly in the closing decades of the twentieth century), it has been argued that liberal political theory is independent of any substantive conception of the good life or of any particular theory of the ultimate ends of life. Indeed, some liberal writers have argued that a stance of neutrality with respect to the ultimate ends of life is the essence of liberalism. There is a sense in which these assertions are accurate, but it is a narrow sense.

It is certainly true that a commitment to toleration of a considerable range of conceptions of the ultimate ends of life is among the most fundamental of all liberal tenets. Yet, this claim itself imposes limits on the range of liberal toleration, limits that liberal political theorists have sometimes found it difficult to set. The kind of life liberals have generally valued is a life of individual autonomy. The best sort of life, according to this view, is one in which individuals ascertain their distinctive values and shape—or in the more dramatic language some liberals deploy, *create*—their own lives to accord with those values. It follows from the idea that a good life is a life of individual autonomy that the choice of one's ultimate ends is a strictly individual choice that should not be dictated by the political institutions or social arrangement that shape the society within which one lives. In this sense, a liberal conception of human flourishing is committed to a stance of neutrality with respect to the ultimate ends of life. However, it also follows from the same idea that a good life is one in which individuals choose their ends and shape their lives in accordance with them. In this latter sense, liberals are committed to a highly substantive conception of human flourishing.

One way to reveal the character of this conception of human flourishing is to contrast it with some of its rivals. The liberal idea of individual autonomy is at odds with the notion that it is good for human beings to submit to any external authority that is beyond their understanding. It is inimical to the notion that a life in which individuals accept roles that are prescribed for them or in which they accede to ends that are given to them, rather than to ends they prescribe for themselves, can be a good life. It is hostile to the notion the some human beings might thrive in relations of dependence. Typically at least, liberals value lives of self-assertion over those of submission. They value active personalities over passive ones, independence over dependence, freedom and self-creation over acceptance of predefined values, norms, and roles. This liberal conception of human flourishing is expressed most vividly in the writings of Smith, Kant, W. von Humboldt, John Stuart Mill, Ralph Waldo Emerson, and John Dewey; and among more recent writers, Joseph Raz and John Rawls. It is a particular conception that is incompatible with some, although not all, understandings of Judaism, Christianity, and Islam.

Although most of the earlier liberal writers were keenly aware of the divide between the idea of human flourishing they endorsed and the conceptions they were rejecting, some recent writers either have expressed only a hazy awareness of this divide or have dismissed it as unimportant. To them, it is unthinkable that any person could defend one of the more traditional conceptions of human flourishing if that person has fully understood the liberal idea. However, the superiority of the liberal ideal of individual autonomy is not self-evident. Many people flourish without being autonomous. In the end, there may be powerful reasons to prefer the kind of society and polity in which a norm of individual autonomy is widely accepted as the favored model of human flourishing over any kind of society that endorses and attempts to enforce an alternative norm. However, liberals will not be able to make the case for this preference as long as they adhere to the norm of individual autonomy as an article of faith or pretend that it is not a contestable ideal of human flourishing.

Liberal Prospects

In the political domain, modern liberalism is riven by internal tensions between those who think that

underlying liberal values will best be served if market systems flourish as fully and freely as possible and those who, mindful of the gross inequalities to which relatively pure market systems lead, favor a robust regulatory state. It is also divided by a tension between these two schools of thought, both of which grew out of the optimistic rationalism of the Enlightenment, and the earlier liberalism that focused more narrowly on avoiding or combating tyranny. The Enlightenment faith in the capacity of human beings to comprehend the social world and to design institutions that will overcome its most serious imperfections has not been borne out as fully as its early proponents hoped. Yet, where constitutional democracies have taken root, they have reduced the potential for tyrannical rule dramatically. Where market systems have flourished in concert with at least moderate regulatory regimes and institutions for welfare, they have significantly alleviated the social and economic pathologies that in earlier periods resulted in severe immiseration.

In social theory, liberalism has continued its long-standing pattern of growth into new territory while being checked from time to time by social forces that have resisted the conversion of virtually all social relations into contractual relations. The feminist movement, which originated with the campaigns for women's suffrage and for widespread acceptance of birth control, gathered force in the last third of the twentieth century largely on the strength of a conception of marital relations as contractual relations between equal partners. At the same time, the family has been a major locus of backlash against the advance of liberal social ideals. At least in the United States, one of the countries in which the feminist movement has advanced the furthest, the idea of the traditional family based on predefined gender roles has enjoyed a significant resurgence in popularity for the past generation, at least. The popularity of the idea of freedom of contract probably peaked in the nineteenth century. Again and again, governments have pushed back against the growth of the regulatory state, with some success, but the age of *laissez-faire* and *caveat emptor,* to the extent to which it ever existed, seems now to be relegated to a distant, almost-forgotten era.

In the early twenty-first century, liberals face challenges that go well beyond these long-standing tensions. It is not clear how extensive the liberal tradition's resources are for facing some of the major problems on the horizon, including the problems posed by an international state system that remains relatively anarchical and is composed of states spanning a broad spectrum, from the very strong to those that have failed altogether; the difficulties created by a rapidly evolving world economic system in which crucial decisions are made by leaders whose lines of responsibility to those whose interests they ostensibly serve are tenuous at best; and the dilemmas posed by powerful forces of nationalism and knotty questions about how and where to draw boundaries between political communities. Yet, the most momentous questions liberals face today are those that put into play the values at the heart of the liberal tradition. Can liberals find a basis for rational conversation with nonliberals and antiliberals—with people who do not accept the historic liberal commitment to the freedom of individuals to shape their lives in accordance with beliefs and values those individuals have subjected to rational scrutiny? Can liberals recognize the dignity in lives that are *not* lived in accordance with or in pursuit of the ideal of individual autonomy without relinquishing their commitment to that ideal? If not, then the prospects for liberalism as an ultimately persuasive conception are bleak because the alternative to rational persuasion is the use of force.

Liberalism, Contemporary

The political theory of contemporary liberalism is dominated by the figure of John Rawls. In his two most famous works, *A Theory of Justice* (1971) and *Political Liberalism* (1993), Rawls fashioned more or less demanding liberal conceptions of political morality that represent the point of departure for alternative liberal and nonliberal conceptions.

To understand debates within contemporary liberalism fully, we must draw a distinction between the political principles that it propounds and the fundamental philosophical ideals on the basis of which those principles are defended. The political principles of contemporary liberalism pertain to the regulation of major social, political, and economic institutions. In this regard, contemporary liberalism affirms the toleration of diverse ways of living and beliefs, or what Rawls calls "conceptions of the good." Liberal toleration finds expression in its affirmation of various civil and political liberties—the freedoms of conscience, speech, and association, as well as democratic freedoms and protection against discrimination on grounds of race, sex, or sexuality. A second distinctive feature of contemporary liberalism is its ambition to reduce the deep and extensive inequalities that beset contemporary industrial societies. Indicative of this ambition are liberal principles of equal opportunity, which seek to improve social mobility, and variously formulated proposals to reduce inequalities of income or to make such inequalities work to everyone's advantage.

A variety of interpretations of the liberal ideals of freedom and equality have been propounded, and there are ongoing significant disputes within liberal thought over political principles and policy: about the limits of toleration and the character of its hostility to the various inequalities that beset the contemporary world. Nevertheless, it is worth emphasizing that liberals share a commitment to a number of principles that distinguish them from alternative conceptions of political morality, such as libertarianism.

Liberalism and Libertarianism

Libertarians share liberal beliefs concerning toleration and the protection of freedom, but they do so on the basis of a commitment to rights of self-ownership and private property. These commitments lead many libertarians to depart from liberal views. This is clearest with respect to socioeconomic matters. For example, whereas liberals insist that discrimination by employers on grounds of race or sex is unjust, libertarians claim that there is no enforceable obligation on private property holders to exercise their property rights in a nondiscriminatory manner. Similarly, while liberals define an individual's economic entitlement by reference to what that individual would enjoy under economic arrangements that are designed to achieve a fair distribution of resources between citizens, libertarians like Robert Nozick offer a conception of entitlement in which taxation of income from work is theft and the voluntary transfer of monetary resources, by gift or exchange, must be free of regulation by the state.

Less commonly appreciated is how liberal and libertarian commitments to freedom differ. Liberals regard the basic freedoms they value—freedom of conscience, expression, alienation, and democratic

rights—as inalienable, that is, individuals do not enjoy the power to transfer these freedoms to others via a voluntary contract. By contrast, libertarians treat these freedoms as part of a bundle of rights that protect self-ownership and private property, freedoms that can be voluntarily transferred to others. For example, Nozick grants individuals the right to sell themselves into slavery and, indeed, his view requires the state to enforce contracts of this kind.

Political Principles (I): Neutrality and Perfectionism

While a commitment to principles of political morality that honor freedom and equality is the common core of contemporary liberalism, there is no such agreement with respect to how liberal principles and institutions are further specified or best defended.

For example, although liberals are identified in part by their adherence to toleration, they disagree over whether it is the appropriate business of the state to take a stand on controversial questions of the good life and to promote valuable forms of living through the use of its powers. Those powers include the use of the criminal law to prohibit damaging lifestyles, or more modestly, the use of educational institutions to cultivate valuable conceptions of the good, or the deployment of the state's powers with respect to subsidizing or taxing certain lifestyles to encourage individuals to abandon unworthy conceptions and embrace worthy ones.

The debate between so-called neutralists and perfectionists requires some clarification. With respect to neutrality, it is common to distinguish between two conceptions: *justificatory* and *consequential* neutrality. Consequential neutrality involves the idea that the consequences of political activity should be equal for individuals pursuing different conceptions of the good. The thought here is that different conceptions should be equally easy to pursue or that the state should not affect the relative costs and benefits of pursuing different conceptions. This version of neutrality, often attributed to liberals, is, in fact, rejected by most contemporary liberals as indeterminate, impracticable, or undesirable. For example, it is plain to see how political decisions regarding public holidays can have unequal effects with respect to the costs and difficulty of pursuing different religions. Public holidays that correspond to the Christian festivals of Christmas and Easter, for example, advantage Christians compared to members of other religious groups, for whom important religious dates conflict with work and school requirements. Yet, if there is a good argument to preserve public holidays, any date that is selected will inevitably be more beneficial for followers of certain religions.

Rather, contemporary neutralist liberals affirm *justificatory* neutrality—the idea that the reasons for adopting particular legal or political arrangements should not depend on controversial conceptions of the good. Neutralists draw a distinction between two kinds of normative ideal. First, there are various ideals concerning our political status—our status as individuals or citizens entitled to treatment as free and equal agents and the legal rights generated by that status—that liberals insist generate important reasons for political action. As we have seen, liberals endorse principles that guarantee civil and political freedoms and a level of socioeconomic provision for everyone. Second, however, there are certain other parts of ethics—relating to our place in the universe, the existence of God, and the worth of different nonpolitical goals such as the value of different personal projects or relationships—that, neutralists claim, do not generate reasons for political action. For instance, there is considerable disagreement over whether gay sex is a sin or a valuable kind of sexual relationship. Neutralists insist that the state should not take a stand on that issue. Instead, political arrangements should be arranged in a manner that is capable of acceptance by individuals who take opposing views of it. The claim that individuals have an interest in enjoying freedom of expression and association and in possessing various opportunities and resources regardless of sexuality is designed to satisfy this requirement of justificatory neutrality.

Perfectionists claim that all ethical ideals and values generate political reasons. Some perfectionists, like Joseph Raz, are liberal in their political conclusions. For example, many who believe that one of the elements of a successful life is personal autonomy favor liberal political arrangements because the development and exercise of autonomy require being exposed to a variety of lifestyle options from which to choose and

the possession of liberal freedoms and material resources so that individuals can bear witness to, and pursue their ethical convictions. Autonomy-based perfectionist liberals might accept that it is legitimate for the state to favor certain techniques for supporting valuable conceptions of the good. They might allow the state to require schools to promote a particular religion and, indeed, offer tax exemptions for associated religious establishments, for example. However, because they favor the good of individual self-determination, such perfectionists remain hostile to various illiberal legal arrangements: For instance, they agree with neutralist liberals that apostasy should not be a criminal offense.

The ideal of personal autonomy is not the only basis on which perfectionist liberalism is defended. Some liberals, such as William Galston, appeal to what they take to be less controversial claims about *value pluralism*. Liberal institutions, these authors claim, are best defended on the basis of an acknowledgment that several different kinds of ethical life are valuable, only some of which include the value of autonomy. These liberals tend to emphasize the value of freedom of expression and association as centrally important. As we shall see, they argue that the reach of liberal ideals is more limited than autonomy-based liberals believe.

Fundamental Philosophical Ideals: Political Versus Comprehensive Liberalism

The distinction between neutralist and perfectionist liberals concerns a debate about whether state officials and, perhaps, legislators can legitimately appeal to controversial ethical and religious ideals in framing and defending their conduct. This debate overlaps with the debate about the philosophical foundations of liberalism. Rawls draws a distinction between two kinds of liberalism: comprehensive and political. Comprehensive liberals offer political theories with liberal conclusions that are premised on controversial ethical ideals. Rawls cites Immanuel Kant and John Stuart Mill as liberals who defend their political proposals on the basis of contested claims about ethics: in Kant's case an ethic of moral autonomy; in Mill's, an ethic that stresses the value of human improvement through the development of "higher pleasures" and individuality. Within contemporary political philosophy, Raz counts as a comprehensive liberal, as does Ronald Dworkin. The latter offers a number of different defenses of liberal institutions. He has developed what he calls the "challenge model of ethics" in which a good life consists of a successful response to an appropriate challenge. More recently, however, Dworkin has developed a justification of liberalism that, while comprehensive, aims to cultivate widespread appeal. His two founding principles are that individuals' lives have equal intrinsic importance and that responsibility for the success of one's life lies primarily with oneself.

One comprehensive defense of liberal institutions, and indeed political neutrality, entertained by Bruce Ackerman and Brian Barry, draws on ethical skepticism: the thought that we cannot know which of the different conceptions of religion or the good life is true. Because these truths are inaccessible, it is claimed, we cannot legitimately impose any particular ethical values on citizens through the law. This defense, however, has been widely criticized. Liberal principles of toleration are themselves normative in character because they tell lawmakers how they should act. If skepticism is applied to all normative views, then it is inconsistent with supplying a justification of liberal principles because the truth about whether the state should be tolerant would be as inaccessible as the truth about whether a religious life is a mistake. Alternatively, this defense might claim that skepticism applies only to certain normative claims, such as whether abortion is morally wrong or the value of homosexuality, but not to claims that relate to toleration or equality. However, it is not obvious why this claim should be accepted. Many are as convinced that homosexuality is a worthy form of sexuality as they are in the soundness of liberal principles, and it is difficult to see how such people are mistaken in their reasoning about ethics and morality.

By contrast, *political* liberals, like Rawls, offer a defense of liberal institutions on the basis of ideals that make no reference to our place in the universe or what it means to lead a good life. Rawls begins his account with a set of claims about our interests in virtue of being free and equal citizens. Such citizens are not viewed as permanently tied to any particular conception of the good life; rather, they are free to reflect on and revise the life plans they

follow. Therefore, in addition to our interest in becoming citizens who deploy a sense of justice, we have an interest in having the liberties and opportunities in place that will facilitate our reflection on ethics and enable us to pursue our life plans. On the basis of these interests, Rawls offers a defense of liberal institutions that supports not only the freedoms of conscience, expression, association, and so on, but also a range of socioeconomic provisions, such as guaranteed health care to a certain level, compensation for unemployment, and a decent level of income for all.

Rawls's desire to avoid controversial ethical claims in justifying liberal principles is motivated by an empirical observation about the inevitable effects of the protection of civil freedoms and a normative commitment to a conception of political legitimacy involving justification to each citizen. The empirical observation is that social and political institutions that preserve freedom of conscience and expression will inevitably produce a diversity of ethical and religious belief and practice. Various explanations of this diversity might be offered: The account might refer to mistakes in reasoning, the different positions from which individuals evaluate the world, or the difficulty of weighing different ethical considerations. If value pluralism is true, then this might also supply an explanation of actual ethical pluralism, but Rawls does not rely on this explanation: Because he aims not to take a stand on these ethical matters, his theory is compatible with value pluralism but not reliant on it.

Turning to his normative ideal of legitimacy, Rawls insists that the defense of principles of political morality should ideally appeal only to goods and claims that individuals can endorse. If this ideal of legitimacy is accepted, then given ethical pluralism, the kind of justification of liberal political principles that is required is one that is not wedded to any particular account of ethics, for such an account would inevitably fail to win the acceptance of some citizens. Thus, Rawls offers a public justification of liberal principles, a defense that appeals to values and ideals, such as those of freedom and equality, that are embedded within the tradition of democratic politics and thought since the Reformation and that can be endorsed by individuals holding conflicting conceptions of the good.

The ideal of legitimacy, which provides the normative basis of political liberalism, is controversial. Others have proposed conceptions of legitimacy in which acceptability to everyone considered separately is not the decisive consideration (e.g., Raz). Rawls's commitment to this ideal, however, is motivated by the value of political autonomy, which he traces back to the thought of Jean-Jacques Rousseau and Georg Wilhelm Friedrich Hegel. For Rousseau and Rawls, the fundamental question of political philosophy is to explain how we might be subject to legal constraints, as we involuntarily are throughout our lives, while remaining free as individuals. Their shared answer to this question is to deny the claim that we can be free only if legal constraints are removed. Rather, they insist that we can be free, despite being subject to coercive constraints, if the goods that such constraints realize are ones we value ourselves. The Hegelian character of this view is that if individuals endorse the aims and justification of political principles that constrain them, they can come to regard their own society as a home rather than an alien environment.

Political Principles (II): Social and Economic Justice and Legitimacy

As noted above, contemporary liberalism is distinguished from libertarianism, in part, because of its commitment to reducing the economic inequalities that characterize modern industrial societies. One of the central projects of contemporary liberal thought has been to try to identify the right conception of distributive justice. In *A Theory of Justice,* Rawls proposed a reasonably demanding conception of justice, which advocated the reduction of class-determined inequalities (his principle of "fair equality of opportunity") and income redistribution to the maximum advantage of those with least wealth and income (the difference principle).

Other liberals have proposed more or less demanding accounts of justice. Dworkin, for example, defends a conception of equality, liberal equality, which allows income inequalities to be generated in virtue of the different life choices individuals make but which compensates individuals for their bad luck with respect to biological endowment or social starting point. By contrast, Raz's liberal conception includes a rejection of egalitarianism, and others have developed conceptions of justice in which individuals have *sufficient*

social and economic goods or in which more or less *priority* is attached to the interests of less advantaged individuals.

Rawls's work on political liberalism led some to believe that he had abandoned his earlier commitment to social justice. That this is a misreading is evident in Rawls's final statement of his conception of justice, *Justice as Fairness: A Restatement,* in which he presents his account of justice as consistent with political liberalism. Nevertheless, an important distinction between *justice* and *legitimacy* should be noted. Conceptions of justice seek to identify a fair distribution of good and bads. By contrast, the question of legitimacy concerns the conditions that justify political authority, the conditions that generate a duty on citizens to comply with the law. As Rawls interprets the ideal, while his own conception of justice passes the test of legitimacy because it does not rest on any particular controversial view of the good life, other conceptions that propose different and, perhaps, more modest principles of social justice also pass this test. For the purposes of legitimacy, a democratic choice between different liberal conceptions of justice might be acceptable: Realization of the difference principle is not necessary for the state to be legitimate. Nevertheless, it is important to emphasize that to count as legitimate, such a conception must satisfy certain criteria: It must give priority to the protection of civil and political liberties, secure educational and employment opportunity for all, and provide individuals with the health care needs and economic wherewithal to be active citizens and to pursue their goals, projects, and relationships.

Political Principles (III): The Reach of Liberalism

Turning to other issues of political importance, contemporary liberals are divided about the extent to which their conceptions of justice and legitimacy generalize to other domains. Consider, first, the issue of global justice and the reach of the liberal commitment to equality. Some liberals, such as Rawls and Thomas Nagel, restrict the application of their liberal conceptions to domestic political matters and elaborate and defend more modest proposals for international and global institutions. They agree that among the principles of political morality that apply globally are a concern for certain human rights, a duty to come to the assistance of countries that lack the resources to maintain acceptable governments, and duties of humanity to come to the aid of those who suffer poverty. Yet, Rawls distances himself from cosmopolitan liberals (e.g., Charles Beitz) who extend a Rawlsian conception of justice to defend radical redistribution from the Global North to the Global South. Nagel has argued that we appeal to a conception of justice to assess whether a set of legal institutions that claim our allegiance is entitled to the obedience of its citizens. At the global level, however, while an intergovernmental agreement might affect the fortunes of individuals in other parts of the world, considerations of justice do not come into play because such agreements do not claim these people's allegiance.

The modest proposals of Rawls and Nagel have, however, been criticized on several grounds. Some appeal to the Rawlsian claim that it is proper to apply principles of justice and legitimacy to arrangements that significantly affect people's lives without their consent. Thomas Pogge's cosmopolitan account, for example, cites the way in which rich countries and global institutions support illegitimate and corrupt governments throughout the world by granting them privileges with respect to borrowing, selling resources, and purchasing arms. Because individuals throughout the world are born into these arrangements that significantly affect their life chances, it is appropriate, he claims, to scrutinize them from the point of view of justice. Other cosmopolitans appeal to different grounds for extending liberal principles. If, as many liberals accept, there is a reason to compensate individuals who suffer worse life chances because of the family circumstances into which they are born, it is difficult to see why individuals who are born in parts of the world that afford them fewer opportunities should not also be compensated.

There are also disputes among liberals with respect to the reach of principles within a society. For instance, the ideal of neutrality might be applied more or less widely. It might be applied narrowly to regulate the choice of a constitution and the basic rights of citizens, so that these rights are not conditional on individuals holding particular conceptions of the good. Some take this view and assert that it is consistent with neutrality for politicians or individual voters to press for particular legislation on

the basis of their controversial convictions about ethics and religion. Liberal democrats of this kind might not object to legislation that promotes the religious practices of the majority; legislation, for example, that requires schools to educate pupils in accordance with those practices or that subsidizes the costs of pursuing those practices. Such legislation, they argue, is compatible with the maintenance of a constitution that does not take sides with respect to these controversial matters. Nevertheless, other liberals extend the reach of liberal principles to include choices made by politicians or voters. They claim that if the case for some kind of neutrality is that it is valuable for individuals to affirm the rules and laws that constrain them, then this affirmation is denied by normal legislation that is framed in accordance with the ethical convictions of the majority as well as by constitutional law.

Second, consider the distinction between liberalism justified by appeal to the ideal of autonomy and that defended on the basis of value pluralism. In principle, autonomy-based liberalism can justify certain kinds of interference into family or cultural life that value pluralism cannot. With respect to certain famous legal cases—*Wisconsin v. Yoder* and *Mozert v. Hawkins Board of Education,* for example—that concern the rights of parents to shield their children from exposure to what they take to be irreligious views and practices, autonomy-based liberals have argued that the child's right to a future in which she or he can exercise autonomous judgment on the basis of an understanding of the alternatives overrides the right of parents to raise their child in accordance with their religious convictions. In general, autonomy-based liberals are critical of cultural practices that place autonomy-inhibiting restrictions on its vulnerable members, particularly children who cannot be thought to consent to those restrictions. By contrast, value pluralists who deny that autonomy is necessary for leading a good life tend to accept that parents can legitimately educate their children in any one of a number of ways, only some of which facilitate an autonomous future for their children.

Criticisms of Contemporary Liberalism

Throughout its history, liberalism has faced various challenges that take the form that its commitment to freedom and equality is *incomplete*. For example, certain socialists and feminists have criticized liberal accounts for not extending these ideals to the workplace, economic choices, or the family. Susan Moller Okin has criticized historical and contemporary liberal accounts for failing to appreciate that the treatment of women within the family is the basis of gender inequality and unfreedom for women. G. A. Cohen's critique of Rawls's conception of justice rests on the alleged arbitrariness of the distinction between the rules that govern socioeconomic institutions, such as the tax and benefit system, and the ethos that should motivate individuals in their daily economic choices, such as the choice of how hard to work. Cohen's target is Rawls's difference principle, which requires economic institutions to maximize the wealth and income of the least advantaged. That principle generates a duty on the part of citizens to vote for political parties that most effectively benefit the least advantaged. But as Rawls elaborates the principle, it permits inequalities of income to arise if they are beneficial in terms of generating incentives for productive individuals to take jobs that are particularly valuable for society or to work harder. However, Cohen insists that if the needs of the least advantaged are our concern, then there seems no reason why this should not extend to guide those other economic choices of individuals. In his view, our duties to the least advantaged should be expressed as an ethos that involves the productive working to benefit everyone without receiving greater than equal rewards.

Okin and Cohen share the view that liberals misidentify the distinction between so-called public matters, with respect to which individuals are accountable to others and considerations of justice apply, and nonpublic matters, which need not be constrained by justice. Liberals have responded to these criticisms in more or less concessive terms. Some are prepared to redraw the contours of the distinction between public and nonpublic. For example, Rawls accepts that his liberal conception should protect women from the involuntary disadvantage that is often generated by a gendered division of labor in society and the family. In other cases, liberals are less concessive. For example, many liberal theorists reject Cohen's proposal of an egalitarian ethos,

claiming that our daily economic decisions with respect to how hard to work, for example, cannot be regulated in a transparent, publicly justifiable manner without intolerable surveillance of our lives.

Another prominent critique of contemporary liberalism claims that it is too individualistic. The critique can take various forms. For example, so-called communitarians have claimed that liberals mistakenly assume that we can attend to the interests, rights, and duties of individuals without acknowledging the importance of the cultural communities in which they live. Different lines of criticism have been advanced in this vein: (a) some claim that principles of political morality can be justified only by reference to the shared values of particular communities; (b) others claim that liberals ignore or disregard the importance of social communities in terms of making available a range of relationships and goals, or generating cultural practices that give individuals' lives meaning; and (c) others emphasize that individual well-being is best served by involvement in the shared pursuit of common goods, which, they claim, liberals deny. Liberals resist the communitarian critique. Two strategies of response have been pursued. First, liberals have agreed with certain claims about the importance of community but insist that their view already incorporates such claims or that it can be revised to satisfy communitarian worries. To illustrate this type of response, notice that Rawls himself claims that his conception of justice can be regarded as valuable because it facilitates the realization of a significant political, or collectively produced good—the good of a well-ordered society. And Will Kymlicka has developed a conception of multicultural citizenship, which incorporates certain communitarian insights within a liberal framework. Second, liberals have responded less concessively to certain kinds of communitarian criticism. They have challenged the idea that it is always possible to identify a community with freely shared values and, even if that could be done, they reject the thought that political principles should merely reflect shared values. This second response emphasizes that contemporary liberals, like many of their precursors, do not regard themselves as offering ideological support for the status quo but, rather, conceptions of political morality that provide resources for a thoroughgoing critique of prevailing social and political arrangements.

Liberation Theology

Liberation theology emerged during the political and cultural upheavals of the 1960s and 1970s in developed and developing countries alike. Critical of human rights violations suffered under authoritarian regimes and of market economies that bestowed the preponderance of benefits on a powerful few, liberationists developed their political theory out of biblical injunctions against the rich in favor of the poor combined with modern social science critiques to identify the origins of social injustice. Diverse versions of liberation theology erupted out of this theory under such loosely defined categories as political theology, black theology, feminist theology, Jewish liberation theology, and Palestinian liberation theology, among others. The political theory of liberation theology achieved a moderate degree of public support during the latter quarter of the twentieth century in some regions of the globe, particularly in Latin America.

The political critiques and advocacy of liberation theology have influenced various attempts at reform and revolutionary change, particularly in the base communities of Brazil (1970s), in the Sandinista Revolution (1979) and Nicaraguan government (early 1980s), and in other liberation movements in countries embroiled in the Central American wars (1970s and 1980s). The attractiveness of liberation theology then waned with the signing of peace accords, the replacement of several authoritarian regimes with democratic governments, and the growing popularity of conservative and predominantly Protestant evangelical efforts. Nevertheless, the social conditions that originally gave rise to the call for liberation remained largely unchanged. During the last decade of the twentieth century and into the early part of the twenty-first century, liberation theology has resurged in popularity, most visibly in the Zapatista liberation movement in Mexico (1990s to the present) as well as the presidential administrations of liberationist Father Jean-Bertrand Aristide of Haiti (1991, 1994–1996, 2001–2004) and Lula da Silva of Brazil (2002–2006, 2006–2010). Then-Senator Barack Obama's presidential campaign in the United States also revealed a liberationist influence from Senator Obama's pastor, Rev. Jeremiah A. Wright, Jr., who described his beliefs as rooted in the black liberation theology of James Cone and others.

Liberation Hermeneutics

According to Latin American liberationists, conventional theologies fail to criticize the root causes of poverty and oppression due to their flawed techniques of interpreting holy scripture. Their failure originates from rules of scriptural interpretation or *hermeneutics* used to explain revelation as unchanging and morally authoritative. From their restrictive interpretation of scripture, Christian theologians typically identify rigid propositions from the Old and New Testaments to serve as static elements in the construction of their theologies. With regard to contemporary social issues, conventional theologies generally presume the legitimacy of contemporary politics and thus are rarely capable of significant opposition to unjust policies. These theologies then tend to be appropriated by the state as ideological justification for the perpetuation of unjust political practices and economic arrangements. Liberationists declare the need for theologies that provide an effective critique of the dynamics and moral status of contemporary politics.

In contrast with mainline religions and conventional theologies that tend to do little more politically than admonish followers to be virtuous citizens, liberation theology urges the application of a hermeneutics that confronts social injustice by appealing to the moral criticisms of society found in the prophetic narratives of the Bible. To this end, liberationists encourage the reading of biblical stories from the perspective of the present-day reader who is affected and offended by social injustice. Thus, the stories are interpreted in light of the reader's own commitment to the liberation of the marginalized members of society, such as the poor, women, racial minorities, and unrecognized

nationalities. In addition, liberationists incorporate contemporary social science methods for explanations of and solutions to problems of social injustice, even as they search the ancient scriptures for moral guidance with respect to the ethical problem of political marginalization. The social application of liberation hermeneutics results in critical reflection on the "sinful social structures" of contemporary politics, particularly within the global economy.

Sinful Social Structures

Many liberationists incorporate Marxist class analysis to analyze economic and political conditions. They argue that traditional capitalism and contemporary neoliberalism support economic arrangements that exploit the majority of citizens, leaving them in a state of impoverishment with little likelihood of improvement. Furthermore, when organizing themselves to challenge unjust political and economic policies, exploited workers encounter either harsh repression that disregards their basic human rights or minimal economic reforms that hardly promote justice. Given their "preferential option for the poor," liberationists condemn as sinful the social structures that leave the majority of citizens suffering needlessly.

Today, Latin American liberation theology tends to focus on the domestic dynamics of class divisions and the economic pressures of corporate globalization as the main source of poverty and oppression. Influenced by liberation hermeneutics, which merges biblical ethics and social critique, other liberationists focus on matters of unequal race relations, religious intolerance, inequitable gender conditions, or supernationalism as containing the primary source of injustice. In addition to preaching the ethical obligation of condemning unjust social practices, liberationists also recognize a responsibility to advocate specific measures for eradicating the unjust social structures themselves. Often relying on the biblical story of the Exodus as the principal paradigm of liberation, liberationists encourage political involvement and, at times, social revolution to confront and overcome social injustice.

LIBERTARIANISM

Libertarianism focuses primarily on the drawing of robust boundaries where individual action—good or bad—ought to be free from intervention and coercion. As a political morality, it specifies the limits of state authority and the use of force, as well as the obligations imposed on the state to enforce rights and arbitrate between competing claims.

A range of theories that purportedly attach singular or primary value to the ideal of individual liberty go by the name *libertarianism*. These theories are animated by a set of distinctive and common concerns. Among them are a deep suspicion of central government and coercion; a favorable view of the market, which may go as far as regarding its outcome as beyond the scope or conceptual concern of distributive justice; and a view of

private property as either exhaustive of all individual rights or at least the most significant right of them all. It is the particular view of distributive justice that has attracted the most attention in contemporary philosophical debate, not least due to Robert Nozick's lively and sharp defense of libertarianism in his 1974 *Anarchy, State, and Utopia*.

In what follows, three major forms of libertarianism are introduced, and three key themes common to these forms of libertarianism are discussed.

Forms of Libertarianism

Three major types of libertarianism may be discerned: (1) *consequentialist* libertarianism (a prominent example, on which subsequent discussion will focus, is the theory proposed and advocated by Friedrich Hayek); (2) a libertarianism inclined to the right (henceforth, *right libertarianism*), which sanctifies entitlements in natural resources and approves of the distributive outcome of the free play of these entitlements; and (3) a libertarianism inclined to the left (henceforth, *left libertarianism*), which seeks to correct the distribution that naturally follows from unequal holdings, reflecting an egalitarian concern. The latter two types are sometimes joined under the label *natural rights-based* libertarianism.

Consequentialist Libertarianism

Hayek's peculiar brand of libertarianism is in some sense consequentialist and ostensibly practice oriented. Focusing on the beneficial outcome of restraining government, it seeks to zealously safeguard individual liberty to counter the slippery slope of state interventionism in both political and economic spheres. Any form of intervention or planning by central government is bound to regress into coercive arbitrariness and impoverishment of the economy.

Natural Rights-Based Libertarianism

Natural rights-based libertarianism, in either left or right variant, is strongly indebted to John Locke. This theory sees the role of the state and the justification of coercion as consisting exclusively in the protection of individual rights. It views all basic rights of individuals as ultimately specifiable in terms of property rights with the principle of self-ownership, the notion that people have full ownership over their bodies and capacities, at their core. This idea protects individuals against coercive measures that might harm them, such as torture or enslavement, or that might lead them to act in unwanted ways; it also prohibits anyone, including the state, from coercing people to perform any morally required act that they do not wish to engage in and that they have not contracted to perform. In its strongest interpretation, however, it also allows individuals to alienate some of their personal rights—to voluntarily enslave themselves or to permit their being tortured.

Either on the basis of self-ownership or independently, individuals can also come to acquire rights over external assets such as natural resources as well as the products of these resources and their labor. Appropriation may be controlled by a (Lockean) proviso that to some extent takes account of the interests of others (e.g., to leave enough and as good for others). Nevertheless, such a structure of ownership rights, coupled with an unequal distribution of natural talents and good fortune, is very likely to lead to significantly unequal material welfare. Although some right libertarians may regret this outcome, they will insist that state coercion is not the means to remedy it.

The strong intuitive appeal of the principle of self-ownership, together with a genuine egalitarian concern, has led some political philosophers to seek a reconciliation of these two ideals. Left libertarianism shares with right libertarianism the view of individual rights as, at bottom, property rights; it also has a strong notion of self- ownership at its core. Where the two differ is with respect to ownership over external resources. Left libertarians deny the idea that entitlements over unowned natural resources may be unilaterally acquired, subject only to a weak condition of nonharm (i.e., a weak version of the Lockean proviso). They view the world in its initial moral state as unowned, with all people having equal an claim to it. Those who acquire private exclusive control of resources and land are required to duly compensate those who thereby have been denied access to resources.

Themes of Libertarianism

Three themes will now be expounded: (1) liberty, (2) markets and justice, and (3) limited government.

For each of these themes, the following analysis is intended to show how a particular view developed—from consequentialist through right to left libertarianism—as an advance on earlier views or a response to problems encountered, sometimes completing a full circle. Also, it demonstrates how, within each form of libertarianism, the view on the role of government might rely on a certain view of distributive justice, which in turn depends on a particular conception of liberty. The unfolding of these themes will provide a fuller account of the three forms of libertarianism.

Liberty

Negative freedom, as the absence of impediments to action, is what libertarians invariably take as their foundational value. Which impediments to action count as coercive and therefore freedom restricting? As we shall see, libertarians are not all in accord on this question.

Hayek's conception of liberty is that of the absence of coercion. It is the state of being able to direct one's own life and not being subject to the arbitrary will and direction of another person. What makes coercion bad is its effect on both the individual and society. It prevents the coerced from fulfilling the potential of their mental capacities, and consequently it denies the community the benefit of the contribution they could have made.

Coercion must be distinguished from the kinds of restrictions we encounter daily. Specifically, setting conditions or terms to render services or benefits is not a form of coercion on this view. This is primarily true in trade settings. Most of what we need or want we get from other people. We cannot force these people to work for us or to provide us with the goods we desire. They must be free to set the conditions under which they will be willing to do so.

Genuine coercion might be exercised by a monopolist of a life necessity. But unless the following two conditions hold, then whatever hardship results cannot count as coercion. First, the good supplied by the producer must be indispensable; if people can do without it, they cannot be coerced. Second, there must be no other producers or employers. If there are many others, none can coerce, for they can remove only one opportunity among many to purchase a good or to earn a living.

One might think that the status of individual employees vis-à-vis the class of employers as a whole (being forced, as they are, to sell their labor power) can hardly be described as free. Yet, Hayek insists that even if this is a fair description of the circumstances of employees, they are not coerced because they are not subjected to any particular will, but rather to the resultant unintentional pressure of the impersonal market. Even if there is just one employer and the employment is an essential life necessity, the employee is still not coerced because no one intentionally put him in this restricted choice situation. Hayek's conception of coercion centers on the intention of the coercing agent—perhaps rightly so. But in terms of outcome, the circumstances appear indistinguishable from the perspective of the harmed subject. Whether this is the intended consequence of coercion, properly speaking, or the unintended result of some events and behavior, the situation equally calls for redress, the misfortune is the same, and, moreover, Hayek's analysis notwithstanding, it is implausible to describe the evil of the situation in terms other than reduced liberty.

Most right libertarians hold a notion of freedom by which only unrightful action restricts freedom. On such a view, what matters is not the intentions of the constraining agents but whether they acted within their rights. The view seems to be that only if an agent acts impermissibly, constraining other people's options by violating their right, can the latter's freedom be considered restricted. Two main lines of criticism have been raised against this conception.

The first objection is that such a moralized notion of being forced to do something and of freedom leads to absurd consequences. Consider Nozick's marriage partners example. Twenty-six women and twenty-six men want to get married and are named A to Z and A′ to Z′ in decreasing preferential order. A and A′ voluntarily choose to get married, each being the most preferred option of the other. Their first option having been removed by the marriage of A to A′, B and B′ marry each other. So it goes all the way down to Y and Y′. Now, Z and Z′, whose only other option is to remain single, finally marry each other. Nozick thinks that the voluntary nature of their act is due to the fact that A to Y and A′ to Y′ all acted within their rights. Some have found this

supposed connection absurd. The history of the narrowing down of options does not seem relevant to the issue at all. If instead A to Y abducted A′ to Y′, the situation of Z and Z′ would not be altered. Their preferences, as well as their available options and the choice they eventually make, are identical in both scenarios. It is difficult to see what could justify ascribing coercion in this revised case but not in the original example.

The second objection to the proposed conception of freedom concerns its role in an argument that grounds property rights. On this account, the truth of the proposition that P's freedom to use X is violated depends on X being P's property. So P's ownership of X cannot be based on the fact that P's freedom is violated. To see this, suppose I have a justified (property) right to the chair I am using. If you take the chair away from me, then you violate that right and, therefore, also reduce my (moralized) freedom. But if you were to inquire as to the justification of my right to the chair, I could not point to the reduced freedom due to not respecting that right because whether or not my freedom *is* reduced, on this account, depends on whether or not I have a (justified) right to the chair.

Left libertarians are not content with such a moralized notion of freedom. The central issue is what sort of obstacles might count as freedom restricting. A conception of liberty that recognizes coercion only to the extent that it suppresses options the agent has a right to choose, cannot discriminate among different sets of rights. Because all it requires is that a system of rights, any such system, is perfectly enforced, nothing concerning the substance of the rights is implied. Freedom as the absence of coercion would be consistent with slavery, for example, or with any other system, repressive as it may be. If slaves have no right to leave the master's estate, they are not being coerced when they are prevented from doing so, and they are as such free. Such a formal definition of coercion is insufficient and must be buttressed by some substantive notion of the rights people have. The most central of these rights, and the one most relevant to freedom, is the right of self-ownership. Coercion, still moralized, then becomes the prevention of action protected by a system of rights including that of self-ownership.

But coercion is not the only possible freedom-restricting obstacle. Security in one's rights, whatever they may be, together with a robust notion of self-ownership, are still insufficient for any effective freedom. Any sort of act in the world involves the use of external objects of which we cannot be assured by mere formal self-ownership. It follows that control of external resources must be seen as freedom enhancing and the lack of such resources as freedom restricting.

Hayek's distinction between wealth or power, on one hand, and freedom on the other is thereby questioned. It is disingenuous to claim that people who have insufficient funds to take a round-the-world cruise are nevertheless free to take the trip because they are not prevented from doing so. Surely, the man-made institution of private property prevents them from boarding the boat without buying a ticket. Without the money, we are not really free to join the cruise, and the worker who has no option but to starve or accept the low-paid and disagreeable job is not really free to turn it down.

Moreover, it is not merely the lack of access to external resources that would count as freedom restricting. Any obstacles—internal as well as external, produced deliberately or by accident or not produced at all, removable or not, can be freedom restricting. As such, the left libertarian conception of freedom is purely descriptive and morally neutral.

The Status of Markets and Distributive Justice

In Hayek's view, the concept of distributive justice is meaningless in an economic regime governed largely by the market, and the attempt to apply it is counterproductive. The concepts of justice or injustice are appropriate only with respect to the result of intentional action. Accordingly, the distribution of benefits and burdens is unjust if it were the result of a deliberate allocation by particular people, rather than the outcome of the free operation of impersonal market forces. On the other hand, an attempt to redistribute according to some favored conception of so-called social justice *is* unjust.

One might object that we can, and normally do, evaluate certain outcomes or states in terms of justice even when they are not the consequence of human agency, and even if there is no one to be blamed. Moreover, the market order is maintained and regulated by human purposeful activity. Hence,

we can identify some responsible agents for the results of market processes. Last, the effects of markets can be "corrected," and surely that makes the decision to intervene or not and its implementation subject to moral appraisal.

According to Hayek, a conception of social justice seeking to trace merit or desert and to reward individuals according to the value of their contribution to society is confused. The notion of value to society is a meaningless construction. Even if we had a compelling notion of moral worth (merit), contribution to society (desert), or need, we would still have no idea about how to combine these into one uniform measure. We might then fall back on material equality and distribute earnings equally. The rationale of earnings is to function as indicators of the most beneficial behavior. Determining them equally, or on the basis of merit, desert, or need, will defeat their purpose.

An attempt to impose some distributive ideal will cause the market to fail in its capacity to adapt quickly and effectively to changing circumstances—a task it accomplishes admirably due to the transmission of information via the price mechanism. In such a case, prices can no longer be relied on to convey the information required for individuals to decide where best to direct their resources, efforts, and skills. At its best, planning would achieve the same result as the market. But unlike the *impersonal* workings of the latter, the orders imposed by a human administrator would be, as such, coercive and unjust.

But these difficulties arise only if redistribution displaces and supersedes prices, that is, if a central authority sets about to fix prices and wages so as to realize its distributive ideal. It need not arise if redistribution is enacted without interfering with free exchange and market price-setting. This possibility surprisingly receives some support from Hayek (1973), who does not oppose a guaranteed social minimum provided "outside the market." So one may ask why not go further and provide full material equality outside the market through redistributive tax and transfer policies after prices have had their effect?

On the right libertarian view, distributive justice is a misleading term. Contrary to what it suggests, there is no central distribution. Things come into the world already attached to individuals in ownership relations.

Nozick's entitlement theory of holdings specifies the conditions under which a person is entitled to things in his or her possession. The theory consists of three schematic principles:

1. A *principle of justice in acquisition* specifying the method by which unheld things become the property of an individual, the kind of things, their extent, and so on. Something akin to Locke's theory of appropriation is thought to fill the details of this principle, whereby original acquisition is somehow connected to, if not directly implied by the idea of self-ownership.
2. A *principle of justice in transfer* specifying the method by which a person can transfer title to some holdings to another person, or the method by which a person can acquire a title to the holdings of another. What comes to mind here are the conventional rules of transfer in a capitalist market society: primarily voluntary exchange (i.e., the trade of commodities and labor) but also gifts, inheritance, and donations.
3. A *principle of rectification of injustice* specifying what, if anything, ought to be done to correct for past injustices.

A just distribution is one in which each holding was acquired by the individual who possesses it either according to the first principle, according to the second principle from someone else who is entitled to that holding, or as a result of an application of the third principle. Thus, once initial holdings are set, justice is conserved through the operation of the unbridled market. Political intervention is required only to correct for conquest, usurpation, enslavement, theft, fraud or coercion. Otherwise, the government has no business in prohibiting or undoing "capitalistic acts between consenting adults."

It is considered an advantage of entitlement theory that it endorses unpatterned distributions. A distribution is patterned when the share of each individual is determined by some natural dimension, when it can be described by a slogan of the form: to each according to. . . . For example, distribution according to moral virtue, contribution, IQ, needs, simple equality, and so on are all patterned principles.

By contrast, according to entitlement theory, each individual's entitlements are determined by a

vast number of uncoordinated individual acts that are, pattern-wise, arbitrary: by gift or inheritance, through exchange or as a product of labor, as profit from investment or interest on loans; the sources of holdings and their relative share in a portfolio vary from individual to individual. The outcome of such a complex system of transfers and retransfers is a distribution that corresponds to no simple pattern.

The problem with patterned distributions is that they are unstable. Their maintenance requires constant interference with liberty. In Nozick's famous example, an original, arguably just patterned distribution of holdings is transformed when spectators are willingly pay an extra quarter to watch Wilt Chamberlain play. At the end of the season and after one million spectators, Chamberlain ends up with $250,000—much more than anyone else. Now, to maintain the pattern, the central distributing agency must return that sum to the spectators, thus restricting their freedom to use their property as they see fit. However, one could argue that what patterns really upset is not liberty as such, but a particular distribution of holdings or a certain property regime, which of course the patterned principle explicitly challenges. So perhaps this is no reflection on patterned principles.

A further indictment of patterned principles is that they require redistributive taxation to sustain. Taxing an individual's earnings amounts to taking the produce of a certain number of hours of work. In effect, according to Nozick (1974), it is equivalent to forcing the individual to work that number of hours for the benefit of someone else.

A closer look, however, reveals that what is at issue here is not coercion, but expropriation. Because both labor and material resources are factors in the product, whether taxation of earnings is a violation of property rights depends on the extent of ownership one might have with respect to the material of which the product is formed. Much hinges on the details of the principle of acquisition: how previously unowned material becomes owned. At this point, left libertarians split with right libertarians (as well as among themselves).

The right libertarian doctrine of original appropriation is based on three premises. First, no one has an initial claim over any part or share of the originally unowned world. Anyone can grab and accumulate as much as he or she is able without thereby violating any rights. Second, people fully own themselves. Formally, they have the moral and legal right to do with their minds and bodies as they see fit. How far they can act in the world crucially depends on how much control they have over material resources, an aspect not guaranteed by the principle of self-ownership. Third, original acquisition might nevertheless be restricted by a very minimal proviso that no one be made worse off by an appropriation as compared to the situation in which there is no system of property at all.

Left libertarianism aims to reconcile self-ownership with some redistributive measures at least with respect to natural resources and any income they might generate. Accordingly, left libertarians have challenged one or another of the three premises of the doctrine of original appropriation in the following ways:

1. Equal concern for the interests of everyone—including latecomers, the unfortunate, the handicapped, and so on—might require rejecting simple nonownership. Steiner (1994) claims that everyone is entitled to an equal share of natural resources, thus challenging the world nonownership premise.

An arrangement whereby each individual owns exactly one nth of the total resources is difficult to implement because births and deaths are unequal in number. It is also inefficient because some less capable people control resources that could be put to better use by others and also because economies of scale are lost. Finally, it is undesirable because it jeopardizes the security people need in their holdings.

Institutionally, it might imply a scheme along the lines proposed by Henry George. Individuals can acquire as much land and other natural resources as they wish, provided they pay a rent to society that reflects the market value of the resources they control. Severe inequalities will persist because this mechanism does not compensate for differences in income-generating talents and differences in needs.

2. Philippe van Parijs (1995) challenges the sufficiency of formal self-ownership as an attractive conception of freedom. For individuals to enjoy substantive self-ownership, they must have control over some significant amount of natural resources. A free society, in terms of real liberty, must guarantee a more equal distribution of resources allowing

each person to have the greatest possible opportunity to do whatever he or she might want to do.

The institutional form this suggests is an unconditional basic income at the highest sustainable level. Such an allowance paid by the state is *unconditional* in the sense that it is paid regardless of the beneficiary being unemployed, unable to work, willing to accept a suitable job or undergo suitable training. It is also *basic,* although not designed to cover basic needs or a decent existence, in the sense of being a foundational income, to which any other income—from work, property, or social insurance—can legitimately be added.

3. Michael Otsuka endorses an egalitarian interpretation of the Lockean proviso. A weaker proviso places some people at an unfair disadvantage. Under such a scheme those who come first, or are more fortunate in any other way, can unfairly remove all the opportunities to appropriate from everyone else. The egalitarian proviso, in effect, permits the original acquisition of no more than one nth of all resources, weighted according to their objective value (e.g., fertility) and the subjective value for the acquirer (e.g., capability). Under this scheme, people are equal in terms of their opportunities for well-being. Hence, this version of left libertarianism is more egalitarian than either of the previous two.

Limited Government

Hayek views the threat of totalitarianism in the 1930s as a natural development of collectivist tendencies in the ideals and social structures of European countries at the time. Foremost among these ideals is what he refers to as planning—the central direction and conscious regulation of all economic activity. Against this ideal, he maintains that the role of government in the economy should be mainly confined to setting up and monitoring the framework for the efficient functioning of competition: an appropriate legal system, money, markets, and channels of information—where these can't be provided by private enterprise. Government may also have a role in the provision of public goods, environmental protection, and some workplace regulation, when compatible with competition. What is unacceptable is the supplanting of competition by planning, rather than supplementing it where it is impractical.

Two central arguments are presented against the intervention of government in the economy.

1. *The argument from ignorance*. Technological progress, division of labor, the growing complexity and extent of modern society, and the diversity of ends and means make it increasingly difficult to obtain a coherent and complete picture of the economic process. Coordination by some central agency, then, appears indispensable to the planners. But the economy is increasingly complex to such an extent that it is naïve to think that any one agency can attain a synoptic view of the economy and facilitate coordination by conscious control. The most reliable way to achieve effective coordination is precisely the flow of information by means of the price system. Prices provide all the information required to make decisions without the need to see the whole picture. Individual decisions, in turn, transmit new information, which flows swiftly and efficiently to where it is required. However, the price system can fulfill its function only under genuine competition, where individuals need to adapt to price changes and do not control them. Compared to this decentralized method of solving the coordination problem, Hayek (1944) says, central direction by government appears "incredibly clumsy, primitive, and limited in scope" (p. 37).

2. *The argument from arbitrariness*. Leaving the economy to run on its own, without guidance, results in an impersonal tyranny of a sort over a considerable portion of individuals' lives. Instead of the impersonal mechanism of the market, planners seek to introduce a conscious plan administered by an accountable elected government. But the very possibility of formulating such a plan is doubtful, and the inevitable failure will lead to arbitrariness and tyranny of a much more disturbing sort. It is impossible for any mind to grasp the diversity and multiplicity of needs competing for available resources and to analyze these needs, attaching appropriate weights to each, to form a coherent plan. It is impossible to agree on a particular scale of value, and planning within certain confined spheres, once embarked upon, expands to embrace all spheres.

The ineffectiveness of democratic assemblies is due to the impossible task with which they are

charged. Majority decision cannot produce agreement on the whole direction of a society's resources. Deciding by majority makes sense where the choice is between two or three alternatives. But where the alternatives are limitless, there will be in all likelihood as many alternatives as members of the legislature. Voting clause by clause will produce an incoherent decision rather than a comprehensive plan. Eventually, the task must be delegated to experts who, without a given single goal, will inevitably impose their own scale of preferences on the community. Hence, in practice, Hayek (1944) says, they are given power to make arbitrary decisions with the force of law.

Advocates of natural rights-based libertarianism, both left and right, typically agree on some general limitations on any state. Accordingly, it is unjust for the state to use force against people

a. for the sake of promoting some morally desirable goal or restricting morally undesirable behavior where no other person's rights are involved (strong *anti-moralism*);

b. for their own benefit or interests against their will (strong *anti-paternalism*);

c. for the benefit to others, even to guarantee that they do their fair share in a social cooperative scheme for the benefit of all (strong *individualism*);

d. for the sake of preventing individuals from exercising their enforcement rights (i.e., to prevent them from using force to prevent others from violating their rights).

Limitations (a) and (b) amount to Mill's famous harm principle endorsed by both liberalism and libertarianism. In opposing the principle of fairness, (c) is distinctly libertarian. Thus, a libertarian state will avoid compulsory jury, community, or military service. Moreover, it seems it could not impose a tax to finance such institutions or public goods, including law enforcement itself, not to mention a more strongly redistributive scheme such as those proposed by left libertarians. Although this is compatible with a *very* minimal sort of state, it is unclear how any kind of state might be made compatible with (d). A monopoly on the use of force must prevent individuals from exercising their enforcement rights. The question arises as to what, other than the unlikely case of universal consent, might justify a libertarian state.

Peter Vallentyne (2007) proposes to impose the costs of enforcement on rights violators. This solves the problem raised by limitation (c) so that at least redistributing enforcement services among those who do and do not pay is unnecessary. Under the proposed scheme, rather than some or all beneficiaries having to pay for the system, violators themselves financially maintain enforcement. Furthermore, although the libertarian state claims a monopoly on the use of force, it doesn't prohibit individuals from enforcing their rights independently. The point is that all force must be *authorized* by the state, not that all use of force must be *administered* by the state. Hence, the problem raised by limitation (d) is finessed because no individuals are prevented from justly exercising their enforcement rights.

One problem with the novel idea of having rights violators pay for the system of enforcement is that the burden will be unjustly imposed only on those who are captured, tried, and found guilty—not on all those who manage to evade justice. Although punishment and the compensation they will pay their victim will be proportional to their crime, their payment to support the system of enforcement will be grossly disproportionate.

A second weakness with this account is that it ignores the problem of the necessity of judgment. We need judgment to decide when a right has been violated, which of two sides has been wronged, what is the appropriate use of force to prevent a rights violation or to punish or to exact compensation. The state, as the agent of some or most individuals, will have, when it judges it appropriate, to protect them against the attempted enforcement by other members or nonmembers—against the latter's judgment. Thus, in effect, these other members or nonmembers will be forced to accept the state's judgment and will be prevented from exercising their rights of enforcement. Hence, limitation (d) cannot be so easily finessed.

Nozick (1974) attempts to justify the libertarian state by showing how a state might evolve without universal consent and without violating any individual rights. Individuals in a state of nature might find it expedient to band together

forming *mutual protective associations* to protect their rights. Such associations will need to allocate protective duties among members and to form a procedure for deciding when their members' complaints (against other members or outsiders) are valid and justify intervention. Some *commercial protective agencies* may also be formed, whereby individuals may purchase such services and be exempt from any protective duties themselves. Division of labor, market pressures, and economies of scale contribute to the emergence of *dominant protective agencies* in each geographical area. Still, such dominant protective agencies in a territory fall short of being a state because they neither claim monopoly over the use of force nor provide protection for all within their territory.

The dominant protective agency within a territory would be permitted to prohibit unreliable and risky enforcement by others, at least until they can settle the issue of whether these independent individuals are justly and proportionately punishing for presumed transgressions, thereby coming to hold a de facto monopoly in the use of force. Thus the *ultra-minimal state* is established by morally permissible means. Enforcing such prohibitions requires compensating those prohibited from acting in a risky manner that may have turned out to be harmless. The most cost-effective way of doing this is by extending protection to everyone within the territory including those who have not paid for this service. The ultra-minimal state is thus transformed into the *minimal state*.

Nozick's account avoids the problems raised by limitations (c) and (d) by stipulating a general right of enforcement and by allowing rights transgression when compensation is made. Thus, the evolving state can prohibit self-enforcement based on its own judgment and the redistributive aspect in providing universal protection, even to those who do not pay, is justified on the basis of a principle of compensation. This rationale for redistribution does not hold for other desirable goods and services and hence cannot justify their redistribution. So no state more extensive than the minimal state is justified.

One serious shortcoming in this account is methodological. It is questionable to what extent hypothetical histories could justify actual states. That is to say, how does the fact that a state similar to our own *could have* evolved without violating any rights possibly make the state with its actual history of libertarian rights violations just?

Left libertarians want to justify more than the minimal state. The provision of public goods and the correction of other market failures, as well as some redistribution, are justified on the basis of a right to an equal share in natural resources, real liberty, or an egalitarian proviso. Thus, although left libertarians have a similar view of what could justify the state, they need to justify more extensive state activities. Left libertarianism, like right libertarianism, aims to justify a state that doesn't violate any individual rights. Where they differ is on what rights these individuals have.

Liberty

Liberalism seems to be the dominant position among political theorists, philosophers, and laypeople in the West. Almost by definition, liberty is the central value of liberalism. However, what exactly liberty is and why it is important are disputed.

There are a number of philosophical questions regarding liberty. (In this entry, the terms *liberty* and *freedom* are used interchangeably.) First, one can ask what the concept of liberty means. Second, once these questions are answered, one can ask what kind of value, if any, liberty has. Liberty is not by definition a valuable thing. Third, if liberty has value, one can ask how much value it has. A fourth question—which institutions best produce liberty—is more social-scientific than philosophical, but most political theorists will be interested in this question as well. This entry considers each of these topics in turn.

The Meaning of Liberty

Philosophers often separate liberty or freedom into two broad kinds, negative and positive. To call a liberty negative is not to judge it—negative liberties are not by definition worse or less valuable than positive liberties. Rather, negative liberty connotes the absence of constraints, interference, or obstacles. Positive liberty connotes the presence of something, usually a power or a capacity of some kind. If somebody ties a bird to the ground, this means it lacks the negative liberty to fly. The reason it cannot fly is because someone stops it. However, suppose the reason the bird cannot fly is that it is a penguin—a flightless bird. It does not have the positive liberty to fly. The reason it cannot fly is because it lacks the relevant capacity, not because there is an obstacle in its way.

Philosophers have offered a number of accounts of negative liberty. One straightforward definition is that liberty is the absence of any obstacles to achieving one's goals. On this view, anything—including other people, the weather, animals, laws of physics—that make it more difficult to achieve one's ends counts as an infringement on liberty. This definition, like most, allows that there is a continuum between being completely free and completely unfree. A person with no obstacles is freer than a person with one major obstacle, who is in turn freer than a person with two major obstacles.

Philosophers have tended to offer more moralized definitions than the previous account, which regards any obstacle whatsoever as infringing liberty. Many philosophers confine themselves, rather, to discussing just those cases where other people impose the obstacles. Metaphysically speaking, an obstacle is an obstacle. Still, suppose one person cannot move because he or she has been wrongfully imprisoned. Suppose a second person cannot move because he or she has been imprisoned after being found guilty of a crime. Suppose a third person cannot move because a tree has fallen on him or her. The metaphysical differences among these obstacles are slight, but the moral difference is significant. For these kinds of reasons, one popular view of liberty holds that it is the absence of impediments imposed by other people, while yet another popular view of liberty holds that it is the absence of impediments wrongfully imposed by other people.

There are also a number of different views of positive liberty. One popular view of positive liberty is that one is free just in case one has the power or capacity to do what one chooses. A rich man and a poor man might both have a right to buy a yacht—that is, a negative liberty that prohibits others from stopping them from buying one—but only the rich man has the power (and thus the positive liberty) to do so.

Some philosophers worry that the power to do as one pleases might simply turn one into a slave of one's passions. Accordingly, this leads some to argue that liberty is the power to do what is right. A stronger version of this view holds that liberty is the power to do what is right without the temptation to do otherwise. On this view, a truly free person would always act as practical reason deems best without any impulse to act otherwise.

A less moralized version of these last two accounts holds that we are free provided our beliefs, actions, desires, and the like are suitably authentic. On this view, we are free provided that the desires and impulses guiding our actions properly express our own nature, rather than being the mere products of the influence of others. This view stresses rational self-direction or autonomy as essential to freedom.

These are only a few of the accounts of liberty political theorists and philosophers have offered. Some philosophers dispute whether the distinction between positive and negative liberty is ultimately tenable. They worry that they collapse into each other. Some reject positive conceptions of liberty in favor of negative conceptions, and vice versa. Some think that only negative liberty should be called liberty and that the concept of positive liberty is inherently confused. Others, especially republicans, attempt to offer new accounts of liberty that combine both negative and positive elements.

Philosophers and laypeople use the word *liberty* to refer to a wide range of states of affairs whose differences are obvious but whose similarities are obscure. Given that there are so many conceptions of liberty in philosophical and commonsense discourse, one might wonder if the concept of liberty can be usefully defined at all. On this issue, there are three possible positions. The nihilist holds that the concept is ineradicably confused and that there is no coherent definition of liberty. The monist holds that it is possible to identify a single, unitary, coherent notion of liberty that fairly captures the common use of the term. The pluralist holds that the concept liberty represents a plurality of different but related things. A pluralist might think every conception of liberty listed above captures a way in which the term *liberty* can reasonably be used. Pluralism provides the most straightforward account of how the term *liberty* is actually used. Still, many philosophers find monism attractive because they hope to provide a simplified, more unified account of liberty than found in day-to-day talk. Those philosophers who lean toward nihilism about liberty tend to do so as a result of what they regard as the failure of monists to provide a satisfactory account.

Settling on an answer to the question of what it means to be free leaves open a further question: What thing is free? Theorists often talk of individual people being free, but it seems to make sense to talk about collectives, such as democratic bodies, legislatures, tribes, or nations, as being free. The freedom of individuals and the collective potentially conflict. For instance, in an unlimited democracy, nothing stops the majority from doing as it pleases, and as a result, this might mean that no single individual in that society enjoys much freedom.

Also, for any given conception of liberty, there are different aspects or spheres of life in which one might use that term. For instance, political liberty concerns the ability of individuals to contribute to and participate in governance. Civil liberty concerns the rights of individuals against government, such as rights of free speech, assembly, due process in court, and the like. Social liberty concerns issues of tolerance and social pressure individuals face from others. Economic liberty concerns the power of individuals to satisfy their wants, to work as they choose, or to make contracts. Psychological liberty concerns the degree to which citizens can make free or rational choices as opposed to being in the grip of their own biases, irrationality, and neuroses.

The Value of Liberty

Once one settles on an account of what liberty is, one can then ask what kind of value, if any, that kind of liberty has. The point of defining liberty is not to settle debates about its value but to enhance them by making it clear what is being discussed. On many of the conceptions of liberty discussed above, liberty is not guaranteed always to be valuable to the free person. For instance, the power to do what one chooses could be dangerous to a child or to an adult with self-destructive wants. Or, if a person is too poor to buy a yacht, the fact that no one will wrongfully interfere with his or her goal of buying the yacht might do little good. Or, consider typical communitarian criticisms of liberalism. The communitarian critic of liberalism and the liberal agree that individuals in an open, tolerant, liberal society are more free than those in the more collectively oriented society the communitarian prefers. However, the communitarian critic claims that these liberal freedoms are not worth having because liberty leads to people having stunted, isolated, disconnected lives. Accordingly, one might hold that liberty has no value whatsoever or even has some disvalue.

On the supposition that liberty is valuable, there are three kinds of value it might have. Liberty could be intrinsically valuable, instrumentally valuable, constitutively valuable, or some mix of the three.

To say liberty is intrinsically valuable means that it is valuable for its own sake or as an end in itself. For instance, one might think that it is good

that people do not wrongfully interfere with each other, even if noninterference does not lead to any further positive result. Perhaps what makes this good is simply that it means people respect each other.

To say liberty is instrumentally valuable is to hold that protecting or promoting liberty tends to lead to other valuable consequences or outcomes. For instance, many argue that freedom of conscience, thought, and lifestyle are instrumentally valuable in helping to achieve scientific and social progress. Economists argue that protecting economic freedoms is important not as an end in itself but as a means to making people wealthier and happier. Many defenders of democracy hold that protecting political freedoms tends to produce better quality government.

Finally, one might hold that liberty is constitutively valuable, which means that liberty is a part or piece of some other valuable thing. So, for instance, suppose one holds that rational self-development is the best form of life. On this view, having the positive freedom (the capacity) to control one's passions and to formulate rational life plans is part of what constitutes a flourishing life. A happy life is composed of different constitutive parts: virtue, rationality, pleasure, positive freedom of a certain sort, and so on. Alternatively, one might argue that liberty is an important component of justice. A just society is a free society, and so liberty is good because justice is good.

Settling what kind of value liberty has does not settle how *much* value it has. In particular, a person who thinks liberty has only intrinsic value does not necessarily hold that it has more value than the person who thinks liberty has instrumental value. The first person might think liberty is an end in itself, but not a very important end, while the second person might hold that liberty, although valuable only as a means to achieving other goods, is extremely important. (In parallel, oxygen is not an end in itself, but few things are more valuable to humans.)

Debate over the value of liberty tends to focus on two issues: (1) whether liberty is more important than other competing values and (2) the degree of instrumental value liberty has. As an instance of the first, consider that the goal of protecting and promoting liberty could potentially come into conflict with the goals of promoting equality or moral virtue. (It could also be that free societies are reliably more equal or more virtuous, but it will still be an interesting question which value is more important when conflicts do occur.) As for the second issue, determining the amount of instrumental value liberty has requires more than philosophical analysis. One needs to examine historical, sociological, psychological, and economic evidence to see what happens when people are free and when they are not.

The Institutions of Liberty

Philosophers have often claimed that different conceptions of liberty entail different political ideals. For instance, some have argued that if one thinks negative liberty (the absence of interference from others) is important, one should support some sort of capitalist regime, but if one favors positive liberty (the power to do what one wants), one should support some sort of socialist or redistributive regime. This is mistaken for a number of reasons.

Even once one has settled on a view of the nature and value of freedom, this leaves open what institutions best promote and protect it. Identifying a conception of liberty and determining how valuable liberty is, so defined, do not entail as a matter of logic that it is government's job to protect or promote liberty. However liberty is defined and regardless of what value it has, the proper role for government as protector or promoter of particular liberties cannot be settled by philosophical analysis alone. One needs to examine the social scientific evidence to see what actually happens when people rely on government or any other institution to play a given role.

Even if one determines that government ought to promote and protect a given kind of liberty, that does not settle how the government ought to do it. In particular, it does not settle whether the government ought to use direct or indirect means. For instance, suppose one holds that positive liberty, in the sense of the power to do as one wants, is the most important value to be promoted by government. The government might attempt to promote this among citizens directly by offering subsidies, grants, free goods, and the like. Alternatively, the government might attempt to promote this indirectly by providing a basic institutional framework (such as the rule of law, constitutional representative

democracy, courts, and a well-functioning property rights regime) under which people can be expected to act in ways that promote positive liberty. Or, it might provide a mix of the two, as is often seen in contemporary Western democracies. Determining what mix of indirect and direct strategies best promotes any given conception of liberty is largely an empirical question to be answered through social scientific investigation.

One important part of this investigation will depend on how people can be expected to act under certain rules. If one assumes that everyone will comply with the rules, then one will favor a different set of institutions than one will favor on the assumption that some or many people will not comply or will try to abuse the rules for their own favor. Many writers on liberty have been suspicious of government power. If their suspicions are correct, this makes a difference as to how much power a reasonable person would want government to have in its attempt to promote liberty.

Accordingly, it is possible for a laissez-faire capitalist and a market socialist to have exactly the same values and to share a conception of freedom and of its value. In this case, their dispute is not moral or philosophical. Rather, it is over a set of empirical claims about how the world works and what it takes to achieve those values in the real world. For these kinds of reasons, contemporary political theorists concerned about liberty often do highly interdisciplinary work.

LIFE

The concept of life has a long history within Western political theory and philosophy, but its importance has increased significantly in recent years. Since Aristotle's exclusion of natural life from the realm of politics and the correlative formulation of *bios politicos* or a distinctively political way of life, the concept of life has presented numerous complexities for political theory, perhaps as much as it has in areas such as philosophy of biology and moral philosophy, albeit in different ways. These complexities have generally been taken up more explicitly in the European rather than Anglo American traditions of political theory. They have particularly been brought to the fore in the past 20 years or so, with the formulation and theorization of the idea of *biopolitics*. The French scholar Michel Foucault initially focused attention on this concept in the first volume of his *History of Sexuality* and in course lectures such as *Security, Territory, Population* and *The Birth of Biopolitics* during the 1970s. More recently, the concept has been centrally important in Italian political thought, especially that of Giorgio Agamben, Antonio Negri, and Roberto Esposito, among others.

Aristotle's Distinction Between Natural and Political Life

In terms of considering the concept of life in political theory, the most influential formulation is likely to be that of Aristotle in *The Politics,* where he claims that the city-state exists not for the sake of living, but for the sake of living well. He goes on to claim that the city-state exists by nature, and furthermore, that the human being is by nature a political animal. Consequently, humans who exist

without a city-state are either sub- or superhuman. The importance of Aristotle's formulation is thus twofold: It establishes a distinction between *living* and *living well,* or between natural life and political life, where it is only in the latter that the nature of being human is fully realized. In addition, his formulation highlights the tight integration of humanity and politics, such that the nonhuman is constitutively deprived of or excluded from the political sphere because of its essential nature. Aristotle's theory of life is known as *entelechism* because he held that all living organisms maintained a specific functional principle or end within themselves. For instance, being properly human meant having and fulfilling the ends or function of human beings. This function was *logos,* which can be understood as rationality and language and which Aristotle saw as being most fully realized in the *polis.*

Arendt on Labor, Work, and Action

One of the most profound contemporary responses to Aristotle's conception of politics and life is that proposed by Hannah Arendt. In her classic work, *The Human Condition,* she revisits Aristotle's construal of the relation between life and politics and proposes her own tripartite distinction of labor, work, and action, all of which correlate to the most general aspects of human finitude—mortality and natality. Labor relates to sheer survival, fulfilling the basic biological processes of the human body and the things that sustain them. It refers to activities such as baking bread, growing grain and fruits, and so on. Work relates to the unnatural dimension of human existence and bestows a degree of permanence on the products of human endeavor; it strives toward the production of *things* and the shaping of a "world" or inhabited environment for humans. Action, the most highly valued of Arendt's triptych, specifically addresses the political sphere; it is the only one of these three dimensions of human activity that goes on between people without mediation of matter or things. As such, it reveals the fundamental condition of human plurality, and moreover, it is specifically addressed to the political task par excellence of beginning something new.

Given this, Arendt argues that the fundamental category of political thought in distinction from metaphysics may not be mortality, as it is often supposed, but natality. The critical dimension of Arendt's unique conception of labor, work, and action is that in the modern era, the distinctiveness of these spheres has been occluded such that labor and work are no longer separable; moreover, the valuation of labor has reversed and now supersedes that of action. Consequently, politics itself has been devalued and occluded.

Agamben and Esposito on Biopolitics

The recent contribution to theorizing biopolitics made by the Italian philosopher Giorgio Agamben can be seen as extending this insight into the occlusion of politics, although Agamben's interpretation of Aristotle is significantly different. For Agamben, Aristotle consigns Western political thought to a biopolitical paradox in the very act of dividing human life from itself—that is, in separating natural life (*zoe*) and political life (*bios*). By introducing this division or caesura into human life, Aristotle opens the way to the biopolitical capture of life in the sovereign exception.

Moreover, this division of human life from itself gives rise to the category of "bare life," which is central to Agamben's construal of biopolitics. Bare life, he argues, is distinct from both natural and political life and emerges from their separation; it is natural life that is politicized through its exposure to death. However, the death to which it is exposed is not a metaphysical condition (insofar as mortality is intrinsic to human life, for instance) but a political one: It is the death to which the sovereign may put those subject to its power and violent abandonment.

While Agamben finds the origins of biopolitics in foundational texts of Western political philosophy, the most deadly paroxysm of biopolitical violence occurs in the modern Western political condition. In reference to German Nazism and the system of extermination camps it established during World War II, Agamben makes the controversial claim that the camp is paradigmatic of the exposure of life to death in modern biopolitics. In *Homo Sacer* and elsewhere, he argues that it is not the city that characterizes the modern world, as some political theorists and sociologists have claimed, but the camp: The camp is the "*nomos* of the modern." Thus, in his closest analysis of the

ethical implications of the Nazi extermination camps in *Remnants of Auschwitz,* Agamben identifies the *Muselman*—inhabitants of the camps who had lost any will to live and any sensate relation with the world and others around them—as the preeminent figures of Western biopolitics. But Agamben's damning view of biopolitics and the production of bare life that it entails is not wholly negative, for just as the *Muselman* signals the reduction of the human to the sheer fact of living, it also signals the possibility of transformation by somehow passing beyond this extreme limit into a new "form-of-life" in which the separation of natural and political life would no longer be possible.

Agamben's construal of concentration camps focuses on the production of bare life; another Italian philosopher, Roberto Esposito, challenges this view and the corresponding theory of biopolitics. For Esposito, the biopolitics of the Third Reich are the result not of the interminable separation of political and biological life and the consequent production of bare life but rather of the absolute coincidence of politics and biology. He argues that the Nazi regime is characterized by a complete biologization of politics: While biological metaphors such as "the body politic" and "national health" have a long history, this conjunction of political and biological concepts is not metaphorical in the Nazi regime. Instead, any distinction between these two spheres collapses completely, such that biological criteria guide political action.

More specifically, however, it was not simply biological ideology that shaped Nazi politics, but the concrete authority given to medicine within the workings of the regime. Doctors oversaw the massive production of death under the Nazis during World War II and lent their authority and expertise to radical experimentation on human subjects and to the T4 program of eliminating people with disabilities and gassing Jews. These programs of eugenics and extermination were undertaken and justified through a discourse of disinfection and cleansing of the German nation of the "bacteria" that threatened it from within.

The role of doctors in the medicalized political production of death in the Nazi regime is well documented, but it would be blinkered to imagine that such practices are alien to liberal democracies. In fact, the eugenics movement arose in the United Kingdom and the United States before the central doctrine of improving human stock through eliminating "degeneracy" was imported to Germany. In the United States, this doctrine led to enforced sterilization of women considered to be feebleminded, on one hand, and on the other, public health programs to promote higher birth rates among those perceived to have good genes. As this suggests, although theorists of biopolitics have focused on totalitarian regimes such as the Third Reich, liberal democratic states have their own violent history of the integration of politics and biology.

Foucault and the Concept of Biopower

Perhaps one of the distinctive strengths of Foucault's approach to the concept of biopolitics is that it focuses on the history of the management of life within liberal arts of government. In the final chapter of *History of Sexuality,* Volume 1, Foucault argues that politics in the West assumed a new form in the late eighteenth century, such that biological life itself became the object and target of political power. He argues that this transformation occurred through a fundamental shift in the rationality underpinning the operation of the political technologies of power, from a power of deduction to one of production. Power no longer operated through a sovereign violence imposed on subjects from above but through the *normalization* of life. Thus, rather than "taking life or letting live," the biopolitical state accords priority to the maxim and associated practices of "fostering life or disallowing it."

As Foucault indicates in course lectures such as *Security, Territory, Population,* the emergence of biopower entailed the correlative emergence of a specific political subject that had previously not existed, namely, the population. With the growth of disciplines such as statistics in the eighteenth century came the crucial capacity to count the population, to draw inferences from population samples, and to track trends and establish norms across populations. Consequently, the population emerged as a subject of a power geared toward the management and intensification of life, and the wealth and well-being of the state was increasingly measured in population terms.

Consistent with this, as well as with his study of the history of the prison in *Discipline and Punish,*

Foucault identifies two axes involved in the historical emergence of biopower. The first, an anatomo-politics of the human body, aims at the individual body and its regularity in relation to the social body of which it is a part; disciplinary power is characteristic of this axis. The second axis focuses on the species body and works from the level of population to the individual body. Foucault calls this the biopolitics of the population. The political interest in biological processes such as the control of human reproduction, death rates, life expectancy and longevity, and the health of populations can be seen as a fundamental to this axis.

Furthermore, Foucault argues in *History of Sexuality* that the modern regime of biopower was indispensable to the emergence of capitalism because this economic system is not possible without the "controlled insertion of bodies into the machinery of production and the adjustment of the phenomena of population to economic processes" (p. 141). Capitalism "had to have methods of power capable of optimizing forces, aptitudes, and life in general without at the same time making them more difficult to govern" (p. 141).

Foucault's understanding of the relation between life and capital revolves around the idea of "docile bodies," in which the forces of the body are simultaneously intensified and subject to more or less rigid controls. Thus, he emphasizes the use value of life forces for capital. While at times he suggests that the forces of the body also escape and challenge the technologies of power and capital, a fuller articulation of the transformative and creative potential of life and the body appears in the work of Antonio Negri and his longtime collaborator, Michael Hardt.

For Hardt and Negri, the notion of biopower refers to the tendency on the part of sovereignty to exert power over life itself, a tendency that is manifest in the production of social life itself in its entirety. But, against this power that strives to subjugate the forces of life, Hardt and Negri also emphasize the capacity and potential of life over which sovereignty attempts to rule to challenge and transform the structures in which it is manifest. They identify this as the power or potential of the multitude to create social relationships in common. This, they suggest, represents a new possibility of politics beyond imperial biopower.

Current and Future Issues in Biopolitics

It is debatable which of these theories best illuminates the relation between life and politics today and whether any of them sufficiently captures the complexity of the current political, economic, and social environment in which we live. But one thing is certain: Never before has biological life been so *valuable* within global capital. That is to say, with the explosion of biotechnological industries in the past decade, biological tissue, ranging from human embryonic stem cells to obscure plant varieties and human organs for transplant, is now available for global profiteering in an unprecedented way. This integration of life in systems of financial circulation is indicated in notions such as *biocapital* and *biovalue,* generated by anthropologists and sociologists of biotechnology and biomedicine in recent years. At the same time, however, other scholars interested in the phenomena of war, genocide, poverty, and global human trafficking, for instance, argue that human life has rarely had such little value. This apparent differential valuation of life and the living is perhaps the central horror of modern biopower.

Lincoln, Abraham (1809–1865)

Abraham Lincoln's contribution to political theory may be analyzed in terms of the theoretical, practical, and historical implications of his thought and leadership. Theoretically, his speeches and writings provide one of the greatest moral justifications of democracy ever given to the world. Practically, his actions provide a model of prudent statesmanship—that is, the ability to apply moral principles correctly under the legal, social, and political circumstances of the time. Historically, he is at the center of America's national myth, the sustaining narrative that defines us as a common people based not on blood, but on fidelity to the principles of the Declaration. As the embodiment of the American experiment, Lincoln has represented the following things to the American people: the savior of the Union, the great emancipator, man of the people, the first American, and the self-made man.

Although he was not a political theorist per se, Lincoln articulated some of the most profound and enduring insights about the nature of equality, liberty, democracy, constitutionalism, and the meaning and destiny of the American experiment in self-government. His Gettysburg Address, which distilled the essence of the American creed, famously defines democracy as a form of government "of the people, by the people, for the people."

Lincoln probed the moral foundations of democracy to vindicate the American regime from the hypocrisy of slavery. He was compelled to provide a coherent understanding of democracy and its core principle of equal consent in response to the twin threats of slavery and disunion. Lincoln maintained that equality was "the central idea" of the American regime and "the father of all moral principle." And he viewed equality as an inclusive principle that applied in the abstract to all individual human beings at all times. Moreover, his view of equality appreciated both the dignity and depravity of our common human nature. Given that all human beings are all equally imperfect, "no man is good enough to govern another man, *without that other's consent*. I say this is the leading principle—the sheet anchor of American republicanism," he said in a speech, "The Monstrous Injustice of Slavery," on October 16, 1854. Thus, no one can be entrusted with absolute power over another. In sum, Lincoln emphasized that the core principle of democracy, equal consent, was utterly incompatible with slavery.

The above view of equality and consent was the moral touchstone of Lincoln's leadership as opposed to proslavery rivals from both South and North. For example, in contrast to Lincoln's view, Southern disciples of John C. Calhoun understood the principle of equality in collective terms, as applying to the equal rights of states and to the corporate body of citizens within these states. Stephen A. Douglas, Lincoln's nemesis from Illinois, interpreted the principle as applying exclusively to white men of Anglo-American ancestry. Speaking of the efforts of his opponents to displace the founding principles of the regime, Lincoln explained in a letter to Henry L. Pierce on April 6, 1859:

> But soberly, it is now no child's play to save the principles of Jefferson from total overthrow in this nation. . . . The principles of Jefferson are the definitions and axioms of free society. And yet they are denied, and evaded, with no small show of success. One dashingly calls them "glittering generalities"; another bluntly calls them "self evident lies"; and still others insidiously argue that they apply only to "superior races."

Lincoln's view of equality was informed by the natural law teaching of the Declaration of Independence. Indeed, Lincoln interpreted the Declaration as a moral covenant that promulgated the first moral principles of a just government. Given this understanding of the Declaration as a moral imperative, Lincoln rejected the moral relativism implicit in Douglas's notion of popular sovereignty, which taught that the justice or injustice of slavery was determined by the preferences and choices of territorial settlers.

Lincoln trusted in reason's ability to discern self-evident truths about politics and universal laws of nature. It was in view of this trust that he considered the principles of Jefferson to be "the axioms and definitions" of free society. His appeal to natural theology against slavery was influenced by the Enlightenment thinker William Paley; and his views on political economy and self-improvement borrows from the Enlightenment rationalism of Francis Wayland.

In response to proslavery theologians and ministers from the South who appealed to the Bible in defense of slavery, Lincoln developed a civil theology that envisioned the fundamental principles of equality, consent, and liberty in the Declaration as articles or dogmas of a "political faith" or a "political religion." Contrary to southern clergymen's exploitation of the Bible to justify slavery, Lincoln argued that the natural law teaching of the Declaration was confirmed by the following precepts from the Bible: "man created in the image of God" in Genesis 1:27; "The Golden Rule" to "do unto others" in Matthew 7:12. To be sure, Lincoln's concise definition of democracy, dating to August 1, 1858, is itself an expression of the Golden Rule, "As I would not be a *slave,* so I would not be a *master.* This expresses my idea of democracy. Whatever differs from this, to the extent of the difference, is no democracy." Other biblical references cited against slavery included: "the Great Commandment" to "love one's neighbor as oneself" in Matthew 22:37–40; and the injunction to "earn bread by the sweat of thy brow" in Genesis 3:19.

Lincoln is relevant to political theory not only in view of his ability to affirm so powerfully ideas about equality and democracy, but also in view of his ability to put these ideas into action. Most notably, Lincoln's leadership sought to harmonize moral obligation to the principles of the Declaration with legal obligation to the rule of law in the Constitution. His oft-stated paramount object was to preserve the Union, but for Lincoln, this also meant preserving the principles for which the Union stood as well. His policy of the Emancipation Proclamation was calculated to achieve the twin goals of preserving the Union and ending slavery within lawful boundaries.

Lincoln's extraordinary use of executive power in suppressing the rebellion—for example, his Emancipation Proclamation, his suspension of the writ of habeas corpus, his raising of funds without congressional approval, and the creation of military tribunals to try civilians—has been debated among political scientists and historians in terms of the enduring question of balancing freedom and security and wartime. Lincoln himself viewed the Civil War as a test that would decide the fate of democracy as a form of government. In his *Special Message to Congress* of July 4, 1861, he posed the question in these terms, "Is there, in all republics, this inherent, and fatal weakness? Must a government, of necessity, be too *strong* for the liberties of its own people, or too *weak* to maintain its own existence?" Critics doubted whether the Constitution would survive Lincoln's efforts to preserve it. Defenders claim that the text of the Constitution itself distinguishes between peace and wartime. They cite the doctrine of executive prerogative, claiming that president has enhanced authority in times of crisis to preserve the state and to bend the Constitution without breaking it.

Lincoln's legacy in American history is by no means uncontested. Various currents in American political thought and history have viewed him as an unprincipled pragmatist, an unrepentant racist, a misguided utopian, a messianic figure, the destroyer of civil liberties, the nemesis of states' rights, and the progenitor of the modern bureaucratic welfare state. However, critics and defenders alike agree upon the centrality of Abraham Lincoln to the character and destiny of the American regime. One cannot understand American political thought without engaging the towering figure of Abraham Lincoln.

LOCKE, JOHN (1632–1704)

A recent essay on John Locke begins with the claim that he is the "most influential philosopher

of modern times." Although it is difficult to be quite so categorical as this, the judgment expressed is surely a plausible one, particularly in the area of political philosophy. Locke's well-known influence in America is one piece of evidence; the general (although not universal) dominance of the ideal (if not reality) of liberal democracy in the world today, an ideal that Locke had a great hand in fashioning, is another.

Locke, of course, was not only a political philosopher. His philosophic activities extended into nearly every area of human inquiry, and his *An Essay on Human Understanding* (1690), a founding text of modern epistemology, stands as one of the seminal texts in the history of philosophy. Locke's political thought is contained primarily in his *Two Treatises of Government* (1690), although also of great political relevance is his *Letter on Toleration,* a text purporting to settle the vexed question of the proper place of religion in political society. Other Locke texts are of greater or lesser political importance, but for present purposes, the *Treatises* will be the focus of interest.

The Biographical Context of Locke's *Two Treatises*

Locke, it is now generally agreed, wrote the *Two Treatises* a decade or so before he published it in 1690. Like most of Locke's philosophic writings, it was both a work of political philosophy in conversation with the tradition and a text directed toward the political situation of Locke's day. He most definitely did not live the life of an ivory tower intellectual. From 1666 on, when he met Anthony Ashley Cooper, later (1672) the first Earl of Shaftesbury, Locke's life veered between the quiet of the philosopher's study and the rough and tumble of a very rough politics. Locke became part of Shaftesbury's household, a trusted adviser, aide, tutor to Shaftesbury's grandson, and—because Shaftesbury was a leading figure in English politics of the day—Chancellor of the Exchequer in the 1660s and from 1672 to 1673 Lord Chancellor; he was much caught up himself in politics. Associating with Shaftesbury introduced Locke to politics at the highest level, so that he never wrote of politics as a mere theorist or armchair thinker.

Associating with Shaftesbury also introduced him to political danger at the highest level. Shaftesbury was sent to the Tower of London and finally into exile in Holland, where he died in 1683. Because of his Shaftesbury connection or because of his own activities and suspect loyalties, Locke felt threatened enough that he too fled to Holland in 1683, where he stayed until 1688. He returned to England in the wake of William of Orange's successful invasion and the triumph in the Glorious Revolution.

It is widely believed now that *Two Treatises* was mostly written in the period from 1679 to 1683, before Locke fled to Holland. At the time, his patron Shaftesbury was promoting the policy of excluding James, Duke of York, from succeeding his brother Charles II as king. Some of the whigs, those opposing the king, and perhaps Locke, too, favored violent action to get their way. Much was seen to be at stake—whether England would follow France down the path to absolutism and whether a known and open Catholic would be king. This is the immediate context for Locke's *Two Treatises,* a work that bears the marks of that context in its effort to develop a strong and unequivocal case against the legitimacy of absolutism, whether in the biblical form of Sir Robert Filmer's *Patriarcha,* in the rationalist form of Thomas Hobbes's *Leviathan,* or in the equivocal form of Hugo Grotius's *Law of War* and *Peace.*

Although the Second Treatise is usually read separately from the First Treatise, Locke announces in the full titles of the works their intimate connection. In the First Treatise, "the false principles and foundation of Sir Robert Filmer, and his followers are detected and overthrown." The "Second" is "an essay concerning the true original, extent, and end of civil government."

Locke's Critique of Filmer

Filmer was a political thinker best described as a political theologian; he defended absolutism on the basis of biblical doctrines, in particular on the basis of the doctrine of the creation of Adam alone and the derivation of all other human beings, including Eve, from him. This, thought Filmer, was God's particular way of indicating that, like God, Adam was singular and the source of all who came after. As source, Adam, like God, had moral supremacy over his issue. Building on this foundation, Filmer laid forth his principles: the absolute

obligation to the illimitable royal power grounded in divine right.

Locke begins with a critique of Filmer, for he aims to overturn both divine right and absolutism, replacing them with popular consent and limited government, respectively. Filmer was not perhaps the most typical of the divine right thinkers, but he made what was probably the most extreme case of the day for those two abominations, as Locke saw them. The most obvious take-away points from the *First Treatise* were few in number, but they were powerfully argued and persuasive to most readers. Although Filmer claimed to build entirely on scripture, Locke said, the good book did not in fact support the propositions he was putting forward. Filmer misquoted, or took out of context, or interpreted tendentiously, or drew insupportable inferences from the texts on which he relied. Locke supplied plentiful examples of all of these flaws. His point seems to be, then, that although Filmer claims to be giving us the authentic biblical political doctrine, the Bible does not actually support Filmerean divine right absolutism.

Although in his positive development of his political doctrine in the Second Treatise, Locke does not develop his theory from biblical texts, he does claim that his position is consistent with scriptures in a way that Filmer's is not. There might be a more radical thought underlying Locke's treatment of Filmer, however. Locke insists that Filmer builds wholly on scripture, although in fact he does not. Locke attributes to Filmer some important doctrines, purportedly derived from the Bible, which Filmer does not endorse. Locke, for instance, attributes to Filmer the view that Adam's authority over Eve derives from the Fall, when Eve persuaded Adam to eat fruit from the forbidden tree and they were cast out from the Garden of Eden. But Filmer is very clear that it does not, and Locke can claim that Filmer so agues only on the basis of a very blatant misrepresentation of Filmer's text. This misrepresentation, so irrelevant to a critique of Filmer, is very relevant to a consideration of the biblical doctrine on politics, or at least to some very widespread interpretations of biblical political doctrines, for at least since Augustine, the Fall has been a prominent part of Christian political thought. One way to understand Locke's argument in First Treatise is to see him using Filmer as a stalking horse for something more fundamental lying behind him, the Bible itself. Locke claims in his title to have laid bare the "false foundation of Sir Robert," a phrase ambiguous enough to refer to the Bible as the "foundation" of Filmer's thinking. Most contemporary readers of Locke are resistant to reading Locke's First Treatise in that way, for they are impressed with his piety and biblical rootedness. Whether or not the evidence goes so far as to support the radical conjecture presented above, it is very clear that Locke does not present his thinking as biblically grounded. As Locke says well into the First Treatise: "reason" is man's "only star and compass" (Vol. 1, p. 58). The only instrument or means of guidance mankind has is reason; that implies that the Bible is not a reliable guide unless it can be shown to agree with reason. It is reason and not revelation that leads; the Bible is to be read in such a way as to harmonize with what reason independently tells us. If we do not put reason first we can be carried "to a Brutality below the level of Beasts" (Vol. 1, p. 58).

The place of reason in Locke's thinking helps us understand an oft-noted feature of his Second Treatise—unlike the First, it hardly cites a biblical passage and never as *the* ground for any claim Locke is raising, although at times as support or in agreement with claims he believes to be true on rational grounds. Thus, he says in one place, "whether we consider natural *Reason,* which tells us . . . , Or *Revelation,* which gives us" a similar lesson (Vol. 2, p. 25).

The Second Treatise

The title of the book announces the topics of the Second Treatise to be "the true original, extent, and end of civil government." The list of topics gives a good catalog of the organization of this book. Chapter 1 is a brief introduction, recapitulating the results of the critique of Filmer and distinguishing political power or government from other sorts of power and authority, followed by seven chapters on the "original," that is, the origin of civil society in the context of and in contradistinction to the "original" of other sorts of authority such as father–child (Chapter 6), husband-wife (Chapter 7), and master–servant (Chapter 5), with all of which the political relation of magistrate–subject (or citizen) is often confused, particularly by Filmer.

The section of chapters on "the original" is followed by seven chapters on "the extent of civil government," including an important chapter on the legitimate purposes of government, which set boundaries to its extent (Chapter 9). Here Locke presents his doctrine on the forms and proper structures of government, a doctrine governed in all places by his understanding of the proper extent. The section on extent is then followed by a series of chapters on the end of government, a phrase that Locke apparently intends in the sense not of *telos* or purpose, but of ending or conclusion. Here he takes up four topics, all of which involve "the end" of government—conquest (Chapter 16), usurpation (Chapter 17), tyranny (Chapter 18), and the "dissolution of government" (Chapter 19).

The State of Nature

No part of the Second Treatise is better known or more commented on than the first section on "the original" of civil government, for here Locke adumbrates his doctrine of the state of nature (Chapter 2): The true original of government cannot be understood unless we understand the "true original" altogether as a state of nature, that is, a state without legitimate political authority of any sort. The "state all Men are naturally in . . . is a *state of Perfect Freedom* to order their actions, and dispose of their Possessions, and Persons as they think fit, within the bounds of the Law of Nature, without asking leave or depending on the will of any other Man." The state of nature is at the same time a "state of equality," where no person has more authority than another.

Locke sometimes speaks as though the refutation of Filmer of itself justifies or even compels that we begin thinking about politics by positing a state of nature. That appears to be a logical fallacy, for one can conceive of other options than Filmer's divine right monarchy and Locke's state of nature. Much of the brunt of the critique of Locke and the other social contract philosophers since the seventeenth century has indeed consisted of dissents from the notion that a state of nature is the proper starting point: It is said to be historically, sociologically, and psychologically false to the nature of human beings and of human society. Despite Jean-Jacques Rousseau's heroic efforts to demonstrate that human beings could well survive in state of nature, most of the critics point to the facts of human birth and childhood helplessness, to say nothing of natural human gregariousness, to contest the plausibility of the state of nature.

Closer study of Locke's argument shows that these many critics have much mistaken his position (perhaps confusing it with Rousseau's) and that, moreover, he does not rely on the simple inference from the refutation of Filmer to establish the state of nature as his point of departure. Locke invites confusion and misunderstanding because he does not treat the state of nature in a simply univocal way. At times, he is quite determined to present it as an actual empirical condition: He refers, for example, to rulers of different nations as being in a state of nature relative to each other because "they have no common superior." He also mentions instances such as two otherwise unconnected individuals meeting on a desert island.

These situations certainly do meet the conditions for a state of nature—no common authority exists over the parties—but they do not effectively bring out Locke's point in positing a state of nature as the beginning or origin of politics. His concern is to establish "the original of civil government," a possession of something Locke calls "civil society," which in turn is characterized by the presence within it of "political power." That is defined by Locke as "a Right of making Laws with Penalties of Death, and consequently all less Penalties" (Vol. 2, p. 3). Many readers have noticed that Locke appears to be committing a category mistake when he calls political power a right; perhaps we would understand his point better if we translated his term *political power* into our term *authority*. He does not mean to be merely descriptive as do positive political scientists, who take power to be a fact and not a right. According to Locke, political power is rightful or legitimate power. We can rightly redefine Locke's task in his quest for the original of civil government to be the attempt to answer the question: What gives some the right to coerce others, even to the point of killing them?

Locke's beginning point is a suspicion or doubt of the rightfulness of coercive power, or, rather, the demand that such power be morally justifiable. It is not so much that demand in itself but the ground of that demand that leads Locke to posit the state of nature. The ground, in a word, is natural rights;

all human beings have rights to life, liberty, and estate. To have a right to such things means that these are not be interfered with without a morally valid reason, if at all. The right to life must include as part of it a right to the unimpairedness of bodies, the platforms of life. That human beings are rights-bearing creatures implies a general moral immunity from coercion, except when morally justified.

Natural Rights

Locke puts before his readers two alternative theories of the grounds for positing natural rights. There is, first, his well-known workmanship argument: "men being all the workmanship of one Omnipotent, and infinitely wise maker; . . . they are his property, whose workmanship they are, made to last during his, not one another's Pleasure" (Vol. 2, p. 5). Having been made by God, humans are his property. As owner, God has the right to do what he will with his creatures, but humans violate God's property rights, that is, wrong God, when they interfere with the life or liberty of other humans. Natural rights, understood primarily as immunities from interference by others, accrue to individuals by virtue of their all being God's property. It should be noted that Locke's workmanship argument is meant to be an argument of natural rather than positive theology.

Locke also suggests another ground for rights: "every man has a property in his own person" (Vol. 2, p. 27). In one obvious respect, this claim is very different from the first one, for here individuals are said to be self-owners whereas in the first, God is said to be their owner. Locke is unclear on how these two claims are to be reconciled, and the scholarly literature is much divided on the issue. Perhaps he did not feel the need to clarify that matter for the politically relevant consequences of the two claims about ownership are much the same—natural or human rights. It is worth nothing that in the Second Treatise, Locke makes no effort to prove either divine or self-ownership. Those tasks are left for his *Essay on Human Understanding,* where he provides a natural proof for the existence of a creator God and develops a theory of the self-possessing self (See Vol. 2, p. 27, and Vol. 4, p. 10).

Because Locke has established in First Treatise that God has not appointed any individual human beings to exercise his proprietary rights, and because Locke's inspection of the natural order shows him that nature also does not mark any with "authority . . . to destroy . . . another," nobody by nature or divine designation possesses *political* power, the right to put another to death. All then are equal in authority; none has any. But this is precisely what the state of nature is—a state of no authority. Locke begins with the state of nature, for it captures the implications of the fact that human beings are equal rights-bearers. Locke's state of nature neither raises nor needs to raise any implausible claims about human beings ever living in a dissociated state or being by nature asocial. Thus, the criticisms of Lockean politics raised by Georg Wilhelm Friedrich Hegel and many after him are based on a rather elementary misunderstanding of Locke's argument.

Law of Nature

Locke's beginning point is a state of nature, a condition of liberty and equality, but, Locke insists, this is nonetheless a state with a law "to govern it," a law that sets moral limitations on what human beings may rightfully do (Vol. 2, p. 6). Locke rejects the Hobbesean conception of the state of nature as a condition with no restraints, a condition where every man has a right to everything.

Locke never presents a comprehensive account of the content, principles, or grounds of the law of nature, however (Vol. 2, p. 12). The most general statement on the content of the law of nature provides that "when his own preservation comes not in competition, ought he, as much as he can, to preserve the rest of mankind" (Vol. 2, p. 6). Locke's development of the idea reveals an important but fairly limited set of duties: One "may not unless it be to do Justice on an offender, take away or impair the life, or what tends to the Preservation of the Life, the Liberty, Health, Limb, or Goods of another" (Vol. 2, p. 6). That is, the natural law limitations appear to be the obverse or corollaries of the natural rights that human beings possess. As one has, for example, a right to life, so others have a duty not to interfere with that life, a duty that follows automatically from the right itself. Locke's law of nature appears largely to express those correlative duties and thus to be the implications of the original natural rights.

Locke spends far more space on one implication of the law of nature than on the content or grounding of the law of nature. "The Execution of the Law of Nature is in that State [of nature] put into every man's Hands, whereby everyone has a right to punish the transgressors of that Law to such a Degree as may hinder its violation" (Vol. 2, p. 7). Such power may be a part of or derived from this law of nature, but it has the character of a right: Notice that Locke does not affirm a duty or obligation to enforce the law, but a right or moral permission to do so.

The executive power of the law of nature plays an important role in Locke's theory, in the decisive respect differentiating his theory of the social contract from that of Hobbes. According to Locke, it is not generally morally permissible to use force against others, but one may do so only in the service of protecting the rights of oneself or of others. One is justified (but not morally required) to use force to protect the rights of others because the guilty party has forfeited the immunities that go along with possessing rights, or because all can rightly consider a rights violator as a potential threat to their rights, that is, as one who has no respect for the system of rights and immunities (Vol. 2, p. 16).

This executive power prevents the law of nature (and natural rights) from being "vain," for without it, there would be no morally acceptable way to safeguard preexisting moral immunities (Vol. 2, p. 7). It also contributes to the breakdown of the state of nature into a state of war for it empowers all to act as enforcers of their own and others rights in circumstances that make it very difficult for both self and others to distinguish clearly between legitimate actions in defense of rights and illegitimate incursions on rights. In large part, the problem arises from the right under the executive power to act preemptively, to act before a threat has ripened into a perhaps unpreventable and irreparable harm (Vol. 2, pp. 16, 136).

The executive power under conditions of the state of nature guarantees a descent into a state of war, a state where rights are "very insecure." Under conditions of "no authority," the empowerment of everyone to act to secure rights leads to a condition of all being radically insecure in their rights. The solution, of course, is the establishment of authority, which is the transfer to the community of what is now seen to be the dangerous executive power of the law of nature; the contractors resign this power but not the entirety of their natural rights as in Hobbes. Society or the government that is formed to wield the resigned executive power on behalf of society derives only such powers as are resigned, and these are the powers to protect rights. The "true original" of political power indicates clearly its proper extent.

The Social Contract

No more than the state of nature itself is the social contract to be taken as an actual historical event. It is rather a reconstruction of what rational actors, understanding both their rights and their insecurity without government, would do to better secure themselves. (See, for example, Vol. 2, pp. 137, 164.) Rational individuals will create not only a government but a certain sort of government, what we now think of as a liberal order. In the first place, rational actors will understand that government is an artifact of their rational willing: As an artifact, it has been made or should be understood as existing for certain specific purposes, namely, to secure their preexisting rights. Rational individuals will understand the shortcomings of the state of nature that produce the radical insecurity of life without government. Although there is a law to govern the state of nature (that is, a set of rational moral rules or restraints), these do not of their own accord suffice. Although the law exists "yet men, being biased by their interest, as well as ignorant for want of study of it, are not apt to allow it as a law binding to them" (Vol. 2, p. 124). That is, the law is not known sufficiently. Moreover, the system of self-enforcement (Locke takes it for granted that the use of the executive power will fall to interested, not disinterested, parties) means there is no disinterested judge to apply the law to resolve controversies (Vol. 2, p. 125). Finally, with no organized enforcement of the law, the naturally strong are able to ride over the weak despite the law of nature (Vol. 2, p. 126). Rational individuals recognize, then, that the chief lacks of the state of nature are the absence of a legislative authority to particularize and promulgate the law, an independent judge to resolve disputes under the laws, and a potent neutral executive to enforce the law. From his doctrine of the state of nature, Locke thus generates the modern theory of separation of functions.

Rational individuals will thus form or will a political system containing these three functions. Anticipating an argument that his great disciple, baron de Montesquieu, was to make more fully in the next century, Locke also concludes that rational individuals will establish a government that separates the powers in different and independent institutions (Vol. 2, p. 143). The separation of powers is one device by which rational actors attempt to assure that the government they establish will serve the ends for which it exists. All "well-framed governments" separate the legislative and executive powers (Vol. 2, p. 159). (Locke considers the judiciary part of the executive, but he does insist on a judiciary significantly independent of the executive head.)

True Extent of Civil Government

Locke concludes that the "true original" of government implies not only separated powers but limited power as well. That means, in the first instance, legislative supremacy over the executive (Vol. 2, p. 149). It also means limitations on the powers of the legislature. Although the core of the limitations is substantive—protection of the rights of all and *salus populi* so far as that is possible, the limitations Locke specifies are more formal than substantive. The legislature must rule by standing public law, not by arbitrary decrees. The laws must apply equally to all (Vol. 2, p. 142), including especially the legislators themselves. Locke sees these two requirements together as the best guarantee of good governance, or at least of governance aiming at the public good (Vol. 2, p. 138).

Although Locke is strongly in favor of legislative supremacy—conceptually, the legislative function is primary, and practically, the legislature, possessing the will but not the force of the community, is more safely entrusted with supremacy. Nonetheless, Locke also demonstrates that there must be a large scope for independent action by the executive, which Locke calls by the traditional name of prerogative. His is not, however, the traditional doctrine of prerogative (Vol. 2, p. 163). He defines *prerogative* as a "power to act according to discretion, for the publick good, without the prescription of the law, and sometimes even against it" (Vol. 2, p. 160). Given his emphasis on legislative supremacy and his concern to establish and maintain rule of law, and given his fear of executive power, his broad prerogative power may seem surprising. Locke and his rational individuals/social contractors recognize that it is not always "necessary or useful to set precise bounds to . . . power in all things" (Vol. 2, p. 164). Political life is too uncertain, too subject to unpredictable and threatening contingencies, for it to be entirely governed by rules and procedures established in advance (Vol. 2, p. 160). Locke, a great champion of what we have come to think of as constitutionalism, recognizes the limitation to the aspiration to constitutionalism. At the same time, he reminds of the dangers of this kind of executive power freed from law and legislative control. Although he generally seeks to control political power by law, he recognizes that at the end of the day, this cannot be entirely done. The executive can appeal to the public good as justification for exercises of prerogative. Locke is confident that if "this power" is "imployed for the benefit of the community, and suitably to the trust and ends of the government, [it] never is questioned" (Vol. 2, p. 161). When the prerogative is questioned, there is "no judge on earth" to settle a dispute between the executive and the legislature. The people themselves, in what Locke quaintly calls the "appeal to Heaven," must judge through some extralegal means. Locke's openness to revolution or the routinization of political violence is a corollary of his attempt to develop a viable constitutionalism marked by the maximum possible rule of law.

The End of Civil Government

Just as Locke's development of the true extent of civil government flows from his account of its true original, so his discussion of the end of civil government builds directly on what he has shown about its extent. Recall that where Locke speaks of the end of civil government in his title, he means the end in the sense of the death or destruction of civil government. His section on the end thus comprises a survey of four circumstances or ways in which civil government may come to an end. Conquest is the equivalent of "demolishing an House" (Vol. 2, p. 175). Usurpation, which occurs when a person or persons other than those designated in the established political order seize power, is also a kind of death for civil government

because a usurper "hath no right to be obeyed," which means that juridically there is no government (Vol. 2, p. 198). Tyranny, which Locke defines as "the exercise of power beyond right, which nobody can have a right to," has the same fatal effects as usurpation (Vol. 2, p. 202). Finally, in a kind of summary chapter, Locke speaks of "the dissolution of government," a chapter in which he lays out his well-known doctrine (usually misnamed as) the right of revolution.

Locke's conclusion on the true extent can be well summarized in the formula he frequently uses—that civil government does not comport with "arbitrary or absolute power." Locke has two complementary arguments to establish that conclusion, corresponding to his two alternative accounts of the basis of rights. One account derives ultimately from the workmanship argument: Because men ultimately belong to God, they do not have absolute and arbitrary power over themselves, and therefore, they cannot establish government with such power over them (Vol. 2, p. 135). Locke has a second explanation for why there can be no arbitrary power; this one conforms to his self-ownership argument.

> Absolute arbitrary power, or governing without settled standing laws, can neither of them consist with the ends of society and government, which men would quit the freedom of the state of Nature for, and tie themselves up under, were it not to preserve their Lives, Liberties and Fortunes; and by stated Rules of Right and Property to secure their Peace and Quiet. It cannot be supposed that they should intend, had they a power so to do, to give any one, or more an absolute Arbitrary Power over their Persons and Estates.…This were to put themselves into a worse condition than the State of Nature. (Vol. 2, p. 137)

That is to say, this second argument concludes against absolute and arbitrary power whether or not human beings have the power to establish such. Contrary to the position taken by many scholars, Locke's argument in the Second Treatise does not depend unequivocally on the theological arguments he sometimes deploys. This is not to say, of course, that he should be taken for that reason to have rejected the theological argument.

In any case, Locke's position on the end of civil government follows seamlessly from his clear rejection of the legitimacy of absolute arbitrary power and his affirmation of institutionally and constitutionally necessary means to the effectuation of nonarbitrary government. Government that goes beyond its bounds is no government at all. When governments act beyond their powers, they are using force without right and thus, literally, provoking a state of war with their citizenry. The citizens may then act as they have a right to in a state of war—they may resist illegitimate authority and act to establish new legitimate government. When they do so, Locke insists, they are not rebelling—it is the authorities who go beyond their legitimate powers, who reintroduce the state of war, and who, therefore, rebel—in Latin, *rebellare*—bring back war (Vol. 2, p. 226). Locke then denies that he is a teacher of rebellion and disorder, as he strives to make resistance to rulers more respectable than it had ever been.

MACHIAVELLI, NICCOLÒ (1469–1527)

In the history of Western political thought, few thinkers have been as influential—or as controversial—as the sixteenth-century Florentine statesman Niccolò Machiavelli. The author of a wide-ranging collection of writings, Machiavelli was a true Renaissance man. He lived a political life of both practical and theoretical importance, while making an important contribution to Italian literature as well. Often misunderstood, his writings have been characterized as representing a cynical, duplicitous quest for power at all costs; hence the colloquial term *Machiavellian*. In fact, the author of *The Prince* and the *Discourses on Livy,* among other works, was a founder of modern political thought who never endorsed the idea that "the ends justify the means." His corpus is rich, complex, and variegated, something that has led to numerous—and sometimes vastly different—interpretations.

Machiavelli's legacy is part of the advent of modernity. However, it involves the recovery and reconceptualization of classical humanism. By being a critic of his own times, he pointed to the past, especially to Roman antiquity, for guidance toward the future. Doing so allowed him to break the religious fetters of medieval political thought, particularly the biblical tradition. This had two consequences: the reemergence of civic republicanism and the idea that politics is fundamentally independent from ethics. The rejection of Christian political morality explains why he was able to cast his gaze back onto the ancient model of Roman pagan culture, as well as to set the stage for a view of politics as an autonomous sphere of social life.

Background and Context

Machiavelli was born in the Italian province of Tuscany, in the city of Florence, on May 3, 1469. He studied Latin from an early age, as his father Bernardo was a lawyer and had ties to humanist circles. He entered public life when he was elected second chancellor of the Republic of Florence, which principally managed Florence's territories. He also served as advisor to Piero Soderini, gonfaloniere of republican Florence after the Medici were driven out of power. He was also known as the creator of the city's militia and as secretary of its war magistracy of Ten, or "Ten of War," the committee responsible for Florence's foreign and diplomatic relations. In addition to his military experience, Machiavelli was involved in many diplomatic missions, including those to France, Siena, the Papal Court, the German emperor, and to Cesare Borgia. His political career ended upon the return of the Medici to Florentine rule, which led to his imprisonment and torture. He wrote his major works thereafter. In 1513 he wrote *The Prince,* seeking employment and dedicating it to Lorenzo de' Medici, although the work was originally written for Giuliano de' Medici. Around that time he also wrote his defense of republican government, *The Discourses on the Ten Books of Titus Livy*. He died in 1527, having failed in his attempts to return to political activity.

During much of Machiavelli's life, his homeland, Florence, was in crisis. Constantly at war or in tension with its neighbors, Florence was also prey to internal and external threats. Internally, powerful elites—such as the Medici family—dominated politics and became corrupt, that is, oriented merely toward their own interests. Externally, the city-state was encroached upon not only by regional rivals, such as Siena and Pisa, but also by more distant enemies, such as the French and the Spanish. In this context of instability, Machiavelli found guidance in the writings of the ancient denizens of the Italian peninsula, specifically the Romans.

Machiavelli wanted to see a free, independent, peaceful, and stable Florence. Moreover, he dreamed of seeing it expand and become a dominant player in the region. For this reason, he read the works of the Roman historian Titus Livy, who recounted the rise of Rome and its transformation from a small republic into a magnificent empire. On reading this, Machiavelli became convinced that Florence could emulate the ancient Roman example and perhaps reach the same imperial power that Rome had reached. He found many admirable aspects of Roman rule and believed that its tradition of civic humanism and republicanism made it strong.

The Recovery of Classical Civic Humanism

Disgusted by the corruption of his Florentine contemporaries, Machiavelli sought solace in the virtues of the ancients. In his analysis of the first ten books of Titus Livy's history of Rome, Machiavelli analyzed what made Rome strong internally and externally. According to Machiavelli, any society is made up of two principal groups or classes: the *grandi* (elites) and the *popolari* (the people). These two groups will never see eye to eye, as they have different interests: The elite seek to govern, and the people just want to be left alone to lead peaceful lives. These two groups, or "humors," as Machiavelli calls them, are almost natural entities. They correspond to the existence of two different human drives: one to control and one to be left alone. The people are the conservative element of the body politic, and the elites are the ambitious component. In his reading of Roman history, Machiavelli deduced that these two groups could never be made to agree; they could, however, learn to not just coexist, but even thrive, under the right institutional circumstances. Thus, for Machiavelli, social conflict generates political greatness. This idea, among others, sets him apart from his contemporaries, who abhorred sectarianism and conflict.

Machiavelli examined Roman law and found that its structure and organization, its "modes and orders," allowed for a balance of power between the patrician and the plebeian elements of Roman society. Both of these elements had a say in the drawing up and institutionalization of laws and rules. This arrangement, where the elites and the popular sectors share power, allowed for his conception of a mixed constitution, whereby elites could manage the state, but only under the supervision and with the input of those from the common citizenry. This arrangement, Machiavelli found, was mutually beneficial to the interests of the two humors. Hence, it worked for the common public good, in other words the *res publica*. Although Machiavelli often sided more with the popular sectors of society, arguing that they are the ultimate judges of public policy, he was cognizant that a balance was necessary. Various mechanisms, such as agrarian laws and laws related to calumny, were institutionalized so that this balance could last. If these laws were followed by all, without exception, and enforced in a comprehensive manner, the legal system would support social stability. Thus, the rule of law was also central to Machiavelli's understanding of republicanism. All citizens must be willing to adhere to the city's laws, and this in itself is part of Machiavelli's conception of *virtù*. A virtuous citizen is one who adheres to the law and partakes in crafting it.

Crucial to Machiavelli's brand of republicanism is patriotism. A state cannot function properly if its citizens do not feel a love for their own country. For Machiavelli, this is a love of not only the country's laws but also its way of life. Machiavelli enjoyed strolling through the city streets and the countryside of his homeland, talking with laborers and drinking and playing games with average townspeople, something that made him appreciate the unique culture of his country, which was, most specifically, the city-state of Florence, but in a larger sense Tuscany and even all of Italy. This subjective love of the place where he was born and grew up is essential to his republican patriotism: It is the basis of a willingness to serve one's

country as a soldier if necessary (Machiavelli despised the use of mercenaries) and to promote its well-being above that of other states. It is clearly reflected in the last chapter of *The Prince,* in which he urges the liberation of his homeland from foreign invaders.

Separation of Politics From Ethics

One way that this love of country can be encouraged, in Machiavelli's republican political thought, is through the proper use of rhetoric. He acquired this by examining the history of ancient Rome, where great orators like Cicero were key to the flourishing of the Roman virtue of patriotism. Rhetoric, an art in Roman antiquity, was recovered during the Italian *Quattrocento,* and Machiavelli was part of this movement. For him rhetoric was valuable in itself, for it possessed artistic value. But it also had an ancillary, political, value: The capacity to persuade others through the artistic use of words was cardinal to forensic life and also helped to generate a common sense of Roman identity. Thus, Machiavelli emulated the great rhetoricians of old, by writing many of his own works in a rhetorical vein. Chief among them was his masterpiece in the traditional mirror of princes' genre, *The Prince.*

It is through rhetoric that the second dimension of Machiavelli's legacy is revealed. The separation of political life from morality becomes evident when we question the very nature of rhetoric. Aimed at persuasion, Machiavelli's conception of rhetoric does not have to adhere to strict rules of veracity. As long as an audience is moved through flowery language, passionate speech, and poetic diction, rhetoric is successful, even if it is slightly mendacious. Whereas it is immoral to tell lies (according to most accounts), the use of fabrications within rhetoric is acceptable as long as it serves to further persuasion. This is one example of the way that Machiavelli pushed the envelope of how far political practices could move from ethical injunctions.

Machiavelli went far in questioning the relationship between politics and ethics. It is not that he did not care for morality. His writings show clearly that he wanted peace, order, stability, and some prosperity for his homeland for moral reasons: He wanted average people to enjoy the fruits of daily life without fear. He also wanted his homeland to achieve a level of greatness, comparable to that of Rome. This in itself is not a moral issue if morality is understood as a question of absolute good and evil, but it is an ethical issue if ethics is defined as how one should live in a community. For Machiavelli, greatness, magnificence, and being admirable are what a political order should aim for. And, sometimes this may require the use of immoral means, such as war, to protect a community and its greatness. Only good arms are the sinews of good laws.

As Machiavelli examined the corruption, weakness, and inefficacy of his Florentine homeland and compared it to the glorious power of ancient Rome, he saw the significance of religion. He saw that the Romans used religion successfully to motivate citizens. Machiavelli tended to see religion as a way to promote political values, rather than as a value in itself. He observed, for instance, the importance of treating the augurs of the Roman "chicken-men" (priests who presaged the outcome of a battle according to whether their chicken would eat or not before the fight) seriously, for, in this way, soldiers could be convinced that their gods were on their side and thus they would fight more valiantly. Thinking about the religion of his own land and times, Machiavelli concluded that Christianity was a religion that, in its emphasis on humility, modesty, poverty, and equality, would hamper the progress and grandeur of an expanding state. He offered a trenchant critique of Christianity, evident in passages such as *Discourses* II.2.2. Believing that Christianity promotes a sort of weakness that is not compatible with the quest for glory that is fundamental to his political theory, he generally treated Christianity as a problem rather than an asset. However, he noted its rhetorical force, for he appreciated the persuasive power of men such as Savonarola, and he invoked religious language in order to persuade. Although Machiavelli's God is a rhetorical one, he did see the efficacy of Christian men who spread the power of the Roman Church through unarmed propagation of ideas.

By examining critically what he thought were the weaknesses of Christianity, Machiavelli pushed further the space between political and moral life, as Isaiah Berlin tells us. It is in *The Prince,* as well as in other writings, such as *A Description of the Methods Adopted by the Duke Valentino When Murdering Vitellozzo Vitelli, Oliverotto da Fermo,*

the Signor Pagolo, and the Duke di Gravina Orsini, where he eventually came to question the utility of following conventional morality in political life. Although written for the specific and mundane purpose of acquiring a job as an advisor to the Medici, the short manual of power that is *The Prince* is a work in moral theory enriched with real-life examples. Fundamentally, the message of this work is to show that to be successful in politics, a leader must be able to act without regard to conventional morality. Throughout the work, there are various examples of this, such as the spectacular execution of Borgia's own lieutenant, Remirro de Orca, who was cut into two pieces and displayed in a piazza, something that left the people "satisfied and stupefied." This act was both politically expedient and awe-inspiring, while also completely immoral. Machiavelli approved of this sort of leadership, which he saw exemplified in the person of Cesare Borgia.

The Prince contains Machiavelli's radical teaching, which is the necessity to act against morality when politically expedient. This is the core of what Leo Strauss, a chief interpreter of Machiavelli, argued when he said Machiavelli is a "teacher of evil." The central figure of *The Prince* is Borgia, a vicious man whom Machiavelli describes as the ideal political leader. Hence, the supreme realist, Machiavelli, acted paradoxically as an idealist when he mythologized Borgia. Borgia's spirit of amoralism and immoralism pervades the text. This is the other side of Machiavelli's notion of *virtù:* It is not merely about acting patriotically for the motherland, it is also a courageous and defiant attitude that allows the transgression of moral principles in order to acquire, maintain, and expand power. Rooted in the Latin term for male (*vir*), *virtù,* according to Machiavelli, is a valuation of masculinity, understood in the archetypal manner of independence, aggressiveness, courage, confidence, brashness, and voraciousness.

The Prince seeks to teach potential leaders that they must become masters of *virtù,* be they male or female. Borgia, in Machiavelli's idealized account, possessed a character that combined four essential components of *virtù:* the ability to act with force, to use fraud, to have foresight, and to be flexible. Moreover, he was loved by Fortune, since much of his success was a consequence of being the son of Pope Alexander VI. Power is the basic terrain of politics, and any regime or ruler needs it. It is acquired and established by great leaders, those who, according to Machiavelli, can use these four qualities. Machiavelli opposes *virtù* to Fortune rhetorically: the capacity to act with force, dissembling, foresight, and flexibility will help to master fate, since "Fortune is a woman." This is represented by Borgia, a man much admired by Machiavelli in spite of the facts that he had family ties to the clergy, was of Spanish descent, and was no republican but in fact an enemy of Florence. Machiavelli believed humans control almost half of their lives' events, whereas luck or Fortune rules the rest. Thus he left out Christian providence from this equation. Using *virtù* appropriately will help tame life's vicissitudes.

In *The Prince,* all three sides of *virtù* are portrayed in a positive light. The use of force or violence is a recurring theme. From the very foundation of a state, violence, represented by the lion, is the guiding principle. Great founders such as Moses and Cyrus are mentioned. The great prince or leader must also be a master of disguise, or, in Machiavelli's symbolism, a fox: He must learn to act fraudulently to fool his opponents and to lie whenever it will be politically expedient. By using the symbols of the lion and the fox in a positive manner, Machiavelli implicitly criticized Cicero, who urged rulers to be humane. Machiavelli preferred the image of the centaur Chiron: a leader made up of human and also beastly (i.e., violent) parts. For Machiavelli, if a prince allows his personal morality to trump what is in the best interest of his state, he fails as a leader. This is part of the tradition started by his contemporary Francesco Guicciardini, that of *ragion de stato,* eventually to be called *raison d'état* (reason of state), which is the basis of realist international relations, as Friedrich Meinecke underscores. We also see Machiavelli's promotion of the idea that the leader must be flexible: He or she cannot have a single way of doing things but must adapt depending on the circumstances.

Questioning the political utility of Christianity at a time of Catholic dominance both in the realm of religion as well as in the city of Rome, Machiavelli lived dangerously in a moral sense. He effectively exposed to public view what everyone knew but no one dared to speak: that politics is a dirty business. Machiavelli's understanding of *virtù* sidelined the

medieval idea that politics should be controlled by Christian virtue and the classical idea, found in Aristotle, that *arete* (rational virtue) must guide political life. Perhaps no Machiavellian dictum is as emblematic of this as the idea of "cruelty well used": A political leader must use cruelty at the right time and in the right dosage in order to achieve his political aims. A similar, if less potent, version of this appears in his exhortation to princes (in *The Prince*) to learn "not to be good." Ideally, a ruler should be loved and feared, but since it is difficult to achieve both at the same time, to be an efficacious ruler, a man must cultivate and manage fear both within and without the state. In the words of Montesquieu in *The Spirit of the Laws*, Machiavelli was full of the spirit of his idol, the Duke Valentino, or Cesare Borgia.

Machiavelli's Modernity and Method

One crucial dimension of Machiavelli's contribution to political theory is his methodology. Owing to his originality, commentators have struggled to determine his precise intention and his mode of approaching politics. By pointing to his purported effort to see how things are, not as they should be, in political life, many have claimed that he is one of the first modern political scientists. Such is the view of Ernst Cassirer and Augustin Renaudet, for instance. Machiavelli examined the workings of *lo stato* and wrote about some general rules regarding its workings. For some, such as Quentin Skinner, he was the first to theorize the modern state. He also cast his gaze on human nature, rather than on divine law, as a way to organize social life. Thus, he must be considered seriously as one of the founders of a scientific or objective study of political phenomena.

This transformation of political method involves moving away from Christian doctrine and toward humanism. Unlike medieval political thinkers, such as Thomas Aquinas or Augustine, Machiavelli did not attempt to square human politics with Christian virtue or commands. At the same time, his recovery of republicanism is a reinterpretation of the classical account: Unlike Aristotle, for instance, Machiavelli did not have a teleological view of human development that required active participation in the *polis*. For him, freedom to create one's laws and to not be subordinated by foreign powers was more important than individual flourishing within a community. Given these crucial distinctions from both the liberty of the ancients and the Christianity of medieval thinkers, Machiavelli must be seen as at the vanguard of modernity.

The turn toward new ways of ordering political life, however, is not uncomplicated. Machiavelli had a nuanced understanding of modern politics. This is most visible in his poetic and dramatic works, such as *The Golden Ass* and *Mandragola*. These artistic works show that, for Machiavelli, the dawn of modernity brings with it an intensification of the sense of being lost and alone in a world of flux. Hence, Machiavelli cannot be seen as a proponent of the simple idea that pursuing ever-increasing power is a clear solution to the travails of modern politics or that progress is inevitable. Machiavelli's literary works add depth and texture to his political ideas and also provide an alternative to the notion that he developed an exact political "science" in anything more than a merely metaphorical way. For this reason, it may be more accurate to say that Machiavelli was concerned with describing the art of politics rather than the science of politics. Such is the view of Jacob Burckhardt and Herbert Butterfield, among others. Still, the debate over Machiavelli's method provides ample room to think about the very meaning of modernity and the exactitude of political knowledge. Machiavelli was a pivotal figure in the transition from medieval thought to early modern ideas. As such, his writings reveal premodern concepts such as the idea that human physiology is made of up fluids or humors that are affected by the cosmos, a cyclical conception of history, and also a persistent engagement with religious symbols and biblical themes.

Legacy of Machiavelli

By contrasting the failures of modern Florence to the successes of ancient Rome, Machiavelli highlighted the crisis of his era. At the same time, he knew that one could not simply return to the way of the ancients. He saw in humanism the key to learning from the past in order to forge a more promising future. Humanism, understood as the centrality of human experience and nature as opposed to that of God in public life, came to

permeate the Renaissance. In Machiavelli's view of politics, this meant a renewed concern with the city as such, as the sphere of human development. But it also meant the need to take a hard look at human nature, foibles and all. This led Machiavelli to see that immorality is part and parcel of human nature.

This process led Machiavelli to displace the traditional foundation of politics, that of ethics. Did he reestablish politics on a different basis? One important interpretation is that necessity becomes the key foundation of his political philosophy. His legacy involves the abrading of the distinction between republics and principalities as a matter of political necessity. A strong executive is needed if a republic is to function well. It must always be aware of external threats, for Machiavelli believed rulers are always either engaged in war or thinking about war. This stance of perpetual vigilance is not only necessary for principalities, but must also be heeded by republican leaders. The importance of making one's laws while preventing the encroachment of always-aggressive foreign powers with a proactive foreign policy is an element of Machiavellian thinking that has had a far-reaching influence. Machiavelli's brand of republicanism had a significant influence both in England through James Harrington as well as in the founding of the United States, as J. G. A. Pocock showed. It is important to note, however, that Machiavelli did not approve of republics whose economic growth was at the center of their expansion. He believed citizens should be deprived of wealth while public coffers should be enriched, and in this sense he cannot be seen as a proto-capitalist thinker.

An alternative interpretation of his refounding of politics on a new base is to be found in the fact that he was a man of letters and a creative playwright as well as a poet. As such, Machiavelli suffused his entire oeuvre with aesthetic principles. The admiration for the glory and power of Rome, the spectacular executions carried out by Borgia, and the valuation of heroism, even if tragic, are part of this artistic outlook on power that Machiavelli drew up at the height of Florence's preeminence in the arts. In his view, politics is about appearances, changing of forms, representation and misrepresentation, and the imitation of the ancients, something that is evident even in fanciful parts of his *Florentine Histories*. And, like much art, it deals in the expression of emotions, whether these are love, fear, or hope. Although he never entirely severed the link between ethics and politics, Machiavelli—an artist, statesman, and political theorist—went far in building a new, aesthetic foundation for politics.

There are limitations, however, to the Machiavellian legacy. As the transitional figure from medieval to modern political thought, Machiavelli had difficulty in dealing with some tortuous problems in political theory. He treated religion as an instrument, although it appears that it can be a basic motivating drive per se for political acts even today. He also came to believe that Christianity was an effete philosophy that would undermine modern states. Yet, European colonialism all over the world was often tied to Christian values and missionaries—for instance, in the conquest of the Americas by Spain, something that Machiavelli largely ignored when he discussed Ferdinand of Aragon. Moreover, he admired the dazzling power of empires, without properly seeing the contradiction in espousing both a republican love of liberty and an expansive, territorial conception of power, which, by definition, takes away the freedom of others. He also believed that only free, republican states could grow and expand successfully, something that was contradicted by the rise and expansion of nondemocratic states such as China and Russia. Still, in the richness of its originality, Machiavelli's corpus is itself a founding act of modernity.

Maine, Henry Sumner (1822–1888)

Sir Henry James Sumner Maine was a British jurist who invited scholars to take a more historical and anthropological approach to law. Maine's theory of legal development posed a significant challenge to the positivist legal theory of John Austin by arguing that there were no abstract, timeless necessary notions in law, but that legal doctrines and concepts were the product of the societies in which they had evolved. In his major work, *Ancient Law* (1861), Maine put forward a theory of legal development. The earliest law, he argued, consisted of the judgments of rulers claiming divine inspiration. It was succeeded first by an era of customary law and then an era of codes. In *Ancient Law,* Maine argued that societies that codified their law early in their history—as Rome had with the codification of the Twelve Tables (c. 450 BCE)—became progressive, whereas those which codified later, such as India, remained stationary. In progressive societies, law continued to develop in response to three external impetuses: fictions, equity, and legislation. These ensured that law would keep up with the needs of the people.

In *Ancient Law,* Maine also traced the evolution of modern individualistic societies out of primitive patriarchal ones. The basic unit of early societies was the family, which was headed by an absolutely supreme patriarch. In such societies, there was relatively little law to regulate relations between different kinship groups. Over time, the individual replaced the family as the basic unit of society, and a more sophisticated system of civil law developed. Maine's theory was encompassed in his famous phrase that the movement of progressive societies has hitherto been one from status to contract. Although politically conservative, Maine was an enthusiast for the individualistic, laissez-faire society in which he lived.

In his later work, Maine expanded his critique of Austin. His experience as an administrator in India convinced him that Austin was wrong to define all law as being the commands of a sovereign enforced by his sanction. Such a view of law not only was incapable of explaining Indian customary law but, when applied by English administrators on the subcontinent, had the effect of distorting it. For Maine, English conceptions of political economy could equally not simply be applied in India. In his later writings, he also developed his ideas on the evolution of property. Abandoning his earlier distinction between progressive and stationary societies, and developing his interest in anthropology, he argued that the study of societies such as India provided living examples of the European past. A comparison of Indian, Irish, Russian, and Slavonic societies could help show the development of individual property rights out of joint-property holdings.

Well written and catching the enthusiasm of the age for theories of progress, Maine's work proved highly popular in his lifetime. After his death, his

influence waned. If lawyers accepted his modification of Austin's jurisprudence, Maine's historical approach was not taken up by later English jurists. Nor did anthropologists accept his anthropology, which was wedded to a patriarchal theory which was soon rejected.

Mandeville, Bernard de (1670–1733)

Bernard de Mandeville was an influential eighteenth-century political economist, social theorist, and satirist. Born in the Netherlands to a family of physicians, Mandeville attended the Erasmian school in Rotterdam and, in 1685, matriculated at the University of Leiden to study medicine. Soon after receiving his degree, he traveled Europe, perhaps to escape public scandal after he and his father were implicated in the 1690 tax riots in Rotterdam. After briefly returning to the Dutch Republic in 1694, Mandeville immigrated to England. While practicing medicine in London, Mandeville actively pursued his literary ambitions until his death in 1733.

A prolific prose writer and satirist, Mandeville is best known for his masterpiece *The Fable of the Bees: Or, Private Vices, Publick Benefits,* a complex work of social satire, political economy, and moral theory. It began as a long poem, *The Grumbling Hive: Or, Knaves Turn'd Honest,* published in 1705. The poem depicts a wealthy hive of bees, driven by pride to pursue material gain and social esteem, even by vicious means. Disturbed by their own behavior, the bees decry their moral failings even as they grow wealthier. Their god answers their cries; he rids the hive of vice and renders the bees honest. After this intervention, the hive is radically transformed. Industry and commerce come to a halt, and the newly impoverished hive is deserted by the bees, who fly away to live contentedly in a tree hollow. Mandeville pointedly notes in the poem's moral that virtue alone will never make a nation great. Rather, it is only vice that, when properly managed, can generate the industry and wealth that sustain a commercial society.

The Grumbling Hive garnered little attention, but Mandeville continued to develop its central claim: Many of the self-interested impulses held to be reprehensible by members of polite, commercial societies were the very same human drives that made it possible for these societies to flourish. In 1714, Mandeville republished the poem, with a preface on the origins of morals and a set of prose commentaries, as *The Fable of the Bees. The Fable* went relatively unnoticed, and Mandeville expanded his commentaries and wrote two new essays for an edition published in 1723. This version of *The Fable* finally thrust Mandeville directly into the center of eighteenth-century British debates about the relationship between commerce and virtue. Mandeville's position invited moral and political critiques from many members of the reading public as well as a crusade against *The Fable* by the Grand Jury of Middlesex. Undaunted, he responded publicly to his attackers and used the debate surrounding *The Fable* as an opportunity to develop its ideas.

Mandeville's followers and critics alike understood *The Fable*'s central claim to be that private vices yield public benefits. In the text, Mandeville draws connections between socially recognized vices and prosperity to suggest that all who enjoy prosperity are ultimately complicit in the persistence of vice, whether or not they intend to be. *The Fable* contains many examples illustrating this point; one of the more striking ones details a robber's decision to spend money outfitting his favorite prostitute. According to Mandeville's map of an interdependent commercial society, everyone, from the local seamstress to any number of commercial textile traders, profits from the stolen money the thief uses to buy his gifts. Mandeville argues that

the structure of exchange and the division of labor that support commerce make it impossible to fend off the long-reaching effects of vicious activity. Without calling for reform, he articulates not only the complex structure but also the moral underpinnings of commercial society and sets an intellectual agenda for the political economists and philosophers who follow him in the coming decades.

More controversially, Mandeville also claims that what men take to be virtue is in fact merely pride redirected in the interest of generating public goods. He depicts people as naturally self-interested and preoccupied with the gratification of their own passions rather than with the well-being of their fellows. Over time, he argues, people have been socialized to channel or suppress self-regarding passions into virtuous other-regarding behavior. Flattery and the threat of shame or promise of reward have taught us to perform virtue. The egoism that drives invention, creativity, and the acquisition of wealth in a commercial society therefore also promotes the practice of virtue.

Despite initial efforts to cast aspersions on *The Fable* and its author, Mandeville's work offered fruitful material for a generation of philosophers trying to make sense of a new commercial world of changing social, political, economic, and moral dynamics. Mandeville focused attention on the idea that a commercial society was composed of self-interested individuals and gave voice to the central moral paradox that later eighteenth-century theorists viewed as a problem for commercial societies—the idea that private vice could yield prosperity for all. His account of the manipulation of self-interest for the purposes of civilizing and socializing egoistic human beings grounded later studies of the emergence of culture and society, such as those of Jean-Jacques Rousseau and Adam Smith. Moreover, his work encouraged both Smith and David Hume to consider the consequences of living in a moral order generated by self-interested, commercial individuals and to elaborate how such an order is stabilized and made livable. However much his successors might have disagreed with his conclusions or tone, Mandeville set a series of questions and problems that were central for Enlightenment thinkers preoccupied with the possibilities and challenges of commerce.

Manners

Every human society maintains itself through the regular interaction of its members. Those interactions take place within the framework of institutional arrangements of power and authority, social practices that structure everyday life, and systems of expression, or cultural forms, that give ways of life meaning and purpose. But it is the patterns of behavior that define the relationships between the individuals involved in different institutions, practices, and cultural forms that support—or undermine—those arrangements. These patterns of behavior are the subject of manners, and they are important for social inquiry for reasons that go well beyond the fact that matters of manners touch on every aspect of our lives. This is plainly evident when we consider that for all of us the earliest, most significant, often repeated, and regularly reinforced lessons we learn are about how to behave. These lessons continue throughout our lives: We are constantly reminded of what proper behavior is and should be, and we quickly learn to expect, and demand, that others behave properly as well. Manners, in short, are both ubiquitous and essential. Every human society maintains itself through the regular interaction of its members, and manners are what makes those interactions work.

The study of manners is part of nearly every form of social inquiry. In political theory, however, that study focuses on particular *kinds* of manners, which differentiates the interests of political theorists from those of other students of manners, and the meaning of manners in politics is further refined by distinguishing between formal and informal arrangements in political communities. This entry reconstructs the logic of these distinctions by examining the definition of manners in political theory, analyzing the forms and functions of manners in politics, and reviewing how the study of manners fits into the history of political theory.

Defining Manners

Examining the etymological roots of manners offers a useful way of beginning to make sense of similarities and differences in the various ways we think about manners and how political theorists have conceptualized their particular approach to the subject.

The word *manners* is derived from the Latin *manaria,* the feminine form of *manuarius,* the literal translation of which is "belonging to the hand" (*manus*). Interestingly, discussions about manners frequently focus on how we use our hands, as in instructions regarding etiquette, where, for example, the use or placement of the hands in eating, greeting, or meeting with others might be at issue. This makes sense: Our hands are arguably the most common if not most effective way for us to relate to the external world. But for political theorists it is the *symbolic* meaning of what "belongs to the hand" that is the key to conceptualizing manners. Manners are about the management of our surroundings and especially our relations with other people, and in this our hands (*manus*) are, symbolically (and etymologically) speaking, everywhere: We *manage* our surroundings, we *manipulate* our circumstances or other people, we *manifest* our intentions in various ways, we *maneuver* in order to make or get our way, we *maintain* our goods or our reputation, our labors are often *manual,* and it is a *manual* we would consult in trying to accomplish some task.

This brings us to another way in which the meaning of manners in political theory is both similar to and different from other uses of the term. Manners are about behaviors that shape our relations, but for political theorists the interesting behaviors are those that follow *patterns.* The synonymous use of manners and habits, from the Latin *habitus* (disposition, character, or condition), intimates this dimension of meaning, yet even here there is more to be said about the kinds of patterns with which political theorists are concerned. In some usages, manners and habits may describe individual patterns of behavior, as in discussions of someone's mannerisms or their manner of writing, running, dressing, eating, and the like. For political theorists, it is the patterns of behavior that individual members of groups or communities *share* that are most relevant. Etymology is revealing here, too: The word *manners* is not only used synonymously with *habits,* but in political theory both are also used synonymously with *customs,* from the Latin *consuetudo,* or *customary usage,* a term that clearly embodies a social or collective referent.

What we have then are patterns of relational behavior shared by members of a group, but there is one more important conceptual theme that is critical for understanding manners in political theory. When groups of people share patterns of relational behavior, these are usually not randomly or arbitrarily generated. Rather, these patterns of behavior give relations a particular meaning or identity. Social scientists of every sort may be interested in these meanings, but for political theorists it is patterns of behavior that bear on moral or normative matters that distinguishes their conceptualization of the subject. The fundamental question here is how certain behaviors promote, undermine, or transform purposes, ends, or goals that define what a good life is or should be. This normative dimension of manners can be seen in the synonymous use of manners and mores, from the Latin *mores* or "conduct, character, or morals," a reference to norms of proper behavior. Thus—to sum up this conceptual reconstruction thus far—when political theorists talk about manners in politics, it is typically in reference to patterns of relational behavior shared by members of a group that affect the realization of a particular conception of the good life.

At this point it should be evident that the study of manners in political theory is part of a broad range of inquiries we would readily recognize as matters of manners, but that political theorists are specifically interested in a particular subset of

those behaviors. What we need to make clear now is how this distinctive understanding of manners fits in the study of politics, for there is more to politics than manners—even the particular kinds of manners political theorists study. Examining the ways that political theorists have addressed and conceptualized the forms and functions that manners take can help situate the place of manners in the study of politics.

The Forms and Functions of Manners

Among the most significant general characteristics of manners that are relevant to political inquiry is the fact that they are both *specific* and *mutable*. Even a cursory consideration of the variety of forms that manners can take in any given society or any particular period of history demonstrates that what constitutes manners in one sphere of activity may have nothing do with what constitutes manners in another sphere of activity. For example, manners are often gender specific, and what constitutes appropriate behavior, or good manners, for men and women is often significantly different.

This seemingly trivial observation has important implications for our inquiries precisely because it has far-reaching implications for our lives. The variability of manners means that patterns of behavior required for us to manage effectively and efficiently in all aspects of our lives cannot be easily reduced to a simple—or even a manageably complex—set of behavioral guidelines. This variability is further exacerbated by the mutability of manners. Here, too, nothing more than a cursory examination is required to establish the fact that what passes as manners in any particular sphere of life at one point in time can be completely different from what passes as manners in that same sphere of activity at another point in time. Consider manners of gender as a case in point: In Western societies today, men who go out in public wearing wigs of long curly white hair might have their masculinity questioned, but until the early decades of the nineteenth century, it was men who *did not* wear wigs of long curly white hair in public who might have had their masculinity questioned. What is implied here is that sometimes our goals change and we change our manners accordingly; in other instances we find that the manners we practice do not advance the goals we have, and this may be another reason to alter our manners.

What the variability of manners suggests is that our lives—and societies—are subject to the facts that we want many different and sometimes incompatible things, that we do not always behave in ways that enable us to get the things we want, and that the things we want change. These basic facts of life are important for political theorists because they raise significant theoretical questions and serious practical challenges for the pursuit of human excellence and happiness, the pursuit of "the good." And it is helpful to think of them in reference to manners because in political theory, the way that we respond to the messiness of life that is reflected in the variability of manners, and the unpredictability that is created by the slippage between the manners we have and goals we want, is itself essential to the pursuit of the good life and thus to how we "do" politics.

We can unpack this claim by considering the sanctions communities use to make people comply with preferred patterns of behavior, and what those sanctions tell us about both the behaviors in question and the ideals they promote. In political theory, the relevant conceptual boundary seems to be located between behaviors that are subject to formal sanctions on one side and behaviors that are subject to informal sanctions on the other. In political inquiry, behaviors subject to formal sanctions are typically included in the analysis of institutions; behaviors that fall under the purview of informal sanctions are the stuff of manners.

The basis of this distinction needs to be clearly understood, as it is absolutely critical to the study of manners in political inquiry. The distinction turns on complex arguments about what kinds of behaviors ought to be and can be effectively regulated by formal sanctions and what ought to be and can be effectively regulated by informal sanctions. It has to be emphasized that these are not simply additional examples of ongoing disputes about the relationship of the individual and the collective, a very large and influential tradition of discourse that some theorists have described as encompassing all of political theory. Nor are they simply about institutional design, another influential tradition of discourse that some theorists have described as the most important theoretical and practical issue for political theory. For political

theorists interested in manners, both of these characterizations of the discipline are wrong: The debate about appropriate sanctions assumes that even the best designed institutions cannot function if citizens do not have the (noninstitutionally sanctioned) manners that enable them to work as they should, and it assumes that the behavior of individuals is always relevant—even when it is not formally sanctioned—to the realization of the good that different regime arrangements embody. The question at the heart of the distinction between what belongs to institutional analysis and what is a matter of manners is whether it is better—or possible—to secure compliance by coercion, or whether it is only possible—or better—to secure compliance by relying on the informal sanctions of shame, ridicule, scorn, contempt, disdain, or other attacks on reputation and character.

These are enormously complex questions, and in the history of political thought they have produced a wide range of arguments and a provocatively interesting literature. For our purposes, these arguments are about how institutions and manners are, to use a phrase popular among social theorists, "mutually constitutive"—or simply, that you can't have one without the other. It is also useful to understand that when political theorists are talking about what manners are and should be, they are thinking about patterns of relational behavior shared by members of a group that affect the realization of a particular conception of the good life, and which should not or cannot be enforced by law, administrative imposition, juridical action, or police powers.

Perhaps the most important question begged by this discussion is why is it useful to think about how manners are discussed and analyzed in political theory? A short excursion into the history of manners can help provide the answer.

A Very Short History of Manners

There are a number of good reasons why we might be interested in the study of manners. One is that it has been an important topic in the history of political thought. Plato's argument that the best kind of polity is one in which individuals understand their proper place in society, Aristotle's argument that statesmanship is the art of fitting constitutions to the character of a people, Machiavelli's argument that successful rule requires both good laws and good habits, and baron de Montesquieu's argument that the Spirit of the Laws requires forms of government that complement the principles—"the manners and mores"—of a people are but a few examples of how political theorists have made manners central to political analysis.

Another reason political theorists study manners is because they matter for our lives. Put another way, we ignore them at our peril. Indeed, what the history of the study of manners suggests is that it is in moments of crisis and change that manners matter most, and some of the most influential work in the discourse of manners has been written in or about moments of crisis. For Plato, Aristotle, Cicero, Livy, Polybius, Sallust, Machiavelli, Milton, Sydney, Harrington, Montesquieu, Rousseau, Hume, Smith, Ferguson, the American founding fathers, French revolutionaries, and many others who have been concerned about manners in politics, crisis was the context of their reflections, and every one of them recognized that we ignore manners in politics at the risk of inviting chaos or despotism.

This brings us to a third, and perhaps the most compelling, reason we might be interested in the study of manners. In the last decades of the twentieth and now in the early twenty-first century, we appear to be in or nearing another crisis of manners. For many years now, politicians, pundits, and scholars have been talking with urgency about why manners should matter to us. Rudeness, incivility, lack of decency, the decline of respect, irresponsible behavior, rising crime rates, family breakdown, cynicism about government, and even economic distress and difficulties are a few of the myriad problems in democratic societies today that have been attributed to the neglect and deterioration of manners.

Where we are now, then, may be the best reason to be interested in how political theorists have studied manners in politics. Now may be as good a time as any to remember why the earliest, most significant, often repeated, and regularly reinforced lessons we learned as children were about how to behave. What the study of manners in political theory can teach us is that in order to get the kind of society we want, we may need to think carefully about how we should treat each other.

Maoism

Maoism is generally synonymous with the thought of Chairman Mao Zedong, who ruled China from 1949 to 1976. Maoism is best understood within the larger context of Marxism and the communist revolutions of the twentieth century. Marxism is generally understood as a theory that claims that the contradictions of capitalism would lead people to create a revolution aiming to construct a new socialist society. However, twentieth-century revolutions in general, and the Chinese revolution in particular, happened in places where the contradictory logic that Marx described in *Capital* had not developed. The various tenets of Maoism must be understood as an alternative Marxist political theory, which emphasizes aspects other than, or in addition to, the contradictions of capitalism. Maoists attempt to show how revolutions in the third world could be part of a world-historical transformation of capitalism. This entry first briefly summarizes Marx's understanding of the possibility of socialism and then discusses certain key themes of Maoism, namely, the emphasis on the peasants, Mao's theory of "new democracy," and Mao's vision during the Cultural Revolution.

Marx and the Possibility of Socialism From Capitalism

During the first half of the twentieth century, Marxists generally described history as consisting of a sequence of stages, including slave society, feudalism, capitalism, socialism, and communism. They contended socialism would emerge out of the contradictions of capitalism and, more specifically, from the conflict between the workers and capitalists. On this view, capitalism differs from previous modes of production because in capitalist society, overtly political ties or hierarchies binding, for example, serf and lord are dissolved and people in society must satisfy their needs by buying and selling commodities in exchange for money. The majority of people in capitalist society have nothing to sell except their labor power, and they sell this to capitalists who own the means of production. The capitalist makes surplus-value by buying labor on the market and then selling the products of this labor for a greater price than what he or she paid for the labor. The capitalist drives to increase profits and thus aims to squeeze as much labor out of workers as possible. According to this basic reading of Marxism, eventually, workers will not tolerate being exploited, and when they realize that they have nothing to lose but the chains that force them to sell their labor, they will revolt and create a new society, in which the means of production are collectively owned by workers.

From the previously described perspective, the possibility of socialism is contained in the contradictions of capitalism. There are a number of reasons for this. For example, it is only in capitalism that there emerges a class that is at once free from the transparent or overt oppression of hierarchical bonds and yet systematically exploited. However, another major transformation that makes socialism possible is the radical increase in productivity and technology, which makes possible a different way of organizing production relations. In other

words, as Moishe Postone has pointed out, in Marx's view, as technology improves, wage-labor becomes more obsolete, but at the same time, the capitalist mode of production is organized around wage-labor. Therefore, increased productivity from technology does not benefit the worker and often leads to unemployment. As technological advances make wage-labor less necessary, capitalism—a society around factory-oriented labor, capitalists, and surplus value—also becomes obsolete; this opens the possibility of people delinking technological advances from the profit motive and democratically organizing this productive power for the benefit of humanity. However, the realization of this possibility is not a natural outgrowth of capital society; it is a political project.

Mao's Predicament and the Problem of Voluntarism

The two major socialist revolutions of the twentieth century, the Russian and the Chinese revolutions, did not occur in places where the contradictions between labor and capital were developed, and they did not take place in areas of great technological development. Hence Mao and other Chinese Marxists faced the problem of how to create socialism in a largely rural society that had not experienced the various contradictions of capitalist production. Mao's response to this question is complex and has led scholars of Mao's thought to debate about whether he was a voluntarist.

Specifically, although Mao did not reject the basic tenets of Marxism, he stressed that China could create a revolution and begin on the socialist path by mobilizing China's large peasant population. Some scholars have considered this an example of Mao's voluntarism, because he seems to argue that political mobilization can effect transformation to socialism even where, according to orthodox Marxist theory, conditions are not ripe. According to Maoism, it is because third world countries are on the periphery of the global capitalist system and have not fully developed capitalist forms of life that they develop a resistance to this system. So while not neglecting the importance of class conflict within a society, Maoism also underscores the contradiction between imperialism and imperialized regions. The position of the imperialized regions on the outside or periphery gives the inhabitants of those regions a critical vantage point from which to see the problems of capitalism and posit alternatives based on existing modes of life.

In his discussion of the transition to socialism, Mao continues a legacy that began in the late Qing dynasty and he gestures in two directions. Because China and other countries on the periphery of the global system faced capitalist expansion in the form of imperialism, they developed a two-pronged response to it. On one hand, they realized that they needed to industrialize and develop modern technology in order to retain their autonomy. But on the other hand, intellectuals and political activists on the periphery of the world system could see the problems of capitalism and envisaged an alternative world, free from exploitation, inequality, and imperialism. Mao's project involved both of these tendencies. He sought to build a strong industrialized nation-state and also, eventually, to transcend the conditions of the present global system. Related to these different goals, Mao put forth two related theories of democracy and politics. These theories roughly correspond to phases in Mao's political career, namely, the periods of New Democracy and the Cultural Revolution.

On New Democracy

Mao outlined his theory of new democracy in his essay "On New Democracy," published in 1940. In this essay, Mao explained that socialist revolutions that occur in colonial or semicolonial nations have a dual task. They must create an independent nation-state and realize certain political and economic ideals associated with the bourgeoisie, such as industrialization and democracy. However, these goals would not be seen as ends in themselves; rather, they are a stepping stone in the process of a long battle to overcome global capitalism and create a radically new society.

In making this argument, Mao reinterprets the significance of the Chinese political movement associated with the protest of the Treaty of Versailles on May 4, 1919. This movement, known widely as the May Fourth Movement, was usually considered a bourgeois movement promoting science and democracy. However, Mao contends that after the May Fourth Movement, the political leaders of China's bourgeois-democratic revolution were the proletariat and not the bourgeoisie.

In Mao's view, because of this leadership, advocates of democracy in China, especially under the guidance of Chinese communists constantly aimed beyond bourgeois democracy toward socialism.

Maoism and the Cultural Revolution

Some of the contradictions embedded in Maoism clearly emerge in Mao's theory of the Great Proletarian Cultural Revolution. Many scholars have dealt with the Cultural Revolution in terms of Mao's personal ambitions to gain power, but this encyclopedic entry focuses on some of Mao's theoretical contributions during this period. Mao's theory of New Democracy presented socialist countries with the contradictory task of promoting ostensibly bourgeois ideals, such as democracy and industrialization, while at the same time aiming to transcend them to create socialism. With the Chinese Communist Revolution of 1949, China attained national independence and began to industrialize under the leadership of the Chinese Communist Party (CCP).

Put simply, Mao's theory of the Cultural Revolution points out that, although China was governed by the members of the CCP, given that they were implementing policies related to industrialization, which implied succumbing to the imperatives and standards of global capitalism, the possibility of merely reverting to the path of capitalism was an imminent danger. Mao was concerned about this from the 1950s and debated Liu Shaoqi and other high leaders of the CCP who claimed that exploitation was good because it would promote productivity. Some party officials argued that by merely increasing productivity, China would eventually attain socialism.

By 1966, against this emphasis on economic development, Mao underscored politics and stressed that if China were to continue on the socialist road, people needed to create a new type of political culture that encouraged mass participation and criticism. In 1949, China followed the Soviet model of socialist government and implemented a centralized bureaucracy, which succeeded to some extent in creating policies of equality and in developing the economy. Mao was generally skeptical of state-centered forms of organization and his theory of the Cultural Revolution represented an attempt to infuse the Chinese political system with a form of participation that had overtones of direct democracy. In other words, he believed that members of the CCP were not actually representing the people and thus the masses needed to participate in politics by actively, and at times violently, criticizing their superiors.

Mao's theory of the Cultural Revolution also involved a critique of the division labor between the technocratic elite and manual laborers. Generally, modern capitalist society stresses mental over manual labor and what is usually called knowledge refers exclusively to the former realm. In an attempt to rectify this tendency, Mao sent a large number of intellectuals and elites to the countryside to learn from the peasants and through working in the fields. In the countryside, intellectuals were to acquire a type of knowledge that was not available in books, a type of practical knowledge that Mao believed was essential to being a complete human being.

These policies of the Cultural Revolution met with limited success. However, following Wang Hui's and Alessandro Russo's investigations, Mao's promotion of radical political practice and his critique of elite education in the Cultural Revolution in the late 1960s corresponded with a global crisis in governance. This was also a global crisis in the state-centric model of capitalist development. In the face of this crisis, people in various parts of the world incorporated Maoism into their politics of resistance and hoped to make the government and the economy more accountable to citizens. By the 1980s, when the new neoliberal phase of global capitalism was more or less consolidated and the Chinese government had officially declared the Cultural Revolution to be a colossal failure, Mao's theory of the Cultural Revolution seemed to be a thing of the past. Indeed, since the 1980s, the Chinese government has tried to promote a nonantagonistic Mao by stressing his "New Democratic phase" while downplaying the socialist project. However, by the 1990s and into the 2000s as the inequalities associated with neoliberal capitalism became increasingly apparent, Chinese intellectuals have often returned to Mao's theory of the Cultural Revolution as a resource to develop a critical perspective on the present. Since Mao's revolution, rural people in states on the periphery of global capitalism around the world have drawn inspiration from Maoism. Movements in Nepal and Peru

provide two recent examples. Despite how movements that draw on Mao's thought are evaluated, today, in a world where the contradictions and crisis of capitalism have become increasingly global, Maoism is significant in posing questions about the relationship between spaces on the periphery of the global capitalist system, politics, and the possibility of radical social transformation.

Market

A market can be defined as a relatively stable network of institutions or organizations that enable the exchange of goods and services among producers and consumers, usually (but not always) on commercial and monetary terms. Conceived in this way, markets are necessary but insufficient predicates of capitalism, which entails a system of production based upon private ownership as well as a market-based system of exchange. Beyond these basic definitional outlines, however, a number of tensions surrounding the concept derive from disagreements about the organization of market capitalism, the state's role in regulating it, and the degree to which markets are naturally arising and self-equilibrating or, rather, politically created and sustained.

A conventional view, common to contemporary economists and many political scientists, traces the market concept back to Adam Smith's *Wealth of Nations* (1776), which provides a seminal understanding of market exchange even though Smith rarely uses the term *market* itself. For Smith, the "general disposition to truck, barter, and exchange" (p. 117) derives from human nature, as does the increasing specialization and division of labor through which nascent markets gave rise to modern capitalism. Markets are guided by an "invisible hand," whereby the pursuit of individual self-interest translates into collective welfare. Smith's conception reflects not only an optimistic view of exchange as an engine of mutual benefit, but also the small-scale, incipient capitalism of Smith's time.

The localized character of markets under early capitalism underpins contemporary debate about the appropriateness of extending Smith's model to larger-scale, contemporary economies. It also suggests the need to distinguish among understandings of the market along two dimensions—first, the scale and scope of market forces, and, second, the degree and type of regulation of market-based exchange. Neoclassical economists such as Milton Friedman, along with neoliberal political figures like Margaret Thatcher and Ronald Reagan, have assumed that Smith's world is both similar to and constitutive of our own. As a result, they have maintained that market-based exchange is a natural human predilection and that aggregate welfare is best served by both extending the *scope* of market forces and minimizing their political *regulation.* As a result, Friedman and most neoclassical economists have argued, the only ethically acceptable and economically viable posture for governments to adopt is one of expanding the use of markets, both domestically and internationally, and regulating them minimally.

This historical treatment of markets stems from Smith's notion that market exchange derives from human nature, which presumably has changed little

in the intervening two centuries. Somewhat oddly from a contemporary perspective, Karl Marx shared with Smith a view of market exchange as an organic outgrowth of human nature, but he drew very different conclusions about its consistency with human happiness. In contrast to Smith, Marx saw markets as the handmaidens of a system, dominated by the bourgeoisie, that produces insoluble class tensions, alienation, and, eventually, the cataclysm of revolution.

These two competing conceptions—one of capitalist markets as sources of welfare, the other of markets as fonts of immiseration—continue to color contemporary debates about the relationship between markets and government. Many have questioned neoliberals' confidence in "pure" markets as an ideal form of economic and social organization and as an engine of expanding opportunity. Karl Polanyi, for example, argued in his influential book *The Great Transformation* (1944) that the vision, born from "the utopian springs of the dogma of laissez-faire" (p. 144), of markets as self-regulating and hence requiring little in the way of government control was both unattainable in fact and profoundly disruptive in its attempted implementation. The attempt to create the "self-regulating market," predicated upon the "fictitious commodities" of land, labor, and money, led to a "double movement," with the state first acting to create markets and extend their reach and, subsequently, society clamoring for protection against resulting economic dislocation. Though Polanyi's argument is problematic in its functionalism and its broad-brush depiction of market institutions, it highlights some of the stubborn tensions within the concept of markets. By identifying market-based exchange, rather than the system of production, as the ultimate source of immiseration, Polanyi's work also represents a shift in emphasis, if not a fundamental paradigmatic break, from classical Marxian analysis.

Views such as Polanyi's also foreshadow contemporary debates. The neoliberalism of recent decades has again assumed that markets are ontologically stable—that they are unitary "things" that are self-equilibrating. Such views obscure the fact that the term *market* is a proxy for a complex network of institutions and organizations that together provide the means for exchange. In this sense, the "market" is actually a metaphor based upon a Smithian image of autonomous, skilled individuals engaged in "truck and barter." Such images have not conformed to market dynamics since at least the early nineteenth century. As capitalism has grown exponentially in scale and complexity, and Smith's world has become more and more remote, claims that markets are self-regulating systems that are stable and automatically serve the aggregate welfare, precisely to the extent they are "free" of government control, have further lost credibility.

These contemporary tensions point to the contested character of conceptions of markets. Contending uses of the concept will persist as long as debates continue about how markets function, the extent to which they are embedded in social organization, and the state's desirable and necessary role in extending their scope, regulating them, and guiding their development.

Marshall, T. H. (1893–1981)

Thomas Humphrey Marshall was a British sociologist renowned for his argument that the development of the welfare state in the twentieth century had introduced a novel form of citizenship—"social citizenship"—which granted to the citizens of modern industrialized states the rights to material resources and social services. Marshall argued

that this social citizenship complemented and reinforced the civil and political citizenship that had been won in the eighteenth and nineteenth centuries, respectively.

Marshall was born into a wealthy professional family and educated at Rugby School and Trinity College, Cambridge. After spending World War I as a civilian internee in a German prisoner of war camp, Marshall returned to Trinity College as a history fellow in 1919. He stood unsuccessfully as a parliamentary candidate for the Labour Party in the 1922 general election. Marshall later recollected that, although this experience convinced him that he was temperamentally unsuited to political campaigning, his brief tenure as a parliamentary candidate was important because it brought him into close contact with working-class people for the first time and directly exposed him to the injustices and prejudices of the British class system. When his fellowship at Trinity expired in 1925, Marshall was appointed as a tutor in social work at the London School of Economics, which remained his main institutional base throughout the rest of his career. He was appointed to a professorial chair there in 1944, but he also undertook significant roles in public service, working for the Foreign Office from 1939 to 1944 and, in his final post before his retirement, as director of the social sciences division of UNESCO from 1956 to 1960. Marshall's career therefore spanned a period of significant social, political, and intellectual change. He had a ringside seat at the depression and class inequality of the 1930s; at the prosecution of a so-called people's war by the British state between 1939 and 1945; at the emergence of the postwar welfare state, presided over by the 1945–1951 Labour government; and at the arrival and professionalization of the discipline of sociology in British universities.

Marshall's most influential piece of writing was his essay "Citizenship and Social Class," originally delivered as the Alfred Marshall Lectures in Cambridge in 1949, only a few years after the Labour government had passed into legislation William Beveridge's wartime plans for universal social insurance. Marshall's essay focused on the gradual historical transition away from medieval societies, in which civil, political, and social privileges were bestowed as a single package on those born into high-status social groups. Marshall argued that, as capitalism and the modern state emerged, a new, egalitarian, and legally defined form of community membership began to take shape: This status of "citizenship" slowly pulled apart the package of privileges hitherto given exclusively to the well-born. In the first instance, Marshall said, the eighteenth century saw the gradual acceptance of the idea of equal civil rights—such as the freedom of speech, the right to own property and conclude contracts, and the right to justice. With the rule of law thus entrenched, Marshall continued, the nineteenth century then saw the expansion of the franchise and hence the universalization of political rights—such as the right to participate in making political decisions and to elect representatives to parliament. Finally, according to Marshall, in the twentieth century social citizenship began to emerge, with the right to material resources and social services increasingly regarded as an integral component of each citizen's package of rights. With the state now guaranteeing universal access to health care, education, housing, and social insurance, Marshall argued that this new raft of social rights had replaced earlier ideas of providing material assistance only as a matter of charity or, as under earlier social welfare legislation, of making state assistance conditional on recipients forfeiting their civil or political rights.

Various criticisms have been leveled against Marshall's account, among others that it merely offers a specific narrative of modern British history rather than a general social theory, and that it oversimplifies the complex evolution of the status of citizenship in Britain itself. However, the most widespread objection pressed against Marshall in recent years is that he presented a rather complacent story of inexorable upward progress, leaving out the bitter struggles involved in winning basic individual rights for all and assuming that the final victory of social rights was an irreversible achievement. His name has therefore become a byword for the smug and triumphalist social democracy that is alleged to have been widespread on the moderate left after 1945 and that was to receive a rude awakening with the rise of the New Right's populist crusade against the welfare state in the 1980s. However, this objection underestimates Marshall's theory. As David Lockwood has pointed out, Marshall's essay should actually be seen as a

subtle attempt to integrate, and improve upon, core themes in social theory drawn from Max Weber and Émile Durkheim. Marshall took from Weber the insight that social stratification can be grounded on the basis of status as well as class and, in particular, that the state plays a central role in legally determining status stratification. Marshall focused on something that Weber did not consider in any detail, namely, that the defining feature of the modern legally determined status order is that it is based on equality rather than inequality. The emergence of the status of equal citizenship, derived from the universal legal authority of the modern state, therefore stood in marked tension with the inequality generated by the market-based life chances of different social classes. In addition, the ideal of equal citizenship furnished Marshall with an answer to Durkheim's attempt to come up with a plausible basis of social solidarity in modern, highly stratified societies. Durkheim had argued that the interdependence created by the division of labor itself, coupled with strong occupationally based associations, would foster greater social cohesion. Marshall maintained instead that it was the ideology of universal civil, political, and social citizenship that would cement together individuals otherwise placed in opposing interest groups by their unequal class positions.

Seen in this light, Marshall's main insight was that there was a sharp tension between the slowly emerging legally authorized equality of the modern state and the great class inequality of capitalist societies. With the emergence of the civil rights to own property and make contractual agreements, Marshall argued, the inequalities of political power and economic resources that structure individual life chances come to seem arbitrary, inequitable, and in urgent need of redress. The widening of the franchise and the creation of social rights are consequently required to address this tension between civil equality and political and economic inequality. Marshall did not see this as an effortless, teleological process but, on the contrary, as the fruit of centuries of difficult struggle. He naturally took pride in the achievements of the British welfare state of the 1940s and hoped that the future might see further progress toward a more egalitarian society. But Marshall did not underestimate the continuing, and in some ways intractable, tension between social rights and the market. As he put it, "in the twentieth century citizenship and the capitalist class system have been at war," and he offered the firm injunction that "the basic conflict between social rights and market value has not been resolved" (Marshall, 1950, 29, 73).

Marsilius of Padua (c. 1275/80–1342/3)

The Italian political thinker Marsilius of Padua (c. 1275/80–1342/3) is one of the most intellectually significant fourteenth-century political theorists in the West. Marsilius's writings primarily reflect his thoughts on the conflict between the elected Roman emperor Ludwig the Bavarian and Pope John XXII. While Marsilius can be considered a political actor in his own right, by virtue of his authorship of important political treatises, he also served as a counselor. In fact, Marsilius's theory of the relationship between the papacy and the Roman empire, a topic which covers most of Marsilius's major work, *Defensor Pacis* (1324), had a significant impact on Ludwig's politics. Despite the fact that Marsilius's theories on the relationship between secular and ecclesiastical powers was of major interest to his contemporaries and influenced political discourse in the centuries that followed, including in the Age of

Reformation, scholars interested in his work focused for decades primarily on his secular theory, as outlined in the relatively short first discourse of the *Defensor Pacis*. In his later and shorter works, *De translatione Imperii* (c. 1324–6) and *Defensor minor* (c. 1341), Marsilius advances some of the ideas previously outlined in his major work *Defensor Pacis*.

Life

Although there is no doubt as to the importance of Marsilius's political theory, relatively little is known about his life and career. Born in Padua c. 1275/80, he divided his life between scholarship and politics. The first confirmed date related to Marsilius is his appointment to the position of rector of the University of Paris in 1313. Then, in 1316 he was appointed canon of Padua. Two years later, he was promised the first vacant benefice in Padua by Pope John XXII, a benefice he never received. Instead, in 1319 he began serving on diplomatic missions for his hometown of Padua. An epigram at the end of *Defensor Pacis* reveals that he completed this work on June 24, 1324, in Paris. Soon thereafter, he moved to the court of Ludwig the Bavarian in Nuremberg, under circumstances that remain unclear. Marsilius later joined Ludwig on his expedition to Rome in 1327. In the same year, Pope John XXII condemned Marsilius as author of *Defensor Pacis* in the bull *Licit iuxta*. Meanwhile, Marsilius worked on *Defensor minor*. In 1343 Pope Clemet VI reported his death.

Secular Thoughts

Although Marsilius's secular thought takes up relatively little space in this entire work, it nonetheless provides the framework for his theory on the relationship between temporal and ecclesiastical power. His main concern is the establishment of an independent secular sphere. He believed that divine authority cannot be relied upon to justify temporal power. Consequently, Marsilius locates the origin of all temporal power in the citizenry. Basing his theory on the idea that those who establish a rule will be most likely to follow it, he conveys the right to establish law as well as the right to elect and, if necessary, to remove a ruler from his office, to the citizens or "the weightier part thereof." To avoid the problem of having two conflicting authorities within one commonwealth, he integrates the priesthood into the secular state and subjects it to the temporal authority. The fundamental idea behind this is Marsilius's theorem that those who benefit from the temporal realm must also be subjected to it and its coercive jurisdiction. Although Marsilius is not a democratic thinker in any modern sense, his secular theory is based on the principle of as much active participation as possible of the citizenry in the political process. The heart of it is the core political sphere of jurisdiction.

Temporal and Spiritual Power

Marsilius's ecclesiastical theory oscillates around and opposes the papal claim for absolute power in temporal and spiritual affairs. After integrating the priesthood into the secular political realm, his main concern is the repositioning of the papacy. As a medieval author, he cannot do without the papal office. Because all coercive power has its origins in the citizenry, he has to define the papal office in a way that the pope is able to fulfill his religious duties without interfering with the temporal authority. Central to Marsilius's solution to this problem is his theory of the general council, an institution that is responsible for the interpretation of divine law. The council is a representative institution of the faithful, that is, all Christian believers. It is composed of lay and priestly representatives. In cases of dispute, the lay representatives outvote the priests. The pope's responsibility is limited to presiding over the council and setting its agenda. In the *Defensor Pacis* Marsilius ascribes to the secular community the right to back decisions of the general council with coercive power and to integrate them into the community's human law. This theory implies that the religious orientation of a community is subject to approval by the citizenry as human legislator. This theorem, however, is problematic when it comes to the question of excommunication, because in medieval times, excommunication did not mean solely the exclusion of a citizen from the sacraments, the excommunicated lost his status as a citizen as well. Consequently, in his later work *Defensor minor*, Marsilius goes one important step further by stating that no divine law should have any

impact on the civil status of a citizen. Whereas the judge in this world is the human authority, the judge in the next world is Christ. Offenses against divine law, therefore, should not be judged by a human judge.

Maruyama Masao (1914–1996)

Maruyama Masao (1914–1996) was a historian of Japanese political thought and a political scientist who became a pivotal intellectual presence in post–World War II Japan. Renowned for his sharp intellect and incisive analysis, Maruyama addressed the vital issues confronting his country at a time of crisis and confusion after defeat in 1945. He was the first to enquire why ordinary Japanese had followed their government into a disastrous war, who was responsible for that war, and what needed to be done in order for Japan to build a liberal democratic society in the postwar world. His core intellectual concerns formed the mosaic of his opus: ultranationalism and nationalism, fascism, modernity, democracy, and autonomy. Maruyama was primarily a scholar, but he also became engaged in political activism, notably in the pacifist movements of the 1950s and in the movement against revision of the U.S.–Japan Security Treaty in 1960. He remains the defining theorist of democracy in his country.

Maruyama's life was punctured by the upheavals of world history in modern times. His first political memory was the violent aftermath of the Great Kanto earthquake of 1923, when Koreans and anarchists were murdered by the police. He entered senior high school in 1931 when the Japanese army transgressed into Manchuria, and he graduated from Tokyo University as military aggression in China transmogrified into war in 1937. Having entered academic life at the prestigious Tokyo Imperial University (Tokyo University), he was called up late in 1944, eventually serving at an intelligence unit based in Hiroshima. Here he witnessed the horrific aftermath of the atomic bombing on August 6, 1945. Astonishingly, Maruyama wrote his first postwar essay, "The Logic and Psychology of Ultranationalism," in the immediate aftermath of the searing experiences of Hiroshima, defeat, and demobilization.

For two decades Maruyama was one of Japan's leading political thinkers and critics, but as the world lurched into a frenzy of antiestablishment protest in the late 1960s, Maruyama found himself to be a primary target of student anger. For them, Maruyama was the epitome of the postwar elite, and therefore, someone who needed to be purged from a position of intellectual leadership. Long plagued by ill health, Maruyama retired from Tokyo University in 1971, but continued to write on subjects as diverse as ancient Japanese political thought, the work of Meiji era thinker Yukichi Fukuzawa, and theories of loyalty and rebellion. He was awarded honorary doctorates by Princeton and Harvard universities in the 1970s and became professor emeritus at Tokyo University. His death on August 15, 1996, lent a tragic symmetry to his life, which had been so focused on deciphering and overcoming the elements that had led to Japan's surrender on August 15, 1945.

Maruyama's conceptualization of democracy involved several core ideas, with the idea of autonomy (*shutaisei*) emerging as paramount. Maruyama commenced his reading of modern Japanese history with the conviction that Japan's experience of modernity from the late Tokugawa period (1850s) onward had been incomplete. Institutions, ideas, and technologies were selectively learned and modified to suit a society in transition from the

feudal to the modern, but the subjective energy that characterized modern society (he also called it "the open society") was missing. As Japan became embroiled in the tensions that permeated world affairs in the late 1920s, militarism partnered with national and racial myths came to dominate the domestic scene. For Maruyama, this resulted in the fatal absence of autonomous value definition on the part of individuals and facilitated the state's absorption of society in its war-time ideology of emperor worship and external aggression. In Maruyama's view, individuals who could not act on the basis of values they had defined themselves did not represent modern citizens; likewise, a society that was undifferentiated from the state could never properly be democratic. Similarly, healthy nationalism was one that coexisted with a developed democratic ethos, something that in Japan had become distorted into ultranationalism in the 1930s because of the fatal congruence of semi-modernity and national ambition.

For Maruyama, defeat in 1945 was an opportunity for Japan to forge its own democratic polity and complete the modern trajectory. This was a huge task in the context of Occupation (1945–1952), the advent of the cold war, and the accelerated economic growth of the 1960s. In the late 1940s, Maruyama argued that the lack of autonomy in war-time Japan had manifested itself politically as the absence of a sense of responsibility, whereby Japan's leaders acted on values invented and imposed on them from above and outside themselves, creating what he called a "system of irresponsibility," where authority and morality did not coexist. Maruyama likewise posited that Japan's fascism was a twist on its European counterparts, in that its momentum was top-down rather than bottom-up. The authoritarian dynamic, with its totalitarian outcome, represented for Maruyama a poverty of autonomy that had to be addressed before Japan could embrace the modern essence of liberal democracy.

Much has been written about Maruyama prior to and following his death. Critics point to his supposed pro-Western bias, leading him to find Japan's own experience inadequate by comparison. Though he later lamented his failure to locate Japan in an Asian historical context, his consistent intellectual devotion to elaborating autonomy—its essence, function, and acquisition—spoke of a predominant adherence to ideas that were universal rather than particular.

Marx, Karl (1818–1883)

Born in the Prussian Rhineland, Marx studied at Bonn and Berlin before becoming a radical journalist. His work was suppressed, and he left Prussia but was expelled from Belgium and France. He lived in England from 1849 until his death. In 1844 he met Friedrich Engels. They wrote voluminously both as independent authors and in partnership. In the twentieth century, many ruling communist parties claimed allegiance to Marx's ideas. Most other countries had opposition parties ostensibly inspired by Marx. Marxism became one of the most influential ideologies of the twentieth century.

Hegelianism

As a student Marx was influenced by the work of G. W. F. Hegel, who considered each person's

mind to be a limited manifestation of the universal *Geist,* or spirit. Hegel saw the history of the world and its progress toward freedom in terms of the dialectical development of spirit, whereby thought proceeded by contradiction of an idea, then resolution of the contradiction. Stages of consciousness would lead to the determinate self for itself.

According to Hegel, people had been unaware of the universal nature of spirit, seeing each other as external, foreign, and hostile. Mind in the individual person was thus unfree and alienated from itself. People would become free when the spirit manifested in them achieved self-consciousness. This would happen when their ideas coincided with those of the state, in which freedom is realized.

In Berlin Marx joined the Young Hegelians, who rejected the notion of the universal mind or spirit as the ultimate reality of all things. "Universal spirit" or "universal mind" could refer collectively to all human minds, the dialectic being the path to human liberation. The radical Young Hegelians believed that the notion of spirit overcoming alienation could be reinterpreted as an account of human self-consciousness freeing itself from the illusions that prevent it from achieving self-understanding and freedom.

Ludwig Feuerbach went a step further, saying that existence precedes thought. Not just religion but any philosophy concentrating on the mental rather than material side of human nature was a form of alienation. Marx went still further in 1843 in *On the Jewish Question*. He argued that economic life, rather than religion or philosophy, was the chief form of human alienation. Money was the barrier to human freedom.

In the postface to the 1873 edition of *Capital, Volume 1,* Marx said his dialectical method was exactly opposite to that of Hegel. The process of thinking was not the creator of the real world. Ideas reflected the material world as they coalesced as forms of thought.

Alienation

In *On the Jewish Question* Marx derided civil or human rights. These so-called "rights of man" were based on a misunderstanding of humans as selfish, egoistic creatures. Furthermore, the social division between private and public in modern capitalist society meant that people saw themselves as both private individuals and citizens pursuing the common good. This dualism that characterized modern bourgeois society prevented individuals from associating in communities. Human beings were thus separated from their essential social nature, becoming atomistic individuals, rather than species-beings.

The idea of the species-being is key to Marx's thought on alienation in his *Economic and Philosophical Manuscripts* of 1844. Alienation, for him, is the material process by which human beings come to be dominated by things they create from nature. The human creative origins of those things are denied. The loss of control of one's creations becomes institutionalized by social and economic arrangements. Creations lose human value, coming to represent only the money they can obtain in the market. Human labor becomes nothing but a commodity, to be exchanged on the market at its lowest price. Moreover, the richer the worker's production is, the poorer the worker becomes. Meanwhile, the relationship between workers and their products becomes that of persons and alien objects. The poorer workers become, the greater is their alienation and exploitation.

Marx identified four aspects of alienation: (1) from the product; (2) from the activity of labor, with ownership and control of the work process being taken over by the capitalist employers as the capitalist division of labor prevents creative work; (3) from the species-being, humanity being a particular creative species characterized by their work and production of things from nature; and (4) from other workers who are seen as rivals, this being the practical expression of alienation from the species.

Marx perceived humans as object creators. Workers unable to master their material conditions were dehumanized, left with biological, animal-life functions. Motivated by greed, the exploiters were driven by an urge that was beneath humanity. Humans would eventually overcome alienation by regaining control over their creations in a communist society—not crude communism of just communalizing property, but true communism where private property would no longer be desired.

Marx's ideas on alienation contributed to his views on class struggle. He became convinced that criticism and philosophy alone could not overcome human alienation.

In 1844, in his manuscript *Towards a Critique of Hegel's Philosophy of Right: Introduction,* Marx referred to the proletariat as the class with radical chains. If those chains were broken, humanity would be emancipated. The proletariat, by liberating itself, could emancipate all other spheres of society. At this time Marx saw the proletariat in terms of specifically German emancipation but thought this would develop into the wider human emancipation. The proletariat's universal suffering and role as the object of injustice in general meant that its recovery would require the complete redemption of humanity. The problem of overcoming the social and economic source of alienation could thus be solved.

In *The German Ideology,* written in 1845 and 1846, Marx and Engels argued that with the abolition of the basis of private property, and thus also of the alien relation between men and what they produce, people would gain control of the mode of their mutual relations. They developed the materialist conception of history (which they had earlier discussed less systematically in *The Holy Family*) arguing that the socioeconomic process forms the basis of human society, from which politics, the law, and religion derive. In his later works Marx would refer to these derivative elements as the superstructure and sometimes wrote "estrangement" where he might earlier have written "alienation."

The Materialist Conception of History

In *The German Ideology* Marx and Engels discussed the division of labor that develops as big business comes to dominate the economy. As this division grew, the productive forces appeared independent of, but alongside, individuals. This was because the individuals to whom the productive forces belonged were divided and in opposition to one another, thus obscuring the fact that those forces can only operate in the intercourse and association of individual human beings. Unnatural individualism led the real-life content of persons to be robbed from them. The social change necessary for the development of productive forces was prevented. The division of labor thus seems to be a process that he would have described in terms of "alienation" in his earlier work.

In 1859, in the preface to *A Critique of Political Economy,* Marx offered what he called the "guiding thread" for his studies. Summarizing his materialist conception of history he said that, independent of their will, people enter into relations of production, which constitute society's economic structure. Such relations correspond to the existing condition of material productive forces, or forces of production, which include not just the means of production, such as tools, machines, and factories, but also skills, knowledge, experience, and other human faculties. "Relations of production" refers to relations between people who produce. Productive forces condition relations of production, which in turn condition the legal and political superstructure in a class system. Social consciousness reflects the superstructure. Although this account involves economic determinism, in a letter to the Marxist Joseph Bloch, Engels said that he and Marx had always recognized that political, religious, and other elements influenced the course of history, the economic element being the ultimately determining one.

In the 1859 preface to *A Critique of Political Economy* Marx suggested that the proletariat would escape from this situation. In the dialectical process the relations of production would eventually become outdated as they became insufficiently advanced to foster those forces and allow them to progress. The conflict that ensued would be resolved in favor of the productive forces. New relations of production, the material preconditions of which had matured within the old society, would better accommodate the continued growth of society's productive capacity. This dialectical process would eventually bring about a communist revolution.

In the *Communist Manifesto* of 1848 Marx and Engels wrote that the history of society amounted to the history of class struggles. Although the modern bourgeois society differed from the feudal society it replaced, class oppression had changed in form rather than disappeared. The bourgeois class that was now the oppressor had found that it was under pressure (from the proletarian class that had grown within the capitalist system) to change. Marx thus believed that oppression and opposition to it rested on economic foundations.

Marx discussed these economic foundations in detail in *Capital, Volume 1* in 1867. (Engels compiled and edited two other volumes from Marx's notes after his death.) Marx argued that the

development of capitalism led logically to the accumulation of capital in increasingly fewer hands. To survive, capitalists had to sell more cheaply than their rivals. This meant increasing productivity of labor and larger scale industry with ever more sophisticated machinery.

Turning again to the increased impoverishment of the proletariat in relation to the wealth they had produced, Marx said this resulted from the accumulation of capital and the never-ending demand for increased capital. The capitalists expended just enough to keep workers and their families alive.

Marx presented the labor theory of value from which, along with the concept of the commodity, he derived his concepts of use value, exchange value, and surplus value. Unlike exchange value, use value is not specific to commodity production or capitalism. The commodity is the form taken by the product under capitalism. Taking this form entails the displacement of use value (usefulness, which characterizes products and commodities alike) by exchange value (exchangeability, which characterizes commodities alone). Abstract labor, labor in general, is a source of exchange value. The value of a commodity is equivalent to the average number of hours of labor necessary for its production. Workers are paid less than the labor value of the product.

Just as exchange value abstracts from the specific quality of goods, treating them as commodities, so labor power says nothing about factors such as the worker's personality. Through machinery and the division of labor, capitalism greatly increases the productivity of human labor. Capitalists obtain the use value of workers' labor power, and pay only the exchange value. The increased productivity is skimmed off from workers' output in the form of surplus value. As labor power is a commodity used to produce more value than it has itself, the process involves exploitation by the capitalists of their workers.

Marx noted that in capitalist society relationships between workers and their labor are often described as relationships between things. Marx saw this as commodity fetishism. Echoing his earlier views on alienation, for him, not only are workers divorced from control of their products but their view of work is problematic. Believing that politics had a role in sustaining this situation, Marx took an interest in the state.

The State

In 1842 Marx wrote an article titled "The Law on Thefts of Wood." Legislation had come into force in the Rhineland concerning the theft of firewood. Although traditionally, wood gathering for fuel was a common right, the influence of the idea of individual property rights, rather than communal property rights, was now conditioning the role of the state. Wood gathering had become an offense. This redefinition of property rights meant that poor people now had to pay for things such as fuel that they had previously been able to gather freely.

The following year, in his article "Defense of the Moselle Correspondent," Marx wrote that the poverty of the Moselle wine growers was broadly the result of objective economic relationships, which determined the actions of both private individuals and individual political authorities independently of will on either side. In those early journalistic articles Marx was exploring the split between civil society, in which private material interests compete, and the state. He began to discuss this more clearly in his *Critique of Hegel's Philosophy of Right* in 1843, in which he criticized Hegel's abstract idea of the state as the representative of society. What Hegel had overlooked was that the activities of the state are determined by and subordinate to private property.

In his *Philosophy of Right* Hegel argued that in political life the individual transcends the egoism of civil society, becoming a public-spirited citizen. Civil society denotes the sphere of relations between the public sphere of the state and the private realm of the family in which citizens associate voluntarily and manage their own affairs. Because of the competitiveness of civil society, individuals had become estranged from the state and community. Reconciliation of the individual's position in the state and civil society would come when individuals recognized that the virtues of public institutions could help bring about spiritual reunion with fellow citizens. He said, moreover, that a universal civil service was devoted to the general interest. Any conflicts of civil society could be resolved by the state, which is the rational form of organization wherein the human spirit fulfils its historical potential. In Marx's view Hegel presented an idealist view that ignored the basic truths of society. Politics actually reflected the divisions and

competitiveness of civil society. Even the modern representative state was distant from and unresponsive to the concerns of ordinary people, who faced exploitation in capitalist society.

For Marx, in his *Critique,* the state sustained the privileges of property owners. The civil service, moreover, pursued its own interests. The oppressed clung to illusions about the state's universality, neglecting their real needs. Perhaps surprisingly, in this early period of his work he believed that the way forward would be through universal franchise. This would lead to the dissolution of the state and civil society as separate spheres. Private property would be transformed into common property. The civil service would no longer be able to treat public affairs as its own private business. There would be self-determination of the people involving direct rather than representative democracy.

Thereafter, Marx and Engels explored the state's subordination to private property, notably in *The German Ideology* in 1845. Furthermore, the division of labor played a central role in their thought. Marx traced the origin of the state to the division of labor. The state, in contradiction to the real interests of all members of society, served as a screen giving a false air of community and concealing the real class struggle.

In the *Communist Manifesto* of 1848 Marx and Engels provided their most powerful and influential comments on the role of the state in the bourgeois economic order. The development of industrial production was gradually polarizing the population into two classes, bourgeoisie and proletariat. All other classes were in decline as the bourgeoisie increasingly dominated the economy. Many artisans and small shopkeepers were becoming proletarians as they lost out in the competitive processes and had to sell their labor. Marx and Engels considered that revolution would be necessary, as the legal and political life of the society was conditioned by the capitalist mode of production. The executive of the state now resembled a committee of the dominant, bourgeois class. This state executive managed the common affairs of the bourgeoisie as a whole. The state was now the political expression of the dominance of the bourgeoisie.

In fact Marx recognized that this was an oversimplistic view of the state. He sometimes said that a fraction of the ruling class, rather than that class as a whole, controls the state. For example, in a series of his articles that Engels would later compile and publish as *The Class Struggles in France,* Marx studied the French monarchy that had been restored after the fall of Napoleon Bonaparte. Discussing the financiers under King Louis-Philippe, Marx said the members of this fraction, rather than the ruling class as a whole, were the effective rulers.

Marx was, thus, not entirely consistent on the nature of the state. Indeed, he believed that the state and its institutions might even act in ways that would not be endorsed by some or even many in the privileged class. He recognized that the state might be able to act with far greater autonomy than he and Engels implied in their broad generalizations in the *Manifesto*. Marx also recognized that the state would sometimes respond to interests other than those of the ruling class, so long as this responsiveness was circumscribed, as it could not be allowed to conflict with the interests of the dominant class. The state would still be acting in the long-term interests of the capitalist system.

Marx developed his more advanced theory of the state from 1848 until 1851, a period of much revolutionary activity in France, followed by reaction, great uncertainty, and political instability. In 1851 Louis Napoleon seized power and proclaimed himself emperor in reaction to the revolution. Marx published *The Eighteenth Brumaire of Louis Bonaparte* in 1852 as an account of these events. Louis Napoleon (Napoleon Bonaparte's nephew) took power of the massive centralized French state seemingly as an individual who embodied the national will independently of class. This was, however, an illusion. Louis Napoleon represented the peasants, the largest class on whom he relied on for support to gain power. The peasants could not represent themselves; each family was self-sufficient. They did not feel themselves to be a class. They were incapable of enforcing their own interests in their own name. This did not, however, mean that Louis Napoleon became the instrument of the peasantry. His role was more of a paternalist figure—a representative who appeared as their master. Furthermore, Marx claimed that Louis Napoleon saw it as his mission to safeguard bourgeois order, for which he needed to respect the property of various groups within the bourgeoisie. This required the repression of the peasants, who nevertheless still supported him in the

illusion that he could repeat his uncle's policies. The state took the role of arbiter.

Marx believed that the placation of different interests takes place within the limits of the capacities of capitalism. Bonapartism—the political dominance of the executive—occurs in capitalism when no group is able to dominate the legislature and control the executive. The bourgeoisie loses its hold on power at a time when the working class is incapable of taking power.

Marx envisaged that, where the class struggle is equally balanced, the state apparatus could operate with greater autonomy from direct control by capitalists. Some scholars describe his view as one of relative autonomy. Although Marx realized that the state institutions and personnel might sometimes side with the exploited and use power independently of the dominant economic class, he saw the state as a condition rather than an instrument of class oppression, as the state must, ultimately, preserve law and order. An orderly climate for capitalist development was thus secured. Crucially, were the state to undermine the process of capital accumulation, it would simultaneously undermine the material basis of its own existence.

Marx discussed the demise of the state in *The Civil War in France*. At the end of the 1870 Franco-Prussian War, with Paris under siege, the French government withdrew from the city, leaving the National Guard effectively in power. The Central Committee of the Guard organized elections in which Parisians took control of their city in the Paris Commune. One third of the Commune's members were manual workers. The Commune lasted for 2 months before being crushed by French government forces.

Marx said the working class could not simply take hold of the existing state machinery and wield it for its own purposes. Over many decades a centralized state power had developed, with its standing army, police, bureaucracy, clergy, and judicature. The state power had assumed more and more the character of the national power of capital over labor. In Paris, the Commune had posed a challenge to this situation. What, however, was necessary to overcome the distinction between state and civil society and the use of the state for partial ends was the development of the state into the political form of the emancipation of the masses.

Marx discussed the revolutionary transformation of the state in his *Critique of the Gotha Program* of 1875. Freedom would mean changing the state from its position of dominance of society to one of subordination to society. This would involve a period of revolutionary transformation. The state would take the form of the revolutionary dictatorship of the proletariat in the transition to communism.

Revolution and Communism

In *Theses on Feuerbach* in 1845 Marx listed 11 theses that summarized his disagreements with Feuerbach. The 11th stressed the importance of changing the world, rather than merely interpreting it. Revolutionary change is part of Marx's guiding thread in his 1859 preface to *A Critique of Political Economy*. Although he did not mention communist society in the thread, he suggested that, after the revolutionary change from capitalism, society would for the first time not be based on antagonism.

Marx's revolutionary thought developed as he read about the French Revolution of 1789, which he saw as a bourgeois revolution. The rising bourgeois class had changed the political structures in accordance with changes that had already been taking place in the property structure. One sort of minority class rule, bourgeois class rule, had taken the place of the earlier minority class rule.

Marx also experienced the Industrial Revolution, which accelerated the productive capabilities of society. Recognizing that the Industrial Revolution was bringing dire poverty to the producers of wealth, he also envisaged the potential for great social change. He said in the 1859 preface that as people realized that the productive forces are capable of providing more than they do, the pressure for social revolution would grow. The bourgeoisie, in developing the productive forces of society, had created the conditions for the next revolutionary transformation of society. The productive forces were potentially powerful, but the conditions of bourgeois society could not accommodate their advancement. Some productive forces had to be destroyed or new markets conquered. Such crises would become more destructive and extensive. The proletariat would overcome their isolation and

competition. The bourgeoisie, Marx and Engels suggested in the *Communist Manifesto* of 1848, would produce its own gravediggers.

Revolutionary consciousness was needed to unite the national and international revolutionary struggles in the movement. This consciousness would develop as the proletariat grew in number and became more concentrated in industry. This would allow the proletariat to recognize its strength.

Marx and Engels's revolutionary thought is more complex than it may seem. With the long-term aim of proletarian revolution, they favored alliances with the peasants when the proletariat was in the minority. They supported the German bourgeoisie in 1848, hoping that it would overthrow the monarchy, as had been the case in France in 1789. This would pave the way for the proletarian revolution.

Marx briefly, and optimistically, considered the revolution imminent in the atmosphere of 1848. The revolutions were quelled, and Marx was particularly concerned about the failure of the Paris workers' insurrection that year. Nevertheless, in a speech to the Central Committee of the Communist League 2 years later he insisted that revolution was still in prospect, if now on the horizon. A successful revolution would require the unfolding of economic events. He attacked his opponents in the League for wishing to organize for immediate revolution. They were thinking that the revolution would be a mere effort of will, rather than the product of realities of the situation. He stressed that preparation for the revolution, changing society, and training for political power may take years or even decades.

For the unusual case of Germany, Marx now recommended permanent revolution, by which revolution would be uninterrupted, as the bourgeoisie and then the proletariat came to power. In this case the need for separate revolutionary stages—bourgeois and proletarian—was eliminated.

Marx's suggestion in 1843 that universal suffrage might help bring about the new society came at a time when his ideas were in a transient state after his earlier Hegelianism. In much of his other work until 1850, Marx assumed that political revolution would involve the use of force. In some of his journalistic articles of the early 1850s he said universal suffrage would only be a threat to the bourgeois state if there was a secret ballot, paid members, and annual elections, and also if the proletariat was the largest class with consciousness of itself as a class. Nevertheless, after 1850 he began to argue that it might be possible to achieve communism peacefully, with a majority in the legislature, in the most advanced countries such as England, Holland, and the United States. He stressed, though, that if the peaceful revolution were to be opposed by the violence of the existing holders of power, physical force would become an acceptable revolutionary weapon. The choice between peaceful means or the use of force to achieve political power would be a tactical matter, depending upon the particular case in question. Marx always feared that there would be a reaction against peaceful change. He believed that a workers' state would need to follow the revolution to overcome the initial problems. As he put it in a letter to fellow socialist Joseph Weydemeyer in 1852, the class struggle would necessarily lead to the dictatorship of the proletariat, which would only constitute the transition to a classless society. In the longer term, according to Engels, the state would wither away.

Marx derided utopian socialists who offered blueprints for the new society. He was mainly reluctant to offer detail about the future society. He had, though, discussed the future communist society in utopian terms in two of his early works—the *Economic and Philosophical Manuscripts* of 1844 and the *German Ideology* of 1845–1846. In the *Manuscripts* he was critical of forms of communism that distorted the essence of private property or the human nature of needs. He favored a form that would not only abolish private property but also eradicate human self-alienation. People would thus reappropriate the human essence for themselves.

In *German Ideology* Marx and Engels said that in communist society the division of labor would be abolished—people would not be tied to a particular occupation. Moreover, the split between the particular interests of the individual and the common interest of society, which had characterized human relations since the end of simple societies, would disappear. Communism would introduce a society with modern technology and highly developed productive forces. This would require the abolition of private property. It would, moreover, require a new way of

thinking and even a change in human nature. He considered human nature changeable, reflecting the material conditions of one's epoch. In communist society human nature would take on a new character. He believed greed, envy, and other traits would disappear in a society based on communal property and socially organized means of production.

In the *Communist Manifesto* Marx wrote that, after the revolution, bourgeois society would be replaced by an association of all people wherein the free development of each would be the condition for all people to develop freely. In this new society, Marx hoped, people would take a new attitude toward work.

In *The Civil War in France* more than 20 years later, Marx stressed that he was aware that the Paris Commune of 1871 was not a socialist revolution; but he was impressed by its democratic character and endorsed the belief of the communards that deputies should see themselves as mandated delegates, or communal agents. These delegates were subject to recall and revocation at short notice. Moreover, the deputies were restricted to workman's wages, so candidates would not seek office or motives of personal gain. The combination of executive and legislative functions in the Commune assembly would prevent bureaucracy, which grew from the formal separation of those functions. A future socialist democracy, he believed, should take note of these developments.

Four years after the crushing of the Commune, in *Critique of the Gotha Programme,* Marx outlined two phases of communism. In the early phase, after the revolution, individual producers would receive back from society exactly what they contributed, except for necessary deductions for society. Individuals would be paid for their labor and buy consumer goods. In the higher phase of communism people would contribute to society according to their ability and draw from the common stock according to needs. Productive forces and cooperative wealth would increase with the all-around development of individuals. Only in this phase could the restrictions of bourgeois right be overcome. Marx hoped for a new morality in society, which would allow communism to develop.

Marxism

The history of Marxism can be encapsulated in a number of paradoxes. Karl Marx (and Friedrich Engels) called for a society in which all its members would be free. Yet his later followers (Joseph Stalin, Mao Tse-tung, and Pol Pot, to name a few) established deeply authoritarian and often barbaric regimes. This paradox may be explained, in part, by another: Marx firmly believed that proletarian revolutions would occur in advanced capitalist societies. Yet apart from having a formative influence on the German labor movement and,

before that, World War I, in world-historical terms Marxism has been much more enthusiastically embraced by relatively undeveloped countries (Russia, China, Cuba), in their quest for independent economic development and opposition to Western imperialism. Although communist parties have been influential in Europe (in interwar Germany and in postwar France and Italy), they have never managed to dominate the political agenda. Here is another paradox: Whereas the Western working class has, by and large, remained resolutely reformist rather than revolutionary, Marxism (even in the United States, but especially in Europe), since the 1960s, has had an enormous influence on the humanities—especially history, literary studies, political science, philosophy, anthropology, geography, and development studies. Contrary to the founders' intentions, Marxism has often served as a guide to explaining and interpreting the world rather than changing it. This entry explores these paradoxes through a discussion of the core ideas of Marxism, its political expressions, and the schools of Marxism that have evolved in the academy: Western Marxism, structuralist Marxism, analytical Marxism, and post-Marxism.

Core Ideas

Marxism became an "ism" during the period of the Second International (1889–1914), when Engels (Marx's lifelong collaborator), Karl Kautsky, and Georgi Plekhanov made Marxism a scientific worldview, explaining both nature and society. Soviet Marxism, diamat (shorthand for dialectical materialism), continued in a similar vein. Yet, what is most is distinctive about Marxism is that unlike other communist utopias, such as Thomas More's *Utopia* (1516), its conception of the good society claims to be realistic, arising out of the contradictions of capitalism, and proposes a political practice that depends on a concrete analysis of existing social, political, economic, and, indeed, cultural conditions.

Marxism consists of three interconnected elements: ethical, explanatory, and practical. These three elements were combined within a teleological conception of history, the idea of historical progress, and the idea that history had a meaning and direction, namely, the realization of freedom for the whole of humanity. Thus, the "real" and the "good" facts and values were in the process of coalescing. Marx's view of history, known as historical materialism, focuses primarily on how societies produce their material means of existence and, to a lesser extent, on how they reproduce themselves. At the meta-level, the forces of production (principally, technology, labor power, and forms of productive cooperation, especially the division of labor) provide the historical dynamic. They develop within certain relations of production (ownership relations), and when these productive forces can no longer develop within a certain set of relations, profound social revolutions occur and new relations predominate, facilitating the further development of the productive forces. The defining feature of any society is the existence or nonexistence of class relations, of ownership relations and the control of the surplus produced (exploitation). There also exists some form of state, law, and ideology (the superstructure) that protects the existing relations of production (the base) and the interests of the economically dominant class.

Within this framework of broad forces or relations of production, Marx more specifically sought to demonstrate how capitalism's contradictions would provide the preconditions for a communist society, enabling the proletariat to get a greater sense of its historical mission and thereby lessening the birth pangs of historical transition. He held that there were three central contradictions between the forces and relations of production: The first was between capitalists' drive to make the division of labor ever more sophisticated, involving increasing degrees of cooperation (an aspect of capitalism's productive forces), and the private appropriation of the collective wealth produced (ownership relations). The second interlinked contradiction was that capitalists, in competing with each other, were compelled to increase the amount of unpaid labor (exploitation) from the workforce. Not only did this mean that industrial conflict was endemic to capitalism, with capitalists attempting to get workers (a force of production) to work harder in some way, but also that capitalists had to continually invest in new technology to reduce the wage bill and increase output. This led to the third contradiction: Capitalist production relations fettered productive forces as a result of an in-built

tendency for the rate of profit to fall as investment became more costly and the rate of return fell. Thus, there was a contradiction between capitalism's productive potential and its performance.

For Marx the working class was central to the transition to communism because it had an interest in overthrowing its capitalist exploiters, especially as they would be increasingly immiserated through economic decline. The logic was that the exploited class—because they exploited no one (unlike the bourgeoisie under feudalism) and would become the overwhelming majority in society as capitalism spread globally—would create a classless society once in power. The logic of their position also meant that given the cooperative nature of their work, concentrated in factories, the working class would have to continue cooperating under communism. Given their numbers and concentration in factories and towns, they had the potential power to transform society. Finally, as a result of its struggles with capitalists, the working class would eventually form a revolutionary party that understood the direction of history and would organize the overthrow of capitalism.

From a communist viewpoint, what was also special about capitalism, apart from creating its own "gravediggers," was its capacity to make labor power enormously productive. This meant that communism would be a society in which there would be little conflict resulting from material scarcity, and that the amount of time required to produce life's necessities could be reduced so that people could become self-fulfilling, autonomously directed individuals. Labor would no longer be a commodity or the means to the end of capitalist profit. Marx's ideal was of a nonmarket society, with distribution according to need and contribution according to individual capacity or ability. The state as an instrument of class domination would also disappear as society became increasingly classless and many spheres within society became democratized.

Marxist Politics: Problems and Issues

The viability of any political ideology lies in its ability to adapt to existing and new circumstances in order to provide the basis for successful political action. The earliest dilemma that Marxists had to face was over the choice of reform or revolution that first arose within the German Social Democratic Party, the most successful organization within the Second International (1899–1914), with mass electoral support, buttressed by an influential trade union movement. Marxists found themselves at the head of a newly emerging labor movement that was far more interested in piecemeal reforms than proletarian dictatorship in an era of German economic dynamism. Eduard Bernstein wanted to revise Marxism to bring it into line with the reformist energies of the German labor movement by challenging Marxism's revolutionary teleology. Rosa Luxemburg, in defending the teleological goal, held that capitalism would at some stage face economic collapse and that, in any case, the capitalist state could only offer limited reforms to workers that could be taken away at any time (including the democratic structure). The reform/revolution issue underpinned the debate between Kautsky and Lenin after the Russian Revolution of October 1917. Kautsky, who had been the chief ideologist of the German Social Democratic Party before World War I, held that the violent and unconstitutional way in which the Bolsheviks had come to power was deeply authoritarian and broke the link between socialism and democracy. Lenin, on the other hand, insisted that the working class could only come to power through violence and that Soviet power constituted an expansion of democracy in contrast with the parliamentary form, where the executive set the agenda. This dilemma again resurfaced in the 1970s when many European "revolutionary" communist parties fully embraced parliamentary socialism and abandoned the idea of the "dictatorship of the proletariat" that had been brought into such disrepute by Stalin and other communist dictators, to become fully paid-up social democrats.

The Russian Revolution also raised the question of how legitimate it was for Marxists to organize a proletarian revolution in conditions of economic and political backwardness, challenging Marxism's standard assumptions. Although Lenin justified this strategy by arguing that Russia was a weak link in the imperialist chain and that a revolution in Russia would ignite a global proletarian revolution, as events turned out, this proved a dubious hypothesis. The Soviet Union remained isolated, and not surprisingly Stalin's "socialism in one country" doctrine gained credence. What followed

in the late 1920s and early 1930s was breakneck industrialization and the collectivization of agriculture, involving even the physical elimination of all opposition. Nevertheless, the principle of state-organized model of industrialization to overcome economic backwardness provided inspiration for many countries fighting for national independence after World War II, especially China and, later, Cuba. The question posed by Kautsky and those to the left of him remained: Could such regimes claim much fidelity to Marx's vision of communism? Were they thriving workers' democracies, of the workers, by the workers, for the workers? Communist parties claimed to represent the workers, but in disallowing any opposition to emerge, such claims were never put to the test. In any case the urban intelligentsias often provided the cadre of such regimes, and the social basis of the Chinese revolution of 1949 was the peasantry. Mao Tse-tung, the Chinese leader, resolved the representation problem by claiming that the Chinese were a "proletarian nation."

Indeed, third world revolutions over the long term raised the question of what were the social sources of radicalism, especially as the working class in the West has largely opted for reformism as first suggested by Bernstein. The so-called new social movements, concerned with issues of race, gender, sexual orientation, peace, and ecology increasingly gained in strength beginning in the 1960s and seemed to offer far more radical activism. Linked to the question of the revolutionary potential of the working class has been capitalism's economic resilience that Marx could not have anticipated. If capitalism had continually faced chronic crises as depicted in *The Communist Manifesto,* there may of course have been greater grounds for holding to Marx's revolutionary assumptions.

Marxism in the Academy

Paradoxically, although the origins of Marxism in the academy were closely tied up with the failure of the Russian Revolution to spread to the West and the bureaucratization of Soviet rule—that is, with working class defeat—Marxism has flourished in the academy since the 1960s, and in many areas of the humanities it has entered into the mainstream in a relatively uncontested sense, as it became fused with other research paradigms, especially those connected to language and psychology. The four main schools or currents of Marxism within the academy can be identified as Western Marxism, structuralist Marxism, analytical Marxism, and post-Marxism. A fifth current may be added, which may be termed classical Marxism, which has resisted many of the trends and fashions within the academy and has retained a far greater political economy perspective, emphasizing the importance of capitalism and class in understanding political life. Many academics have been attracted to Marxism not merely because of its moral appeal (solidarity, ending exploitation, individual and collective self-realization) and powers of social, political, and ideological critique, but also because of its capacity to explain the world, past and present.

Western Marxism

Although many academic Marxists have often avoided the question of political action, Georg Lukács (1885–1971) and Antonio Gramsci (1891–1937), the two main founders of what is termed Western Marxism, had been political activists. Both were deeply influenced by the Russian Revolution and its implications for Marxism. Both concluded that it represented not the triumph of a deterministic Marxism and the laws of history as adumbrated by historical materialism, but the triumph of human will, political agency, and the dialectic of theory and practice. And just as Lenin had become strongly influenced by his reading of Hegel during World War I, they, too, returned to what they saw as the Hegelian roots of Marxism. They rejected the objectivist and positivist Marxism of the late Engels and Kautsky that seemed to explain revolutions in terms of natural laws. Lukács, in *History and Class Consciousness* (1923), saw the Russian Revolution as the result of the dialectic of subject and object, where the proletariat ceased to be the object of history and became aware of itself as a self-transforming *class* and thereby as a world-transforming or totalizing subject. In doing so, it overcome the reified, fragmentary nature of society under capitalism and also the subject–object dualism that Hegel believed could be overcome in thought.

Although Gramsci was far less interested than Lukács in the realization of philosophy through

revolution, he was just as keen to formulate a nondeterministic Marxism and explore the nature of revolutionary working-class consciousness, or rather its absence. In his famous *Prison Notebooks,* penned while incarcerated by Mussolini between 1926 and 1935, Gramsci maintained that in advanced, complex capitalist societies, unlike pre-1917 Russia, bourgeois domination rested far more on consent—on ideas—than the force of the state. Consent was created through the institutions of civil society—the church, schools, trade unions, political parties, and newspapers. Gramsci used the term *hegemony* to describe this form of domination. He drew the conclusion that a much longer and complex war of position, in contrast to a Bolshevik war of maneuver, was needed and involved the creation of a new common sense within these social institutions, involving a complex series of alliances. In this process the proletariat would need its own organic intellectual—the Marxist party—just as the bourgeoisie had its own practical organizers—civil servants, political leaders, industrialists, technicians, managers, teachers, and the like.

The most important group within Western Marxism was the Frankfurt School, originally known as the Institute of Social Research. Founded in 1923, it decamped in the United States in 1933, to return to Frankfurt in the early 1950s. Its key figures were Theodor Adorno (1903–1969), Max Horkheimer (1895–1973), Herbert Marcuse (1898–1979), and, later, Jürgen Habermas (1929–). It developed a body of Marxism that it called critical theory, building on Lukács's critical subject–object dialectical framework (although the proletarian subject vanished) and his concept of reification as well as on Weber's observations on the growth of bureaucratic rationalization and instrumental reason. A central concern was with the loss of a critical, reflective—indeed, human—standpoint in Western societies, whether in the high culture of art, music, literature, and philosophy, or in the low mass cultural consumption of popular music and film. In Marcuse's phrase, the world had become one-dimensional. Critical theorists maintained that the contemporary human sciences, grounded on positivism and empiricism and being supposedly value-free, reflected the growth of instrumental reason and were therefore conservative. Although such science was crucial in conquering nature (the positive side of the Enlightenment), when applied to understanding society, it could only lead to the domination of human over human in the name of utility and efficiency. In other words, the interests that such ideologies served became obscure.

Although they were concerned about the bureaucratization of the socialist project in the Soviet Union, the members of the Frankfurt School devoted more of their energy to explain the loss of the critical impulse in Germany that witnessed the rise of totalitarian Nazism. Unlike the political economy approach of classical Marxism, members of the Frankfurt School resorted to psychoanalytical explanations, especially the decline of male authority within the family, which led to the rise of the authoritarian personality. The psychoanalytical dimension was especially prominent in Marcuse's work. In *Eros and Civilization* (1955) he gave a progressive twist to Sigmund Freud's notion of sublimation, suggesting that the repressive work ethic was no longer required in a world of technologically created abundance. However, in his later *One-Dimensional Man* (1964), he was pessimistic about the liberating role of technology, with consumerism integrating workers into capitalism. Only those outside the system—the unemployed, the unemployable, and racial minorities—were still in touch with their critical faculties.

Habermas, too, was critical of modern capitalism and its bureaucratic form, particularly its, or the system's, colonization of the lifeworld of individual autonomy. Yet he was more optimistic about modernity than were his Frankfurt predecessors. He developed his own critical standpoint based on an ideal speech situation of unconstrained and undistorted discussion, leading to what he later called "communicative action." Thus, the realm of instrumental reason could be controlled through a consensus of shared understandings required to coordinate action. In his later years he maintained that liberal democracies could serve as the actual basis of this standpoint, although it is far from clear that the money and power of those who steer the system do not undermine this ideal.

Structuralist Marxism

If Habermas saw the normative potential in language, Louis Althusser (1981–1990), a member

of the French Communist Party, saw its explanatory, scientific potential, which he indeed pitted against the humanist, Hegelianized Marxism initiated by Lukács. Althusser was responding to the crisis of Marxism in the mid-1950s, when Stalin was strongly criticized by the Soviet Communist Party and the Soviets invaded another proletarian country, Hungary in 1956. Humanist, existentialist Marxists such as Jean-Paul Sartre (1905–1980) were developing a Marxism independently from the Soviet diamat (dialectical materialist) version that could potentially have united socialists, communists, and Catholics in France. He also wanted to defend the autonomy of intellectuals within the French Communist Party. In *For Marx* (1965) and *Reading* Capital (with Étienne Balibar, 1970), influenced by French philosophers of science Gaston Bachelard and Georges Canguilhem, Althusser sought to put Marxism on a rigorously scientific basis through a symptomatic reading of Marx by making sense of the silences in his writings. He concluded that there existed an epistemological break in Marx's work, between the Hegelian and Feurbachean philosopher of alienation: philosopher of human essence and human freedom on one hand, and on the other an objective, value-free scientist who developed concepts that centered on the mode of production, such as forces and relations of production.

Althusser argued that Marx was, in effect, in the process of developing a structuralist methodology of the kind later seen in the work of the anthropologist Claude Lévi-Strauss (1908–2009), who based his work on the linguistics of Ferdinand de Saussure (1857–1913). The understanding of social structures could be modeled on what was regarded as the inherent structure of language. Just as the meaning of words was relationally derived from the meaning of other words, so societies had to be thought of in terms of interrelated dimensions. Rejecting the simple base/superstructure model, the social totality was constituted by three interacting levels or practices: the ideological, the economic, and the political. Yet true to Engels, the economic in the last instance determined which level was dominant. Thus, society and history could be explained in a far more complex way than by a simple dialectical teleology as proposed by Hegelian Marxists. To capture this complexity, Althusser used the term *overdetermination*, a concept derived from Freud's analysis of dreams, to describe how history and society consisted of a condensation of multiple contradictions. On this reading the Russian Revolution did not have to be seen as an aberration, departing from the orthodox Marxist teleological schema that assumed that socialism was possible only in advanced capitalist countries. Indeed, he famously maintained that history was a process without a subject.

Perhaps the most dramatic implication of his structuralist rendition of Marxism was his rejection of the Hegelian Marxist emphasis on class consciousness, crucial to historical transformation. Rather, consciousness, subjectivity, and indeed morality were the effects of these complex structures. Individuals were the unwitting bearers of these structures, their roles ideologically created. The self was an ideological effect. Social relations were therefore not the product of individual intentions. Althusser drew a further conclusion, shocking even to an orthodox Marxist, that ideology was required to ensure that social roles were reproduced in *any* society and was therefore a permanent feature of the human condition. It would not disappear with the coming of a classless society.

For Althusser the epistemological and scientific dimension was essential, as science was required to get behind the appearance of things; science had enabled Marx to uncover the exploitative essence behind the fair wage agreement between capitalist and worker. Thus, much scientific labor was needed to understand the ideological effects of contemporary capitalism.

Analytical Marxism

In attempting to reassert Marxism's rigorously scientific credentials and dismiss Marxism's Hegelian historical teleology, Althusser inadvertently paved the way for analytical Marxism, which flourished in the 1980s. Although there was little political or methodological agreement among analytical Marxists, they were all equally committed to methodological rigor, definitional clarity, and logical consistency. Moreover, apart from G. A. Cohen's *Karl Marx's Theory of History: A Defence* (1978), the inspirational text for this group, they were far keener to reconstruct Marx's ideas than demonstrate their validity (especially given the problems of collective action for the

proletariat), using techniques of rational choice, game theory, and mathematical modeling derived from neoclassical economics, all normally premised on the microfoundations of methodological individualism. They started with Marxist questions (e.g., What is exploitation? Why are workers not revolutionary?) but did not come up with Marxist answers.

Cohen sought to rebut the criticisms made by British analytical philosophers (especially H. B. Acton and John Plamenatz) in the 1960s. He distinguished between Marx's teleological, Hegel-inspired *philosophy* of history, which he rejected, and Marx's *theory* of history, which could be defended, especially if given a functionalist gloss. Thus, although he gave the development of the productive forces throughout history explanatory primacy, the productive forces did not create production relations themselves, but made use of existing relations that facilitated their further development. Supposedly Marx was more concerned with talking about directionality in history than its inevitability.

Given the rejection of Marxism's teleological aspect, with the real and the good (almost) inevitably coalescing, the normative and explanatory elements became detached from one another. The analytical Marxists' areas of research reflected this separation, with Cohen and John Roemer moving into the realm of moral philosophy and John Elster and others more interested in social and political explanation. Elster took exception to Cohen's functionalism because it ruled out conscious human intention. Rather, he sought to reconstruct Marx on methodological individualist lines: Social phenomena were to be explained as the outcome or aggregate of myriad individual choices and actions rather than by some hidden purpose (e.g., social reproduction or proletarian emancipation of humanity). Supraindividual entities (humanity, classes) therefore had no ontological independence. In seeking to develop a general theory of exploitation after rejecting Marx's idea that it was premised on the labor theory of value and the capitalist's extraction of surplus value from the worker, Roemer also based his argument on individualist methodology. Exploitation occurred because of the differences in the distribution of initial productive assets or endowments, which included individual skills and talents as well as instruments of production. Thus, exploitation could occur in all exchanges, not merely between capitalist and worker, but in situations where some are more talented than others, because some have to work longer than average to earn their "consumption bundles." Thus, hypothetically, those who would be better off if they played their own game by taking their talents and their per capita share of external resources elsewhere are deemed to be exploited, according to Roemer. Thus, exchanges between those equal in assets and endowments could not be deemed exploitative.

Whereas Roemer used economic modeling to develop normative theory, Cohen applied the techniques of analytical philosophy to criticize mainstream liberal discourses on equality. He attacked Robert Nozick's libertarian notion of self-ownership used to defend economic inequality, and he questioned John Rawls's difference principle (inequalities are legitimate if they improve the lives of the least well off). In attempting to marry equality and individual autonomy, Cohen became a "luck" egalitarian: Although individuals had to be protected against brute luck, there was still scope for personal responsibility. And although he held that the self-ownership principle helped explain Marx's theory of exploitation, he emphasized that it was not only workers who experienced injustice.

Post-Marxism

Like analytical Marxism, post-Marxism also began to flourish in the 1980s, but it differed fundamentally. Post-Marxists regarded the search for foundations as chimerical, whether analytically as stable meanings or methodologically as "micro" explanations. They also differed because, apart from Ernesto Laclau and Chantal Mouffe whose seminal text was *Hegemony and Socialist Strategy* (1985), it was not a self-conscious intellectual movement. Post-Marxism is a label that can be loosely applied to a variety of thinkers, to those who were *not* neo-Marxist in wanting to update Marx. Their thinking was either Marxism "plus," as in the case of feminists whose dual systems explanation of women's oppression combined patriarchy and class analysis, or they went beyond Marx. Whatever the large differences between

them, they shared a common view about the failings of orthodox Marxism, which they saw as a form of conservatism or worse. They rejected its grand narrative, a teleological view of history with the proletariat liberating humanity from the shackles of capitalism. The underlying assumption of historical necessity ignored the contingent, the circumstantial, and the unpredictable.

Often influenced by the events of May 1968 in Paris, in which students proved to be more radical than workers, post-Marxists turned for inspiration to the new social movements, which advanced the causes of sexual and ethnic identity, ecology, and peace rather than the proletariat. They rejected the idea that Marxism was a science. Instead, Marxism was a political discourse, an expression of power relations, often of a distinctly totalitarian kind. Its claims to truth and transparency were bogus. Indeed, given their sensitivity to problems posed by language and human psychology, post-Marxists were far more committed to the idea of the indeterminacy of meaning and the singularity of human experience. Thus, rather than the knowing (Marxist) Party guiding the proletariat in accordance with historical laws, those who sought to bring about social transformation had to speak for themselves. This implied that democracy, albeit of a radical type, was more important than communism. Democracy was also essential because Marxism assumed that most human conflict would disappear in a classless society. Laclau and Mouffe, in particular, stressed that human desire stemming from a congenital "lack" would always destabilize human relations. Democracy was the best way of insuring that such desires did not result in domination. Most post-Marxists, however, were not anti-Marxist. Jacques Derrida, perhaps speaking for many post-Marxists in *Specters of Marx* (1994), explicitly associated himself with its critical spirit in relation to liberal democratic capitalism. The problem was that Marxism did not go far enough in its radicalism, which had to embrace an unpredictable and unknowable future.

Classical Marxism and Its Derivatives

Despite these different Marxist trends within the academy, there have remained thinkers far truer to the political economy spirit of Marx, who use his ideas to understand the contemporary world and its antecedents. This spirit lives on in such journals in the Anglophone world as *The Socialist Register, Historical Materialism, Science and Society, Capital and Class,* and earlier editions of *New Left Review,* in the writings of Ellen Wood, David Harvey, and Alex Callinicos, or the "regulation school" started by Michel Aglietta in the 1970s. There are also those who use Marxism as a starting point of analysis but do not feel constrained by a fidelity to Marx, such as Bob Jessup and Roy Bhaskar, founder of the critical realism school of thought.

Conclusion

Despite the paradoxical history of Marxism and its political and intellectual fragmentation, the existence of many liberalisms, feminisms, and conservatisms shows that fragmentation can be an expression of strength as much as weakness. Politically, Marxism may be a spent force, with capitalism proving to be far more resilient and the working class less revolutionary than Marx anticipated. Nevertheless, for the first time in human history we live in a globalized capitalist world, in which human relations become increasingly commodified, with deeply unequal benefits and burdens, serious economic downturns, imperialism(s), rampant militarization, and the planet ecologically challenged. Whatever Marx's intentions to produce a body of radical theory that was not utopian, the evidence suggests that he was not successful in this respect. On the other hand, his analysis of capitalism helps to bring *any* normative thinking down to earth, trenchantly demonstrating how, in the contemporary world, the realization of liberal, and indeed democratic, ideals are profoundly utopian within the capitalist context. In thinking outside the liberal democratic "box," Marx, with all his theory's imperfections and overblown ambitions, offers rich resources as a critique of the contemporary world and as an explanation of how it is as it is.

Mass Psychology

Interest in mass psychology has heightened since the terrorist attacks of September 11, 2001, as many wonder about Islamic fundamentalism and the waves of apparent mass fury that it has released around the world and which seem to appear almost weekly on U.S. television. Not so easy to see are the forces of mass psychology at work in society. Yet, if Freud is correct in *Group Psychology and the Analysis of the Ego* (originally published in 1922), the principles are the same.

According to Freud, in the group the individual is liberated from the forces of repression, allowing him or her to more freely express his or her unconscious impulses. The apparently new characteristics of individuals in groups are nothing more than the emergence of characteristics that were present all along but kept on a tight leash by the ego and superego, or conscience. In other words, there is no such thing as a "group mind." Groups are nothing more than the attributes of the individuals within them. What changes is how relatively unrepressed these individuals become when they have given themselves over to the allure of the group, the promise that they will not have to forever inhibit their unconscious desires, especially their anger and hatred toward others. A nation at war, whether just or unjust, does not escape this psychology.

What holds groups together? In part the sheer pleasure of being part of the mass of humanity that is no longer required to repress its desires, particularly the pleasures of aggression. But that is not enough. The leader holds the group together, says Freud. Individual members of the group identify with each other, but only in a superficial way. Each imagines that he or she is in an individual relationship with the leader. The relationship may be real or imaginary, but it is as if each member of the group is bound to every other member of the group only because they have the same leader. The result, according to Freud, is that it is incorrect to define humanity as a herd animal, one that gathers around its own, like sheep. Humanity is a horde animal—that is, a follower of leaders. One possible criticism of Freud is that he did not fully appreciate the way in which an idea or an ideology could take the place of a leader.

Developed out of his experience treating the victims of "shell shock" (now called posttraumatic stress disorder) in World War II, Wilfred Bion came to see groups as existing in a perpetual state of tension between their work tasks, such as building a bridge or running a hospital ward, and the more basic dependency needs of their members. Rarely are these basic dependency needs addressed directly; instead, they are acted out in ways that are often destructive of the group task. In a well-known and possibly apocryphal story illustrating the tension between task and need, a nurse in a hospital ward is said to have blurted out in the middle of a ward meeting, "We could be such a fine unit if we just didn't have these damn patients to take care of."

The three unconscious patterns into which groups tend to organize themselves, patterns that invariably detract from the task at hand, are, according to Bion, the dependency group, the fight–flight group, and the pairing group. Dependency groups act as if they tacitly assume there is a leader who can magically meet the

group's need for security and nurture. Another basic assumption is the fight–flight group, the group that acts as if it is faced with a terrible danger it can neither name nor specify. The third basic assumption is the pairing group, in which members of the group assume that a couple, usually heterosexual, will pair off and eventually bear a child who will save the group.

These are, for the most part, ridiculous assumptions, but they survive because no one questions them; generally no one even notices the assumptions are getting in the way of the group's work. It is the task of the psychologically aware leader to call attention to these unconscious dynamics, when they occur, without making a big a deal of it. In other words, knowledge of group psychology helps get the work of the group done; it is generally not an end in itself, except as a special field of study. Sometimes group psychology is simply practical.

A self-educated longshoreman, Eric Hoffer published *The True Believer: Thoughts on the Nature of Mass Movements* in 1951, when the memory of the Nazis was still fresh, and the influence of communism throughout the world was a frightening phenomenon. In the days after September 11, 2001, Hoffer's work has experienced something of a renaissance.

Seeking to explain the appeal of mass movements, Hoffer wrote that they attract not those who seek to bolster the self but those who seek to be rid of the burden of the self. For those who lack individual hope, mass movements provide a group substitute. Mass movements attract charismatic leaders, frequently of limited intelligence and originality. These leaders use the slime of frustrated souls as the mortar binding the bricks of a new world, an image Hoffer draws from the Book of Genesis.

Hardly an attractive picture of the true believer, it is surprising but important to note that Hoffer concludes that fanaticism and mass movements are the great invention of the Judeo-Christian tradition. Without fanaticism and mass movements, nothing truly new would be brought into the world; instead, the social world would slowly die of entropy. Dangerous to live with, fanaticism and mass movements would, in this sense, be even harder to live without.

May Fourth Movement

News that the Paris Peace Conference would not return the Shandong territories to China but instead transfer the German interests to Japan sparked student demonstrations in Peking on May 4, 1919. Although the march from Tiananmen Square was orderly when it began, the day ended with violence—Chinese foreign minister Cao Rulin's residence was sacked; the minister to Japan, Zhang Zongxiang, was beaten up; fighting broke out between students and police, resulting in one student death; and 32 students were arrested. In the days that followed, demonstrations, strikes, and boycotts spread throughout China. The demonstrators garnered widespread support, not only from students and intellectuals but also from industrialists, merchants, and workers. Disillusionment and anger with great power politics and leaders that betrayed the ideals of democracy and people's self-determination, which had been identified with the Allies' cause, compounded by the weakness and treachery of the Chinese government, which sold out the nation's interests for secret loans from Japan, awakened the people to a burning sense of crisis and an urgent need to "save China."

The May Fourth Movement began earlier in what was initially known as the New Culture Movement. In the aftermath of China's military defeat by Japan, and the humiliation of the 1915 Sino-Japanese Treaty based on Japan's notorious "twenty-one demands," designed to turn China into a Japanese colony in all but name, many Chinese believed that nothing short of a new culture was needed to save China. Thousands of Chinese students who had studied overseas in America, Europe, and Japan returned with new ideas, and numerous foreign publications were translated into Chinese,

feeding a movement to replace traditions blamed for China's weakness and problems and to usher in a new China, modern and strong. A well-known component of this movement was literary reform. Vernacular language, being much more accessible to the common people, was promoted; this resulted in improved communication between the educated and the general populace, which had a significant impact on the politics of subsequent years.

All kinds of Western political theories were also introduced to the Chinese during this period. Socialism and anarchism were introduced via Japan as well as France. French ideas, whether of democracy and liberalism, or nationalism and Marxism, were so influential that some refer to the May Fourth Movement as the Chinese "French Enlightenment"; others called it a "Chinese Enlightenment" or "Chinese renaissance." John Dewey's pragmatic social liberalism also gained considerable influence, as did Bertrand Russell's guild socialism during their visits at this time. Among the key players and those inspired by the movement were founding members of the Communist Party, such as Chen Duxiu, Li Dazhao, and Mao Tse-tung. Chinese interest in these political theories was far from academic; the Chinese were looking for solutions to urgent problems. Many issues that have subsequently preoccupied Chinese political theorists and intellectuals were inspired by the controversies and unresolved problems of the May Fourth Movement. Nationalist sentiments, which united people at the height of the movement, did not last but for the most part ended by 1921 with the eventual split between the liberals and the Communists.

Mazzini, Giuseppe (1805–1872)

Giuseppe Mazzini (1805–1872) was an Italian political activist and a nationalist theorist who is considered one of modern Italy's founding fathers. Born in Genoa, a port city of northwestern Italy, Mazzini earned a university degree in law, but showed more interest in literature, aesthetics, and politics. In 1830 he was arrested because of his affiliation to the patriotic secret society Carboneria. Choosing exile over imprisonment, he moved to Marseille in southern France, where he founded the political movement *Giovine Italia* (Young Italy) and its homonymous journal. The movement aimed at Italy's liberation and unification, in the form of a democratic republic. In 1834 Mazzini founded in Bern, Switzerland, the short-lived *Giovine Europa* (Young Europe), a republican alliance with German and Polish patriots. In 1837 he moved to London, where he made the headquarters of his political activities in favor of a unified Italy. Mazzini returned to Italy in 1848 and was among the leaders of the Roman republic of 1849. He returned there permanently only after the country's unification in 1861, while still fighting for the conquest of Rome, the future capital and one of Mazzini's most hailed political symbols. When Mazzini died in 1872, he was still living under an assumed name and in hiding as a dangerous republican wanted by the Italian police. Most of the political and military coups he had planned in the previous decades had ended in failure and bloodshed, and the Italian nation had been created as a monarchy and not as a republic. Nonetheless, Mazzini is still considered one of the major inspirations behind Italian political unity and the foremost leader of the democratic currents of the *Risorgimento* (the nineteenth-century movement for Italian national unification and independence).

Mazzini's political thought developed chiefly in contact with, and under the influence of, French currents, such as the moderate republicanism

stemming from the revolution of 1830; the Saint-Simonian doctrine (a Hegelian protosocialism that spread across France between 1828 and 1830 and was marked by contrasting ultrademocratic and reactionary traits that shaped profoundly Mazzini's religiosity); and elements of liberal Catholicism, particularly as articulated by Felicité de Lamennais. Other influences came from the political culture of exiles—particularly Polish exiles—living in France, such as the poet Adam Mickiewicz. Mazzini always remained an antisocialist, from his critique of Charles Fourier in 1836, to his later attacks—in the context of the First Socialist International Congress—on Karl Marx and his followers, and on the anarchist Mikhail Bakunin, both of whom he criticized for their materialism, internationalism, and atheism.

Mazzini's political vision was chiefly centered on the concept and ideal of the nation. He developed a form of nationalism that was universalistic and irenic, and thus he rejected political antagonism and xenophobia. Mazzini's understanding of nationalism—exposed in the founding documents of his movement and in writings such as *Foi et Avenir* (Faith and Future) of 1835—was based on the notion of nationality (in French: *nationalité;* in Italian: *nazionalità*), as representative of the national character and mission of each people, attributed by God, and the grounds by which every nation was obligated to fight and be unified. All nationalities needed to develop and affirm themselves harmoniously: They had to ally themselves to one another in the fight for their right to freedom and sovereignty. According to Mazzini's definition of 1835, nationality was a common thought, a common principle, a common aim, and the part that God assigned to a people; the mission it should accomplish on earth. This voluntaristic conception of the nation, echoing Jean-Jacques Rousseau's and French revolutionary and constitutional thought, was reinforced by the fact that Mazzini imagined the nation as necessarily republican and democratic. The mazzinean interpretation of the nation nourished a tradition of nationalist thought that would later include Woodrow Wilson's Fourteen Points of 1918 (affirming the right to sovereignty and self-determination of all nations) and would extend into Asian (especially Indian) and South American nationalist movements.

In 1846 and 1847 Mazzini published a series of articles in the *People's Journal,* under the common title *Thoughts Upon Democracy in Europe*. Here, the Italian patriot confronted the major social doctrines of his time, criticizing and distancing himself from Jeremy Bentham's utilitarianism, Charles Fourier's collectivism, and Louis Blanc's and Pierre-Joseph Proudhon's radicalism. He also distanced himself from the authoritarian elements of the Saint-Simonian doctrine, which nonetheless still partially shaped his political vision. In contrast to these thinkers, he proposed a tutelary conception of democracy (he considered democracy an educational problem), based on duties instead of rights and on a collective and spiritual aim for society and the people.

Mazzini's social thought was delineated most systematically in his booklet *Duties of Man,* published in 1860 on the basis of previous articles from the 1840s. This was a sort of decalogue in which Mazzini laid out his traditionalist and paternalistic conception of the lower classes. Enumerating the duties of workers toward God, the family, the fatherland, and humanity, he invoked the cooperation of capital and labor and condemned socialism and communism. Mazzini defended the right to private property and attacked collectivism, and he represented society as based on social harmony and subordination to authority.

Mazzini's thought, often unsystematic, was based more on the evocation of formulas and slogans than on clearly defined concepts. Partly for this reason, it would later be appropriated and instrumentalized in Italy by parties with different, even conflicting, political aims on both the right and the left, and particularly by the fascists and antifascists in the first decades of the twentieth century.

Mead, George Herbert (1863–1931)

George Herbert Mead (1863–1931) is regarded as one of the classical American philosophical pragmatists. He is known today primarily for his account of the social origins of reflective thought and the self, although his work has wider ramifications. It has been influential in social psychology, interactional sociology, and social philosophy, more generally.

Mead studied with Josiah Royce at Harvard, where he also became acquainted with William James. After incomplete doctoral work at Leipzig with Wilhelm Wundt, and further work in Berlin, he took a position at the University of Michigan with John Dewey and Charles H. Cooley. When Dewey left for the University of Chicago, Mead joined him, helping to create a strong group of philosophical pragmatists there. In Chicago Mead was also involved with Jane Addams's Hull House and other reform efforts.

Mead considered his approach to social psychology a form of "social behaviorism" but distinguished it from John Watson's behaviorism. Mead's approach viewed acts as developing over time, like Dewey, and utilized a tripartite theory of signs, like C. S. Peirce. In doing so, he was able to account for the development of higher mental processes rather than attempt to reduce or eliminate them or presuppose their prior existence.

The Conversation of Gestures and Social Meaning

The notion that an act unfolds over time suggests that its early phases serve as signs of forthcoming behavior to other organisms. Mead termed such preparatory acts serving as signals to others, such as changes in posture, gaze, or vocalization, *gestures,* following Wundt. As animals interact, they learn to respond to earlier and earlier signs of each other's coming actions. As a result, their interaction becomes something like a conversation of gestures, a mostly unconscious dance of feints, counter-feints, and counter-counter-feints. The overall drama that unfolds is the product of this process of responding in an anticipatory though largely unconscious fashion to the implicit meaning of one another's gestures.

Like Peirce, Mead argued that meaning involves a triadic relation between sign, interpreting response, and object signified, and not just a dyadic relation between sign and signified: "A gesture by one organism, the resultant of the social act in which the gesture is an early phase, and the response of another organism to the gesture, are the relata in a triple . . . and this threefold relationship constitutes the matrix within which meaning arises" (quoted in Strauss, 1956, p. 178). If a cocked arm leads another boxer to duck, the former is interpreted by the latter response as meaning a blow—an interpretation that may or may not be confirmed subsequently. This approach has the advantage of showing how meaning is "a development of something objectively there as a relation between certain phases of the social act" rather than something subjective located in the head (p. 178). It also allows meaning to change as interaction proceeds, so that an act may become, and come to mean, something different than initially anticipated.

Language, Mind, and Self

Mead treated speech as a specialized form of gesture, noting that vocal gestures are useful because, unlike facial gestures, they allow one to perceive one's own gestures as others do. Whereas most gestures have meaning only for another, some come to have the same meaning for an actor as they do for others in a social act. Mead termed these *significant symbols,* or elements of language.

Mead believed that reflective thought arises from learning to use significant symbols to respond to the meaning of one's own acts as others would. It is essentially a "conversation of gestures" that one has with oneself: "Thought . . . is only the importation of outer conversation, conversation of gestures with others, into the self in which the individual takes the role of others as well as his own role. He talks to himself" (quoted in Strauss, 1956, p. 42). Mead interprets the self in terms of this reflective social process applied to determining the

meaning of one's own attributes or behavior. This involves the same interaction between an active phase, the "I," and a passive or appreciative phase, the "me." Having a "self" is having the ability to carry on an inner dialogue between the "I" and the "me," thereby reaching conclusions about oneself as viewed by others. This doctrine has proven extremely congenial to those political theorists who seek to preserve the essential aspects of Hegel's theory of recognition while jettisoning its problematic metaphysical setting. A recent example of this sort of appropriation of Mead's ideas can be found in Axel Honneth's *The Struggle for Recognition.*

All of these social processes are learned by participating in social activities, first in simple play, such as alternating being chaser and chased; then in games involving stable rules, such as tag; and finally in more complex cooperative activities involving a common or public good (the attitude of the "generalized other"). Adult social behavior involves learning to respond from these first, second, and third person perspectives and harmonizing these perspectives.

Mind, Nature, and Emergent Evolution

The wider aim of Mead's philosophy was to develop an integrative approach to the relationship between mind and nature. Rather than regarding these as opposing things—one ideal, the other material—Mead sought to find "such a place for mind in nature that nature could appear in experience" (Mead, 1932, p. 161). In other words he sought a naturalistic account of the emergence of mind adequate to account for a scientific understanding of nature.

One key to this project was the adoption of the act as a biological unit of behavior in between the units of physics and those of the social sciences (Mead, 1938). Another was the notion of emergent evolution. According to Mead everything has "sociality," or the possibility of being different things at the same time. Which identity is actualized is a contingent matter that depends on situational specifics. As a result, evolution is continually being worked out rather than determined, with new objects and properties emerging within nature. When animals evolved, or humans with reflective intelligence, they changed nature itself, giving natural objects new properties, such as functioning as "food" or inspiring worship. The past itself is remade as people use an interpretation to create a different future to which it is a "past." Nature and history are continually evolving, and people are among the agents contributing to this evolution.

Mercantilism

Mercantilism was the predominant approach to theorizing political economy and designing economic policy in early modernity. The mercantilist period stretched roughly from the sixteenth century to the late eighteenth century, and Britain and France were arguably the dominant nation-states in the mercantile system. Mercantilism should not be understood as a wholly systematic theory of political economy; in fact, *mercantilism* and *mercantile system* were terms of art coined by political economists—most notably, Adam Smith—who were formulating critiques of the predominant ideas and policies of early modern European economic powers. Rather, mercantilism is better seen as a somewhat disparate set of policies and justifications for these policies that can be distilled into a set of core ideas, chief among them the belief that a nation-state's wealth or prosperity depends on its store of capital and that the best way to increase prosperity is by maintaining a favorable balance of trade. Although mercantilism declined in popularity toward the end of the eighteenth century, strains of its protectionist theories live on,

especially in contemporary debates regarding international trade.

Mercantile policies developed, for the most part, from mutually beneficial collaboration between the governments of larger trading states and their prominent merchant classes. Governments were largely interested in maintaining domestic employment and building a sizeable cache of gold and silver currency to support the standing, professional military forces that were increasingly seen as essential to the security of wealthy nation-states. To achieve these goals, governments imposed levies and taxes on classes of merchants and producers, who, in return, sought support for their business endeavors at home and abroad.

The partnership between the mercantile classes and central governments resulted in a number of protectionist policies, chief among them those aimed at maintaining a favorable balance of trade. Domestically, governments enacted policies that organized industries into guilds and established monopolies in both their local and colonial markets. They also promoted new industries by pouring in capital and waiving constraining guild rules and taxation. These policies were aimed primarily at increasing production and subsequent exports, largely of manufactured goods rather than raw materials. On the international side, mercantilist policies worked to limit the importation of manufactured goods by a number of means, including imposing tariffs on imports, setting quotas, and, in some cases, placing strict prohibitions on the importation of certain goods, namely those produced domestically. Other policies were designed to control the trade routes themselves; for example, England's seventeenth-century Navigation Acts barred foreign merchants from participation in England's domestic and colonial trade and routed all shipments to its colonies through England.

The primary end of all mercantilist policies was to ensure a favorable balance of trade for the nation-state in question. The conventional wisdom was that a nation's wealth could be measured in terms of its supply of bullion, so trade was considered profitable only if states were achieving a trade surplus and hence pulling in more hard currency for the national stockpile. Critics of mercantilism, most notably Adam Smith, attacked both the premise that bullion constituted wealth and the argument that a perpetual positive balance of trade was desirable or even possible. To be fair, by the time Adam Smith struck the definitive blow against these tenets in 1776's *The Wealth of Nations,* the mercantilists were already beginning to deemphasize the importance of bullion, if not their commitment to maintaining a positive balance of trade.

Smith's *The Wealth of Nations* remains the most trenchant critique of mercantilist policies and what Smith called the mercantilist spirit. Following the French physiocrats and his friend David Hume, Smith argued that wealth should not be equated with gold and silver, because the value of bullion, like that of other commodities, varies according to the laws of supply and demand. Smith's analysis of trade policy also supported the view that trade, when freely entered, should be a positive-sum enterprise for both parties, rather than a zero-sum game. Smith famously argued that nation-states were most likely to experience economic growth if they traded freely with others, as trade expanded the available market; allowed trading states to specialize in what they were best positioned to produce; and increased productivity for all participants. Smith argued that trade barriers and domestic monopolies were thereby imprudent and in fact hampered the prosperity of nation-states and their general populations, even though they might bring short-term economic benefits to particular interest groups. In that vein, he attacked the politics of the mercantile system, railing against the collusion between traders and governments to deceive the public about the best means of increasing national wealth.

The Wealth of Nations effectively sounded the death knell of the mercantile system, which some scholars argue was already in decline before Smith published his incisive critique. By the mid-nineteenth century, most of the policies of the mercantile period were effectively overturned. It is worth noting, however, that vestiges of mercantilism persist in present-day debates about international trade. Even as that trade brings economic benefits overall, it still damages particular domestic industries and sectors of the population. Contemporary debates about when and why to intervene in international trade still reflect the concerns and questions that animated the theory and practice of international political economy during the mercantile period.

METAPOLITICS

Metapolitics designates, either positively or negatively, a particular relation between politics and the thinking of politics, that is, between historical instances of politics, governance, and policy making, on one hand, and categories of theory, intellectual history, or philosophy, on the other. It is the name for an encounter, or missed encounter as the case may be, between action and thought, even while its most recent usage is meant precisely to cancel out all traditional oppositions between practice and theory, between history and conceptuality, or between the real and the speculative. In the ideological realm, the invocation of metapolitics over the past 200 years has covered the full spectrum of possibilities, from the liberal Enlightenment to antirevolutionary Catholicism and from a neo-pagan New Right to the proposal for a reinvention of communism. This vacillation is partly due to the fact that the term is used both as a programmatic self-description and as the name for a position pejoratively ascribed to others.

Among German liberal thinkers such as Gottlieb Hufeland, August Ludwig von Schlözer, and Carl von Rotteck, credited with having coined the term, metapolitics refers, first, to the theoretical study of the principles of right derived from the state of nature and, then, to the theory of the state as such, independent both of politics in the narrow empirical sense and of statistics as the history and theory of constitutional right. In this sense, the term *metapolitics* acquires the meaning of a metaphysical study into the principles of politics, its fundamental grounds, and its ultimate ends. This is also how Joseph de Maistre, albeit from the opposite end of the ideological spectrum, introduced the expression into French. Metapolitics would thus be to politics what metaphysics is to physics, or, put differently, it amounts to a metaphysics of politics. De Maistre's antiliberal perspective, in which politics is a matter of transcendent if not God-given values, dominated the history of metapolitics until the close of the twentieth century. The religious and more properly messianic dimension, on the other hand, is best expressed in the work of the Polish philosopher and mathematician Józef Maria Hoëné-Wroński, who saw metapolitics as a union of religion and philosophy.

Metapolitics, in this first broad sense, is the study of the ultimate founding ideas, myths, and values behind all concrete forms of political practice. It signals both a movement by which political science becomes increasingly self-reflexive and the possibility of rooting the empirical and mundane in transcendent or transcendental—frequently divine or eschatological—principles. As such, the term frequently acquires a pejorative connotation, for example, in Peter Viereck's study into the dark cultural and spiritual roots of Nazism.

Beginning in 1930, the term has also been adopted as the program title for an eschatological regrounding of modern politics, especially in the work of the Italian philosopher Silvano Panunzio and his student Primo Siena, now residing in Chile. They seek to restitute the sacred roots, mythic symbols, and eschatological values to a disenchanted and secularized modern world. Metapolitics, combining a "sacred science" (metaphysics), a "profane science" (politics), and a "prophetic and regal science" (eschatology), would thus be opposed to the dominant "crypto-politics" of capitalist multinational corporations, media conglomerates, and drug cartels. The ultimate goal of this struggle, symbolized in the opposition between the Eagle and the Serpent, is the return to a transcendent linkage between politics and Christianity. Other figures who continue in this same vein include Attilio Meliadò and Giovanni D'Aloe.

In 1968, with an international seminar titled "What Is Metapolitics?" organized by the conservative think tank GRÉCE (*Groupement de Recherche et d'Étude pour la Civilization Européenne*), metapolitics became an official

watchword of the European New Right, led by the French writer Alain de Benoist. Paradoxically borrowing many insights from the New Left, most notably the Gramscian idea of "cultural war" and the struggle for "hegemony," de Benoist and his followers in Belgium (Louis Pauwels, Robert Steuckers), the United Kingdom (Michael Walker), Germany (Pierre Krebs), Italy (Marco Tarchi, Carlo Gambescia), and Russia (Alexander Dugin, Eduard Limonov) give primacy to the struggle for cultural power over and above any concrete policy making, or politics as usual. Part of this struggle involves a will to return to the Indo-European roots and the so-called originary values of Europe, as opposed to the false universality of Christian-American hegemony.

Especially in Italy, following the example of Benedetto Croce's study of liberty, metapolitics becomes more value neutral as a near synonym for the conceptual history of ideas in political science and philosophy. For Giacomo Marramao, a metapolitical study of the antinomy of system and action that continues to undergird the theory of new social movements may thus help us overcome the reign of postpolitics, without having to reach back for a metaphysics of politics or prophetically announcing a superpolitics. This understanding of metapolitics is indebted to the work of Manfred Riedel who, in his *Metaphysik und Metapolitik,* likewise argues for the semantic analysis of the concepts of the political, without relying on a doctrine of metaphysical foundations.

The Argentine philosopher Alberto Buela, who otherwise is close in spirit to Panunzio, Siena, and Alain de Benoist's New Right, has tried to separate his own understanding of metapolitics from both its metaphysical underpinnings and its messianic expectations. Following the Greek, *ta meta politika,* he defines metapolitics as the mixed discipline, being both political and philosophical, that goes beyond politics and seeks to ground it in its ultimate raison d'être, that is, "the nonpolitical ground of politics."

For Jacques Rancière, metapolitics is one of the three main figures of political philosophy, or what he calls "the politics of philosophers," the other two being archipolitics and parapolitics. All three serve to obscure, displace, or deny the operations of politics proper. Metapolitics, which Rancière associates with Marx, does so by submitting real political practices to a double verdict, either of being mere appearances that hide the truth of the underlying social class struggle or else of falling short of the realization of a genuine politics in which society would reach its fulfillment and its end.

Alain Badiou's recent proposal in *Metapolitics,* finally, is diametrically opposed to all extant definitions of this notion. For him, metapolitics can become the exact opposite of a political philosophy bent on defining the political or even the nonpolitical ground of politics, provided we accept that politics, as a truth procedure or militant form of emancipatory practice, is already in itself a mode of thinking. Ironically, although Badiou and Rancière share a similar understanding of the operations of emancipatory politics as egalitarian and universalist, the latter thus sees metapolitics as an obstacle that covers up the play of liberty and equality inherent in such politics, which the former with the same concept—despite the fact that its history is steeped in right-wing ideology—proposes to think through and set free.

Methodological Individualism

Methodological individualism is a doctrine in the philosophy of the social sciences about the relationship between society and individuals. The idea can be formulated in several related but somewhat different ways: Social facts are constituted by facts about individuals; social entities are composed of individuals and their properties and relations; social structures and entities are nothing but ensembles of individuals and their behaviors; social explanations must be derivable from facts about individuals; scientific statements about society must be reducible to statements about individuals and their properties and relations; social laws or generalizations must be derivable from general facts about individuals. There may be other possible formulations as well.

The idea of methodological individualism is one that has appealed to philosophers and social thinkers for almost as long as there has been systematic thinking about social science. Modern philosophy of social science began in the nineteenth century, and John Stuart Mill's theories of social knowledge contained the assumption of methodological individualism. In *A System of Logic* Mill argued that social phenomena are nothing but the aggregate result of the actions and dispositions of individuals; so the foundation of the social sciences should be found in the laws of psychology. A classic twentieth-century statement of the doctrine was presented by J. W. N. Watkins, who argued that the most fundamental explanations of social phenomena must be derived from facts about the beliefs, goals, and constraints of individuals. Max Weber also assumed the doctrine, particularly in the context of his definition of the object of sociology as social action carried out by individuals.

In recent years, methodological individualism has had a rebirth of interest among philosophers. The thesis can be formulated as a statement about explanation, as a thesis about social ontology, or as a statement about intertheoretic reduction. The explanatory version, as stated by Daniel Steel, holds that it is possible and desirable to explain social outcomes exclusively in terms of the actions and behaviors of individuals. James Woodward's fundamental idea is that one explanation is more fundamental than another if it is invariant with respect to a wider range of interventions. The ontological version, as stated by Daniel Little, maintains that social entities and their properties are constituted by individuals and their actions; social entities have no independent existence. The intertheoretic version, as stated by Julie Zahle, holds that it is possible to reduce theories containing social properties to theories containing only properties of individuals.

Methodological individualism is the limited version of a family of perspectives on social explanation that we might refer to as "agent-centered" approaches to social explanation. Here the general idea is that we explain social outcomes as an aggregate result of the actions, choices, and mentalities of individuals. Individuals' behavior and choice constitute the causal dynamics of social outcomes. A special case of the agent-centered approach is the field of rational choice theory: the view that social outcomes can be explained as the aggregate effect of the individually rational actions of a set of actors. But agent-centered approaches can give more "social-ness" to the individual than the founding statements of methodological individualism would permit. For example, the position

of methodological localism, as formulated by Little, identifies socially constituted and socially situated individuals as the foundation of social explanation, but explicitly denies the idea that all social facts are reducible to bare psychological facts about individuals. Rather, individuals are themselves constituted and constrained by previously established social conditions. A recent strategy—expounded by both Jon Elster and Little—in approaching the issue of the relationship between social facts and individual facts is to postulate that social-level statements and causal judgments need to be provided with *microfoundations,* that is, descriptions of the pathways through which socially situated individuals are led to act in such a way as to bring about the macro-level fact.

The logical contrary of methodological individualism is the idea of social holism, most explicitly advocated by Émile Durkheim. Holism is a form of antireductionism. Antireductionists maintain that there are facts about the social world that do not reduce to facts about individuals. Society is autonomous with respect to the individuals who "make it up." There are social forces (e.g., systems of norms) that exercise causal power over individuals rather than norms being constituted by the psychological states of individuals. Other varieties of social holism are possible as well. Structuralism is the view that social structures exercise autonomous causal properties—for example, linguistic systems, kinship systems, or modes of production.

It is important to highlight some points that methodological individualism does *not* entail. methodological individualism does not entail that individuals are egoists or purely self-regarding. It does not entail that individuals are not social. It does not entail that social facts do not have causal consequences—for other social facts and for individual behavior. It is indeed possible to reframe almost all substantive sociological theory in terms that are consistent with the reasonable conditions implied by methodological individualism. Even Durkheim's central theories can be formulated in a way that is innocent with respect to the charge of "action at a distance." And, from the other direction, even a theorist with as clear a commitment to methodological individualism as Max Weber, is still able to make macro or holistic claims about the causal importance of factors such as religion or morality.

Considerations

Arguments in favor of methodological individualism derive from several valid observations. First, there is the point that social facts are evidently constituted by the thoughts and behaviors of groups of individuals. Social movements are composed of individuals with specific psychologies and beliefs; organizations are composed of individuals in concrete relationships with each other; and, arguably, moralities and cultures are made up of individuals with specific beliefs and values. Second, there is the point that social "laws" are rare, exception-laden, and conditional; so there is a methodological reason to look for the more basic laws that may regulate social behavior—at the level of individuals and their psychology. Third, there is a preference for ontological parsimony: If we can explain social facts in terms of facts about individuals, then we do not need to attribute ontological status to social facts and entities. Fourth, there is a concern about obscurantism that is appealing to many philosophers; the idea that social facts might be autonomous with respect to individuals gives an impression of occult causal powers or action at a distance. So there is a range of reasons to think that social outcomes are made up of or determined by the aggregate results of individuals and their interactions.

Are there any arguments in support of holism? There are. First is a very reasonable point deriving from pragmatic objections to reductionism. If we know on ontological grounds that the behavior of the whole depends upon the features and behavior of the constituent parts and nothing else (the heart of the theory of supervenience, discussed later in this entry), but we also know that it is entirely hopeless to attempt to calculate the one based on facts about the other, then perhaps it is justified to consider the whole as if it embodied causal processes at the macro-level. So there is a pragmatic argument available that recommends the autonomy of social facts based on the infeasibility of derivability.

Second is the plausibility of the idea that there are large historical or social forces that, for all intents and purposes, are beyond the control of any of the individuals whom they influence. The fact that a given population exists as a language community of German speakers or Yoruba speakers has an effect on every child born into that

population. The child's brain is shaped by this social reality, quite independently from facts about the child's agency or individuality. The grammar of the local language is an autonomous social fact in this context, even though it is a fact that is embodied in the particular brains and behaviors of the countless individuals who constitute this community. But this is probably similarly true when we turn to systems of attitudes, norms, or cognitive systems of thinking.

It is obvious but perhaps trivial to observe that the vector of influence flows through individuals who possess the grammar, norms, or folk beliefs—this is the ontological reality captured by the methodological individualism thesis. But perhaps a point in favor of a modest holism is that the fact of the commonality of Yoruba grammar can be viewed *as if* it were an autonomous fact, even though we know it depends on the existence of Yoruba speakers. The point of the holism thesis is that the social fact of the current grammar is coercive with respect to current Nigerian children in specific communities, and, perhaps, likewise with respect to other aspects of social cognition and norms. And this takes us some distance toward Durkheim's central view: the autonomy of social facts.

Advocates for a modest social holism might maintain two plausible positions: (1) that all social facts are embodied in the states of mind and behavior of individuals but (2) that some social facts (institutions, social practices, systems of rules) have explanatory autonomy independent from any knowledge about the particular ways in which these facts are embodied in individuals. The first is an ontological point, and the second is a point about explanation. In other words, we are not forced to choose between agent and structure; rather, agents influence structures and structures influence agents.

Reductionism

The doctrine of methodological individualism sometimes represents a form of reductionism from one area of scientific theory to another. Reducibility means that the statements of one scientific discipline should be logically deducible from the truths of some other, more fundamental discipline. Thus it is sometimes maintained that the truths of chemistry ought in principle be derivable from those of quantum mechanics. Mental states must be reducible to a set of facts about neurophysiology; statements about living organisms must be reducible to a set of facts about the molecular chemistry and physiology of cells. A field of knowledge that is not reducible to another field R is said to be autonomous with respect to R. Advocates of the reductionist version of methodological individualism, then, maintain that theories about social entities and properties must be reducible to theories and statements about individuals and their properties.

A somewhat less restrictive view than reductionism is the theory, as explicated by Jaegwon Kim, of supervenience between levels of scientific description. According to the theory of supervenience, facts at one level of description are fixed or determined by facts at a lower level of description. To say that X supervenes upon Y is to say that there is no difference between states of affairs concerning X for which there is not also a difference in states of affairs concerning Y. This is a less restrictive doctrine because it does not require derivations of the facts of X from facts of Y. The theory is first applied to mental states and states of neurophysiology: There can be no differences in mental states without some difference in neurophysiology states. Supervenience theory implies an answer to the question of whether one set of facts "fixes in principle" the second set of facts.

This provides the beginnings of an answer to one of the fundamental issues raised by methodological individualism: If we believe that social facts supervene upon facts about individuals, then we are forced to accept that the totality of facts about individuals fixes the facts about society. However, supervenience does not imply reducibility in principle, let alone reducibility in practice between levels.

In short, for a variety of reasons it is reasonable to take the view that social facts supervene upon facts about individuals, but that social explanations are autonomous from laws of psychology. At the same time, the requirement that social explanations require microfoundations appears to be a reasonable one: We need to know what it is about the circumstances and motives of individuals such that their ordinary socially situated choices and behavior result in the social

processes and causal connections that we observe. And in field after field it is possible to demonstrate that it is possible to provide such microfoundations.

These arguments suggest two things. First, holism and individualism are not so sharply opposed as perhaps they appear. But more important, two styles of social explanation are validated and compatible: the compositional or aggregative model of explanation—explain the outcome as the aggregative consequence of the behavior of large numbers of individuals—and constraining or filtering explanations—the structuring of individual behavior that is created by the workings of social institutions. The first model of explanation corresponds well to the assumptions of methodological individualism, whereas the second corresponds to the idea that structures and large social factors cause patterns of individual behavior. Neither has antecedent priority over the other.

MICROPOLITICS

According to the idea of micropolitics, to understand the political sphere it is not enough to study the behavior of large-scale political formations such as the state or the nation, nor is it enough to start from the apparently essential structure and interests of the political individual. To understand politics, we must also attend to the political character of the everyday and see how the texture of day-to-day life produces particular political subjects, with particular patterns of beliefs, habits, affects, desires, and perceptions. Political subjects are formed not just by the state, or the economy, but also by micro-level formations, such as pop culture artifacts, or the organization of the household, as well as the specific and unpredictable interactions between them.

As an explicit concept, micropolitics was developed primarily by Gilles Deleuze and Félix Guattari in their text *A Thousand Plateaus*. However, micropolitics is also deeply influenced by the work of Michel Foucault (who frequently invoked "micromechanisms of power"), as well as the microsociology of Gabriel Tarde.

Micropolitics and the Political Subject

Whereas many forms of political theory take political subjects and their interests as pregiven and then seek to describe their interactions, micropolitical analysis looks at the various social, political, cultural and economic forces that function to produce particular types of political subjectivities. An example of this is Foucault's work on disciplinary spaces, in which he investigates how the specific ordering of bodies in prisons or schools serves to produce certain forms of subjectivity and agency. A micropolitical approach will reorient a research agenda away from the large-scale mechanisms of control and organization and toward those forces operating at the personal and prepersonal level to produce certain patterns of habits, behaviors, perceptions, interests, beliefs, and desires. For example, in Deleuze and Guattari's account of fascism, they argue that the fascist state cannot be explained solely by its macropolitical order of authoritarian control (as there are many authoritarian states that are not fascist). To truly explain fascism one has to look to the micropolitical level, to see the way in which a fascist subject is produced which accepts, and even desires, repression.

However, it is important that we not develop too functionalist an understanding of micropolitics. Micropolitics is not simply the act of producing and organizing subjects in ways that maintain entrenched power structures. If we understand micropolitical power solely as organized by, or even originating from, macropolitical centers (such as the state or the capitalist economy), then we have missed the point entirely. Though macropolitical imperatives such as state or economic necessity are not absent, local formations (the organization of the neighborhood, the household, the office) are just as likely to play a key role in the constitution of political subjects. Micropolitics involves a vast and complex web of forces, too diffuse to be rooted in any centralized organizations and deeply responsive to the particularities of local situations. Sometimes this web of micropolitical flows conjugates in ways that shore up large-scale structures of administration and organization. Other times they connect in such as way as to produce what Deleuze and Guattari call "lines of flight," which leak out around the large-scale aggregations and power centers of macropolitical formations. In this regard, micropolitics is as much a theory of how macropolitical formations hang together as how they fall apart.

Collective Identity

From the perspective of micropolitics, most forms of political analysis simply assume what is to be explained: namely, how it is that countless diverse individuals can come together to act in an orderly manner and think of themselves as bearing some form of collective identity. Where a macropolitics perspective accounts for identity in terms of large aggregations, a micropolitics view studies a field of infinitely varied individuals, who can sometimes come to circulate around certain forms of collective identity. For example, where some forms of macropolitical analysis see the binary duality of *classes* (bourgeoisie/proletariat) held together by inherent connections of economic interests, micropolitical analysis instead see a complex and varied *mass*. This mass contains butchers, bakers, and candlestick makers (as well as artists, the unemployed, intellectuals), each of whom has multiple ways of conceiving of their economic interests (immediate interests versus aspirational interests), as well as multiple forms of noneconomic interests (familial, national, religious). This *mass* of individuals (each a mass of possible interests and identifications) will only crystallize into the unitary identity of *class* if specific micropolitical processes are present: processes of subjectivity formation that will highlight some forms of interest over others; deployment of affective attachments and identifications that might have their source in religious or nationalistic drives. These macropolitical aggregates will be held together by a shifting multiplicity of different micropolitical forces. At times this broad segmentation into classes will remain stable. But the masses of individuals underneath will continue to flow and shift, occasionally leaking out and around these identities, potentially connecting in unexpected ways to produce new, unanticipated identities.

Micropolitics and Scope

It should also be noted that what makes micropolitics "micro" is not the scope of its effects, but the singularity or locality of the web of forces that produce those effects. Micropolitical effects can be

conterminous with the entire social field. Take the question of the economic sphere. To explain the functioning of the economy, researchers must of course take into consideration the actions and decisions of macropolitical actors such as states, central banks, and corporations. However, we must also consider the vast and complex movements of the stock market: flows of capital that are driven by countless decisions made at the level of the individual, each produced by a singular and local convergence of micropolitical forces of desire, fear, belief, and attraction (rooted in everything from a sense of familial responsibility to the fever pitch of business reporting on the news). The confluence of these individual decisions (themselves rooted in preindividual forces) will produce systemwide effects—the surges, panics, booms, and busts—which will determine economic possibility.

Mill, John Stuart (1806–1873)

John Stuart Mill was a major philosopher who made contributions to many areas of philosophy, including moral and political theory. He was the eldest son of James Mill, who held a senior administrative position in the East India Company, which looked after the affairs of British India. James Mill was a close friend and disciple of Jeremy Bentham, the founder of the doctrine of utilitarianism. According to utilitarianism, the rightness of an act depends on whether, among all the available alternatives, it maximizes the happiness of those affected by it. Utilitarians take into account the various dimensions of happiness, such as its intensity, duration, and the number of people affected.

John Stuart Mill was educated at home by his father, who subjected the young Mill to an intense and wide learning process. Mill made remarkable achievements at an early age. He was appointed to a position in the East India Company, where he worked for 35 years, rising to the top position of examiner. He found time to write many of his works while he was in the service of the company. His recovery from a mental breakdown at age 20 led him to develop new interests and to be open to new influences. He developed a close but platonic friendship with Harriet Taylor, the wife of a merchant. Two years after the death of Harriet's husband, Mill and Harriet were married. They were dogged by bad health, and about 7 years later, Harriet died. Mill continued to write prolifically. He was elected to the House of Commons and served for one term. He unsuccessfully tried to pass a motion giving women the vote. The enfranchisement of women was a cause very close to both Mill's and Harriet's hearts. Mill died in Avignon, France, where he and his stepdaughter, Helen Taylor, had spent much time close to the grave of Harriet. He was buried there next to Harriet.

Liberty

The love of liberty, anxiety about its current state, and fear for its future dominated Mill's political theory. For him, a free and tolerant society was essential for people to realize their individualities and to attain what he called "the dignity of thinking beings." The essay *On Liberty,* published in 1859, is rightly considered to be his major work in political theory. He warns against the "tyranny of the majority" in a democracy. The tyranny would find expression in oppressive laws and organized public opinion. The majority, with a uniform set of values and preferences, would be intolerant of conduct that they disliked or disapproved of. Mill argues that coercive interference with the conduct of individuals is never justified for a moralistic

reason, that such conduct violates what the majority regards as the correct moral standards, or for a paternalistic reason, that interference promotes the individual's own good. The only proper basis for interference is to prevent harm to others without their consent, although Mill also seems to allow for interference with acts that are public offensive nuisances, such as perhaps public sexual intercourse, that do not harm others in any ordinary sense. However, his remarks on such publicly offensive acts are passing, and he does not think that they bear on the central issue of liberty. Although he would certainly reject mere offense as a basis for interference, there is an important issue, which he does not discuss, as to when public offensive acts, which unavoidably intrude on people's daily activities, may be interfered with.
