Preface

This handbook aims to give a broad overview of the philosophical traditions, concepts, and ideas which business ethics is rooted in.

As a research field, business ethics is not always regarded as being part of philosophy, but can be located within different institutional and disciplinary contexts, like economics, management, theology, psychology, social sciences, and – philosophy. This is not an accidental phenomenon, but rather reflects the complex history many ideas in business ethics have undergone – before the separation of disciplines from philosophy. Originally, most of the relevant philosophical ideas and concepts (like justice or virtues) were inseparably intertwined with considerations of – what would later be called – economic, psychological, or business nature. Many of the great thinkers in philosophy have contributed to the philosophical foundations of business ethics in this manner, such as Aristotle, Confucius, David Hume, Adam Smith, or Amartya Sen, to name but a few. All of them are covered extensively in the *Handbook of the Philosophical Foundations of Business Ethics*, which, therefore, can also be seen as an attempt to revive the old connections between philosophy and its neighbors.

The historical dimension is complemented here with a systematic one, which focuses on issues like human rights, property rights, gender, or free markets. In many cases, the contributions aim at not only presenting a concept but also reinterpreting it. This makes it inevitable for the authors to take sides. For a handbook which covers a strongly normative discipline, this is not a bad thing; in fact, this is what pluralistic discourse is all about: Controversy ensures the discipline stays alive.

And controversy is to be found here in many respects. In fact, it will be almost impossible for anyone to subscribe to all views presented here at the same time – or only at the high risk of contradicting oneself internally. This handbook is not just a collection of “objective” facts, but first and foremost – as I hope – *thought-provoking*.

Provoking thoughts is, however, not something seen as a *l'art pour l'art* enterprise: Rather, the challenge lies in bringing together ethical intuitions and functional requirements of modern market economies. This requires the cooperation of all the disciplines mentioned above.

Throughout the course of this handbook, it should become clear that controversy in business ethics exhibits qualities quite similar to controversy in other disciplines. And what is shown in particular: Normative questions can be taken on in a systematic, methodological, and, indeed, scientific way.

Aristotelian Foundations of Business Ethics

Aristotelian Business Ethics: Core Concepts and Theoretical Foundations

1

George Bragues

Abstract

This chapter offers an introductory overview of the key ideas and concerns of an Aristotelian business ethics. Based on a close reading of the Greek philosopher's writings, we point out that an Aristotelian business ethics is fundamentally oriented around the quest for happiness or human flourishing. Behaving morally in business is about acting in ways that conduce to one's authentic well-being. Using a dialectical mode of analysis involving the examination of prevailing opinions, Aristotle concludes that happiness consists of activity in accord with reason, a life devoted to the practice of the moral and intellectual virtues. As such, the pursuit of wealth characteristic of business life is properly limited to what is necessary to materially support those virtues. Aristotle suggests, too, that the virtues relevant to commerce require a supportive political framework. The peak expression of virtue attainable in business involves the undertaking of leadership roles.

Introduction

Proponents of virtue theory often preface their discussions by noting, if not lamenting, the dominance of utilitarianism and Kantian deontology in contemporary moral philosophy. Though there is an almost ritual-like quality to this observation, it does not make it any less true. Yet it is surely the case as well that the field of moral philosophy has witnessed a revival of what is, after all, the oldest tradition of ethical thinking. Philippa Foot [1], G.E.M. Anscombe [2], Bernard Mayo [3], and Alasdair Macintyre [4] are among the best-known figures of this movement. A corroboration of its success can be obtained by typing in the phrase,

“virtue theory” at Google’s Ngrams, a database referencing the more than 15 million published books that have been digitized so far by the search engine firm [5]. After being virtually absent for most of the twentieth century, the percentage of instances that “virtue theory” has been written began to steadily rise in the 1980s, a trend that accelerated in the 1990s (Google Ngrams is only searchable until 2000). Simply inputting the term, “virtue,” shows an analogous and more revealing pattern. After declining in use throughout the entirety of the nineteenth and most of the twentieth centuries, the occurrence of “virtue” stabilized in the 1980s and started to recover in the 1990s.

Within the branch of moral philosophy known as business ethics, the return of virtue theory has certainly made itself felt. The leading light of this cause has definitely been Robert Solomon [6]. Other contributions have included Edwin Hartman [7], James O’Toole [8], George Bragues [9], Geoff Moore [10], and Deirdre McCloskey [11], in addition to Samuel Gregg and James Stoner [12]. Beneath the diversity of purposes and methods in these efforts to bring the language of virtue into business, a common thread is at work. All parties agree, whether implicitly or explicitly, that Aristotle somehow still matters more than just being a seminal figure in intellectual history, that despite approximately two-and-a-half millennia having passed since he wrote, during which the martial and agricultural societies of his time have given way to an industrial and commercial civilization, his thinking continues to be relevant in grappling with the moral challenges posed by modern business life. After all, the idea that figuring out what one ought to do is primarily a matter of determining what kind of person one should strive to be – the fundamental claim of virtue theory – ultimately goes back to the fourth century BC Greek philosopher. It is true that Plato and Socrates before him discussed ethics in terms of the virtues, as did the ancient Greek poets and dramatists. In the *Nicomachean Ethics*, however, Aristotle took something that had been somewhat loosely, if pleasingly, addressed within narratives and dialogues and gave it systematic expression. To rephrase Alfred North Whitehead’s famous statement about Plato and subsequent philosophy, all virtue theory is a series of footnotes to Aristotle.

In this, the introductory chapter to the Aristotle section of the handbook, we will focus closely on the *Nicomachean Ethics* [13] with a view to articulating the theoretical foundations and core concepts of the Aristotelian approach to business ethics. Other works in Aristotle’s corpus, *The Politics* [14, 15] chief among them, will also be consulted when necessary to shed light upon issues arising in his major ethical work. Our account will start by describing the primacy of personal happiness, or human flourishing, as the goal by which proper conduct in the business world should be defined. Afterward, Aristotle’s epistemological method of ascertaining the ways to reach this goal, namely the dialectical method, is outlined. Then, we summarize Aristotle’s conception of the virtues and the good life as well as the institutions necessary to support these in the political-economic framework. All the while, we will preview a number of the key topics and controversies explored in the proceeding chapters of this section.

The Telos of Happiness

It is well known that Aristotle is a teleological thinker in that he believes all beings in the universe, the human species included, act for a purpose. This feature of Aristotle's thought manifests itself right from the start of the *Nicomachean Ethics* where he raises the question of humanity's end or *telos*. How does Aristotle manage to answer this seemingly inscrutable question? He notes the elementary fact that all human activities aim at some good (1094a1-25) [13]. A sick person goes to the doctor to seek health; a general planning a battle aims to secure victory over the enemy. Every action, in other words, involves the deployment of means calculated to attain a certain end. Since the means are only valued to the extent that it potentially realizes the end desired, it follows that the latter is a higher good than the former. We only appreciate heart surgery insofar as it holds out the prospect of saving our life. Were we able to restore the well-being of our hearts without having to resort to such an invasive procedure, the prospect of having our chests cut open would strike us as crazy. At the same time, for almost every end an individual may happen to go after, the question can legitimately be raised to them as to why they are pursuing it. Asked why they are pursuing victory, a general will answer that it is for the good of the nation. In this way, the end of a given action comes to sight as the means to another end. And given the relative valuation of means versus ends, this newly disclosed goal must be higher than the more proximate one.

Now one may continue with this interrogation of action objectives, thereby revealing each end to be a means to a yet higher end, but this cannot go on *ad infinitum*. Otherwise, as Aristotle points out, human conduct would ultimately be purposeless and ineffectual, as life would turn into an unrelenting execution of means toward a goal that is always just around the corner. Eventually, the point is reached where a purpose is apprehended that is desirable for its own sake. This is the highest good. Insofar as ethics concerns that which rightfully claims the greatest allegiance of the will, the *summum bonum*, as the Latin writers would subsequently call the highest good, must ground all our reasoning about the nature of a morally commendable life. According to Aristotle, this basis is nothing other than happiness (1095a5-20) [13]. If, for example, a person seeking medical assistance is asked why they desire health, the response might well be that they want to function optimally in their everyday affairs. Asked again why they want to do that, they might say they want to be able to go to work and earn money. Pressed yet again why they want money, the reply is apt to be that it conduces to their happiness. Once this is stated, it is pointless to probe further because happiness is intrinsically desirable. Nobody can long wonder why they want to be happy. We just do. From the Aristotelian standpoint, business ethics must be oriented around this basic fact.

Such a position invites a number of criticisms. One is that Aristotle seems to take a monist stance about human fulfillment, not recognizing that a plurality of incommensurable goods exist that people value [16]. A second objection is that Aristotle commits the naturalistic fallacy in deriving ought from is. That people ought to aim for happiness is inferred from the fact that they do ultimately seek it. So too, an

existentialist, convinced of the meaninglessness of the universe, is apt to reject the notion that the logic of human action points to a *telos* serving as an objective guide for our decision making. How can one be so serene in failing to comprehend that human striving is vain and absurd, that our predicament is equivalent to that of the mythical Sisyphus repeatedly trying to lift a huge rock up a hill only to see it roll back down just before reaching the top? [17] Then there is the charge that Aristotle's moral teaching is egoistic in establishing happiness as the lodestar, for, after all, that is a mental state belonging to individuals. On this view, Aristotle misses the point that morality is not so much about the condition of the self as it is about that self's regard for others, such as family, friends, neighbors, colleagues, and, more importantly, the larger society, if not humanity as a whole. For business ethicists, this is a potentially damning judgment, since their field of study is very much dedicated to challenging the thesis, often advanced in popular defenses of capitalism, according to which self-interest can be relied upon in the economic sphere to further the public interest.

Let's begin addressing these points with Aristotle's apparent monism about the good. It must be remembered that he is using that term, the good, as a general concept that is admittedly in need of concretization. Evidencing this is Aristotle's subsequent evaluation of the relative merits of pleasure, wealth, honor, friendship, moral conduct, and intellectual contemplation as potential constituents of a truly fulfilled life (1095a20-1096a11) [13]. Aristotle's vision of such a life, as we shall see, comprehends each and every one of these as goods worth possessing and cultivating. While acknowledging the potential tensions between them, particularly between the acquisition of wealth and the practice of virtue, he insists that each of the specific goods can be accorded its due place and proportion so as to be harmoniously manifested in the character of a morally estimable person. There is a diversity of objects worth valuing, but they can be rendered commensurable by delineating their respective contributions to human happiness.

Regarding the accusation of a naturalistic fallacy, it would be to misconstrue Aristotle's position to say he is endeavoring to infer ought from is. Ought, after all, implies can. Declaring a person ought to engage in a particular behavior supposes the possibility of having two or more alternative courses of action about which one can deliberate and be held accountable for the decision ultimately taken. As Aristotle says, deliberation is limited to those matters within a person's capacity to influence. It is, "about the things which he can do by himself" (1112a35) [13]. No one, for instance, considers whether or not to obey the laws of gravity. Since that is dictated by natural necessity, the notion that one ought to respect those laws makes no sense. The same reasoning applies to the quest for happiness. It structures human activity such that all our deliberations are willy-nilly directed toward it. Aristotle's greatest student, St. Thomas Aquinas, nicely clarified this point in designating the imperative to seek the good as a foundational premise of practical reasoning, just as the logical laws of identity and noncontradiction ground theoretical reasoning [18]. Similar to the logical laws, the validity of the proposition that humans pursue their well-being does not depend on another premise. One can know it to be true by merely intuiting it (1140b31-1141a8) [13], in this case by reflecting

upon the nature of human choice. The upshot of all this is that whether an individual ought to do X, rather than Y or Z, properly applies to the means of realizing human fulfillment as opposed to that end itself. Instead of being derived from is, the ought is found to be imbedded in the decision-making context of human affairs.

Given the individualist tenor of our age, and the postmodernist tendencies in our culture, Aristotle's contention that a discoverable purpose exists that is relevant to all human beings irrespective of time and place will strike many people today as the most questionable part of his ethics. Even before the existentialists came along to voice this criticism in angst-ridden tones, leading Enlightenment thinkers sought to displace the kind of teleological ethic that Aristotle champions with a moral system that dispensed with the supposition of a human telos. In the *Leviathan*, Thomas Hobbes insisted, "there is no such *Finis Ultimus* (ultimate aim) . . . nor *Summum Bonum* (greatest good) as is spoken of in the Books of the old Moral Philosophers" [19]. Opposing Aristotle's argument that the series of ends identifiable in human action cannot extend to infinity, Hobbes maintains that happiness is actually more like riding a treadmill, "a continual progress of the desires, from one object to another; the attaining of the former, being still but the way to the latter" [19]. Not long afterward, John Locke added to this anti-Aristotelian case by observing that people's conceptions of happiness are irreducibly different. "The Mind has a different relish, as well as the Palate," the seventeenth-century English philosopher says, "and you will as fruitlessly endeavor to delight all Men with Riches or Glory, (which yet some Men place their Happiness in) as you would to satisfy all Men's Hunger with Cheese or Lobsters." Locke continues: "Hence it was, I think that the Philosophers of old did in vain enquire, whether *Summum bonum* consisted in Riches, bodily Delights, or Virtue, or Contemplation" [20].

With no ultimate aim to strive for, moral deliberation is left to consider only the means to each person's idiosyncratic ends. Ethics becomes the regulation of those means, the latter constituted by those capabilities and scarce resources that give individuals the power to get what they happen to want whenever they want it. Money is obviously an important component of such power. Once Aristotle's *telos* is subjectivized, then, constraining the use and accumulation of money by individuals and firms engaged in the buying and selling of goods and services comes to form the essence of business ethics. Most virtue ethicists nowadays have opted to follow this route. The result is that the virtues are understood, not in terms of the purpose of human life, but as a set of qualities fitting individuals toward the actualization of any goals they might have in a commercial society, an approach which Eugene Heath (see also ► [Chap. 6, "Virtue as a Model of Business Ethics"](#) of this handbook) describes later in this section by following the evolution of virtue theory from Aristotle toward a more bourgeois variant that began to develop in the eighteenth century. Another option is to define the virtues as those traits that meet the expectations of one's role in a larger community, which is Robert Solomon's position [6]. A combination of these two possibilities is also possible, which Edwin Hartman (see also ► [Chap. 4, "Aristotle on Character Formation"](#) of this handbook) points to as well in a subsequent article in this section.

We shall leave it to the reader to decide whether Aristotle was originally right in thinking that happiness is an objective condition. To help make that decision,

we shall outline the key arguments he makes in favor of that claim. In the meantime, the implications of viewing happiness in a relativist fashion need to be acknowledged and, chief among them, is that greater significance is lent to the egoism charge that one might level against Aristotle. To someone that asks why a businessperson should refrain from defrauding their customers, Aristotle can respond that doing otherwise would be self-defeating. By committing fraud, one would be undermining the health of one's soul. For most of the ends that people typically pursue, an analogous answer can be given, although the happiness at issue would not refer to the real condition of one's psyche, but rather one's personal sense of contentment. The usual way of going about this is to argue that the fraudster will suffer a bad conscience or, barring that, by noting that the odds are such that he or she will eventually be held to account and incur punishment. Still, if we conceive of a businessperson who seeks to amass wealth above all else, and is willing to assume the risks of detection, the dilemma posed by what David Hume called the sensible knave rears its disturbing head [21]. With no *summum bonum* to invoke, an Aristotle inspired theory of the virtues thus comes to require a compelling account that morally equates personal merit with how an individual tends to the concerns of others.

In avoiding the sensible knave dilemma, Aristotle distinguishes between two kinds of self-regarding. One kind refers to individuals who seek more than their fair share of pleasure, status, and money. This is what most people have in mind when they speak of selfishness as immoral. Yet the person who takes proper care of themselves by limiting their pursuit of worldly goods to a measure that is consistent with the cultivation of their highest intellectual and moral capacities is also being selfish. If anything, as Aristotle notes, they are more so than the type of person typically deemed as self-centered in that they are satisfying their needs in a more clear-sighted way (1168b10-35) [13]. On the original Aristotelian view, then, businesspersons are not so much summoned to constrain their selfishness as they are to manifest it in an elevated form. This implies a relegation of the material concerns that contemporary economists typically sanction as legitimate forms of self-interest, placing those concerns instead into the category of ignoble selfishness.

As this suggests, Aristotle does not define happiness as we are commonly apt to do as consisting of a pleasant or unperturbed state of mind. Happiness is not a feeling, but an activity. If it were simply about feelings, Aristotle observes, then it follows that a person who is constantly asleep or spends their days lying on a couch watching television is fulfilled (1098b30-1099a7) [13]. No one really believes that. Instead, in everyday life, those who are considered to be thriving are those who are doing something valuable with their lives. For this reason, and given its hedonic connotations in the English language, Aristotle's conception of the good life is often not described as happiness, but rather as self-realization, self-completion, self-perfection, or human flourishing. The virtues, according to this view, are precisely those activities that embody that flourishing. Among them is friendship – a rarely, if ever, discussed topic in business ethics – whose highest perfection is reached when the individuals concerned are both virtuous and desire the good of their friends as their own (1166a30-32; 1168b1-5) [13]. It is not merely

with friends, however, that the virtues socially manifest themselves, but also in our relations with greater communities, including firms as well as the states in which these operate. For as Aristotle famously states, human beings are social and political animals (1253a1-3) [14]. As we cannot rely entirely upon ourselves for the satisfaction of our needs and seek company for its own sake, we cannot live well except in living with others.

Dialectics

Being a first principle of ethical inquiry, the identification of happiness as the goal of proper conduct does not require much discussion of methodological questions. With respect to the *telos*, all one needs to grasp it is a bit of uncomplicated reflection on our own behavior. The situation changes, though, once the effort is made to figure out what exactly happiness consists in and how all this applies to commercial life. At this point, one is forced to confront the towering influence of the scientific method, the empirical-mathematical epistemology whose enormous success in the natural sciences has led it to progressively dominate the various social science disciplines that focus on the human things. The subjects that business students are required to learn – whether it be marketing, economics, accounting, finance, organizational behavior, operations, management – all reflect this positivist approach. Writing well before Francis Bacon invented the experimental method, Aristotle did not run controlled tests of hypotheses using human subjects, or construct surveys and mathematically analyze the results, or formulate regression models on available data sets. In quite a few eyes, this makes Aristotelian business ethics a hopelessly unscientific enterprise, nothing but a vessel by which its proponents can claim the intellectual authority of a historically renowned figure to advance their personal moral preferences. This objection, however, ignores the fact that an Aristotelian approach is, in many respects, open to social scientific techniques. More importantly, it assumes that the reigning positivism is the only legitimate way to comprehend human affairs. Aristotle reminds us that the sheer complexity of those affairs, as well as their inescapably ethical dimension, necessitates the adoption of complementary epistemologies.

The one that Aristotle puts forth for our consideration in business ethics is dialectics. Aristotle took this method from Socrates, who sought truth about the essence of justice, courage, piety, friendship, and the like by going to reputable authorities and asking them to state and defend their views [22]. Never satisfied with the initial definitions he heard, always uncovering some lacuna or contradiction, Socrates would scrutinize his interlocutors, eliciting them to restate their positions about the topic at hand in a more defensible manner, doing so repeatedly with the aim of eventually reaching an understanding beyond any reasonable objection. Stated more formally, as Aristotle does, dialectics starts its investigation of *X* by canvassing the prominent opinions people hold concerning *X*, whether by experts or significant parts of the public (1095a29-1095b14) [13] (104b1-7) [15]. In starting with opinions, Aristotle presumes that the human mind, in forming its

judgments about debatable issues, is able to glimpse at least a portion of the truth. Unlike the scientific method, whose pursuit of regularities is conducted on data acquired from the senses requiring minimal interpretation by the intellectual faculties, dialectics embraces people's attempts to make sense of their experience and tries to eliminate the inevitable biases by pitting their beliefs against other views. The point of engaging in this clash is to separate the elements of validity in each of the rival opinions and arrive at a statement of the matter that synthesizes the partial truths espied within the diversity of perspectives. At the end, the degree of certainty reached depends on what the nature of the subject matter permits. In ethical inquiries, according to Aristotle, we can only capture general tendencies by offering counsel that applies to most cases as opposed to every single one (1094b12-30) [13]. Circumstances play a decisive role in determining what is right and wrong. As these are always distinct from one business situation to the next, what is deemed as liberality and justice in one instance may well, even where the differences in circumstances are slight, be seen as profligacy and injustice in another. An Aristotelian business ethics can only offer probable judgments about the types of conduct associated with a flourishing existence.

How exactly are we supposed to go from opinions to probable knowledge? Noting strong parallels between Aristotelian dialectics and John Rawls' reflective equilibrium, Edwin Hartman (see also ► [Chap. 4, "Aristotle on Character Formation"](#) of this handbook) makes the interesting proposal, again later in this section of the handbook, of adopting the method of wide reflective equilibrium to appraise the divergent notions about how a person ought to act in a given business context. As Hartman explains, wide reflective equilibrium is an amplification of John Rawls' well-known technique articulated by Norman Daniels [23]. Whereas reflective equilibrium asks us to weigh and adjust our moral principles against our judgments in particular cases, the wider variant advocated by Daniels allows us to bring a third factor into the equation relating to scientific theories and other factual observations that bear on the ethical issue under consideration. Hartman provides a number of illustrations of the way Aristotle's ethical analysis accords with the wide reflective equilibrium approach in contending, for example, that the latter's teleological view of morality relies on his theories of the physical universe.

Going simply by what Aristotle wrote, the move from opinion to probable knowledge is a more traditional process, involving the time-honored methods of deduction and induction that he first clarified (105a10-19) [15]. Of the two, Aristotle prefers deduction, inferring particular statements from general premises, because the conclusions generated are certain. By contrast, there is less certainty to be gained via the inductive mode of forming generalizations from particular facts. Though not as much as the originators and present-day champions of the scientific method would like, Aristotle nevertheless recognizes the value of induction and, indeed, concedes that its empirical procedure renders it more convincing to most people. Inasmuch as what the prevailing positivist epistemology urges is a form of induction, this means that the Aristotelian approach is, in principle, open to the insights offered by modern social science. One way that immediately suggests itself involves the happiness studies literature that has grown dramatically in the past two

decades [24, 25]. To be sure, this literature must be approached keeping in mind that it tends to define happiness in subjectivist terms by asking people in surveys how they are feeling about their lives. These responses are then typically analyzed against variables, such as level of income, employment condition, marital status, country of residence, to gauge the factors that lead to happiness. Interestingly enough, despite the opposite conception of happiness, studies have leaned in Aristotle's direction in finding that, beyond a certain amount, money does little to add to happiness and that a key driver of life satisfaction is the quality of one's relationships.

In fact, we can go further with the opening offered to the social sciences by the acceptance of induction and challenge some of Aristotle's own notorious conclusions. An example is his claim that women are inferior to men, from which he deduces gender-distinctive expectations of virtuous behavior (1259b2-4 & 1260a9-15) [14]. Aristotle tries to back this by asserting that females are less intelligent than males. But data from IQ tests reveal similar scores across both genders [26]. Even more revolting to contemporary moral sensibilities is Aristotle's defense of slavery as a naturally supportable practice (1254a18-1255a3) [14]. In thus arguing for human inequality as a morally relevant fact, he is challenging the belief in equality that underlies all contemporary moral thought. The whole edifice of business ethics depends upon this egalitarian presupposition – without it, all the concern about protecting workers, women, minorities, consumers, and local communities from rich, powerful shareholders and corporate executives would make no logical sense. Aristotle's inegalitarianism is based on the idea that human beings can be put into one of two categories, the wise and the not-wise. The wise, he argues, ought to rule the not-wise because the former know better what is truly good than the latter do. As a result, while the wise will obviously make the right choices in benefiting themselves, even the not-wise will be better off in having the wise make decisions on their behalf. Once again, the social sciences, though admittedly common sense and historical experience would do just as well if not better, can be invoked against Aristotle here in pointing out that human selfishness is such that we cannot expect the wise not to take advantage of their authority to exploit the not-wise. Moreover, the same IQ studies that reveal no difference between genders demonstrate that humans cannot be neatly sorted into binary categories. Human intelligence being distributed in a bell curve, most people have similar levels of intelligence, with relatively fewer spread out along a continuum toward the two opposing extremes. Not to mention that even the most hard-line advocates of the thesis that intelligence is genetically influenced concede that social factors, and not just natural ones, help explain the tabulated variances in IQ scores [27].

Yet it should be remembered that induction is not simply equivalent to scientific empiricism. Traditions, customs, and consensus of public opinions also represent, though developed in a less systematic and rigorous fashion, generalized inferences from a multitude of events over time from numerous local standpoints. These, too, must be brought into the dialectical conversation of Aristotelian business ethics. Another important source of inductive understanding that Aristotle highlights is the prudent individual, someone whose good judgment, honed by life experience,

enables them consistently to take all the relevant circumstances into account in framing the alternatives correctly and making the appropriate choices (1140a25-b11) [13]. This is basically to say that the moral dilemmas of commerce are not to be reserved to academics engaged in dialectical discussion. Especially when the issue is very circumstantial and context specific, the inquiry must also integrate the considered views of morally respectable and experienced businesspersons – and not those who have simply managed to project an ethical image through public relations in championing fashionable causes.

The Virtues and the Good Life

It has already been pointed that Aristotle defines happiness as an activity and, more specifically, as a series of deeds and accomplishments expressive of virtue. But how exactly is Aristotle sure that the good life consists in virtuous action? In what does virtue consist? In line with the dialectical method, Aristotle launches his investigation into these questions by assessing prevalent opinions about the nature of happiness. He identifies three: pleasure, honor, and contemplation (1095b15-1096a6) [13]. If the decisions between these three alternatives were to be dealt with democratically by majority vote, what would surely emerge victorious is the thesis that living well is to enjoy a steady stream of sensual delights, bodily comforts, and cognitively undemanding diversions and entertainments. Inasmuch as firms must satisfy consumer preferences in order to survive and prosper, contemporary commercial societies attend to this conception of personal well-being through all the savory foods, tasty drinks, labor saving devices, luxury cars, and spacious homes that are made available in the marketplace. Not only that, but most people that work in business do so to obtain the means of acquiring such pleasures. It would be a smaller group that would opt for honor, being recognized as someone great, as defining the good life. True enough, many people seek a modest version of this in trying to signal their success through the brand names of the clothes they wear, the kinds of cars they drive, and the neighborhoods in which they choose to reside. In the realm of business, however, the quest for honor reaches its highest pitch among CEO's and entrepreneurs striving to make a name for themselves as product innovators, industry transformers, or visionary risk-takers. The contemplative life, the pursuit of truth for its own sake, would hardly receive any votes in the business world, except perhaps among people working there unable to find a place for themselves in academia. Nevertheless, something resembling the life of the mind can be discerned among company scientists engaged in product research and development along with financial market analysts and management consultants offering advice to investors and corporate executives.

In view of its popularity, and its hold over human nature, pleasure takes up the bulk of Aristotle's analysis. That hold means that pleasure cannot be excised from a credible account of human flourishing. Any moral theory that depicts it as evil is guaranteed to evoke hypocrisy among its exponents and contempt among its onlookers, since nobody can persistently resist the lure of pleasure (1172a34-b9) [13].

Ascetic and puritan critiques of capitalist consumerism have no place in an Aristotelian business ethics. But the acknowledgment of pleasure as an ineluctable motive of individual action does not mean that it should define self-fulfillment. Spending our days merely gratifying our senses and amusing ourselves with mind candy would reduce us to the level of the irrational animals (1095b20-21) [13]. If pleasure is the good, it would follow that the pleasures of the adulterer or the rapist are equivalent to those of the loyal partner or consensual lover (1173b20-1174a1) [13]. But this contradicts the widely held opinion that there is a difference between these two sets of experiences, that the pleasures of the first are, respectively, shameful and unjust, while those of the second are befitting and just. This means that pleasures can be distinguished as either good or bad, which in turn implies a higher criterion by which their respective contribution to individual fulfillment can be assessed. Aristotle observes, too, that no adult would choose to restrict themselves to the pleasures that children enjoy (1174a2-4) [13]. No matter how simple and worry-free such an existence might appear, our preference is always for the greater challenges of an emotionally and intellectually mature condition. Reinforcing this conclusion, Aristotle says, is that people will generally not give up their capacities for memory and knowledge, even though the exercise of these is not always pleasant (1174a4-12) [13].

It is by parsing the view equating happiness to honor that Aristotle is brought to the essence of the good life. Where the quest for renown and distinction goes awry is the dependence it entails upon other people's judgments. Complete self-sufficiency may be impossible, yet a significant component of it is surely a prerequisite of a felicitous situation, for it is hard to believe that a person can be deemed to be living well while entirely subject to the vagaries of public opinion. Aristotle also points out that the individual who is authentically committed to attaining honors wants to actually deserve them, instead of merely receiving the acclaim (1095b24-31) [13]. What people like Steve Jobs and Warren Buffett want is for other people to corroborate, rather than define, their estimable qualities and accomplishments. From this, Aristotle deduces that what really matters is that one act well – which is to say, virtuously. The good life thus comes to sight as conduct in accord with virtue. If we add to this what has already been concluded about the desire for pleasure being part of the constitution of human nature, a properly ordered individual will take enjoyment from doing virtue and feel pain at the thought of committing vice (1099a14-31) [13].

This still leaves the term virtue in need of specification and, to this end, Aristotle once again seeks guidance from common opinion. Keeping in mind that virtue is coterminous with acting properly, he reminds us that whenever people say that a thing or person is operating as it should, what they mean is that it is performing its function (1097b22-1098a21) [13]. A lawn mower is said to be in good condition if, upon turning it on, it cuts the grass. The queen bee is considered to be thriving if she is reproducing for her hive. With respect to a person, we tend to evaluate them in terms of their role. Thus, the head of the IT department is thought to be doing well if the company's servers and computers are running smoothly and helping employees to be productive in meeting customer needs. But human happiness,

the goal of ethics, is not simply reducible to the performance of one's assigned role within a firm, much less whatever parts beyond it that one has inherited or consented to play in the greater socioeconomic fabric. It is not unusual to hear such statements as, "Jim is a great advertising executive but his life is incomplete" or, "Anne has been a wonderful secretary, but she still has so much unrealized potential." These statements point to roles that we should be exercising as human beings, given a certain structure and set of needs, and not just what our place in society happens to demand of us. Now just as within the social division of labor, the most appropriate role for each of us is that which suits our unique abilities, so it is in trying to figure out what character human beings should assume within the natural order. What makes humans distinctive from all the other living forms in nature is that we are able to generate enormous benefits for our species due to the possession and use of reason. Hence, to function appropriately as human beings, to act virtuously, is nothing else than to exercise our rational capacities (1097b24-1098a18) [13].

Few concepts are fraught with more controversy than the meaning of rationality. Part of its character has already been sketched in the account of dialectics wherein reason is essentially portrayed as the inferring of new propositions from other already established claims. Befitting a teleological mindset, Aristotle does not leave it at this, but seeks to fully understand the nature of reason by identifying the purposes for which inferences are made. Primary among them is the desire for truth. "All men," Aristotle opens the *Metaphysics*, "by nature desire understanding" (980a). While recognizing that people often seek knowledge to attain a separate aim, he also maintains that they do so for no ulterior motive. This is evidenced by the fact, Aristotle says, that sciences like mathematics, less tied to the provision of necessities and conveniences, developed only after societies generated enough wealth to enable the existence of a leisure class with no pressure to produce applied learning (981b15-25) [15]. Aristotle refers to the pursuit of truth for its own sake as theoretical reason and its goal is to identify the fundamental causes of phenomena through general ideas that capture the necessary and universal aspects of reality (1139b18-36 & 1140b31-1141b10) [13]. Where truth is sought for the sake of something else, it is called productive knowledge, or a technical skill, wherein reasoning is used to bring an object, such as a chair, into being (1140a1-24) [13]. On the other hand, it is called practical knowledge when reasoning is used to guide our appetites in our actions (1140a25-b30) [13]. The first is related to business insofar as it covers the manufacture of products, but it is not connected to ethics since the question as to whether or not a certain good ought to be made cannot be answered by a description of how to make it. Business and ethics come together in practical reason which, unlike its theoretical counterpart, focuses on particulars, applying the universal imperative to seek the human good while attentive to the circumstances, nuances, and complications inherent to everyday commercial life.

By reason, though, Aristotle does not simply mean the apprehension and application of truths. He well recognizes that people are not Spocks capable of acting toward their real advantage by simply putting their minds to it. Human reason operates alongside the passions (1102b13-1103a4) [13]. These must be restrained

and well disposed in order for us to think clearly and execute what our minds determine. Rejecting the Socratic thesis equating virtue with knowledge, Aristotle does not go the Platonic or Cartesian route of depicting reason as a despotic ruler of the passions. In acknowledging, for example, that people are able to know what is good and still not do it, Aristotle sees the intellect and the emotions as mutually influencing each other. Still, in this interplay, reason remains the higher principle since it defines who we are as a species. Not only that, reason is able to substantiate this priority and guide the passions, though not (to use an apt analogy put forward by St. Thomas Aquinas) in the manner that an autocrat can secure obedience to his orders, but more like a democratic politician can persuade the public to accept her proposals. According to Aristotle, the moral virtues consist of those personal characteristics that exemplify this rational control of emotion. On the other hand, the mental qualities by which a person effectively apprehends and applies knowledge make up the intellectual virtues (1103a3-10) [13].

One might be wondering at this juncture how the desire for wealth, the ruling passion of most people involved in business, fits into this moral teaching. The notion that happiness involves being rich, or at least affluent, is a prevalent opinion, if not expressed in what people say, certainly deducible from the way they act. Does Aristotle not consider this view in his dialectical analysis of ethics? He does address it, though he does not include it among the three main candidates for happiness – pleasure, honor, and contemplation – because wealth is not something, whether viewed logically or factually, that is intrinsically desirable (1096a6-11) [13]. Asked to explain their behavior about money, most people will concede that their wish to earn an income is not based on value of money in itself, but to afford other goods. Despite this admission, many behave as if money is an end in itself, being always open to the opportunity of getting more. But the problem with this is that, on its own terms, money can only be measured as a quantity, which can be increased without limit. There is nothing about the nature of money that tells us when to stop accumulating it (1257b-1258a19) [14]. Consequently, positing wealth as the overarching goal of human action is inconsistent with proper understanding of happiness, according to which it is the terminus of desire. Being a means instead of an end, wealth is viewed by the Aristotelian business ethicist as merely providing the resources for the exercise of the moral and intellectual virtues, its acquisition and use being limited to what will optimally express those personal traits. This obviously creates a tension between Aristotle’s moral teaching and the mores of the present-day commercial order, a tension that Colin D. Pearce (see also ► [Chap. 2, “Aristotle and Business: An Inescapable Tension”](#) of this handbook) explores in this section of the handbook.

Ever consistent with his methodology, Aristotle builds his catalog of the specific intellectual and moral virtues by reference to frequently stated moral opinions. Thus, he notices that some people are praised for being courageous, others for being generous and amicable, and yet others for being prudent and just. By refining these judgments, separating their common and distinctive elements, Aristotle spells out thirteen moral, and two intellectual, virtues. In the process, Aristotle is led to adopt the popular view that each person has a character and that what matters most in

evaluating the morality of that person is not so much what they do, but the kind of character they have. A person's character, in turn, is constituted by the set of ingrained tendencies toward certain behaviors. These tendencies, if good, are virtues; if bad, they are vices. When he develops this everyday notion, Aristotle makes it a point to observe that the virtues are not impressed into our characters by nature or, as we would nowadays say, by genetic inheritance. Instead, he maintains that the virtues are instilled by continual practice until they become habitual or second nature to us (1103a14-1103b6) [13].

Does the scientific evidence, though, bear these views out? In his contribution to the handbook, Miguel Alzola (see also ► [Chap. 5, "The Empirics of Virtue Theory: What Can Psychology Tell Us About Moral Character?"](#) of this handbook) alerts us to social science findings that appear to run against Aristotle's emphasis on character. A number of studies in social psychology point to situational factors determining people's moral choices, rather than their traits. The best-known study in this literature is the set of experiments conducted by Stanley Milgram in which a majority agreed to obey an authority figure in delivering huge electrical shocks to individuals that committed mistakes on a word memory exercise [28]. Arguing that such experiments do not truly test the character hypothesis, Alzola's article offers an illustration of our earlier contention that modern science can be brought to play within Aristotle's dialectical approach to morals.

Not all the virtues that Aristotle claims go toward defining a model character pertaining to business. Out of the thirteen moral virtues, seven are relevant to business. Between the two intellectual virtues, only one is directly applicable, namely prudence. The other one, wisdom, is not directly germane and so is left out of [Table 1.1](#) (see below) listing the eight virtues comprising an Aristotelian system of business ethics based closely on the original texts. Reflecting Aristotle's famous doctrine of the mean, according to which acting rightly involves behavior that avoids opposite extremes, the table below cites these two vices, alongside the relevant virtues. Moreover, for each of the virtues, we summarize the behavior it entails for business.

The Institutional Framework for Virtue

In Aristotle's view, then, economic considerations are properly subordinate to moral demands – more precisely, whereas the logic of economics tells us to prefer the lowest cost means in a given action, morality directs us to consider the ultimate end of all our actions, in addition to simple pecuniary factors, in determining the means we are supposed to choose. Yet it will be recalled that Aristotle also claims that human beings are by nature political, and, from this, he additionally infers that ethics is subordinate to politics (1094a30-b12) [13]. Not only is this because the peace and stability that justice brings would be impossible without government but also because politics opens up the possibility for the display of estimable virtues involved in leading a community, by say running the country's foreign policy or its economy, that comprises the highest pitch of prudence. For it is no mean thing to intelligently make decisions for one's self, but it is far more challenging and publicly spirited, and

Table 1.1 Table of the Aristotelian business virtues

Virtue	Defining feature	Opposing vices	Business implications
Courage	Managing fear	Rashness and cowardice	Willingness to take reasonable investment and entrepreneurial risks
Self-restraint	Managing desire for pleasure	Self-indulgence and insensibility	Healthy diet and moderate alcohol consumption for workers/managers; regulation of sexual behavior among employees; discouragement of excess consumption in product offerings
Generosity	Regulating love of money	Stinginess and prodigality	Avoid greed, especially through sordid activities; be more willing to give or spend money than to save it
Magnificence	Regulating love of money where personal wealth is substantial	Vulgarity and pettiness	Donate to the arts and other worthy causes; be tasteful in one's large expenditures
Magnanimity	Pride management	Pusillanimity and vanity	Confidently seek the highest honors by undertaking rare and challenging deeds
Sociability	Regulation affection for others	Obsequiousness and flattery	Be courteous, engaging, amenable with colleagues and customers
Justice	Allocation of goods amongst individuals	Only one opposing vice: injustice	Rectificatory justice regulates transactions and demands reciprocity and fairness; distributive justice considers what people deserve and so requires that companies assign their employees rewards and penalties in line with merit
Prudence	Deliberation about choices	Only one opposing vice: imprudence	Thoughtfully consider alternatives before deciding while being attentive to circumstances; individual approaches peak levels of prudence by assuming leadership roles

hence more ethically admirable, to assume successfully the responsibility of steering the well-being of a large group (1094b8-11) [13]. So too, governments have the power to educate its citizens, both through the laws it enforces and the subjects it mandates for youth to learn (1094a30-b3) [13]. Insofar as people are not born virtuous, but can only become so through practice and habituation, education has a significant role to play in the formation of character (1179a34-1180a19) [13]. In order to be fully operational in the business arena, the virtues must be nurtured and supported by the institutional framework established by the government. Reinforcing this point is that, as Edwin Hartman (see also ► [Chap. 4, “Aristotle on Character Formation”](#) of this handbook) points out in his chapter, the student who enters a business ethics class, whether at the undergraduate or graduate levels, already arrives morally formed, in part by their experiences at home and with their friends, but also by the earlier stages of their education, which the government, to this day, heavily regulates. On the original Aristotelian view, as Colin D. Pearce (see also

► Chap. 2, “Aristotle and Business: An Inescapable Tension” of this handbook) goes on to suggest in this handbook, business ethics will only be authentically practiced if the state gets into the morality business.

For Plato on through to Karl Marx and his followers, the fundamental issue which the state had to confront in grappling with the self-interested behavior encouraged by commercial activity was that of property. Both Plato and Marx, of course, contend that the moral dilemmas posed by the desire to accumulate wealth could only be resolved with the elimination of private property in favor of the common ownership of resources. In the *Republic*, a dialogue in which Plato articulates his vision of the ideal polity, the ancient Greek philosopher seems to restrict the prohibition of private property to the guardian class of his hierarchical utopia, whereas Marx unequivocally called for the complete socialization of the means of production. In his analysis of Plato’s *Republic*, Aristotle opposes this tradition of political economy, arguing that communally held property generates quarrels as people dispute whether what they receive out of the common pool is proportionate to their productive contributions. Raising the prospect of conflict as well is that decisions over resources involve a greater number of people. Given the self-love imbedded in human nature, private property gives individuals better incentives to better manage available resources. Very interestingly, too, Aristotle maintains that socialism removes the ground for generosity, inasmuch as that virtue presupposes one has something of one’s own to give to others (1262b37-1264b25).

None of this means, however, that Aristotle sides with the laissez-faire view that resources should be entirely under individual control with minimal limitations. While he maintains that property should be owned privately, he does insist that individuals ought to make their possessions available for common use. Indeed, Aristotle states that it “is indeed a particular duty of a lawgiver to see that citizens are disposed to do this” (1263a38-39) [14]. This suggests that Aristotle’s thought offers a basis for a redistributionist state, though it would not be for the sake of social justice, the most oft-cited rationale today for government intervention in the economy. With Aristotle, a person’s character is defined more by how high-minded they are in making themselves the best person they can be than it is by what they do for the poor and disadvantaged. To the extent that Aristotle would be concerned about the divide between the rich and the poor, it would be for the government to ensure that it adopt measures to avoid the political instability that sharp inequalities tend to bring about by instead fostering a large middle class (1295b1-1296a23) [14]. But the full exploration of this issue belongs to what one might call Aristotelian political economy as opposed to Aristotelian business ethics. Nevertheless, it is worth noting that the imperative to make one’s property available for use by others points to the idea of corporate social responsibility. It does not perfectly point in that way as the question remains open whether the managers of the corporation, on behalf of the shareholders, are supposed to factor in wider social interests in the deployment of the firm’s resources or whether that is to be done by shareholders themselves with the dividends they receive. The first possibility fits corporate social responsibility, the second is compatible with Milton Friedman’s [29] view that corporations should focus on earning profits for its shareholders.

Besides exploring the corporation's relationship to the larger community Alejo Jose G. Sison (see also ► [Chap. 3, "Aristotle and the Corporation"](#) of this hand-book) also takes up the question whether Aristotle's political science might be helpful in illuminating how the corporation should be governed internally. Focusing on Aristotle's discussion of citizenship in *The Politics*, Sison distinguishes between two kinds of political participation: liberal-minimalist versus civic republican-communitarian. The liberal conception, emphasizing as it does the protection of various individual rights to be left alone by the state, demands relatively little of citizens, except the requirement to respect the freedom of others. The civic republican view, by contrast, envisions freedom as the capacity to influence the rules and policies of the community under which one lives. Sison maintains that Aristotle endorses the civic-republican alternative and that, therefore, the kind of corporation that aligns with his political theory is one in which the various stakeholders – shareholders, customers, suppliers, and, particularly, employees – all actively participate in the company's activities as the business equivalent of Athenian citizens. In support of this view, we can refer to Aristotle's teaching concerning how the virtues come to perfection. Between the moral and intellectual virtues, the highest are the latter because their exercise of reason cultivates the faculty that distinguishes us as human beings (1178a9-11) [13]. Aristotle also holds that intellectual virtue reaches its apex with the virtue of wisdom practiced by the philosopher, the individual dedicated to the search for truth about the fundamental principles and causes of the divine, natural and human orders (1177a11-1178b32) [13]. As there is limited space for philosophical contemplation in commerce, the most relevant intellectual virtue for businesspersons becomes prudence, which, as we have seen, shines brightest in the ruling of a state or, to put it more broadly, the leadership of sizable associations. Instituting the civic republican ideal of citizenship within the corporation opens the practice of prudence up to more individuals.

Conclusion

Contrasting the prevalent utilitarian and deontological streams in ethics, the return to Aristotle for ethical guidance concerning business leads us to a virtue theory of morals. Aristotle's version of this theory takes its cues from our quest for happiness. Unlike most contemporary proponents of virtue theory, Aristotle believes that happiness is not a subjective matter but rather can be objectively defined. He maintains that personal fulfillment lies in the full realization of our rational capacities through action that brings the intellectual and moral virtues to fruition. An Aristotelian business ethics consists of the subset of these virtues applicable to commercial life that serve to advance human flourishing. In gauging what leads to this goal, as well as explicating the specific features of the virtues, Aristotle proposes the dialectical method. This involves the examination of widely held and expert opinions on the subject under consideration with a view to reaching a noncontradictory understanding. Using this method, Aristotle argues that the money-making art characteristic of business should be subservient to the requirements of courage, self-restraint, generosity, magnificence, sociability, justice, prudence, and wisdom. The likelihood,

according to Aristotle, of these being authentically practiced in business life will depend on the government's assumption of an educative role in the character formation of its citizens. The highest expression of virtue that is feasible in business involves prudence, which can be encouraged by fostering a civic-republican mode of citizenship within the corporation.

Aristotle and Business: An Inescapable Tension

Abstract

This chapter attempts to assess the availability of Aristotle to the field of business ethics. It does so by reviewing some of the scholarly work which has dealt with this possibility against the backdrop of certain key themes in Aristotle's thought. The chapter begins by first outlining the controversial nature of the claim that Aristotle is integral to the business ethics field. It then explains how such controversy is only natural given what Aristotle has to say about the relationship of wealth acquisition to the natural ends of man. The chapter goes through the arguments made by various scholars, some of whom seek to bring Aristotle to the business ethics table, and others who do not feel he deserves an invitation, while attempting to place the debate in the context of Aristotle's radical "communitarianism" on the one hand and his radical "individualism" on the other. This is the obvious procedure because Aristotle maintains at one and the same time that the individual both belongs "body and soul" to the civic community and yet is able with the aid of philosophy to transcend the horizon of that community completely. Hence, it is that Aristotle is difficult to adjust to any moral context where the individual is in a middle state of being both in possession of certain rights against the community, and yet under certain social obligations to that community as part of an exchange for the sake of individual freedom. Aristotle's paradoxical communitarian-individualism or individualist-communitarianism is difficult to "privatize" to the level of an independent, profit-seeking commercial organization and also to "socialize" to the level of simple concern with the general welfare as distinguished from the individual pursuit of transcendence made possible by philosophic contemplation.

Introduction

Q: What does it take to be an entrepreneur in 2010?

A: (Kevin O’Leary) You have to cast out the concept of balance in life. You should have no doubt that as an entrepreneur you will be a slave to the business until you sell it. You spend 25 h a day working on the business. Every ounce of energy has to be focused on that. There is no other distraction. That is the only way to be competitive and win in today’s environment. If you want balance, that’s what you get after you’re rich [1].¹

However, I don’t detect much progress from “wisdom” literature in Administrative Theory during the past 50 years. Aristotle and the Hoover Commission sound much alike, except that the former was good deal more sophisticated than the latter about the relation of politics to administration. (Herbert A. Simon).²

This chapter proceeds on the assumption that a serious consideration of the way in which Aristotelian ethics relate to the discipline of business ethics is a valid exercise. In the sections which follow, I will pursue such questions as the following: How in the context of business should Aristotle’s notion of man’s being a political animal be understood? How does acquisition relate to the life of civic virtue? What is the status of the social scientific approach in the business ethics field? What is the relation of the *vita contemplativa* as the ultimate goal or telos of human life to the practical economic activity of business and economics? What is the difference between Aristotelian “individualism” and the modern variety? What are the comparative merits of Aristotelian and Kantian ethics in the context of the modern business? What is the ethically wise individual’s situation in a business environment? These will be the guiding questions in the discussion which follows which seeks to explore the ways in which the teachings of Aristotle relate to, and more importantly, come into tension with, the world of business and commerce.

In the process of doing so, I shall be considering various arguments made in articles by John R. Boatright, Robert C. Solomon, Thomas J. Lewis, Allen Buchanan, Denis Collins, Claus Dierksmeier and Michael Pirson, Tomas Kavaliauaskas, and Christine Hoff Summers.

“Capitalist Acts Between Consenting Adults”

The notion of applying Aristotelian ethics to modern business has been frequently recognized as a problematic exercise. Consider the remarks of John R. Boatright:

Business, for Aristotle, is a perversion. Trading goods for money with a view to profit – which Robert Nozick has called “capitalist acts between consenting adults” – was regarded by Aristotle as an unnatural activity, since goods are not being used for their intended purpose. And since goods should be exchanged only for their “real value,” profit is a kind of theft, a charge which led to centuries of aversion to business. With some justification, therefore, Aristotle might be described as the Krafft-Ebbing of economic theory [4].

Thus, critiquing Robert C. Solomon's *Ethics and Excellence*, Boatright takes up the latter's claim that business ethics can appeal to "the egalitarian sensibility and the sense of fairness shared by the business community itself" [4]. Boatright quotes Solomon as saying that "The Aristotelian view presupposes a larger framework that meets with our general approval. . . . And that larger framework has everything to do with the actual function and aim of business".³

Boatright's brief regarding Solomon is that even if we should grant that specific normative conclusions can be arrived at within a framework of an agreed upon conception of the nature of business, the task of elucidating this framework in a noncontroversial way still remains. As Boatright observes, Solomon allows that there "is little to be said in defense of business to one who rejects the very idea of a business society" [4]. And here, Boatright has pointed to the whole debate in a nutshell. To be serious, the discussion of Aristotelian ethics in connection with business has to somehow proceed after acknowledging at the outset that Aristotle is actually not a proponent of the kind of society in which business plays a dominating or even central role.⁴ We have to approach the question of Aristotelian business ethics knowing full well that such a phrase might be as oxymoronic as the phrase "business ethics" is frequently suggested to be by those just informed that one is a teacher of the subject.

To his credit, Solomon is fully aware of the problem addressed by Boatright and frankly poses the question of whether it is "inappropriate if not perverse to couple Aristotle and business ethics".⁵ Solomon readily allows that Aristotle does indeed discuss the ethics of exchange and may even be entitled to be called the first business ethicist in history. Still, the Greek philosopher described "*chrematistike*," or trade for profit as "wholly devoid of virtue and called those who engaged in such purely selfish practices 'parasites'" ([15], p. 322). Solomon further acknowledges that Aristotle's attack on the practice of usury and the personal vice of avarice was an influential ethical stance until the seventeenth century. As Solomon concedes, Aristotle would have thoroughly approved of the fate of a "*chrematistike*" like Shylock in Shakespeare's *The Merchant of Venice*.

Solomon identifies hostility to business or commerce with the aristocratic class of which he considers Aristotle a spokesman. As such, Aristotle reminds us that aristocrats are not the natural allies of capitalism.⁶ Solomon wishes to identify capitalism or business with democracy, and in so doing, he wishes to identify Aristotle with plutocracy or elitism. This is the Aristotelian contempt for business, a contempt expressed from a standpoint of privilege which underlies much contemporary criticism of business. Indeed, for Solomon, the disdain of finance that preoccupies so much of Christian ethics even to this day might be traced back to Aristotle ([15], p. 323). Solomon would even go so far as to say that the defenders of business themselves have been unconsciously infected by these Aristotelian prejudices. This is evident when they describe the life of the business person as somehow a less than truly moral or noble sphere of activity. Alfred Carr, for instance, draws an analogy between poker and business while for his part, Milton Friedman famously said that "the [only] social responsibility of business is to increase its

profits” ([15], p. 323). Both men are seeking to remind their readers that commerce is a practical and therefore merely necessary part of social existence. As liberal thinkers, they view all the other possibly higher activities as private matters that are of no concern to the state.

As Solomon presents the case, commentators like Carr and Friedman are in ultimate agreement with Aristotle that business is not a highly moral or admirable activity, but unlike the Greek philosopher, they are prepared to make a vigorous apologia for it. The activities of business are required in contributing to the overall well-being of society. What more can be asked of a system of production, distribution, and exchange? Stated another way, Carr and Friedman have accepted Aristotle’s separation of business from high moral standards as practically valid and have sided as a matter of economic philosophy at least, with the lower pursuits of commerce, if not against the noble things. The noble things may or may not have their role in the culture, but their status and standing are of no concern to business.⁷ Solomon, by contrast, would say that both the high-minded antibusiness view, such as we see reflected in Aristotle, and the practically minded probusiness views we see in Carr and Friedman are equally wrong in portraying business as little more than gambling and unreconstructed selfishness.⁸

Dual Citizenship?

Breathes there the man with soul so dead/Who never to himself hath said/This is my own,
my native land! . . . The wretch, concentred all in self/. . . doubly dying, shall go down/To
the vile dust from whence he sprung, Unwept, unhonour’d, and unsung. (Sir Walter Scott –
Lay of the Last Minstrel. Canto VI, Stanza i)

Solomon suggests that the schism between business and the rest of life is something which Aristotle could not accept because he thought life was supposed to fit together in a coherent whole. As it happens the “same holistic idea” is in fact at the root of business ethics. Today, it is understood that business people and corporations are first of all part of a larger community ([15], p. 323). He explains that what is best in us, our virtues, are in turn defined by that larger community, and there is therefore “no ultimate split of antagonism between individual self-interest and the greater public good.”⁹ Solomon readily allows that there were no corporations, as we would understand them, in Aristotle’s time. He also acknowledges that modern corporations differ from ancient *poleis* in that they are not isolated city-states. This dissimilarity holds even with respect to the biggest and most powerful multinational enterprises of our time. Indeed, large companies such as Exxon, Wal-Mart, and Microsoft, though they might dwarf the classical *polis* in terms of population and economic output, are in fact part of a “larger community,” rather than being free-standing and sovereign entities like the Greek *poleis*. Solomon explains that the people who work for corporations are in fact “citizens of two communities at once” ([15], p. 323). He makes the perplexing observation in this context that “one might think of business ethics as getting straight about that dual citizenship” ([15], p. 323). But what is the identity of the second community to which Solomon thinks the people who work

for corporations belong that roughly corresponds to the Greek *polis*? Solomon's answer is that they are "part and parcel of a larger *global* community" (my emphasis) ([15], p. 323). The meaning is unmistakable here: Solomon defines the citizenship of the corporate employee as dual in the sense of holding a passport from the company and a passport from the globe. Solomon's "neo-polis" that transcends the business corporation is not a municipality, state or province, or even the country of which the corporate employee is citizen either by birth or naturalization. Rather, the "neo-polis" is the "larger global community."

Yet Solomon is talking about something that does not in truth exist. The global order is divided up into roughly 200 sovereign states. Of one or another of these units, virtually, every human being on the planet is a citizen. If there are dual citizens, it is usually because some individuals have been born in one country and live and work in another. What Solomon has left out completely from his discussion is the fundamental unit of citizenship since the Enlightenment, American Independence, and the French Revolution, that is, the nation-state.¹⁰ If there is any sense in which the corporate employee is "civic" above and beyond his or her place of work, it is in their role as a citizen of a particular state as distinguished from other states. Beyond this, in other jurisdictions, such an individual would be classified as a foreigner. If there is anything that might remotely be classified as Aristotelian and as calling forth more than private concerns, it is the modern nation-state, an epochal phenomenon Solomon leaves entirely out of account.

Corporate employees, then, may indeed be part of a "larger community," but on the practical plane, it is manifestly not the role posited by Solomon. They may be called away from their jobs but not by the "larger global community" but by, say, an emergency in their own country. Or they might be summoned to serve in their country's armed services because of the outbreak of war. Perhaps, incidentally, they might serve the U.N. should their country have made a commitment of troops for peace-keeping duties. In general, though, if a corporate employee is going to be "civic" – vote, run for office, join a political party, etc. – it will be on the municipal, regional, or national level and not the international. This accords with Aristotle's view insofar as he focuses on local attachment and rootedness in a particular community as the essence of civic virtue. By contrast, Solomon's virtuous business person is *heimatlosen* (homeless) in Martin Heidegger's terms. He is without *Bodenständigkeit* – "rootedness."¹¹

But Solomon is forced to erase the nation-state from the picture and substitute corporate communities within a globalized order. For to the extent one allows that it is the nation-state that is the proxy of the classical *polis*, Aristotle becomes exceedingly problematic as a proponent of business ethics. Thomas J. Lewis has made this evident in his discussion of the problem of the *polis* and private institutions [22].

Polis Life Versus the State Within a State

Discussing the question of acquisition, Thomas J. Lewis acknowledges "the process of retail trade, the buying and selling of commodities – the middleman

function – including the lending of money at interest, is condemned (by Aristotle) as an entirely unnatural mode of acquisition” ([22], p. 76). According to Lewis, this is because acquisition should be sufficient to allow the household to sustain the political life of its head. The pursuit of wealth should minimize the anxiety of the head of the household, while enabling a path of transition from the household to politics. Aristotle stands opposed to market exchange because the market cannot satisfy the need to be free of worry about one’s finances ([22], p. 76).

Lewis explains that, for Aristotle, the necessity of continuously increasing acquisition is a “perversion” which obliterates the proper end of acquisition and converts the means into a pseudo end. This could lead to the subversion of the state by private interests who might be tempted to persuade fellow citizens to commit their resources to commercial and military enterprises designed to further their personal agendas. Indeed, there is a potential for a number of households to corrupt the *polis* itself, by rendering it into an essentially economic and military institution devoted to acquisition and the maintenance of livelihood.¹² The private household or collection of households cannot be allowed to be a state within a state pursuing its own goals unsanctioned by the community. Such is Aristotle’s version of Corporate Social Responsibility, Lewis might say.¹³ The corporation’s responsibility is not to exist. Aristotelian citizenship automatically implies that the individual could never think of themselves as being free or independent enough to identify their interests with those of an employer or private economic organization against those of the state. From an Aristotelian point of view, the choice between the state and a private corporation would be no choice at all.

Lewis notes that Aristotle’s economics involves the participants in the life of the *polis* having the opportunity to reject market acquisition, “both in the relatively private sphere of household concerns and in the public sphere” ([22], p. 86). The latter decisions need to be made regarding the acquisition and management of the material resources of the *polis* as a whole. But with respect to those such as craftsmen who may not be in a position to freely reject market exchange, Aristotle favors the establishment of an environment distinguished by customary rights and obligations within which prices would be generally settled.¹⁴

Lewis’s analysis of Aristotelian economics reminds us that whatever else might be said about Aristotle’s amenability to the world of business, he is not a “capitalist” or free market thinker *tout court*. Thus, the tension between Aristotle’s ethics and today’s world of business and finance has always to be kept in mind. Lewis’s analysis helps us to see that Aristotle’s economic writing was an attempt to bring the exchange process under political control. Aristotle wished to make use of the exchange process rather than allow the community to be dominated by it. For Aristotle, business ethics is about the political rule of economic activity. For many business ethicists today, however, it is more about self-imposed ethical guidelines operating within a sphere which expects to be free of political control as long as it operates within the parameters of settled law ([22], pp. 89–90).

Social Science Versus the Natural Approach

If Lewis takes Aristotle very seriously with respect to the Greek philosopher's influence on our understanding of the relationship between economics and politics, for Allen Buchanan, it is in fact Robert C. Solomon who has taken Aristotle too much to heart. Buchanan claims that Solomon is looking in the direction of Aristotle for guidance on such vital questions as "mindless conformity and careerism" and "nurturing creativity and a commitment to general prosperity" and in so doing is making a mistake [26]. This is because these questions can all be better posed and pursued beyond the moral architecture of Aristotelian metaphysics [26].

Thus, Buchanan criticizes Solomon for invoking a teleological view of morality. In other words – ethics, business, or otherwise – have no natural footing and are a matter of pure convention, habit, feeling, or taste. The root of Buchanan's stance is evident when he criticizes Solomon for failing to provide support from the social sciences for his main claims about the role of the virtues in facilitating cooperation within organizations. Without such support from the social sciences, Buchanan argues that Solomon's project must lack credibility, especially among business faculty who, for the most part, tend to be trained in mathematical and empirical methods. By not providing a remedy for this oversight, according to Buchanan, it is inevitable that the virtue approach to business ethics will be marginalized in the very environment in which it could have the most impact.¹⁵

Accordingly, Buchanan's solution is to resort to the social sciences, the basis of which is the famous fact/value distinction or the inability of scientific reason to make claims to moral or ethical knowledge. For Buchanan, no concept of natural purpose should be allowed to broaden the environment within which to pursue ethical instruction. Buchanan's business ethics is about the *is* of empirical social science and not the *ought* of anything like Aristotelian teleology. We have no space here to go into the libraries full of discussion of the *is/ought* and *fact/value* distinction led most famously by David Hume and Max Weber. Suffice it to say that to exclude value judgments from business ethics is to assume that the matter is closed when this is far from being the case.¹⁶

For his part, Denis Collins sides with Buchanan over against Aristotle's naturalism. Aristotle's three major social premises – the naturalness of the state/polis, the political nature of man, and the state/polis's practical encompassing of the individual – have issued in premises the fallaciousness of which has been diligently demonstrated by various philosophers. Collins is sure that "Aristotle would have been on more solid ground if he opted for arguing that the state exists by convention." Unfortunately, however, Aristotle appears intent on demonstrating that his *telos* is grounded in nature. For this reason, Collins says we may choose either to toss these theories aside as examples of what happens when personal prejudices infuse the construction of a theory of nature, or we could see these three concepts from the perspective of convention. Collins opts for the convention approach and then tries to reconstruct an Aristotelian argument defending the existence and legitimacy of modern corporations [28]. In other words, Aristotle may be used for business ethics provided he is uprooted from the very soil in which he planted all his

arguments, that is, the natural ends of man. As such, “community” is a central term in Buchanan’s discussion but not so “natural purpose” ([26], p. 94). Buchanan’s community makes no claim to natural purpose, or, stated in another way, his community is somehow meaningful precisely because it is a purely conventional creation having no *raison d’être* intrinsic to itself beyond the passing whims and preferences of its members who may or may not be community minded.

Even though Buchanan leans in a communitarian direction, he nevertheless praises Solomon for refraining from “indulging in abstract speculations about the virtues of fifth-century Athens or pining for highly idealized nineteenth-century American town meetings.” Thus, it is that “we can concentrate on understanding actual communities about which we know or can know, a great deal, and which are truly relevant to our lives.”¹⁷ But was not fifth-century Athens a real community? And do we not know a great deal, indeed a very great deal, about the life and thought of fifth-century Athens via the works of Aeschylus, Euripides, Aristophanes, Thucydides, Plato, Aristotle, and others? And was not the nineteenth-century American town meeting an actual event which was observed and highly praised in Alexis de Tocqueville’s classic study of American democracy?¹⁸ Moreover, Buchanan fails to explain why the particular communities which he feels to be more authentic than classical Athens or the New England township are more relevant to our times. Is it imaginable that the life and events of a modern business enterprise could have more to teach us than the works of the Greek authors or an observer of American democracy like Tocqueville? There seems to be a certain hint of parochialism in Buchanan’s approach.

For their part, Claus Dierksmeier and Michael Pirson appear more sanguine about what Aristotle can say about business ethics ([23], p. 421). According to these authors, the distinction Aristotle makes between *oikonomia* and *chrematistike* “makes or breaks individual well-being, the wealth of households, and the welfare of the state” ([23], p. 421). Such a distinction is a helpful tool for thinking through such questions as business ethics, Corporate Social Responsibility, management theory, social entrepreneurship, self-regulation, and corporate governance. Dierksmeier and Pirson emphasize Aristotle’s overall condemnation of the idea that economic life could be severed from moral or political concerns. Aristotle teaches us that households and organizations are not atomistic entities first and then later related to their social, cultural, and political contexts ([23], p. 421). Aristotle in fact immediately casts the individual as a political being before he is anything else. For Aristotle, then, the household is integrated into the life of the *polis*. By extension, it is a mistake to view corporations as “profit machines” first and then to pose the question of whether they have social obligations. On the contrary, Dierksmeier and Pirson say that firms should be seen from the outset as in fact corporate citizens and thus naturally invested with certain social responsibilities.

Dierksmeier and Pirson seem to have Milton Friedman in mind when they say that “Longstanding management wisdom holds that fiduciary duty all but precludes environmental, social, or governance considerations in institutional investment decisions” ([23], p. 424). But for them, it is clear that Aristotle makes no such separation, because for him, business is an embedded part of society, and this status

needs to be reflected in its strategic decision-making. They say that goal setting in business is an “oikonomic” process, and as such, it encompasses ecological, social, financial, and intergenerational concerns. “Oikonomic” businesses (good) as opposed to “chrematistical” businesses (bad) are concerned with overall well-being rather than responding to the demands of any particular interest group. To aim at profit maximization alone is a flawed strategy according to Dierksmeier and Pirson because it goes beyond the “oikonomic” level in the direction of “excess.” By contrast, strategies based on an “oikonomic” foundation will be “virtue-based and moderation-oriented” ([23], p. 425). So Dierksmeier and Pirson enlist Aristotle in the cause of Corporate Social Responsibility on the grounds that for Aristotle man is a “political being” for whom household life is integral to *polis* life. Dierksmeier and Pirson basically state that the business corporation is a kind of enlarged household and therefore also political in the sense that it encompasses ecological, social, financial, and intergenerational concerns.

Living Blessedly in Business

Dierksmeier and Pirson do not hesitate to make a value judgment about the moral superiority of the *oikonomic* over the *chrematistical* approaches in business. Opposed to them stand such commentators as Buchanan and Collins who seek a “value-free” business ethics. Dierksmeier and Pirson’s “moralism” situates them outside the scope of Buchanan’s empirical social sciences which by definition are forbidden to make any judgments of value such as would privilege Corporate Social Responsibility over corporate rapaciousness and irresponsibility let alone “teleological” judgments as to the noble and base such as we are likely to see in Aristotle. And what is of the essence for Dierksmeier and Pirson is a misguided exercise for Collins who proceeds by simply asking “Why all the hassle with trying to mesh the function of business (making a profit) with the goal of society (a virtuous life)?” ([28], p. 571). In Collins’ view, the main issue from Aristotle’s point of view is “stability” because this question is at bottom the question of the most desirable life. “For stability to arise,” Collins explains, Aristotle requires that “we must first decide what is the most desirable life, for if we do not know that, the best constitution is also bound to elude us” [31]. From here, Collins proceeds to the claim that for a corporation to maintain stability, it must be part of a community in which everyone is able to prosper and live blessedly. This community would include the CEOs, workers, and society at large. In this way, it could define its purpose (as) not merely to provide a living but to “make a life that is good” ([28], p. 571).

But in making his case, Collins does not attend to the very words of Aristotle that he cites. While he does indeed quote Aristotle’s point about identifying the good life, he does not take us through the stages of discussion that lead us to his ultimate conclusion that philosophy or the *bios theoretikos* is indeed the most desirable life. This progression leads to the inevitable question as to the relation of the business corporation to the life of philosophy or “science” (*episteme*). Without confronting this question, it seems premature for Collins to state that “I have demonstrated that

it would be improper to use Aristotle's thought as a blanket disapproval of business and profits" ([28], p. 571). Collins is sure that "There are no valid reasons for philosophers to simply assume that Aristotle would be anti-business and anti-profit today based on conclusions he reached 2,000 years ago."¹⁹ This claim of Collins will meet with resistance from other commentators on the nature of Aristotle's "commercial" thought.

Tomas Kavaliauskas, for example, says that the attempt to apply Aristotle's virtue ethics, alongside the drawing of an analogy between the corporation and *polis*, is "artificial" [33]. Kavaliauskas explains that for Aristotle, the divine element in life consists in contemplation, the defining activity of a wise person. A life of *theōria* is available to us because we possess mind (*nous*), and this is the element of our existence which transcends the concerns of "earthly life." Kavaliauskas argues that by definition, the corporate community is not inclined to encourage its members to transcend an intense concern with the daily events of this world, for such a concern is at the heart of economic life ([33], p. 16).

Kavaliauskas's point is that the end or purpose of a business enterprise is not a virtuous life but economic efficiency and profit. As such, it can only see virtue as "a means to good business" ([33], p. 16). But in the ethics of Aristotle, the end is not economic efficiency and profit but a virtuous life. In the contemporary corporation, the ethical locus has shifted from the autonomous individual as pursuing a virtuous life to the larger unit of the corporation, taking on the role of a moral institution. As Kavaliauskas sees it, this shift contradicts the original intent of the *Nicomachean Ethics* in which eudaimonistic happiness is reserved for the highest moral institution, namely, "the singular individual, who discovers virtue on his own" ([33], p. 16).

If Kavaliauskas is correct, then Messrs. Solomon, Buchanan, Collins, Dierksmeier, and Pirson could be accused of some startling distortions of Aristotle's arguments. But perhaps, such a confusion is only to be expected given Aristotle's paradoxical stance that, on the one hand, the individual belongs completely to the city while, on the other hand, that the highest reaches of human intellectual, and therefore ethical, consciousness are only accessible at the individual level.²⁰

The Vita Contemplativa Versus the Vita Activa

From Kavaliauskas's point of view, therefore, Solomon, Buchanan et al. have failed to recognize that Aristotle's conception of the good life is not identical to a life lived in a corporation, which is of the sort where, as Denis Collins suggests, everyone is able to prosper and "live blessedly."²¹ [28]. But to talk of living well, in Aristotelian terms, is to refer to a condition of such transcendence that it takes the individual beyond even the all encompassing questions of political life such as justice, equality, law, and government. Obviously, the narrower concerns of the business world such as profit, efficiency, productivity, operating costs, sales statistics, and so on would be at an even greater distance beneath the blessed condition of Aristotelian *eudaimonia*.

This blessed condition is contemplation. Man has *nous*, and this allows him to utterly transcend the realm of his practical circumstances. In this sense, the modern corporation, while obviously not unconnected to certain necessary activities in modern life, diverges from Aristotle's vision of human excellence. This is because the telos of a business enterprise is not to find a CEO for the top floor office who is distinguished by his or her ability to contemplate the swirling current of human activities on the streets below or to meditate on the orbits of the heavenly bodies above. It is rather to find an individual that will most likely enforce financial discipline, raise workplace productivity, and thereby enhance profits. For Aristotle, such activity is meant only to be a means to the *eudaimonia* that comes from the highest form of intellection or contemplation. The very name "corporation" or "company" is indicative of the gap between Aristotelian and business ethics in that for Aristotle, the crown of the whole process of ethical education and human development is a unique individual condition and the person in this unique condition has no "company" so to speak.

Aristotle's ethics is ultimately about the autonomous individual who emerges only at the end a long and arduous process of intellectual and philosophical training. Business ethics on the other hand tends to be very much a "corporate" enterprise, a set of behavioral principles to be internalized by all members of the firm from the mail room to the board room. Business ethics is likely to invoke the ethical solidarity of the group. An ethical consensus is needed among the personnel within the corporation as part of building the particular esprit de corps which informs its daily activities. Yet ethical "team spirit" in a profit-seeking entity is one thing; individual philosophical contemplation is another. The modern corporation might well rival, if not surpass the Aristotelian *polis* in terms of population and economic output many times over, but by definition, it is excluded from attaining the goal posited by Aristotle for the *polis* and therewith the human race, that is, thinking about thought "thinking itself" (*noesis noeseos*) [35]. Aristotle says:

Happiness (*eudaimonia*) extends, then, just so far as contemplation (*theoria*) does and those to whom contemplation belongs (*uparkei ta theorein*) are more truly happy, not as a mere concomitant but in virtue of the contemplation; for this is in itself precious (*aute gar kath autein timia*). Happiness therefore must be some form of contemplation . . . in this way too the philosopher (*sophos*) will more than any other be happy.²²

In saying that happiness is contemplation, Aristotle also insists that although man is not self-sufficient like the gods, he must have "bodily health and a supply of food and other requirements" [36]. But he immediately adds that it must not be supposed for this reason "that happiness will demand many or great possessions." "One can pursue noble virtue (*prattein ta kala aretein*) with moderate resources" (*metrion dunait*) [36]. Aristotle teaches us that we need sufficiency of equipment (*loipei therapian uparkein*) to lead the best life possible for human beings. We cannot all be philosophers, but neither do we all need to be rulers of land and sea. Indeed, private citizens "do not seem to be less but more given to doing virtuous actions than princes and potentates" ([36], p. 1279a7-8). Business ethics on the Aristotelian view would require that individuals and corporations not see business

activity and economic enterprise as a means of becoming “princes and potentates” but to becoming *philosophoi* and *sophoi*. To be sure, such a change in orientation would lead to a serious slackening of the economy. But Aristotle would hasten to remind us that the economy is not coterminous with the political community but a means to the continued existence of that community which only truly comes into being if we are seeking to share in a flourishing existence.

But is it not a fair thing to say there is no such thing as seeking “moderate profit” in the business world? Profit maximization is the key term in modern economics. Why should this be so? It is because the life of contemplation is not the goal (*telos*) of modern business. In short, as we have seen in his distinction between *oikonomike* and *chrematistike*, Aristotle’s ethics above all rest on a notion of “limit” (*peras*). Given this fact, Aristotle’s key question would be: Are we in a position to get by with what we have? For to seek more would be to take on encumbrance that interferes with the time needed to bring us closer to the good life. Bring *theoria* and *philosophia* into the picture and the endless pursuit of profit maximization comes to sight as a diversion from the best things of life. Conversely, if we remove *theoria* or the life of philosophy from the picture, then unlimited acquisition admittedly appears more reasonable and, with it, the minimal ethics of “injustice avoidance” and formal contractual honesty.

Varieties of Individualism

The above observations from the field permit us to return to Robert C. Solomon and his suggestion that Aristotelian ethics involves the cultivation and encouragement of individual virtue and integrity. But here is the critical point: Solomon defines individual virtue and integrity as not being “anti-individualistic in any sense of ‘individualism’ that is worth defending” ([15], pp. 320–323). Solomon’s version of individual virtue and integrity is compatible with his own specific and carefully defined version of individualism but not with other versions of individualism that are, as he puts it, “not worth defending.” Presumably, the form of individualism which he sees as unworthy of defense is the egoistic individualism such as is sometimes associated with names like Bernard Mandeville, Max Stirner, Ayn Rand, or Milton Friedman.²³

But Solomon’s “individualism” would not comport with that of Aristotle. While Aristotle insists on individual transcendence via contemplation, his starting point is to place the individual fundamentally in a context of collective solidarity. Is it possible that business ethics could be built on the premise that all citizens belong to the state (*polis*) or civic community if not in some ultimate sense then at least to all practical intents and purposes? Aristotelian virtue would in effect mean the annihilation of the kind of individualism here intended by Solomon even if it is an individualism which attenuates the egoism of the likes of Mandeville,²⁴ Stirner, Rand, and Friedman. Aristotle is famous for having said that “one ought not even consider that a citizen belongs to himself.” This is because all citizens “belong to the city (*pantas tes poleos*) for each individual is a part of the city” and each part

“naturally looks to the superintendence of the whole (*to olou epimelian*).” The upshot is that the training that each citizen receives should be made common (*tauten koinen poieteon*) ([31], p. 1337a21–32). The citizen should be educated “for the character that is proper to each sort (of regime). For the character that is proper to each sort of regime both customarily safeguards the regime and establishes it in the beginning” ([31], p. 1337a11–12). Hence, “the best character is always the cause of the best regime.” While Aristotle is indeed an individualist believing that the individual philosopher can rise above the human condition in the direction of the divine, he is not an individualist in the sense that this term tends to be taken today.²⁵ The individualism of Aristotle’s philosophy consists in a higher individual condition represented by the life of philosophy. This higher individual condition, obviously enough, emerges temporally speaking after the political and legal structure of the *polis* is completed. This kind of transcendental individualism which is more or less unconnected to political rights individualism goes undiscussed by Solomon, presumably because it has no place for the business world even if it does form an object of emulation with some scholars in the modern university, research institute, or think tank.²⁶

Solomon denies the fundamental difference between Aristotelian or ancient political philosophy on the one hand and modern liberalism on the other. This difference is rooted in the fact that for the ancients, there was no seamless transition from individual self-interest to the good of the whole. The individual had to be molded to consider the public interest in defiance of his very own selfish concerns and desires. This transformative process is most usually symbolized by the name of “Sparta” which name is synonymous with the idea of turning natural man into civic man through a rigorous training from the earliest age.²⁷ It is Solomon’s passing over the “Spartanism” of classical thought which allows him to come to the very strange conclusion that in fact it is not the “modern” Immanuel Kant who is most suitable for training in business ethics but the “ancient” Aristotle.

“A Dozen or So Bright, Restless Corporate Managers”

Solomon suggests that Aristotelian ethics is more relevant in our modern culture than that of Kant, the German thinker whose very intention was to address the moral condition of modern liberal society. Solomon describes Kant as taking “everything of significance to be a matter of *rational principles*.” Kantian morality, he says, implies “a sense of duty to the moral law.” For Aristotelian ethics, however, the practice of reasoning about our actions and of formulating general moral principles is subsequent to the cultivation of character ([15], pp. 317–319). Furthermore, Solomon explains, Aristotle defines duties not in terms of any abstract ratiocination, principle of contradiction, or a priori formulations of the categorical imperative, but rather in terms of the particular roles we might play in any community to which we might belong, for example, a corporation. For this reason, Solomon claims, Kant has proved to be a kind of “disease in ethics.”

Kant's ethics may very well be elegant and even brilliant, but when one is faced with "a dozen or so bright, restless corporate managers" waiting in the seminar room for someone to teach them about the ways in which the latest developments in business ethics are relevant to their concerns, then Kant fails to meet the occasion ([15], pp. 317–319).

And then we tell them: don't lie, don't steal, don't cheat – elaborated and supported by the most gothic non-econometric construction ever allowed in a company training center. But it's not just its impracticality and the fact that we don't actually do ethics that way; the problem is that the Kantian approach shifts our attention away from just what I would call the "inspirational" matters of business ethics (its "incentives") and the emphasis on "excellence" (a buzz-word for Aristotle as well as Tom Peters and his millions of readers). It shifts the critical focus from oneself as a full-blooded person occupying a significant role in a productive organization to an abstract role-transcendent morality that necessarily finds itself empty-handed when it comes to most of the matters and many of the motives that we hear so much about in any corporate setting.²⁸

Amazingly, Solomon distances Kantian ethics from the business sphere and attempts to bring Aristotle closer to it. Yet it is precisely Kant's transcendent system of morality that is designed specifically for the mentality represented by "bright, restless, corporate managers." One can make this claim because it is evident that this kind of individual is not an obvious candidate for an attitude of Olympian contempt for money-making, utility, efficiency, and work. If anything it is Kantianism that might impress "bright, restless corporate managers" as an ethical doctrine attuned to the highly complex, technological, and science-based world of modern business and modern individualism. Kant very obviously developed his ethical system for the modern, enlightened society which he knew would very much be populated by people who have been taught to reason and calculate in precise and technical ways and so will appreciate the precision and elegance of his ethical solutions.²⁹ Kant's categorical imperative is available at any time and at any stage of adult life and in any practical situation. Perform the mental exercise involved and the moral answer will potentially emerge.

Solomon's problem is that Aristotle as a philosopher is more alien to the commercial and business environment than Kant. The latter challenges modern "consequentialism" in the name of moral intentionality and a good will. Kant insists that the maximization of pleasure and happiness and the minimization of pain and suffering can conflict with the doing of one's duty to others. In such a situation, he says, the rational and enlightened citizen will choose to focus on his or her duty. Surely, such a clear response to the "utilitarian" tendencies of modern commercial morality will be reasonably comprehensible to modern students highly trained in subject areas under the influence of modern social science methodology. This is not to say that Aristotle's placement of the "*to kalon*" at the center of all moral reflection would have no potential to appeal to the modern ethics student in general, if not the "bright, restless, corporate managers." Certainly, this is the view of Christian Hoff Summers. But her reflections on the teaching of ethics suggest a radically different approach to that of Solomon whatever their agreement on the centrality of Aristotle.

Approaching Ethical Education

Hoff Summers agrees with Solomon that in respect of ethical education, “Aristotle is the best place to begin” and even goes so far as to say that he should be “the *locus classicus*” for the teaching of the subject [47]. Unlike Solomon, though, she does not for this reason even remotely suggest that Kant is “a kind of disease in ethics” ([15], p. 318). Rather, she says that on matters of virtue and vice, Kant should be studied along with Augustine and even Mill. Hoff Summers is not interested in the matter of a simple choice between Aristotle and Kant or any other philosopher because she is more focused on the potential of literary classics for the effective teaching of ethics. In this respect, works such as *King Lear*, *Oliver Twist*, *Huckleberry Finn*, or *Middlemarch* should be at the core of ethical education in Hoff Summers’ view. Such books require that the reader have some understanding of, and sympathy with, what the author is saying about the moral ties that bind the characters together. He or she needs “to gain a sense of the bonds which hold the social fabric in place and in which people play their roles.” *King Lear*, for instance, shows us “that society cannot survive when filial contempt becomes the norm.” In this way, literary figures can “provide students with the moral paradigms that Aristotle thought were essential to moral education.”³⁰

Whatever the emphasis placed on literature by Hoff Summers as vital to ethical education, it remains true that literary insight cannot simply replace philosophic analysis. Still, literary input can be helpful to a very large degree. Just as no philosopher would simply say that studying the work of Ludwig Wittgenstein, Alfred North Whitehead, Bertrand Russell, or William James could relieve one of the duty to consider the literary explorations of D.H. Lawrence, James Joyce, T.S. Eliot, or Ernest Hemingway, so no *litterateur* could seriously argue that having read D. H. Lawrence’s discussions of the man-woman relationship or F. Scott Fitzgerald’s thoughts on human failure necessarily relieves one of the duty to read Kant on the limits of reason or Spinoza on the nature of “substance.” Yet a knowledge of the literary approach to the human condition in all its triumph and tragedy, as may be found in the works Charles Dickens, Gustave Flaubert, Fyodor Dostoevsky, Anthony Trollope, and any number of others, can only serve to enhance the meaning of the more technical and abstract discussions of the “pure” philosophers. The educated person needs to read Kant alongside Goethe, Mill side by side with Dickens, and Lawrence together with Heidegger. The promise of a mutual illumination of the two dimensions of mind represented by literature and philosophy makes the combined approach well worthwhile.

For all that no one will deny that there is a gap or distinction between the literary mode of philosophizing and the philosophical literary style. The first, of course, aims to reproduce the immediacy of concrete experience while the second deploys concepts that are often at a certain remove from the direct experience of life. At the same time, though, literary productions can put some human flesh on the hard abstractions of the philosophers, while the tools available to the philosophers can be of great use in analyzing the insights of the literary imagination. The most sensitive and perceptive observations of the literary eye can be conjoined to the most

advanced and sophisticated concepts known to speculative reason for enhanced results in both philosophy and literature.

Allowing all this, Hoff Summers is certain that with respect to the teaching of ethics “casuistry” is not the place to start. Such an approach tends to involve “an exclusive diet of dilemma ethics.” Such a diet has a tendency to give the student the impression that ethical thinking is “a lawyer’s game,” and at the end of the day and taken by itself, dilemma ethics provides little or no “moral sustenance.” Hoff Summers is quick to add that she would not go so far as to say that puzzles and dilemmas can play no role in the effective teaching of ethics. She would be the first to allow that students of ethics should be exposed to rigorous logic and precise reasoning as essential to any discourse designed to deal effectively with questions of moral principle. But she also acknowledges that if moral edification is indeed a vital part of ethics education, then the questions “What sort of course in ethics is effective?” and “Which ethical teachings do the most to edify the students?” must be asked. In her own experience, Hoff Summers has found a course on the philosophy of virtue is the right path to take in response to these questions.³¹ Her point is that ethics is about virtue and virtue is about philosophy classically understood.

The question posed by Hoff Summers’s pitting the philosophy of virtue approach, which she ties to the tradition of great literature, against the dilemma ethics approach and by implication the social science approach along with it, is whether effective ethical consciousness raising can take place without the educationally hovering presence of the highest happiness as understood by Aristotle. The issue might be stated as asking whether effective coaching and training in cycling and hockey can take place without the heroes of the *Tour de France* and the Stanley Cup as role models for aspiring participants in the sport. This means that if commentators such as Robert C. Solomon seriously wish to connect Aristotelian ethics to the world of business, they will be forced to explain where in the business organization, be it at the managerial or at the employee level, the insistence on the priority of the contemplative life is to be made.

If a Solomon should say that this is an unreasonable consideration because business is manifestly a practical and instrumental pursuit, then is he not obliged to concede that actual business activity is “Aristotelian” in roughly the same sense as someone writing a symphony who never listens to Beethoven or Mozart is engaging in classical music composition? Without the “summit” or “crowning glory” in view, it cannot properly be said that the art is being practiced.

The problem then with the promotion of the virtues in the business realm is that however they might be denominated – either using classical words like “wisdom,” “justice,” “moderation,” and “courage” – or in the more “updated” parlance such as “trust,” “self-control,” “empathy,” “fairness,” “truthfulness,” (and) “cooperation,”³² they are interpreted ultimately as virtues *for* business, that is, for the sake of efficiency, utility, and profit. But for Aristotle, the relationship is reversed – if any efforts are made in the direction of efficiency, utility, and profit, they should be for the sake of virtue defined as an end in itself, however far down the road this virtue might be. Given the inversion in the meaning of Aristotelian virtue involved

in praising various human qualities that are acknowledged by all to be admirable as means to commercial success, the most that can be said is that business ethicists wish to enlist the authority of Aristotle in the service of an ethical culture in the commercial sphere. But in order to make this program plausible, they are forced to produce a version of Aristotle that has been chopped down on a Procrustean bed constituted by the general psychology of business and commerce, a version that might recall the quip that “the operation was a success but the patient died” ([16], p. 13).

Conclusion

“The Man Who Knows”

If the goal of virtue ethics is to mold and cultivate human beings as a gardener does a rosebush in order that they develop into a hoped for perfect specimen, then the principal-agent relationship such as usually exists in a business enterprise will have little potential to complete the task. The deepest moral formation of individuals is a task that only the political community can undertake. Thus, it is that when asked by a father how his son could be brought up in virtue, the philosopher is said to have answered: “Ensure he grows up in a city with good laws.” Going by what Aristotle says, these laws would sooner or later have to entail the opportunity for the individual to be placed in front of “the man who knows” (*all eiper tinos, tou eidotos*). This is because he is clear that in order to get any one “into the right condition” (*protethenta diathenai kalos*), it is not simply a matter of putting the person in the care of “the first chance comer” (*esti tou tuchontos*). If it is possible at all to get a human being “into the right condition,” it has to be in connection with “the man who knows” (*eidotos*). If the ill person must be placed in front of a physician to improve his health, then the individual who is to be trained in “matters which give scope for care and prudence” (*epimelia kai phronesis*) must be placed under the influence of the virtuous teacher [36]. But is this person likely to be in the HR Office at a corporation or on the company staff as a consulting industrial psychologist? It is of course a possibility that “the man who knows” could be found in a business environment. After all, the poets Wallace Stevens and T.S. Eliot worked in *Hartford Accident and Indemnity Company* and *Lloyd’s Bank*, respectively.³³

But even allowing this possibility, we have to ask ourselves how often is it that a poetical soul such as Wallace Stevens or T.S. Eliot is found in general society let alone in a business context. We would also have to ask ourselves about the odds of a twenty-first-century Stevens significantly influencing today’s *Hartford Accident and Indemnity Company* which has an annual revenue of roughly \$3.4 billion and employs a staff of approximately 26,000, or a twenty-first-century T.S. Eliot shaping the ethical culture of what is now known as *Lloyd’s Banking Group* whose profit before tax in 2010 was 2.2 billion pounds and which counts among its 3,000 branches in the United Kingdom alone.

But education at the workplace is an idea that goes back to the great reformers of the nineteenth century who saw clearly how the working populations in the new factories were in need of exposure to both virtue ethics and basic knowledge. In this tradition, it would be perfectly sensible and wise for the Director of the Ethics Office at any company to attempt to establish a lunch time or after work routine of readings of literary and philosophic works suitable to the situation of both management and employees. Such a company officer might also recommend that for the sake of both pleasure and instruction, all employees should attend a monthly screening of video productions of works by, say, George Bernard Shaw and Anthony Trollope, to name just two authors who would relate well to the field of business ethics training.

To be sure, the pace of modern commercial life is rapid so such measures seem problematic on the face of it, and of course, there can be no penalties in the modern workplace for nonattendance at these kinds of events because coercion with respect to cultural preferences is outside the bounds of company authority. But Aristotle himself said “All human beings by nature desire to know,”³⁴ and those who inhabit the corporate or business environment are human beings just as much as were the Athenians walking by Aristotle’s *Lyceum* two and a half millennia ago. To encourage ethics in the business workplace then should involve increasing the opportunities for management and employees to grow in all kinds of knowledge which, while perhaps only indirectly related to their workplace functions, is definitely related to their self-improvement as human beings. And what business does not want better human beings to be found in its offices, hallways, and boardrooms?

Abstract

Despite the fact that, for historical reasons, Aristotle could not have known about the modern corporation, there is sufficient basis in his *Politics* to afford us a glimpse of his probable thoughts regarding its nature, place, and function in society with regard to human flourishing (*eudaimonia*). Corporations are, on the one hand, artificial and imperfect societies. On the other hand, they are intermediate bodies between the family and the state dedicated to the pursuit of economic ends, that is, the large-scale production of goods and services. A central concept in Aristotelian politics is that of citizenship. We explore two ways in which this can be applied to the corporation: (1) by viewing the corporation itself as a citizen of the polity and (2) by conceiving the different stakeholder groups as citizens of what one might call the corporate polity. These are analyzed in relation to currently dominant understandings of citizenship, both liberal-minimalist and civic republican-communitarian.

Introduction

To the extent that Aristotle is brought to bear on discussions of business ethics, it is the *Nicomachean Ethics* his analysis of morals, which is typically mined for insight. By contrast, *The Politics*, Aristotle's renowned inquiry into government, is mostly neglected, except for portions of Book I where the fourth-century-BC Greek philosopher examines trade and household economics. The truth is that *The Politics*

offers valuable insights into current debates about the theory of the firm. This chapter applies these insights in setting forth an Aristotelian understanding of the corporation.

We embark on this task in [section “Governance and Government from an Aristotelian Perspective”](#) by drawing a parallel between politics and corporate governance. The basis for this parallel is that both states and corporations are social institutions composed of different kinds of people organized in particular ways to pursue common ends. It is by comparing and contrasting these ends with respect to states and corporations that we draw an analogy between the two in [section “What Is the Purpose of States? What Are Firms For?”](#). [Section “From Shareholders and Stakeholders to Citizens of the Corporate Polity”](#) explores the usefulness of applying the political concept of citizenship to corporations. This manner of proceeding highlights the social dimension of corporations as an institution, provides them with a source of identity, and offers a justification of the different rights and responsibilities that they possess as legal persons. There are at least two possible readings of the expression “corporate citizenship.” The more widespread, seeing the corporation as a citizen of the state in which operates, will be discussed in the first subsection, “Beyond the Metaphor of Corporate Citizenship.” In the proceeding subsection, “Citizens of the Corporate Polity,” we examine a second, less common, understanding of corporate citizenship, according to which different stakeholder groups are viewed as potential citizens of the corporation, with the latter in turn viewed as an analog of the state. Within the framework of the corporation as a polity, we then examine how well each stakeholder group fulfills the requirements of “corporate citizenship” from both a liberal-minimalist and civic-communitarian perspective. [Section “On Corporate Regimes: Despots and Constitutional Rulers”](#) delves into the analogy that could be drawn between states and corporations on the basis of their regimes or constitutions, as these are distinguished by Aristotle. As such, we can speak of corporate monarchies and tyrannies, corporate aristocracies and oligarchies, and corporate polities and democracies. [Section “Conclusion”](#) concludes.

Governance and Government from an Aristotelian Perspective

Whenever one hears the word “govern” and its cognates, such as “governance” and “government,” the notions of “authority” and the exercise of power and control immediately come to mind. Ordinarily, one also thinks of a political unit such as the state in its dual role as both the subject and the object of governing. The state governs those under its authority, although at the same time, and in the best of cases, those under the state’s authority are also the ones who control the state. Ideally, the state is an instrument through which people subject to its authority govern themselves.

Surprisingly, none of these associations come to mind upon reading the definition of a corporate governance system: the complex set of constraints that shape the ex-post bargaining over the quasi-rents in the course of a commercial relationship [1].

A corporate governance system specifies rules of bargaining over contingent future goods that escape contractual agreements. This distance between what it means to govern and the rules of a corporate governance system further increases in the market context. If the market is responsible for the allocation of resources, what need is there for authority and control, as governing implies [2]?

Any specific notion of corporate governance depends on the theory of the firm adopted [3]. Granted that among enterprises making up the so-called new economy, the importance of human capital relative to physical or inanimate assets has increased considerably, one model construes the firm as a “network of specific investments,” a combination of reciprocally specialized assets and people that cannot be reproduced by the market [4]. All mutually specialized parties such as workers, suppliers, and customers are considered as belonging to the firm. Apart from shareholders or owners of financial capital, other stakeholders are viewed as parties to corporate governance. From this wider perspective, corporate governance becomes the relationship among shareholders, management, and the board as it determines the direction and performance of corporations ([5], p. 1). In particular, it refers to the processes surrounding the election of board members, their compensation, and the evaluation of their task of supervising management. Although this explanation outlines the board’s major functions, it may, however, obscure other dimensions of governance. As Koehn observes, “corporate governance is better understood as the art of governing – in a principled fashion – so as to maximize the welfare of the company and of its relevant stakeholders” ([6], p. 1). Corporate governance problems would be better addressed not only with legal safeguards and economic incentives but also with trust-building institutional practices: “Governing well ultimately means acting in a trustworthy fashion. No company will ever succeed in the long run if it is not trusted by its customers, employees, suppliers, advisors, shareholders, and other important stakeholders” ([6], p. 13). At its core, corporate governance refers to how quasi-rents are *best* produced (in terms of efficiency) and *best* distributed (in terms of justice) among parties in a firm. Since these two tasks are contingent, it is impossible to devise fixed rules beforehand about how future quasi-rents are to be partitioned. Contingency and the absence of rules are essential conditions for corporate governance.

When it comes to defining politics, we often hear that it is, as Harold Lasswell famously put it, basically a matter of deciding “who gets what, when, and how.” This is the essence of the “social contract” on which most modern political theories are founded. Indeed, politics concerns itself with how certain “goods” are produced and how these “goods” are distributed among various claimants. Efficiency and justice thus play important roles. And these political decisions are necessarily made both in the absence of previously set rules and under conditions of uncertainty. They are not the mere execution of directives agreed upon beforehand, and prudence, the knack for making correct decisions taking all the peculiar circumstances into consideration, is utterly crucial. Aristotle’s *Politics* [7, 8] is generally recognized as an obligatory reference for the study of government, particularly, the running of states: “Government. . . is the subject of a single science, which has to

consider what government is best and what sort must it be, to be in accordance with our aspirations.” If corporate governance is essentially government, applied to the firm rather than the state, could we not find it illuminating to study Aristotle’s *Politics*?

While we believe the answer to this is yes, in pursuing the question, we will first have to develop the analogy between Greek city-states and modern business firms. Nowadays, corporations have evolved into economic entities characterized by limited investor liability, transferability of investor interests, legal personality, and professional management ([5], pp. 8–10). For historical reasons, Aristotle could not obviously have imagined such institutions. Since his time, too, governments have largely adopted the formula of Westphalian nation-states – that is, as entities controlling self-contained territories inhabited by people related to each other by blood, sharing the same birthplace and culture [9]. Given these fundamental differences, one might justifiably question whether it really is possible to find meaningful similarities between states and corporations.

Let us recall first that, at their root, both are social institutions with defined objectives. Both states and corporations are composed of a large number of people divided into multiple classes that are hierarchically ordered. Both states and corporations admit a variety of regimes, with particular structures of authority and power. And finally, in both states and corporations, groups of people are organized to pursue a common purpose or end: a political one, in the case of the state, and an economic one, in the case of the firm. We can therefore work out an analogy between states and corporations, marking their similarities and differences as social institutions, on the basis of three factors: the kinds of people who comprise them, the types of organizations or regimes they assume, and the particular ends they seek. Let us begin with this last category.

What Is the Purpose of States? What Are Firms For?

That the governance of corporations is inspired by the government of states is evidenced by the choice of similar terms, even beyond well-known examples such as “management,” “administration,” or even “leadership.” This parallelism has led certain authors to think that “theories of government offer a way of fully understanding the behavior of [...] large corporations” and that “management can only be properly studied as a branch of government” [10]. The problem, however, lies in the fact that “unfortunately, corporate governance is often misconstrued, and interpreted as if its task were not governing corporations but making them more like governments” [11]. Notwithstanding the similarities, corporate governance should not boil down to transforming corporations into the bureaucracies that characterize states.

On account of their end or purpose, states are considered by Aristotle in the *Politics* to be “natural” and “perfect” societies. The state, like the family and the village, is a “natural” society because it stems from an innate tendency in human beings. So too, the family, which arises from the union of man and woman,

is “natural” because it arises in response to a deeply felt need in all human beings to reproduce and have children. The village is also “natural” insofar as the human instinct for self-preservation requires one to look beyond daily needs and adopt a longer-term horizon. The village is, in this sense, like an extension of the nuclear family. Next down this line of “natural” institutions is the state, which results from the union of several villages. Among these three “natural” institutions, however, only the state is “perfect” because it alone is “self-sufficing” for the good life. Only in the state, transcending the family and the village, can human beings truly aspire to live a completely good life. The state thus represents the “end” or “final cause,” the fully developed stage of human existence [8, 12]. For this reason, although the state may be considered chronologically posterior to both the family and the village, it is in ontologically prior to them: “The proof that the state is a creation of nature and prior to the individual is that the individual, when isolated, is not self-sufficing; and therefore he is like a part in relation to the whole” [8, 13]. Individuals, then, just like the families and the villages they form, are like parts with respect to the whole represented by the state. Only in the state can the social instinct in all human beings be fully developed and perfected through the institutions of law and justice. For outside the state, human beings become the most savage and worse of animals [8, 13].

What constitutes the good life? Aristotle offers several complementary accounts. In one, he lists the basic conditions for the preservation of life – food, skilled trades, arms, revenue, the power of deciding the public interest, and justice – while explaining that these can only be adequately fulfilled within the state [8, 14]. Elsewhere, he enumerates the necessary ingredients for a flourishing life: external and bodily goods as well as perfections of the soul, also known as the virtues [8, 15]. He also establishes the proper ranking of these items, noting that external and bodily goods are merely the conditions for the performance of excellent actions, expressed through the practice of the virtues: “the best life, both for individuals and states, is the life of excellence, when excellence has external goods enough for the performance of good actions” [8, 16]. Happiness, a good and flourishing life, comes to sight as characterizing more so individuals of a cultivated mind and character, possessing a moderate share of external goods, than among those who enjoy physical comfort and hold a large fortune but lack the goods of the soul. With the latter, not only do external goods bring their possessors no real benefit but may even cause them harm. In this way, Aristotle clarifies the true character of material goods as being nothing more than means or instruments – their possession and use should attend to a limit established by their purpose, which is the performance of the virtues: “it is for the sake of the soul that goods external and goods of the body are desirable at all” [8, 17].

How does the firm fit within this Aristotelian account? First of all, although Aristotle does not mention business firms and corporations in the *Politics*, we could find allusions to them in the “family connections, brotherhoods, common sacrifices and amusements” [8, 18] that draw human beings together. As opposed to the family, the village, and the state, the firm may be considered an “artificial” society as it arises neither directly nor organically from human nature. Rather, the firm is

based on voluntary bonds of a utilitarian mode of friendship, a foreshadowing of contracts, primarily among citizens of the same state. The firm must be viewed as an “imperfect” society in that it is not self-sufficing for the good life. A corporation is an example of an intermediate body or association [8, 18], situated between individuals and families, on the one hand, and the state, on the other. It is not meant to substitute the family in the provision of daily needs nor the state as the proper locus of complete flourishing. Like other intermediate bodies, its purpose is to furnish some of the means, in this case the goods and services that businesses produce, necessary as a foundation for the good life [8, 18].

Consider another difference between the state and other associations. For Aristotle, the mere fact that citizens of the same or different states band together to defend themselves against an internal aggressor or a common external does not, in and of itself, make a state. Such a union only constitutes a security or military alliance. Neither is it enough to constitute a state that human beings associate solely for the production and exchange of goods, by entering contracts, trade agreements, or commercial treaties. As Aristotle unequivocally affirms, “suppose that one man is a carpenter, another a farmer, another a shoemaker, and so on, and that their number is 10,000: nevertheless if they have nothing in common but exchange, alliance, and the like, that would not constitute a state” [8, 18]. Beyond security and wealth, a state is concerned with the good life, an existence whose essence is to be shared among all citizens. For this reason, the state has to take care that its citizens display political excellence or justice. Security and wealth are conditions with a view to this aim of a good life in the *polis*, “a community of families and aggregations of families in well-being, for the sake of a perfect and self-sufficing life” [8, 18].

How do intermediate groups such as corporations relate to the state? Although intermediate groups are voluntary and contingent, rather than naturally necessary, they are nevertheless vital to achieving the political end of advancing human flourishing. It is not any specific intermediate body that matters but the presence of intermediate bodies as a whole. The appropriate reciprocal relationship between the state and intermediate groups has been called, in certain traditions, one of “subsidiarity” [19]. Both the state and the intermediate groups have their own legitimate objectives and spheres of action. However, they owe each other respect, notwithstanding their respective positions in the social hierarchy. There is a double dimension to the state’s role with regard to intermediate associations. It is incumbent upon the state as the superior-order society to *positively* help, support, and assist lower-order intermediate bodies. Viewed *negatively*, the state should refrain from substituting or absorbing these intermediate associations. By encouraging the growth of these, the state contributes to a healthy pluralism and diversity in society. The state should delegate to these intermediate groups tasks that they are better able to execute, given their closer proximity to the needs and desires of the people. By fostering the legitimate initiatives of intermediate groups, the state makes a more rational and efficient use of resources, focusing on matters such as defense, foreign relations, or the administration of justice that come within its area of competence. Subsidiarity guards against statism in its

many forms: excessive centralization, bureaucratization, the shirking of personal responsibility, welfarism, and paternalism. Subsidiarity provides protection against a self-serving state.

Amid the miscellany of intermediate bodies, a special place is reserved for those that seek economic ends, including corporations. This economic focus distinguishes businesses from other intermediate groups such as churches, professional colleges, sports associations, neighborhood councils, cultural clubs, and the like. It is not that these bodies lack an economic dimension; it is just that such an economic dimension is not their main concern. Business firms, then, are intermediate bodies that pursue economic goals.

In Aristotle's *Politics*, such economic concerns are seen as originating within the family, as "household management" [8, 20]. His treatment of the economy in its original, etymological meaning of "household management" begins with a survey of the different parts of the household and their relationships: "the first and fewest possible parts of a family are master and slave, husband and wife, father and children. We have therefore to consider what each of these three relations is and ought to be: I mean the relation of master and servant, the marriage relation (the conjunction of man and wife has no name of its own), and thirdly, the paternal relation (this also has no proper name)" [8, 20]. From the state's point of view, the need for marriage is quite clear because that is how children, potential citizens, are born and educated toward responsible adulthood. Moreover, a stable and exclusive marriage assures mutual help to both husband and wife for life's daily necessities. The other two relations that Aristotle cites as being required for a complete household demand more elaboration. In Aristotle's time, it was an accepted legal and moral norm that the children were the property of the father, as opposed to the mother. Of course, no child can be born without the woman's cooperation, but she merely represents the passive principle, in Aristotle's reckoning. In a paternalistic and patriarchal society, of the kind in which Aristotle lived, the male's ownership of the children was grounded on his being seen as the active principle in the male-female relation. Equality was not recognized between male and female.

Then there is the matter of slavery. Why, in Aristotle's thinking, are slaves essential to the economy? The reason is that slaves are a form of property: "Property is a part of the household, and the art of acquiring property is a part of the art of managing the household; for no man can live well, or indeed live at all, unless he is provided with necessaries" [8, 20]. Aristotle understands property in a broad sense, encompassing all material things. Yet there are different kinds of property, some living, others lifeless. "And so, in the arrangement of the family, a slave is a living possession, [. . .] and the servant is himself an instrument for instruments" [8, 20]. Slaves, therefore, are like livestock, a form of living property no family could do without. But they are living property of a special kind, useful insofar as they obey the will of their masters. The work of a slave, its function, is to accomplish the will of its master. "Hence we see what is the nature and office of a slave; he who is by nature not his own but another's man, is by nature a slave; and he may be said to be another's man who, being a slave, is also a possession" [8, 21].

Aristotle, too, distinguishes between the art of household management in itself and the art of getting wealth or chrematistics [8, 20]. In both, Aristotle distinguishes between natural and nonnatural forms of pursuing those arts. Natural chrematistics refers to the provision of “such things necessary to life, and useful for the community of the family or state, as can be stored” [8, 22], whereas nonnatural chrematistics, of “riches and property [which] have no limit” [8, 23]. Natural wealth-getting is based on the premise that true riches, the property needed for a good life, have a limit. There is a level beyond which the mere accumulation of material things becomes a nuisance or a liability. Nowadays, one might think of having more cars than those that fit in the garage, or more foodstuffs than what the refrigerator could store. Nonnatural wealth-getting, on the other hand, is predicated on the idea that “more is always better.” Although the example may be somewhat dated, by nonnatural wealth-getting Aristotle referred primarily to retail trade and exchange, which allowed the accumulation of wealth without limit. And as he says, “coined money is a mere sham, a thing not natural, but conventional only, because, if users substitute another commodity for it, it is worthless, and because it is not useful as a means to any of the necessities of life, and, indeed, he who is rich in coin may often be in want of necessary food. But how can that be wealth of which a man may have great abundance and yet perish with hunger. . .?” [32].

At the same time, Aristotle implies that household management, or economy properly speaking, refers more to the use of property rather than to its acquisition. As was the case with its acquisition, with respect to the use of property, we are supposed to differentiate between the natural and the nonnatural modes. Take the case of a shoe: if worn, one makes a proper use, while if it is used for exchange, one makes an improper use, “for a shoe is not made to be an object of barter” [8, 25]. The proper use of any material possession acknowledges a limit or a further end that makes the activity honorable, whereas its improper use is void of limit and, hence, censurable. As an illustration of this unnatural use of wealth, Aristotle points to usury, then defined as lending on interest: “money was intended to be used in exchange, but not to increase at interest” [8, 26]. The difference between the natural and the nonnatural depends more on the dispositions of human beings, on their desires, than on the material things themselves [8, 27]. Unbridled desires, the want of wealth, pleasure, or enjoyment untutored by virtue, lead to nonnatural forms of getting and using material possessions. The fault lies in our vice, not in the material things themselves.

To summarize this section, from an Aristotelian perspective, firms constitute a class of artificial, intermediate bodies that belong to the realm of the economy. All economic activity, in turn, functions under the guidance of ethics, the “practical science” of virtue. The economy’s mission, properly understood, is to facilitate the cultivation and practice of virtue by establishing favorable material conditions. And virtue and ethics, in the final analysis, are sought insofar as they help us attain a flourishing life, a life that can only come into being within a political community regulated by the state.

From Shareholders and Stakeholders to Citizens of the Corporate Polity

The next step in developing the analogy between states and firms consists in examining the different kinds of people that comprise each of these institutions.

Beyond the Metaphor of Corporate Citizenship

Business theory has borrowed the notion of citizenship from politics for several reasons: above all, to highlight the social dimension of firms and, secondly, to analyze the role of power in resolving conflicts. Through the concept of citizenship, politics also imparts a sense of identity to firms, by way of membership in the community, and a justification for their rights and responsibilities as legal persons. Wood et al. even go as far to that business organizations, in comparison to individual persons, are “secondary citizens” ([28], pp. 35–36). Although we normally treat business organizations as independent legal entities carrying out their activities in pursuit of particular goals, they only exist thanks to the objectives and the resources furnished by their participants. Corporations are collective instruments created by individual citizens to achieve ends which they would not be able to attain individually. Such ends are likely to have a sociopolitical dimension and reflect values held in the community. But the notion of citizenship itself has a long history. To discover its potential in clarifying the status of corporations and the issues concerning how they ought to be governed, it would be convenient to have a look into the origins and evolution of this concept.

In the *Politics*, Aristotle delves into the question of citizenship by observing that the “state is composite, [and] like any other whole [is] made up of many parts – these are the citizens, who compose it” [8, 29]. He then proceeds to identify who the citizen is, along with the meaning of the term, by determining what the citizen does. Then, Aristotle differentiates citizens from other classes of people in the state, explaining the process by which one acquires citizenship. Finally, he distinguishes the various kinds of citizens depending on the form of government adopted by the state. Only within this context could the query – what makes a good citizen? – receive an appropriate response. According to Aristotle, “a citizen in the strictest sense, against whom no such exception can be taken” is he or she who “shares in the administration of justice, and in offices” [8, 30]. The essential task of the citizen is to participate in deciding what is good and just in the state. A citizen is a “juryman and member of the assembly,” to whom “is reserved the right of deliberating or judging about some things or about all things” [8, 31]. Although many people in a state may actually participate in deliberating about the public good, only citizens possess this right. What characterizes a citizen is “the power to take part in the deliberative or judicial administration of any state” [8, 31]. This does not mean that a citizen always has to hold office. It would suffice that he or she have the power to occupy such a post, “sharing in governing and being governed” [8, 32].

Aristotle was aware that the state needed other kinds of people besides citizens in order to be viable [8, 33]. Mere necessity for the state's survival or flourishing did not automatically qualify one for citizenship. Consider children who, not being mature, are incapable of deliberation and judgment. They may only be called citizens by qualification. Neither are members of the artisan class, composed of slaves and foreigners, citizens. The latter do not even refer to free men as such, in which case foreign workers would be citizens, but only to free men who are exempted from providing menial services. Citizenship requires distance from the tyranny of having to satisfy daily needs since political participation demands leisure. By implication, then, citizenship presupposes a certain level of affluence. It is reserved to those who can afford it.

Aristotle enumerates the different classes needed for the state's existence: farmers, artisans, traders, laborers, and the military [8, 34]. Even so, "as the soul may be said to be more truly part of an animal than the body, so the higher parts of the states, that is to say, the warrior class, the class engaged in the administration of justice, and that engaged in deliberation, which is the special business of political understanding – these are more essential to the state than the parts which minister to the necessities of life" [8, 34]. To the extent citizens are involved in deliberating the public good, they are like the soul, the most important part of the state, although by themselves, they do not suffice to constitute the state. One can also deduce from this that mere residency does not suffice either to make one a citizen. Resident aliens and slaves share the same living space with citizens but not the same rights [8, 35]. To be a citizen, it is also not enough to have the right to sue or be sued before a state's tribunals. After all, this right can also be held by resident aliens owing to international treaties. Insofar as resident aliens are normally obliged to have a citizen-patron, they could only participate in the community very imperfectly, never in their own name and always under the citizen-patron's tutelage. In this respect, they are much like children, the old and the feeble. How, finally, does one become a citizen? Excluding cases where one becomes a citizen accidentally, Aristotle says that "in practice a citizen is defined to be one of whom both the parents are citizens" [8, 31].

Having defined citizenship and established the process by which it is acquired, Aristotle insists that there are as many kinds of citizenship as states or forms of government: "he who is a citizen in democracy will often not be a citizen in an oligarchy" [8, 30]. In democracy, the people, the demes, are citizens insofar as they are able to influence public affairs. In aristocracies, citizenship is restricted to fewer people, based as it is there on excellence and merit. In oligarchies, it is based on wealth [8, 33]. Even allowing for variances in citizenship, Aristotle maintains that, ideally, the excellence of the good citizen coincides with the excellence of the good man. That occurs in the best of states, so long as the good man and citizen take part in public affairs [8, 36]. Twenty-four centuries later, several models and typologies of citizenship, still based on the distinctive forms of government, have been offered [28, 37, 38]. These categories could be collapsed into two, with their respective variants: liberal-minimalist citizenship, on the one hand, and civic republican-communitarian citizenship, on the other.

The liberal-minimalist ideal conceives citizenship fundamentally as freedom from oppression and protection against the arbitrary rule of absolutist government ([38], pp. 7–9). Citizens are vested with political rights to choose their rulers or be voted into public office. The duty of government is to secure such rights which form the core of citizenship. For some, this set of rights is composed of the rights to life, to liberty, and to property (Locke); for others, it encompasses the right to a just share of the social product or utility (Smith, Bentham); while for still others, the rights to equality before the law and to free rational agency or autonomy (Kant). Whichever set happens to be relevant, the important thing is that the rights and freedoms be guaranteed. With some latitude, we can include in this group the libertarians ([28], pp. 41–42, 44), who support a very limited state, along with those who uphold a deliberative democracy ([38], pp. 15–16), who want a more robust form of government to safeguard conditions of equality in political discourse. By contrast, civic republican or communitarian citizenship emphasizes participation in the public good by fostering communal ties and the practice of civic virtues ([28], pp. 42–43, [38], p. 9). While liberal-minimalist citizenship is marked by “negative freedoms,” or “freedom from” state oppression and interference, civic republican-communitarian citizenship is characterized by “positive freedoms,” or “freedom to” actively seek the common good. Liberal-minimalist citizenship stresses individual rights or state-guaranteed powers against collective pressure; civic republican-communitarian citizenship underscores belonging to the group as the factor constitutive of an individual identity and sense of personal purpose. It is the group with its hierarchically ordered set of goods, rules, and practices that makes virtue or human excellence possible. The role of government here is to strengthen institutions such as families, neighborhoods, schools, and churches. Only when these institutions fall short should government intervene, yet without losing sight of the principle of subsidiarity. There is greater insistence in the civic republic-communitarian vision on fulfilling obligations – to protect the family, obey the law, pay taxes, and comply with jury or military service, and so forth – than on demanding rights, which have the effect of separating the individual from the group. Insofar as Aristotle accentuates the embeddedness of citizenship within a sociocultural and historical context, and given his identification of the excellence of the citizen with that of the *polis*, he unequivocally sides with the civic republican-communitarian model.

How are these different views of citizenship reflected in the notion of the corporation as a citizen, or to be more precise, a “corporate citizen”? As a citizen in the liberal-minimalist model, a corporation would be expected, first and foremost, to protect its “right to exist,” based on the freedom of association of participants, as well as its “license to operate,” resting as that does on the freedom of enterprise. A corporation would very much prefer “to stick to its own business,” embarking on philanthropic activities with the utmost reluctance, only where it accorded with enlightened self-interest, that is, to the extent that it would ultimately improve the bottom line. Obviously, this notion of citizenship has great affinity with a shareholder view of the firm focused exclusively on increasing the value of its equity. On the other hand, if a corporation were to

follow the civic republican-communitarian type of citizenship, apart from exercising political, civil, and social rights, it would also strive to fulfill political, civil, and social obligations. Such a company would not hesitate to become involved, harnessing resources and expertise, whenever the government was failing to live up to its obligation to advance the common good. The firm could provide social rights (e.g., health care or housing), enable civil rights (e.g., be an “equal opportunity employer”), and serve as a channel for the exercise of political rights (e.g., host a forum for political debate on certain issues). Community involvement and political activism characterize the civic republican-communitarian corporate citizen. Responsibility is not only of an economic nature but sociopolitical as well, and it is owed not only to shareholders but also to other stakeholder groups.

Citizens of the Corporate Polity

There is another possible interpretation of corporate citizenship, distinct from the understanding of the corporation itself as a citizen of the state. It consists in the view of the corporation as an analog of the state and of the various stakeholder groups as potential citizens. The approach and intent is similar to that carried out by Manville and Ober [39] who tried to draw management lessons from classical Athenian democracy. Here, we shall examine the different stakeholder groups and decide which of them best fits into the general definition of citizenship. In the process, we will find uncover who among the different stakeholders should be entrusted with a governance role.

Drawing inspiration from Wood on the different approaches to corporate citizenship, we may link the liberal-minimalist perspective of citizenship to the idea of the corporation as a “civic association” and the civic republican-communitarian view to the vision of the firm as a corporate polity ([28], pp. 41–45). The liberal-minimalist theory of citizenship insists on individual freedom, expressed in the form of rights to pursue self-interest. But this pursuit, insofar as individual desires inevitably differ and clash, cannot constitute a corporate common good. The corporation is then reduced to a “civic association,” some sort of “clearing house” where minimum restraints are applied to keep an individual from infringing on the rights of others. The different groups of people dealing with the corporation do not really behave as “citizens” but mere residents of a common jurisdiction. They comply with the laws but only as a means to reach individual goals. Coercive laws are the only forces that keep them together. There is no attachment or loyalty among themselves nor between each of them and the corporation. Relationships are purely contractual, and the corporation is nothing more than a nexus of contracts. Shareholder-principals who provide capital are granted ownership rights, and manager-agents are on the understanding that they will endeavor to maximize the returns on the company’s stock. The corporation is effectively an empty shell wherein investment, employment, and sales contracts are negotiated and fulfilled: “The language of citizenship might even be used, but the motivation is not to

provide a collective good or to contribute to society's [or we may say in this case, the corporation's] well being, but only to achieve a private end" ([28], p. 42).

The demands of a civic republican-communitarian kind of citizenship on the stakeholders of the corporate polity will be altogether different. Since their personal flourishing is not independent from that of the corporate polity, they will actively participate in the deliberation and execution of the corporate good. This does not mean disregard for individual rights; it simply means that those rights are neither supreme nor absolute. The recognition, enforcement, and respect for those individual rights should always be done within the context of the corporate common good. This common good is not inimical to individual goods such as rights. What is needed is an order or hierarchy, such that "goods in respect of another" – for instance, rights – are subjected to "goods in themselves," and the various "goods in themselves" subjected in turn to the "common good" of the corporate polity. As an example of this, the right to free enterprise would not include the right to buy and sell body parts, if only to safeguard the physical integrity of prospective suppliers.

A misconstrual of the common good may be at the root of the conflict that Wood detects between communitarian and global citizenships ([28], pp. 42–46). Loyalty to the local community may be at odds with the demands of a multicultural global society. Yet global society and local community do not exist on the same level. Serious conflicts among these different levels of organization may arise. However, the strength and success of the superior levels in terms of human flourishing depend on that of the inferior levels, as the principles of subsidiarity and solidarity explain.

Consider a corporation that applies pollution control measures in its home community but neglects them in other communities where it is a mere guest. It need not follow a free-standing universalist standard of global citizenship to recognize its duty to reduce pollution wherever it holds operations. It would be sufficient to become aware of the interdependence between its home and host environments, between its efforts to curb pollution locally and globally. Only by identifying itself with the good of its home region – that is, by subscribing to the communitarian ideal of citizenship – can a corporation realistically contribute to the good of a wider global and multicultural society.

To our knowledge, the analysis of the different stakeholder groups as prospective citizens of the corporate polity has only been carried out from the viewpoint of liberal-minimalist citizenship [40]. We shall now proceed to draw a picture of the various stakeholders that comes closer to the civic republican-communitarian ideal: Who among the different stakeholders best fulfill the requirements of the civic republican-communitarian citizenship within the corporate polity? Who among them is most deserving to govern? If citizenship consists in participation in governance, who is best equipped to do so in the firm understood as a corporate polity?

Shareholders are the first to come to mind. Having provided financial capital, they are typically acknowledged as the "owners" of the company. In accordance, too, with the application of agency theory to firms, laws are generally designed to protect their interests as principals against possible abuse by their agents, that is, managers. Yet this account neglects a number of crucial facts. The shareholders' only real property is a piece of paper, the certificate that entitles them to a "share" of

the firm's residual equity [41]. Depending on whether the company has been profitable, they may receive dividends or sell their shares at a higher price. None of this is guaranteed. Other shareholder rights include choosing board members, participating in general meetings, and voting on proposed changes in the capital structure – nothing more. Shareholders cannot walk into the company premises, occupy a room, and, say, start selling the furniture. What is more, given the huge number of shareholders, their fragmented interests and dependence on management for information on the company's condition, it is quite understandable that they do not even consider themselves “owners” at all. It is easy to understand why a shareholder, with an infinitesimal holding, often does not bother to attend general shareholder meetings; his or her vote will not make much of a difference. Many shareholders do not hold their shares over a long period and often sell to take profits or cut losses short. Beyond this, the ordinary shareholder feels no commitment to the firm. Because of their rights to residual equity, shareholders may claim liberal-minimalist citizenship within the corporate polity. But that is not sufficient for a civic republican-communitarian kind of citizenship, which requires the exercise of rights with a view to the corporate common good.

Hence, we must broaden the field to include other stakeholders in our quest for civic republican-communitarian citizens of the corporate polity. “Stakeholders” are defined as all those who may have “legitimate interests” in the firm [42]. This does not mean, however, that each and every one of those interests warrants formal legal protection. The legitimacy of stakeholder interests could come, not merely from courts but from social recognition. As for the requirement of active involvement in governance, we should not interpret it in the sense that *all stakeholders* have to participate in *all corporate decisions*. It would be enough that those with legitimate interests intervene in the issues that concern them.

Accordingly, the next stakeholder group we need to consider is that of clients or consumers. In recent decades, corporate strategy has often been formulated from their point of view, to satisfy their needs and serve them better, coming up with the best “value proposition” [43]. This trend is evidenced in slogans like, “the customer is always right” or “the customer is king.” “Consumer sovereignty,” however, has been better known in the breach than in the observance. Until recently, the market mindset was based on the principle “*caveat emptor*” or “buyer beware” [44]. Responsibility for the consumer's interest lies almost exclusively with the consumer. The fundamental consumer right, on this view, has consisted in their ability to not buy a product, whenever he or she did not like the terms and conditions. Over the last several decades, especially in the developed world, we have witnessed a vast expansion of consumer rights. Aside from the right to free market choices, we also enjoy, in varying degrees, the right to fair market prices, to safe and efficacious products, to truthful advertising and honest communications, to privacy, and so forth. Moreover, tests have been designed to protect “consumer sovereignty” in its different dimensions: from consumer capability (freedom from limitations in rational decision-making) to information (availability of relevant data) and to choice (switching possibility) ([40], p. 270, 289). By virtue of the first aspect of consumer sovereignty, for example, neither tobacco nor alcohol can be sold to minors;

by virtue of the second, foodstuffs must be properly labeled for common allergens; and by virtue of the third, we have the right to change our telephone service providers while keeping our numbers. The guarantee of such rights in support of consumer sovereignty arguably corresponds to a liberal-minimalist corporate citizenship for consumers.

How might consumers make the transition, however, to a civic republican-communitarian model of citizenship? They would to the extent that they somehow participate in the governance of the corporation – as in when consumers decide to patronize and recommend, or boycott, a company, for ethical, social, and environmental reasons. Consumers might also flex their governance muscle by participating in product design and promotion by, for example, sharing travel preferences with the airlines whose frequent flier programs they have joined. Such consumers would potentially deserve the title of corporate citizen in line with the civic republican-communitarian ideal. Even so, the issue would be how effective they are in influencing corporate policy. This would be the ultimate test of civic republican-communitarian corporate citizenship for consumers.

Let us turn our attention now to competitors and suppliers. How do they qualify as citizens of the corporate polity? First, in market economies, the reciprocal rights of competitors and suppliers, the right to fair play, are laid down in competition law. These would include the freedom to enter and to leave the market, the right to set prices without coercion, the right to offer products to potential customers, and so forth ([40], p. 305). Upholding these rights may suffice for liberal-minimalist corporate citizenship. But corporate citizenship of a civic republican-communitarian type would, of course, demand a higher level of engagement. Suppliers could organize themselves around an ethical supply chain management initiative, with a view to eliminating unfair labor practices (e.g., child labor), unhealthy working conditions (e.g., sweatshops), and environmental degradation. They could do this even before Third World governments, often hampered by limited resources and corruption, introduce their own legislation to address those problems. In addition, suppliers and competitors could engage in “fair trade” agreements like those in coffee, tea, and cocoa; they could guarantee minimum prices and offer better conditions to small commodity growers in developing countries ([40], p. 333). These activities would move suppliers and competitors up toward the civic republican-communitarian standard. Unfortunately, these practices are still uncommon and their effects on corporate governance not fully known.

The government’s role as a stakeholder of the corporation is affected by significant uncertainty ([40], p. 391). On the one hand, it seems more proper to think of the corporation as a stakeholder of the state. In modern liberal democracies, governments are formed by representatives of the citizenry, and indirectly, of the different intermediate associations and civil society organizations. With their monopoly on the legitimate use of force, governments could choose either to restrict or enable corporate activity. States intervene in business by collecting taxes, which represent a not insignificant deduction to profits, but they also assist business by granting tax breaks and providing subsidies. At the same time, we can comprehend states as either depending upon, or competing with, corporations.

Governments compete with multinational companies in providing welfare and even security in developing countries. Yet were it not for independent, private businesses, born from the freedom of enterprise and association of citizens, states would be paralyzed or become terribly inefficient, as was the case in communist nations. The state could also constitute a stakeholder group – not just by owning a significant, if not a controlling tranche of shares, but in other ways as well. As corporate stakeholders, states undoubtedly hold important rights, enough to qualify them as a liberal-minimalist corporate citizen. Remember that corporations only exist thanks to a legal charter, that is, an explicit recognition by the state. There is no escaping government influence, whether for good or ill. The most we will venture to say about this debatable issue is to appeal to a golden mean: Neither statism, where private initiative, freedom of association, and freedom of enterprise have all been annihilated and the state has completely taken over the economy, nor absolute *laissez faire*, where markets would have usurped functions such as internal and external security or the administration of justice, effectively getting rid of the state. Government should not be in the business of developing and peddling software, for example, just as corporations should not be setting up private tribunals of justice or forming private armies. The state could behave as a good civic republican-communitarian corporate citizen if it proceeds in accordance with the principle of subsidiarity without renouncing to its areas of competence.

This leaves us with a company's workers or employees, among which we ought to include the managers. Among the different stakeholders, employees are the ones most closely integrated and identified with the corporation: "employees, in many cases even physically 'constitute' the corporation. They are perhaps the most important production factor or 'resource' of the corporation, they represent the company towards most other stakeholders, and act in the name of the corporation towards them" ([40], p. 224). A liberal-minimalist analysis of employees as citizens would limit itself to their rights and duties in the employment contract: a right to fair wages, a right to healthy and safe working conditions, a freedom from unjust discrimination, a duty to provide an acceptable level of work performance and quality, a duty to respect company property, and so forth ([40], p. 228). The civic republican-communitarian standard would take other areas into account, such as the economic externalities and the socioethical opportunities that escape employment contracts. The latter cannot fully capture the demands of employee loyalty, the breaches of which would hardly be actionable in the courts. Yet employee loyalty counts as an enormous positive externality for the company and furnishes an opportunity for employees to become more virtuous. Employee loyalty also makes demands on the company. A company should never consider the employee merely as an expendable resource, the first thing to jettison whenever difficulties and challenges arise. Instead, the corporation should try to reciprocate employee loyalty by provisioning adequate resources for them and encouraging their professional development. Loyalty is not so much the result of locking-in assets as a mutual concern for each other's flourishing and well-being.

Among employees, those who own shares in the company merit special consideration. That worker and shareholder, agent and principal, governor and governed

coincide is precisely the biggest advantage of shareholding workers over other stakeholder groups. Only here can the condition of actively taking part in corporate self-government be adequately fulfilled. Only here, too, can we find the objective dimension of work – the external goods and services produced – united to its subjective dimension – that is, the improvements in knowledge, skills, habits, and virtues that effort nurtures in the soul of the worker. Thus, avoided is alienation from the products of one's own labor. In this sense, cooperatives, or business organizations that are run and controlled by their owners, would fit the definition of a self-governing corporate polity to perfection. Its shareholding workers and managers would represent civic republican-communitarian corporate citizenship in the highest form.

For this reason, other nonshareholding employees must be formally recognized as a separate category within the firm. To be sure, the corporation cannot exist without them, yet they cannot be considered corporate citizens because their tasks are carried out for others, the shareholders, rather than themselves. The situation of nonshareholding employees is thus very similar to that of the artisan class composed of slaves and foreigners in the Greek city-states (1278a). Without them, the city-state could not stand, yet their integration was very limited and their participation in government practically nil. Similarly, the other stakeholder groups – shareholders, clients, consumers, competitors, suppliers, governments, states, and nonshareholding workers – through contracts and agreements hold a status comparable to those who enjoyed certain rights in the Greek city-states where they resided, whether due to trade treaties or military alliances, without at the same time being citizens (1274b). For as we hope we have made clear in this section, possessing certain rights is not enough to render one into a citizen of a civic republican-communitarian organization. One must take part in ruling.

On Corporate Regimes: Despots and Constitutional Rulers

The third element of our analogy between states and firms refers to their organization. Both states and firms require a governing body with a rule or constitution. The major difference between them is that while states are sovereign, corporations are not. Therefore, the governance of business organizations is always subject to the governments of the states, which represent the supreme authority in the places where they operate.

In the *Politics*, Aristotle explores a diversity of regimes. These are distinguished both by the number of people that govern as well whose good it is for which they govern. The main division is between “despotic” and “constitutional” regimes: “there is one rule which is for the sake of rulers and another rule which is for the sake of the ruled; the former is despotic, the latter a free [constitutional] government” (1333a) [45]. Despotic rule is exercised over subjects who are “by nature slaves,” and constitutional rule over those who are “by nature free” (1255b) [46]. With regard to a despotic regime, although both slave and master may have coincident interests, a slave is ruled primarily for the master and only accidentally

for himself or herself (1278b). Compare this with a father's government of the family as an example of a constitutional rule, where the common good of the household comes first (1278b). To the extent that a despotic regime regards only the interests of rulers, it is "perverted" and "defective"; a constitutional rule, to the extent that it looks after the common interest in accordance with the principles of justice, is a "true" one (1279a) [47].

Both true and perverted regimes are, in turn, subject to further subdivisions, depending on the number of rulers. Among the true forms, we have kingships or monarchies, when there is but one ruler; aristocracies, when the best of men rule, always comparatively few; and polity, when the many rule (1279a–b) [48]. In all of these, it is the good of the state and the citizens that prevails. Among defective forms of government, we find tyrannies, when the ruler is one; oligarchies, when the rulers are few; and democracies, when the rulers are many (1279a–b). In tyrannies, the whole state is ruled with the sole interest of the autocrat in mind; in oligarchies, in accordance with the interests of the wealthy; and in democracies, with the interests of the poor.

The division into despotic and constitutional rules is arguably applicable to corporate governance. After all, some firms have been known to be run for strictly private interests, while others have had the wider common good in view. As a result, some companies may be said to be governed justly, with every one of the constituents receiving their due, while others unjustly, with most of the parties feeling short-changed. In addition, some corporations can be said to be despotically run, whenever the governed are treated virtually as slaves. Other firms are managed constitutionally, whenever the governed are regarded as free and equals vis-à-vis the leadership. As for the distinctions depending on the number of rulers, an instance of a corporate kingship would be a firm whose shareholding CEO is, at the same time, chairman of the board, while running the company in a way that fits the description of what is nowadays known as the "imperial CEO." One might argue that such concentration of power is not by itself objectionable, for it could certainly bring heightened effectiveness to the CEO position. Even so, the danger that power will be abused, so as to render the imperial CEO the commercial equivalent of a political tyrant, is not insignificant.

As for corporate aristocracies, these may be considered to be made up of those businesses whose governance lies in the hands of a few people, at least if they happen to be the most qualified professionally. In corporate culture of the Anglo-Saxon world, that would transpire if, for example, a perfectly "balanced" unitary board were in place, in which different powers and functions are equitably shared among a handful of shareholding executive directors and nonexecutive directors. An equivalent of this in the Central European tradition is the dual supervisory and management boards, so long obviously as the members of both boards held shares and exercised their executive functions with a view to the common good of the corporation. No doubt, the issue of determining, from among the various corporate constituents, those who are the "best" equipped to govern is subject to great controversy. Despite the problems in gaining consensus on the relevant personal traits, of this much we can be sure: the qualifier "best" refers to a limited group of

people whose claim to corporate governance does not rest on mere wealth. That would correspond to what, from an Aristotelian point of view, would have to be termed as a corporate oligarchy. The “best” specifies those who have both a genuine concern for the good of all as well as the competence to achieve it.

Finally, we can think of corporations where some sort of “constitutional rule” holds. Such firms would have to fulfill the requirement that “the many” participating in governance seek the good of all within the ambit of the corporation, not just their own good. For examples of this, we can look to cooperatives, where workers own stakes in the corporation and share in the profits. These owner-workers, though, would also have to be owner-manager-workers to satisfy Aristotle’s criteria. The most difficult thing, however, would be to find a corporate equivalent for what in states is called a democracy. This is because, in the first place, Aristotle equates the “the many” with the relatively poor, with those lacking capital to set up a business. Secondly, as is typical in a democracy, the general run of employees, the closest analog to Aristotle’s many, would be apt to pursue their own good instead of the common interest, which is often a recipe for organizational disaster. Neither should we confuse corporate democracy with just any manifestation of “shareholder activism.” The latter simply refers to a situation wherein small shareholders come together to exercise their voting rights in challenging managers and majority shareholders. Democratic corporate governance goes beyond these incidental activist challenges and is both broader and deeper not only in scale but also in scope.

Conclusion

This chapter takes Aristotle’s political thought as a guide to proper corporate governance practices. According to Aristotle, states are natural and perfect societies that properly exist for the purpose of promoting individual human flourishing. Business organizations and firms, on the other hand, are examples of artificial and imperfect societies. They are a kind of intermediate body, between families and states. The proper relationship between the state and intermediate bodies such as corporations is one of subsidiarity. This means that the state has the positive duty of helping intermediate bodies to contribute to the good life (eudaimonia) and the negative duty of refraining from absorbing their functions. For Aristotle, politics represents the ruling science by virtue of its object, happiness (eudaimonia), which is the highest good. Subordinate to politics is ethics, the science of virtue, and subordinate, in turn, to ethics is the economy, the science concerning “external” or “material goods.” From this, we infer that business organizations, insofar as they belong to the realm of the economy, are subject to ethics and ultimately to politics.

A key Aristotelian theme relevant to the corporation is that of citizenship. Of the two models of citizenships – liberal-minimalist and civic republican-communitarian – Aristotle’s position undoubtedly comes closer to the latter. Whereas the liberal-minimalist conception emphasizes the individual rights against the group and conceives the corporation as a nexus of contracts, civic republican-communitarian citizenship focuses on active participation in the common good. The stress here lies on the duties and obligations toward the group.

Thus, the demands on the individual of civic republican-communitarian citizenship in the corporation are more stringent. Only shareholding managers are able to fully meet the standard of active participation in corporate governance. Only in their case are we able to avoid the different forms of alienation and separation between ownership and control, capital and labor, principals and agents, as well as between the objective dimension and the subjective dimension of work.

Aristotle's classification of political regimes is also helpful in understanding the corporation. Applied to the latter, Aristotle's typology of regimes is constructed on the basis of whether the rulers of the corporation whether they aim at the common good, in which case the regime is constitutional, or serve the interests of the rulers, in which case the regime is despotic. His typology is also based on the number of rulers. As a result, we can speak of corporate monarchies and tyrannies, corporate aristocracies and oligarchies, and corporate polities and democracies. From the Aristotelian standpoint, corporate polities offer the most appealing standard for modern-day corporate governance.

Abstract

Aristotle claims that character develops over time as one acquires habits from parents and community, first through reward and punishment. One acquires a good character much as one may learn to play a musical instrument: initially, one may be under some pressure to practice, but eventually, one enjoys playing with skill and understanding. Aristotle claims that one is partly responsible for one's character, but he thereby raises the question whether one freely chooses one's character. A person of good character does choose freely, however, and is able to frame complex situations accurately. The full development of character requires rational reflection: Aristotle argues that dialectic, to which Rawls's reflective equilibrium bears some resemblance, generates principles that can guide us, though they do not serve as unexceptionable rules. A business ethics course, and in particular the case study method, may increase students' understanding of ethical principles and of the ways in which environmental influences may undermine ethical thought and language.

Introduction

Virtue ethicists, often following Aristotle's *Nicomachean Ethics*, claim that ethics is primarily about the sort of person you are. Aristotle argues that habitually acting generously is an important part of the process of becoming generous. The notion that ethics is primarily about virtue, rather than principles, is a minority opinion among moral philosophers today. The same is true of Aristotle's claim that we become

virtuous by getting into the habit of acting virtuously. I shall argue that Aristotle's views are more sophisticated and plausible than they may seem at first glance, and they have important implications for ethical development and education.

Virtues and Character

If you are a virtuous person, you will act virtuously. If you are not, you may sometimes act as a virtuous person does, but not for the right reason, as when someone important is watching. Principles are secondary: though being generous makes you act generously, you can act on the principles on which a generous person acts and yet not be generous.

One reason for embracing virtue ethics is that the moral principles on which we can reach a consensus are usually vague, often in conflict, seldom unexceptionable, hence not reliably action-guiding. Anyone who has tried to bring moral principles to bear to convince people, especially businesspeople, that a certain course of action is right or wrong will know how little use principles are in controversial cases. Suppose, for example, that you try to use Kant's categorical imperative to make a decision. The maxim of your act – the principle on which it is based – must be able to be a universal law. But it is often not clear what the maxim is, whether there is only one maxim, whether a maxim is impermissibly ad hoc, or even whether it might be better for you to act on some maxim if and only if other people act on a different one. If you undertake to act on some utilitarian principle, as many economists seem to advocate, you will find situations in which you can maximize happiness by doing something unjust, such as executing an innocent but undesirable person. Or you may increase contentment over time by lowering people's expectations or curtailing their autonomy. There is also a problem about the nature of happiness: surely, it cannot be identified with preference satisfaction. A preference can be based on a false belief or an irrational whim; in such a case, its satisfaction may do one little good. Aristotle rightly distinguishes between rational and irrational desires.

So we may prefer to focus on good character and its component virtues – that is, on what sort of person to be, rather than what principles to follow.

We may define character as one's typical pattern of thought, desire, and action with respect to one's own and others' well-being and other major concerns and commitments; so says Kupperman, approximately [1]. According to Aristotle, we have certain enduring desires that can serve as premises of so-called practical syllogisms – in effect, as good reasons to act. These desires do involve our well-being and reflect our most important concerns and commitments. So a person of generous character acts generously, wants to do so, and thinks he/she has good reason to do so. If you are generous, you are and want to be motivated by thoughts like this: "Jones needs help, so I'll help him." You not only help your friends and donate to the needy: you are happy to be generous, ashamed when you act selfishly, disinclined to respect people who are selfish, and offended by selfish acts. So to be a person of truly generous character is to have and to want to have a settled disposition to help a friend

in need, and emotions to match. It entails wanting to be consistently motivated by a friend's need. (This is an example of a desire to have a desire, what Frankfurt [2] calls a second-order desire.) Some of our enduring desires, especially those concerning the sort of person we want to be, we call values. To have a value entails wanting to be motivated by certain kinds of desire. If you value generosity, for example, you want to be the sort of person who genuinely wants to help a friend in need. A virtuous person differs from a vicious one in taking different and better considerations as reasons for action.

Allowing that a good act is the sort of act that a virtuous person characteristically likes to do and does, what makes a trait a virtue, a component of a good character? Surely, not just that it is the sort of thing that a virtuous person would do. And in any case, why should you care about what is virtuous and act accordingly? In brief, for the moment, a life of virtue is a life that is appropriate to human beings, who are born with the capacity to become highly rational and sociable creatures. To the extent that you fulfill that potential, you will be a person of good character. It is one of Aristotle's primary goals in the *Nicomachean Ethics* to explore what it means to live a good life, with which one can be justifiably satisfied. Since human beings are sociable as well as rational creatures, living a life of good character largely overlaps with living the life that is best for oneself. In fact, says Aristotle, one's very survival is a matter of having a consistent character over time [3]. It should be clear that Aristotle differs from those, such as Kant, who regard ethics as essentially a constraint on our natural selfishness. Of course, it can be a constraint in some cases, for there are some things that a virtuous person does not do.

This is not egoism. The virtuous person is immediately motivated by others' interests and respects their rationality. But the virtuous person enjoys being the sort of person who is motivated in that way and has a good life by being rational and sociable in that sense. So argues LeBar [4], who gives a compelling account of the nature and importance of being (in Aristotelian language) rational and sociable. He is one of many philosophers who have recently argued that acting on reasons that take others' reasonableness into account is a necessary condition of living well. Yet there may be some acts that are immoral primarily because they harm the agent in a certain way: telling a harmless lie, for example.

Virtue involves appropriate feelings as well as desires, as Aristotle suggests in claiming that character is not just a matter of what you do but a matter of what you enjoy doing [5]. When you give me a generous gift, I ought not only to thank you but also to be actually grateful. Ethicists who rely on principles have a hard time saying why one ever has an obligation to be grateful, or to be a caring, loyal, honest person.

Those who believe that one has such an obligation must defend the view that one is morally responsible for one's feelings, which are not typically voluntary. Aristotle does not claim that you can make yourself feel grateful on a particular occasion, but he does believe that over time, you can become the sort of person who is grateful on appropriate occasions and has the right feelings and desires generally [6].

Aristotle is taking a position that is clearly different from utilitarianism, particularly the kind, embraced by many economists, that equates the good with desire fulfillment. Aristotle holds that not all desires are equally worthy of fulfillment, that

one can desire the wrong sort of thing, have the wrong sort of disposition, and even have the wrong sort of interest. Getting what one wants, whatever one wants, is no guarantee of a fulfilling life. No less important, Aristotle holds that one can decide what one shall want. Character formation is a matter of developing certain interests, cultivating certain desires, and welcoming certain emotions. And how should you decide which interests, desires, and emotions they should be? What sort of person should you become? The short answer is that the desires – and dispositions and emotions – of a good person are consistent with the rational and sociable nature of human beings. It is clear that character formation – in particular, forming the right habits – is crucial for Aristotle.

Emphasizing character and virtue does not undermine principles. On the contrary, to understand a virtue is to know what principles it generates. Hursthouse [7] uses the term “v-principle” to designate a principle that is definitive of some virtue. Consider generosity, for example. To be generous is, among other things, to be prepared to act on the principle that one should happily lend money to needy friends even if they may not be able to pay it back. But if you are a generous person, your immediate thought in deciding to lend the money to a friend is not that one ought to be generous under certain conditions but that *Jones needs help*. That need is your motivation – a reason for action, from your point of view. V-principles are limited in scope in a way in which Kantian or utilitarian principles are not, but they may be more useful in complex situations and will more likely enter into your deliberation.

Virtue ethics seems a bit vague; indeed, Aristotle repeatedly acknowledges that ethics is not an exact science. V-principles help clarify what generosity and other virtues require of us and why, but they do not make ethics exact. There are no v-principles that tell us exactly how needy Jones should be to qualify for a loan or how much money you ought to lend him. Aristotle offers some help, but no precision, in saying [8] that we should be generous and avoid the extremes of wastefulness on one hand and taking more than one’s share on the other. There are no algorithms that show us how to prioritize competing principles. If we did have (let us call them) metaprinciples governing the application of principles, then we would need metametaprinciples governing the application of the metaprinciples, and so on to infinity.

Most people, including many philosophers, are confident that a normal person can determine the right thing to do in simple cases and act accordingly. But how does the normal person acquire this ability and more sophisticated ones, and how are ethical judgments justified?

How We Begin to Acquire Character

Aristotle gives his account of character development in the early chapters of *NE II*. One acquires character: a typical human being is born with the capacity to be courageous or cowardly or otherwise virtuous or vicious, but does not naturally possess any virtue or vice. One acquires (say) bravery by acting as a brave person acts until it becomes a habit, much as one becomes a harpist by playing the harp.

One's decisions create one's character [9]. In learning a virtue, you learn to avoid excess and deficiency – for example, recklessness and cowardice. You cannot become a good person by studying ethics as a purely philosophical subject: that would be like trying to achieve health by listening to what a physician has to say about health and not acting accordingly [10].

But you can practice badly over a period of time and thus become a bad harpist; so a teacher is required. Similarly, you can set out to practice acting courageously but fall into the habit of acting in a foolhardy way. To avoid this, you need moral guidance, which typically comes from your community – plausibly enough, since Aristotle believes that the virtues characteristically contribute to one's community – or from your parents. Both may provide important role models. You should start doing the right things early in life and, thus, develop good habits and in due course become a good person.

Rules can play a part in your early development. Telling a child not to lie, for example, and enforcing the rule against lying will help get the child into the habit of telling the truth. The enforcement mechanisms are pleasure and pain – reward and punishment, as we might now say. It follows that the development of character requires that we learn to enjoy right actions and find wrong ones painful. This is consistent with Aristotle's view that good character is a matter of enjoying the right sort of thing. But adult education is, as we shall see, more than habituation: for those who have moved beyond reaction to reflection, education is about reasoning [11]. Later in life, we learn that there may be circumstances in which lying is appropriate, as when the dictator's secret police come looking for your friend. But we are likely to tell even a necessary lie with some feelings of repugnance, thanks to the habit of truth-telling with which we have become comfortable.

I have claimed that Aristotle takes feelings to be an important part of virtue. It is a person of good character who, needing to act rightly in the face of danger, willingly braves the danger and acts. But Aristotle demands more: the truly courageous person does not have to push aside any serious temptation to cut and run. Whatever one's feelings of fear, one faces the foe or takes the risk with alacrity. But as Aristotle shows in his discussion of *akrasia* (usually translated weakness of will or incontinence) in *NE VII*, one may truly want to be courageous and sincerely believe that a courageous person will join in this attack, but run the other way nevertheless. Or one may join the attack by overcoming an almost paralyzing fear and running towards the enemy while wishing it were not necessary to do so and hating every second of it. Or one may foolishly believe that there is nothing to fear. In these cases, one falls short of true courage. Preparation in the form of repeated drilling can help soldiers face the enemy bravely.

In a workplace, a strong corporate culture may support good or bad values, in part by habituating people to certain ways of acting. Role modeling can be effective, as can talking openly about corporate values, and about a corporate mission with which employees can identify. Rules too, including ethics codes, may enforce good habits, particularly if people understand their rationale. Employees' attitudes are important, but punishing free riders for violating the rules will encourage those with positive attitudes [12]. In some cases, coordination

will require rules. How people talk will affect how they frame situations, but role modeling is more effective than rules for encouraging certain kinds of speech. We are usually happy to emulate those that are widely admired, but we do not like speech codes.

Developing Character

Becoming virtuous is a little like learning to play the piano: it is a matter of practice, practice, practice. When you start learning and your mother makes you practice an hour a day, you are not good at it and you do not enjoy it very much. As time goes by, though, and you keep at it, your playing improves and you begin to enjoy it. Gradually, you learn that playing well is not just a matter of hitting the right notes: expression counts. If all goes well, in the end, you play superbly and get extraordinary pleasure from it. You also learn some of the technical aspects of playing, and you can say why Glenn Gould sounds better than Liberace. You may become a virtuoso.

Character develops in a similar way. A virtue is a result of habituation, Aristotle says, but practical reasoning comes in as well. Little Philip begins to learn courage by doing as his parents say in taking or avoiding risks and by following the examples of others. If he follows bad examples, his parents and others correct him. In this way, Philip gets into the habit of performing brave acts, on the whole, but even then, he is not fully courageous. For one thing, he makes telling mistakes. He cannot quite distinguish between courage and machismo, for example; so he sometimes takes inappropriate risks because his peers are doing so or because Andrea is watching. He is fairly good at doing and avoiding the sort of thing his parents have taught him to do and avoid, but he does not extrapolate very well from the paradigm cases. Even when Philip gets it right and takes the right amount of risk, he does so without thinking about (or having thought about) why what he has done is courageous. This is because he has no basis for distinguishing between, say, courage and recklessness; so he accepts the right amount of risk by luck, for no particular reason.

If he comes to know what courage is and what it requires, Philip can distinguish the courageous from the macho and is more likely to follow the former rather than the latter. The knowledge of what courage is entails knowing why courage is a good thing and recklessness and cowardice are not. Philip might come to believe that courage is the sort of thing that good soldiers have and the rest of us do not. Then, cowardice is a matter of being unsoldierly in certain ways. If he were to learn from the words of Socrates and Plato, as Aristotle did, then Philip might broaden his view and come to believe that courage is a matter of fearing what is truly dangerous and acting accordingly. But Aristotle does not believe that one can acquire the kind of knowledge of courage that a mathematician has of a circle.

Courage entails understanding the value of things. Risking your life to recover a toy that your child has tossed into a lion's den is reckless, not courageous. Risking your life to repel an armed invasion is courageous if you have good reason to value

the security of your country very highly, as you almost certainly do. To be fully courageous requires Philip to have a clear idea of what his values are and to be concerned about them – to be concerned, that is, about the kind of person he is. Knowing what courage is and why it is important to act courageously enables Philip to be confident in his belief about what is the courageous thing to do in a particular situation. Clearly, all this demands a high level of rationality.

Socrates was wrong in thinking that knowing what courage is is a necessary and sufficient condition of being courageous. He was probably also wrong in thinking that we can give a neat, unitary definition of courage or anything else. But being able to give some sort of account of what courage is, perhaps by stating certain v-principles, is surely a contribution to one's ability to act courageously. If Philip is rational, he acts courageously because he values courage and knows what it looks like in practice. To value courage is to want to be a courageous sort of person. If Philip wants to be courageous but is overcome by stark terror in the presence of danger, then his desires are incoherent, and he is irrational in that sense. To value courage without knowing what it looks like in practice is to value something without knowing what it is. It is not clear that that is even possible, and it is surely irrational in some way. Not to value courage at all is also irrational since courage is a necessary component of a good life.

Rationality of this sort is necessary for courage, according to Aristotle, but not sufficient. Aristotle holds that one has to have the appropriate emotions in support of one's reason. If Philip is really scared and would much rather not do this courageous thing but does it anyway while wishing he were not called upon to act courageously, then he is not truly courageous. Recall that according to Aristotle, character is a matter of what one enjoys doing, and virtuous people enjoy doing good things [5]. We should not interpret him as saying that if you are truly courageous, you will find that risking your life is a lot of fun, but there is satisfaction in doing one's duty. True virtue engages our emotions. We ought to be angry when wronged, determined when going into battle, grateful when done a favor, and cheerful when giving. Grudging action is not enough; you must genuinely want to do the right thing. Having a virtue is a matter of having certain desires and wanting to have these desires. You want to want to act courageously; you do not want to have a desire to run at the first sign of danger.

Acting out of inordinate fear is irrational if, as is likely, one is acting against one's values. I may have good reason to believe that in the long run, an investment in a randomly selected portfolio of a dozen stocks is superior to an investment in bonds, but I may nevertheless choose the latter because short-term fluctuations make me very nervous. In this and many other ways, we are all sometimes irrational. Our values and some of our desires are inconsistent: we want what we wish we did not want, sometimes because emotion plays an inappropriate role, and we act on desires that are inconsistent with our values and not on those we know we should be acting on.

Although rationality and clarity about what one is doing are very important, even the most virtuous and rational person sometimes finds it impossible to say precisely what is the right thing to do and why. Even if over time Philip becomes able to

understand that courage is a matter of fearing what is really dangerous, it is often impossible to estimate danger accurately, particularly as there is always the possibility of rationalization, under emotional pressure or otherwise. That is one reason why it is important to have the right emotions. True courage does not require that Philip be able to say precisely why he decided to perform one act rather than another in this situation. There is no algorithm for determining what is truly courageous – at least none that is useful at the time of decision. So it is with many crafts. A good comedian – one of Aristotle’s examples – cannot reduce humor to a series of propositions about what makes people laugh and what does not.

This indefiniteness, reminiscent of intuitionism, may seem to undermine the rationality of virtue. The reasons that the agent can give for what he/she does do not always suffice to show why he/she should not have done something else. In the area that lies beyond rules like “fear what is truly fearsome,” wise and good people follow their intuitions and emotions and usually satisfy themselves and others. But many people, not least businesspeople, think themselves wiser and better than they are and have far too much confidence in their own intuitions. Virtue is hard because people are irrational.

Free Will

People of strong character can resist the pressures in the environment; they have more autonomy than those who succumb against their better judgment or just do not recognize the pressures that influence them. Autonomy in this sense – the ability to form and act on intentions that are based on one’s well-considered values – is virtually equivalent to practical wisdom (*phronesis*, sometimes translated “prudence”), which is a necessary and sufficient condition of good character. But we do not withhold blame from the weak-willed: their lack of self-mastery, as Adam Smith called it, is a fault in them. Character development aims at something better. We are ethically obligated to acquire the right traits and desires and the ability to act on them.

There is a possible problem in Aristotle’s account, however. He holds that one’s family and community strongly influence character development. If you are fortunate, your parents and fellow citizens will offer you good role models, rewards and punishments, and ethical education. But what if you are not so fortunate? Is it your fault if your family and your community are bad and raise you accordingly? Aristotle claims that you are jointly responsible for your character [13], but it is hard to see how you can be responsible for your character at all if you cannot choose your family or your community.

Aristotle is well aware of factors that do or do not make actions involuntary and, thus, beyond the reach of praise or blame. That is the topic of *NE* III, especially Chaps. 1 and 46. Acting under physical compulsion is an example of an involuntary action. But if you do something wrong because you are drunk, it is your fault because you voluntarily drank to excess [14]. Ignorance of a certain kind may also excuse you: you may know that trespassing is wrong while not knowing that you have strayed onto my property. In this case, you know the universal but not the

particular. (Whether your ignorance is a legal excuse is another matter.) But if you know that selfishness is wrong but fail to see that what you are doing is selfish, or if you wish you were not selfish, you are responsible. Nor does any other sort of weakness of the will excuse you. Aristotle says that your choices form your character [15]. If you are responsible for your character in that way, you are also responsible for what appears to be good because your character determines what seems to you to be good [16]. If demanding more than your share seems to you simply a case of standing up for yourself, or if you are insensitive to some ethically salient aspect of a situation, there is a problem about your character.

Aristotle does not contemplate the determinist objection, familiar in recent centuries, that the decisions we make as we develop a character are themselves the products of unknown preexisting conditions beyond our control and knowledge. One likely reason for Aristotle's apparent failure to face this problem is that he does not embrace causal determinism generally. According to his science, things happen always or for the most part, he often says. There is teleology in nature. Necessity does not govern all events. There are accidents.

Yet it is arguable that Aristotle's position on free will is not far off the mark. It makes sense to think of free will as the ability to form and act rationally on intentions that are in turn based on rational values and desires. *Akrasia* is a good example of the absence of free will since your will is weak rather than free and effective. In a state of *akrasia*, you are influenced by inappropriate factors in your environment or by your own psychological pathologies not to act rationally, and the reasons you offer for your actions are rationalizations at best. On this account, free will is a matter of degree. So, arguably, are praise and blame, because one may be more or less susceptible to them. (But the appropriateness of praise and blame does not track precisely with its effectiveness, or with freedom of the will.) Paradoxical as it may seem, one may not be able to decide whether to have freedom of the will. One's ability to act freely can be a matter of luck in upbringing or in some other respect.

Aristotle does not believe that one is a passive victim of one's desires, however, and he is surely right. Elster [17] advocates "self-management" to keep inappropriate desires and emotions from diverting us from our most rational intentions. This may involve staying away from situations in which we are vulnerable, as well as what Elster and others call "adaptive preference formation": we cultivate certain desires that support us in acting according to our values. This presumably includes getting into the habit of acting as if one had certain preferences and certain reasons for action and eventually coming to have them. So we develop habits of desire and of reasons for action and not just habits of action. "Assume a virtue if you have it not," Hamlet urges Gertrude. He suggests that she refrain from having sex with Claudius that night, and the next, and over time it will become easier to abstain. "For use can almost change the stamp of nature" (see further Audi [18]).

If this account of free will is correct, then at least some claims about free will are empirical claims. Social psychologists do research that tells us whether and under what circumstances people act on rational deliberation. For managers and management theorists, those findings will have practical implications. If one is to influence

the behavior of employees and others, it is useful to know to what extent they do act on their values, as opposed to social pressure of some kind. But there are ethical issues as well (not that ethical and psychological issues can be easily distinguished). To motivate employees in ways that ignore or undermine their values – managing by fear, for example, or lies – is a form of manipulation that undermines the character of agent and victim alike.

Framing

Aristotle claims that if you are a person of good character, you perceive a situation rightly. Getting it wrong – failing to grasp the ethically essential features of the situation – is a sign that you have a character flaw. A good person will perceive that a certain act is courageous rather than foolhardy, generous rather than vainglorious, and will act accordingly [19]. Aristotle also claims [20] that one can go wrong in apprehending a situation under the wrong universal – that is to say, under a description that is not the most salient one, even if it is true. For example, one sees a piece of food as delicious rather than fattening.

Aristotle is talking about something like framing, which is easy to get wrong. Tversky and Kahneman [21] did an experiment in which people strongly preferred a state of affairs in which 25% of some population would survive some event to one in which 75% would die. This indicates serious irrationality; in particular, it suggests that people may make judgments and take actions in large part on how they describe a complex situation to themselves – differently according to which of two logically equivalent descriptions they attend to. The same is true of situations in which one act admits of different but compatible descriptions. You can frame eating a doughnut as a pleasurable experience or a fattening act, as it is both, but a person concerned with health should take the second way of framing rather than the first as salient. In some cases, the problem is that the agent acts on a description that is misleading or false. So it was not difficult for those in financial services to mischaracterize the risk that they were taking for their customers, by focusing on the profits to be made so long as things went well (see further Werhane [22]).

Your environment will influence the way you frame a situation: you will likely do it as others do it, as is the custom in your profession, as the client wishes, etc. (see Bazerman and Tenbrunsel [23]). One way to interpret the Milgram [24] experiment, for example, is to say most of the participants did not see themselves as causing pain to an innocent subject but instead as following directions and helping Dr. Milgram in his important work. Your self-image will be influential as well: you are likely to describe your failure to confront the boss as a piece of thoughtful diplomacy, whereas others will see it as self-serving and cowardly. Your interests will influence the framing as well: you tend to argue for the moral rightness of actions that favor you. This is a form of rationalization, in which one begins with a conclusion and then attends to the features of the situation that support one's conclusion – the opposite of the way in which Aristotle claimed that ethical

reasoning should go. No doubt something like this afflicted the Arthur Andersen accountants working for Enron. A person of good character, on the other hand, perceives the situation correctly – notices and evaluates aspects of the situation that are lost on people of lesser character.

That is not easy and not as common as we might suppose. Doris [25] and others have claimed on the basis of evidence from Tversky and Kahneman, Milgram, and others that there really is no such thing as character as we understand it: there is only the immediate environment. Perhaps, a safer inference would be that the character of many people is weak. But that is not universally true: a significant number of the participants in the Milgram experiment refused to cooperate beyond a certain point, presumably because they did have enough character to understand and assess what was really going on.

The experiment supports some points made earlier. A strong corporate culture may cause one to act against one's values, but a culture may support good values, in part by habituating people to certain ways of acting. Role modeling can be effective, as can talking openly about corporate values. Rules too, including ethics codes, may enforce good habits, particularly if people understand their rationale. In some cases, coordination will require rules. How people talk will affect how they frame situations, but for encouraging certain kinds of speech, role modeling is better than rules.

A similar kind of framing is at work in developing strategy; so says Rosenzweig [26]. Skilled strategists are aware of the data that analysts gather; they know many techniques for using the numbers in assessing the prospects of strategic business units. A good strategist can see threats and opportunities behind the numbers. It is a matter of knowing which factors are salient in a particular market – product quality, manufacturing cost, logistics, image, market share, and even quality of management. What is salient will differ from one market/product to another, and the ability to analyze a market involves knowing what is salient. There may be a rule of thumb that market share matters more in the fast food business than elsewhere, but that rule can be overridden by factors like bad management, and it applies better in East Chicago than in East Vassalboro. It normally takes years of experience – habituation, we might say – to develop a reliable ability to see what is salient. This is similar to the way in which virtuous people see ethically salient features of situations that improperly habituated people do not see or do not consider reasons for action.

But Rosenzweig goes further and claims that character is as important as analytical skill: a manager must resist the pressure to do what is safe and standard, what worked last time, and what will not expose him or her to criticism if things do not work out. A weakness of character can affect one's ability to understand a strategic opportunity, as when one looks at a promising opportunity and sees it as unpromising because a failed attempt to exploit it might expose one to ridicule.

Appropriate emotions assist correct framing. Aristotle notes that an irascible person will take offense too readily, whereas a phlegmatic person will not be angry even when anger is appropriate [27]. You should be grateful for kindnesses, angry if and only if you are seriously wronged, sympathetic towards the wretched, and glad to help your fellow citizens. The person of good character has an enjoyable life

doing good things, unless misfortune intervenes. From Aristotle to Robert H. Frank [28], philosophers and others have argued for having the right emotions and intuitions, rather than none at all. Without them you may be no more than a clever rationalizer, and at worst a sociopath. With the wrong ones, you may be moved to act wrongly. As in the case of gratitude, however, you cannot simply choose to have a certain emotion in a particular situation. Yet as Hamlet implies in speaking to Gertrude, you can sometimes cultivate emotional reactions over time, by habitually acting as though you were grateful or brave or delighted with your friend's success.

Through habit, we can develop good ways to act, to analyze, and even to feel. But there is reason to doubt that the ability to frame correctly, and reflective ability generally can always be produced entirely by habitual action.

Rational Reflection

On the Aristotelian view, the great question of ethics is: "What sort of person do I want to be?" The sort of person you are determines what your interests are; so the Aristotelian question is in effect asking: *What do you want your interests to be?* This question ought to be part of anyone's education. Do you want to be the sort of person who can enjoy only overwhelming financial success? Or the sort of person who enjoys a life in which work plays an important but not dominant role and in which that work offers challenge, variety, growth, association with interesting people, and compensation that lets you live comfortably? The question is not which one you prefer. It is a higher-order question about which one you would choose to prefer if you could make that choice. It suggests that one ought to have desires that are rational at least in the sense of being consistent with one another and with one's values over time, and actions that are consistent with one's desires; so Aristotle says [29]. He is echoed by psychologists like Chaiken, Giner-Sorolla, and Chen [30] and Haidt [31]. It is not a straightforward question about self-interest, but according to Belk [32] and Kasser and Ryan [33], cited in Haidt [34], most people who have strong personal connections are happier in the end than those who give the first. Humans are, after all, sociable creatures, says Aristotle; it is not contrary to our nature to be virtuous. According to Aristotle, virtue is a matter of identifying and acting on reasons that take into account our nature and what it implies about the good life.

Becoming the right kind of person and acting accordingly is extraordinarily difficult. Mere habituation will not suffice; the process requires rationality in working out what one ought to be and do. Aristotle's model of rationality is the practical syllogism, which begins with a statement of what one wants and ends with an action. This seems straightforward: I figure out what is good for me and act accordingly. But as Aristotle himself acknowledges in his acute discussion of weakness of the will [35], it just does not always work that way. As a host of social psychologists have argued, most people are not very good at determining what is good for them or, even if they succeed in that, at acting accordingly.

Aristotle has high standards for rationality. It is not just a matter of the efficiency with which a means leads to the satisfaction of some desire, as Hume and many mainstream economists hold. It is not only irrational to value health while eating and drinking to excess, smoking, and avoiding exercise; it is irrational not to value health at all. It is also irrational to have inconsistent values and desires, or to be unclear about what one's values are.

In a book that has influenced a generation of business ethicists, MacIntyre [36] argues that one of the characteristic problems of modern liberalism is that it takes rationality to be about means rather than ends and is therefore neutral on the value of ends. MacIntyre suggests what Aristotle asserts: that the ultimate end for any person is to live well, hence to be virtuous. As noted earlier, Aristotle believes that premises of certain syllogisms can be known without being seen to follow from other premises. So certain truths about the nature of human beings are knowable even if they are not conclusions of sound syllogisms, and it would be unreasonable to reject them. The idea that ethics can be read off from human nature has limited appeal nowadays, particularly to those who are less certain than is Aristotle about what is natural and what is not. The opposite extreme, the idea that living well is just whatever an individual decides it is, seems equally implausible. But we can set some limits on what could count as a good life by trying to imagine, for example, how impoverished our lives would be if we cared so little about one another that no person's well-being provided any other person with a reason for action.

Consider Smith, a woman who gets on well with people of other ethnic groups. When she was a child, her parents told her that all races are equal, and they policed her language as well as her actions. They saw to it that she became accustomed to hanging out in diverse company, and she now enjoys doing so. When she says that she judges people by the content of their character, she means it. She is in a better position morally than a person who has acquired no such habits, and who reacts to human differences in a way that reflects our hard-wired tendency to favor our in-group. But there are some racial issues that are not amenable to habit-formed intuitions: think of affirmative action and racial profiling, for example. She is able to think about these issues fair-mindedly, and that is good. But the best intentions and attitudes are not enough. She needs to reason about the issues and to reflect on her own thoughts and emotions. She therefore needs to bring to bear some principles that support her intuitions or raise difficulties about them.

All this requires adult education in what Aristotle calls dialectic, and to that we now turn.

Principles and Dialectic

Beyond a good upbringing and maturity, what more might be needed to make one virtuous? Consider Jones, who is well brought up and has good habits, including the habit of candor. If he chops down a cherry tree, he will readily admit it. If he is asked his opinion, he offers it accurately. But a problem about candor as a habit is that it is not always appropriate. If Mrs. Jones asks Jones whether she looks fat in a certain dress (as she does), he ought to answer with care. It pains him to lie, but

telling the truth will bring a different sort of pain. Jones must understand when and why something less than candor is called for in situations like this as well as others that are more serious. The mere habit of candor does not suffice.

Another problem is that most people do not have virtues that carry over from one sort of situation to another. Social psychologists have discovered that people are often just or conscientious or courageous or even talkative in some situations but not in others. Developing the habit of being conscientious about feeding one's dog does not necessarily contribute to the habit of being conscientious about showing up for work on time. As I have noted, some philosophers have inferred from these discoveries that there is no point in talking about character. Others, including Alzola [37], are not convinced.

It is axiomatic in the military that courage is the product of preparation. Soldiers are endlessly drilled so that they will readily act in combat as they have in training – that is, they will act courageously. But this sort of training will not make it any easier for them to face the dentist's drill or save the boss from a serious mistake by offering a frank warning. It may even make it harder to summon up the courage to refuse to fire on innocent civilians when ordered to do so. Sometimes, psychological traits cross moral lines in disturbing ways. Asch [38] discovered that subjects who were able to ignore peer (i.e., confederate) pressure and give accurate estimates of the comparative lengths of lines tested poorly on cooperativeness and congeniality.

It will be helpful for people with some good habits to consider why these habits are virtuous – that is, for example, what is involved in being just and how it contributes to a good life. From this consideration will emerge some broad principles concerning the nature and application of justice. Simply knowing these principles will not make the agent just, as Aristotle often says, though it will help. There will still be some difficulties in applying the principles in certain cases. As the previous section indicates, the agent will need a certain kind of perception to decide and act justly. So, for example, a just person not only will espouse equal pay for equal work but also will see a female colleague as a colleague rather than as, say, the lady manager.

This is not as easy as it looks, according to Bazerman and Tenbrunsel [23] and many other social psychologists. We convince ourselves that we are fair-minded people and that our judgments on women and others are made on the basis of pertinent evidence, however prejudiced they may actually be. But one can avoid even the most obvious inferences from one's espoused principles. Think of our enlightened Founding Fathers, who in the Declaration of Independence declared it self-evident that all men are created equal but later in that document charged King George with having encouraged slaves in America to revolt.

Fully developed character entails making good judgments on the basis of good principles. Aristotle holds that one arrives at acceptable judgments and principles by the process of dialectic. This process usually starts with common opinions, or at least the opinions of those widely regarded as wise people. The objective is to find as premises of practical syllogisms principles that are consistent with those opinions and explain them and eliminate the opinions that are wrong [39].

Aristotle's view, laid out in NE I 4, is that a good upbringing that inculcates good habits prepares one for consideration of definitions of the virtues. A person who is well brought up and has good habits is capable of making correct judgments about individual cases of virtue and vice and capable too of making somewhat more general judgments. Aristotle undertakes to go further, however, and illustrate how we can justify these judgments by coming to understand justificatory principles (*archai*), which typically take the form of definitions of virtues, which presumably generate v-principles. We collect common opinions, giving preference to those of wise people, and then look for principles that show why they are true and thus justify them – most of them, that is, since some will be shown to be false. When Aristotle speaks of beginnings, he sometimes has in mind what we would consider moral principles, while at other times he is thinking of particular moral judgments. The ambiguity is confusing, but he explicitly claims that a starting point of an argument that leads to a principle is called a beginning while the principle itself is a beginning in a different sense: it is the starting point of the justification of a particular judgment [40]. He sometimes distinguishes the two kinds of beginning by saying that particular judgments are known to us whereas the broader principles known by nature. So the broader principles justify some of our particular judgments and rule others out.

Here, we may think of Rawls's [41] reflective equilibrium: one compares one's principles with one's judgments about particular cases and adjusts both in an effort to make them consistent. Neither the principles nor the judgments are prior; each is subject to adjustment by reference to the other. If our principles are nothing more than the result of rationalizing the intuitions on which we act, then our intuitions are prior in an impermissible way and likely not very good. If we embrace principles that have no connection to our intuitions, they will have little credibility.

It seems unlikely that we shall ever reach a consensus on how to apply the principles on which we agree and not only because unforeseen situations will forever arise. Aristotle does not believe that the knowledge of ethical principles is unassailable, or their application always straightforward. He takes them seriously as a carpenter or a navigator [42] or a physician or a comedian [43] must take seriously the principles of carpentry or navigation or medicine or comedy, but not as the geometer takes seriously the principles of geometry [44]. The difference is important: we know just how to apply the principles of geometry to a geometry problem, even a problem in actual space and time.

However much skill one acquires in developing principles, the possibility and the temptation to rationalize – in particular, to assess situations according to one's own interests or prejudices or by social pressure – will often arise. Becoming able not to rationalize is more than a matter of rational skill: it requires habituation, good principles to refer to, and rare self-knowledge. Aristotle sets a high bar in saying that in ethics as elsewhere *nous* (understanding that is not purely inferential) should be part of our perception and that the intuitions of an ethical person will incorporate the right principles into a particular judgment.

In the case of wide reflective equilibrium, so called by Daniels [45], we bring in pertinent science and other facts as background. Irwin [46] finds in Aristotle what

he calls strong dialectic, which resembles wide reflective equilibrium in that it too incorporates not only pertinent facts but also Aristotle's analysis of them. Aristotle's metaphysical works supply him with a conception of substance (it is the individual essence) that derives from common opinion but is superior to it because it makes sense of it. It explains our ability to say, for example, that this thing is the same one we saw yesterday though it has changed a bit, and it avoids certain puzzles to which unaided common sense may be subject (e.g., you cannot step into the same river twice). The notion that a substance has these characteristics and that a human being is a substance underlies Aristotle's arguments in *De Anima*, his primary work on psychology.

When he comes to the *Nicomachean Ethics*, Aristotle can build on views about persons reached in *De Anima* in part by dialectic. His *Physics*, too, is in the background. He begins his ethical work with a certain view of humankind: rational, social, ensouled, and endowed with capacities that reflect those features. Not least important, humans have ends, which help determine the nature of the excellent life. So when Aristotle undertakes dialectical inquiry in the *Nicomachean Ethics* he is dealing not only from common opinion but also from his own views about human nature and the good life. These views do not radically undermine commonly held opinions but usually sharpen them.

So, for example, Aristotle dismisses the preference fulfillment conception of human good by saying [47] that no one would choose to live a life with the intellect of a child and a child's idea of fun. Why not? Can Aristotle be sure that any reader would agree with him? But Aristotle has already argued, with his metaphysical views in the background, that the excellent life is about actualizing one's human capacities. We may be inclined to agree with him; if so, our assent will probably have something to do with our own consideration of what makes a life worth living, based in part on our own views of the nature of humankind. We do not envy the happy idiot.

Similarly, when we consider business ethics dialectically, we have as background some notions of the purposes of business and of what is likely to achieve those purposes. Most business ethicists accept the increasingly widespread view that capitalism is a source of prosperity but that it must be restrained in some areas. Most of us believe that work and autonomy can be mutually reinforcing but often are not and sometimes cannot be. Most of us oppose discrimination on the basis of irrelevant personal attributes. Most of us can identify instances of bad behavior in organizations and in markets. It is important to have some guidelines for thinking more thoroughly about those issues; so there is a place for dialectic in a business ethics class. But that is not all that can be done to contribute to our students' character formation.

Teaching Character

Most who teach business ethics do not claim to improve their students' character. Typically, a course in business ethics gives students tools – usually principles – for making ethical decisions. Students familiar with cost-benefit analysis will grasp utilitarian theories without difficulty. They will understand justice and negative rights pretty well. Yet all this may not convince them that they have

good reasons to be ethical. So one might concede that a course in business ethics does not make a student ethical any more than a course in finance makes a student greedy.

Skepticism may be a problem as well. Insofar as moral philosophers claim that ethics is primarily about principles, they may be setting their students up for disappointment and cynicism. Students will realize, with or without the instructor's help, that applying different and sometimes competing moral principles to complex situations in the real world is difficult; in fact, it seldom settles a disputed case. They may even doubt the principles themselves, particularly if they have been encouraged to question the facile pieties with which they grew up. Making ethics entirely about principles does not imply that there is no fact of the matter, but it may leave that impression.

Ethics taught from a virtue perspective, on the other hand, ought to recommend itself to students. However thoroughly business students may be steeped in the language of maximization, most of them want to think of themselves as trustworthy and courageous and would object to being called snakes or wimps. They sense that there is something undesirable about being that kind of person. Virtue ethics in the Aristotelian tradition takes the position that ethics is about the good life, a life which one has good reason to live. To take virtue ethics seriously is to have a sense of why one should be ethical. In that respect, a course in virtue ethics will be more ambitious than a course that just considers principles. But Aristotle holds that becoming ethical is a long process, which begins in childhood. How much can be accomplished in one semester?

One criticism often made of business ethics courses, and other ethics courses as well, is that students have already learned ethics, for better or worse, before they get to kindergarten and that therefore a course will do them no good. Here, Aristotle would agree in part. Youngsters learn virtues as habits; then, at a certain point – long after kindergarten – they may reason about them. But Aristotle sees dialectic as picking up where habituation leaves off and turning a critical eye on our principles and intuitions and criticizing each with an eye on the other. This process of advanced character development is far from the revaluation of all values, in Nietzsche's words.

Successful dialectic requires a certain attitude towards dialectic itself – a determination to be guided by its conclusions rather than by one's prejudices. To understate, that is difficult. Aristotle says again and again that mathematical certainty is not available in ethics. In dialectic, in particular, one has the option to adjust one's individual judgments or one's principles, and there are no clear rules on when to do which. (Something like this can happen in science as well.) No doubt that is a matter of good character.

The case study method suits business ethics as it suits strategy. In a typical strategy course, the students read a text and then consider case studies that invite them to apply the strategic principles stated in the text. This is the beginning of the process of developing and refining their habitual ways of thinking about strategy. In real-life corporate strategy, there is much to be said for trusting the intuitions of an intelligent and experienced person with a good track record. When a manager

makes decisions about the strategies for certain business units, there will be some easy cases. Where the market is growing and the unit is dominant, reinvesting for growth is the obvious strategy. But there are nonobvious cases, as when a group of weak units can together achieve economies of scale or use slack resources, or when one's competitors have serious weaknesses. There is seldom any algorithm for inferring the correct strategy from the available numbers, but some managers are consistently better than others at knowing which description of a strategic situation is the salient one. Their record of success is evidence of their skill.

Case studies do much the same work in ethics. They exercise students' judgment about particular instances of principles, including situations in which justice and economic efficiency conflict. In looking at a case and considering what its salient features are, students are developing framing ability and thus practical wisdom and thus good character. Simply understanding that there are many ways in which a situation can be framed will improve students' ability to frame. There is no substitute for actual experience, in strategic management or in ethics. We have noted that Aristotle says [48] that one cannot achieve virtue just by philosophical argument, but one can help students make the most of their experience, including the experiences that they had early in life.

Business students are not naturally rapacious, nor is there any good reason to believe that their parents and communities have made them ethical predators, though they may have heard that success in business requires that of them. Most of them probably share the common opinions that are the basis of dialectic. On the whole, they are willing to cooperate with others who are cooperative and to trust others who are trustworthy. Most students have fairly good values, but those values will be tested in the workplace. There is some encouraging evidence that students can learn to recognize the warning signs of rationalization and ethical anesthesia, so that when they join an organization that is an ongoing Milgram experiment, there will be a spark of recognition. Beaman et al. [49] show that people taught about social pressure will be better able to resist it thereafter. Bazerman and Tenbrunsel [23] argue that instruction in these matters, which they call behavioral ethics, must be an essential component of any business ethics course. Lieberman [50] offers evidence that continued discussion in an appropriate environment – something like dialectic in a good *polis* – can make a positive difference. It can at least encourage students to speak in a language that includes ethical terms.

Aristotle does not claim that those who go through the process of dialectic will find principles that apply perfectly to complex situations. Ethics still is not geometry; that is itself a lesson worth learning. But a dialectical conversation may make one's principles clearer, though possibly somewhat more complicated and tentative. Certain of one's values – for example, those that shape one's view of appropriate gender roles – may have to give way. One will have better and more trustworthy intuitions where principles compete or are hard to apply. If all goes well, one's intuitions will lead one to apprehend the situation under the right principle rather than on a principle that social pressure forces on one, or one that rationalizes one's preferred behavior. There is some evidence that such

a conversation can have good results. It is striking that Haidt, who makes much of the strength of emotion and the moral importance of intuition, claims [51] that those with philosophical training are more likely than others to reason through ethical problems, rather than rationalize, and to act on the conclusions.

A course in strategy teaches students how to choose appropriate long-term objectives for an organization and then to marshal the necessary resources and organize them to move in that direction. A course in ethics can help students think about their own lives in that way. It can raise questions about why someone would want to pursue a certain sort of career or join a certain sort of firm. So it may help expose the reasons given as incoherent or based on self-ignorance or peer pressure.

The objective is to help students learn to answer the question “What shall I do?” in part by asking them to address the question “What shall I be?” Choosing the long-term objectives of one’s life is no easy task under any circumstances. One cannot readily choose which desires to have: many people are perfectly happy to be tempted by doughnuts, some by dishonesty. Students can, however, do some strategic preference formation by reflecting on what is most important to them and how to protect it and, then, trying to form the habit of acting accordingly. They can surely come to understand how facile and misguided it is to say that ethics is opposed to their interests, and how they can have something to say about what their interests will be.

If a strong organizational culture can affect one’s character, then the choice of an employer will in effect be choosing which desires to cultivate – a form of adaptive preference formation – hence making a significant choice about one’s character. Aristotle would not accept that choosing the right community is a sufficient condition of developing a good character, but he does believe that it is a necessary condition. If you go to work for a rapacious Wall Street firm that demands your whole life and pays you lavishly, you may well turn out to want to be an overworked shark. If you go to work for Google, it probably will not be long before you want to be and are the sort of person who enjoys working in a Google-like culture.

Students can also learn ways to create organizations that are hospitable to ethics. Some, most famously MacIntyre [52], argue that the profit motive will undermine virtuous activities in organizations, and among organizations as well. The intrinsic satisfactions of cooperation, trust, and creativity will be eliminated in favor of making money, which will become an end in itself, and employees the means to it. That is exactly what Aristotle says is the characteristic vice of money-makers [53]. MacIntyre seems to assume that managers are Weberian bureaucrats who treat employees as cogs in the machine. That is not always the case. Some managers are aware of the benefits of engendering trust, of permitting employees to be creative, of convincing them that they all have a stake in the success of the company, and of persuading them to support its mission rather than be free riders.

Aristotle claims that politics is the culmination of ethics [54]. The politician is responsible for creating a community that encourages virtue, which is a matter of rationality as well as of sociability. Aristotle is more optimistic than we are about the ability of politicians to improve our lives, and in part for that reason he gives them, rather than the family, primary responsibility for character development. But good communities are at least necessary conditions of virtuous citizenship, and for

many of the same reasons, well-designed organizations are necessary to make working life more hospitable to those who want to be fair, cooperative, trustworthy, productive, and creative in their work. That is a lesson that all students should learn.

We should not be altogether pragmatic in assessing a course in business ethics. Aristotle holds that the best life of all is one that is dominated by abstract thought. That is what one might expect a philosopher to say. But we encourage the study of the humanities in part because we think there is something to be said for rationality, subtlety, and creativity of thought for their own sake. A course in business ethics should aim at these goods, which MacIntyre would probably call internal goods, as well as at preparing students for a successful and honorable career in business. Business school need not be only a trade school.

Conclusion

Habituation alone will not make one virtuous, but good habits over many years can lay the basis for a virtuous life. At a certain point one becomes capable of thinking rationally about ethical issues and about what influences our ability to grasp and analyze ethical situations. Ethical education can have an important role at that point, but it will likely be successful only with those whose good habits make them amenable to rational thought about right and wrong.

The Empirics of Virtue Theory: What Can Psychology Tell Us About Moral Character?

5

Miguel Alzola

Abstract

In this chapter, I submit that virtue theory offers the best framework to account for our moral experience in life and in the context of business decision-making. And I argue against an empirically grounded objection to virtue theory, which holds that character traits of the sort postulated by virtue theorists do not exist because differences in social circumstances explain people's behavior rather than any character trait. The objection does not succeed because virtue is rarer than we may expect, because the experimental evidence does not support the claim that character lacks any explanatory power, because virtues cannot be merely reduced to behavioral dispositions, and because virtue theory is concerned with the whole span of a human life rather than isolated behavior.

Introduction

A few years ago, my father found a wallet full of cash in the street. No one was around when he found it. He badly needed the money. He immediately returned the wallet – with the money inside – to its owner. In time, in the small town where he lives with my mother, his actions were highly praised. The immensely grateful owner of the wallet published a small letter in the local newspaper to thank him for the deed. My father's friends prepared a large poster with the newspaper article to congratulate him. His coworkers told him that he did something admirable.

I am pretty sure my father is proud of his behavior now, as is the rest of our family. But I knew how badly he needed the money at the time. At one point,

I asked him, simply: “Why?” He did not say anything about ownership or property rights nor, in his response, did he appeal to universal principles that everyone could rationally choose or that no one could reasonably reject. He did not think about the maxims that would make things go best [1]. Instead, he said that he did not even think about keeping the wallet, that he was merely doing the right thing, and that he was raised that way. He went on to say that keeping the wallet is not the kind of thing he would ever do and that maybe in the back of his mind, he was trying to serve as a role model for my siblings and myself.

Folk psychology and virtue theory would explain my father’s behavior by reference to his character traits: “He is an honest man.” Situationist psychologists and philosophers demur. Trait attributions, they argue, tend to be wildly incorrect, and we lack scientific evidence that people differ in character traits.

In this chapter, I shall suggest that virtue theory offers the best framework to account for my father’s behavior. And I shall argue against the standard interpretation of the experimental evidence according to which character traits of the sort postulated by virtue theorists do not exist. Hence, I shall defend the claim that it makes sense to continue making character attributions such as, say, the character trait of honesty to my father. And I shall conclude that such traits merit consideration as virtues, even if they are fragmentary.

This chapter is organized into five sections. In section “[Virtue, Ethics, and Psychological Realism](#)”, I shall briefly introduce and assess virtue theory and explain why normative ethical theories must meet the demands of psychological realism. In section “[Skepticism About Trait-Concepts](#)”, I shall present a large body of experimental literature on behavioral inconsistencies that has been interpreted as a challenge to the existence or the explanatory power of character traits. In section “[Skepticism About Situationism](#)”, I shall make a case against the empirically based challenge to virtue theory. In section “[Probabilistic Traits, Modular Traits, and Local Traits](#)”, I shall discuss some lessons to be learned from the experimental results on behavioral inconsistencies. Section “[Conclusion](#)” concludes.

Virtue, Ethics, and Psychological Realism

Virtue theory is already established as one of the four mainstream theories in normative ethics and in business ethics, along with consequentialism, Kantian ethics, and contractualism [2, 3]. Roughly, what makes virtue theory unique is its commitment to the primacy of *aretaic* terms in normative ethics.¹

In essence, virtue theory holds that basic judgments in ethics are judgments about character [4]. As a character-based ethical theory, it embodies two main theses. First, at least some judgments about the value of character traits are independent of judgments about the rightness or wrongness of actions. Second, the notion of virtue justifies the notion of right conduct in a sense that is explanatorily prior to the notion of right conduct: the moral value of an act cannot be assessed independently from the moral value of the person performing such an act

[5]. What is morally permissible, required, and prohibited is explained by reference to the states of character of the person in the context of a community in which moral standards are developed and learned in the same way the language is developed and learned. Both theses oppose the view that the value of character traits depends on the value of the conduct that these traits tend to produce and that the concept of right behavior is theoretically prior to the concept of virtue.

The justification of the virtues lies in the essential role of these character traits in human flourishing. Virtues are deemed as necessary and as constitutive elements of well-being. According to virtue theory, human flourishing is the primary concept in ethics, from which we derive the virtues and then proceed to infer the criteria of rightness.² An action is obligatory, virtue theorists believe, if and only if it is what an agent with a virtuous character would do under the circumstances. And an action is wrong if it is not what the person of good character would do given the situation. By constituting his flourishing, the virtues benefit its possessor as a human being. He flourishes only if he is virtuous because human nature is such that flourishing for humans requires us to live in a virtuous way.

Virtue theory is said to fare better than rival ethical systems because it provides a better fit with our moral experience in life and in the context of business decision-making. We do not judge nor make decisions on the basis of the abstract rules or universal principles postulated by Kantian theory, consequentialism, or contractualism. Rather, we act on the basis of whether our behavior fits well with what a person of good character, a role model, would do under the circumstances. Another advantage of virtue theory is that it fits very well with folk psychological explanations of human behavior. Ordinary people assign causes to events, such as behaviors and mental states, by making trait attributions; that is, we explain morally relevant behavior by reference to causes that are located within the actor, namely, the character traits he possesses.

One of the questions a theory of virtue needs to address is whether, as a matter of fact, we can live a good life. In the ancient world, classical forms of virtue ethics appealed to the best science available [6]. An ethical theory is weakened, I have argued elsewhere, if the best contemporary science conflicts with its claims or if it makes it too hard to see how they could be true [7]. Likewise, contemporary virtue ethics must look at patterns of flourishing particular to the species from the best contemporary science. Without a psychologically plausible story of how it is possible for rationally bounded creatures like us to be virtuous, virtue theory runs into trouble, enough to raise the question whether it can remain a genuine alternative to contending moral frameworks.

Moral theories too often neglect facts about human nature and about society to the point that, as a result, they become inadequate for our real needs. Thus, normative theories must take seriously the kind of persons we are, what we can actually achieve, and the types of cognitive and motivational structures we have [8]. In short, psychological facts matter. They impinge on normative ethics by setting constraints of feasibility. Goldman puts it nicely:

A moral code that is psychologically unrealizable by human beings, or just too demanding or difficult for people to satisfy, might be rejected on metaethical grounds. [9, p. 358]

A moral theory that is not realizable in principle by the creatures for whom it is intended places us under serious moral quandaries. And being unrealistic does not count in favor of a moral theory. One may even say that there might be enough grounds for rejecting a normative theory if it depicts a way of life that is psychologically unrealizable.

There is a fundamental determinant of what standards a moral theory can put forward, namely, the requirement of psychological realism [10, 11]. As Griffin puts it:

One cannot, in the sense relevant to obligation, meet a demand if the demand is beyond the capacity of the sort of people that, on other especially important grounds, we should want there to be. [11]

The requirement of psychological realism sets a number of constraints for any normative theory, including, of course, virtue theory.

In order for any theory of virtue to be psychologically realistic, the following three claims must be true: First, there must be character traits of the sort postulated by virtue theorists as virtues and vices. Second, human beings must differ in the character traits they possess. Third, people must be able to develop the sort of traits that constitute the virtues. If any of these claims do not hold, charges of lack of psychological realism will hold substance.

What are character traits of the sort postulated by virtue theorists as virtues? Roughly, a virtue is a deep-seated state of character that provides (normative) reasons for action together with appropriate motivations for choosing, feeling, desiring, and reacting well across a range of situations. The traits of character traditionally postulated as virtues have at least two fundamental features. First, they have a tendency to influence conduct. The virtues characteristically yield appropriate behavior. If someone is, say, honest, we assume that he has a character of a certain sort that makes us expect that he habitually behaves honestly (when he acts *in character*). Second, character traits are global in the sense that someone who possesses the trait X is inclined to behave in an X-like manner across a broad range of circumstances. Thus, so-called global traits entail predictions of cross-situational and cross-temporal behavioral consistency. Traits are manifested in virtuous behavior across a range of trait-relevant eliciting conditions and over time. Virtues are thus robust and stable character traits.

Skepticism About Trait Concepts

Regardless of the normative relevance of moral character, some psychologists and philosophers have expressed skepticism about the existence as well as the explanatory and predictive power of character traits of the sort postulated by virtue theorists. An empirically grounded objection to virtue theory has been recently articulated, which holds that virtues and vices do not really exist or, if they do, they are irrelevant to explanations and predictions of human behavior [12, 13]. According to this view, known as situationism, differences in social circumstances explain people's morally relevant behavior rather than any character trait.

Situationists point to a host of fascinating experimental studies suggesting that prosocial as well as destructive behavior fundamentally varies with slight situational variations which are morally irrelevant, such as whether the actor is in a hurry or has plenty of time [14], is in a good or a bad mood [15], or is observing an emergency in a group or alone [16]. Psychologists Ross and Nisbett summarize these findings by saying that:

manipulations of the immediate social situation can overwhelm in importance the type of individual differences in personal traits or dispositions that people normally think of as being determinative of social behavior. [17]

The situationist literature in social psychology, philosophy, and management research is well known by now, so I shall briefly summarize the major findings as they pertain to two of the major virtues in the literature.

Honesty, Compassion, and Experimental Social Psychology

The most widely cited experiment in the situationist literature concerning honesty was conducted during the 1920s by Hartshorne and May [18]. The studies were administered over a 6-year period. More than 8,000 children, ages 8–16, were examined on dozens of tests, all designed to measure honesty and gauge whether children’s tendencies to engage in honest behavior are explained by personal characteristics, such as certain character traits, as opposed to being the result of situational variations. Schoolchildren were placed in somewhat tempting situations in which they had opportunities to cheat. Specifically, they could cheat at school on tests by copying from a key, by adding more answers after time was called, by peeping, and by faking a solution to a puzzle. They could also cheat on homework and fake a record in athletic contests. They were also tested while playing party games: they could fake, peep, and steal. Additionally, they could steal money from a box used in a test. And they could lie about their conduct in general or their behavior on the aforesaid tests.

Hartshorne and May reported very low correlations between honest behavior in test-taking, property-returning, and truth-telling situations. But they found high correlations between honest behavior in any one of these areas and further honest behaviors in that same area. They concluded that honesty was largely situationally determined. For example, copying from an answer key correlated strongly with copying from a key on a similar test at a later day (0.70), but not with continuing to work on a speed test after the time is called (0.29). Hartshorne and May’s results – as well as the study of introversion and extroversion conducted by Newcomb [19] at a summer camp for troubled boys – are still widely cited in support of the claim that trait-relevant behavior is inconsistent and, specifically, that honest behavior is highly situation-specific.

Similar findings have been documented in the situationist literature on compassion. The following is a brief summary of how seemingly insignificant situational variations have a considerable impact on helping and destructive behavior.

Studies on mood effects apparently indicate that people are more likely to help when they find a coin in the coin return slot of public phones [15] and when they are exposed to pleasant aromas [20]. People who feel incidental gratitude are more trusting and receptive to advice than people in a neutral emotional state [21]. Moreover, some seasonal anomalies in stock returns are said to be caused by mood changes of investors due to lack of daylight [22] and temperature variations [23]. In a thorough review of the literature, Schwarz consolidates a large body of evidence corroborating the impact of moods and feelings on judgment and decision-making [24].

The extensive literature on bystander effects suggests that when one is alone, one is more likely to help someone in need than when other people are around. For instance, bystanders hearing an epileptic seizure over earphones were less likely to seek assistance for the victim when they believed other witnesses were present than when they believed they were by themselves [25]. More recently, Bargh, Chen, and Burrows [26] reported that activating knowledge structures – priming the elderly stereotype – can affect social perception and people’s subsequent behavior (participants who were primed with an elderly stereotype walked out of the laboratory significantly slower than participants in the neutral condition). Likewise, recent research suggests that merely imagining the presence of others can lead to less helping behavior on a subsequent unrelated task [27].

Another classic work related to compassion is the Good Samaritan experiment originally conducted by Darley and Batson in 1973, which showed that reading the biblical parable of the Good Samaritan did not affect the helping behavior of seminary students. The degree of hurry the subject is in apparently offers the best explanation of the subjects’ behavior. The seminarians who were told they were not in a hurry were six times more likely to help the confederate who appeared to be in distress than those in the rushed condition [14]. More recently, a study conducted by Tang and collaborators [28] on employee helping behavior fully supported the Good Samaritan effect across four cultures (American, Taiwanese, Polish, and Egyptian). And in a laboratory experiment, Wright et al. [29] found that people displayed the lowest helping behavior when they were assigned difficult tasks and paid on the basis of goal attainment.

The most widely cited experiment in social psychology is arguably Milgram’s studies on obedience to authority. Subjects were instructed by an authority figure (the experimenter) to administer “painful but not dangerous” electrical shocks in 15-V increments to a coparticipant (unbeknownst to the subjects, a confederate of the experimenter who received no shocks) for incorrect answers to word-matching questions. Milgram was concerned with the question of obedience (and disobedience) to these orders – that is, identifying the highest level of electrical shocks the subjects would administer before refusing to continue, even as the coparticipant was complaining about the pain and banging on the wall. In the first set of experiments, 65% of the subjects administered the highest voltage to the coparticipant [30]. Situational variations in the design of the experiment provide additional evidence: when subjects were free to choose the shock levels to

administer, only 3% delivered the maximum shock; when the experimenter was physically absent and gave his orders by phone, there was a 21% level of obedience; in a touch-proximity condition with the learner, obedience was 30%; and when the shocks were administered by a confederate while the subject performed subsidiary tasks, obedience climbed to 93%.³ The Milgram effect was also explored in the business setting. Brief et al. [31] found that people in a simulated corporation would obey orders to employ racist criteria when making personnel decisions. And Brief et al. [32] found effects of prejudice and business justifications by authority figures in discrimination against minorities in hiring situations.

Eliminativism About Traits

The situationist data are seemingly at odds with virtue theory: helping behavior is not accounted for by character variables, but instead is a function of irrelevant features in the environment – such as whether the would-be helper is in a hurry or has plenty of time or whether he is standing alone or finds himself standing with other persons in an emergency. And destructive behavior is also situation-specific rather than governed by robust and global traits of the sort postulated by virtue theorists. The main lesson, then, is that the explanatory and predictive power of character attributions is much weaker than we normally think.

There are at least two ways to articulate the situationist threat to virtue theory.

The stronger version of situationism, which is defended by Harman [33], challenges the reality of character and, hence, of virtue. In his words:

...there is no evidence that people differ in character traits. They differ in their situations and in their perceptions of their situations. They differ in their goals, strategies, neuroses, optimism, etc. But character traits do not explain what differences there are. [34, p. 329]

If there are no character traits, it follows that there are no virtues, and if there are no virtues, there can be no theories of virtue to be about.

A second, more qualified, version of situationism does not defend the claim that virtues do not exist. Rather, it holds that character attributions do not have much explanatory and predictive power. Indeed, situational factors that would seem to have little moral significance have more explanatory power than any personal qualities. This is taken as evidence that these personal qualities, if they exist at all, are too weak to qualify as virtues. This nuanced view was first articulated by Flanagan [10] and has been recently defended by Doris [12]. To put it more simply:

1. If behavior is governed by virtues, observation will reveal behavioral consistency.
2. Observation does not reveal behavioral consistency.
3. Behavior is not governed by virtues.

Doris' argument is valid by *modus tollens*.⁴ But I do not think it is a sound argument, for the reasons I shall provide in the next section of this chapter, which challenge the two premises.

Skepticism About Situationism

Situationism has, to be sure, made an important contribution by calling the attention of virtue theorists to a body of experimental findings in social psychology that was absent in the philosophical discussion of the virtues until a decade ago. Still, I submit, the situationist thesis remains unconvincing.

There are at least three ways of dealing with the empirical evidence presented in the previous section so as to develop a conception of virtue that is not seriously undermined by the situationist data. First, one may argue that the standard conception of virtue is untouched by this data. Second, one may contest the situationist interpretation of the experiments by showing that the empirical evidence does not support the conclusion that character does not exist or lacks predictive/explanatory power.⁵ Third, one may resist the conceptualization of character traits and virtue that is implicit in the situationist thesis. These three strategies can be combined, but the first is incompatible with the second one. The second and third moves entail challenging the two premises of Doris' argument, as presented in section "[Virtues As Ideals](#)".

Virtues as Ideals

This view offers the least accommodation to the situationist critique. It simply holds that the empirical findings reviewed in section "[Skepticism About Situationism](#)" fail to threaten the most promising version of virtue theory, according to which virtues are moral ideals that we should aim to attain even if we are unsuccessful. Appiah, among others, defends such a view:

Philosophical accounts of the character ideal of compassion, the conception of it as a virtue, need make no special assumption about how easy or widespread this deep disposition is. Acquiring virtue, Aristotle already knew, is hard; it is something that takes many years, and most people don't make it. (. . .) But difficult is not the same as impossible; and perhaps we can ascend the gradient of these virtues through aspiring to the full-fledged ideal. [36]

The fact that virtue is rare – assuming for the moment that it is a fact – the finding that people are imperfect and not fully virtuous is not a serious threat to virtue theory. Normative ethical theories, the argument goes, are untouched by any experimental evidence, as they are not committed to any behavioral prediction. True virtue is rare enough to leave a statistically significant footprint in psychological studies [6, 37, 38]. Furthermore, the question of whether anyone has a virtue is heavily laden with evaluation, and thus, the evaluation is not likely to be convincingly operationalized by psychologists.

While this view fundamentally captures the ancient view on the nature of virtue, it faces an important objection. Situationists may say that such a normative theory fails to meet the requirement of psychological realism introduced in section "[Virtue, Ethics, and Psychological Realism](#)." Yet, I do not think the objection holds. What would really count as an argument against virtue theory would be to deny that it is

possible to become virtuous, that is, to acquire, retain, and exercise good character traits. But such an empirical claim is not supported by the available evidence. A fair number of subjects, even if they were a minority, behaved according to virtue in the social psychological experiments previously discussed.⁶

Empirically Unsupported Eliminativism

Elsewhere I have offered six methodological objections to the situationist thesis, which indicate that the empirical data provide no reason to doubt the existence of character traits of the sort postulated by virtue ethicists as virtues or the influence of such traits on human behavior whatsoever [39].

The studies cited by the situationist involve, at least, six methodological problems.

First, the ecological validity of these studies is controversial: situational factors are less powerful in natural contexts than they are in experimental contexts, and experimental conditions may weaken dispositional traits [40]. Psychologists can create situations in which the influences of personality are minimized (e.g., under strong norm constraints) and other situations in which personality influences are maximized (e.g., in unstructured interactions). In addition, the gold standard for measuring causal effects, namely, random assignment of individuals to treatment and comparison, is not the way real life works in the context of organizations. Rather, “people select themselves into and out of real organizations” [41].

Second, subsequent variants of some of the experiments listed above show divergent results from those obtained in the original experiments. For instance, keeping the same experimental conditions of the mood effects studies, Blevins and Murphy [42] found that 43% of the subjects helped in spite of failing to find any coin in the phone booth (and 40% of the subjects who did find a coin in the return slot did not help the confederate). Moreover, in a study conducted in Rio de Janeiro, 100% of Brazilians helped retrieve a pen when a stranger dropped it, but when the study was replicated in the USA, only 31% of New Yorkers helped [43]. And Wuthnow [44] found that knowledge of the Good Samaritan parable was a strong predictor of compassionate behavior and caring. Furthermore, a sizable body of literature on dispositional effects in psychology and organizational scholarship challenges the bold situationist thesis (e.g., [45–49]).

Third, new and strong experimental conditions may have prevented the manifestation of virtue: under extreme circumstances, situations usually rule behavior, especially in the lab [50]. The right thing to do under a theory of virtue is what a person of good character would do under the circumstances. But what a person of good character would do in a psychology lab may not be obvious for the subjects of these experiments. Moreover, the evidence presented by situationism is tilted toward novel situations, in which the agent may not be able to practice his ethical sensibilities [51].

Fourth, one-shot studies are not sufficient to assess the state of character of a person. The experiments did not track the behavior of particular individuals across

situations on multiple occasions. In the experiments summarized above, psychologists typically observed any given individual only on one occasion in a particular situation. We cannot say much about the consistency of the subjects' behavior on the basis of one single observation. Correlations between character and behavior look higher when we compare aggregates of behavior in situations of one kind or another than when we compare single instances of behavior [52]. As Funder puts it, "one problem is that a single behavior is not always or perhaps even usually very informative about personality" [53]. Observation of individuals over a period of many years in numerous and diverse situations is needed in order to support any thesis about the predictive power of traits.

Fifth, while some of the experiments mentioned above entailed multiple tests on the same subjects – e.g., Hartshorne and May's honesty studies – they did not track their behavior as individuals, but instead inferred the behavior of individuals from the behavior of groups. The problem is that not all individuals in a group behave like the group average. For example, a coefficient of consistency of, say, 0.1 between lying and stealing is an average of all children that does not exclude there being some individuals for whom the correlation between the stealing and lying situations is much higher. Therefore, what are presented as correlations of behavioral consistency are merely relationships between the distributions of a population's behavior in different situations, but they do not reflect different behaviors performed by particular persons.

Sixth, at least some of the studies make inappropriate inferences between child behavior and adult behavior. The subjects of the honesty studies conducted by Hartshorne and May were schoolchildren. But it is inappropriate to infer adult behavior from child behavior, especially in the context of virtue theory, where a virtuous child is a contradiction in terms. Aristotle describes a youth as someone who "lacks experience of the actions in life, which are the subject and premises of our arguments" [54]. One expects children to be more impressionable, less committed to particular ideals of conduct, more likely to be swayed by passions, and less integrated than adults.

There are surely possible replies to these claims. Still, as I argue elsewhere, taken together, the six objections make a good empirically based case against both the stronger and the more qualified versions of situationism [39].

Irreducible Virtue

The virtues as operationalized by situationism have little to do with the traditional conceptualization of virtue. Situationists reduce virtue to behavioral dispositions to act in accordance with certain principles or rules of conduct. As Doris claims, "to attribute a character or personality trait is to say, among other things, that someone is disposed to behave in a certain way in certain eliciting conditions." But he does not say much about "the other things." Then, ascribing the character trait of honesty to my father means, simply, that he is disposed to behave as required by a duty of honesty. That includes, presumably, a disposition to return a lost wallet.

In contrast, virtue theorists highlight the importance of the inner dimension of character in defining virtue as “an inner quality of an agent and of his acts” [55]. Virtue theory is concerned with the whole span of a human life rather than with a particular action or a single decision.

Situationism suggests that X-like behavior is necessary for attributing character trait X. But X-like behavior is neither a necessary nor sufficient condition to grant virtue ascription. It is not necessary because a virtuous person may fail to act in an X-like manner and still be X.⁷ And it is not sufficient because a behavioral disposition is only part of a virtue. At a minimum, the agent must have a good motive for his behavior if his disposition is to count as a virtue.

It is at least possible that my father has a disposition to behave honestly only out of fear of the social consequences of dishonest behavior without caring at all about the owner of the wallet for his own sake. Alternatively, my father may have a disposition to return lost wallets only for the sake of impressing my mother or his friends. Or he may regularly take a pill that impairs his capacity for successful deception and so behave in a consistently honest way. Such a behavior – provided that it makes sense to call it honest behavior – does not count as a manifestation of a virtue because the action does not stem from the virtue of honesty.

Conversely, an agent may possess the virtue of gratitude without saying the words “thank you.” Or, an agent may lack the virtue of gratitude and still perform an act of gratitude. Such a poorly motivated disposition may still be socially useful when compared with the alternative of lacking any disposition to honest or grateful behavior. But few – except, perhaps, situationists – will think that it is excellent enough to be regarded as a virtue.

Virtue theorists have good reasons to resist a dispositional analysis of virtue. For if virtue is merely shorthand for “being disposed to right action” and if virtues are reduced to “character traits which produce good effects” [57], then the most characteristic feature of virtue theory, the primacy of character in normative ethics, is lost.

Virtue theory is best understood along the lines of a nonreductive account of virtue, by which virtues are states of character. To have good character entails the possession of a capacity to entertain higher-order thoughts about thoughts (beliefs) that enables the agent to reflect upon, and to change, his own beliefs and patterns of reasoning. A virtuous person will consider what highest-order desires, values, and beliefs should govern his life. Within limits, he will cultivate certain higher-order desires, such as the desire to overcome his fear of being embarrassed, and free himself from other higher-order desires, such as the desire to be vindictive. These desires being not merely to have or to lack certain first-order desires but desires that one or another of his first-order desires should be effective, in the sense of ordering action. He will also develop values and cultivate adherence to certain principles through reflection and disciplined habituation. Possessing a value entails wanting to possess certain kinds of desire. If my father values “honesty,” for example, that entails that he wants to be the sort of person who really desires to return the wallet he found in the street to its owner, even if the wallet is full of money that he desperately needs. He does not want to be just someone who merely acknowledges

a duty to return the wallet. To have a strong character is also a matter of cultivating the appropriate emotions: he feels good rather than angry about giving the wallet back.

In sum, moral character consists of higher-order desires and values, beliefs, framing capacities, emotions, and enduring patterns of behavior that have any bearing on moral matters. Although they are interrelated, these elements of character cannot be described solely in terms of each other. For an action to be from a state of virtue – i.e., for an action to be expressive of virtue – it must be expressive of appropriate inner states.

Two other problems arise in connection with the reductive account of virtue defended by situationism, namely, the problems of *akrasia* and the observational equivalence of traits.

First, the experimental data invoked by situationists do not capture a key distinction in the virtue theory literature between incontinence and vice and continence and virtue. Virtue and vice do not constitute an exhaustive classification of states of character. Rather, they mark the end points of a spectrum of kinds of states of character, namely, heroic virtue, ordinary virtue, continence, incontinence, vice, and brutishness [54]. The two states of interest here are continence (*enkrateia*) and weakness of will (*akrasia*). A weak-willed person lacks the unity of reason and feeling that characterizes the person of true virtue. Although he does recognize and aspire to the good, he has emotions and appetites that tempt him away from the good. And unlike the continent person, the weak-willed agent gives in to temptation, and, perhaps with remorse, he does what he knows to be wrong [58, 59]. By focusing only on overt behavior, the situationist experiments fail to provide enough information about the person's character. In observing behavior, the experimenter might readily confuse the continent person with the virtuous person and the incontinent person with the vicious person.

Second, a dispositional account of virtue has weak explanatory power when dealing with traits that are observationally equivalent. It is a truism that people have more than one character trait. Two different traits, thought of as internal individual differences, may come into conflict in a situation, such that we are unable to establish through observation which one of the two traits is expressed in the agent's behavior. As an illustration of observational equivalence, consider the virtues of compassion and honesty. Construed as behavioral dispositions, these virtues have observationally equivalent manifestations when responding to the Nazi official's request for the whereabouts of the Jews who happen to have hidden in your basement [60]. Then, experimental findings of behavioral inconsistency may be the result not of the absence of any trait underlying behavior but rather the result of different traits that are manifested in a situation. When a disposition is present together with a countervailing disposition, manifested in identical circumstances, behavior may appear inconsistent only if it is assessed with reference to that one trait. But it is wrong to automatically conclude that if behavior is not guided by the trait under investigation, then it is controlled by situational factors. Multiple traits may be relevant in a situation, and different traits may motivate different behavior.

Probabilistic Traits, Modular Traits, and Local Traits

As far as I know, my father has found a wallet in the street only once in 66 years. He may return another lost wallet he encounters in the future. We do not know. But he may not always tell the truth in the workplace, say, while conducting negotiations with the union. He might have cheated once in his business' tax declaration even if he never cheated in his personal declaration. And, alas, he is not a courageous person when facing physical danger. He is terrified anytime he has an appointment with the urologist. He probably possesses the character trait of benevolence, broadly construed, as much as he lacks the virtue of fortitude. He could be defined overall as a generous person, but he is definitively more generous with his family members than with strangers.

Now, in spite of the situationist evidence and these anecdotal observations, I argue that it makes sense to attribute these character traits to my father. Unlike the experimenter, I am not ascribing virtue concepts on the basis of one-shot observation but over 65 years of interaction with him. And I am not assessing his character based only on overt behavior. Being an honest person is to have certain values, first-order and higher-order desires, beliefs, emotions, and so on. Suppose that these character attributions are quite accurate. The interesting question, then, is whether these character traits I ascribe to my father are sufficiently robust or "global" to warrant their classification as virtues.

Indeed, situationists could be quite sympathetic to the characterization of my father I just provided. They may say that it does not run against an accurate interpretation of the experimental evidence. Yet, they would claim that according to traditional virtue theory, it does not make any sense to describe my father as a virtuous person. Situationists would be willing to endorse character attributions such as "generous-around-friends-and-family" or "mountain-climbing-courage." But they would reject any attribution of the sort of global traits postulated as virtues under virtue theory, such as generosity or honesty.

I hope I have already offered a convincing case against the empirically based challenge to virtue theory. But perhaps, the main lesson to be drawn from the empirical evidence on social psychology about behavioral inconsistency is not that virtues and character do not exist (or, if they do exist, that they lack any explanatory or predictive power). Perhaps, the lesson is that these local traits do manifest probabilistic or modular traits of character, traits that indeed qualify as virtues. Let me briefly elaborate this point and refer to the appropriate literature.

I have disputed the reduction of moral character to behavioral dispositions. But the behavioral dispositions that are part of a virtue, say honesty, may still amount to significant probabilities of honest behavior even if they do not predict with certainty. Situationism holds that the effect of personality on behavior is minimal because a correlation of 0.30 [61] or 0.40 [17] represents the upper limit to which one can predict human behavior from personality variables. But a correlation of 0.40 means that a prediction of behavior based on a personality trait score is likely to be accurate 70% of the time [62]. That is not that bad after all. To illustrate this

claim, Sabini and Silver compare personality coefficients with baseball stats. The difference between the batting average of one of the greatest hitters, Ted Williams (.344), and one of the weakest, Bob Uecker (.200), accounts for 0.33% and 1% of the variance in whether these particular batters will get a hit on a particular occasion. A correlation of 0.3 is between 3 and 27 times as predictive of particular instances of honesty and dishonesty as batting averages are predictive of whether someone will get a hit on a particular turn at bat. Yet, baseball fans know that the difference between Williams and Uecker is highly significant in the long run [63]. While aggregations of observations may not make it possible to predict individual behavior on every single occasion, it can help make reliable predictions about the average response that each person will have over a large number of future observations. And, more importantly, when the experimental statistics used by social psychologists are algebraically converted into correlations of the sort used by personality psychologists, the effects of situations on behavior are not any bigger, statistically, than the documented size of character traits on behavior [64]. For instance, in the Good Samaritan studies, whether the subject was in a hurry had a correlation of -0.38 with helping behavior. And in the Milgram's investigation, the correlation that reflects the size of the effect of victim isolation is 0.42.

The second point concerns the "modularity of virtue," that is, the idea that some behavioral dispositions can be seen as modules of virtues. The hypothesis of the modularity of morals was first introduced by Flanagan [10], who suggests that virtues such as honesty and generosity have different emotional bases, domains, and learning histories and thus possess characteristics of other skills that have been modeled modularly, such as language and the basic emotions. Behavioral dispositions are, according to one version of this thesis, autonomous competences, in the sense that a person develops and exercises a disposition to behave in a certain way in certain domains – for example, in the workplace or while playing games, as in Hartshorne and May studies – without being disposed to behave in the same way in other domains – for example, at home or while completing a school assignment. The argument is an Aristotelian one. Insofar as behavioral dispositions are part – and only part – of what a virtue is, there is no reason to expect a firefighter who fearlessly races into a burning house to save a child to be equally fearless in contemplating a trip to the dentist's office. These domain-specific behavioral dispositions, the argument goes, can be aggregated together, thereby forming "a more inclusive composite disposition" [65].

Now, can these composite behavioral dispositions be worthy enough to merit their classification as virtues? The answer to this question is highly contentious. For the sake of space, I will not examine it in this article. Suffice it to say that some virtue theorists defend the unity of virtue thesis – according to which anyone who has one of the virtues must have all of them because there is really no set of distinct and separate virtuous character traits, but rather at the bottom, only a single, unitary virtue [66–68]. Other virtue theorists regard the unity thesis as a platitude [69], argue that there is no necessary connections among the virtues [70], acknowledge that certain virtues are incompatible [71], and even consider that a "local"

cross-situationally consistent disposition may have positive moral value and so be part of a virtue [65].

Before concluding, I would like to emphasize again that virtues should not be reduced to behavioral dispositions. But such dispositions are still part of the virtues. Instead of dismissing the situationist data, we can entertain the possibility that these narrow – as opposed to global – behavioral dispositions, whose existence situationists are willing to acknowledge, can support fairly reliable predictions and, under certain conditions, be considered modules of virtues.

Conclusion

Virtue theory is often praised because it allegedly offers a realistic account of moral motivation and decision-making. And, it is claimed, it fits very well with the way we humans explain behavior, namely, through trait attributions. In this chapter, I have outlined the most recent empirically based challenge to virtue theory. In the end, Situationism attacks virtue theory on grounds of psychological realism.

I hope I have provided enough reasons to persuade the reader that virtue theory offers a plausible account for why people like my father, who happen to find a wallet on a sidewalk, try to locate the owner, while other people simply pocket the contents and throw the wallet away. And I hope I have articulated a convincing case against the situationist thesis. To reprise, situationism does not hold because (a) virtue is rare, (b) the experimental evidence does not support the claim that character traits of the sort postulated by virtue theorists do not exist (or lack any explanatory/predictive powers), (c) virtues are much more than just behavioral dispositions, and (d) virtue theory is concerned with the whole span of a human life rather than with a particular action; it is concerned with character and human activity rather than isolated behavior. Thus, I conclude, it makes sense to continue making character attributions of the sort advocated by virtue theorists.

Even the dispositional content of a virtue may support quite reliable predictions of the average response of a person in the long run and about the distribution of his responses. Even if they do not provide enough material to make an unflinching prediction, they have as much predictive power as some of the situational variables that are seen as the real causes of ethically relevant behavior.

Even if it were proven, which has not happened so far, that character traits are only narrow and local – as opposed to global and integrated – such narrowly constructed traits may retain a number of features that merit their consideration as moral virtues and vices. Those features concern the very functions of trait attribution, namely, descriptive, explanatory, and evaluative functions. Traits may be used to summarize the agent's past behavior and predict the agent's future behavior, to explain the agent's behavior with reference to the individual's character, and to provide evaluations of the agent, her activities, and practices in a way that the value of the virtues – and the disvalue of the vices – attaches directly to their possessor rather than its products.

Notes

1. *Areteic* is derived from the ancient Greek word *arete*, usually translated as “excellence” or “virtue.” *Areteic* thus means “of or pertaining to virtue or excellence.”
2. What I describe in this section is the standard, Aristotelian, eudaimonistic version of virtue ethics. There are indeed other varieties of virtue ethics. Noneudaimonist versions of virtue ethics reject a strong relationship between virtue and eudaimonia. They include character or motive consequentialism, intuitionist theories of virtue, Kierkegaardian existential virtue ethics, and Nietzschean theories [71, 57].
3. The replication of the experiment was presumptively unavailable – for ethical reasons – until recently, when Jerry Burger, a psychology professor at Santa Clara University, managed to replicate the Milgram’s experiment with slight variations. The results simply confirm the original findings.
4. Alternatively, Doris proposes that the situationist argument can be articulated as abductive: the variousness of human behavior is best explained by reference to the hypothesis that virtues are rarely substantiated in human beings [35, p. 633].
5. One may also make a distinction between the explanatory and the predictive power of virtue attribution. While the question about predictive power is primarily an empirical question that can only be answered through observation, one may contend that the explanatory power of traits does not depend entirely on their predictive power.
6. Notice that I wrote “*according to* virtue” rather than “*from* virtue.” I shall discuss this distinction in section “[Irreducible Virtue](#).”
7. Virtue theorists disagree on the question of the relation between virtue and imperfection. Whether the person of good character may ever respond – behaviorally or attitudinally – in deficient ways, that is, less than the wholly virtuous way, is a controversial subject. Annas seems to disagree. She advocates the strongest view: “a courageous person must behave courageously in roughly *every* situation”: “It is hard to see how any situation could be excluded” [6, p. 33]. Aristotle is sometimes interpreted as providing a more realistic portrait of virtue: “Aristotle’s virtuous person may act wrongly in seven different ways while remaining virtuous” [56].

Abstract

A theory of virtue may be employed as an ethics of business. This chapter offers an account of the foundational theory of Aristotle, followed by illustrations of how some particular virtues are relevant to commerce. A discussion of the moral thought of modern thinkers – David Hume, Adam Smith, Samuel Smiles, Robert Solomon, and Deirdre McCloskey – illuminates further the application of virtue to commerce. Despite challenges, virtue theory provides a plausible model for considering how one may conduct business in an ethical and successful manner.

Introduction

A theory of virtue provides a plausible moral framework in which one may conduct business and exchange. Such a theory provides, therefore, a plausible model for developing an ethics of business. The ethicist who relies upon a theory of virtue has a rich history of philosophical thought from which to draw, though theories of virtue with specifically commercial applications are fairly recent. Nonetheless, if a theory of virtue is applicable to how one is to live, then such a theory should also bear upon how one ought to create, produce, and exchange. To address how virtue may serve the business ethicist, it is important to consider first the nature of virtue, turning in the second section to the foundational ethics of Aristotle. The next two sections illustrate how virtue may be applied in commercial settings, focusing in the third on the contributions of Robert Solomon and in the fourth on specific virtues. A fifth section, devoted to [Modern Virtue](#), sets forth significant modern and contemporary

treatments of virtue (including those of Adam Smith and Deirdre McCloskey). The final section takes up two critical questions regarding virtue and business ethics and notes some of the positive features of the theory.

Virtue as a Theory

Virtues are traits of character. To speak of a person's character is to consider something fundamental about the person. Less individualized than personality, the idea of character suggests an aspect of the self that carries normative import. Subject to moral praise or blame, character provides reliable indications of how one might act (or feel) in various circumstances and how such action (or feelings) might flow out of a settled tendency or disposition. The traits of character that are good and morally praiseworthy are virtues. Virtue incorporates dispositional, affective, and cognitive elements. In the most general sense, a virtue is a disposition to act (or to feel the appropriate emotion) in the right circumstances, to have a settled desire to act (or to feel) in this way for its own sake, and to know that such action (or feeling) is appropriate in these circumstances. Being virtuous may have beneficial effects for the virtuous agent and for others – or society. For example, the businessman who is honest may also be a successful businessman: His honesty may bring him material wealth, and it may serve his customers too. However, the businessman's honesty has its own value, regardless of these good effects.

Competing Accounts of the Moral Life

A normative account of virtue should articulate a theory of virtue (its conceptual nature and its relation to human psychology) and describe specific virtues. Some treatments emphasize both the theoretical elements and specific virtues, but many accounts focus on the latter. A fully developed model of virtue [1–3] offers an alternative to other normative ethical theories as well as to specific approaches to business ethics. Virtue theory emphasizes being rather than doing: Right actions arise only from persons who have good qualities of character. Other normative ethical theories focus on principles, rules, and actions: Utilitarianism counsels that one ought to act so that one's action has the greatest probability of maximizing utility; Kantianism maintains that one's actions should be universalizable (or that one should uphold principles of human autonomy and dignity); contractarianism demands that one adhere to the norms of a social or political contract; intuitionism lays out *prima facie* duties that have their own self-evident truth. Theories such as these focus primarily on what one ought to *do*, but a theory of virtue emphasizes what one ought to *be*.

A theory of virtue need not eschew any appeal to rules or principles, a fact made plain in Adam Smith's account ([4], III.5–6) and in several contemporary accounts ([5], p. 324; [6]). Smith describes how rules may serve as summaries of and guides to good conduct. Nonetheless, one may argue that principles of justice require an

articulation and justification distinct from virtue. A principled theory of justice may, therefore, complement a theory of virtue. Similarly, a theory of rules may rely on an account of virtue to explain how individuals are motivated to follow rules, apply principles, and act morally. These complicating elements are noted, though they are not developed further in this chapter.

Virtue theory also competes with other leading models of business ethics such as theories of social responsibility [7], stakeholding [8], and social contract [9]. These competing theories, understood as normative rather than empirical, are invoked typically to show how the practices of commerce and the life of corporations can be rendered ethical. To assert that a theory of virtue offers an alternative to these theories is not to say that virtue is incompatible with or otherwise precludes these theories as complementary. However, virtue theory offers a perspective distinct from these and provides, thereby, a foundation for a normative business ethics [5, 6, 10–14].

Before turning to these discussions, it is important to respond to a major objection to virtue theory. This objection, more recently termed “the separation thesis” [15], comes in various guises, but its major claim is that business is distinct from other areas of life: Anyone engaged in market exchange must be pursuing self-interest. If self-interest is the motive of commercial interaction, then according to this view, there is no place for virtuous behavior for virtue is incompatible with self-interest. This egoistic challenge is sometimes given credence because of its employment, by economists, in theoretical economic models. Of course, the conception of self-interest utilized in these models ranges from pure self-interest to nothing more than rational consistency among one’s revealed preferences ([16], p. 29) Indeed, an economic model, especially one purporting to describe some state of “perfect competition,” is hardly meant to be descriptively true. Even if agents act merely to achieve their highest value or strongest interest, that would not imply that agents were acting merely out of *self-interest*. After all, an agent’s strongest interest might be social, religious, or political, or it might have something to do with caring for one’s family. As Philip Wicksteed argued [17], we should think of economic exchanges in terms of a variety of motives, some of which might be selfish, or just self-interested, and others of which might be benevolent and other-regarding. However, what occurs in the exchange – regardless of motive – is that each party is “non-tuistic,” thinking less about the good of the other trader than of what he or she wants to do with the results of the trade. Each party is seeking, in general, the best deal that he or she can get. Business exchange is not gift exchange (nor is it a coerced exchange), but there is nothing essentially egoistic in the trade itself. Therefore, the claim that commerce is necessarily self-interested does not hold true, and it cannot, therefore, be used as an objection to a theory of virtue in business ethics.

Aristotle on Virtue

The first systematic theory of morals [18], Aristotle’s *Nicomachean Ethics* offers an account of the conceptual and psychological components of virtue, as well as a specific list or catalog of virtues. Aristotle links virtue to an account of the good

life – what it is to live well. His understanding of a life lived well requires a knowledge of human nature and a theory of the human good. The particular virtues that Aristotle sets forth include traits important to any human being, such as generosity, courage, and self-control. However, Aristotle does not seem to think that all persons could attain full virtue. He also doubts whether those engaged in trade or in money lending could be virtuous individuals. So it remains to be considered whether Aristotle's theory is compatible with commerce or whether a variant of that theory can provide a moral foundation for business.

Virtue, the Good, and Happiness

Aristotle's theory is often characterized as teleological: The sort of person one should be – how one should live – is determined by the good (end, purpose) or *telos* of the human being. This *telos* is natural and objective, not conventional or social. The *Nicomachean Ethics* commences with a conception of human action: Our intentional acts aim at some end or good, but these may come in either of two varieties. The end of an action may be a product or outcome of the action. For example, the end of baking is the production of bread. Or the good may lie within the action itself, as when one takes a walk merely to enjoy the stroll, not to lose weight, deliver a letter, or clear a path.

Given that we engage in various activities, each with some end or purpose, there must be some overarching good desired for its own sake and toward which all other ends are directed. This ultimate end, says Aristotle, is *eudaimonia*, typically translated as happiness, but more literally "living well." Such an ultimate end is no temporary state, nor does it consist in pleasure, contentment, honor, or wealth. To provide a fuller understanding of the content of happiness, Aristotle turns to human nature – in particular, the special characteristic, or function, of the human being. The characteristic of the human being is reason, an active life of reason. And the qualities that render possible the excellent performance of reason are the virtues. These virtues enable one to live a life characteristic of the human.

The virtues divide into two classes, virtues of character and virtues of intellect. Complete virtue involves the virtues of character, such as generosity, temperance, courage, as well as practical wisdom, an intellectual virtue concerned with moral decision-making. Whereas intellectual virtue requires teaching and the honing of one's deliberative capacities, the acquisition of virtues of character demands habituation. One must be habituated to feel, respond, and act in certain ways and at certain times. The properly habituated person, having acquired moral virtue, comes to see that what he or she is to do is precisely what must be done, even if its performance is not subsumable under a formula or description. In his account of the two species of virtue, Aristotle is drawing on two aspects of the moral life: habit and reflection. Habit, arising through example, suggestion, and precept, is embedded within the community, just as reflection, in the form of practical wisdom, also draws from the particulars of experience. Although one can distinguish these, they are not so much separable as complementary.

The Nature of Virtuous Action

The virtues give rise to virtuous conduct. But under what conditions is an act virtuous? Genuine virtue has cognitive, intentional, dispositional, and affective components. For an action to be genuinely virtuous, the agent must (1) *know* that the act is of a certain kind. For example, the temperate person refuses a drink because, even though he recognizes that the drink would be pleasurable, the circumstances are not appropriate for drinking. Nonetheless, to know that an act is of a certain kind does not entail that one chooses the act because it is of that kind. Therefore, the virtuous agent must (2) choose virtuous acts “for their own sake” ([18], 1105a33). For example, one should give generously because generosity is what is called for, not because it will be applauded. The businessperson should speak honestly to a customer, not because “honesty is the best policy,” but because honesty is the right course of action. Aristotle also revisits the dispositional element of virtue, asserting that a virtuous act must (3) “proceed from a firm and unchangeable character” ([18], 1105a34). The act must express or manifest a deep feature of the self with which one identifies. Indeed, the relation of the act to character suggests a fourth, affective condition: (4) The virtuous act must involve pleasure. The virtuous person finds pleasure in being virtuous. The act itself need not be pleasant or enjoyable, but the fact that the act is virtuous entails that one desires to do it and its omission would be painful. For example, even though the circumstances that call for courage are not, typically, pleasant, the courageous person finds it painful not to demonstrate courage at the right time and place.

As a state of character Aristotle describes virtue as a *mean*, an appropriate state in relation to one’s emotions or actions. The mean, typically falling between an excess and deficiency of emotion or action, is relative to the agent and the agent’s circumstances. The appeal to relativity does not imply ethical relativism, for Aristotle maintains that there is an objectively right (or wrong) response. But the mean response is necessarily concerned with one’s affective or behavioral response to a particular situation. Aristotle offers this summary definition of virtue:

Virtue, then is a state of character concerned with choice, lying in a mean, i.e., the mean relative to us, this being determined by a rational principle, and by that principle by which the man of practical wisdom would determine it. ([18], 1107a)

Moral choice requires knowledge or wisdom. As a mean state, virtue involves the agent having the right emotion or performing the right action: at the right moment, for the right length of time, in the right circumstances, to or for the right persons, in the right manner, to the right degree, and for the right purpose. These seven elements of virtuous action reveal the particulars of moral decision-making. The virtuous person must see, attend, discriminate, and judge the particulars of moral choice. It cannot be assumed that there is a formula, principle, or rule by which one can specify what one must do in a particular situation. Reason must guide and control both affect and appetite so that one hits the mean. In difficult cases, this may require deliberation and reflection. One must perceive the particulars, weigh the various goods that are at stake, and react in the right manner and

degree. Aristotle's appeal to practical wisdom does not mean that the virtuous are constantly engaged in reasoning. In many instances, the virtuous person will know what to do almost instantly. But if asked, the practically wise person could provide a reasoned explanation for his or her response.

Aristotle's Catalog of Virtues

Aristotle delineates a set of virtues that includes such universal traits as generosity, self-control, justice, and courage, along with magnificence (giving to public purposes), honor, good temper, friendliness, honesty, and wit, as well as qualities such as magnanimity (or high-mindedness) that are not universally accepted. For each virtue, there are specific objects and circumstances – the “concern” and the “context” ([14], pp. 96–97). For example, courage is focused on one's relation to fear; generosity is concerned with the giving and taking of material wealth. These virtues are praiseworthy precisely because they are concerned with the right sort of things – each is a part of living well. So the courageous person is not fearful of just anything (a mouse, say, or distant thunder) but is, for Aristotle, concerned with the possibility of death on the battlefield in fighting for a good cause. The courageous person will fear death but not in excess, and this fear will be endured in the right manner and for the right end. The virtue of generosity is concerned with material goods, with the appropriate use of wealth. An excess of giving is extravagance, a deficiency stinginess. The virtue of self-control is concerned with physical pleasures of touch and taste such as those of sex, food, and drink. Self-control is a pivotal virtue for Aristotle because unless one can control one's pleasures then one will not be able to act and feel in the appropriate ways. Instead of finding pleasure in virtue, one will be distracted by the pleasures of the palate or body. The person who cannot control pleasure is morally weak: This person knows what ought to be done but fails to do it because another pleasure beckons.

Courage, generosity, and self-control are three traditional and universal virtues. But Aristotle describes other virtues, not all of which we may find as easy to accept. Some of these other virtues manifest an aristocratic context and concern. For example, the virtue of magnificence is a trait that only some portion of society might have, for only a few have the wherewithal to give large amounts to public purposes. High-mindedness, or greatness of soul, is another virtue that may apply only to some. The high-minded person is concerned with and demands proper honor, but “honour from casual people and on trifling grounds he will utterly despise” ([18], 1124a11–12). A virtue that Aristotle regards as a crowning quality would, centuries later, come to be seen as improper. High-mindedness is hardly compatible with humility, which would emerge as one of the Christian virtues and an antidote to natural pride and selfishness. Indeed, some have argued that humility is foundational for good conduct precisely because its presence ensures an effacement of self that allows one to see the world as it is: “The humble man, because he sees himself as nothing, can see other things as they are” ([19], p. 101).

Aristotle's list suggests that virtues not only apply to distinct spheres of activities but may be conditioned by social circumstances. Alasdair MacIntyre suggests that Aristotle has provided "a theory whose subject-matter is that pre-philosophical theory already implicit in and pre-supposed by the best contemporary practice of the virtues" ([20], p. 148). Differing circumstances and beliefs may call forth distinct virtues (or distinct instantiations of virtues), so Aristotle's virtues may reflect some of the economic and social conditions of his day. Nonetheless, Aristotle's catalog includes virtues of comprehensive and universal appeal: justice, courage, generosity, honesty, and practical wisdom. Such universal virtues may have distinct particular instantiations or tokens across ages or societies. Living well in one type of society may require particular manifestations of generosity distinct from the examples of generosity found in other places or ages. Courage in a warrior society may differ from that in a commercial society. The relative priority of one virtue over another may be distinct, depending on social conditions or beliefs.

The distinction between general and socially conditioned virtues suggests another demarcation. Some virtues will have role-specific instantiations. Within any society, organization, or institution, there will be positions with specific responsibilities. The manager of a small business has distinct obligations from those of the clerk. The manager must make prudent decisions for the firm, the clerk no. The chief executive officer of a corporation must interact with a variety of persons, exhibiting friendliness and honesty, as well as courage and generosity. A manager, owner, or executive may be required to display leadership, which, though itself not a virtue, may demand particular virtues (e.g., courage, justice, practical wisdom) without which leadership would be impossible.

Taking Stock

Aristotle's account of the virtues yields significant insights. That virtue is a disposition of character with both affective and cognitive components is a central tenet of almost any theory of virtue. That virtues involve an application of reason that is more perceptive than purely calculative reminds us of the importance of moral vision. That the moral life contains elements of the traditional and habitual is a thesis that is too easily dismissed in an age, such as ours, that clamors after abstract ideals.

Any appeal to virtue must take into account Aristotle's theory. Yet his theory has distinct elements, and these may be logically separable: One may accept some elements and reject others. Aristotle holds, as noted above, that virtues, in general, are mean states between excess and defect. This characterization offers a helpful portrait of virtue, but it does not, as Aristotle himself recognizes, cover all of the virtues. Moreover, although the ideas of excess and deficiency may prove to be helpful criteria in making a choice, neither excess, defect, nor mean may reveal a reason that one particular state is appropriate.

Second, Aristotle's moral psychology of virtue – as a disposition of affect and reason, connected with an ultimate good – does not *entail* the particular set of virtues that Aristotle recounts. The chief virtues – justice, courage, self-control, honesty, and generosity – may be accepted as universal traits. Other virtues, such as high-mindedness, honor, or wit do not share the same universality, even as they have their interest. If one rejects one of these virtues, then one is also rejecting Aristotle's doctrine of the unity of virtue: To have one virtue is to have all the virtues ([18], 1144b33–35). It is not unreasonable to set this doctrine aside, if only by counterexample: Some genuinely honest persons also lack courage.

For Aristotle, the moral life is to be understood in terms of a single end or purpose, with each intentional action contributing to that purpose. The end is understood in terms of human nature, a biological basis for an objective good. However, as a third consideration, one may accept the teleological element but reject any biological basis in human nature. If one does this, then one must find some other basis on which to ground the objectivity of virtue. On the other hand, one may challenge the idea that there is single good toward which all things aim. In contrast, there may be plural and incommensurable goods. Or the traits of virtue may be good in themselves and not otherwise related to a single *telos*. Virtuous persons may remain virtuous even as they are acting without a specific goal or purpose but merely responding to circumstances ([21], p. 758).

Finally, it is not clear how one should interpret Aristotle's *telos*. The claim that our moral lives have an end must be considered in light of Aristotle's distinction between ends intrinsic to an activity and ends that exist apart from the activity. The end of virtue is happiness, but happiness is itself a manner of being, not some state, goal, or terminating point. It is not so much that one sets about each morning to be generous, courageous, and just, as it is that one seeks to do other things – to walk the dog, interview an employee, issue a contract to a new supplier, speak with an unhappy client, enjoy a dinner with the neighbors, and so on. The virtuous person has many aims, but his conduct is informed and conditioned by his humanity. On this interpretation, the presence of virtue will preclude some activities and engagements, suggest others, and more generally influence and modify one's actions. If this schematic interpretation is plausible, then the teleological element in Aristotle's ethics may prove less strong than often thought.

Aristotelian Virtue and Commerce

One need not accept the Aristotelian theory in its totality in order to appreciate its insight, value, and influence. Can Aristotle's theory function as a basis for business ethics? Is the theory compatible with commerce? It is well known that Aristotle expressed theoretical misgivings about some aspects of exchange, even as he recognized (contrary to Plato) the significance of property for leading a good life. The economy of ancient Greece did not incorporate the sort of widespread markets that we have today. Aristotle's own treatment of value and exchange, in both the *Nicomachean Ethics* and the *Politics*, suggests that some kinds of trade (including charging interest

on loans), in which the parties seek less to acquire genuine wealth than to make money, are not fully virtuous. Aristotle's thoughts on exchange do not, however, settle the question of whether his theory of virtue is compatible with commerce as we understand it today. Neither Aristotle's psychological account of virtue nor its conceptual bases seem to render his theory incompatible with a market social order in which there is private property and the voluntary exchange of goods and services.

Solomon's Aristotelian Virtue

Within business ethics, the most prominent application of Aristotelian virtue to business has been in the work of Robert C. Solomon. Solomon regrets that so much of business ethics focuses on policy, thereby omitting "an adequate sense of personal values and integrity" ([13], p. 111; see also, [22], p. xi). For Solomon, an Aristotelian understanding of business ethics commences with the idea that virtues of character are embedded within both the social community and the smaller community of a business. Pointing out a list of qualities or virtues – moral and nonmoral – relevant to business ([14], pp. 96–141), Solomon identifies honesty, fairness, and trustworthiness as basic business virtues. He treats fairness, for example, as related to mutual agreement, "a willingness to exchange value for value" ([14], p. 114). Within a firm, fairness demands that all receive their due, whether it comes via salary, promotion, or commendation. Honesty, he writes, is "the first virtue of business life," adding that honesty need not entail "full disclosure" and that the differences between honesty and dishonesty are "two extremes in a rich colorful spectrum" ([14], p. 118). For Solomon, there are also particular business virtues, including "toughness" and "friendliness," each particularly suitable to commerce.

According to Solomon, the communities of society and of business have their own purposes. Drawing a distinction between the goals and purpose of business, Solomon asserts that one, but not the only, goal for business could be profit making. However, the *purpose* of business, the "reason for engaging in the practice" ([13], pp. 119–20), is more fundamental than a particular goal. He characterizes the purpose as, "the satisfaction of public demand, the introduction of innovative, more efficient, more cost-effective products to fill a need and the optimal on-going relation between producer and consumer" ([13], p. 20).

Solomon's energetic and insightful defense of virtue is valuable. The purpose(s) he sets forth, an overarching *telos* for business as a general practice, seeks to identify what business *really* is. However, the justification for stipulating this general purpose is unclear. It is true that business must be distinguished from other forms of organization – the nonprofit, the governmental, and so on. However, the very purposes that Solomon attributes to business are not unique to it. Such purposes – which are not *single* but plural ends – could pertain to an individual, an artisan, or even an artist. Any number of organizations might have the purposes that Solomon invokes, including a socialist cooperative enterprise, or a planning agency of a socialist state. These organizations too might seek to satisfy public demand, to innovate, and to achieve an optimal relation between producer and consumer.

A socialist enterprise might maintain these purposes even if it does not fulfill them with the same success enjoyed by the business enterprise.

Solomon's proposal also fails to distinguish a purpose for business as general practice from the purpose of a particular business. Yet we work in particular businesses not business in general ([23], pp. 836–837). One may undertake a business enterprise for all sorts of reasons. As an activity, business involves exchange with each trader expecting some value in return. Alexei Marcoux discerns that business is an activity, not an organization, and the engagement in business requires no specific organization at all ([24], p. 58). To engage in the activity of business is not only to perform certain kinds of transactions, but to *seek* those transactions. Moreover, these are intentional activities that seek to be self-sustaining: “Business, then, is a(n intentionally) self-sustaining transaction-seeking and transaction-executing practice” ([24], p. 60).

This characterization recognizes the essential identifying element of business, exchange, but it does not require an appeal to a substantive purpose, as Solomon demands. In this revised sense of business, exchange takes place against certain assumptions, a framework of property relations – mine and thine – as well as certain beliefs and values, habits, and customs. When the activity of business becomes self-sustaining, then one is “in business” in the sense that one intends one's activity to sustain future transactions over time. To be in business is to be seeking trades and exchanges of a certain sort – namely, business exchanges.

Illustrations of Virtue in Commerce

Even without setting forth a substantive end for business, the virtues may be applied to commercial activity. Business exchanges can be embedded within a core of universal virtues, as Solomon and others contend [5, 11, 12]. Given that virtues have their contexts and concerns, a core set of virtues – self-control, courage, justice, generosity, and honesty – translates easily into commercial society, even as their particular tokens or instantiations depend on the particulars of history and circumstance.

Self-Control

Self-control concerns physical pleasures, but it may extend to other temptations as well. The person of self-control does not pile up debt or spend beyond his means, saves funds for the unexpected, and otherwise demonstrates a “low time preference” for the present (placing thereby a higher value on the future). Thus, the person of self-control may forswear immediate satisfaction, save for the future, and practice the virtue of thrift [25]. The person of self-control, able to allocate time and effort and to prioritize, works well under pressure despite distractions. Moreover, the person of self-control is able to master emotions when dealing with obstreperous colleagues. These are some of the ways that self-control is essential to the roles and responsibilities of commerce.

Courage

Courage is a virtue that might seem appropriate for a warrior society, but danger need not be bodily. An individual may rightfully fear many things, including a loss of well-earned reputation, embarrassment, financial loss, or another person's anger. A manager may muster courage to fire an employee, adjudicate a dispute, or state an opinion that runs counter to what is expected. An entrepreneur who perceives profit-making opportunities, however risky and uncertain, must act with decisiveness and courage: "Whenever you see a successful business, someone once made a courageous decision" ([26], p. 233). To start a new venture – a new advertising strategy, a new product, or a new method of production – is to take a calculated risk. As in the case of scientific discovery, a commercial hypothesis may not survive testing [27]. Of course, decisive and strategic conduct may conform to courageous conduct without manifesting genuine courage. Nonetheless, courage is needed precisely when a person is unsure of a strategy or assumes significant risk. Even the strategically minded person may require courage to see a project to completion.

Justice

Aristotle understood justice in its most general form to involve treating equals equally and unequals unequally ([18], 1131a23–25). The virtue of justice enters commercial society in various ways. The basis of exchange is voluntary and informed agreement: The just person does not seek to coerce, threaten, or mislead. Adam Smith offers this portrait of the just businessman:

In the race for wealth, and honours, and preferments, he may run as hard as he can, and strain every nerve and every muscle, in order to outstrip all his competitors. But if he should juggle, or throw down any of them, the indulgence of the spectators is entirely at an end. It is a violation of fair play, which they cannot admit of. ([4], II.ii.2.1)

For Aristotle, justice also involved fairness. And there is a sense in which his basic dictum of justice, expressive of rational consistency, involves a procedural fairness: One is not to play favorites, allowing one person to do or to receive something not available for others. As a virtue of decision-making, justice often takes the form of fairness. Employees must be evaluated fairly, rewards must be allocated by fair criteria, and employees hired, evaluated, and promoted according to public criteria. An employee must be just in relation to his colleagues and his company, endeavoring to put in a good day's work and to execute conscientiously his responsibilities.

Justice may also come into play in how a firm or corporation seeks to use the power of government. In the *Wealth of Nations*, Adam Smith criticizes businessmen who use the power of the government to forge monopolies, as in the case of "merchants and manufacturers" who seek exclusive privilege [28], IV.ii.21; see also I.x.c.25, I.xi.g.10, IV.vii.c.43) or otherwise engage in a "conspiracy against the publick" ([28], I.x.c.27). A businessman who via recourse to the state, "raises in any

country the ordinary rate of profit higher than it otherwise would be” ([28], IV.vii.c.26) is subject to Smith’s scorn. If one adopts an ideal view of a market, in which rules of justice allow free and open competition, in which no laws or regulations grant special privileges, monopolies, or favors to particular industries or firms, then any attempt to use the political process to gain advantages over a competitor – what the economists refer to as “rent seeking” – may not only be deleterious to the body politic ([28], IV.vii.c.43) but unfair, if not unjust. Operating in these ideal conditions, the just businessperson – essentially no different from any other party or firm engaged in exchange – does not seek special favors, legal privileges, or regulatory protections. The persons who lobby for such favors are among an “order of men, whose interest is never exactly the same with that of the publick, who have generally an interest to deceive and even to oppress the publick” ([28], I.xi.p.10). Yet within contemporary democracies, under political conditions that sanction and do not discourage rent seeking, it is not so obvious that the rent-seeking businessperson is regarded as an unfair or unjust person ([29], pp. 6–7), though at a minimum the businessperson who advocates a free market but nonetheless seeks legal or regulatory protection is guilty of hypocrisy.

Generosity

The virtue of generosity might seem, at first glance, to be incompatible with business exchange: Generosity involves giving, but business involves reciprocal trade. However, within the individual firm or in the midst of reiterated exchanges (between two traders, owner and employee, manager and supplier), there is room for the virtue of generosity. For Aristotle, generosity is concerned with the giving of material goods, more generally with the appropriate use of wealth. Its excess is extravagance; the defect, stinginess. The generous person finds pleasure in giving to the right people in the right amount and for the right reason. Thus, one is not generous if one provides cigarettes to a 10-year-old child. Generosity also concerns what one takes: “Nor will the liberal [generous] man take from wrong sources” [18], 1120a32). For example, one who is well-off should not take from those in need. We might consider generosity to include nonmaterial goods. One could be generous with one’s time: A physician takes extra time to calm a nervous patient; the experienced employee pauses to help a new employee. One could also be generous-minded when considering the merits or shortcomings of others. Just as the person who gives material goods wishes well to another, so does the person who is generous-minded wish well of another in that he puts the other person in a favorable light.

One kind of social generosity is discussed by Aristotle and that is magnificence, but there is room for generous giving of other sorts, including time, money, and labor. Numerous voluntary social groups, mutual-aid societies, charitable associations, and business, labor, and professional organizations encourage and rely on generosity and benevolence (as well as friendship, responsibility, civility, honesty, and trust). These institutions and societies – intermediary between state and citizen, neither governmental nor commercial – serve as avenues by which individuals

come to relate to others in ways other than through commercial exchange, thereby creating networks of friendship and acquaintance which complement, if not counterbalance, any tendencies of the market to valorize efficiency and prudence over the bonds of neighborhood, community, and society.

Honesty

Honest communication is a condition of any society. In commerce, honesty has special significance. An honest person is trustworthy, and trust is necessary for cooperation, contracts, promises, and agreements. The honest person avoids deceit but also avoids deceitful persons, as well as situations that present one with options that demand deceit. The honest person desires to relate to others in truthful rather than deceptive ways, even as telling the truth is not equivalent to telling the *whole* truth. Indeed, honesty may be compatible with emphasizing one element of the truth over others, embellishing some matters, or playing up certain features. On the other hand, the intentional effort to deceive is wrongful precisely because the dishonest person seeks to take advantage of trust or otherwise ignores another person's justified desire to be told the truth. There are many avenues for dishonesty besides lying, including manipulation, scheming, trickery, and dissembling. Honesty is also a matter of deed: For example, the honest person adheres to the agreed contract, performs what was reasonably expected, and applies professional knowledge appropriately. A supplier conforms to the contract and refrains from shortcuts, never substituting a cheaper version for the agreed model. An honest accountant applies her expertise in conformity to expected rules of accountancy; an honest employee credits correctly the hours worked.

Modern Virtue

Some of the first modern appeals to virtue occurred in the eighteenth century in the midst of debates concerning the moral and ethical consequences of commerce [30, 31]. The debates took on sharpness with the publication of the doggerel poem of Bernard Mandeville [32] in which he argued that self-interest (vice), not virtue, is the fount of a bustling commercial society. The productivity and complexity of commercial societies – circumscribed by justice and governed by the rule of law – are the result of our self-interested appetites: private vices and public benefits. Norms of conduct and virtue emerge in such a society, but these are strategic devices that allow us to cooperate. According to Mandeville, the widespread practice of genuine virtue would render a bustling commercial society impossible.

David Hume

Many argued against Mandeville, including David Hume. Commercial societies are the happiest and the progress of commerce advances moral refinement. “[I]ndustry,

knowledge and *humanity* are linked together by an indissoluble chain” ([33], p. 271). Yet Hume’s account of the moral life [34, 35], and his appeals to virtue, reject teleology or any overarching social purpose. We praise, he says, those qualities of character that are either agreeable or useful to the self or to others. He draws a distinction between two kinds of virtue, the natural and the artificial. The natural virtues draw from sentiments or passions original to human nature, but qualities (such as justice) approved as artificial virtues require the establishment of a general convention if they are to be useful or agreeable. Among the catalog of virtues that Hume discusses are traits of “common life” – the everyday life of family, work, and society. These include benevolence, generosity, courage, honesty, and loyalty, all useful to the wider public; industry, frugality, honesty, and fidelity, as well as discretion, caution, enterprise, and industry, useful primarily to the individual agent. Hume distinguishes these virtues from the “monkish virtues,” which are “everywhere rejected by men of sense, but because they serve to no manner of purpose; neither advance a man’s fortune in the world, nor render him a more valuable member of society” ([35], p. 270).

Hume believes that commerce diminishes partialities and brutishness. However, it is not Hume’s concern to suggest that the sort of benevolence operating in small groups can be found in larger groups in which our interactions are neither reiterated frequently nor otherwise enhanced by relations of acquaintance, friendship, or family. Moreover, in considering the matter of foreign trade, for example, Hume explicitly describes commerce as occurring with “strangers” ([36], p. 264).

Adam Smith

In both of his great works [4, 28], Adam Smith also maintains that commerce involves interaction with strangers, though his theory of virtue is distinct from Hume’s. Recognized for his elaboration of a system of natural liberty in which the interactions of individuals – motivated by desires to better their condition and to achieve acclaim – generate a division of labor and a commercial market, Adam Smith also delineates an important account of the moral life. His theory of the virtues does not set forth an overarching good, such as happiness. He maintains that the virtues, developed through social interaction, in combination with human nature, are part of a benevolent system of nature – a universe with its own laws. Smith recognizes that human beings tend to be self-interested and self-centered, but, he believes, they are not destined to be such. Through our ability to imaginatively place ourselves in the circumstances of others, we come to understand the concerns and passions of other persons. The correspondence of sentiments between spectator and agent is what Smith refers to as “sympathy.” Sympathy generates moral approval. Each of us has a desire for this sympathy or harmony, and each employs the imagination to understand how another feels in his given circumstances. Smith describes how the human imagination, via social interaction, develops a general standard of propriety encapsulated by the perspective of the impartial spectator,

the proper outlook from which to assess the character and actions of others. In addition, each agent must come to be an impartial spectator of his own self and character. In so doing, one must exert self-command so that one adjusts one's own passions and desires to what the impartial spectator would approve. The basic virtues that are approved are benevolence, justice, prudence, and self-command.

Adam Smith believed that virtue played a crucial role in the good life of all persons, including those in commerce. Nonetheless, it is this same Adam Smith who famously remarked:

It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest. We address ourselves, not to their humanity but to their self-love, and never talk to them of our own necessities but of their advantages. ([28], I.ii.2)

Smith is contending not that self-interest is the only motivation in business, but that our interactions with others do not (and should not) depend solely upon benevolent motives, special requests, or "servile and fawning attention" ([28], I.ii.2). To engage in commerce, the just person refrains from threats or harms. However, Smith (like Hume) does not perceive our interactions with strangers, commercial or not, to be defined by relations of benevolence.

In part VI of *The Theory of Moral Sentiments*, Smith introduces benevolence in terms of differing orders of society: family, friends, nation, and universe. His discussion, which commences with the statement of "our very limited powers of beneficence" ([4], VI.ii.intro.2), raises the question of why beneficence is so limited. In the next chapter, devoted to the "Order in which Individuals are recommended by Nature to our Care and Attention," Smith stipulates that each individual is most fit to take care of himself; from there, Smith proceeds to consider the caring concern exhibited within the family, subsequently noting how similar affinities among friends and close associates can produce analogous sentiments of benevolence. Of an agent's relations to family, Smith writes:

He is more habituated to sympathize with them. He knows better how every thing is likely to affect them, and his sympathy with them is more precise and determinate, than it can be with the greater part of other people. ([4], VI.ii.I.2)

Smith *cannot* expect that persons of commerce will be exercised by the kind of benevolence that we more commonly expect within such small groups: He cannot have such an expectation simply because Smith's invocation of the sympathetic imagination – that operation of thought by which we represent the circumstances and values of others and by which we generate norms of benevolence and prudence – presupposes, as a necessary condition, a degree and kind of knowledge that is not typically available in market exchanges. The impartial spectator, in other words, serves as a standard for market as well as nonmarket interactions. Yet unlike familial groupings, the market is an arena of relative anonymity, and distance in which one must utilize self-command in order to get along. As we interact with strangers and endeavor to see ourselves as others see us, we exert self-command – the capacity to adjust our passions and desires – so that our interactions with others are polite, gentle, and amiable.

Amiability need not entail benevolence, but it does not exclude prudence either. Just as Smith criticizes Mandeville's system as "licentious" and "destructive" ([4], VII.4), so does his account of prudence demonstrate a place for attention to self. Security of wealth, health, rank, and reputation are the objects of prudence, a virtue which though "respectable and even, in some degree...amiable and agreeable" is distinct from Aristotle's practical wisdom, which is "directed to greater and nobler purposes" ([4], VI.i.14–15). The virtue of prudence is cautious and earnest, industrious and frugal, and sincere and inoffensive – it is the primary virtue of commerce. In the midst of what Smith recognizes as the corrupting appeals of vanity, there is room within commercial society for the person of sober-minded and unostentatious productivity.

Samuel Smiles

Unduly neglected by business ethicists, Samuel Smiles offered, in the nineteenth century, an account of business virtue in a chapter of his book, *Self-Help* [37]. Smiles delineates an optimistic yet sensitive account of the power of character, both for the individual and the nation. Often aphoristic rather than philosophical – "The poor man with a rich spirit is in all ways superior to the rich man with a poor spirit" ([37], p. 245) – Smiles' work is important and worthy of consideration. He contends that it is incorrect to characterize the businessman as "mean" – uncreative, plodding, or pedestrian ([37], p. 208). The path of success in business is no different from the path of success in life. Among the qualities that Smiles illuminates are self-reliance, prudence, perseverance, honesty, and integrity. But Smiles also defends such qualities as "Attention, application, accuracy, method, punctuality, and dispatch" ([37], p. 213) – all essential for success. "They are little things, it is true; but human life is made up of comparative trifles" ([37], p. 213). Along with these traits, he notes the importance of "sound discretion, quick perception, and firmness in the execution of [the businessman's] plans" ([37], p. 219).

For Smiles, character has intrinsic value, commanding authority regardless of wealth or status. Yet he also maintains that character offers the "road to prosperity and wealth" ([37], p. 236), even as he admits that "the scrupulously honest man may not grow rich so fast as the unscrupulous and dishonest one; but the success will be of a truer kind, earned without fraud or injustice" ([37], pp. 230–1). The person of character shows consideration for those "subordinate to him," including employees, and has a sense for the feelings of others – "respect for their self-respect" ([37], p. 249). As Smiles puts it, "morals and manners" are of greater importance than laws ([37], p. 240), and it is "better to lose all and save character" ([37], p. 231).

Deirdre McCloskey

The most recent and ambitious account of virtue and business comes from Deirdre McCloskey [38, 39]. Indebted to Aristotle, among others, she characterizes virtue as a "durable, educated characteristic of someone to exercise her will to be

good” ([38], p. 64). Yet McCloskey is wary of relating the idea of goodness to some social or public good. McCloskey defends virtue as part of a larger defense of liberty: Liberty is valuable because it is a condition for realizing a moral and virtuous life.

She undertakes a wide-ranging and spirited elucidation of seven virtues, the four classical virtues of justice, prudence, courage, and temperance, as well as three theological virtues, faith, hope, and love. These are the basic virtues around which other qualities are built, including commercial or, as she puts it, “bourgeois” versions. One may live virtuously as peasant, artist, or aristocrat, but one may also do so as a bourgeois. Prudence is the most significant of the bourgeois virtues, but commercial conduct does not rest on prudence alone. Faith or “a willed steadfastness” ([38], p. 153) rests on integrity. Love entails “trust, good humor, neighborliness, respectfulness, cooperativeness, decent intentions” ([38], p. 127). The virtues not only sustain commercial practices but are encouraged and required by capitalism: “they have been the causes *and consequences* of modern economic growth and of modern political freedom” ([38], p. 22). She seeks to counter the widespread view of markets and business as, somehow, antithetical to virtue, community, friendship, and a life lived well. In so doing, she refocuses the ethics of business away from its dominating concerns with public policy (and topics more political than moral) and toward the commonplace acts and decisions inherent in the conduct of business.

Central Issues

As is true of all philosophical theories, a theory of virtue faces challenges, two of which are noted here. One challenge is that virtue offers few explicit guidelines for conduct. It is suggested that the alternative to virtue, an appeal to rights, rules, or principles, provides clear lines of action. Yet, the objection continues, it is not so easy to draw a clear course from virtue to a specific act. True enough, a theory of virtue does not offer a mechanical application of a principle or standard. Of course, the virtue theorist may appeal to exemplary narratives to assist in our deliberations and decision-making ([5], p. 324; [6], p. 287). However, it is also worth recounting that Aristotle held that a theory should have the precision appropriate for its subject ([18], 1094b12–28). The particulars of the moral realm may manifest a complexity not reducible to principles (even if principles are necessary). Moreover, as Aristotle also remarked, those who study ethics should already have a sense of right and wrong, developed within the community ([18], 1095a2–11). So the virtue theorist might argue that if we are born into communities, then the search for fresh principles is misplaced: In a good community, the ethical world is present already in anyone who inquires. (As Adam Ferguson remarks, “Mankind are to be taken in groupes, as they have always subsisted” ([40], p. 10).) When the virtue theorist articulates the dispositional structures and basic goods of this world, a traditional moral know-how is presupposed [41]. This resolution may leave the theory of virtue without a set of algorithmic principles. However, according to the virtue theorist, such principles

misrepresent what the moral life is about. Nonetheless, the study of virtue will help the individual to hit the moral mark ([18], 1106b31–32).

An underlying question remains at stake in this debate: What is it that an ethics of business is to do or to provide ([42], p. 358)? If business ethics is to settle philosophical queries regarding the nature of the corporation and other public policy issues, then virtue ethics makes no pretense of responding to these questions. Alternatively, if business ethics is to provide a moral and philosophical justification of the market, then virtue ethics may not be the place to start, but neither are the major theories of business ethics such as stakeholding or social responsibility. However, if business ethics is to guide individuals in their everyday business lives, and if these individuals have a sense of right and wrong, and good and bad, then the appeal to virtue may inspire the motivation, hone the perception, and sharpen the moral cognition of the businessperson.

A second challenge suggests that virtue is appropriate only for small, organically unified societies, not large commercial societies with divergent ends and purposes. One version of this challenge may be found in the work of a defender of virtue, Alasdair MacIntyre. He contends that virtues are always situated within practices, a vision that does not rest easily with commerce, at least of the sort that is liberal and individualist. As MacIntyre puts it, “For liberal individualism a community is simply an arena in which individuals each pursue their own self-chosen conception of the good life, and political institutions exist to provide that degree of order which makes self-determined activity possible” ([20], p. 195).

This objection assumes not only that the practice of virtue requires a substantive and common end across society but that the forces of economic liberalism – with its embrace of free and equal spheres of action – have weakened, if not swept away, any substantive agreement on ends. On this account, the very societies in which business flourishes lack the agreement necessary for virtue, so it will prove difficult to embed the practices of business within the traditional moral virtues. Such an objection assumes that theories of virtue demand a strong notion of a communal end, or *telos*. However, it is important to understand how the *end* of our lives is found in a manner or mode of activity and not in some goal extraneous to the activity. Moreover, it is not so obvious that commercial societies must be as atomistic as this sort of objection suggests. Under some descriptions, commercial societies incorporate intermediary social groups and organizations, as well as regional and local traditions. No doubt, commerce produces innovation and changes, but it is unclear whether the changes that have occurred in commercial societies are the result of exchange rather the outcome of centralizing tendencies in modern democracies that have shorn the individual from nonpolitical and local affiliations [43].

Conclusion

The first systematic theory of morals, that of Aristotle, offers a rich foundation for exploring and understanding virtue and character. Although Aristotle’s account of virtue does not include specifically commercial virtues, neither is its moral psychology inherently incompatible with exchange. Even as contemporary theorists often challenge particular elements of Aristotle’s moral

thought [2, 3, 44], some of the basic and universal virtues of Aristotle may be brought to bear in commercial conditions, yielding thereby *Aristotelian* virtues applicable to conditions of exchange. Other virtues, such as those delineated by Adam Smith, Samuel Smiles, or Deirdre McCloskey, testify to how the commercial life may be a virtuous life. In sum, the virtuous person lives well in a commercial society, even as that person is not self-consciously pursuing an end of happiness that is either distinct from or caused by the virtues themselves.

As a theory of business ethics, virtue may also possess an advantage over theories of social responsibility or stakeholding. Each of these theories seeks to render business ethical by essentially altering the nature of business ([45], pp. 72–76). A theory of social responsibility asks a manager to make decisions with an eye to social or political endeavor, not with an eye to exchange or consumer demand. To spend funds on socially responsible endeavors is to deploy one's effort for something other than production for exchange. Genuine social responsibility, as typically construed, asks the business person to engage in something other than business. The stakeholder theory, conceptually distinct from a theory of social responsibility, suggests that the businessperson should attend to the interests of stakeholders, not to the signals of the market, such as prices. The advantage of virtue theory is that it allows business activity to proceed as embedded within the lives of virtuous individuals.

To be virtuous is to be a person whose perceptions, dispositions, responses, and actions possess a quality and manner of goodness. The virtues influence our range of options, as well as our inventory of desires and our basic commitments. These moral qualities affect how we see a world beyond self. For these reasons, the ideals of virtue have a transformative appeal, connecting a person's character and model of life to a specific set of traits. In this sense, virtue serves as inspiration and aspiration ([6], p. 286). A recognition of and search for virtue also assists us in identifying morally good persons ([6], p. 280) whose character has a steadfast reliability. Indeed, within the business realm, one may easily ask this question: With whom would one prefer to work – the virtuous individual or the person devoted to abstract principle? One person perceives the world and its particulars; the other adheres to a proposition. Both may do good deeds, but only one carries goodness within. A theory of virtue is also comprehensive, bearing relevance to individuals working at all levels of business activity, proprietorial and managerial certainly, but also at the level of wage earner and customer. A theory of business virtue is not simply for policymakers, executives, or regulators but for all individuals in the everyday working world. The importance of virtue resides in its influence on choice, desire, and action. Virtue is a manner of living and in this simplicity of perspective resides its power and appeal.

Scholastic Thought and Business Ethics

Scholastic Thought and Business Ethics: An Overview

7

Domènec Melé

Abstract

The generic name “Scholasticism” covers a number of thinkers who lived and wrote between the eleventh and mid-seventeenth centuries in western Europe, with its Golden Age being the thirteenth century. What is termed “Later Scholastic” was another brilliant period, especially for economic and business ethics. Scholastic thought, however, is not only a historical matter. At certain points from the late nineteenth century there were revivals, and we are seeing another now, which may have potential. This chapter reviews the main stages of development in Scholastic thought, paying special attention to its origins, its mainstream schools of thought, its method, and its philosophical grounds. It also discusses how Scholastic thought, especially that of Thomas Aquinas, can take on some current key issues in business ethics. This includes integration of economics and ethics, universal ethics and ethical relativism, ethical decision-making, shareholder versus stakeholder approaches to corporate governance, human rights in a global world, and the role of philosophy and religion/theology in business ethics.

Introduction

Since the 1970s, we have seen a remarkable development of business ethics [22]. However, interest in business ethics is not new. In the Middle Ages and, above all, in the fifteenth, sixteenth, and early seventeenth centuries, a number of significant ethical issues were already being confronted by Scholastic thought.

As a rough classification, two great periods can be distinguished; the First or Medieval Scholasticism [17, 38], which lasted until the fourteenth century, and the Second or Late Scholasticism, including authors from the fifteenth to the mid-seventeenth centuries [2, 14, 61, 77].

“Scholastic” derives from the Latin word *scholasticus*, a name given to the head of Christian schools in the Middle Ages, and who generally taught dialectics – one of the seven liberal arts adopted at that time in academic curricula. This was the only branch of philosophy then studied systematically. Later the term “scholastic” was used at the early universities to designate both a method and a system. This makes sense inasmuch as the deep roots of Scholasticism are to be found in the medieval schools established in cathedrals and monasteries from the eighth century onward, which became very relevant centers of learning in western Europe. They were the seedbed of the early universities created from the eleventh century onward.

This chapter firstly reviews the origins of Scholasticism, its mainstream schools of thought, the Scholastic method, and its philosophical grounds. The rest of the chapter discusses some possible approaches from Scholastic thought, especially that of Thomas Aquinas (probably the most important Scholastic author), to some current key issues in business ethics. Namely, how Scholastic thought, especially that of Aquinas, can take on some current key issues in business ethics. This includes integration of economics and ethics, universal ethics and ethical relativism, ethical decision-making, shareholder versus stakeholder approaches to corporate governance, human rights in a global world, and the role of philosophy and religion/theology in business ethics.

The overview on Scholastic thought presented in this chapter is followed by another four chapters, in which different authors analyze and discuss in a certain depth some aspects or periods of Scholastic thought. Dierksmeier explores business ethics in Thomas Aquinas and the alternative and critical view of William of Ockham. Schlag studies Italian Scholastics, Alves and Moreira present the School of Salamanca, and Alford focuses on the influence of Thomistic thought in contemporaneous economic and business ethics. She also discusses the relationship between Thomistic thought and the modern Catholic social teaching.

Origins and Historical Development of Scholastic Thought

With Boethius (480–524/525) as a precedent, it is John Scotus Eriugena (815–877) who is frequently considered the oldest Scholastic because he, who knew Greek very well, introduced some ideas from Neo-Platonism to the intellectual community in western Europe. However, the real development of Scholasticism began in the eleventh century with Peter Abelard (1079–1142) and the Archbishops of Canterbury Lanfranc (1005–1089) and Anselm (1033–1109). In this period of Early Scholasticism, there was strong debate, which continued until the thirteenth century, regarding the relationship between philosophy – understood as love and pursuit of wisdom by intellectual means – and theology, which regards the study of

God, defined by Augustine of Hippo (354–430) as “reasoning or discussion concerning the Deity” ([8], VIII, 1). For Christian theologians, theology tries to develop the Christian Revelation accepted by faith through rational discussion.

Meanwhile, from the ninth to twelfth centuries, Arabs contributed to the introduction to western Europe of Greek philosophy, including that of Plato and Aristotle, many of whose original writings had been discovered. This was accompanied by valuable commentaries on Aristotle’s works in late antiquity and by Muslim and Jewish philosophers in medieval times. Schools of translation grew up in Spain, Italy, and other European countries, and in the early thirteenth century most of the recovery of Greek philosophy was complete and the texts were made available to scholars.

The introduction of these materials provided a great impulse to intellectual life at the existing universities (Bologna, Paris, Oxford, Cambridge, Salamanca, Montpellier, and others) created by kings or municipal administrations from preexisting Christian schools or as new higher study centers, as sites of higher education. In this context, in the thirteenth century and early fourteenth century became what is generally considered as the high period or the Golden Age of Scholasticism.

The Golden Age of Scholasticism, in both teaching and writing, was in the thirteenth century. Albertus Magnus (1193/1206–1280), and, above all, his disciple Thomas Aquinas (1225–1274) were outstanding authors. Aquinas, who taught at the University of Paris, presented interesting insights on moral aspects of business in the world as it then was, but his main contribution – as with Aristotle – is probably not to business ethics per se, but in providing philosophical bases for its development [15, 16, 50]. Another important figure of this period was John Duns Scotus (1265–1308), who proposed different perspectives within Scholasticism [19, 90]. Alexander of Hales (1185–1245) and Peter Auriol (1280–1322) were also notable thinkers of this period. Most authors of this period were members of two religious orders: Dominican and Franciscan.

The Middle Age Scholastics was in the second half of the fourteenth century. On the Dominican side, successors of Thomas Aquinas taught mere repetitions of their master, presenting innumerable classifications and forgetting the deep richness of the genuine Thomas. On the Franciscan side, some thinkers presented proposals quite critical of conventional Scholastics and, in particular, of Thomas Aquinas. One of these proposals came from the Franciscan friar Roger Bacon (1214–1294), who emphasized empirical knowledge, becoming a pioneer of the modern scientific experimental method, but in opposition to Scholastic thought. Another Franciscan, William of Ockham (1288–1348), opened new directions far distant from Aquinas, with important implications for metaphysics and ethics.

In the late fourteenth and fifteenth centuries, however, one can find a number of significant developments in business ethics, which were led by a number of Italian Scholastics and occasionally by authors from other European countries; among them, Peter John Olivi (1248–1298), Astesanus de Ast (died ca. 1330), Bernardino of Siena (1380–1444), and Antonino of Florence (1389–1459), all of them mentioned by Schlag in this book, and Johannes Nider (1380–1438) [93]. At this

time, remarkable economic development took place in some cities in northern Italy favored by trade with East Asia, relatively large shipyards, banking, and some new financial tools – an early form of capitalism, we might say. These Scholastics dealt with topics such as the right to private property and its limits, the role of profits, proper conduct in commerce and the work of merchants, value and utility, just price, and exchanges and fraud, along with the question of the illegitimacy of usury – a very controversial topic at that time – and its difference from lending at moderate interest rates.

Another brilliant period of Scholastic thought was what is known as the Late or Second Scholasticism, and also as the School of Salamanca, in the sixteenth century and the first half of the following century, with authors such as Francisco de Vitoria (1483/1486–1546), Domingo de Soto (1493–1563), Diego de Covarrubias (1512–1577), Martín de Azpilcueta (Navarrus) (1492–1586), Tomás de Mercado (1523/1530–1575), Luis de Molina (1535–1600), and Juan de Mariana (1536–1624), among others. These developed interesting approaches on ethics in economics, business, and finance, and also on international law. New issues were raised on these matters and some existing topics were extended. Their thought on justice in contracts, value theory and just price, banking and interest, taxation and regulation, and human rights are worth mentioning [2, 14, 40, 61, 88].

After a long period of decadence, in the late nineteenth century a revival of Thomistic thought emerged and, with different approaches, it is still present today. The origin was in a number of Catholic thinkers who, facing several philosophical theories such as Kantianism, Hegelian Idealism, and Empirism – mainstreams in their time – turned their interest toward Thomas Aquinas. A definitive impulse to recover Thomism was given by Pope Leo XIII through the encyclical letter *Aeterni Patris* [51], published in 1879. This document proposed restoring the renowned teaching of Thomas Aquinas (n. 25), adding that “all studies ought to find hope of advancement and promise of assistance in this restoration of philosophic discipline. . .” (n. 29). The recommendation of Thomas Aquinas’s writings as a solid basis for sound philosophical and theological training in ecclesiastical institutions of the Roman Catholic Church has been reiterated by several successors of Leo XIII to the Papacy and the Second Vatican Council ([85], n. 16). This does not mean that other philosophies are not allowed within the Catholic Church, but Aquinas is proposed as a critical reference work.

The revival of Thomism brought about a number of significant philosophers, including Étienne Gilson (1884–1978) and Jacques Maritain (1882–1973). Gilson tried to recover the genuine Thomas from some of the accretions and distortions of the commentators. In this respect, Gilson [37] considers the distinction made by Aquinas between *being* and *essence*, and highlights the originality of Aquinas’s doctrine of being, as against that of Aristotle and some of the commentators on Aquinas, who put excess emphasis on essence (*essentialism*). Maritain [58, 59, 60] introduced some innovations into Thomistic metaphysics, ethics, and social philosophy with the end of harmonizing Thomism with *personalism* within a pluralistic and democratic society. A Thomistic personalism has been developed by the Lublin School, the best-known proponent of which is Karol Wojtyła [91, 92], who became

Pope John Paul II. He presented a phenomenological realistic approach which tries to articulate the Thomistic conception of the human person. Other authors have developed general aspects of Thomistic ethics and Aquinas's theory of the action [54, 55], or specific aspects of such theory regarding virtues [34, 35, 75], or natural law [52, 79, 83]. Utz [86] and Messner [66] have made an outstanding contribution to social and economic ethics from a Thomistic approach. There are also philosophical initiatives connecting Thomism with analytical philosophy by focusing on the "analytical" side of Thomism.

Nowadays, a significant influence of Thomas Aquinas can be found in a number of key concepts adopted by Catholic social teaching, although with certain differences, as Alford notes in this book. This teaching was introduced in its modern version by Leo XIII himself and was continued and enriched by subsequent popes, including John Paul II and Benedict XVI, mainly through encyclical letters addressed not only to Catholics but also to all people of good will.

Scholastic Schools of Thought

Scholastic thought was not by all means homogeneous. We can make the rough approximation that two main schools can be distinguished, both led by friars of two religious orders, the Franciscan and Dominican. These two great religious orders were founded in the early thirteenth century within the Church. They were born in the context of a commerce-based dramatic growth of economic activity from the twelfth to the early fourteenth centuries [53]. Their members – friars and nuns – resided no longer in isolated monasteries but in convents built in the new commercial towns, trying to understand the new commercial way of life, and to preach and minister to the merchants. They were termed "mendicant orders" because they lived from the alms given to them.

Franciscan and Dominican schools of thought, although with some differences, shared many common points, including the Scholastic method. The first Franciscan intellectual leader was Bonaventure, who followed the theology of Augustine and the philosophy of Plato and with only a minor influence of Aristotle and including some Neoplatonist elements [36]. Another important Franciscan Scholastic thinker of this early period was Alexander of Hales. In a second stage, John Duns Scotus, Peter Auriol, and William of Ockham were the most relevant authors. The latter two were intellectually quite different from one another, and from Bonaventure. Actually, there was not a single Franciscan school of thought, there were several. This may have been favored by a number of dissensions within the Franciscan order, some of these even during the lifetime of St. Francis of Assisi (1181/1182–1226), the founder. Olivi, Astesanus, and Bernardino of Siena were also Franciscan.

In contrast, the Dominican order, founded by St Dominic de Guzmán (1170–1221) and also known as the "Order of Preachers," had a good organization and a solid intellectual consistency. It made extensive use of Aristotle's works, newly available at that time, as noted above, and emphasized speculative reason and intellectual contemplation rather than practical leaning as the Franciscans did.

Albertus Magnus and Thomas Aquinas were the most significant Dominican figures. Aquinas has become the point of reference for most Dominicans down the centuries, and for the Roman Catholic Church, at least from the late nineteenth century, as noted above. Antonino of Florence and Nider were also Dominicans.

Among the Late Scholastics, especially in the School of Salamanca, the Franciscan followers of Duns Scotus (“Scotists”) were a small minority ([25], pp. 312–314). Initially Dominicans chaired the universities of Salamanca and Alcalá, along with other places within the School of Salamanca and applied Thomistic thought to the new realities, as Alves and Moreira note in this book. Later, the Society of Jesus (Jesuits), a religious order of the Roman Catholic Church founded in 1534, also became very influential within the School of Salamanca (Molina and Mariana were Jesuits). Like the Dominicans, Jesuits initially took Thomas Aquinas, and to a minor degree Duns Scotus, as their intellectual guides. However, over time, especially from the seventeenth century, Jesuits tended to follow the Jesuit Francisco Suárez (1548–1617), who challenged traditional Scholastic views on metaphysics, and was a significant influence in the following periods, the study of which falls outside our scope here.

Dialectical Reasoning, the Scholastic Method

The Scholastic method is based on dialectical reasoning. Dialectical reasoning is based on a rigorous conceptual analysis of different positions and a careful drawing of distinctions for a better understanding of questions under consideration. This method, whose roots can be found in the Socratic dialogues, tries to resolve contradictions or disagreements and to extend knowledge by inference. The first Scholastics attempted to harmonize different authoritative sources, including those of their own Christian tradition and classical philosophers, whose writings, as noted, were becoming available in western Europe.

In both teaching and writing, the dialectic method starts with a question formulated about a relevant topic (*videtur quod...*, “it seems that...”). Along with the question, all possible objections are presented, including both old and new ones, which may have been proposed by the scholar or students. The next stage involves presenting a strong argument in favor of the question (*sed contra*, “on the contrary...”). There follows a rational discussion which should lead to the determination of the question after weighing the evidence (*respondeo dicendum*, “I answer that...”). This is the “body” of the argument. It concludes by providing replies to each objection.

An important background for formulating questions was provided by the *Four Books of Sentences (Libri Quattuor Sententiarum)* written by Peter Lombard in the twelfth century. They contain a collection of authoritative statements – or “sentences” – on biblical passages or taken from the Patristic sources (writings of the Fathers of the Church, primitive Christian writers with recognized authority).

A typology of Scholastic writings would include *comments* on previous outstanding works (e.g., the *Comments on the Nicomachean Ethics* by

Thomas Aquinas); *questiones disputatae* (“questions for discussion”), dealing with difficult or important topics (e.g., *De Veritate* by Aquinas, about how to know the truth); and *treatises* – quite common in the Late Scholastics regarding contracts and other matters – which provide in-depth commentary and analysis of specific subjects. They often use concise, tightly reasoned chains of argument applied to the matters studied. Great masters wrote *summae*, which was an attempt to give a comprehensive view of the whole of attainable knowledge. The *Summa Theologiae* or *Summa Theologica* (“Sum of Theology”) by Thomas Aquinas is an illustrative example. Written between 1267 and 1273, it contains three parts. The first deals with the existence and nature of God and the universe he created, the second – divided in two further parts – deals with human activity and ethics, and the third deals with Christ and the sacraments. Following the Scholastic method, each part is made up of a number of questions, extended over several articles, each accompanied by some enumerated objections; then comes a reasoned discussion of the article, and answers to the objections.¹

Philosophical Grounds of Scholastic Thought

Rational speculation on the Christian faith dates back to the Patristic period, which covered writers from the end of the Apostolic Age (early second century) to the middle of the fifth century, or even up to the eighth century for some. They were prompted to employ Neoplatonism for their reflections, along with some elements of stoicism, another philosophical stream in fashion at the time, to accompany their faith with rational developments. The influence of Neoplatonism appears in Augustine of Hippo, one of the most brilliant thinkers in the Patristic period on the rational approach to the Christian faith.

Augustine realized the importance of reflecting on the relationship between philosophy – understood as love and pursuit of wisdom by intellectual means – and theology, which regards the study of God, defined by Augustine as “reasoning or discussion concerning the Deity” ([8], VIII, 1). For Christian theologians, theology tries to develop Christian Revelation accepted by faith through rational discussion.

In the Middle Ages, the Patristics, and particularly Augustine, were highly considered. This may explain why an Augustinian and Neoplatonist influence is clear in Early Scholasticism, including some of the scholars mentioned above, such as Boetius, John Scotus Eriugena, and Bonaventure. This Neoplatonic–Augustinian approach, although dominant in Early Scholasticism, declined in the Golden Age of Scholasticism, during which Aristotle became highly esteemed.

A few early Scholastics were alienated by Plato’s philosophy, which is a genuinely outspoken exaggerated realism because he believed that the material world can seem to us the real world, but it is only an image or copy of the real world made up by universal forms or abstract representations of things and properties that we feel around us. In other words, what we see is an apparent world, in constant change, whereas reason knows an unchanging world of forms, which is the cause of the apparent world.

In quite stark contrast to Plato, Aristotle followed a moderate realism. Moderate realism holds that there are universal concepts which faithfully represent particular realities. Universal concepts are mind representations but founded in existing things (*cum fundamento in re*). Thus, the idea of “human” is not a mere name but a universal concept which in reality is found in singular individuals. These can be called “human individuals” because they are a particular existence of “human.”

A moderate realism in line with Aristotle was openly professed by Aquinas, Bonaventure, and Duns Scotus. These authors and most of the others in the Golden Age of Scholasticism accepted Aristotle in his epistemology, logics, and metaphysics.

Nominalism is another philosophical position within Scholasticism in opposition to any realism. The first representative of Scholastic nominalism was Roscelin of Compiègne (1050–1125) but it had scarcely any importance in Scholastic thought before Ockham in the late fourteenth century. In accordance with nominalism, there are no universal concepts, such as “human” or “human nature,” which are nothing other than a mere name. Aquinas would have said that universal concepts are real, although it is only in individuals or actions that they become tangible. In other words, if you consider the universal “human nature” as what humans have in common, this is much more than a name, it is a reality, and we can talk of individuals with human nature. Obviously, however, to know what human nature is, we need to know the human individual in which the human nature is tangible. In contrast, for Aquinas, every concrete individual is made up of an *essence* (common to many) which becomes a *being* in “this” concrete individual. With this denial that universals are real – strongly defended by Ockham – the focus was moved toward individuals, and concepts such as human nature, person, society, justice, and government became without content; a complete vacuum. This also had significant consequences for ethics, a point to which we will return below.

The celebrated writer Chesterton, praising Thomas Aquinas for his philosophy of “common sense” and, in contrast with other philosophies descending from nominalism, he said, “Since the modern world began in the sixteenth century, nobody’s system of philosophy has really corresponded to everybody’s sense of reality; to what, if left to themselves, common men would call common sense. Each started with a paradox; a peculiar point of view demanding the sacrifice of what they would call a sane point of view” [15].

A question which arose from the very beginning was about the relationship between reason and faith. It is easy to understand this since all Scholastic thinkers shared Christian faith, and all were both philosophers and theologians.

In the Early Scholasticism, Peter Abelard and others adopted a strong intellectual approach to theology, up to the point of holding that reason can prove even the supernatural mysteries of faith. Thus, philosophy and theology became two aspects of a rationalistic system. This position provoked great controversy since it openly opposed the teachings of outstanding early Christian writers, such as St. Basil of Caesarea (330–379), Origen of Alexandria (185–254), and St. Augustine of Hippo (354–430), and practically the whole Christian tradition. The latter held that there are two orders of truth, a natural truth accessible by reason and another, supernatural,

which requires faith; both orders of truth are different but not contradictory. However, the limits of these two realms of truth were not completely clear.

Bonaventure held that a true philosophy separate from theology was impossible. He believed that Christian wisdom was a unity of the truth revealed by God and the truth known by human reason. In contrast, Albertus and Thomas Aquinas defended the independence between philosophy and theology, and the latter showed how to deal with this relationship appropriately. This approach has prevailed in most of the Catholic thinkers. According to Aquinas, philosophy and theology are two distinct sciences. Philosophy relies on reason only, whereas theology uses the truth derived from divine revelation ([39], Chap. 2). They converge in the knowledge of certain truths – e.g., the human condition and some basic norms of morality – but other truths – namely, the mysteries of faith – lie completely outside the domain of philosophy.

The distinction between philosophy and theology and the Scholastic philosophical contributions of Thomas Aquinas are not a derivation from faith but neither are they contradictory to it. They use philosophy to develop data about faith and thus they make theology; and in this sense philosophy serves theology. However, it would be unfair to affirm that the Scholastics made reason subservient to authority. On the contrary, they strongly advocated the use of reason. It is true that in the Middle Ages people shared one faith – the Christian faith which was undivided – and the authority of the Church was to be obeyed in matters regarding faith and morals, but scholars had full freedom to think about and use their intelligence to answer numerous disputed questions, some of which regarded theology and, of course, philosophy. In practice, Scholasticism shows a variety of opinions in matters that are not incompatible with Christian faith. As Schumpeter emphasized, obedience in questions of faith was compatible with great freedom of opinion in all other matters. In nonreligious matters, arguments from authority were even regarded with disdain ([84], p. 76s).

As regards ethics, Thomas Aquinas and many other Scholastics followed Aristotle, but with some originality to their approach. In Thomistic ethics [54] virtues are central and natural moral law is too. Actually virtues and natural law are interrelated (see below). Similarly to Aristotle [5], pp. 1, 13), Aquinas related the Aristotelian *eudemonia* (*beatitudo*, in Aquinas) as happiness associated with human flourishing: “happiness is a virtue-oriented activity proper to man in a complete life” [4], which requires virtues in high degree: “happiness is an operation according to perfect virtue” ([3], I-II, 3, 2).

Natural law – according to Aquinas – is discovered by practical reason looking for what is best for us in order to achieve the end to which our nature inclines. Natural law is seen as the participation of humans in the Eternal Law of God, through their reason. It is a rational apprehension of divine wisdom expressed through the Creation, which includes the rational nature of the human being. Thus, natural law cannot be contrary to the divine precepts we find in the Bible.

Faith and reason converge in many moral matters. Thus, the moral precepts of the Decalogue (the Ten Commandments of the Bible), accepted from the divine authority, are also a matter of reason, although evidence to support them is diverse ([3], I-II, 100, 1).

Two kinds of precepts are not reckoned among the precepts of the Decalogue: viz. first general principles, for they need no further promulgation after being once imprinted on the natural reason to which they are self-evident; as, for instance, that one should do evil to no man, and other similar principles: and again those which the careful reflection of wise men shows to be in accord with reason; since the people receive these principles from God, through being taught by wise men. Nevertheless both kinds of precepts are contained in the precepts of the Decalogue; yet in different ways ([3], I-II, 100, 3).

Duns Scotus partially agreed with Aquinas, whereas Ockham went further by assuming that ethics comes from the fully arbitrary will of God, and rejecting the idea of an immutable natural law grounded in God's Reason. Whereas for Aquinas God necessarily legislates in a way that harmonizes with right reason, for Ockham ethics derives from the arbitrary will of God and we only know what is good from divine commandments. Thus, saying that "love your neighbor is good" means exactly the same as affirming "God commands that you love your neighbor." Aquinas would have said "loving your neighbor is good" (we can understand this rationally) and that is why God commands that you love your neighbor. Ockham was consequent with his position suggesting that if hating God, stealing, or committing adultery were not forbidden but were ordered by God, these actions would not be bad but good. Obviously, Ockham did not try to deny the immorality of such actions, but tried to stress that hating God, stealing, or committing adultery are evil only because God forbids them. Following this premise, in a secularized world, the authority of God in determining moral norms may be easily substituted by the "authority" of those who have power, or by social norms or democratic norms (laws), without any rational foundation, nor any reference to human good.

Ockham's rejection of a natural law is one of the few exceptions within Scholastic thought. Actually, Scholastics made a relevant contribution to the natural law theory based on a moderate realism – different from the rationalistic natural law defended by John Locke and other thinkers. According to Aquinas ([3], I-II, 94, 2) humans have "practical reason," which provides the capacity for discovering what ought to be done in every situation; and "'good' is the first thing that falls under the apprehension of the practical reason, which is directed to action: since every agent acts for an end under the aspect of good." Thus, practical reason finds a natural moral law, the first principle of which is "good is to be done and pursued, and evil is to be avoided." He adds that "all other precepts of the natural law are based upon this: so that whatever the practical reason naturally apprehends as man's good (or evil) belongs to the precepts of the natural law as something to be done or avoided."

The end of human inclinations in order to flourish as a human being allows practical reason to apprehend what human good is. Thus, life is apprehended as a human good by considering the end of the inclination to preserve human life. Aquinas mentioned this, and additionally provides some other basic inclinations from which human reason can apprehend human goods that should be "done and pursued". According to Aquinas ([3] I-II, 94, 2) firstly, whatever is a means of preserving human life, and of warding off its obstacles, belongs to the natural law. Secondly, natural law entails a proper sexual intercourse and education of offspring

and so forth. Thirdly, there is a natural inclination to know the truth about God, and to live in society: and in this respect, whatever pertains to this inclination belongs to the natural law. An elemental consequence is “to avoid offending those among whom one has to live” ([3], I-II, 94, 2). The most relevant aspect for business ethics such as justice and truthfulness derives from this “to live in society” in a proper way, that is, generating trust and fostering harmony and peace. Some Neo-Thomists have proposed a more detailed list of “human goods”, such as life, knowledge of the truth, and friendship [69, 70]. This is a quite common sense morality, since “human beings exhibit a tendency to pursue life, and knowledge, and friendship, and so forth; and reflection on this tendency occasions an immediate grasp of the truth that life, and knowledge, and friendship, and so forth are goods. The affirmation of the claims ‘life is good,’ ‘knowledge is good,’ ‘friendship is good,’ etc. makes intelligible the persistent pursuit of these ends by rational beings like us” [70].

Some misinterpretations of Aquinas’s natural law can lead to a certain “physicism” (mere description of human inclinations) or even naturalism (duty to one’s own inclinations). These positions have been the object of criticism accused of “naturalistic fallacy” [67]. Related to this, we have the so-called “Hume’s law,” which states that it is impossible to derive an “ought” from an “is,” that is, any prescription (normative truth) from any description (nonnormative truths). However, these criticisms should not be applied to Aquinas ([52], Chap. 8; [79], Chap. 1). Thomists hold that it is reason, and not simply a description of inclinations, that determines the moral obligation, although from these natural inclinations practical reason is able to discover the existential ends of human life or “human goods.” Some defend the claim that the first principle of the practical reason (“good is to be done and pursued, and evil is to be avoided”) entails the fundamental moral difference between good and evil and an immediate inference from the evidential character of good ([83], p. 160).

Integration of Economics and Ethics

Since the late eighteenth century, there has been a profound separation between economics and ethics. The self-interest argument as the exclusive driver of economics and business ignores ethics, maybe except for a few principles such as justice in exchanges and respect for private property. The *homo oeconomicus* made ethics irrelevant and positivism reduced ethics to the realm of subjective values.

Libertarians see business as an autonomous sphere, as an economic institution under pressure from the strengths of the market and governmental regulations, and with the exclusive goal of creating wealth for stockholders. “Business is business,” expressing the amoral character of business, has long been a motto for many business people. However, things changed for a number of reasons, including business scandals and an increasing societal concern about social and environmental issues, along with a strong public opinion demanding business responsibility. This, in addition to some business people who have acted for a “conscious capitalism,” has brought about a wide movement around business responsibility and business ethics.

Over the decades, since the late 1970s, spurred or aided by a favorable atmosphere, business ethicists have made important advances in analyzing business issues and behaviors, and in developing theories and normative criteria, and also in providing judgments on particular situations and recommendations. They have tried to understand business, and to avoid generic moral norms without connection with the real business world. Even now, the challenge is a deeper understanding of businesses, as Brenkert and Beauchamp ([10], p. 709) have reminded us, adding “even if we are certain we know what they should be doing, unless we can relate this to how businesses can come to operate in those ways, the normative arguments will lack power, persuasiveness, and effectiveness. Only if we are able to provide this analysis will our normative ethics fulfill the practical task it has taken upon itself.” This is what Scholastics, especially from the fifteenth century, and especially in the School of Salamanca, tried to do.

Late Scholasticism was not made up of a set of moralistic exhortations without a connection with the real business world. Quite the contrary in fact, Scholastics of that period made a sufficiently serious effort to understand economics up to the point that they were able to contribute to the history of economic thought with some remarkable ideas [80].

Although the influence of Late Scholastic thought on modern economics was dismissed for a long time, it is now firmly recognized, especially in the Austrian School of Economic Thought. Rothbard [82] and De Roover [24] qualified Bernardino of Siena and Antonino of Florence as “the Two Great Economic Thinkers of the Middle Ages.” In this and other works, De Roover [23, 25] is one of the authors who do justice to Late Scholasticism by recognizing its contribution to economic thought.

Joseph Schumpeter in its monumental *History of Economic Analysis* [84] demonstrated that some Spanish and Italian Scholastics developed a system very close to the Austrian and subjective-utility approach. Marjorie Grice-Hutchinson [41] discovered in the late sixteenth century Spanish Scholastics a pre-Austrian subjective-value-and-utility view, one quite distinct from earlier Scholastics approaches and also from that of Aristotle.

Based on Duns Scotus, Scholastics were accused of being hostile to trade and considered that the just price is the cost of production plus a reasonable profit ([42], pp. 106–108, cited by [82]), which is quite close to Karl Marx’s position. However, De Roover ([25], pp. 312–314) noted that both De Soto and Molina denounced as “fallacious” the Duns Scotus notion of just price; instead these held that the just price is the common estimation, the interaction of supply and demand, on the market. In addition, Molina pointed out that competition among buyers will drive prices up, whereas a scarcity of purchasers will pull them down.

What is most remarkable for our purpose is that the aim of all these Scholastics was not to develop economic theories, but to understand how business and the market work to provide moral criteria for good behavior. This is, no doubt, a valuable lesson which can be learned for business ethics from the Late Scholastics.

Universal Ethics and Ethical Relativism

In the twentieth century two radical positions can be found regarding ethics and business ethics: on one hand, those who defend the position that there are universal ethical principles and/or human values which apply to all human beings and, on the other hand, ethical relativism, which can be individual (subjectivism) and sociocultural (cultural relativism).

Subjectivism means that every individual determines what is good and bad, right or wrong, without any foundation beyond his or her own feelings or mindset. Two philosophical streams had a strong influence among those for whom ethics is purely subjective and without any universal principles: existentialism and pragmatism.

Existentialism includes a number of philosophers (Kierkegaard, Heidegger, Sartre, among others) with important differences between their positions but, in one way or another, all of them emphasize the condition of human existence, and a radical individual freedom with responsibility in its use strongly depending on one's own choice. There are no principles or rules before the existence of each individual, who makes the rules for himself or herself. Pragmatism (James, Dewey) also rejects any form of absolutism and universality of thought, including any universal ethical principle or universal value. For the pragmatists, reality is identified with human constructs and ethical principles are seen as social constructs to be evaluated in terms of their usefulness.

Cultural relativism takes a different perspective. The starting point comes from cultural anthropology, whose findings show that a number of differences in making moral judgments exist among different cultures. This also deals with social acceptance of some behaviors which are not accepted in other cultures (e.g., eating beef in Europe and India; female genital mutilation, which is accepted in some African countries; and tolerance of bribery in certain countries as normal). Cultural relativism concludes that ethical norms come from each culture and no moral norm can be accepted as superior to another, since all cultures are equally respectable.

Ethical relativism, both subjectivist and cultural, has been very influential since the last century and continues to have both proponents and opponents [9, 45, 49]. However, since the late 1940s, many people have often made explicit demands for universal standards at least in some basic aspects. A number of blatant crimes against humanity may have contributed to this (Nazism and Stalinism some time before the mid-twentieth century in Europe, and the Rwandan and Bosnia genocides, in the mid-1990s), as might the increasing concern about universal human rights, and the lack of respect for these in some countries, and a fear of the destruction of the natural environment is also increasingly evident. Financial and business scandals and some terrible industrial "accidents" associated in some way with negligence have also brought about a greater esteem for universal standards of morality.

The existence of some universal values and transcultural ethical principles is already recognized by many. The Golden Rule and the dignity and innate rights of every human being are examples of transcultural ethical principles.

Aquinas supported the view that humans can know natural law in its very generic principles, whereas other laws would require a more elaborate reflection and the assistance of wise people ([3], I-II, q. 94; see also [52, 79]).

Natural law does not exclude, however, what is unique in each situation. For Aquinas, as for Aristotle, practical reason deals with practical situations with all their particularities. Thus, good moral reasoning requires practical wisdom, the virtue which reinforces practical reason [64]. This makes the reconciliation of universal principles with the uniqueness of each particular situation possible, including in those aspects derived from cultural diversity.

To sum up, accepting that all of humanity shares a common human nature, the natural law provides a rational approach for a universal ethics, which seems extremely important especially in the age of globalization. However, natural law is far from being either rigid moral absolutism or cultural relativism. It includes a few types of actions ethically unacceptable in every circumstance, but most moral evaluations need to be carefully analyzed with practical wisdom.

Ethical Decision-Making

Decision-making is a crucial aspect of business and, as a consequence, considering the ethical dimension of a decision is essential in business ethics. For this purpose, several ethical theories have been proposed for making moral judgments ([18], p. 85ff; [71], p. 50ff; [63], p. 89ff). Some of these theories are centered on rationalist principles, which can be based on duties (deontologism), on evaluation and weighting of consequences (consequentialism, and mainly utilitarianism), or can be taken as a basic principle that ethical obligations derive from a social contract or agreement among parties involved in a certain issue or activity (contractualism). Virtue ethics is a second approach, which considers the agent's moral character (virtues) as the main foundation for moral judgments. All of these groups of theories focus on specific aspects of the human action (duties or norms, consequences, and virtues). Some other approaches are based on emotions or on a sense of responsibility in dealing with particular situations. When faced with so many approaches, one wonders what ethical theory should be applied. Crame and Matten ([18], p. 120) argue that the views provided by the diverse theories pave the way to an intelligent and considered response to the problem. However, this is highly questionable since each theory has its own philosophical premises.

In contrast with this fragmentation, Thomas Aquinas considers the agent's moral character – virtues and especially practical wisdom – duties, and consequences in a consistent way in ethical decision-making. Aquinas's natural law theory is not separate from virtues. Virtues are not contextual and therefore relativistic, depending on what each social environment understands by excellence, but are rooted in human nature through the natural law. Literally, Aquinas affirms that “all virtuous acts belong to the natural law” ([3], I-II, 94, 3) and “precepts are given about acts of virtue” ([3], II-II, 44, 2, 1). Thus, principles and goods (natural law)

and virtues are fully interrelated. Duties derive from principles and norms (“precepts,” in Scholastic terminology).

Aquinas’s ethics does not derive from formal aprioristic principles, but from practical reason, as noted. His ethical approach is closely related to his theory of the human act (Aquinas [3], I-II, 6-21). It is a first person ethics, not a third person ethics. This means that the moral judgment is made by the decision-maker and not by “experts,” as occurs in the utilitarian principle which requires the evaluation of consequences and determining through an arithmetic calculation whether or not the course of an action brings about “the greater happiness for the greater number.” Intentionality is crucial since the moral evaluation of a decision, which includes the selection of an end (intention) and the election of a means for this end (“object,” in Aquinas’s terminology). The circumstances of the action which the decision-maker should reasonably have known, including foreseeable consequences, are also part of the Aquinas theory, which is sometimes termed the “triple font of morality theory” ([6, 65], p. 57ff).

In Aquinas, we can also find some insights on the responsibility for secondary effects of human actions. What nowadays is known as the “principle of double effect” has its roots in Aquinas’s discussion on the permissibility of self-defense ([3], II-II, 64, 7). Killing one’s assailant in self-defense is physically the same as murder, but the apprehension of the right reason of these actions is radically different. Aquinas observes that “nothing hinders one act from having two effects, only one of which is intended, while the other is beside the intention [...] Accordingly, the act of self-defense may have two effects: one, the saving of one’s life; the other, the slaying of the aggressor. Therefore this act, since one’s intention is to save one’s own life, is not unlawful, seeing that it is natural to everything to keep itself in ‘being,’ as far as possible” ([3], II-II, 64, 7). However, good intention is not sufficient. The justification for secondary effects, such as killing in self-defense, requires proportionality and minimization of the undesirable effects: “And yet,” Aquinas adds, “though proceeding from a good intention, an act may be rendered unlawful if it be out of proportion to the end. Wherefore, if a man in self-defense uses more than necessary violence, it will be unlawful, whereas, if he repel force with moderation, his defense will be lawful.” The principle of double effects, applied with practical wisdom, provides criteria for solving ethical dilemmas in decision-making when secondary effects are significant ([63], p. 117ff.)

Shareholder Versus Stakeholder Approaches to Corporate Governance

Good practices of corporate governance have come under increasing attention, especially since 1992, when the committee chaired by Sir Adrian Cadbury published a celebrated report setting out recommendations on the arrangement of company boards and accounting systems to mitigate risks and failures due to a deficient or incorrect corporate governance. The Cadbury Report has been

adopted or has been taken as a reference for other recommendations and even legislation regarding the foundations, processes, policies, laws, and institutions whereby the supreme organs of a corporation, basically the board of directors, wield power and authority over the organization and direct and control management. Good practices of corporate governance contain many ethical elements, including a careful selection of directors, loyalty, diligence, justice, truthfulness, and transparency ([63], p. 192ff). Our focus here is on the philosophical foundations of a crucial question. In favor of whom should a corporation be governed and managed?

The answer to this question is closely related to the purpose of the firm in society and this to the question of property rights. The right of ownership entitles one to dispose of the property, to use it or not, to prevent others from using it, or to transfer ownership. The latter includes the right to delegate, rent, or sell any portion of the rights by exchange or gift at whatever price the owner determines. The latter may be the most controversial in some cases for the social and human impact which certain decisions based on this right can have, especially if you consider the corporation merely as property. This is the case of massive layoffs or introduction of outsourcing in which people are considered as no more than a simple instrument for profits.

When property rights are interpreted as absolute, or with no constraints other than those imposed by law, the stockholders bearing property rights of a company have a right to decide how to use their property. The company owners hire managers to work for them, and to act in their best interest. Thus, managers appear with fiduciary duties to shareholders, and no other obligation except compliance with the law. From this premise, it is assumed that shareholders want the corporation to maximize its profits, and consequently corporate governance and managers should seek to do so.

This shareholder approach is usually assumed by economic and finance theories. It is a “property conception” of the corporation, which considers that a business corporation is organized and run primarily for the profit of the stockholders, and the powers of directors are to be employed for that end. Little by little, this narrow view of the firm is being replaced by a more social view.

A well-known alternative approach to the shareholder approach to corporate governance and management is the stakeholder approach, which considers that corporate governance and management should act in the interest not only of shareholder but of all relevant stakeholders, including employees, shareholders, suppliers, costumers, and consumers. This alternative has been the subject of much debate and of much work trying to clarify it and to respond to objections published to it [73, 74].

The stakeholder approach needs a sound justification ([26], p. 73ff), and a critical point is that absolute property rights are questioned. Although the idea of property as almost an absolute right persists, the right to private property as an unrestricted right is seriously questioned. Property rights include restrictions against harmful uses of property [44] and other intrinsic limitations [27]. There are also scholars who hold that property rights are embedded in human rights ([72], pp. 27–28).

Aquinas, in *Summa Theologica* ([3], II-II, 66, 1–2), defended private property, and so did Duns Scotus, although with different arguments, and the Late Scholastics. But, at the same time, Aquinas defended property rights not as an absolute entitlement ([3], II-II, 66, 1–2). On the contrary, he emphasized that this right is limited by the common right of all human beings to possess what is necessary for life ([3], II-II, 66, 2 and 7) (we can also say for the right to live). He argued that although there is a generic right to possess things, “the possession of external things is natural to man” ([3], II-II, 66, 1), the division and appropriation of things are based on human law, and “according to the natural order established by Divine Providence, inferior things are ordained for the purpose of succoring man’s needs by their means. Wherefore, the division and appropriation of things which are based on human law do not preclude the fact that man’s needs have to be remedied by means of these very things” ([3], II-II, 66, 7). In other words, economic means and their possession are instrumental for human needs. In current terms, we can say that property rights are not independent of and superior to human rights, and private property has a social function. This view is very close to the above-mentioned modern views of private property. Although it would require further development, it seems justifiable, from a Thomistic view point, that corporate governance bear certain responsibilities toward all relevant stakeholders, and not only toward shareholders. However, Aquinas would add that stakeholder interests should be related and, in the case of conflict, subordinate to the common good, since “the good of a part can be directed to the good of the whole” ([3], 58, 5) and “the common good transcends the individual good of one person” ([3], II-II, 58, 12). However, this is within the same level of goods. As Aquinas himself states, “The common precedes the proper, when both are of the same genus; but when they are of divergent, there is nothing to prevent the proper being prior to the common” ([3], III, 7, 13 ad 3). Thus, economic results for the company (instrumental common good) should not permit disrespectful treatment of people (human common good), such as deceiving clients. Neither does it justify pressuring employees into unethical behavior for the sake of a supposed “common good.”

Human Rights in a Global World

Respect for human rights is an important aspect of modern business ethics. Acceptance of human rights entails that these are innate rights whose existence and validity is previous to and independent of their legal codification. Human rights are an important component of recognized international standards for corporate responsibility, such as the UN Global Compact, the Global Reporting Initiative guidelines for corporate auditing and reporting, and ISO 26000. They are often cited, for example, in the context of poor working conditions, unfair discrimination, manipulation of people, and lack of respect for free speech and free association, and as a reference for multinational corporations [7, 68], including their complicity in chain supply [89], and a basis for their code of conduct [13]. Human rights are

particularly apparent when considering what are termed “sweatshops,” in which the lack of respect for human rights is striking [78].

As we will discuss below, in Thomas Aquinas there is a seminal notion of human rights, and Late Scholastics were real pioneers of human rights. However this fact has been largely ignored. Instead relation is often drawn between human rights and politics and post-Scholastic political philosophy. In Europe, the first stage of the notion of human rights is generally accepted as being in the proclamation of the *Twelve Articles* (1525) adopted by Swabian peasants as part of their demands raised toward the Swabian League in the German Peasants’ War. Then the English Bill of Rights was promulgated (1683), followed by the Scottish Claim of Rights (1689), and the French Declaration of the Rights of Man and of the Citizen (1789). In America, human rights are first recorded in the Virginia Declaration of Rights (1776) and, in the same year, the United States Declaration of Independence, which encoded in law a number of fundamental civil rights and freedoms. The US declaration stated: “We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.” The French and American declarations show the influence of two philosophers: John Locke (1632–1704) and Jean-Jacques Rousseau (1712–1778). The former stressed that the constitution of a country should be based on natural law, which includes a natural right to self-preservation, individual freedom, and private property, which are seen as self-evident. The latter assumed that all individuals in a society had entered into a contract to form a civilized society in exchange for the government giving them equality.

A wider enumeration of human rights than these ancient declarations is the UN Declaration of Human Rights (1948), which has become quite popular. This has a political dimension, but its tune is rather a set of socioethical standards which stress respect for human dignity and innate rights, seeing these as essential for living together in a respectful and peaceful way.

If human rights are to have such importance, they require a solid philosophical foundation. However, they are frequently taken for granted, and accepted as self-evidently true and universally valid moral principles. Others, however, argue that human rights are a matter of mutual interest or that they are empirical facts in the contemporary world [32]. But these arguments are more sociological than ethical.

Thomas Aquinas provides an embryonic theory of human rights and their foundation [33, 57], although he did not use the expression “human rights.” Instead, he talks of “natural rights.” These rights are deduced from human nature. In essence, the Aquinas position is that basic human needs require fundamental human rights.

The Late Scholastics, in the Thomistic tradition, stressed objective rights [11]. In the context of the School of Salamanca, an important intellectual debate took place motivated by the discovery of America by Christopher Columbus and other explorers and the subsequent Spanish and Portuguese colonization. A first question was whether the Indians should be treated as humans or could be reduced to slavery.

At that time, some stated that these indigenous peoples were savages, without soul, and were born to be slaves. Francisco de Vitoria, a pioneer in the foundation of international law, reacted energetically in defense of the rights of the Indians [43], and so did his disciples Domingo de Soto and Fernando Vázquez de Menchaca [11]. Aligned with these theologians, and to avoid any doubt, in 1545, Pope Paul III put an end to the question through the papal bull *Sublimus Dei*, declaring the indigenous people of the Americas to be rational beings with souls, and condemning their reduction to slaves in the very strongest terms.

From a practical perspective, Bartolomé de Las Casas (1474–1566) is also remarkable. He was a Dominican friar, trained at the School of Salamanca, who became the first bishop of Chiapas, Mexico. An indefatigable champion of native Americans who fought against the abuses of the colonialists and demanded freedom from slavery for all humans regardless of their race or religion, he is considered one of the first advocates of universal rights.

Philosophical and Theological Approaches to Business Ethics

At the beginning of the business ethics movement in the 1970s and early 1980s, philosophers played an important role in its development. The bibliography on business ethics in the 1970s included philosophical, but also theological and business entries ([46, 47], cited by [21], p. 431). However, according to De George [21], the theological writings showed more concern for social ethics than business ethics. Although this may be a partially correct description of historical reality, this does not mean that religions, and specifically Christian moral theology, should be excluded from the domain of business ethics.

The first textbooks on business ethics presented no religious or theological approaches to this discipline (see, e.g., [20, 87]) nor did the first issues of currently recognized journals in this field such as *Business Ethics Quarterly*, which started in 1980, and the *Journal of Business Ethics*, which first appeared in 1982. However, the situation has changed and now these journals include articles from the viewpoint of religions or wisdom traditions. Calkins [12] held that business ethics might become more integrated, interesting, and autonomous as an academic discipline by incorporating key religious traditions. Enderle suggested that there are common grounds between philosophy and theology [28] and argued that religion in business is highly relevant [29]. Epstein [31] supported the idea that religious traditions merit a critical role in management education.

In spite of this, the exclusion of religion from the business ethics field was still evident late in the first decade of the twenty-first century. Even in certain comprehensive handbooks and encyclopedias on business ethics, religious approaches are quite marginal. This is the case with *The Oxford Handbook of Business Ethics* [10]. According to Enderle [30], for the editors of this handbook the field of business ethics consists of the (Western) philosophical analysis of moral problems and case studies of business, including internal and external issues. Second, it is a “practical” matter viewed from “a business orientation,” dealing

with “various relationships that obtain largely within business.” With this double-pronged definition and 26 contributors from the USA and one from Canada, this handbook – concludes Enderle ([30], p. 731) – represents the typical “American” approach to business ethics. Another case mentioned by Enderle is the *Encyclopedia of Business Ethics and Society* [48], the biggest encyclopedia of “business ethics” and “business and society”; at the end of the first decade of the twenty-first century, only eight of almost 900 entries deal with religious matters in business and economic ethics.

However, wisdom traditions and religions, including Christianity, Judaism, Islam, Confucianism, Buddhism, Hinduism, and Shintoism, along with moral theology, provide abundant ethical guidelines for business [62]. In Asia and the Middle East, religions have a strong influence on the conduct of businesses and on the adoption of business values. Nevertheless the historical and global importance of religious views on business ethics is sometimes underestimated in standard introductions to business ethics [1].

The narrow vision of business ethics, which focuses only on Western moral philosophy and excludes religion, is not shared by many scholars. Rossouw [81] argued that postmodern culture offers theology an opportunity to become more involved in the world of business, and especially in business ethics. But what is the relationship between philosophy and religion and theology?

In practice, philosophical and religious approaches seem like two incommunicable realms, and some business ethicists, such as De George [21] in the first years of the business ethics movement, argued that business ethics, with its fine distinctions, is a matter for philosophers, and maybe also for theologians, but not as theologians but in the role of philosophers. According to De George, theologians only speak to believers, whereas philosophers speak to everybody and provide rational arguments. Since theology is based on faith, “it seems appropriate to the philosopher that theologians address members of their own religion. If a theologian addresses non-believers, he presumably attempts to influence them by the strength of his feelings, by the intuitive appeal of his value judgments, or by his persuasive skill rather than by strictly theological arguments. If the appeal is only in terms of reason with no recourse to theology, the theologian assumes the approach, if not the role, of the philosopher” ([21], p. 424). As a conclusion, it seems that a business ethic acceptable by everybody is the exclusive competence of philosophers. At first glance this might seem reasonable to many, but on closer examination problems appear. Philosophers propose a vast number of theories, and each assumes certain epistemological and anthropological premises along with fundamental ethical principles, such as the categorical imperative, the utilitarian principle, and the existence of virtues. One wonders which ethical theory is the right one, and how Western theories of ethics could be acceptable worldwide. Religious people may also ask whether or not a certain theory is compatible with one’s own faith. There is still a deeper question in the field of business ethics. Is it enough to accept philosophical proposals to develop a business ethic which provides a full sense of life in business activity, rather than being merely a tool for solving ethical dilemmas?

Another question which arises is: Might nonbelievers learn something from religion and theology (rational development of religious faith)? Many Catholic social encyclicals are addressed to believers but also to “all people of good will,” probably with the hope that they can be useful as inspirational thought or as an aid to reflection. Business is a part of human life and it does not seem correct to see business ethics as being disconnected from a meaningful life; and in this both faith and reason have their role. According to the pope-philosopher John Paul II, “[f]aith and reason are like two wings on which the human spirit rises to the contemplation of truth” ([76], Introduction).

Furthermore, do theology and philosophy need one another? Theology – not simple “religion” – needs philosophy for further developments. Philosophy uses reason not faith, but certain propositions of faith can stimulate reason for rational discussions. Thus, “reason is stirred to explore paths which of itself it would not even have suspected it could take. This circular relationship with the word of God leaves philosophy enriched, because reason discovers new and unsuspected horizons” ([76], n. 73).

This circularity between faith and reason is not far removed from the view of Thomas Aquinas, who provided a solution to the relationship between philosophy and Christian theology based on two points.² Firstly, as noted above, Aquinas distinguishes theology and philosophy as two distinct enterprises, of which the main difference is their intellectual starting points. Whereas theology starts with Christian Revelation and accepts its data on the basis of divine authority, philosophy starts with reason and rational knowledge from information provided by senses. Theology uses as a starting point confidence-based knowledge; it is based on the reliability of God, who reveals Himself to people. The reliability on philosophical knowledge comes from our natural faculties being employed with respect to the natural world.

Secondly, Aquinas defends the convergence of reason and faith in matters accessible to human reason. He held that rational discussion cannot disagree with theology in matters which are accessible to human reason. This includes issues of business ethics such as the prohibitions on stealing, bribing, or telling lies. Of course, this is not the case of strictly supernatural truths such as the Trinity of Persons in One God or the divinity of Jesus Christ, which are not matters of philosophy because of their suprarational character. If, in practice, the conclusions reached by theology or philosophy are in conflict, Aquinas holds that such conflict is apparent and is due to some prior error in the theological or philosophical reasoning, since God is the author of both the Revelation and the world accessible to human reason. Thus, a more accurate rational process will be necessary.

Regarding ethics, Aquinas proposed using both reason and faith in presenting Christian commandments and virtues. Natural moral law, which, as noted above, determined the end of human virtues, is a philosophical approach and a moral matter for all people, including Christians, of course. Christian ethics, however, goes beyond this since it has Jesus Christ as a main reference.

Applied to business ethics, natural reason and human virtues provide foundations for business ethics for everyone, regardless of what religion they might have, or even if they are not religious. Christians should go further by extending what natural reason proposes with Christian teachings.

Conclusion

After presenting an overview of Scholastic thought, this chapter explored how such thought, and especially the tradition based on Thomas Aquinas and the Late Scholastics developments, can provide interesting insights on a number of business ethics topics currently under debate. Linking economics and ethics is within the scope of most Scholastic thought. It is also remarkable how universal principles and situational particularities and cultural differences can be considered altogether, without falling into ethical relativism. In ethical decision-making, Aquinas provided the triple font of morality theory as an alternative to conventional theories based on deontology, utilitarianism, contractualism, for example. He harmonized principles (natural law) and virtues. This suggests overcoming the dichotomy between principle-based theories and virtue-ethics-based theories. Scholastic thought supports the existence of responsibilities toward relevant stakeholders, and not only shareholders, but points out the common good as a main reference, also for purposes of solving problems of conflicting interests among stakeholders. Human rights in a global world receive much attention from Late Scholastics. Finally, the role of philosophy and religion/theology in business ethics, and their relationship, is carefully determined in Aquinas's approach.

Although Thomism is not in the mainstream of business ethics right now, it might again be, as it was in other times. In this regard, we might usefully remember that virtue ethics and the Aristotelian tradition were not present at the beginning of the modern business ethics movement in the 1970s and 1980s, but they are now a respected approach. As noted, Aquinas presented a serious approach to virtue ethics by taking human nature as a reference.

Aquinas may offer lessons for ethics and business ethics today. Significant may be the recognition of Thomas Aquinas by Alasdair MacIntyre, a highly influential author in virtue ethics, mainly for his book *After Virtue*, published first in 1981. In the preface to the third edition of this book, he wrote:

I had now learned from Aquinas that my attempt to provide an account of the human good purely in social terms of practices, traditions, and the narrative unity of human lives, was bound to be inadequate until I had provided it with a metaphysical grounding. It is only because human beings have an end towards which they are directed by reason of their specific nature, that practices, traditions, and the like are able to function as they do. So I discovered that I had, without realizing it, presupposed the truth of something very close to the account of the concept of good that Aquinas gives in question 5 in the first part of the *Summa Theologiae*. ([56], p. xi)

Hopefully, this chapter and the following chapters in this section of the book can contribute to better knowledge of Scholastic thought, especially in connection with business ethics. Our conclusion is that Scholastic thought and more specifically the Thomistic tradition have much to offer in further developments of business ethics.

Abstract

For Thomas Aquinas, economic transactions, as human interactions, cannot be separated from ethics. Since the human being flourishes through virtuous living and strives to flourish, virtues are just as much of relevance to business as they are to every other sphere of human conduct. Moral objectives are neither external nor marginal to economics. Instead, they are fundamental in order to understand central human motivation behind the production and exchange of goods. Business has a social purpose; it is to serve the common good. Thus, Thomas limits the quantitative pursuit of profit by qualitative concerns for human well-being and establishes a hierarchy of life-promoting goods (as ends) that business (as a means) is to procure. On this basis, he develops a rich economic ethics that spells out how business should be informed by virtues and conducted in the light of the idea of social justice. Private property and corporate wealth have to serve all members of society and must be used with respect to the human dignity of each. This, Thomas argues, holds true across time and culture. Irrespective of the requisite specifications that context and circumstance demand, he defends the general orientation of business and the economy toward human well-being and dignity as of global reach and universal validity.

Thomas's normative business theory rests ultimately on intermediary position that he holds in the debates about metaphysical universals that captured the minds of medieval thinkers. According to Thomas, human intellect is capable of conceiving valid universals about reality. This assumption was severely challenged by nominalist thinkers of the late Middle Ages. They argued, on the contrary, that the ideas of the human mind were but the names (*nomina*) of

things – signifiers, which revealed nothing (objective) about the signified but communicated only the (subjective) interests of their users. Once, however, ideas are viewed merely as linguistic conventions, the assignment of a “natural” value to a given good above and beyond its customary (market) value becomes notoriously difficult. Thus, by undermining the metaphysical foundations of medieval epistemology, nominalist philosophers, such as William of Ockham, also destabilized the ethics that rested upon them.

Introduction

High Scholasticism in the Twelfth and Thirteenth Centuries

The scholasticism of the twelfth and thirteenth centuries is characterized by the conflict between Platonic-Augustinian and Aristotelian metaphysics [49].¹ Fueling this controversy were philosophical problems (e.g., about the epistemological rank of thought vs. experience), theological questions (e.g., about the nature of sin and the moral status of the human body), as well as tensions between philosophy and theology (e.g., about the priority of reason vs. faith). The philosophy of Thomas Aquinas gained the enormous significance it holds up to date because it offered a synthesis to many of these intellectual conflicts on the basis of a reconciliatory epistemology. Between the extremes of a Platonic *idea-realism* (ascribing to ideas an existence independent of the things they described) and a radical *nominalism* (arguing that ideas were but inductive generalizations of particular notions), Thomas Aquinas held an intermediary position. Against the nominalists, Thomas defended the truth of universals through the independence of general concepts from the particular notions, intuitions, and experiences they characterized. Against the Platonists, he argued that the reality of universals must not be used to hypostatize the *conceptual* distinction between universals and their objects of reference into an *ontological* bifurcation. Existence and essence can be separated intellectually but not in reality [33]. In short, while the Platonic idea-realists sought universals *ante rem* (irrespective of objects of reference) and nominalists generated them solely *post rem* (contingent upon such objects), Thomas located them *in re* (as general and thus functionally independent signifiers of the particular objects they signified) [87]. This functional (or transcendental) metaphysics allows the human intellect to disclose interpersonally valid truths about reality [88] and, thus, a realist approach to life and ethics.

With the demise of Thomism in the late Middle Ages, however, the centrifugal forces of the aforementioned positions began to tear asunder the scholastic framework that had held them together, for the didactic method of high scholasticism corresponded closely to its dialectical mission: to elucidate truth by reasoning [66]. In order to succeed, the scholastic project had to establish and defend an intrinsic connection between the “natural light of reason” and the concept of “natural law.” With the dissolution of this very connection through *nominalist* and *voluntarist* theories began, therefore, the demise of scholasticism in general. Therein lies the

overarching significance of the struggle between conceptualism and nominalism, carried out by debates between proponents of the metaphysics of Thomas Aquinas and supporters of *William of Ockham*, that stands at the center of this chapter. First, we will reconstruct the metaphysics of Thomas Aquinas and expound its virtue-based business ethics; then, we will present the alternative philosophy of William of Ockham.

Thomas taught that the “natural light” of reason (*lumen naturale*) leads to truth (*S. th.* I-II, 109, 1 ad 2; II-II, 8, 1 c; 15. 1; 171. 2 c & 4 ob. 3; etc.).² The human being is endowed with rational capacities that may be supervened but are never contradicted or annihilated by “supernatural” (*lumen supernaturale*), that is, revelation-based, knowledge (*S. th.* I-II, 109, 1 ad 2). In emphasizing the capacity of human reason to reach truth unaided by theology, Thomas addresses the rational powers of every human being, everywhere and always (*SCG* 1, 2). Studying the world in its own light, that is, uncovering the laws of nature as they show themselves to reason, honors God, he argues, because through creation we learn indirectly about its Creator (*SCG* I, 7&8 and II, 4). True faith is in harmony with worldly knowledge, since God chose to reveal himself also in, and through, his creation (*De Ver.* q. 14, 9, ad 8). While not everything can be known through the conclusions of reason alone – in matters of faith and salvation the powers of rationality are inadequate (*Sent.* III, d. 1, q. 1, a. 2-3) – the basic tenets of theoretical philosophy can be known solely by reason, and the same holds for the fundamentals of moral reasoning (*S. th.* I-II 94, 2). While Scripture contains transcendent concepts that do not appeal to everyone, in the essential questions of human conduct, Thomas holds that the moral precepts of Scripture and secular reason converge.

The medieval jurist, Gratian, provides an example of one such convergence when he defends the proposition that everyone is bound to do for another that which one wishes to be done for oneself (*Decretum*, I, 1, prologue). While directly revealed through Scripture (*Mt.* 7:12), this Golden Rule is also just as evident to those who proceed through sound philosophizing to an understanding of human nature (*S. th.* I-II, 94, 4 ad 1). It is this overlapping consensus between reason and faith that provides high scholastic thought with the requisite unity for its imposing intellectual works. It is this very unity, too, however, that will be dissolved through the nominalist philosophy of William of Ockham.

Thomas Aquinas’s Approach to Business Ethics

According to Thomas, humans need specific cultural forms in order to articulate ethical norms (*S. th.* I, 5, 1). Moral insight advances through the unification of three different levels of ethical understanding: first, a principled insight into the good (*synderesis*³); second, a situational judgment (*prudentia*) that informs which kind of behavior meets the criteria of law, custom, and virtue that specify the good in each concrete context; third, knowledge (*scientia*) that identifies the specific factual nature of the case at hand. Whereas the second and the third form of moral

reasoning are contingent upon the finite mental abilities and the limited scope of information available to the persons involved – and thus fallible – the first is not [35, 37]. The reason is that all persons know in their hearts that “good is to be done and pursued, and evil is to be avoided” (*S. th.* I-II, 94, 2); the awareness of this fundamental principle (*synderesis*) can never be expunged (*S. th.* I-II, 94, 2); as an indestructible core of sustained righteousness (*perpetuae rectitudinis*), it resides forever in everyone (*Sent.* II, d. 24, q. 3, a. 3 ad 3; [14, 47, 76]). Notwithstanding this fundamental moral principle, people do not always agree on moral questions. What accounts then for their ethical disagreements?

Thomas explains: Whereas in *theoretical* philosophy our (descriptive) theories about the world may *actually* differ (because of flawed deductions, faulty premises, illegitimate inferences, etc.), *potentially*, that is, under ideal conditions, all our judgments could converge. The world is but one, and to Thomas, diversity in its theoretical descriptions thereby proves only that human knowledge of the world has not yet reached its ultimate, adequate, and all-integrative level (*S. th.* I-II 94, 2). Instead, in *practical* philosophy, that is, in regard to all moral (prescriptive) questions, the diversity of judgments is only sometimes, but not always, merely an expression of nonideal conditions. The variety of ethically charged customs and conventions also reflects the divergent contingencies of circumstance of moral practice (*S. th.* I-II 94, 4). Virtuous behavior can, and at times must, vary according to context [8], for instance, when circumstances change so as to alter the object or bar the realization of the intention of the respective action [4].

Obviously, this insight is of immediate relevance for the regional ethics of business. In fact, any and all contemporary theories of business ethics must answer precisely this very question, where to delineate universal strictures from regional customs, lest they succumb either to obtuse universalism or obdurate relativism. When and how may circumstance change the ethical case in point, and how far does reason offer stable guidance even in changing environments? Are there global norms and virtues, and, if so, what are they [30]?

Virtue and Natural Law

Thomas acknowledges general precepts about virtue (*S. th.* II-II, 44, 2, 1) and holds that “all acts of virtue are prescribed by the natural law” (*S. th.* I-II, 94, 3). Hence, if the essence of the latter is intelligible to human reason, so should be the nature of the former. Virtue pursues the good, while the natural law teaches what the basic goods of human life are. Thomas lists the following as the most basic goods of human life: self-preservation, procreation, education of the young, seeking knowledge and the truth about God, and living in society (*S. th.* I-II 94, 2). The general principle “to do good and to avoid evil” becomes more specific when applied to these natural goods, that is, in the command to promote (and to abstain from hindering) their realization. Some concrete moral precepts can be inferred directly, for example, a command, “such as ‘one must not kill’, may be derived as a certain conclusion from the principle that ‘one should do harm to no one’” (*S. th.* I-II 95, 2),

explains Thomas. Other norms, however, need further contextualization in order to afford us ethical guidance. For instance, while “the law of nature holds that the one who does wrong should be punished; that one is punished in such a manner is a (further) determination of the law of nature” (*S. th.* I-II 95, 2). While requisite contextual differences in regard to the specificities of regional customs (*S. th.* I-II 95, 3) and temporal affairs (*S. th.* I-II 96, 1) are generally accepted by Thomas, ethical diversity also meets clear “natural” limits. Not all variants introduced by circumstance and context are morally acceptable.

Thomas points to the habitual thievery of Germanic tribes, for instance, which, in his eyes, is not a legitimate cultural specification of the institute of property but must rather be attributed to the depraved customs and corrupt habits of said Germans (*S. th.* I-II, 94, 4-6). His reasoning is that such a behavior cannot be accepted from a global vantage point, since it rests on a failure to connect a requisite derived precept (*do not steal*) from the universal principle (*do not harm*). (*S. th.* I-II, 94, 6 ad 1) Similar judgments can certainly be made in regard to harsh labor practices that violate the physical integrity of employees and make it impossible for the individual workers to flourish [80]. Thus, the fundamental imperative to advance the natural goods of human life leads to a substantial context-invariant body of moral norms, binding all humans, at all times and in all places [89]. Business actors, just as much as governmental agencies or individuals, are called upon to meet standards whose global reach Thomas defends by stating that the virtuous conduct they demand derives from basic insights of human reason into the nature of the human good (*S. th.* I-II, 94, 3).

While a contemporary moralist might emphasize mostly the benefits of virtuous acts upon their respective recipients, Thomas also stresses the positive effects of justice upon its practitioner. Human virtue, he argues, not only renders the act good but also improves the agent of the good deed. In fact, a natural *inclination* to act reasonably and virtuously is for Thomas common to all human beings (*S. th.* I-II 91, 2), regardless of political, religious, or geographical differences (*S. th.* I-II, 94, 4; 95, 2). Virtuous behavior unlocks otherwise dormant potentialities and helps individuals to make the most of themselves. People flourish from acting justly toward one another; it lies, hence, in the self-interest of individuals (and firms) not to be selfish [3].

According to Thomas, “the natural law, in the abstract, can in no wise be blotted out from men’s hearts” (*S. th.* I-II 94, 6). No human being is ever wholly without an innate awareness of the good and, hence, never thoroughly without any goodness at all. Even those who commit atrocious sins cannot thereby divest themselves of their rational nature as such or of their potential to redirect their lives to the good (*S. th.* I-II 85, 2). While the moral *worth* of individuals changes with their actual actions and convictions, this fundamental capacity to moral reform highlights the *dignity* of each person as a human being, which remains untarnished by personal conduct [91]. Each human being, therefore, is always – in business transactions just as in all other aspects of life – to be treated with respect due to this very dignity [55].

From these deliberations, two important conclusions can be drawn. First, a cross-cultural insistence on the basic moral tenets cannot be dismissed as an illegitimate

infringement on cultural sovereignty rights [36]; rather, any practice that directly contravenes universal prescriptions can justly be proscribed (S.th. I-II, 95, 2). A clear stance in favor of the *United Nations Declarations of Human Rights* and its consistent application in the economic sphere is but the consequent translation of this ethics into our contemporary life world [12, 83]. Since natural law addresses itself to all actors, that is, to firms just as well as to individuals and states, the same holds for a corporate commitment to its principles, as expressed by the signatory companies to the *United Nations Global Compact* [55, 90]. Second, if an inclination to moral conduct is deemed essential for human life, anthropologies (such as the neoclassical *homo oeconomicus* theorem) that overlook this normative dimension will necessarily err in their prognostic treatment of human behavior as well as in their recommendations for economic policy. With Thomas, one must reject as incorrect all positivistic and relativistic approaches to economics. The *prescriptive* nature of human reason must inform any *description* of human agency; in brief, economics without ethics is – descriptively – as incomplete as it is flawed and – prescriptively – bound to pervert the true purpose of economic activity. Not in (quantitative) maximization of utility lies the ultimate purpose of business but in a richer (qualitative) conception of economic success, including virtue and social responsibility [18]. Business, in short, has to benefit the common good, not just the transacting parties and their financiers [61]. Pecuniary measurements can, hence, from a Thomistic perspective, only serve as controlling but never as guiding principles of corporate conduct [41].

Natural Law and Justice

Thomas says that “what is particular to justice among other virtues is that it orders a human being in those affairs which concern another” (S. th. II-II, 57, 1). The idea of justice expresses a “habit according to which one gives to everyone what is right (*ius*) with a constant and perpetual will” (S. th. II-II, 58, 1). The designation of internal constancy of the will to justice implies that true justice not be limited to particular time and circumstances (S.th. II-II, 58, 1, ad 3). Rather, the extension of the individual virtue of justice into social dimensions suggests a need for certain forms of *institutional*, for example, legal, justice. Justice must manifest itself in public laws that represent more than the collective pursuit of individual self-interest; they should address the common good, not just aggregate interest [27]. Moreover, Thomas extends the understanding of the essential nature of justice (arranging affairs in their correct order) beyond the commutative fairness. The virtue of justice is directed to others *in common* and requires that one, who serves individuals within a community, also serves that community at large. As a result, individual justice, when perfected, contributes to justice in society by aligning the forms and norms of legal justice with the general good (S. th. II-II, 58, 5).

As a requisite extension of individual goodness to its societal object, the virtue of justice cannot be limited to the legal realm. Thomas demands that the fair and adequate treatment of others characterizes *all* actions by individual and collective

agents. A durable and healthy society requires that justice not only informs the rules of law, it also demands that justice inspire all norms of moral and social conduct, including the customs of business [81]. Through justice, the equity of social proportions is preserved. Hence, *justice justifies* as it rectifies the agent's social relations and thus legitimizes the agent's position in society, whether this agent be an individual or collective person such as a firm. Justice, moreover, commits one to form a sufficiently objective view of others and what is due to them (*S. th.* II-II 58, 1); that is, through the orientation toward justice, the otherwise overly individualistic notion of virtue gains a decidedly transpersonal content. By commanding alterity-oriented objectivity from the individual's worldview, justice calls for prudence as well. For in obliging the individual to act with adequacy toward others, justice demands that one develop a keen understanding of the lives and needs of others. To act with justice demands the prudent integration of external standpoints and a sensitive regard for the specificities of others, that is, bridging cultural and societal divides and overcoming ethical parochialism [8]. By committing each and everyone to nonpartisan perspectives and integrative viewpoints, the idea of justice promotes a more integrative worldview than a unilateral satisfaction of personal wants requires [16]. Applied to the business context, this approach directs the firm, for reasons of both justice and prudence, to recognize the concerns of and to accept responsibility for *all* of its stakeholders [2].

While Thomas acknowledges that in different countries varying circumstances will lead to the construction of divergent social norms and legal codes (*S. th.* I-II 96, 5), he holds that certain strictures of natural law apply to all peoples around the globe (*ius gentium*) because of their shared humanity (*S. th.* I-II 95, 4). As reflected in later teachings of the *School of Salamanca* that largely developed its cosmopolitan business ethics based on commentaries on Thomas's works, the normative orientation of natural law extends to the socioeconomic realm worldwide [1, 19, 53, 69]. The diversity of global business practices notwithstanding, certain core elements of moral conduct can, and indeed must, be safeguarded universally. While Thomas regards the specifics of wealth creation as alterable social constructs, his conception of *ius gentium* relates also to the business sphere and assigns that the overall direction of economic activity must always be guided by the overarching end of natural law: the common good (*S. th.* I-II, 92, 1). As Thomas's establishment of the precepts of justice as a duty to everyone (*indifferenter omnibus debitum*: ST II-II, q. 122 a. 6) can be understood as the beginnings of a concept of universal human rights ([26], p. 23), the socioeconomic dimensions of Thomas's concept of natural law (*S. th.* I-II, 91, 5) can today be well reformulated as common socioeconomic rights of humanity. Core mandates of socioeconomic justice, that is, ought to attain worldwide legal sanction [89].

Social Justice

Beyond traditional demands of commutative and distributive justice, Thomas proceeds to the idea (albeit not the term) of a social justice that *binds* as well

as *bonds* individuals and societies. Thomas reiterates Aristotle's position that wealth is not an end in itself but merely an instrument to attain higher goods (*S. th.* II-II 118 ad 5). Thomas regards neither wealth as (necessarily) a good nor poverty as (necessarily) an evil. Their assessment depends upon the role they play in human life (*SCG* III, 30, 2). In case riches make individuals anxious or immoral, then, he thinks, it is surely better that poverty frees them from these afflictions. One should, however, neither view poverty as a good in itself; it, too, is only of instrumental value and praiseworthy "only in so far as it liberates (one) from those things by which a human being is prevented from intending spiritual things [. . .]. And this is common to all external things that they are good to the extent that they lead to virtue, but not in themselves" (*SCG* III, 133, 4).

Thomas's repeated emphasis on the merely *functional* nature of possessions is of central importance for his socioeconomic philosophy overall. Individuals shall hold possessions in keeping with their social position (*suam conditionem*, *S. th.* II-II 118, 1). Yet whenever "the practice of virtue is hindered by them, they are not to be numbered among goods, but among evils." (*SCG* III, 133, 1). In contradistinction to some modern notions, Thomas defends concepts of property and profit that merely convey *relative*, yet never *absolute* entitlements, for Thomas's central socioeconomic argument is that goods, whose value is contingent, neither express nor fulfill human nature; in consequence, human beings do not have an *unconditional* human right to their possession [38]. Material wealth is in agreement with the natural rights of human nature under the condition that it is regulated by human laws promoting both individual virtue and the common good. Wealth acquisition and profit making are rendered legitimate through their wider social purposes.

Which are these social purposes of individual possessions? The use of the earth and its goods has been given to humanity in common (*S. th.* II-II, 66, 1). Legitimizing private ownership against a benchmark of initial equality, Thomas simultaneously limits the acceptable forms and manifestations of private properties through their social functions, for, *prima facie*, forms of property that exclude the use of others, that is, "private" property (from Latin: *privare* = to deprive, rob, strip away), do *not* fall within the domain of a common stewardship of the earth. Exclusive property rights are hence in need of moral justification, which can be found in the following arguments.

First because every man is more careful to procure what is for himself alone than that which is common to many or to all: since each one would shirk the labor and leave to another that which concerns the community, as happens where there is a great number of servants. Secondly, because human affairs are conducted in more orderly fashion if each man is charged with taking care of some particular thing himself, whereas there would be confusion if everyone had to look after any one thing indeterminately. Thirdly, because a more peaceful state is ensured to man if each one is contented with his own. Hence it is to be observed that quarrels arise more frequently where there is no division of the things possessed. (*S. th.* II-II 66, 2)

Far from giving unconditional support for the privatization of the earthly goods, this conditional justification *qualifies* and *limits* the individual right to exclusive property [60]. Since private property is *not* a direct institution of natural law but an

institution justified indirectly by it (*S. th.* II-II 57, 3), Thomas states that, *a fortiori*, the specific “division of possessions is not according to the natural law, but rather arose from human agreement which pertains to positive law” (*S. th.* II-II, 66, 2 ad 1). Since the institution of private property has to be justified relative to its function in fulfilling natural law, specific property relations within a certain society can never be defended *absolutely*. They are always subject to critical scrutiny, whether they benefit or harm a given community. One should “possess external things, not as one’s own, but as common, so that one is ready to share them with others in their need” (*S. th.* II-II 66, 2). While not demanding “that all things should be possessed in common and that nothing should be possessed as one’s own,” this passage does indeed mean that society can, and should, define proper boundaries of private possessions (*ibid.*). There is, in short, no abstract right to enrichment at the cost of the common good, either for individuals or for collectives, such as firms, since from a Thomistic perspective, *all* possessions are generally constrained by “the right of all persons to subsist upon the bounty of the earth” ([72], p. 245).

The law accepts, however, the presence of many evils and the absence of numerous goods on behalf of the higher good of human freedom which cannot otherwise be sustained (*S. th.* I-II, 96, 2). Hence, the moral precept of almsgiving or philanthropy does not translate into laws of massive income redistribution. Yet at the same time, Thomas also explicitly denies that the legal provisions for the institution of private property can be used against the right of those in need. “Inferior things” – he declares as if addressing a libertarian audience – “are ordered to assisting those in need. The obligation to assist those in need by such things is therefore not prevented by the division and appropriation of things which proceed from human law. And so things which some have in abundance should be used according to natural law to assist the poor” (*S. th.* II-II 66, 7). Human society, bound by the principle of justice for its legitimacy (*S. th.* I-II 95, 2), must never accept the superabundance of some in the face of the need of others [73]. Thus, a case for redistributive action on all social levels is made that can be extended to corporate actors as well [40]. For if we understand firms as communities of persons, then, just as individuals, they too have to promote social justice. Business cannot relegate all social responsibilities to the public realm. Instead, firms are not only *allowed* but, on occasion, such as given state failure or the total absence of public governance, *required* to act as subsidiary facilitators of social justice [5].

Commerce and the Just Price

In his rejection of avarice (*S. th.* I-II 84, 1), Thomas follows Aristotle’s criticism of greed or *pleonexia* [23]. Yet he also provides a more neutral assessment of commercial exchange than Aristotle, who had accepted trade only as a necessary evil. Exchange relationships, while often leading *subjectively* to a “certain debasement” of the involved tradesperson (*S. th.* II-II, 77, 4), are nonetheless viewed by Thomas *objectively* as transactions without intrinsic faults: their moral value is, like that of private wealth, wholly functional. Whether commercial transactions are

condemned or commended depends on what they accomplish for society. When they benefit all involved parties, they gain his approval (*ibid.*). Merchants, for instance, are allowed to seek not only surplus returns for their labor, costs, and risks (i.e., as reimbursement for their transport and insurance outlays) but also moderate gains resulting from the fluctuations of general market prices and particular customer demand (*ibid.*). Thomas sees the “just price” that shall be observed in trade not as a *quantitative* fixture but as a regulative idea of a *qualitative* nature. It is meant to eliminate excessive pricing in order to prevent the exploitation of dependencies and need, without demanding static prices, fixed to an unalterable economic equilibrium (*S. th.* II-II, 77, 1).

For the later development of the feudal and mercantile economies into the capitalistic system, this deviation from Aristotle is of highest importance [1]. *Prima facie*, Thomas seems simply to follow the many biblical injunctions against usury (Exod. 22:25, Levit. 25:37, Deut. 15:6; 23:19, Ps. 14:5., Lk. 6:34) and to reiterate Aristotle’s charge against the “sterile” nature of monetary transactions in favor of the more “fruitful” dimensions of commodity production and exchange. On second inspection, however, we see that Thomas’s approach is more subtle. On one hand, Thomas does value labor over exchange and, in turn, commodity exchange over monetary investment when it comes to assessing the morality of revenue claims [28]; the healthy preference of “sweat equity” over capital returns that characterizes medieval philosophy in general also permeates his deliberations (*Contra impugnantes*, VI, ad 12). On the other hand, that does not mean Thomas would grant a legitimate role in generating income only to labor and never to capital [65].

While Thomas censures money lending as “usury” with many of the same arguments we find already in Aristotle (Pol. 1258b) and the Bible (*S. th.* II-II 78, 1) and while he also opposes the notion of interest as reimbursement for opportunity costs (*S. th.* II-II 78, 2, ad 1), it would still be erroneous to conclude that Thomas simply espoused a labor cost theory and would have dismissed today’s capitalistic economy therefore as illegitimate (cf. [63]). Thomas does allow for gains without the direct input of labor, for example, revenues from rent and also from investments in trade partnerships (*S. th.* II-II 78, 2). Why these exceptions in favor of capital-based income? The most convincing answer proceeds from the postulation of social justice as the core virtue of business. In either of these forms, the invested money has served a socially productive function – for example, building up real estate in the former, outfitting a merchant voyage in the latter – that is, the money has been used as *productive* capital, realizing social utilities that, without the expectation of gain, might have remained unrealized. This is where the crucial difference lies.

That Thomas rejected lending with interest must be seen before the medieval backdrop. At the time, private surplus funds were not yet identified as social capital because they often remained idle or were used for ostentatious consumption [25]. To lend money demanded hardly more from the creditor than rejecting the morally dubious pleasures of living the life of a miser or a waster, respectively. Those who asked for pay to forgo either option met with moral indignation. An altogether different plane is entered once we view money as capital [84]. Money can, after all,

no longer function as a permanent measure of value when, as capital, it is itself traded. In a thoroughly capitalized and growing economy, money, too, carries a price, and so every outlay implies not only hypothetical opportunity costs but real expenses to the lender. While probably beyond the imagination of Thomas, it is not beyond the reach of his ethics to deal with such a state of affairs. Thomas might well have accepted income from capital investment as long as they were conducive to the welfare of all stakeholders [6]. *Mutatis mutandis*, this thought may nowadays serve as a guideline for a more humane economy [21]; it inspires us to include parameters such as virtue and social responsibility into our management theories [39, 61]. In particular, Thomas's instruction shows how social justice as a relational virtue business can reconcile corporate and societal interests to the benefit of all concerned [22].

William of Ockham and the Demise of Ethical Realism

Thomas had taught that virtue reaches farther and deeper than the law; it can operate where the latter lacks power and extends beyond its commands [75]. Thomas argued, moreover, for an interpersonal dimension to virtue ethics which allows for its application across cultural divides [48], enlisting into the pursuit of the common good businesses just as well as every other human institution [54]. The ultimate foundation for this ethical realism was his metaphysical conceptualism, that is, his conviction that rational concepts can elucidate the natural law and show which conduct best befits human beings. Ethics and anthropology were intimately intertwined. This intricate connection, however, rested itself on an epistemology that was increasingly questioned by posterior thinkers, the most radical of which was, arguably, William of Ockham. Attacking the metaphysical basis of Thomas's epistemology, Ockham severed the "natural" link that Thomas had forged between ontology and axiology.

Theoretical Premises (Nominalism)

"Ockham's razor," as a maxim of argumentative parsimony (*Sent.*, lib. I., *Dist.* I., q. 1&2), is what today most people associate with William of Ockham (c. 1288–c. 1348). Ockham did in fact express the view that, all other things equal, in scientific explanations the simpler explanation shall be preferred and unnecessary assumptions are to be avoided (*Quodlib.*, IV, q. 19). The context for the formulation of this maxim was his opposition against the "realism" of concepts as self-standing universals ([13], p. 115). Ockham held that what can be known with certainty is only that which we derive (directly or through logical deductions) from first-order and second-order intuitions [62]: Intuitions of the first order are sensory perceptions (of individual things), self-evident intuitions (axioms of logic), and knowledge through revelation (*Reportatio* II, qu. 150). These first-order impressions inform us *that* something exists. Intuitions of the second order form relations between the former intuitions (*Quodlib.* I, qu. 15) and instruct us *how* things correlate and as

what we can categorize them ([13], p. 110). Only the former type can establish *real* (existential) knowledge, whereas the latter merely afford us *nominal* (linguistic) definitions ([46], p. 69). Thus, Ockham argues against metaphysical thinking, which, he holds, posits without justification merely nominal definitions as real ones and infuses the realm of the real with fictitious entities (*Summa Tot. Log.*, Pars. I., cap. 12, f. 6, r. A). While using the *idea* “man” in the predication “Socrates is a man” makes sense, assuming an *object* “man” in and of itself does not. We can use the (universal) idea of humanity but shall not presuppose it exists apart from being an illustration of the (singular) objects it describes (Sum tot. log. I, 66).

If one sees universals as mere signs, certain consequences follow. First, the distinction between existence and essence is rendered superfluous, as now (nothing but) existence defines essence (Sum. tot. log. III, 2, 27). This applies also to God; no longer can his “real” existence be proven from a “nominal” definition of his essence. With the rational access to God barred, reason and faith begin to go different ways ([13], p. 121). Second, since reality appears no longer as ordered by universal, or essential, forms of the divine intellect, it must be said to spring from the productive will of God instead [24]. Through changing his will, God could, theoretically, alter all causal connections ([46], p. 29). Unbound by eternal laws (Sent II qu. 5), the will of God (and hence natural law) can no longer be deduced but must be received. Third, with the *essence/existence* bifurcation, the *potentiality/actuality* distinction recedes too. The world appears not as matter-in-potentiality but as actualized matter-of-fact (Summulae I 14). This positivistic ontology concurs with a positivistic axiology. Ockham locates the law of nature in the promulgations of secular and divine law and in actualized morality. As natural law can no longer be derived in a counterfactual manner from metaphysics, it must be inferred from the commandments of the Bible, the laws of the state, and society’s customs ([13], p. 107).

Practical Consequences (Voluntarism)

Ockham had the acuity and audacity to carry nominalism to extreme consequences [11, 62]. He gives up justifying the moral law by appeals to nature or reason. God commands, and his will assures the law’s legitimacy ([82], p. 161). Understanding the rationale behind its norms matters less than obeying them ([67], p. 342). In the old question, already posed by Socrates to *Euthyphro*, whether the Gods demand something because it is good or whether it is deemed good because the Gods demand it, Ockham comes out in favor of a morality based on divine command [64]. The intellect provides no *substantial* reasons that establish the goodness of an act or virtue but only furnishes the human being with *formal* conclusions as to the logical implications of God’s revealed commandments. If God commanded them, even heinous acts would become meritorious (II Sent, q. 19). On the objective level, this view shifts the emphasis of moral theology from *virtues* to *commandments*; on the subjective level, the focus moves from *inclinations* to *obligations* ([67], p. 251).

Whereas Thomas had theorized about morality only after having described the cognitive and appetitive powers of man and had thus oriented his ethics at the

natural inclinations of the human being (*S. th.* I, qu. 75-83), Ockham eclipses these dimensions through a single-minded concentration on the (purity of the) human will. He argues: We can, through suicide, reject life itself. If, however, we can negate life, we can, *a fortiori*, negate its (alleged) ultimate aim: beatitude (IV Sent, q. 14 D). Being able to decline acting upon our innermost inclinations, we are radically free – free, that is, not only to do good but to do anything we choose. Our liberty consists in choice. Inclinations, acts, and even virtues are consequently praiseworthy or blameworthy only in regard to the will that guides them (Quodl. III, 14). Human actions are never good in and of themselves, but always only insofar they follow a will that has subjected itself to Biblical or legal commandments. Thus, the notion of natural law shrinks dramatically, ultimately to represent in Ockham no more than “a traditional, convenient category for listing moral obligations” ([82], p. 336). Thomas had held that obedience to the natural law was good because of the natural goodness of the law itself, whereas in Ockham, the natural law now becomes a derivative of positive (divine and worldly) law. Obedience alone is truly good because it signals the subjection of the individual will under the higher will of God and/or the state. In later centuries, the divine will was dropped from this conception and what remained was the positivistic commitment to the respective political authority, culminating in Hobbes’s dictum that “authority and not truth makes the law” (*auctoritas non veritas facit legem*) (Hobbes 1681 [34], p. 5).

Ethics and Business

Events around the year 1328 – when Ockham decided to take sides against the Papacy – turned him rather into a political writer [79] and so suddenly that some authors divide his philosophy strictly in his (apolitical) writings before and his (very political) works after this date, treating them as entirely distinct spheres [10, 11]. Some interpret his metaphysics entirely without regard for his political philosophy [45]. Others proceed vice versa [51]. Yet at least two major connections between the two realms have still to be admitted. First, Ockham *does* derive certain political postulates from his theology. For example, since the writings of the Apostles are part and parcel of divine revelation, he concludes that the *liberation* they promised was a tenet with binding power for regents [56]. Second, his freedom theory also impacts his views on the (legitimate vs. illegitimate) *dominion* over goods. In regard to the first qualification, Ockham holds that the sovereignty of the Pope and of kings is based on Scripture and must never violate its stipulations ([11], pp. 449–457). The Bible explains how political governance became necessary once man succumbed to sin. Upon leaving paradise, the original communism of earthly goods and the harmony in their use ceased: In order to rein in their harmful selfish desires, people began to need governments (*Breviloq.*, Lib. 3, c. 6). In this process, the demarcation and defense of property as exclusively private also became necessary. This theorem connects secondly with Ockham’s theory of the free will. Since the free will alone inscribes values into the world, the principal task of property is to express voluntary

dominion over the world. Worldly goods are to express the (desires of the) human will and its free choices and thus deserve special respect [50].

This doctrine stands in stark contrast with the theory of ownership for use (*dominium utile*) promoted by Thomas Aquinas [60]. Whereas Thomas respected intrinsic limits to the human use and consumption of nature [57], Ockham does not acknowledge any essential link between morality and legality in the right to goods. Human law must obey natural law only insofar as it tracks divine commandments; human law is, however, not bound to cater to further moral duties [70]. While Thomas advocated a *relative* concept of private property, Ockham sides with an almost *absolutist* notion. As long as human or divine law does not stand against it, human beings are unlimited in their entitlements to commodities [77]. Everything Ockham's framework needs and allows for is already included in the laws. How to use the freedoms that legally remain to individual and corporate actors is, within his framework, a question left to private discretion. In this conception, there is neither need nor space for a virtue-based business ethics. The positivistic tinge of his philosophy colors Ockham's political thought and inspired later thinkers to break with certain Scholastic doctrines of political economics [52]. By reducing the scope of natural law to what *recta ratio* could deduce from the normative principles of the Bible [17], Ockham narrowed down the ethical sphere overall, with marked ramifications for the further development of economic ethics and the future directions of business ethics.

Subjective Versus Subjectivist Values

A consistent follower of Ockham had to reject the conceptualism behind the Thomistic doctrine of the "just price." Against the assumption that there was really some such universal to which prices (ought to) gravitate, a consistent nominalist would let the distinction between the market price and the just price collapse. Whereas Thomas had held that, as a rule, in well-ordered societies the natural price of the market approximated the just price and, where not, could and should find a corrective in the common (interpersonal) estimation of value, in the wake of Ockham, this subtle distinction between signifier and signified was annulled. Absent stark improprieties, the market price was increasingly regarded as the just price of goods. Thus, the entire realm of counterfactual values and their proclaimed objectivity would eventually be ceded to first the customary and later to solely subjective valorizations. From Ockham, in short, goes a straight line to the subjective value theories of modernity [68].

Late medieval theorists who followed this line of thought did, nonetheless, stipulate that market transactions had to remain within limits imposed by the authorities [59]. In fact, there was a strong tradition of late medieval price fixing in the interest of establishing or restoring just prices [85]. When, for instance, prices for grain "went up to fantastic heights in case of dearth," medieval authorities intervened. In such situations, for sure, "it would have been folly to rely on the automatic operation of competition" ([85], p. 429), and the respective governments

were practically “forced to resort to regulation” ([85], p. 425). This tradition of late medieval price fixing, however, must also be understood before the backdrop of voluntarism and the positivistic idea that prices fixed by the government were *eo ipse* just prices, thus the right to economic intervention. Usury was henceforth to be defined by the law alone. The moral use of the usury reproach waned, slowly but surely. Merchants needed ever less moral wisdom but ever more legal savvy in order to meet the normative demands of their societies. Business ethics began to shrivel to the imperative of abiding by commercial laws and regulations.

Through the works of Weber [86] and Tawney [78], we have long been accustomed to seeing the Protestant work ethics as a driver and Catholicism as a retarding force in the development of modern capitalism. In such narratives, the doctrine of the “just price” typically figures as a hallmark of an alleged medieval hostility to commerce and economic progress. This tale must be replaced by a more nuanced view of late medieval and early modern Catholic thinking [53]. We have to note that with the nominalist and voluntarist teachings of Ockham began an approximation to subjectivist price and value theories already in late medieval Catholic social teaching [15]. Protestantism did not invent the latter but only promulgated them more and farther [71].

We have, in particular, to distinguish between at least three fundamentally different ways of utilizing the “just price” theory. (1) Commercial forces were curtailed only where, as by Duns Scotus or John Mair, the “just price” was fixed by a strict labor cost theory meant to replace “unjust” market prices. Only very few medieval theologians, however, followed this view ([85], p. 421). (2) Most, instead, adhered to Thomas’s rather favorable view of the market price that, in well-ordered societies, could serve as a signifier for the just price [42]. Thomas’s later commentaries by the “School of Salamanca” demonstrated how his theory made sufficient room for subjective components of price building, while remaining committed to an overall objective conception of value [9, 58, 69]. (3) Inspired by nominalist and voluntarist notions then, we see an emerging trend within Catholic moral theology toward subjective value theories [32, 74]. Once the objective counterweight of universals was removed, in a number of late medieval price theories the *subjective* components became *subjectivist*. The singular replaced the universal that it hitherto represented: the market price was no longer seen as indicative of but as identical to the just price, at least in the absence of monopoly ([7], p. 76) or undue market entry barriers ([15], p. 83).

With hindsight, one must judge this subjectivist trend in Catholic economic ethics with due caution [29]. As much as narrowly objectivistic conceptions of the just price doctrine are negligent of important subjective and customary dimensions of economic value, wholly subjectivist value theories are, on the contrary, oblivious to all counterfactual and normative value dimensions [43]. Where the former tend to fight the market in the name of justice, the latter operate in the opposite direction. The golden mean lies in a position that reconciles the subjective with the objective components of value ([42], p. 190) and commits all parties to an economic transaction to the common good ([44], p. 439). This can neither be achieved by a static value conception that is impervious to the vicissitudes of trade nor by one that fluctuates with the market without any and all correctives.

Rather, one must combine a stable orientation toward social justice with flexibility toward commercial circumstances so that the just price serves not as a quantitative fixture (i.e., a distinct mathematical price point) but as a qualitative regulative (i.e., a realm of fair prices). The just price is then not an automatic resultant of abstract market forces geared to a predetermined equilibrium but the concrete outcome of human arbitration procedures oriented at equality and equity [58]. Its objective would be the avoidance of economic exploitation through parties intended to respect the common good [42]. The “universal” of the just price has consequently to be located neither “before” nor “after” the market price but “through” it, that is, through fair transactions in a morally well-ordered market. In more technical terms, the requisite value theory can neither rely on an idea-realist nor on a nominalist value conception but must proceed from a intermediary type of metaphysics. Thomas’s economic ethics had been of this sort.

Conclusion

In Thomas’s works, we find a well-balanced harmony between the subjective and the objective moments of value and between the personal and the interpersonal, that is, social demands of virtue. In prescribing justice as a social virtue and directing justice both legally and morally to the common good, Thomas provided an important normative horizon for business. Importantly, instead of moralizing economic transactions from without, this normative orientation proceeds from within economic rationality in that it expresses the fundamental nature of economic transactions as human interactions. By integrating economic rationality, thus, in a comprehensive theory of human reason, Thomas developed a truly global conception of business ethics that withstands the relativistic pressures of cultural diversity and enables a thoroughgoing humanistic conception of management. From unconditional respect for the human dignity of each person, Thomas expanded the realm of business ethics beyond the strictures of law and commutative justice; he declared the well-being of all and the flourishing of each the immanent goal of business overall. Not only did he thus write a stakeholder ethics *avant la lettre* but Thomas made clear that business, rightly understood, is a stakeholder of society and not vice versa. Consequently, the ascription of social responsibilities to corporations does not mean to saddle business with additional burdens outside their area of core competence. On the contrary, once the foundational role of ethics for economics is recognized, one can argue that the assumption of social responsibility must be inherent to each and every corporate endeavor. With Thomas we can argue that – given the moral nature of the human being – its ethical orientation is what makes the success of business truly sustainable.

Economic and Business Ethics in Select Italian Scholastics (ca. 1200–1450)

Martin Schlag

Abstract

Between 1200 and 1450, Italy was one of the main actors in the “commercial revolution,” which took place in this period. This protagonism positively impacted scholastic reflection on economic ethics. Against the background of earlier chapters, four important authors among a great number of Italian scholastics have been chosen for closer examination: Olivi, Astesanus, Bernardino of Siena, and Antonino of Florence. They justified and exalted the importance of commerce and the social role of merchants praised for their honest work. The profit merchants made was considered to be a just recompense for their service of transporting, storing and improving goods. Profit was not, however, to be sought out of greed or avarice but in order to sustain one’s family and give alms. All authors were unanimous in their condemnation of usury as a form of exploitation of the poor. Their distinction between usury and interest and the establishment of so-called extrinsic titles to interest paved the way for the modern system of regulated interest rates in legal financial markets.

Introduction

Italy plays a very important role in the history of economic thought. This is true for the socioeconomic development as well as for the scholarly reflection on economics. Joseph A. Schumpeter [1], Raymond de Roover [2], Julius Kirshner [3], Robert S. Lopez [4, 5], and Jacques Le Goff [6], just to mention some of the more important authors in recent years, as well as other contemporary scholars like Joel Kaye [7], Diana Wood [8], Fabian Wittreck [9], Giacomo Todeschini [10], and, towering over all others, Odd Langholm, demonstrate that there is, “among

historians in general, a renewed interest in the Middle Ages” ([11], p. vii). All mentioned authors pay due attention to Italian scholastics.

In the following section, without any claim to originality, I would like to offer a synthetic overview of Italian scholastic thought on the economy, from ca. 1200 to 1450.

The Socioeconomic Context of Scholastic Thought on the Economy in Italy

The scholastic authors wrote during a period of accelerated economic growth generally referred to as the “Commercial Revolution”.¹ It took place from the twelfth to the early fourteenth century and reached its peak between 1245 and 1345. The whole process was a combination of political, economical, monetary, and social factors.

After the year 950, the Genovese, Pisans, and Catalans had conquered all of the islands in the Western half of the Mediterranean, and the first Crusade had finally brought the complete opening of the Mediterranean trade routes. Once again, as in Roman times, the goods that caravans brought to the Syrian ports from India and China could reach Western and Northern Europe. Prominent among these goods were spices, incense, perfumes, medicine, dyestuffs, glue, silks, cotton textiles, paper, rice, oranges, apricots, and gold and silver artifacts ([12], pp. 54ss, 154).² Along with these imports came Arabic numbers and arithmetic and calculus, essential know-how for an increasingly monetized and rational economy ([8], p. 12). In exchange, the European traders sold wool cloth from Flanders, wood, iron, and sadly also slaves.

The period of peace following the defeat of the Saracens and the conversion of the Normans brought about an increase in Europe’s population growth, augmenting the number of soldiers for the armies in the East as well as contributing to the workforce necessary for trade, the cultivation of new territories (either by converting forests into plow land or winning land from the sea by dikes), and the massive construction works in the new urban centers which sprung up everywhere to create space for the new merchant quarters (boroughs, bourgs, borghi) around the old feudal fortresses ([12], p. 66ff).

This commercial activity brought high financial profits, which quickly, thoroughly, and enduringly changed the economic and social structure of Europe. Throughout the entire period studied in this chapter, Northern Italy was clearly predominant not only in an economic sense but also intellectually, bringing forth men capable of rationally penetrating and dominating the mechanisms of economic and financial exchange. This is illustrated by the fact that the financial instruments of modern capitalism and banking were invented and first practiced in embryonic forms in Northern Italy ([1], p. 78).³

The reason for Italian predominance is rooted in its geographical situation. Intellectually, Italy had received the cultural heritage of Greek, Arabic, and Jewish learning through the Byzantine rule and then through Frederick II’s cultural policy

in Southern Italy. Politically, Venice, Genoa, and for some time also Pisa were the great harbors and the undisputed maritime powers of the Mediterranean. Between these coastal cities on the Eastern and Western side of the peninsula, the Lombard plain, with its great urban centers such as Milan, Parma, and Lucca, and, farther to the South, Siena and Florence, were stimulated by the ever-increasing demand for manufactured goods. They grew wealthy through craftsmanship, commerce and soon also through international finance. By the thirteenth century, the “big four,” Venice, Milan, Genoa, and Florence, had taken the lead and were in control of trade.

This movement was furthered by the appearance of international commercial fairs, especially those in the French region of Champagne. Mostly Italian and Flemish merchants who exchanged their goods and also cleared debts, negotiated, sold futures, and made financial transactions visited them.

The eruption onto the scene of a monetary system also began about the year 950 and was one of the decisive factors in the Commercial Revolution. Once again, the Italians took the lead and stabilized the currency by introducing the *grossi* (heavy silver coins) and the gold coins that had fallen out of use since the Carolingian Renaissance. The feudal economy had not had any use for currency of such high monetary value. The need for money with higher value reflected the rapid economic growth of the thirteenth century. Genoa and Florence both introduced their gold coins more or less in 1252. Venice, with its golden “ducato,” established in 1284, was able to create an equally famous and appreciated currency.⁴

But even more important than metal money were the cash-free financial instruments the Italians developed during this time, resulting in the appearance of the great banking houses with representatives in the more important European towns. These were the financiers of the princes and nobility throughout the whole of Europe during the thirteenth, fourteenth, and fifteenth centuries. The Italian merchants held the finances of the entire continent in their hands.

Italian merchant and bankers invented a system, which eliminated the need for payment by coin by transferring sums of money from one account to the other and by using bills of exchange. This first appears in Genoa at the end of the twelfth century. The money changers, who held the deposits of their clients, were able to clear debts among them by transferring payment from one account to another. Moreover, three forms of financial instruments were invented: petty exchange, bill of exchange, and dry exchange. In petty exchange, money was immediately changed from one currency to another. With a bill of exchange, an amount had to be paid back later in another country and in a different currency. Often interest for the loan, disguised as exchange rates and fees, was hidden in the sum returned. Dry exchange,⁵ instead, was a fictitious bill of exchange. The sum was to be paid back with a fee in the same currency and in the same place. This obviously was a circumvention of the ban of usury, as it was a form of credit ([9], p. 147ff).⁶ The rate of interest was usually 10% p.a. in normal commercial credits. In an urgent case of need with high risk, the interest rates could be 50%, 100%, or more. The interest rate of the “Lombards” was 43.3%.

Incessant wars which began in the fourteenth century (1346–1453) and then, after a 40-year lull, continued during most of the sixteenth century, scourging taxation and inflation, recurrent major epidemics, famines, demographic decline, social unrest, the schism of Christianity and the exile of the Popes in Avignon, and perhaps unfavorable climate pulsation deeply and durably scarred the economy in the second half of the fourteenth century. The Black Death in 1348 alone cost Europe a third of her population, fatalities reaching even 65% in centers of dense urbanization: “the cream of the economic world was skimmed” ([5], p. 386).

The wool trade collapsed, and in 1378, the Florentine weavers revolted and social unrest among the laborers spread throughout the whole of Europe ([8], p. 42). The Bardi and the Peruzzi, the biggest companies of merchant bankers in Florence, went bankrupt, and all of Europe was engulfed in an economic depression. It was also the end of the flourishing of an optimistic scholastic learning.

We must, however, not overemphasize this dark picture of the fourteenth and fifteenth centuries. The progress accomplished in business methods during the Commercial Revolution was not lost. It would be a mistake to assume that Italy lost the primacy it had achieved in trade in the fifteenth century. Italian merchants and bankers still towered above the businessmen of the rest of the world. Banking, maritime trade, industry, and agriculture continued to thrive in Italy. Between 1430 and 1480, the Medici Bank was the largest financial organization in Europe ([5], p. 398s).

Special Questions and Topics Dealt with by Select Italian Scholastic Authors

Ever since Joseph A. Schumpeter exalted Antonino of Florence (1389–1459) as an economic genius ([1], p.98) and Raymond De Roover wrote his landmark essay on Bernardino of Siena (1380–1444) and Antonino of Florence (cf. [13]), calling them “the two great economic thinkers of the Middle Ages,” both have been in the center of attention. Roover himself, however, was aware of the dependence of Antonino on Bernardino and of both Bernardino and Antonino on another author to whose texts he had no access, Peter John Olivi (1248–1298) ([13], pp. 19, 42). Later studies demonstrated that Antonino paraphrased Bernardino and that Bernardino copied long passages from Olivi’s manuscripts without acknowledging his source [14].⁷ The reason may be in the fact that the Church had posthumously condemned Olivi because the spiritual faction of the Franciscans⁸ had started a cult around his person. Bernardino, who belonged to the “Observants” among the Franciscans (a movement which took up the Spirituals’ desire of strict observance of St. Francis’ legacy, without breaking away from the Catholic Church), was careful not to expressly quote the intellectual star of the condemned faction, but he does not hide his admiration for the author to whom he refers as a “*magnus doctor*” (grand teacher).

After the terrible events of the fourteenth century, a new spirit of hope began to flourish in the fifteenth. Bernardino was one of the great preachers of his time,

managing to reconstruct religious and spiritual life in a society ravaged by diseases, famine, war, divisions, and moral depravity. His sermons were impressive because of their vivacity and their content. Even his learned Latin handbook “*Quadragesimale de Evangelio aeterno*,” in spite of its scholastic length and burdensome details, contains some brilliant rhetorical figures, explaining the fascination emanating from this priest who dedicated himself exclusively to studying in order to preach. It is easy to imagine how delightful it must have been to hear him describe the misery of the miser who every night checks and rechecks whether all his gold coins are where they ought to be, counts and cradles them as if they were babies, and suffers great agony at every loss. The miser is like a blackbird, writes Bernardino, that can only cry “*mio, mio, mio*” (mine, mine, mine). Although Bernardino’s sermons took several hours, his audience was left with the impression that he had spoken for no longer than half an hour. It is probably thanks to holy priests like Bernardino that the Italian population was reconciled with the Church on the eve of the great schism of Christianity wrought by the Protestant Reformation. Even so, Bernardino was certainly not innovative. In his age, the breeze of the Renaissance was already blowing over Italy. In his writings on economic questions, this is not perceived. Bernardino is medieval. Actually in several aspects, Bernardino is less open to the realities of commercial life than Peter Olivi (d. 1298, nearly 150 years before Bernardino). The true geniuses behind Bernardino are others, particularly Olivi and Duns Scotus. Bernardino does have a keen interest for and a sharp understanding of economy and social life. However, his ethical evaluation of these phenomena remains completely medieval and conservative.

In one of the periods of his life in which he was forced to rest, Bernardino wrote a learned handbook for preachers called *Quadragesimale de Evangelio aeterno*. It fills three volumes of the works of Bernardino in the Quaracchi edition (volumes 3–5). Sermons 32–45 in volume 4 form a unit, like a book unto itself, highlighted by an introductory phrase (“Here begins the treatise on contracts and on usury”) and a concluding sentence (“Here ends the treatise on contracts and on usury”).

This treatise has a systematic structure and possesses the merit of blending the most important quotations together, adding as well personal reflections and evaluations.

I have selected two Franciscan forerunners of Bernardino, Peter John Olivi, and Astesanus of Asti, for the reasons I explain below, as well as the above-mentioned Antonino, Archbishop of Florence, as he was a Dominican scholar, nearly contemporary to Bernardino.

Although Peter John Olivi is French, I include him in this study on Italian scholastics, because he came from the Mediterranean part of Southern France, was a student of the Italian St. Bonaventure of Bagnoreggio, and taught in Florence for 2 years. He deeply influenced thinkers like Bernardino and Antonino. “Next to Thomas Aquinas, no medieval author influenced the ideas of trade and price in the later Italian penitential tradition more markedly than Peter Olivi, transmitted by Bernardino” ([15], p. 120).

Astesanus of Asti, in 1317, published a manual on moral theology called the *Summa de casibus conscientiae* or simply *Summa Astesana* or *Summa Astensis*. It was a very successful book, remaining popular for a long time, as witnessed by the

existence of many manuscripts and *incunabula* (early prints before 1500) editions. By extracting the essence of scholastic (mainly Franciscan) economic doctrine and presenting it summarily in a work designed for everyday use in practical pastoral work, it was certain to reach a large circle of readers ([16], p. 452).

Against the background of the earlier synthetic chapters, I will try to present each of these authors in chronological order. In rendering the contents of the selected works, where possible, I will follow an order of topics: property, exchange, commerce and merchants, the just price, money, usury, and bonds (titles to public debt). In order to avoid repetition, I will fully develop only Olivi's teaching, using it as a reference point to show what new ideas later authors contributed or in which points they lagged behind the greatest economic thinker of medieval Italy, Peter Olivi.

Peter (Son of) John Olivi

Born in Sérignan, Provence, in the year 1248, Peter Olivi entered the Franciscan Order as a mere lad of 12 years. He studied in Paris with the Franciscan Masters William de la Mare, John Peckham, and Matthew of Acquasparta, under the Minister General St. Bonaventure. In Paris, he received the title of Bachelor but did not pursue that of Master.

He dedicated his life to teaching and writing, publishing about 60 books on speculative theology, biblical exegesis, and spirituality, which earned him the honorific title *Doctor speculativus*. His ideas were so innovative and original that he repeatedly had to defend himself against accusations of heresy. Many admired him for his holiness of life and his ingenious insights and teaching. He was acclaimed the leader of the Spirituels and as such maintained an ideal of perfect poverty in the spirit of St. Francis.

In the last years of his life, he taught in Florence at Santa Croce (1287–1289) and then in Montpellier (1289–1292). He then withdrew to the convent in Narbonne where he died in 1298.

After his death, all of his books were collected and burnt by order of the Minister General, and heavy penalties were laid on any friar who, defying the prohibition, dared to hide and conserve manuscripts of Olivi's books. Many of his writings, however, were conserved and have reached us under false names or anonymously, as evidenced in the case of his economic writings.⁹

Nearly all of his economic thought is contained in three treatises, combined in a book whose title is unknown but which is now called "*Tractatus de emptione et venditione, de contractibus usurariis et de restitutionibus*." There are also some *Quodlibeta* which touch on economic affairs, especially Quodlibet I, q. 16, and q. 17 on interest.

What is new in Olivi is that he does not look to the Bible to define economical concepts but he looks at reality as it is first and only then measures it by faith. This type of analysis remained exclusive to the thirteenth century. Its results were copied during the fourteenth and fifteenth centuries until the intellectual seeds of the method sprouted in the Renaissance.

Commerce, Merchants, and Profit

Peter Olivi dealt with commerce and merchants in the sixth “*quaestio*” of his treatise on purchases and sales. He did so indirectly by answering the question whether it was morally admissible to buy and resell a good at a higher price than the price it had been bought at “as merchants usually do.” This approach was of course typically scholastic. The moral problem they were trying to solve was justice and equality in exchange. How could somebody buy and resell the same good at a different price without committing the sin of injustice? Had the good changed its value by passing from one hand to the other? What if this problem affected a whole profession?

Olivi tackled this problem by adducing five arguments in favor of commerce and of commercial profit, not without stating that in practice it was very difficult for a merchant to avoid sin. The first argument was the advantage for the common good brought about by the merchants’ activity. Farmers, craftsmen, and soldiers could not travel to the foreign countries where the goods lacking at home were abundant. Few people had the diligence and the know-how to do that. It was therefore convenient for the community that those who possessed the necessary qualities for commerce dedicated themselves to this service for which they deserved recompense. Merchants had to be trustworthy and honorable (*honorabiles*) and also wealthy (*pecuniosi*) in order to be able to acquire the expensive merchandise they needed in sufficient amounts. As far as I know, this is the first time that a Christian author combines honor and wealth in a positive and affirmative way. The second argument ran as follows. The profit the merchant made by raising the prices did not exclude the people working in his supply chain from profit. Even more, his commercial activity made the others’ livelihood possible. The third argument had two parts. One was an argument based on equality. If the craftsman and the farmer were allowed to make profit when selling their goods, so was the merchant by raising the price at resale. The other part of the argument, however, was more important and original to Olivi. The merchant was a specialist in evaluating the value and the price of goods. This was an important service to society. People in general were thus advised and guided as to the real market value of goods, which was not at all easy to estimate. In their purchases, potential buyers were protected from overpricing by the good and trustworthy merchants who made a reasonable profit but did not overcharge. This service justified the existence of merchants and of the profits they made.

Exchange and the Just Price

Both Thomas Aquinas and Olivi agreed that the price had to be just and that it had to correspond to the value of the good sold. Olivi, however, gave overruling importance to the economic value, and he analyzed it in the process of formation. Following Augustine, Olivi identified value with utility (use value): a mouse is worth less than a piece of bread even though the mouse is ontologically more valuable than a lifeless object (*De Civitate Dei*, XI, 16) [17]. According to Olivi, this use value varied in regard to time, place, and person. He developed three criteria in its formulation, which Bernardino copied and summarized very strikingly. The utility of

a good is defined by (1) its qualities which in themselves satisfy our needs (*virtuositas*); (2) its scarcity: the rarer something is, the more we value it (*raritas*); and (3) the special affection we have for something (*complacibilitas*). This last criterion reflects that the economic value is also a consequence of individual choice, a novel insight formulated by Olivi ([14], p. 34ff).

In the exchange of goods, the value of the thing given and received should be equal. Thomas Aquinas and Olivi spoke of an “estimation” of value and therefore of price. This word “estimation” expressed that the price was not an exact amount but had a “convenient margin.” Obviously, if subjective utility were equal, nobody would exchange. May this inequality influence the price? Olivi solved this problem by giving priority to subjective utility with its three above-mentioned criteria; however, he also defined his concept of utility by introducing the common good: the value of utility was not purely individual but was the typical utility of the general public. He was concerned with the injustice of establishing price exclusively by personal use and interest. Take the cases of selling a lifesaving medicine to a dying person or a cup of water to a parching man. If the price were solely based on individual subjective utility, then it would be infinite in these cases, because their subjective value as a lifesaving means is infinite. Olivi thus valued common use over individual subjective use and the common good over one’s own individual good. Acting otherwise would destroy the social network of humanity, the civil society. It is interesting to note that for Olivi, all economic contracts must aim also at the common good. This is an important insight. The common good is referred to by Olivi as the sociability of man and as the community, to which he belongs. The common good is the “good life” of the community in which one lives in and is, therefore, one’s own life. The common good was not conceived of as something different from the citizens who form the community.

The general estimation of the price in such a community resulted in the “just price”: it was the common estimate of the value of a good according to its common use in the community interested in maintaining its common good. With this concept, Olivi has introduced what in modern parlance would be the market price ([14], p. 40ff).

In his analysis of how the market arrived at the common estimation of price, Olivi considered two elements in regard to demand and two in regard to supply. All four elements were objective and are not used in an individual but in a generalized sense.

In regard to demand, Olivi wrote that: (1) The common estimation cherishes the natural qualities of goods. A good which is instrumental to other goods or that holds longer or is prettier than others is esteemed more. (2) The community (market) values the scarcity of a good.

In regard to supply, we find arguments from the costs of production. (3) The community (market) considers the costs and the risks undertaken by the craftsmen and merchants to produce the good or the service and to make it available. The community (market) also values expertise (an architect receives more than the mason). (4) Insofar as wages are concerned, the community (market) also considers the dignity connected with certain labors and grants higher wages to persons who have more representative costs.

The common estimation can deviate from the value of the good and still be accepted as the just price. For example, in a period of famine¹⁰ which affects the entire community, the prices should be allowed to rise as they will naturally do. Olivi realized that this could have a positive effect: high prices motivate merchants to import and to sell, reducing the famine. This is a remarkable example of an analytical explanation “instead of vaguely referring to natural law” (cf. [16], p. 360ff).

This analysis demonstrates that Olivi grasped that there could be a difference between the effective market price and the perfectly just price, allowing the market price to be binding for the contracts. The question is: When does this difference become so large that the effective market price is forbidden because sinful? This problem was posed by Olivi not insofar as it referred to the common market price but to the individual concrete price in practice. On this theme, Olivi was innovative in comparison to Thomas Aquinas. Thomas had distinguished between civil law and moral law. Whereas, he acknowledged, civil law drew the line with the *laesio enormis* (the stipulated price is more than a half above or below the true value of a social good), the moral law is stricter, as God sees the heart and requires equality in exchange. So the just price, can only be the price that corresponds to the true value of the good exchanged. Olivi objects to this that after original sin, social institutions had to be made to fit the nature of fallen man. A sick man must not be treated in the same way as a healthy one. After original sin, mankind is sick. What is evil, therefore, is the *intention* of making an unequal exchange. The unequal exchange in itself, however, might be socially useful and correspond to the necessary equity. Olivi brings four arguments in favor of his position. (1) The common custom has the force of law; so does the common estimate of the value of a good. Forbidding any small deviation from the just price and obliging the parties to give back what was won unjustly would cause endless strife and ruin peace. (2) God does not demand perfect equity and equality in business. (3) A contract is ratified by the free will of both parties. Therefore if someone, who has not been deceived by the seller’s fraud, wants to buy something at a certain price, then this is as just as if he wanted to make a gift. (4) All human estimates on prices are highly uncertain and imprecise.

Olivi draws the *moral* line with the *laesio enormis*. This means he makes the legal criterion converge with the moral one. He does comment though that “perfect justice” requires equality; this means that the just price has to strictly correspond to the true value of the exchanged goods. He thus introduces a distinction between “mere justice” which suffices for everyday life and “perfect justice” which seems to be impracticable and unfeasible as a criterion for business ethics. His moral line for business transactions is the *laesio enormis*. Any price, 50% above or below the value of the sold good, is unjust and requires restitution. Anything within this margin of price, however, is acceptable. He uses an analogy to make his point: Sour wine is still wine. There is a degree of sourness when wine turns to vinegar (cf. [14], p. 49ff).

Usury

Like all scholastic authors, Olivi was very clear in condemning usury, understood as any sum of money to be given back beyond the amount loaned. However, he was

quite innovative in his time and the distinctions he made influenced later development. His thoughts did not have an immediate impact but exercised their influence like a subterranean river, re-emerging when the times were ripe.

Olivi distinguished between “mere” money in a drawer or a chest destined for consumption and capital. For Olivi, “capital” is any good, including money, which has a “*ratio seminalis*” (the character of a seed) of profit.¹¹ Money is therefore not always and in any case capital but acquires the seed character and becomes “capital” through the “*propositum*” (resolution) of its owner to invest it in a concrete commercial project. It is the owner’s deliberate intention to invest which turns money into capital. Through this investment finalization, money acquires an added value (“*valor superadiunctus*”) to its face value (cf. [14], p. 64ff).

Underscoring the owner’s intention in his actions, Olivi condemned usury as the *intention* to make speculative gains with loans. Whether or not the creditor actually made a profit was not decisive. Intention determined the relation of the loan to usury. Olivi thus concluded that giving a loan in itself could never be an investment. A sum of money invested in commerce always implied a participation in the risk. It could also be lost. On the contrary, a loan characteristically established the right to receive the same amount of money back without loss. The general rule, therefore, was: If someone gave money to a merchant, he had to partake of profit *and* loss. If he was to receive back his money independently of the outcome of business, this was usury. Olivi even forbade the contract in which only the capital had to be returned in case of loss whereas interest was due if the merchant had made profit ([18], p. 121).

If, however, the creditor of the loan was a merchant, who had been planning to use the money for an investment, but instead gave it as a loan to a friend, then he could charge an interest for the lost investment he had been determined to make with his capital. Together with other scholastic teachers, Olivi distinguished between usury (any sum of money given back beyond the amount granted as loan) and interest (indemnification for damage or lost profit). He allowed the agreement on interest from the beginning of the loan; this means that the interest was calculated from the first day of the loan. This does not mean that Olivi would have accepted a general interest on loans but only on those sums of money which had already been destined for commercial investment and whose investment had become impossible because of a friend’s plea for a loan. The general Italian tendency was different: Thomas Aquinas, Innocence IV, Johannes Andraeae, and other Italian scholastics were of the contrary opinion which allowed indemnification only after the term agreed upon for repayment of the loan. This Italian mainstream opinion prevailed from the fourteenth to the sixteenth century; then, the general opinion reversed to that of Olivi.

The notion of capital is also decisive for solving the problem of discount. Time as such has no price, writes Olivi in accordance with the other scholastic teachers, but if the debtor pays back his debt before the stipulated term, then this is *his* time in which he would have been able to invest the sum. His interest in doing so has a price, which is paid by the creditor with a discount. Olivi is the source of Bernardino’s famous theory of the “year of a horse” [19].¹² If I have been given a horse in lease for a year, this year of the horse is mine, and I can sell my year

(my year's use of the horse). Similarly, if I have been granted a 3-year term for repayment of a loan, and we convene that I should pay back earlier, then I deserve recompense for the time I concede. This is not the "common time" which cannot be sold because it belongs to all men but "my time" which I can sell. Olivi also considered whether one could extend this argument to money in general which someone owns perpetually without time limit. He denies this possibility, stating that in this case, money is simply mine and its use is not divided into units of time. In the eyes of a modern beholder, it is inconsistent of Olivi (and the scholastic tradition in general) not to allow the inverse of discount: should a buyer wish to have paid later, the seller was not allowed to charge a higher price for the deferment of payment. This would constitute usury. Olivi, however, adds that this would only be the case if payment were specifically made for deferment, because time was a common good, belonging to God and to all people. It could therefore not be sold. In the case of deferred payment, however, Olivi expressly allowed the merchant to raise the price to the possible upper limit of the just price, that is *laesio enormis* ([20], p. 114ff).

Olivi enumerated nine arguments against usury, which – to him – proved that this practice was contrary to divine and natural law ([21], p. 97ff). It is important to point out that Olivi did not recur solely to divine law (stemming from faith) but also to natural law, as a moral system accessible to human reason. Olivi stated that usury weakened and destroyed all piety in society. Usurers devoured the goods of others, simulated compassion, and in reality were capable of selling benevolence. Our author repeatedly used the argument of consumption developed by Thomas Aquinas: whosoever gave a loan did not grant any use of the lent money besides its consumption. The use and utility of money, for the scholastic teachers, consisted in its consumption. Charging interest above and beyond the restitution of the lent sum (without there being a case of incurred damage or lost profit) meant selling the same thing twice, which was clearly unjust ([21], p.104). Moreover, the reason the debtor profited by the loan was his labor, not the loan ([21], p. 107).

Once again, Olivi went beyond this traditional and conservative stance as regards usury in his analysis of capital used by merchants. His conclusion was that the merchant who bought "capital" (not simply money) with the sole intention of investing it and of making it fruitful was actually buying the future fruits of something. However, as future fruits were not absolutely certain but were only probable and at risk, so this contract, according to scholastic teaching, was not usury ([18], p.123). It was licit because of the risk involved.¹³ Capital therefore is capital only in the hands of an active merchant; otherwise, it is simply money, worth its face value alone, or at least it does not contain any value of profit.

The interest of the probable profit was contained in this capital in a potential way and, as it were, in an embryonic state, otherwise it could not be legitimately charged; but in the above mentioned case, what is sold is interest, contained as potential in capital in as far as it is capital, that means it must be really and not only hypothetically retained and destined for commercial operations. ([18], p.125)

Olivi also underscored that the creditor ran the risk of losing his capital, which he left completely in the hands of the merchant. The merchant would most probably,

even certainly, draw profit from the borrowed capital. He was an expert and would not have borrowed money if it were not for certain gain ([18], p. 127). Therefore, capital was worth more than its nominal value as money when it was given as capital to a merchant. What was then being sold was its future profit. Money, simultaneously and actually, had two natures, wrote Olivi ([18], p. 127f): simple money value and capital value. This capital value was the future profit, derived from its commercial use; it already existed therein and was sold and bought as such. Therefore, in commercial credits, Olivi allowed the stipulation of interest from the beginning of the loan. If I understand Olivi correctly, he proposed a balance between the value of capital, the probable profit, and the probable risks, in order to calculate the interest rate. All this shows that Olivi was far ahead of his time, already in the thirteenth century grasping the logic of commercial credits and the added value of the use of money in commercial investments.

In his book on restitution, Olivi quoted examples that further clarify the way he understood the seminal quality of capital. If somebody's hand is cut off, the guilty perpetrator of this crime is liable to indemnify his victim of the medical costs but not of all possible future gain he would have had with his hand, because the hand was too remote a cause of gain. Cutting off the hand meant destroying the power or the capacity for profit but not the actual cause of profit or the act of profit as such. In the same way, he who stole money or a horse did not have to restore all possible gain but only the probable amount deriving from the concrete investment plans which had been frustrated by the theft [22].

This acuteness of distinction and penetration of economic reality becomes apparent also in what Olivi wrote regarding the rights to the future possession of something. The acquisition of future *rights* to a good was worth less, wrote Olivi, than the possession of the good itself, because the future was uncertain ([23], p. 128ff). Therefore, it was not usury to buy a future rent. Olivi, for example, accepted that a person bought five future annual rents of 1,000 lb per year to be paid throughout the coming 5 years (totalling 5,000 lb) at the price of 2,500 lb cash down. Of course, this contract would become illicit if the *intention* was usurious, that is, if the contract in reality was intended as a circumvention of the ban of usury and was a disguised form of loan. The example Olivi gave for this makes it clear what the scholastics had in mind when they were talking about and condemning usury: I give a loan of 500 lb to be paid back after 10 years. Every year, I am supposed to receive 100 lb as installment on the interest and the capital, and after 10 years 1,000 lb. What made this contract illicit in the eyes of Olivi and his fellow teachers was not the 300% interest rate but the *intention* of receiving interest on a mere loan of money which was not capital ([23], p. 129).

Inversely, Olivi discussed an interesting case of his time. Someone had lent a merchant a sum of money so that the merchant could trade and work. The two had agreed upon the merchant paying back the sum at the end of the term. If the merchant had made a profit, then he was to pay the creditor 50% of his profit; if he had not been successful and made no profit, then he was only to give back the capital. According to canon law, such an agreement was considered to be usury. However, the creditor in his heart had the firm intention not to demand the capital

back if it was in any part lost. He merely wisely refrained from saying so, in order not to create a moral hazard for the merchant. Olivi stated that because of the creditor's intention, this loan was not usurious as the creditor partook of both profit and loss. Therefore, the creditor could justly receive his 50% share of the profit. However, Olivi could not omit stating that such dealings were sinful, because they created the impression of usury, thereby motivating others to follow suit. Instigating others to evil acts (in this case usury) was and is a sinful act known as scandal.

In the wake of Henry of Ghent, Olivi ([20], p. 116), Alexander the Lombard, Astesanus of Asti, Bernardino of Siena, and other Italian scholastics affirmed that changing money was not usury. Money changing was seen as a necessary element in commercial practice and a service to merchants for which money changers could justly demand recompense. If the merchant, however, intended to make profit from the volatility of the exchange rates, this was condemned as usury.

State Title and Treasury Bonds

In Olivi's time, the financially hard-pressed city governments had begun to resort not only to taxation of their citizens but also to forcing them to grant loans to the public household. This practice was intensified in the course of time. In Bernardino's and Antonino's age, it was normal practice not only for governments to sell their public debt but also for the private investors to trade in these titles. Olivi stated that citizens justly received interest for the damages caused and the profit lost by forced loans to the public household but that citizens were obliged to subtract the lack of risk in regard to their capital or their profit. The interest rate could therefore be lower ([23], p. 130ff). As we shall see, Bernardino and Antonino were to extend this line of thought.

Astesanus of Asti

Hardly anything more than what has already been written above is known about the life of the Franciscan friar who wrote the *Summa de casibus conscientiae*. Even his name is unknown; "Astesanus" simply means "a man stemming from the town of Asti."

His *Summa* comprises eight books covering a general foundation of moral theology and its application to particular cases as well as to economic reality. Economic cases are specifically dealt with in Book Three on contracts and last wills. In spite of its name, the *Summa* is not a "case book." It is written with refreshing brevity and in an intelligible Latin.¹⁴ It is a manual of moral theology, including the sacraments, with a strong leaning toward canon law. Its contents, but not its structure, follow Thomas Aquinas. There is also a clear influence of the Franciscan school, but Astesanus maintains his own originality and independence of thought. His definitions are often taken from Augustine, but he does also quote Aristotle quite frequently.

The section relating to his general thought is important, because he bases his moral teaching on love, love of God in the first place. From this commandment,

all other commandments are to be derived (Summa, I, [24], t. 3, a. 2). Astesanus does not mention the distinction that Duns Scotus made between *potentia absoluta* and *potentia ordinata* and which was to forcefully influence William Ockham. This distinction had been introduced to explain why God could seemingly make exceptions to the Ten Commandments in the Old Testament. The Ten Commandments were divided into two tablets: the first three commandments formed the first tablet, which referred to God. From these God could not make exceptions. The second tablet contained the commandments referring to one's fellowmen. From these, so Duns Scotus and Ockham affirmed, God could make exceptions. Astesanus expressly rejected this distinction: God could not and would not dispense from the commandments on the second tablet of Law, because these commandments constituted the love of neighbor without which nobody could love God (Summa, I, [24], t. 3, a. 5). This starting point is important in order to avoid casuistry.

Private Property

Book Three on Contracts and Last Wills is a thoroughly legal book, which logically and coherently sets out from the question of private property.

With Duns Scotus and all other scholastic moralists, Astesanus assumes that there was not any private property in Paradise. All goods were in common, and this system in Paradise worked better than the division of goods among private owners. After original sin, this precept of common ownership of material goods was reasonably revoked: without private property, a peaceful life in society would not be possible and the necessary sustenance would not be guaranteed, because people do not take care of communal goods as efficiently as they do of privately owned things. Furthermore, in a system of collective ownership, the stronger would dispossess the weaker. These arguments are in origin Aristotelian, and in consequence, Astesanus argues more or less in the same way as Thomas Aquinas. However, there is an important difference. Whereas Thomas conceives private property as a precept added to natural law by reason and incorporated into natural law through the *ius gentium*, Astesanus conceives private property as the result of the repealing of the natural law precept of common ownership. Following Duns Scotus, Astesanus taught that private property was split up by positive human law, for example, through the paternal authority of Noah after the flood. Division of property was not made by natural law but by human law (*secundum codicem humanum*), which belongs to positive law. Thus, private property was not contrary to natural law but is added to it through an invention of human reason (Summa, III, [24], t. 1).

As in scholastic mainstream thought, Astesanus distinguished between property and use, maintaining that nobody should consider things as destined exclusively to his own use but to the use of all, in order to be able to readily communicate things to others in need (Summa, III, [24], t. 1).

Commerce and Merchants

In this chapter as well, the dependence of Bernardino on Astesanus and of both on Alexander of Hales becomes apparent. As Diana Wood has analyzed, the medieval

attitude toward commerce went through three phases: condemnation, justification, and exaltation (cf. [8], p. 111ff). With Duns Scotus, Astesanus and Bernardino scholastic teaching enters the phase of exaltation.

Commerce is not only not illicit but allowed and approved of by natural law. Astesanus thus grants commerce a greater legal standing even than private property. God, the Lord of all, has created the world with different regions, in which some have abundantly what others lack. Therefore, one region should remedy the needs of another through trade. Commerce, wrote Astesanus, could be just and profitable at the same time. Where there is abundance of a certain good, the price is lower; where this good is rare, its price is higher. The profit resulting from transporting the goods from one place to another and selling them to the local price is just. From Duns Scotus, Astesanus takes – albeit not integrally – the notion of “*commutatio negotiativa*” (commercial exchange). For commercial exchange to be just, it had to serve the commonwealth, which it did if the merchants transported and stored the goods for sale. Whosoever thus served the commonwealth could justly receive profit as reward for his labors, solicitude, industry, and risk. On the other hand, merchants who neither transported, nor stored, nor improved commodities, nor certified that prices corresponded to the value of the goods on sale, but only bought to immediately resell at a higher price, were to be expelled. Astesanus also condemned as “abominable” monopolists who bought up all the stock, induced need, and raised prices over the market level at their will. His verdict on speculation was likewise negative: gains from buying wheat and wine in order to resell them later when prices rise were “filthy lucre,” and the profit had to be given back to the poor (Summa, III, [24], t. 8, a. 10).

Trade therefore could become illicit under certain negative circumstances, in which both Astesanus and Bernardino paraphrased Alexander of Hales: the wrong person (e.g., a cleric), the wrong cause (greed), the wrong method (fraud), the wrong time (holidays), the wrong place (in Church), and abusing the inexperience of strangers could make what was licit become sinful. A layman was permitted trade in order to sustain his family and give alms but not out of avarice and greed.

Just Price

Neither Astesanus nor Bernardino possessed the economic insights and the flexibility, which characterized Olivi. Both held more traditional positions and substantially followed Thomas Aquinas. Nobody was obliged to sell, wrote Astesanus, but if he proffered his good for sale and his price was not just, then the judge could force him to lower the price (Summa, III, [24], t. 8, a. 6). A merchant was, however, allowed to sell his good for more than it was worth. Of course, this was only true if no fraud was involved, and the price had to correspond to the just estimation of the good “at the price it is commonly sold at on the market” (Summa, III, [24], t. 8, a. 10). There is a very clear axiomatic formulation of scholastic theory on exchange strewn in among the reflections on the doubtful cases of usury. Between buyer and seller, wrote Astesanus, there should be the equality established by natural law that a good should be exchanged only for a good of the same value measured by money. This equality, however, had a wide margin of estimation (*magnam latitudinem habet*).

Therefore, small digressions were harmless as long as they remained within the margin of half the good's value (Summa, III, [24], t. 11, a. 5). Astesanus thus accepted Olivi's criterion of *laesio enormis* as a moral and not only legal benchmark. He went further, however, in introducing a quite modern sounding distinction between merchants and consumers. Merchants could deceive each other up to half the good's value, because they were specialists. If they then paid a higher price, they had a reason for so doing: either they had a particular esteem for the good or their payment was deferred. The consumer, on the other hand, was simpleminded (*simplex*) and weak. Astesanus therefore strove to protect him from wily businessmen by granting him protection from deceit for less than half the good's value. In consumer contracts, the just price thus had to be much closer to the real value of the good than in business among merchants and definitely further from deviations such as the *laesio enormis*: "*etsi non jure fori, tamen jure poli*" (if not by the law of the Courts, then by law of the market) (Summa, III, [24], t. 11, a. 5). This is a very early example of both consumer protection and of the idea of soft market law granting legal validity to economic ethics.

Astesanus abides by the rule established by Thomas Aquinas and endorsed by Duns Scotus that selling and purchasing was introduced for the common good, the good of both the buyer and the seller. Neither, therefore, should have an advantage over the other. The buyer could ask for indemnification by raising the price if parting with the good meant a great loss for him. He should, however, not raise the price if the buyer was in great need of the good. This would mean deriving an advantage from someone else's need, and this was considered to be unjust. (Summa, III, [24], t. 8, a. 10).¹⁵

Astesanus fully accepted discount: a merchant could charge higher prices knowing that he would reduce them in the case of a cash payment. Astesanus clearly distinguished this from usury. What was new in Astesanus is that he accepted the logical inversion of discount, namely, the increase of the price in the case of delayed payment. This generally was considered to be usury, because the period of time which would elapse between the contract and the payment was valued and paid for in money. Astesanus, on the contrary, excused the seller: he had not raised the price simply because of the lapse of time but because of his wish for indemnity and for his labor derived from granting the deferment of payment (Summa, III, [24], t. 11, a. 4).

Money, Wealth, and Beneficence

Astesanus underscored the social obligation of almsgiving. He frequently quoted St. Ambrose, saying that whatever one possessed beyond what was necessary for sustenance was "violently retained." This went especially for clerics. With St. Jerome, he repeated: "whatever clerics possess belongs to the poor." They committed theft if they spent more than they needed for food and clothing (Summa, I, [24], t. 35, a. 2).

For the laity, his standards were more realistic but still severe: a merchant could make a "moderate profit, as it were a wage for his work" (*lucrum moderatum quasi laboris stipendium*), in order to sustain his family and in order to be able to give

alms to the poor (Summa, III, [24], t. 8, a. 10). The rich, furthermore, were sternly reminded of their duty to succor the poor. Those who did not want to help were “thieves and robbers.” If a poor person died because he had not received assistance from his rich neighbor, he had been slain by the rich man who had not shared his goods with him in his extreme need. Rich people who held back the surplus they had no need of for themselves and who knew and saw the need around them committed robbery by their stinginess (Summa, I, [24], t. 35, a. 1). This harsh verdict is mitigated by two considerations. First, what was necessary differed according to the social status and the social responsibility a rich man had. For instance, a king needed more than a count (Summa, I, [24], t. 35, a. 1). Like Thomas Aquinas, Astesanus taught that one was not obliged to give what one needed to preserve one’s own social status, except when the other person was in extreme need (Summa, V, [25], t. 26, a. 3). The second consideration bespeaks the common sense of our author. One could reject a plea for help because of one’s own need, because the pleader had enough or was malicious or there were others who needed help more urgently (Summa, I, [24], t. 44, a. 7). In our hearts, we should want to do good to everybody. Although we cannot actually aid everyone, we can desire to do so. In the case of enemies and criminals, the good we do them is the avoidance of their committing further evil (Summa, II, [24], t. 66).

Part of the social dimension of property was the willingness to give gratuitous loans. This is of interest also in connection with usury, because it makes clear that the prohibition of usury has its origin in the obligation to help the poor. Astesanus taught that one was obliged to give loans freely to neighbors in need. One sinned against this commandment if one did not lend, demanded the loan back too early, did not give back or destroy pawns, charged interest for the loan, or accepted payment for extending the term of payment (Summa, I, [24], t. 44, a. 8).

Usury and Money Changing

Astesanus took his rather intricate and complicated definition of usury from other scholastic sources. He shared the general condemnation of interest on loans: anything returned in addition to the owed sum was usury. Of course, this did not hold for any free gift: if the debtor, after having paid back his debt, freely and of his own accord gave a present to the creditor to show his gratitude, this was not usury (Summa, III, [24], t. 11, a. 1). Astesanus condemned usury as a mortal sin, basing his position on arguments stemming from human reason and from divine authority. He clearly belonged to those authors convinced that there were rational arguments against usury. His arguments may seem unacceptable nowadays, but they are clear, sober, and not overlaid with unnecessary words. His arguments, however, were not innovative. Basically, he stated that loans should be an expression of charity with the needy: we are obliged to help those in need, not to sell to the poor what we should give to them freely. That is, we should help them with free loans instead of charging usury. He quoted Thomas Aquinas’ argument from consumption and referred to the unfruitfulness of money as such, becoming fruitful only through the debtor’s labor. Moreover, usury was not voluntary on the debtor’s side. He was in duress and constrained to accept the

creditor's conditions. As his contract was not voluntary, the usurer committed a theft when he received the interest (Summa, III, [24], t. 11, a. 3).

In spite of these negative evaluations, Astesanus did distinguish interest from usury; however, he did so without differentiating between money and capital as Olivi had done. Interest for Astesanus was indemnification. In this context, he brought up the same example as Olivi: a merchant was about to make a sure investment, when a friend pleaded with him for a loan. The merchant ceded on the condition that he would receive back the loan plus the lost profit. This, said Astesanus, was interest, not usury. In essence, Astesanus accepted *damnum emergens* (damage), *lucrum cessans* (lost profit), and *poena morae* (penalty for delayed payment) as extrinsic titles to interest, distinguishing them from usury. He did not particularly highlight them, and they are to be found scattered among rather dated arguments. He also subordinated them to secondary justifications of interest by positive law. This just shows that Astesanus himself probably did not quite grasp the momentum these arguments contained.

Money Changing and the Purchase of Rights

He was, however, clearly positive on the question of money changing. Like Olivi and Alexander of Alexandria before him, Astesanus considered money changing (*campsoaria*) to be licit and necessary, because merchants and legates traveled through regions with different currencies, obliging them to change their coins. This exchange was not a loan but a barter. With some detail and as an early representative of this insight, Astesanus distinguished between the nominal (*valor secundum taxationem legis positivae*) and the material value (*valor secundum naturam rei*) of coins. The *campsoar* knew these different values and the rates of exchange between currencies and could therefore establish a just change from one currency to another. For this service, he could justly charge recompense and draw a profit. Money changing was not a gratuitous contract as was the loan contract (Summa, III, [24], t. 9, a. 5).

In Astesanus' time, kings had resorted to the devaluation of coins to reduce public debt. Can somebody, who fears such a devaluation, stipulate that the loan he has given be paid back at the same real value it has at present? Astesanus seems to have answered this question in the affirmative, because the creditor does not seek his gain but indemnification (Summa, III, [24], t. 11, a. 5).

In other ways too, Astesanus was innovative for his time. Where he was not bound by tradition (as was the case in usury), he was open to the present economic reality and understood its rationale. Rents are an example, which he dealt with under the question whether one was allowed to buy future annual rents of money. He was aware of the opinion that such a purchase was in reality a usurious loan, because the buyer received back more than his capital. He himself, however, endorsed the contrary position. The purchase of a future rent is not a loan, and usury was only possible in loans. What was bought in a rent contract was the *right* to receive money in the future, and "*jus non est pecunia*" (a right is not money). Astesanus made it clear that he did not like this sort of business. It was not as "honest and decent" as the selling and buying of visible objects where equality in exchange could more easily be verified. He illustrated his attitude with an example

of a rent contract that he considered to be illicit: A young 25-year-old woman bought a life rent at such a price that she would have received her whole capital back after only 8 years. If this woman were not ill or exposed to such hazards that her premature death were in some way probable, such a contract was unequal and illicit (Summa, III, [24], t. 8, a. 11).

Up to this point, Astesanus probably did not transcend Olivi. In another example, however, he comes closer to modern reality. A man had 100 lb “in banco,” which were to be paid to him in 4 months time. Could someone buy his right to receive the 100 lb in the future for 80 lb in the present? Many scholars had answered yes: A right to 100 lb was and is worth less than 100 lb. It is safer to have a good than to have a right to a good. Therefore, a right to something could be sold at a cheaper price. Astesanus quotes Alexander of Alexandria who considers this case to be uncertain. It seems to be hidden usury for an indirect loan: somebody gives 80 lb in order to receive 20 lb as interest. If, however, there were a risk of not receiving the deposited money, then the transaction would certainly be permitted. Astesanus leaves the question open but ends in such a way that one is left with the impression that he is in favor of permitting this operation.

Astesanus also allowed a merchant to sell to the city of Genova the salt he had transported there. The sales contract contained the clause that payment would be made in future when all the salt merchants had brought in their salt. The merchant could not wait and sold his right to a probable 25 lb to a financier for 20 lb. Both have an advantage and a risk (Summa, III, [24], t. 8, a. 11).

His moral judgment of bonds is similar. Astesanus had already presupposed that the government paid interest to their citizens if they had forced them to grant loans to the public household. He went on to say that the citizens could legitimately sell their titles to public debt on the private market. He who possessed a just title could also sell it legitimately for the price it was given on the market, because a thing was worth the price it could fetch (*res tantum valet, quantum vendi potest*) (Summa, III, [24], t. 11, a. 5).

Bernardino of Siena

St. Bernardino was born in 1380 in Massa Marittima as son of the noble family Albizzeschi from Siena. As has already been noted, he entered the observant branch of the Franciscan Order at the age of 22 and dedicated his life to preaching. His sermons were largely popular not only due to their direct and authentic style but also because they dealt with the real life of his congregation. Aspects of the economic life of his time are consequently prominent (cf. [26]). He was the first theologian after Peter Olivi who wrote a complete book on economic questions. As Bernardino copies literally from Olivi, and Antonino from Bernardino, and Bernardino draws heavily from Duns Scotus or Astesanus, little remains to be said about the ethical aspects of economy as they were already present in the two Italian saints of the fifteenth century. Bernhard is more systematical and synthetical than Olivi, summing up Olivi’s ideas in precise phrases. For instance, in analyzing

value of utility, he expresses Olivi's criteria with the slogans "*virtuositas, raritas, complacibilitas*," thus indicating the qualities of the good in itself, its scarcity, and the subjective esteem of the beholder. This is part of the rhetorical and communicative genius of Bernardino. Both Bernardino and Antonino have the merit of having realized the importance of Olivi's analysis, blending his quotations with others and saving his ideas from oblivion. However, both were more conservative than Olivi. Bernardino does not copy Olivi's third question in his treatise on sales and purchases, in which Olivi develops the free formation of prices and advocates the raising of prices in the case of famine as a means of reducing dearth ([14], p. 69ff). Bernardino even reinterprets the principle of Roman law, present in all scholastic thought on economics, that a good is worth as much as the price at which it can be sold on the market (*res tantum valet quantum vendi potest*), by introducing an ethical criterion: a good is worth as much as it is allowed to be sold. This, of course, is something quite different: a descriptive definition has turned into a prescriptive norm (Sermo 34) ([27], p. 188). Bernardino is above all a moralist, and he is therefore interested less in penetrating the market logic than in regulating passions and curbing sins.

As regards the economic thought of Bernardino and Antonino, we can refer to what has been said about Olivi and Astesanus. Within the limits just described, Bernardino also accepts Olivi, Astesanus, and Duns Scotus as regards the "seminality" of capital justifying interest and discount.

What follows are important supplements, which can highlight some peculiarities of these two authors.

Private Property

Bernardino drew his conclusion from the axiom that private property was a result of positive human law. As property only existed due to human law, just positive law could also transfer existing property rights. He did not, however, seem to have confiscations by the public hand in mind but was striving to justify the legal institutes of prescription and *usucapio* of property. He also adds that laws transferring private property against the will of the owner must have the same cause and the same aim as the original division of property after the original sin of man (Sermo 32) ([28], p. 124f). This position is less respectful of individual rights than the position of Thomas Aquinas who purported a natural right to property.

Property could, of course, be transferred voluntarily, and this is the only real core of economic exchange. It is interesting to note that Bernardino, following Duns Scotus, distinguished two kinds of transfers: gift (*actus mere liberalis*) and exchange (*actus secundum quid liberalis*). (Sermo 32) ([29], p.134ff). The Latin wording renders the meaning better. Gift and exchange are economically speaking very different, but both were seen by Bernardino as two ways of living the virtue of liberality and the virtue of administering wealth. Both giving away and selling are forms of parting with what one possesses. But there was a further connotation in Bernardino's definition: both gift and exchange were seen as forms of generous "liberality." Even in exchange, there was an element of gift, wrote Duns Scotus, because both partners to the exchange had to cede in some points in order to reach an agreement.

Exchange and Just Price

Exchange according to Bernardino had to be just and in accordance with right reasoning (*secundum rectam rationem*). This meant that the value derived from the utility of the exchange should be equal for both parties. The equality of value, however, was not an invisible point but a wide margin of estimation (Sermo 32) ([29], p. 139). In order to protect the weaker party from the bargaining power of the stronger party, the scholastics underscored this criterion of the just price and referred to the common or the market price as a general benchmark against overpricing. In this line of thought, Bernardino quotes the Roman law maxim that the just price is the general estimate of a good's value on the market, that price at which the good could be sold (*secundum aestimationem fori occurrentis, secundum quod tunc res quae venditur in loco illo communiter valere potest*). Like Thomas Aquinas, Bernardino held that the moral obligations regarding the just price were stricter than the legal ones. Bernardino therefore did not accept the limit of *laesio enormis* as morally relevant. (Sermo 33) ([30], p. 157f).

Commerce and Merchants

Bernardino is certainly to be counted among those scholastic authors that exalted commerce and merchants. As Olivi and Astesanus before him, he not only justified but defended the service of honest merchants to society. Commerce was all the more worthy of reward and profit because of the four great virtues of merchants: industry or efficiency, responsibility, work or diligence, and risk. Of course, commerce could also become perverted when it turned against and damaged the common good. Two or three bad merchants could spoil all the other merchants of a city and should therefore be expelled and banned. As was already present in the tradition before him, Bernardino listed a number of abuses of commerce. He dedicated many pages to the wrong way to conduct commerce: by lies, perjury, duplicity of speech, sophisticated expressions, circumvention of prohibitions, falsification of measures and weights, etc. (Sermo 33) ([30], 145ff). He proposed that merchants should use the rules of good conduct, which he establishes, as “mirrors” for their own self-bettering. He also imposed on them accountability to their business partners at least once a year, the necessity to carefully take written note of all monetary transactions and the foresight to always have their testament ready in written form. “Such a merchant with the help of God will become rich (*lucrosus*), famous, pleasing to God and men, (. . .)” (Sermo 33) ([30], p. 162).

Usury and Financial Operations

Bernardino listed twelve reasons why usury was against natural law. These are all traditional arguments whose validity Bernardino never doubted (Sermo 38) [31]. What is of permanent value in their arguments even today is their struggle against the exorbitant interest rates, which were common then and would also currently be severely condemned as usury. They warned against unwise indebtedness, then and now a deplorable phenomenon, which becomes apparent for instance in pure consumer credits. The scholastics, and among them Bernardino, raised their voices against the unproductive hoarding of wealth locked up in a chest, instead of being

put to the service of society through investment. Then and now, the idea of fraternity they strove to spread among men was and is important: there are always the poor that need help. By developing “extrinsic titles” and distinguishing usury from interest, the Italian scholastic teachers paved the way for our present usage of the word “interest” and the regulated interest rates common in the legal world of finance.

From Olivi, Bernardino took the sound rule: “profits and losses (risk) should go together” (*lucra et damna communia esse debent*) (Sermo 39) [32]. He forbade any kind of financial investment in which only the entrepreneur took a risk and the financier was secure. For instance, he was very skeptical about the so-called irregular deposits. These were bank deposits that the banker was allowed to use for investment. At the end of the term, the banker gave the depositor a certain percentage, which was called “*dono de discrezione*” (“discretionary gift”). Both Bernardino and Antonino condemned this relentlessly as usury (Sermo 37) ([27], p. 233). Bernardino condemned public institutions that granted loans at a regulated interest rate. He criticized as usurers merchants who “out of insatiable greed amass wealth,” seeking out widows’ dowries as loans in order to invest them in business expansion. He likewise criticized moneylenders who took up cheap loans from the public institutions and then made loans at profitable interest rates with this money (Sermo 43) ([27], p.381). All this goes to show that Bernardino was not yet capable of grasping or appreciating modern financial mechanisms. He does have the wise social insight, however, that buying goods from the poor is better than giving them loans and bleeding them with interest. Even though the price the poor fetch for their goods might not always be just, they would certainly end up better off this way than by taking loans and giving their goods as pawns (Sermo 43) [33].

Money was the blood of society, wrote Bernardino, and the blood had to flow through the whole body returning to the heart of society. In this context, I must not omit a negative aspect in Bernardino: he is belligerent toward and exclusive of the Jews. Ambrose had stated that usury was allowed only as a weapon against one’s enemies. Bernardino endorsed this, allowing usury against enemies (among them the Jews and other infidels) and warning Christians against becoming prey to supposed enemies. Bernardino excluded “infidels” from the blood circulation in society (Sermo 42) [34]. Astesanus in this context was more benign and inclusive. He interpreted Ambrose’s dictum rhetorically: nobody, Christian, Jew, or pagan, must be our enemy; therefore, usury never is allowed (Summa, III, [24], t. 11, a. 3).

After all that has been said, it is clear that Bernardino was not an intellectual forerunner of the “*montes pietatis*” the Franciscans would soon be establishing throughout Italy. From 1462 onward (only 18 years after Bernardino’s death), Italian Franciscans opened the first chain of more than 150 “*montes pietatis*.” Bearing some similarities to modern-day “pawnshops,” these were places where one could take out a loan at very low interest against some type of bond or surety. This practice was established all over Italy to provide credit accessible to craftsmen and poor farmers in moments of crisis (i.e., microfinance and loans to small and medium enterprises). These friars were in constant contact with the poor, who

frequently ended up the victims of usurers. The latter paradoxically, and precisely because of the canonical prohibition against giving loans with interest, fell outside all regulation and therefore at times demanded exorbitant interest. At the same time, the poor often were forced into a much greater indigence, because the usurers impounded their work instruments and their livestock. This situation was reversed thanks to the “*montes pietatis*,” for which the Franciscan theologians after Bernardino, overcoming great difficulties, had to create the necessary theoretical framework.¹⁶

Antonino of Florence

The great scholar and bishop Antonino of Florence was born as Antonino Pierozzi in 1389. He became a Dominican and soon had to bear official responsibilities in his Order, which he did so well that Pope Eugene IV, in exile in Florence, personally appointed him archbishop of this city. He fulfilled this calling with charity, magnanimity, and profound learning. He died in 1459. Among other books, especially his manuals for confessors, he wrote a large and comprehensive handbook of moral theology called *Summa theologica* or *Summa moralis*. His aim was to educate priests to be able to respond to the intellectual needs of their time and to live up to spiritual and cultural standards. As Florence was one of the commercial and financial centers of the time, it is not surprising that he deals with several economic aspects. It has already been said that Antonino is not original but draws mainly upon his predecessors, especially from his fellow Dominican, Thomas Aquinas, but also from Bernardino and others. Langholm summarizes Antonino’s importance as follows: “In the area of economics, the stature of Antonino of Florence has shrunk a bit in recent years as more of the medieval sources of that work (*Summa moralis*) have come to light. Among other things, he drew on Peter Olivi, mainly, and perhaps entirely, through Bernardino of Siena. Antonino was not an outright compiler, however, for he drew attention to new areas and problems of economic ethics and thereby influenced subsequent authors of penitential works, Dominicans as well as others” ([15], p. 132).

Antonino defined commerce simply as profit made by reselling goods whole and unchanged. Commerce was lawful if conducted for some good purpose. In this case, commerce, among “all mechanical arts,” was the most honorable in society (*Summa*, P. III, [35], p. 218, t. 8, c. 3, col. 298).¹⁷ This positive evaluation only held for modest commerce exercised according to the justice demanded by God, not that conformed only to human justice (*Summa*, P. II, [35], p. 217, t. 1, c. 16, col. 254) and not if the merchant’s principal purpose was greed. In this case, his gain became *turpe lucrum* (*Summa*, P. II, [35], p. 220, t. 1, c. 16, col. 250). Antonino considered price-fixing among merchants as fraudulent (cf. [15], p. 134). In the *Summa moralis*, Antonino also attacked another antisocial activity of the rich merchants of Florence: the truck system. Workers were paid not with money but in kind (cloth or silk or wheat), for which they had no need, and were thus obliged to sell these goods at an inferior price than that at which they had been received (cf. [15], p. 135).

Conclusion

As has become apparent throughout this chapter, the scholastic period in Italy was of paramount importance for the development of the economy in Europe. Italy's geopolitical position in the Mediterranean and its cultural heritage from the Antique past and its Christian present resulted in a characteristic and fruitful blend. The Franciscan school of philosophy and theology was especially important, perhaps because of the social background of many of the friars in middle-class commercial families which enabled them to grasp the practical problems of the merchants' life in a realistic way. Medieval evaluation of commerce went through different phases: prohibition, justification, and exaltation. Italian scholars tended to exalt the social role of merchants and to underscore the great service they did to society by importing, storing, improving, and selling needed goods. This economic activity required money (in the words of Bernardino of Siena, the "blood of society") and financial operations. The existence and usefulness of money for commerce was never put into doubt, and a growing understanding of forms of cash-free operations, including certain forms of credit, slowly gained ground. Of course, some of the results achieved by the Italian scholastics are outdated and may even seem bizarre to contemporary readers. This is especially true for the condemnation of all forms of interest as usury, independently of the rate of interest. However, what all authors were unanimously aiming at though the prohibition of usury was avoiding the exploitation of the poor, a value of unabating actuality. Their distinction between usury and interest and the establishment of so-called extrinsic titles to interest paved the way for the modern system of regulated interest rates in legal financial markets. Besides, the many rational arguments put forward against non-gratuitous loans do pose some questions to modern business ethics that are worth considering: exorbitant interest rates were and are a severe problem; unwise indebtedment, then and now a deplorable phenomenon, becomes apparent, for instance, in pure consumer credits. The Italian scholastics raised their voices against the unproductive hoarding of wealth locked up in a chest, instead of being put to the service of society through investment. Then and now, the idea of fraternity they strove to spread among men was and is important: there are always the poor that need help.

The economic thought of the Italian scholastics was characterized by a wholistic approach to economic questions, which, first, placed the personal relationship between the buyer and the seller at the center of attention and, second, evaluated economic phenomena as part of a greater whole, the ethical perfection of the persons involved in economic intercourse. This is why the virtue of justice and the equality of the value of the goods exchanged are of central importance in scholastic thought. This led to the in-depth study of the meaning of value and to important insights in the value of goods. Value was derived from utility, which was conceived as a sum of objective qualities, of the scarcity of the object, and of subjective choice.

This wholistic approach procures lasting interest in the economic thought of the scholastics. Langholm therefore rightly suggests that we direct our search for

a “possible (and a possibly very important) legacy” of scholasticism toward ethics ([10], 199).

Abstract

The School of Salamanca consisted of a distinct group of Iberian scholastics of the sixteenth and early seventeenth centuries that worked mostly within a Thomistic framework and developed it in order to deal with the European expansion into the “New World” and to make sense of the important ethical issues arising from the rapid growth of commercial and financial activity in this period. After briefly reviewing the socioeconomic and cultural context of the School and its intellectual background, this chapter surveys their main contributions for business ethics, namely, on the legitimacy and limits of property rights, the ethical evaluation of commerce, justice in contracts, just price theory, banking and interest, taxation and regulation, and human rights and international law. It is shown that the School of Salamanca provided important contributions for the understanding of the operation of market processes and for business ethics by relying on a realistic natural law framework that emphasizes the ethical, legal, and anthropological foundations of the market economy.

Introduction

The label “School of Salamanca” is used to refer to a distinct group of Iberian theorists of the sixteenth and early seventeenth centuries. The Dominican Francisco de Vitoria (c. 1483–1546) is widely and justly credited as the founder of a School of thought in which several other Dominicans (such as Domingo de Soto and Martín de Azpilcueta) were prominent. But a number of Jesuit authors (such as Luis de

Molina, Juan de Mariana, and Francisco Suárez) can also be included in this specific line of late Scholasticism.

Of particular relevance for business ethics is the fact that the authors of the Salamanca School applied and enlarged the Thomistic framework in order to deal with the European expansion into the “New World” and also to make sense of the important ethical issues arising from the rapid growth of commercial and financial activity in this period.

While the University of Salamanca was extremely important for the birth and development of the School, the use of the expression “School of Salamanca” can be misleading, as that was not by any means the only university where authors belonging to this tradition worked and taught ([2] pp 13–23). In Spain, Alcalá de Henares was also a key intellectual center, and some of the most important authors of the Salamanca School developed the largest part of their work in the Portuguese universities of Évora and Coimbra.

Origins and Development of the School of Salamanca

The founder of the Salamanca School, Francisco de Vitoria, studied at the University of Paris where he developed a distinctly Thomist line of reasoning. In 1526, Vitoria assumed the prime chair of theology at the University of Salamanca, a position from which he exerted tremendous influence over the next two decades. In the following years, numerous Vitoria’s disciples came to occupy important academic and political positions not only in Iberia but also in Latin America. An important contemporary of Vitoria (and greatly influenced by him) was Domingo de Soto, who also held a chair of theology at Salamanca and who in 1545 took part in the Council of Trent following a request by Charles V. Soto, also a Dominican like Vitoria, analyzed many issues of great interest for business ethics and his treatise *De Iustitia et Iure* was greatly influential in this and other regards. Another important disciple of Vitoria was Diego de Covarrubias y Leyva (1512–1577), who held a number of important administrative positions and played an influential role in the Council of Trent. Covarrubias published widely on matters of theology, history, law, and economics and his work reflected both his vast theoretical knowledge and his practical managerial and leadership experience. Several Salamancans devoted a great deal of attention to the ethical dimension of financial transactions and Martín de Azpilcueta – who was born in 1492 in Navarra and taught both at Salamanca and at Coimbra – put forth a pioneering account of the quantity theory of money [1]. The realistic and thorough analysis of commercial practices was an important feature in many of the works of the late Iberian scholastics and in this regard the work of Tomás de Mercado (born c. 1530) should also be mentioned. Combining accurate historical descriptions with ethical analysis of business activity, Mercados’s *Suma de tratos y contratos* (*Compendium of treatises and contracts*) was first published in Salamanca in 1569 and is one of the prime examples of its kind, constituting in some respects a forerunner of business ethics manuals. Mention should also be made of key Jesuit authors who

worked within a similar theoretical and methodological framework and provided many important contributions for the ethical analysis of business issues, taxation, human rights, and international law. These include Luis de Molina (c. 1535–1600), who studied in Salamanca and Alcalá and held academic positions at Coimbra and Évora and the highly polemic Juan de Mariana (1536–1624), who studied at Alcalá and taught in several locations in Europe, including Rome and Paris. All of these authors contributed to a distinctly integrated tradition of scholastic inquiry where the analysis of practical business problems and of the conduct of all of those engaged in economic activity was believed to require a solid understanding of the central principles of natural law and justice.

The Socioeconomic and Cultural Context

The intellectual importance of the School of Salamanca corresponded historically with a period in which the Iberian Peninsula was in many respects the center of the world. This golden age of Iberia partly came about as a consequence of the worldwide journeys of discovery enacted by Spanish and Portuguese navigators and explorers. But it was also fostered by favorable demographic, economic, cultural, and political circumstances. The Iberian Peninsula was in this period a privileged focal point not only for commerce and diplomacy but also for intellectual intercourse, and the University of Salamanca held a key position in this regard.¹

In the Iberian Peninsula, the fifteenth century was marked internally by the culmination of the process of reconquest of land from the Arabs. Externally, both Portugal and Spain carried out a series of successful maritime expeditions throughout the world. Portuguese expeditions explored the African coast, pioneered a sea route to India in 1498 that came to revolutionize trading patterns in the following decades, and were the first Europeans to reach Brazil in 1500. The most significant of the Spanish undertakings of this period was undoubtedly Columbus' expedition to America in 1492. By the end of the fifteenth century, Portugal and Spain were the two most important economic and political powers on the world stage and the 1494 Treaty of Tordesillas can be regarded as a symbol of this dominance. The Treaty, signed between the two Iberian powers to settle territorial disputes, divided the World (outside of Europe) in two parts, with the Western section assigned to Spain and Eastern one assigned to Portugal.

Throughout the sixteenth century, the Iberian Peninsula became the world commercial center, with cities like Lisbon and Seville flourishing with economic activity and also becoming major points of diplomatic, social, and cultural exchange. New ethical problems and new questions inevitably arose from the new relationships, particularly in the economic sphere. It is therefore not surprising that Iberian scholastics of the time came to be at the forefront of reflecting upon them and putting forth new answers. Grasping this socioeconomic context is essential to understand the depth and the vast scope of the contributions of the Salamanca School. As synthesized by Melé [4]:

In the sixteenth century, commerce, trade and banks experienced spectacular development, which was supported, in large part, by the discoveries of the New World and by the influx of precious metals. Spain became a significant center of commerce, acquiring the economic hegemony previously enjoyed by northern Europe and the northern Italian cities. Fairs like the ones celebrated periodically in Seville, Burgos and Medina del Campo, all perfectly synchronized with other European fairs, were privileged settings for the economic transactions of this era: exchange of merchandise, coins, bills of exchange and other financial instruments. (...) These new economic phenomena, coupled with the great religiousness of the people, led them to seek moral guidance from theologians and priests. The authors of the School received abundant requests for consultation from merchants, moneychangers, bankers and even public authorities.

Alongside the expansion in economic activity and the establishment of overseas domains came the enlargement of bureaucratic structures, both civil and military. Thousands of people were hired to perform administrative, managerial, and judicial roles and this provided further stimulus for the growth in higher education. Iberian Universities faced an increasing demand to train lawyers, managers, tax specialists, and other professionals and this was an additional factor fuelling the expansion of academic and intellectual activities in this period. The religious Orders most active in academia and the external demand for professionals fostered a competitive academic environment that also contributed to the scholarly productivity of this period. Educational innovation and competitiveness are well expressed in the motto of the University of Salamanca: *Omnium scientiarum princeps Salmantica docet*, which stressed that Salamanca was the leader in the teaching of all the sciences.²

Culturally, the interaction between Christian, Jewish, and Muslim elements in the Iberian Peninsula was also an important factor. Furthermore, the development of the printing press brought about unprecedented possibilities for the mass production of literary material and the rapid diffusion of new ideas. The humanistic lines of thought that characterized the Renaissance were present in Universities such as Alcalá and Salamanca, and while in some ways the new trends did not fit easily with traditional Scholasticism, they were also certainly a cultural incentive for the renewal of scholastic approaches.

Finally, in what regards the social, theological, and cultural context, mention must also be made of the vigorous confrontation between Catholics and Protestants that swept Europe. The conflicts between Catholics and Protestants provided further stimulus for the development of strong intellectual centers. Threatened by different strands of Protestant reformers all claiming to be closer to the original meaning and practices suggested by the biblical texts, the Catholic Church was under strong pressure to mobilize intellectual resources and reinvigorate the defense of its positions. In the context of the Protestant challenges, the Council of Trent (1545–1547, 1549–1551, 1561–1563) put forth a number of internal Church reforms and offered a strong condemnation of key Protestant claims.³ The perceived need to restate the Catholic doctrinal positions led to the movement that came to be known as the Counter-Reformation. A movement in which the Society of Jesus – formally recognized in 1540 – played a key role. It is worth remembering at this point that from the later part of the sixteenth century, Jesuits assumed a prominent role in the School of Salamanca which contrasted with the

leading role of Dominican scholastics in the foundation of the School. It is not a coincidence that some of the most important works of the late Iberian scholastics (particularly of the Jesuits) were written precisely in the context of the Counter-Reformation and of a pressing need to answer the Protestant theological and cultural challenges.

With an unprecedented expansion of economic activity, new questions arising from interactions in the “New World” and the serious theological and cultural challenges posed by Protestants in Europe, reflecting upon ethics and developing solid moral arguments mattered more than ever for the Iberian Catholic scholastics. Justice and its practical applications became a central intellectual concern.

Intellectual Background: Relevance of Justice

The European revival of Thomism – spearheaded by figures such as Pierre Crockaert (c. 1450–1514) and Thomas de Vio (1469–1534) – was an extremely influential movement in the genesis and development of the Salamanca School. Starting with Francisco de Vitoria – who studied under Crockaert in Paris – the thought of the late Iberian scholastics was greatly influenced by the Thomist approach to natural law ([2], pp. 30–34). In the Thomist framework, natural law is the part of eternal law that deals with mankind and it can be discovered by employing human reason. It is deemed “natural” not because it is held to be purely instinctive but rather because it can be reached through man’s natural ability to make use of reason in order to separate right from wrong.

Since natural law in its purest form does not offer more than general principles, it is by itself insufficient to direct all human actions. The primary precepts of natural law are the ones that can be known with greater certainty but they are also the more general. Secondary precepts of natural law offer more guidance for decision-making but have a much larger degree of variation and uncertainty, since they reflect different particular circumstances of time and place. Humans are thus obliged to reason from the general principles of natural law both to develop supplementary human laws and to make moral decisions.

Closely related to natural law, is the notion of justice as that of rendering to each person what she is due. Acting ethically requires the employment of right reason so that in each specific circumstance one behaves toward others in accordance with the demands of justice. In line with the Thomist tradition, for the late Iberian scholastics the capacity to discover the principles of natural law was not directly dependent on faith, but reason by itself was not sufficient to ensure their application. Prudence, understood as a practical disposition to act according to right reason, was also deemed necessary. In this perspective, exercising right reason requires not only understanding what justice demands but also having the prudential virtue of acting according to those demands.

The adherence to this integrated Thomist conception of natural law is a common feature of the vast majority of the late Iberian scholastics. But in addition to being largely shaped by the preexisting Thomist framework, the works of the Salamanca

School also expanded it, particularly in what concerns the analysis of economic and business issues. It was precisely in these fields – more so than in theology or political philosophy – that the authors of the School introduced more substantial innovations that broadened the Thomistic framework allowing the resolution of existing ambiguities and the fruitful analysis of the emerging complex business phenomena of their time.

The type of ethical analysis practiced by the authors of the Salamanca School can be described as “casuistry based on solid principles” ([4], p. 182). This essentially means that proper ethical analysis must start from a solid understanding of the general principles of justice and then apply them accounting for the specific circumstances of each case. The Salamanca School’s use of casuistry attaches great importance to prudence in decision-making and to the consideration of particular circumstances but frames them within a rigorous theoretical understanding of justice. Contemporarily, casuistry has gained a bad reputation that is often fully justified given that this type of analysis, if not pursued rigorously and under a proper theoretical framework, can easily degenerate into moral relativism and rhetorical play. Nevertheless, the late Iberian scholastics contributions to business ethics demonstrate that this does not need to be the case. By combining solid theoretical knowledge in the Thomist tradition with a thorough understanding of the business realities of their time, the authors of the School were able to provide ethical analysis that was simultaneously nonrelativistic and applicable to real-world scenarios and decision-making.

Most of the analyses of economic and business problems by the late Iberian scholastics appear in their voluminous and detailed Treatises on *De Iustitia et Iure* (on justice and law) and in other works dealing primarily with moral theology ([6], p. 101). A good example is Domingo de Soto’s own *De Iustitia et Iure*, a work first published in 1553–1554 that contains numerous insights not only on matters of theology, law, and political philosophy but also on questions concerning economic and business affairs.⁴ Although contemporary readers may find that awkward, the location of the texts concerning business ethics should not lead to the deeply mistaken conclusion that this constituted a limitation for the authors of the Salamanca School. For, as explained by Melé:

They recognized that the Bible contains no abundance of norms regarding concrete economic behavior, and that the ones that can be found there refer to economic practices contemporaneous with the publication of those texts. But this did not hinder the authors, for as Catholics they knew that the sources of moral theology are not limited to the Bible. Morality is also derived from the powers of reason, to which God has given the capacity to know the natural moral law, at least in its most elementary aspects. ([4], p. 179)

The prime concern of the late Iberian scholastics in what concerns business activity was to analyze conduct from an ethical perspective. But they also realized that accurate ethical judgment required a proper understanding of economic processes and that existing knowledge was often insufficient in this regard. They thus undertook the double task of developing a better understanding of the economic phenomena they observed while simultaneously seeking to formulate appropriate ethical judgments and recommendations that could serve as guidance for business conduct.

While the major authors of the Salamanca School gave currency to their ideas through lengthy treatises on justice, it is interesting to note the existence from very early on of complementary – simplified – handbooks containing a summary of applied teachings and insights directed at merchants and businessmen in general. As pointed out by Grice-Hutchinson ([8], p. 96), these minor treatises came to enjoy substantial influence in their own right, a fact that signals that the concern with business ethics in this period of rapidly expanding commercial activity was not confined to ivory tower scholars disconnected from the real world of business.⁵ It is probably not a coincidence that these works were published in cities in which the imperial economy was developing with great dynamism.⁶ These handbooks were important not only as means of disseminating to a wider audience the complex theories of natural law expounded in the more formal treatises but also as sources of practical guidance for everyday business life, contracts, and decisions. The multiple editions and translations, as well as citations by subsequent authors, strongly suggest that their popularity was quite significant, a fact that is even more striking if one takes into consideration the levels of literacy at that time.

The combination of a permanent emphasis on justice with a realistic natural-law outlook (that incorporates actual human ends without ignoring the necessity to evaluate them from an ethical standpoint) is a distinctive feature of the Salamanca School's contributions for business ethics. In the perspective developed by the late Iberian scholastics, individual agents and their moral conscience occupy a role that cannot be replaced by "third-person" mechanisms of ethical evaluations. It is therefore an approach "centered on action, but ordered to the agent," ([4], p. 187) as evidenced by the Salamanca School's contributions toward the analysis of specific issues in business ethics.

Legitimacy of Property Rights and the Common Good

For the School of Salamanca, the justification of private property lay in its potential to promote a better use of material goods while at the same time contributing to an ordered, hospitable, and peaceful community. The defense of private property by the School of Salamanca was thus closely connected with an understanding of the very negative consequences of common ownership of material goods given the conditions and characteristics of human earthly existence. In the words of Domingo de Soto:

Considering also the premises that in a corrupted [i.e., fallen] state of nature, if men lived in common they would not live in peace, nor would the fields be fruitfully cultivated, men have deduced that it is more convenient to divide property. ([7], book i, q. v, a. iv. (our translation))

And in the context of replying to popular arguments in favor of common ownership:

What the poet has said, that these words: mine and yours, lead to many disputes and fights, we sincerely recognize; but there would be many more [disputes and fights] if the things were possessed in common. ([7], book iv, q. iii, a. i. (our translation))

Although private property was strongly defended and regarded as being fully compatible with the principles of natural law, it was not considered an absolute right. It was rather a “dominion ordered to a social function.”⁷ Private property’s ultimate subordination to the common good meant that in extreme circumstances of imminent danger to human life it could be legitimate to make use of goods one did not own. Thus, for example, Vitoria referred to the implications of situations of extreme need as follows:

It is enough to see the indigent prostrated in his bed, anguished by his ailments, or when tolerating hunger for an extended period reaches such extremes that, if he is not succored, he would rapidly walk to death. It is then, when there is extreme need and, if it can be done without scandal, that it is licit to rob from the rich.⁸

Even in these cases, however, the late Iberian scholastics tended to have a cautious approach, stressing that the goods should be returned to its original owner whenever possible.⁹

Commerce: Wealth and Fair Transactions

In line with their views on private property, the authors of the School of Salamanca analyzed commercial activity essentially based on its social consequences. In some notable cases, the late Iberian scholastics distanced themselves from long-established prejudices directed against merchants and trade. In addition to placing the emphasis on the individual patterns of conduct of business men (as opposed to condemning business activity on the whole), there are clear recognitions of the social importance of commerce. Juan de Mariana understood commerce as a way of overcoming scarcity through mutually beneficial exchanges and he stressed that:

If the exchange of goods were abolished, society would be impossible, and we would all live in distress and anguish. We would not have faith in our children nor would children trust their parents.¹⁰

Considering the ideas they inherited, the authors of the Salamanca School held in many regards a more tolerant view of commerce and market activity in general than previous scholastics. While they never failed to emphasize the grave moral dangers posed in the context of profit-seeking activities, their concerns were largely balanced by a sophisticated comprehension of the social benefits of free exchange in market settings. Profit could thus be ethically justified in numerous circumstances as long as the ultimate goal was compatible with the common good and business activity was pursued in accordance with principles of justice and morality.

Domingo de Soto stressed that commercial transactions in themselves are not intrinsically virtuous or vicious:

Business is not in itself intrinsically good, as is the virtue of charity, nor is it in itself intrinsically bad, as is lying, it is in itself indifferent, as the act of eating, which can be good or bad depending on the its purpose and on the circumstances. ([7], book iv, q. ii, a. ii. (our translation))

While Soto emphasized that commerce is necessary for society, he also warned that the art of business is “surrounded by many dangers.” Among these, he particularly condemned lying and fraud, vices that Soto understood are not an exclusive problem of commerce but can be more prevalent when businessmen fall prey to an insatiable thirst for profits.

In one of his most significant passages for business ethics, Domingo de Soto stresses that “the vices of merchants are not intrinsic to commerce but to the persons who practice it” ([7], book iv, q. ii, a. ii. (our translation)). And he eloquently adds that if one wanted to ban commerce from society due to the sins of merchants then one would equally have to ban farming and all forms of industry, given that there are also farmers and producers of other goods and services that lie and cheat in order to obtain higher profits.

Justice in Contracts

The late Iberian scholastics devoted a great deal of attention to contracts, and particularly to the conditions under which they could be considered licit and as giving rise to legal and moral obligations. As noted by Roover, [14] the great importance attached by the Salamanca School to the study of justice and ethical implications of contracts was deeply influenced by Roman Law. This influence on the works of the late Iberian scholastics should not come as a surprise considering that the Roman Law tradition held a lasting influence on European legal thought and that the most important custodian of this tradition was the Catholic Church.¹¹

From Roman Law – and particularly from Justinian’s compilation – the Salamanca School adopted primarily a thorough and systematic methodology of analyzing contracts and also the principle of voluntary and free consent that is central to the Roman legal tradition. The late Iberian scholastics combined this framework with a Thomistic understanding of the importance of commutative justice and applied it to evaluate the increasingly complex business contracts of their time.

Commutative justice was generally regarded as demanding equality between the parts involved in a contract but the exact implications of the principle in practical terms were often the subject of intense debate.¹² A strict interpretation of the Aristotelian concept of reciprocity of exchange can lead to a significantly restrictive position on contracts but the idea can also be interpreted in terms of mutuality. Under this more flexible interpretation, as explained by Elegido ([16], pp. 34–35):

The principle of equality only asks for mutuality; this can be put negatively as requiring that one party does not gain precisely by the loss of the other; it can also be formulated positively as requiring that the transaction makes the two parties better off. Therefore, there is nothing in this principle that precludes one party from making very high profits; all it requires is that he makes those profits by creating very high value for his customers while keeping his costs as low as possible. If he succeeds in doing this, it will be possible, in strict conformity with this principle, for him to contribute a lot of value to others and to do very well for himself and for those to whom he bears special responsibilities.

While there is some room for debate in terms of what is required by commutative justice in terms of the outcome of specific business transactions, there was no doubt for the late Iberian scholastics that coercion, fraud, and deceit all gravely undermine the justice of contracts. In the words of Domingo de Soto:

To make use of lying or deceit to sell something dearer than it is [i.e., for a price higher than its just price] or to buy it cheaper [i.e., for a price lower than its just price] is a sin, as it is in every contract, and a mortal sin for its kind. ([7], book vi, q. iii, a. i. (our translation))

In what concerns the implications of different scenarios of asymmetric information on the justice of contracts, Molina offered what is quite possibly the most clear and thorough treatment of the problems involved.¹³ In some instances, the informational disadvantage of one of the contracting parts may be such that the voluntary nature of the contract is put into question. Simultaneously, when one of the contracting parts holds an illusion about the object of the contract, the resulting inequality is prone to jeopardize respect for the principle of commutative justice. Building upon the works of other late Iberian scholastics, Molina went as far as providing a detailed analysis of the obligations of sellers to inform potential buyers of defects in the products being sold ([17], pp. 229–259). He equated in considerable detail the different circumstances under which business contracts should be annulled due to defects in the products involved and also situations in which discounts should be granted on account of them.

Nevertheless, the issue where the authors of the Salamanca School provided their most important contributions to the ethical analysis of business is quite possibly just price theory, a matter that is obviously related to justice in contracts but requires separate treatment. And it is also in this subject that the distinctive comprehension of market processes developed by the late Iberian scholastics is clearer.

Market Economy and Fair Price

One of the key distinguishing features of the Salamanca School – and perhaps the most important characteristic of its economic thought – is its sophisticated understanding of the operation of the market economy. While the late Iberian scholastics did not, in most areas, offer a radical break with the past, they often put forth a more benevolent view of the functioning of the market economy than other earlier and contemporary thinkers. This view was also associated with a greater awareness of the dangers associated with undue political intervention in the market, which raised a broad scope of ethical concerns. As synthesized by Madigan [18]:

These thinkers developed an “optimistic” attitude towards the early developments of capitalistic business economics, going against the tide in castigating the developing absolutist monarchies for such policies as attempted price controls, interventions in the market through currency debasement to raise revenue, and the *encomienda* system of land grants which frequently resulted in brutal enslavement of the native peoples.

At the same time, the operation of the market economy was itself also subjected to moral evaluation in a way that led the late Iberian scholastics to analyze in depth

the ethical implications of economic activity. This is perhaps clearest of all in the Salamanca School's contributions to the discussion of what constitutes a just price. In his *History of Economic Analysis*, Schumpeter [19] attributed to the late scholastics a key role in the development of price theory and stressed the importance of ethical concerns in their work:

Aristotle not only distinguished value in use and value in exchange as clearly as did any later writer but he also perceived that the latter phenomenon derives somehow from the former. But in itself this is not only common sense but also commonplace, and further than this he did not advance. His failure to do so was made good by the later scholastics, who are entitled to the credit for having developed the theory of price which he himself cannot be said to have had. It has been held that this was due to his preoccupation with the ethical problem of justice in pricing—"commutative" justice—which diverted his interest from the analytic problem of actual pricing. Nothing could be farther from the truth. Preoccupation with the ethics of pricing, as the example of the later scholastics suffices to show, is precisely one of the strongest motives a man can possibly have for analyzing actual market mechanisms.

The theory of value and the economic and ethical analysis of the role of prices in transactions are naturally areas of great relevance for business ethics. The Salamanca School provided important contributions in this regard. Elegido summarizes them as follows:

In my view the leading authors of the Salamanca School can contribute three key ideas to a modern discussion of justice in pricing. They used a substantive standard for assessing the justice of exchanges; they claimed that the fundamental standard of commutative justice is equivalence in value; and, finally, they argued that the best indicator of the value of a good is the price that it fetches in an open market. ([16], p. 30)

The first two contributions are directly related with the Salamanca School's consistent approach to the analysis of justice in contracts. But it was the third that had wider and deeper implications for business ethics. The association of value with common estimation in the market results from an understanding of prices as being ultimately grounded on what contemporary economic science refers to as the subjective theory of value. Molina is one of the most sophisticated scholastics in this regard, as can be observed in his explanation of the concept of "natural price":

They call him so not because it doesn't depend to a large extent upon the esteem with which men appreciate some things more than others, as happens with certain precious objects, that sometimes are valued in more than twenty thousand gold coins and more than many other things, which, by their nature are much better and more useful; nor do they call him so because that price doesn't fluctuate and change, since it is evident that it does change; but they call him natural because it is born out of these same things, independently of any human law or public decree, but dependent on many circumstances which make it vary and on the affection and esteem that men have for things according to the several uses in which they can be employed. ([17], p. 168)

Covarrubias goes even further along this line by stating that the "value of an article does not depend on its essential nature but on the estimation of men, even if that estimation be foolish."¹⁴ This understanding of the value of goods as deriving from subjective human preferences has important implications in terms of the

ethical evaluation of prices. A price that reflected “common estimation” and was practiced in a business transaction in a free trading environment that did not involve force or any form of fraud could be considered a fair price. Again, Molina is particularly clear in this regard:

To sum it up, the just price of goods depends, primarily, of the common estimation of the men in each region; and when in a region or place it is usual to generally sell a good by a given price without fraud, monopoly or other forms of deception, that price should be taken as the measure and rule to judge the just price of that good in that region or place, provided there is no change in the circumstances with which the price legitimately fluctuates up or down. ([17], p. 169)

The use of common estimation as a value standard has important implications. As explained by Elegido:

If the standard of justice for a price is the amount obtainable in an open market, it not only follows that it is right to charge the price obtainable in an open market even when one’s own costs are much lower, but also that it is unjust to charge a higher price if one’s costs happen to have been significantly higher. (. . .) The moralists of the Salamanca School used the prices obtainable in an open market as an indicator of value. What can be said in defense of this choice? Prices obtainable in an open market are a value standard, as opposed to a cost standard. A strong reason for not using a cost standard for defining a just price is that not all activities which add costs add also value. ([16], pp. 32–34)

This does not mean, however, that only the natural price (derived from common estimation in the market) was considered just for the Salamanca School. In line with earlier scholastics, the authors of the School also considered the possibility of a legal price being set by a legitimate authority. However, while both the natural price and the legal price were part of the notion of just price, authors like Mariana and Azpilcueta displayed great skepticism toward distortive political controls on prices and showed concern for their harmful social consequences.¹⁵

Ethics of Banking: Usury and Interest

Due to their specific characteristics, financial activities were held to a higher degree of ethical scrutiny than the remaining areas of business. The moral condemnation of usury was a traditional hallmark of scholastic thought on business ethics and, in its beginnings, the Salamanca School did not change this stance. However, the gradually more liberal interpretation of the traditional extrinsic titles that could justify the payment of compensation on loans meant that more and more situations where interest was effectively charged were accepted or at least tolerated. While this paved the way for the acceptance of interest payments as part of regular business activity, the fact that the formal terms of the moral prohibition of usury remained mostly unchanged meant that the late scholastics were, in this regard, open to charges of hypocrisy.¹⁶

The contributions of the Salamanca School were more significant in what concerns another aspect of the ethics of banking, namely, the debate over reserve requirements. Within the School, there were those who argued for the necessity

of requiring full reserves on demand deposits and those who believed in the permissibility of a fractional-reserve system. In the first group were included authors like Saravia de la Calle and Martín de Azpilcueta, who were highly critical of the bankers' practice of loaning out funds received as demand deposits and argued for a system of full reserve requirements that would limit credit creation and monetary expansion. Other authors, such as Domingo de Soto and Luis de Molina, accepted the practice of fractional reserve banking but stressed that it imposed strict ethical obligations in terms of the prudent management of the funds received and of the risks taken. This obligation is made explicit by Molina:

It is important to warn that [bankers] commit mortal sin if they use in their own business dealings so much of the money they hold on deposit that they are later unable, at the right time, to hand over the quantities the depositors request or order to be paid against their deposited funds.... In addition, they commit mortal sin if they become involved in business dealings entailing a risk of not being able to return deposits.¹⁷

The Salamanca School thus devoted substantial attention to the ethical analysis of financial activities. While theoretical progress on the subject of interest payments was limited, the late Iberian scholastics demonstrated a rather developed understanding of banking practices and particularly of the economic and ethical implications of different reserve systems.

Business and Government: Taxation and Regulation

The financing of government and its implications for business and economic activity were also a theme of concern for the Salamanca School, particularly in what concerns taxation. In line with the Thomist tradition, moderate taxation to finance the proper activities of legitimate governments was deemed justified and implied an ethical obligation to contribute. But simultaneously the authors of the School were deeply concerned with the possibility of excessive public expenditure and the consequent oppression of the population in order to finance government spending ([2], pp. 83–85).

Of particular interest in this domain is the relationship between public spending, inflation, and the business activity. In the period during which the Salamanca School was active, the Spanish government greatly expanded its financial needs, both for internal purposes and for imperial expansion. This led to a constant search for revenue streams and one of the most readily accessible for government was currency debasement. Among the late Iberian scholastics, the harshest critic of these practices was Juan de Mariana, who devoted a great deal of attention to the subject: He understood it as a particularly aggressive and dangerous form of taxation. Mariana went as far as describing the debasement of copper coins as a government perpetrated form of theft:

The king is not free to seize his subjects' goods and thus strip them from their lawful owners. May a prince break into granaries and take half of the grain stored there, and then compensate for the damage by authorizing the owners to sell the remainder at the same price as the original whole? No one would be so perverse as to condone such an act, but such was the case with the old copper coin. [21]

Inflationary policies were condemned not just because of constituting a particularly mischievous form of taxation but also because of their very negative effects on business activity. Given that a monetary unit of account is essential for commerce, any policies that jeopardized its stability – just like that of weights of measures – should be avoided and denounced.

The contributions of the Salamanca School on taxation and inflation make clear that its authors understood that the broader economic, legal, and political framework has important implications for business ethics.

The late Iberian scholastics also held interesting views on competition, and these have important implications for regulation. For the most part they refrained from resorting to the idealized models of perfect competition that have come to dominate the imagination of many contemporary economists and regulators. As explained by Elegido:

The members of the Salamanca School had never heard of a perfectly competitive market; in fact, nobody did for two hundred years after them. They are clear that a market price which results from hoarding, collusion or any other effort to restrict artificially the goods offered in the market, does not provide a standard of fairness; but at the same time many of the examples they offer as instances of just prices refer to situations in which there are few vendors or even only one. (. . .) They themselves usually refer to the “common estimation” of people and the examples and arguments they put forward make it plain that they do not think of this as a “common opinion”, far less as the result of a formal poll. What they have in mind is the price at which a certain article is commonly sold, provided that there has been no collusion or artificial restriction of supply. ([16], p. 32)

This did not stop the late Iberian scholastics from understanding the harmful consequences of anti-competitive practices. Being keenly aware that the number of buyers and sellers in a given market influences prices, the authors of the Salamanca School were in general quite critical of situations of monopoly and monopsony. In the words of Domingo de Soto:

This conclusion clearly shows the iniquity of monopolies, which arise when a person buys from his prince the privilege to be the only one to sell an article; or when two or three merchants, forestalling the rest, combine to buy up stock, so that everyone must buy from them; or when they agree not to sell below a fixed price. (. . .) Symmetrically, and for the same reason, even if it does not happen as frequently, the monopolies of buyers with the intent to reduce prices are also unjust. ([7], book vi, q. ii, a. iii. (our translation))

Although the authors of the Salamanca School generally expressed tolerance for the establishment of monopolies by public authorities under certain conditions, their calls for moderation and restraint provide further evidence of their awareness of the problems associated with them.¹⁸ By contemporary standards of competition law, no comparable detailed regulatory prescriptions are to be found in the works of the Salamanca School, but it is probably safe to affirm that the positions of the late Iberian scholastics would point toward a regulatory mandate to promote contestable markets and limit anti-competitive practices that are detrimental to the common good.

Human Rights and International Law

The Salamanca School's contributions to the fields now referred to as human rights and international law are numerous and diverse but they share the common feature of trying to harmonize a Thomist conception of the common good with a respect for individual rights and personal autonomy. Although the concrete definition of the common good was not a central point of discussion in the Thomist tradition [22], the notion was generally employed in an organic sense to refer to the desirable conformity of the social order with the mandates of natural law. The Salamancans, for the most part, accepted this perspective but they added to it a stronger emphasis on personal autonomy than previous authors in the Thomist tradition. This is clear, as pointed out by Brett [23], in Vitoria's defense of the people's liberty to hunt wild animals on the grounds of valuing the personal responsibility of each individual to autonomously act according to right reason. Domingo de Soto further elaborated upon the notion of individual rights and stressed the intrinsic value of each person. This is particularly clear in a passage where Soto argues against the idea that a nation may legitimately sacrifice one of its innocent citizens in order to achieve a common goal, because "a man, although he is part of the commonwealth, is nevertheless also a person existing for himself, and so capable of suffering injustice, which the commonwealth may not impose on him" ([7], book v, q. i, a. vii. (our translation)). In the case of Jesuit authors like Molina, Suárez, and particularly Mariana, the emphasis on an individual sphere of freedom was most prominent in their discussion about the concept of self-defense. This was deemed to include not only individual life and integrity but also the protection of property and even actions against illegitimate aggressors of third parties.

An important characteristic of the Salamanca School is the emphasis placed on universality. That is perhaps clearest of all in the thought of Diego de Covarrubias y Leyva, who developed upon the ideas of Vitoria and Azpilcueta.¹⁹ Covarrubias started from an assumption of natural equal liberty among all men in a universal setting. Based on that, he argued for the existence of a basic set of individual rights that ought to be universally recognized and that are an indispensable part of the correct conception of the common good. This line of enquiry leads directly to an understanding of fundamental rights that largely transcends particular political and historical circumstances, as evidenced by the contributions of the School of Salamanca to the conceptualization of international law.

Francisco de Vitoria – along with his disciple Covarrubias – can be said to occupy a central place in the foundation of modern international law.²⁰ The late Iberian scholastics developed the traditional Roman law concept of *ius gentium* (*right of people*), extending its application to a global setting. The *ius gentium* was regarded as universally applicable and independent of the will of particular rulers or legislators. This meant that basic individual rights and fundamental principles of justice – as well as obligations to respect them – were not circumscribed to a particular nation or specific groups of people. Vitoria – although not all members of the School – went as far as considering the free movement of people and freedom of commerce as part of the *ius gentium*, a position that led him to be critical of restrictions imposed in these areas.

The practical application of the ideas of the Salamanca School in what concerns human rights and international law was clearest of all in the arguments about colonization and economic relationships in the New World. Making ample use of the doctrines of the late Iberian scholastics, the activist Bartolomé de Las Casas (1474–1566), a Dominican who studied at Salamanca, pursued a relentless campaign against the *encomienda* system that was prevalent in America. The *encomienda* system consisted essentially in allocating land and indigenous populations to European colonizers, who were legally entitled to explore their labor and demand tribute. While colonizers were also legally obliged to convert and educate the Amerindians, abuses were common and the practical situation was frequently one of near serfdom. The lobbying and campaigning efforts led by Las Casas directly led to the New Laws of 1542 enacted to limit the exploitative treatment of American Indians.²¹ The public controversy over the ethical implications of the colonization of the New World culminated in 1550, with the famous intellectual confrontation between Bartolomé de Las Casas, who argued that the Amerindians ought to be treated as free men, and Juan Ginés de Sepúlveda, who defended the Spanish colonizers on the grounds that Native Americans were slaves by nature.²²

The controversies over the colonization of America provide ample evidence not only of the notable universalistic conceptions about individual rights and the intrinsic dignity of the human person held by authors of the Salamanca School, but also of their courage in applying those ideas to the ethical analysis of widespread political, economical, and business practices of their day.

Contributions and Limitations of the School of Salamanca for Current Business Ethics

In line with the Thomist tradition, the business ethics of the Salamanca School is characterized by the aspiration to harmonize reason and faith. It is true that, in a context of increased religious diversity, some of the theological aspects of the School may appear misplaced or even naive. But that limitation seems less relevant if one is aware of the deep shortcomings of present-day business ethics in terms of supplying a purely rationalistic foundation for their conclusions. Furthermore, the method of the Salamanca School was rooted in a genuinely universalistic approach. Natural law was regarded by the late Iberian scholastics as apprehensible even by non-Christians and thus as universally applicable. The role of theology should be seen in the context of an interdisciplinary approach that sought to integrate ethical, juridical, and economic insights to a complete and robust understanding of real-world business activities. Both the universality and the interdisciplinary nature of the Salamanca School's contributions to business ethics constitute a valuable asset in the context of a global economy where problems and decisions have an increasingly important international and intercultural dimension.

The Salamanca School's approach to business ethics is also particularly relevant in the context of contemporary Catholic social thought.²³ Through the integration

of solid ethical foundations with an understanding of economic processes, the late Iberian scholastics show the importance of business activities for the common good and also how Christian principles can be made an integral part and a source of guidance for those activities.

It is true that in some areas – such as the payment of interest – there are considerable limitations on the positions of most authors of the School. It would be unreasonable and anachronous to expect them not to exhibit any such shortcomings. Nevertheless, they contributed notable achievements in some other areas – such as the subjective theory of value – that led to an understanding of the role of prices and entrepreneurship from which many valuable insights may be taken to enlighten contemporary debates on topics such as “fair trade,” market regulation, and even wage determination.

Conclusion

Overall, the main contributions of the Salamanca School to business ethics rely on the consistent application of a realistic natural law framework that emphasizes the ethical and anthropological foundations of the market economy. The first-person ethics adopted by the late Iberian scholars combined a universal understanding of the dignity of each person with a stress on individual responsibility. It was this approach that allowed them to make and explore the vital distinction between acts of misconduct undertaken by merchants and businessmen and the ethical evaluation of commerce and business in the context of their important contribution for the common good.

It was also by making use of this framework that this distinct group of Iberian scholastics of the sixteenth and early seventeenth centuries were able to make sense of the important ethical issues arising from the rapid growth of commercial and financial activity in the period in which they lived.

The Influence of Thomistic Thought in Contemporary Business Ethics

11

Helen Alford

Abstract

The chapter opens with a short passage that bridges from the time period covered by the previous chapters in this section, twelfth to early seventeenth centuries, to the period considered here, the twentieth century. Between the seventeenth and nineteenth centuries, the relation between business/economics and ethics fundamentally weakens, so that the way Thomist thinkers deal with questions in these fields in the twentieth century is often more fragmented than in the past. Similarly, economists and business experts themselves rarely make reference to philosophical ethics and almost never to Thomism. On the other hand, Thomism receives a major boost at the end of the nineteenth century, thanks to Pope Leo XIII, who also launches what becomes a new body of thought known as Catholic social teaching (CST), and thus, CST is much influenced by Thomism, although on some key points of importance to business ethics, there has been some divergence between Thomism and CST. Three areas of some divergence are discussed here. Key concepts within the Thomist/CST body of thought that are of importance for business ethics include: the concept of what is good, the nature and dignity of the human person, the common good, and human virtue. A more extensive account is given of two book-length treatments of economics and business, since although these kinds of texts are few in this period, they continue the Thomistic tradition of a systematic reflection on commerce and business, and other areas of business ethics where Thomistic thought has been influential are discussed. An assessment of the influence on business ethics of Thomism and CST is made. While they are currently ignored to a great extent by the mainstream of business ethics, there is

potential for a “breakthrough” in the future. This is due to the kind of problems that business ethics is currently experiencing and to what Thomism and CST can offer to remedy these problems.

Introduction

The previous chapters in this section regarding “Scholastic Thought and Business Ethics” demonstrate how scholastic thinkers, over about a 400-year period, developed very detailed analyses of key economic and business problems from an ethical point of view. By the time we arrive in the twentieth century, a lot of water has gone under the economic bridge; economic thought has become far more sophisticated, while the relation between economic thought and ethics has been fundamentally weakened and, at least for most leading economists, entirely broken. Whereas law, which developed as a separate field of study long before economics, always included within it serious reflection on the philosophy of law (jurisprudence), the philosophical reflection of early economists, including Adam Smith, never develops into a consistent tradition of reflection on the philosophy and ethics of economics. Thomism too, even among philosophers and ethicists, has been through a long period of marginalization, swept aside firstly during the Reformation, which included a strong antiphilosophical element as part of its elevation of the importance of the Bible, and then, for philosophical reasons, in the Enlightenment. Any ethical and philosophical overarching system of thought, such as that of Aquinas, breaks down in the face of these onslaughts, just as science and technology are developing integrated models of the world, increasing the marginalization of philosophical ethics and theology. Alasdair MacIntyre [27] has thus characterized the contemporary period as one of “living in the ruins” of any kind of ethical synthesis. One of the main concerns of this chapter, therefore, is to highlight the ways in which twentieth-century thinkers have tried to recover or renew the links between the most important strand in scholastic thought, Thomism, and the thought and practice of economics and business. One of the consequences of this situation is that we find far fewer systematic treatises on economic and business questions from the point of view of Thomism in the twentieth century than in the past; one of the few to have been attempted is the *Wirtschaftsethik* of Arthur Fridolin Utz. Since, thanks to its metaphysics, Thomist thinkers have always tried to produce an integrated system of thought, the attempt by Utz to produce an integrated socio-economic ethics for the twentieth century that takes into account twentieth-century economic thought and practice is particularly significant for this chapter and therefore will be considered in some detail.

Against this rather bleak backdrop the nineteenth-century Pope, Leo XIII (elected 1878) produced two “encyclicals” (authoritative statements, often quite long and detailed, made by a Pope) that make a crucial change in the situation, at least as regards the members of the Catholic Church. One year after his election, he published the encyclical *Aeterni Patris*, where he presented the thought of St. Thomas Aquinas as the basic source for theology and for the training

of priests.¹ Leo argued that the thought of St. Thomas on key issues such as the genuine meaning of freedom, on the sources of authority and law, on just forms of government, and on the importance of mutual love for social life, were a vital resource in dealing with the challenges of the day. Then in 1891, he published another encyclical on the condition of the working classes, entitled *Rerum Novarum*. Since Leo himself was deeply influenced by Thomism and convinced of the value of a Thomist ethic for the modern world, the main philosophical influence on this document is that of Thomism. As we will see later, *Rerum Novarum* launched a whole new area of reflection and action on the part of members of the Catholic Church with regard to “earthly realities,” including economics and business, which came to be known as the “Catholic social tradition.” Like Leo himself, this tradition is deeply influenced by Thomism.

Interest in these developments was not only limited to the Catholic Church, however. In October 1891, shortly after the publication of *Rerum Novarum*, John Keane, the recently appointed Rector of the new Catholic University of America, wrote an article for the *Quarterly Journal of Economics*, the oldest economic journal still in publication, under the title “The Catholic Church and Economics” [25]. Although the article denounces the way that economic thought has developed, separated “from what the civilized world understands by ethics” ([25], p. 29), it is nevertheless striking that such a prestigious economic journal, where many foundational articles in economics have been published in the twentieth century, should have accepted such an article. In many ways, this example is symptomatic of the relations between business ethics and both Thomism and the Catholic social tradition; in some ways, the fields of economics and business resist discussions about ethics, and yet, again and again, through different phases of the twentieth century, and in different ways, we will see them interacting, sometimes quite strikingly. It is not altogether surprising, therefore, that in looking ahead to the prospects for the future, we can identify some positive tendencies that may suggest that the currently marginal position of Thomism and the Catholic tradition in business ethics could develop into a more solid relationship.

Within the Catholic social tradition, there are a few other important terms to note, most of which also have the acronym in English of “CST.” The term “Catholic social teaching” usually refers to the encyclicals and other official documents of the Papacy, but it may also include documents produced by individual bishops or conferences of bishops, since all bishops are considered as official “teachers” in the Catholic Church. The term “Catholic social thought” usually includes Catholic social teaching but extends beyond this to include reflections produced by scholars and others on social questions (sometimes the nonofficial part of Catholic social thought is referred to as “Catholic Non-Official Social Teaching” (CNOST), as in Boswell et al. [12]). Catholic social movements have been crucial in carrying the social teaching and social thought out into the workplace and the wider society and for channeling practical experience and innovations on the practical level back to the teachers and scholars and thus promoting the ongoing development of this body of thought and practice. These movements have included Christian trades unions, the Young Christian Worker’s movement, the international movement of Christian

businesspeople (UNIAPAC), as well as more modern movements such as Communion and Liberation (with its special section for entrepreneurs known as the “Compagnia delle Opere”), and the “Economy of Communion” group of businesses that are linked to the Focolare movement.

In this chapter, for the sake of both brevity and clarity, the primary reference will be to Catholic social teaching, and the acronym “CST” will be used for this.

Twentieth-Century Developments in Thomism

Thanks to the impulse it had been given by Leo XIII, at the beginning of the twentieth century, Thomism was riding high in the Catholic Church. Some scholars (e.g., [13]) have suggested that, apart from its evangelical and pastoral merits, the Thomistic renewal was part of a move by the Church Magisterium from a defensive stance vis-à-vis modernity and liberalism toward constructive engagement with it. At the same time, however, this engagement with modernity should not be seen as an uncritical recognition of its value (nor of its economic and business elements that are of relevance to us here). Rather, the tension between Liberalism and Church teaching remains, even if the terms in which it is couched become less strident. A potential tension between accepting what is good and maintaining a critical edge toward modernity and postmodernity is an ongoing part of the interaction between Thomism and Catholic social teaching with modern sociopolitical and economic systems.

Thomism itself is not monolithic, with different schools of thought having developed within it following *Aeterni Patris*, often with very strong disagreements between them. These internal struggles within Thomism itself (mostly among Thomist philosophers) have given rise to various “hyphenated Thomisms”: “Neo-Thomism,” the most important strand within which came to be known as “Existential Thomism,” associated with the names of Etienne Gilson and Jacques Maritain; “Transcendental Thomism,” the leading thinkers within which have included Karl Rahner and Bernard Lonergan; and, later, “Personalist Thomism,” as developed by Jacques Maritain and Karol Wojtyła (later Pope John Paul II) and their followers.² As can be seen by the fact that Jacques Maritain figures strongly in both, Neo-Thomism and Personalist Thomism are close to each other, and both differ on key points from Transcendental Thomism.³ From the point of view of business ethics, the most important schools have been Neo-Thomism, for the first half of the twentieth century, especially in its Existential Thomist form, followed by Personalist Thomist in the latter part of the century.

In the area of Thomism more directly connected to business ethics, moral theology and philosophy, and more especially in the English-speaking world in the latter part of the twentieth century, there has been renewed interest in a Thomistic virtue-based ethics, pioneered by Elizabeth Anscombe and Peter Geach, and then picked up by other figures such as Alasdair MacIntyre. Of these thinkers, MacIntyre has had the biggest influence in the field of business, even though he has written little that deals directly with business ethics [19]. Apart from the general

importance of his thought, which applies to other great thinkers of this period like Anscombe, his significance for business ethics may be in part due to the fact that he uses the figure of the “manager” as symbolic of modern culture in a hypothetical reconstruction of the characters in a modern version of the medieval mystery play [27]. Interestingly, MacIntyre too is largely regarded as being “antimodern,” though Dobson contests the label often given to him of “antibusiness” since “modernity has corrupted business” ([19], p. 128); for Dobson, it is a “critique of modernity which lies at the heart of MacIntyre’s work, that provides the key to a full understanding of his position on business” ([19], p. 125). One of the key ideas in MacIntyre’s thinking is that of a “practice,” where internal goods are promoted in the carrying out of the activities that make up the practice, including the development of human capacities (virtues) in the process. MacIntyre contrasts this type of activity with the way business is conceived in much of the business literature, that is, as means for producing external (economic) goods, with the production of the internal goods of the virtues being at most incidental to the process. Indeed, this represents one of the great ethical challenges to business at the beginning of the twenty-first century; we become more and more efficient at producing economic goods, but we become less and less clear as to *why* we are doing it. Production becomes an end in itself, at least at the social level; only individuals may give whatever individual meaning they desire to their lives and apply the use of the economic goods they have earned or acquired to creating this meaning. The problems are clear: firstly, we spend most of our waking hours working, and if no meaning can be given to this, and we are not developing through our work activity or such development is only incidental, what meaning can we really give to our lives if we can only dedicate ourselves to that meaning in the few hours of “free time” that we have? Secondly, what sense does it have to talk about individual meaning? Language, the primary means by which we express meaning, is necessarily social and arises from a shared way of life. But MacIntyre is right to locate these problems in modern thought, not primarily in business, even if business may be one of the main mechanisms by which that modern thought impacts on our society today.

Thomistic Thought and Catholic Social Teaching: Similarities and Differences

As already noted, as a form of moral philosophy and theology, Catholic social teaching is heavily influenced by Thomism. Compared to Thomist thought, CST is less systematic, but in terms of application to current questions of relevance to business ethics, it is more developed than Thomism. This section, therefore, will present key themes that are common to Catholic social teaching and to Thomism, distinguishing between them where appropriate.

Key Common Concepts in CST and Thomism

Concept of the Good

For St. Thomas, the first concept from which his whole system of thought derives is that of existence. God is existence in a complete sense, whereas other beings participate in God's existence and only exist incompletely. Beings as we know them in this world are always changing – hopefully, mostly developing in a positive way, but they may also be damaging themselves or being exploited or abused by others. They change because they are not fully developed or fully existing; they are always beings *in potentia*, with the potential to change and develop further. Developing as yet unrealized capacities, which exist so far only potentially in the person him or herself – or, we might say, becoming more “alive” – is what is fundamentally good, and other meanings of good are derived from this meaning. This good is developed through action, since it is through action toward good ends that we turn potential into actual capacity – that we realize our potential more completely, exist more fully, and therefore create that which is good. The capabilities approach of Martha Nussbaum [32], building as it does on an Aristotelian philosophy, is close to this position, as is, to a lesser extent, the work on capabilities of Amartya Sen [39]. A Thomistic ethic, therefore, such as a business ethics based on Thomism or CST, starts from the idea that doing what is good is doing what brings about more human development, greater realization of potential, most of the time in a community of action where the good is developed together and, to some degree at least, only held in common (goods like culture, language, or a sense of justice are only held among a particular group of people or they are not held at all; it makes no sense to speak about an individual language, not shared with anyone else, or an individual sense of justice).

Common Good

One of the key Thomist thinkers on the common good in the twentieth century has been Jacques Maritain. Starting from the personalist insight that each human being, though a unified whole, has both an individual and a “personal” (i.e., intrinsically relational) dimension, Maritain can show that we truly do hold goods *in common*, which is possible because of our intrinsic relatedness to others, allowing us to pursue objectives in common and thus to create really shared goods between us. It is through this development of shared goods that we arrive at the articulated idea of the common good, with its various components, outlined below. The common good is there to support our development as persons, since our spiritual or relational dimension extends beyond the physical, and we are all ends in ourselves. At the same time, as individuated beings and members of the species *Homo sapiens sapiens*, our individual good is part of the good of the whole, and the whole as such can ask sacrifices of us (as when soldiers lay down their lives for their countries). Therefore, Maritain can argue that the relation between the good of each person and the good of all persons (the common good) is one of “mutual implication and reciprocal subordination” ([29], p. 46).

“The” common good is the result of the common goods that we develop with each other at various levels and in various groups. It can be “sedimented out,” so to speak,

in tangible ways, as in the development of various kinds of infrastructure (transport, communications, energy supply), and has a very extensive “instrumental” or “tool-like” dimension, such as in policies, rules, and customs, all of which allow the development of persons in the context of various types and level of community. According to one of the most authoritative statements in Catholic thought in the twentieth century, the common good is “the sum total of social conditions which allow people, either as groups or as individuals, to reach their fulfilment more fully and easily” ([16], n. 164, quoting *Gaudium et Spes*, 26). Bringing the idea into business ethics, De George [18], following indications in *Gaudium et spes*, identifies five components of “the” common good: (1) “public goods” (parks, roads, armies, and so on, but on the relation between public and common goods, see [2]); (2) common goods that do not necessarily require government provision, such as air or water; (3) immaterial goods, such as relations, conditions, systems, and structures existing in a human community; (4) moral values and virtues, and all that enhances human life and flourishing, such as solidarity, freedom, peace, justice, respect for human life, and so on; and (5) goods and services produced and traded in the marketplace (private goods), insofar as they are part of our overall well-being.

Another way in which the common good is incorporated into business ethics is through “grounding” or “founding” stakeholder theory and corporate social responsibility ([3, 5–7]). Goodpaster et al. [22] have shown that stakeholder theory, for instance, provides a useful analytical tool, helping us to identify who are the relevant parties to be involved in business decision-making, but that it contains no ethical principle itself which would allow it to decide how to make that decision. Various possibilities have been suggested: Freeman and Gilbert [21] suggest using a Kantian principle, but they themselves recognize that this has practical problems; Sacconi [37] suggests using a social contract model, but this suffers from a weak sanctions system (the “reputational mechanism”) and, more importantly, tends to create a “crowding out” effect whereby intrinsic motivation to do the good is replaced by extrinsic (avoiding penalties and gaining rewards). The common good, however, can provide a foundation for decision-making that respects stakeholders as ends in themselves, allows a decision to be synthesized (thus going further than Freeman and Gilbert [21], who claim to base their approach on a Kantian ethic), and, because it is made in the interest of all stakeholders, since it is based on their *common* good, avoids the perverse side effects generated by the social contract approach.

A key place within the common good concept needs to be given to the environment, seen as both an ecosystem on which life depends and as a gift from God, and is referred to in the *Compendium* explicitly as a “common good” ([16], n. 466). Creation is a gift to be treated with responsibility and respect, “destined for all.” The “different categories of beings, whether living or inanimate” cannot be used “with impunity” just for economic ends ([16], n. 466). At the same time, as a gift given by the creator to human beings, responsible human intervention in nature is “positive” ([16], n. 473). Where scientific data on human intervention is limited or contradictory, CST recommends the “precautionary principle” meaning “certain guidelines aimed at managing the situation of uncertainty” and which “encourage every effort for acquiring more thorough knowledge,” as well as, given the

uncertainty involved, transparent decision-making procedures ([16], n. 469). There is both a sense that the environment is a good in itself, to be preserved and developed, with special mention of the value of biodiversity ([16], n. 466), and that the environment needs to be protected for the good of human beings, including indigenous peoples ([16], n. 471) and future generations ([16], n. 467). The principle of the universal destination of goods provides “a fundamental moral and cultural orientation” with regard to the tragic interconnections between poverty and environmental degradation, especially where “hunger and poverty make it virtually impossible to avoid an intense and excessive exploitation of the environment” ([16], n. 482).

Closely related to the question of the common good as it relates to the environment is that of globalization. Strikingly, the *Compendium* presents globalization as one of the three “great challenges facing humanity today,” along with “the truth itself of the being who is man” and “the understanding and management of pluralism and differences at every level” ([16], n. 16). If globalization is to be a true extension of the common good to the global level, it must be a “globalization in solidarity” or, in other words, “a globalization without marginalization” ([16], n. 363). A whole chapter of the *Compendium* is dedicated thus to the “international community,” whose organizations “exist solely for the common good” and “for the purpose of achieving a greater degree of international ordering” ([16], n. 442); more on the question of “order” is given below. Among the many aspects of economic life that are treated with regard to globalization (including work, unions, civil society, and economic/financial systems), perhaps the question of agriculture and the production of food merits special attention, linking this question to the environmental one as well ([16], n. 299).

Nature and Dignity of the Human Person

The fundamental starting point for modern CST is the centrality of the human person for the consideration of any social question. Insofar as this relates to the recognition of freedom of conscience and belief, this represents the reinterpretation and incorporation into Christian teaching of an idea that came to maturity among Enlightenment thinkers (building on early more explicitly Christian thinking) and which it took some time for Church authorities to accept. At the same time, the nature and dignity of the human person grounded on the biblical affirmation that each person is made “in the image and likeness of God,” with an even greater sign of their dignity in the passion, death, and resurrection of the Son of God for each human being individually as well as for humanity as a whole, is standard teaching.

In the *Compendium*, the third and last chapter of Part I is dedicated to the human person and human rights. It begins with reference to the human person as “the living image of God himself” ([16], n. 105), and that social life should have the human person as its “subject, foundation and goal” ([16], n. 106), creating a parallel with the Church herself “since she is neither outside nor over and above socially united men [and women], but exists exclusively in them and, therefore, for them” ([16], n. 106). Social relations create “some of the best possibilities for ennobling the human person” but may also involve the “most loathsome rejections of human

dignity” ([16], n. 107). Being in God’s image indicates a natural openness toward God in the human being, and, since God is Trinity, three persons in one Godhead, a natural relational or social dimension ([16], nn.109, 110). Since both men and women are made in the one image of God, they are equal in dignity and are called to help each other. They are also called to have dominion over the earth, expressed through the image of naming all creatures: “in giving things their names, man must recognize them for what they are and establish with each of them a relationship of responsibility” ([16], n. 113). Sin, however, disrupts these natural relationships, creating alienation, that is, separation from God, from each other and even conflict within oneself. This then leads to mutual accusation, to hate, to killing, and to all kinds of wounds in the social fabric, such that we may recognize that sin has personal and social dimensions. Some sins directly attack the social order, especially those against justice or against human rights, generating “structures of sin,” starting from personal transgressions against the good and amplifying the effects of personal sins so that these effects “grow stronger, spread and become sources of other sins, conditioning human conduct” ([16], n. 119). These effects go “well beyond the actions and brief life span of the individual and interfere also in the process of the development of peoples, the delay and slow pace of which must be judged in this light.” The *Compendium* picks out two of the most important categories of social sins in our day: “the all-consuming desire for profit” and “the thirst for power, with the intention of imposing one’s will upon others” ([16], n. 119). At the same time, there is no cause for despair; through the Incarnation and Redemption wrought for us by Jesus Christ, the grace needed to overcome both sin and its effects is available to us: “the new reality that Jesus Christ gives us is not grafted onto human nature nor is it added from outside: it is rather that reality of communion with the Trinitarian God to which men and women have always been oriented in the depths of their being, thanks to their creaturely likeness to God” ([16], n. 122).

Beyond the biblical texts, looking more philosophically, the human person is neither an absolute individual nor a mere part of a bigger social body. The human person has an individual dimension and a relational (spiritual) dimension, even though, as the *Compendium* affirms as the first of the “many aspects” of the human person that it considers, the human being is a union of these aspects, that is, a union of body and soul ([16], n. 127). Human beings have an individual, corporeal dimension that links them to the material world and a spiritual dimension that confers a unique dignity and a profound openness to relating to others and to God, making our relationality as much a part of our being as our individuality. It is on this basis that the CST can insist on the “social nature” of the human being, a relating to others that is part of our nature and being. Another key aspect of the human person is his or her freedom, which is built on our nature and the nature of the world around us, and needs to be exercised in accord with the order in nature. Human rights are recognized as “one of the most significant attempts to respond effectively to the inescapable demands of human dignity” ([16], n.152), since the “roots of human rights are to be found in the dignity that belongs to each human being” ([16], n. 153).

Duties are “inextricably connected to the topic of rights” since “in human society to one man’s right there corresponds a duty in all other persons: the duty, namely, of acknowledging and respecting the right in question.” Those who claim recognition of their rights while neglecting their duties towards others “build with one hand and destroy with the other” ([16], n. 156).

Virtue

The idea of virtue, or of virtue ethics (as opposed to Kantian or utilitarian ethics), has gained ground in the business ethics literature during the latter half of the twentieth century and this has continued on into the beginning of the twenty-first. The role of the Thomism in this is recognizable, even if the main point of reference for most virtue ethics in business is Aristotle rather than St. Thomas. Interestingly, this idea has not been nearly so prominent in the tradition of Catholic social teaching before John Paul II, compared to some other themes that have been incorporated into business ethics (such as the questions of the common good, just wages, and human work).

One of the issues that has tended to separate the way in which virtue ethics has developed in the business ethics field, compared to its Thomistic version, is the separation of principles from virtues. Solomon, therefore, can say that the virtue-based approach to ethics is opposed to “that 200 or so year obsession in ethics that takes everything of significance to be a matter of *rational principles* . . . Aristotle is quite clear that it is the cultivation of character that counts, long before we begin to ‘rationalize’ our actions” ([40], p. 323, italics original; see also [30]). Solomon argues, however, that this means that virtue ethics needs a “corrective,” coming from the “language of rights” and a “sense of utility” ([40], p. 324). Melé [30], however, starting from Aristotle, but especially also from St. Thomas, argues that “it does not seem incoherent to introduce principles into virtue ethics, if these serve as guidelines for acting virtuously” and quotes St. Thomas in saying “precepts are given about acts of virtue” ([30], p. 228). For St. Thomas and the tradition of Catholic social teaching, virtues are oriented toward the promotion of the common good of a complete (political) community and intermediately to the common good of the incomplete communities in which we take part (families, local communities, and organizations including businesses, sports clubs, and so on). Both the common good and the exercise of virtue are guided by the fulfillment of our nature, that is, the good action is what helps human beings, in communion with creation as a whole, to develop. St. Thomas and the tradition of Catholic social teaching use the idea of “natural law” to explain this; our actions are made good by doing what realizes the potential of our being, in communion with others, which is like saying that it is guided by the “law” of our nature. For St. Thomas and the tradition of CST, therefore, there is no incompatibility between principles and virtues, but rather the two support each other. Melé [30] demonstrates how two principles from the tradition of CST, the “personalist” and “common good” principles, can be integrated into a virtue ethics of business to make it more complete. The superiority of the Aristotelian-Thomistic virtue approach to decision-making over other approaches such as emotional intelligence, in the sense of incorporating passions

or emotions, along with the will, into an integrated decision-making approach guided by the intellect, and thus avoiding dry rationalism, impulsive and relativist voluntarism, or pure hedonism, has also been pointed out [9].

Differences Between Thomism and CST

Person and the Common Good

One of the ways in which CST and Thomistic morality are both linked and differentiated from each other regards the two basic concepts to which they make reference: the common good and the human person. It is not surprising that a solid theory of human action should be based both on a particular model of the human being (or human nature) and on how human beings cooperate toward, and are supported by, common structures and shared goods. But thinkers often diverge regarding how the common good and the person, especially human freedom, relate to each other. While Thomists can take varying positions on the relation between the two, in much of CST, it is the dignity and freedom of the human person that is more emphasized (a “turn to the subject”), though that person is seen to have a “social dimension” which necessarily links the exercise of freedom and the promotion of human dignity to the common good. The German Jesuit school, represented by Nell-Breuning, Gundlach, and especially Heinrich Pesch and his “solidarist” economics (for a good synthesis, see [46]), gives a greater role to human freedom, while German Dominican thinkers of the same period, especially Eberhard Welty, would see the common good as the controlling concept; each person finds their fulfillment in this life on the basis of that common good, and in the life to come, God is the “common good” in which all find their everlasting life and goodness [33]. In the *Compendium*, while the third chapter is dedicated to “The Human Person and Human Rights,” the common good is only the first of the seven principles enunciated in Chap. 4 entitled “Principles of the Church’s Social Doctrine.” To some extent, this difference is explained by the different periods of history in which these two bodies of thought originally developed.

Private Property

Another key issue of relevance to business ethics where a distinction can be made between Thomism and CST is on the question of private property. In the discussion of the thought of Arthur Fridolin Utz, below, we see a classic presentation of the Thomist view of the justification of private property, qualifying this right in a more precise way than one finds in the CST. Especially in *Rerum novarum*, the presentation of the right to private property gives the impression of being more absolute than Thomists would have put it, although the impression given by later encyclicals is that there is a move toward a more nuanced position. But there are clear indications that at least in the early stages of the development of CST there was a difference from Thomism; if not, it is difficult to explain why one of the leading Thomist thinkers of the early twentieth century, the Hungarian Dominican

and Angelicum professor, Alexander Horváth, was censured by the Holy Office for his 1929 book *Eigentumsrecht nach dem Hl. Thomas von Aquin*, including as it did a classic presentation of the Thomistic position on the justification of private property.

Natural Moral Law

A third and final area where Thomism and CST can be distinguished regards the role of natural law. For Thomists, natural law is a foundational concept and is very present in their moral theology and philosophy. Natural law is also foundational for CST, but it is referenced much less than it is by Thomists. This can partly be explained by the twentieth-century general distrust, especially in the social sciences, of any kind of language that seems to fall into the “naturalistic fallacy” as G.E. Moore calls it in his 1903 *Principia Ethica*. Moore argues that one cannot logically move from a factual premise to a moral conclusion, but since he does not argue that one cannot move from a moral premise to a moral conclusion, the so-called fallacy collapses if the argument is expanded to include moral, and not only factual, premises [14, 45]. Ridge [36] points out that Moore himself later accepted that his arguments in his 1903 book to sustain the position that goodness was not a natural category were not sustainable, and there have been many refutations of the so-called fallacy by others [34], including, interestingly, evolutionary biologists [17, 45]. Moral philosophers may still disagree with each other as to how nature and morality relate, but they cannot maintain that it is illogical or inadmissible to start a moral argument from premises that include, among others, statements about nature. As a slogan, however, the term “naturalistic fallacy” has been very successful in blocking the use of the idea of natural law in moral discourse, and the effect of this on CST can be seen. Still, the differences between Thomism and CST regarding natural law are more to do with presentation than substance, and the concept of natural law remains fundamental for it, since not to do so creates an even more difficult problem: with what other criteria does one determine what is just (i.e., in what other way does one recognize what is due to all members of society)? Modern social and ethical theories make reference to various methods of arriving at consensus, referring to the fundamental model of society as a social contract, but there are clear problems with basing our evaluation of what is just on what is the supposed consensus in society. We know from history that the consensus can be unjust (twentieth-century history is full of such examples), apart from the serious problems involved in determining when a consensus has been reached and how to ensure full and real participation in the decision-making process. The great systematic Thomist ethicist, Arthur Fridolin Utz, for instance, saw the importance of natural law as enabling “a pluralist society to achieve successful dialogue and consensus on core values” ([15], p. 344). It is possible that with the current recognition of the “nature” of the environment, that is, that we cannot treat our planet only according to our supposed “consensus” (many would say “what consensus?”) but that we need to treat it according to its own nature, the possibility of seeing nature, including human nature, as a guide for human action in general could be more widely recognized.

Influence of Thomism and CST on Business Ethics

It is notable that encyclopedias of applied ethics or ethics and philosophy will include entries regarding Thomistic thinkers on politics, social ethics, just war theory, and the common good, but that this will be the first handbook which includes a discussion of the relation between Thomism and business ethics.

There is some difference of opinion as to how much Catholic social teaching, and Thomism by implication, has influenced business ethics [20, 28, 31]. Fleckenstein [20] is perplexed as to why “business students and businesspersons are not more influenced” by such an “extremely rich” tradition as Catholic social teaching. She suggests some possible reasons: excessive idealism, resentment of Church authoritarianism, the insistence on rights that preclude mutual agreement, and the underlying secular pluralism of the United States, though her discussion is not limited to the USA. McCann [31] was hopeful that the 1991 encyclical of Pope John Paul II, *Centesimus annus*, could do for late-twentieth-century society “what Leo XIII did for the blue collar working class.” Marens, instead, argues that sociocultural changes over the twentieth century have made it harder for CST to influence society; CST has lost “not relevance, but opportunity” ([28], p. 286). He gives other historical examples to support his case that influence can only be had where there is an openness on the part of society and especially societal leaders to listen to what is being said and to act on it. At the same time, Velasquez and Cavanaugh [42] open their paper on “Religion and Business” with an impressive account of the interest generated across US society, and especially in the business press, during the process that resulted in the pastoral letter entitled “Economic Justice for All,” at the end of which they can say “[t]he letter will likely have a lasting impact” ([42], p. 124).

More generally, it needs to be said that without a philosophical reconstruction of the “mainstream” way of understanding business and management, Thomism and CST will continue to have difficulty in engaging with them properly. This is because, for Thomism, business ethics is not just one subject to be studied alongside the rest but provides the underlying principles for guiding business activity at its more technical level. This is the idea of Utz in grounding business ethics in the wider definition of an ethical economic order, and his thought has been expounded more fully here than that of others here for this reason. Techniques are always used toward achieving certain goals, and one of the objects of the discipline of ethics is to ascertain what those goals are or should be. Technical disciplines that do not recognize that they are based on more profound assumptions or premises that they take as self-evident (unexamined) and on which they are built do in fact have such assumptions, but their experts are not aware that this is the case, and the fact that they use their techniques to achieve these goals is not a question on which they reflect. In such situations, unless these taken-for-granted assumptions happen to be amenable to an Aristotelian-Thomistic ethic, a well-founded, open dialogue with Thomism and CST is not possible. Since utilitarian philosophical assumptions are largely to be found at the basis of most mainstream economic and business theory up to now, a philosophy that is incompatible with Thomism and CST, this block against an open dialogue remains. Thinkers have advanced

proposals for rethinking the fundamental purposes and goals of business within the Thomistic tradition, but these approaches remain marginal to the business disciplines as a whole, including business ethics, and thus, the dialogue remains blocked on this, foundational, level.

The influence of this body of thought also depends on the critiques it receives from elsewhere. Sacconi [38], for instance, has criticized the use of Maritain's concept of the common good as an ethical grounding for corporate social responsibility because he claims it is too "demanding" on a metaphysical level, that is, it requires metaphysical assumptions that most are not willing to make. There is some merit to this argument, though it can be countered in a number of ways. Firstly, one could note that much empirical research on the border between psychology and economics confirms the approach to the common good adopted by Maritain, so that one can arrive at similar conclusions taking a phenomenological approach, with its much more limited metaphysical presuppositions. Secondly, some thinkers have tried to avoid the teleology implicit in virtue ethics by linking it to other, similar bodies of thought. Bertland [11], for instance, tries to base a virtue ethic on the capabilities approach of Nussbaum and Sen, while Velasquez and Brady [44] make the bold attempt to found business ethics, including the virtues, on natural law.

Arthur Fridolin Utz: A Key Thomist Thinker on Economic and Business Ethics

A. F. Utz was one of the major Thomist thinkers in the area of social and economic ethics in the twentieth century. He is one of the few thinkers in this period who was able to continue the tradition of an integrated treatise on economic and business questions from a Thomist position. As a result, his thought merits a more extended treatment than that of others mentioned here. In his *Wirtschaftsethik*, Utz aims to produce a systematic economic ethics, building both from empirical observation and from an ontological analysis of man, of his nature and his ends. In the preface he says: "The moral philosopher thus begins with an empirical analysis. In a second step, he tries to assess how the goal of an action fits within the framework of the overall sense of human life; here he passes beyond the limits of the empirical and pushes towards the essential goals of man. Only in this way does the definition of an action stand squarely on real ground."

One of the fundamental elements of the approach adopted by Utz is the need to abstract from current, historical economic arrangements in order to be able to make a proper evaluation of what the key elements of an ethical economic order should be. As he says in the preface, "there is no realistic ethics without abstraction." Too often, he laments, thinkers take their own historical circumstances as read and reflect on the ethical dimension of such circumstances. He admits that it is not at all easy to make the abstraction required (and we always risk contaminating it with elements that are historically conditioned through insufficient detachment from our concrete circumstances), but he insists that some kind of abstraction is unavoidable, and the question thus becomes how well we are able to do it not whether to do it or

not. All great moral theories have to abstract at some point; Rousseau needed the idea of the social contract, and Rawls has the idea of the “original position,” both of which are abstractions on the basis of which influential moral theories have been developed.

If we start from a nonindividualistic, that is, social, view of the human being, however, the first concern for economic ethics is “to determine what is the common good to be achieved through economic actions” ([41], Sect. 2.2). From this then flows the need to consider the ethics of an economic order or system, “understood as an ordering of actions that are, on principle, not arbitrarily unified, thus not of a contractual nature, but that are oriented to a common good as established by a social ethics” ([41], Sect. 2.2).

Utz maintains that an argument needs to be made on three levels in order to arrive at an ethically sound ordering of the economy. The first level is the most general and abstract, that of the supreme norms of economic ethics. These norms come from the nature of man and can be called the “metaphysics of the economy” ([41], Sect 1.2.5). The defects that are part of concrete human nature are not considered at this level. Here we find the imperative that requires that the common good be placed before the private good in economic action. This is recognized, for instance, in most national constitutions that allow the state to expropriate an individual’s private property – compulsory purchase (UK) or eminent domain (US) – with proper compensation, if the needs of the society as a whole require it.

On the second level, the actual mode of behavior and inclinations of man in relation to economic goods are considered. At this level, we can begin to see what aspects of economic order are needed so that economic actions can realize in at least an approximate way the supreme norms of social justice. So at this level we can ask ourselves: what organizational principle of economic planning is necessary given the natural, or quasi-natural, behavior of the members of that society in relation to natural resources and the general good? We will find the justification of private property at this level of analysis, and, at the end of the analysis itself, we will be able to propose the key elements of a socially just economic order.

On the third level, we find considerations of the various practical elements of a real economy in relation to ethics (price formation, relations between workers and employers, questions of money and credit, and so on). Most books on economic or business ethics focus on this level. But if we do not make the two prior steps in the analysis, we risk requiring too much on an ethical level from the businessperson. The latter cannot be held responsible for problems that arise from the organization of the economic system as a whole; these are in the realm of the politician. If, for instance, the economic system is so constructed that the manager is expected to be primarily concerned about profit, then he cannot be blamed (or at least he is only partly responsible) if he behaves that way. The economic order or system should create the possibility for the profit motive to be harmonized with, or at least to not contradict, the supreme norms of economic action.

Economic rationality has to aim to include social needs in some way or another, or else we end up either with an unstable system or the “economization” of society

and the exclusion from it of higher values. The first step, according to Utz, is to recognize that we are not here dealing with rational economic principles, such as efficiency, that need to be oriented toward the realization of a-rational values (such as those deriving from religious revelation alone), but that the values too can be rationally discussed. His argument arrives ultimately at the position that all political systems have to orient their economies to the satisfaction of needs and the creation of values that can be rationally determined, even if they are not produced in the same way as economic values are. Utz argues as always that these ultimate values come from natural law, such as self-preservation, self-fulfillment/perfection, generation and education of children, acquisition of knowledge, and knowledge of God. A Kantian approach here is not able to help, since it is based on duty and the free exercise of will, rather than on being.

Private property is considered by Utz to be the heart of the problem of the economic order. It relates to the second level of a natural law analysis. For Thomas, at the first level of analysis, we find natural law in the strict sense, “that which is knowable directly from the ends of nature, without rational inference” and is therefore accessible to everyone, from the most simple and uneducated to the greatest scholar. The second level “does not derive from nature in itself but from a rational reflection of man towards a useful configuration of human life” ([41], Sect. 6.1.3.2). This distinction was known to the scholastics as “primary” and “secondary” natural law: “secondary natural law is changeable, contrary to that which is primary, due to the changeable objective, concrete conditions” ([41], Sect. 6.1.3.2). The right to private property belongs to this second level of natural law, since it connects with the need to support individual initiative in the economy, which, as we have seen, we only find in a second moment of our analysis. The primary level of natural law leads us, as already said, to expect that the common good comes before individual good. Thomas also sees this difference as part of the fall of man from his ideal state ([41], Sect. 6.1.3.2).

With regard to the impact on the economic order of the justification of private property, a key issue is whether private property is an individual right, which only in a second moment gives rise to social obligations, or whether it needs to be seen from the beginning in the light of the social nature of the person. Most modern systems of justification of private property start from a subjective, individualistic view of the human person, and thus, private property is justified on the basis of serving the realization of the individual. The social aspect of the economy creates problems for this position, since paying taxes or any other kind of social obligation cannot be satisfactorily justified against this ethical foundation. If, however, private property is justified in terms of a secondary natural law where at the primary level the requirements of the common good are taken to be prior to those of the individual, the justification for a “social mortgage” on private property arises naturally. This has important implications for the creation of an ethically grounded economic order. In order to arrive at the definition of such an order, Utz reasons in three stages:

Step 1: This is on the first, or metaphysical level of analysis, where economic ethics must take the axiological ends of man as the starting point. The aim of the

economy is the material well-being of the members of society, measured according to the essential final ends of man, taking into account the limited nature of resources and a sustainable relation with the environment. Particular attention to the environment is of the highest order among ethical requirements, since all societies have to consider their well-being in relation to others and to the future. The aim of the economy given here requires us to include factors that an analysis based only on pure economic efficiency alone would exclude, such as the need for all to have access to work, and for man's needs that go beyond those arising from work. It is necessary to be aware of anthropologically founded ethical norms, on the basis of which technoeconomic decisions can be made. Economic science, if based on a global orientation such as this one, cannot regard indifferently "more as better"; the end of the economy is not to produce as many consumable goods as possible, while ignoring the consequences of this for the quality of life for the whole of society.

Step 2: Here we move to the second level, where we look at the human being in more concrete terms. At this level, our focus is on the harmonization of individual economic actions with the requirements of the common good. Utz begins by noting that it would be logical for man to put the common good before his own personal good, but that in practice, at least in the economic sphere, we do not find that this is so. Still, the basic principle of step 1 is still valid – ultimately all individual economic actions have to be harmonized with the final ends of man in society. At the same time, concrete men and women are not motivated to participate in the economy by the idea of promoting the common good, and this is partly due to the inability of each one (in a large society) to foresee or know what that common good could be (whereas it may be possible to see it on the level, say, of the family). We can develop useful indicators of the pursuit of the common good in society, but these operate a posteriori, measuring a situation already created by economic actors. So concrete human beings invert the precedence that we have mentioned in step 1: they seek their own personal good first when acting economically. We must found any realistic economic ethic on this "regulating principle" of the economy. The only economy that can be considered to correspond to the nature of man as we experience it practically is one that gives practical priority to initiatives stimulated by the search for individual good. The economic decisions of the members of society have to be harmonized thus, through the economic system, with the common good, since that harmony cannot be found at the first stage of the economic system (in the motivational structure of human beings themselves). We should also note at this level that concrete economic decisions should avoid the waste of resources as much as possible, and thus we must ask ourselves: what are the conditions that lead to the most parsimonious use of natural resources? This condition can only be satisfied in an economic system that legitimizes private property.

Step 3: What are the elements required of the economic system by the common good? Utz says that "an economy oriented towards the common good implies: 1. the capacity to acquire goods on the part of all members of society; 2. the possibility to take part in the economic process for all members of society who have the ability

and the will to do so, either (a) as entrepreneurs, or, (b) as employees” ([41], Sect. 7.8.6). The first condition is satisfied by what we may call the “second distribution of income,” covering all those who do not participate directly in the economic process (the sick, the elderly, and so on). This “second distribution” must be considered as part of the essential definition of a market economy. The second condition implies the widest possible participation in entrepreneurial activities and the offer of work to all those who are able and willing, that is, full employment. In a national economy, stability of prices can be maintained, though this becomes problematic once the economy is seen in an international/global context. Similarly, in an economy where competition is ordered toward maintaining full employment and the stability of prices, growth is necessarily ordered toward these ends and can no longer be growth at any cost. Utz thus arrives at his ethicoeconomic definition of the economic order: “*the competition economy, founded on the universal right to private property, both for production and consumption, with the greatest possible diffusion of productive property, with stability of price levels and full employment.*” He argues strongly that “this definition is the only real one. The shorter one given by economists is instead unreal because it does not correspond to the integral economic ends of man” ([41], Sect. 7.8.6).

Other Thomistic Thinkers on Economic and Business Ethics

Other thinkers who also have produced important general discussions of Thomism in regard to the social political order would include Johannes Messner (see [44]), Thomas Gilby *Between Community and Society* [47], and, much later, Jonathan Boswell in *Community and Economy* [48].

Alford and Naughton in *Managing as if Faith Mattered: Christian Social Principles in the Modern Organization* aim to provide a textbook for an introduction to management course or a business ethics course in Catholic universities, as well as being useful for practicing business people [1]. The aim of the book is to provide an introduction to CST, and the wider Catholic/Christian social tradition, as it relates to business and in a way that makes sense to business people, that is, not by beginning from the principles of CST but from the existential experience of managers who are trying to live as Christians in their workplace. The book is structured around the idea of “engaging” the tradition of Christian social thought with business theory and practice, on the model of the gears engaging in a gearbox and allowing the power from an engine to be transmitted to the wheels of a car. Energy and power is released when people who work in business are able to “engage” or connect their lives of faith with their work lives, instead of living the damaging and weakening experience of a “divided life.” This is the opening idea of the first chapter of the first part of the book “Establishing the Engagement,” which discusses the obstacles to connecting faith and work and then considers three main models for doing so (as mentioned above): an implicit model, based on shared understandings of the good (relying on the natural law); an explicit model, where a business is explicitly founded on Christian principles – we are less accustomed to

this in practice, but we are used to the idea of Catholic schools, hospitals, and civil society organizations, which are also forms of “enterprise” in a wider sense; and a prophetic model, where the level of injustice in a situation is so great that the only way to “engage” it is to denounce it (this is a true form of engagement; the Old Testament prophets were not condemning the people of Israel, but were sent by God to wake them up from their desertion of their true calling and to bring them back to a right relation with God). Two chapters then follow, the first on the structural level of a business, and focused around the question “what is business for?,” and the second on the level of the human person, and focused on the questions of human development and the virtues in business. As part of the structural chapter, it is argued that we need to analyze the goods that a business creates and manage them all in an appropriate way; this means including the management of the production of common goods and excellent or intrinsic goods, those which relate to the development of the human person, both as an individual and as part of the “community of work” which is the business. As part of this analysis, the shareholder model of the firm is found wanting, since it negates the creation of excellent goods within the firm’s production process and treats the business as no more than a machine for making money. The stakeholder theory is also subjected to a qualified critique, since it cannot account for common or shared goods, which are also created during the operation of the business.

Part two, “Making the Engagement,” takes a number of activities that form part of the everyday work of a business and “engages” them with CST on the basis of the general models established in the book’s first part. These are job design (organization of the work process); forms of property ownership in the business; and new product development and pay systems. In each case, the authors attempt to expand the currently dominant vision to include the excellent and common goods that the firm develops during its operation so as to provide a more complete and realistic way of managing these activities.

Alongside book-length presentations, and partly because a dialogue on a truly Thomist/CST business ethics would require other business ethicists to make profound adjustments to their *weltanschauung*, Thomists and scholars of CST have tried to stimulate dialogue on the questions of business ethics in other ways. Many thinkers have made attempts to evaluate elements of business theory from the perspective of Thomism and CST or to evaluate concepts or approaches in business on this basis. This more fragmented dialogue has been carried forward in journals such as *Business Ethics Quarterly* and the *Journal of Business Ethics* by thinkers such as Antonio Argandoña, Albino Barrera, Richard DeGeorge, Wolfgang Grassl, André Habisch, Dennis McCann, Domenec Melé, Patrick Murphy, Michael Naughton, Alejo Sison, Manuel Velasquez, and Jim Wishloff. The *Journal of Business Ethics* in particular has had special issues, such as on the pastoral letter “Economic Justice for All” produced by the US bishops’ conference and an upcoming special number on Caritas in Veritate and business ethics, and also on themes such as “Virtues and Business Ethics.” Recently, a 2010 special issue of the *Journal of Management Development* was dedicated to “Practical Wisdom in the Christian Tradition” as part of a series on various religious traditions and their

contributions to management and business ethics. Some of these contributions, such as Albino Barrera [10], “Social Principles as a Framework for Ethical Analysis” or Domenec Melé [30], “Integrating Personalism into Virtue-Based Business Ethics: The Personalist and the Common Good Principles,” both in the *Journal of Business Ethics*, or Jim Wishloff [46], “Solidarist Economics” in the *Review of Business* try, in an article-length presentation, to give an integrated approach to business ethics based on Thomist philosophy or CST, but again, like the book-length presentations, so far they have not generated a critical mass that would allow this position to enter the mainstream alongside utilitarianism, Kantianism, and social contract approaches. It remains to be seen whether the most recent of these, among them a 2011 article by Wolfgang Grassl and André Habisch in the *Journal of Business Ethics*, “Ethics and Economics: Towards a New Humanistic Synthesis for Business,” which draws extensively on the most recent encyclical, will meet with a similar reaction [24]. On this point, however, we should keep in mind the important insight of Marens that whether a particular point of view is accepted or not depends not only on how well it is formulated but also on the receptivity to it on the part of society as a whole.

More specific issues like the evaluations of concepts and practices within business and economics, such as self-interest, marketing strategies, or the understanding of work, are complemented by articles that aim to bring concepts from Thomism and CST into the vocabulary of business ethics. Thus, for instance, the interesting 1997 article of Manuel Velasquez and F. Neil Brady on “Natural Law and Business Ethics” or another in 1992 by Velasquez alone in the same journal on “International Business, Morality and the Common Good [43].” There are also articles that attempt to review the value of CST as a whole for business ethics in the light of current developments, as does Dennis McCann in his 1997 “Catholic Social Teaching in an Era of Economic Globalization: A Resource for Business Ethics.” McCann here also shows the impact that CST has had on crucial moments of US economic history, such as after the First World War (primarily through the 1919 Bishop’s Program for Social Reconstruction) and at the time of the New Deal. There are also articles that aim to ground concepts within business ethics on the idea of the common good, or on CST, such as Argandoña [7] “The Stakeholder Theory and the Common Good” or Alford [4] “Does Corporate Social Responsibility need Christian Social Thought?” This can often have a certain level of success, in the sense that any attempts in business to go beyond a focus on moneymaking pose the question of the fundamental assumptions on which business theory is based (since they imply a revision of the answer to the question: what is business for?) and for which other theories may be less able to provide the grounding needed. The recent idea of Porter and Kramer [35] called “shared value” represents a further possible point of convergence between management theory and Thomism/CST.

Business ethics textbooks increasingly include a discussion of the virtue approach to ethics. *Business Ethics: Policies and Persons*, a widely used text in MBA courses now in its fourth edition, edited by Ken Goodpaster et al. [23], includes a column for a “virtues-based outlook” as part of its “Case Analysis

Template” (CAT scan), alongside other columns on “interest-based,” “rights-based,” and “duty-based” outlooks. However, the text and the graphical representation of the CAT scan give the impression that these are four alternative ways of thinking about business ethics, with various advantages and disadvantages. Another term, the *moral point of view* (italics original), is introduced which “governs and disciplines what we take to be the central virtues . . . a mental and emotional standpoint from which all persons have a special dignity or worth,” and the case instructor should see the “ultimate purpose of the analysis” as “*to seek the insight of the moral point of view* in the case situation” ([23], p. 10, italics original). From the Thomistic point of view, it is odd to put the virtues in a column alongside partial views of ethics, such as an interest-based one, and then add the idea of the moral point of view as synthesizing them all, and as the “ultimate purpose of the analysis.” So, virtue ethics is present in the book but not in a way that is compatible with a Thomistic or CST view of virtues.

Conclusion

Future Prospects for the Interrelation Between Thomism, CST, and Business Ethics

Currently, there may be said to be both positive and negative signs as to the future possibilities for Thomism and CST to be incorporated more fully into business ethics. On the one hand, the collapse in many quarters of an ideology of “scientism” that excluded on principle any input from a faith tradition has created new openings for religious voices to be heard in the marketplace of ideas. At the same time, the postmodern position is hardly sympathetic to CST and certainly not to Thomism, seeing these two bodies of thought as carrying forward the project of a “universal rationality” which postmodernism negates. Other faith traditions, where the philosophical component to their thought and teaching on social questions is much less extensive and rigorous, may well find a better hearing in this context.

Its philosophical rigor, however, coupled with the interesting empirical results that are emerging from the disciplinary boundary between psychology and economics, such as in the field of behavioral economics, gives Thomism and CST a different, and probably more profound, way of contributing to business ethics than some other religious traditions could. The current problems in the field of business ethics are well known: a cacophony of voices; business theory that incorporates presuppositions into it (often without being aware of them) that make it resistant to ethics; minimal if any impact on the real world of business. David Lutz [26] argues that we cannot overcome these problems without a philosophy of business that starts from a philosophy of human action wherein the virtues, and especially prudence, play a central role, along with the promotion of the common good. Much of the literature discussed here makes a contribution toward doing this, as does the interesting work of others not mentioned in detail, such as Pérez López [8]. Thomism and CST are especially

suiting to the task of providing the basis for this philosophy, as the discussion above of the ethical grounding of CSR indicates. The next best alternative, the social contract position as developed especially by Lorenzo Sacconi, creates perverse side effects that weaken the ethical basis of business action, and these effects can, at least potentially, be avoided with a business philosophy based on Thomism. Much work still needs to be done, including on the objections raised by people like Sacconi, probably both in terms of defending it and using complementary approaches to arrive at a similar position (for instance, a phenomenological approach that incorporates the insights of behavioral economics). Nevertheless, the opening up to religious positions in general coupled with the philosophical strength of Thomism and CST, in the presence of the current disarray in business ethics, could create a set of propitious conditions for a major breakthrough of the Thomist position into business ethics in the not-too-distant future.

Notes

1. Papal encyclicals (literally meaning “letters”) are always officially published in Latin and are known by their opening words. So the encyclical on the thought of St. Thomas opened with the words “Aeterni patris,” and hence, the encyclical is known by that name and the date of its publication.
2. There have also been other developments, such as the interest that has developed among analytical philosophers in the second half of the twentieth century in the logic of St. Thomas.

Part 3

Morality and Self-Interest: From Hume and Smith to Contemporary Perspectives

Gerhard Engel

Abstract

This chapter first explains the concept of “Enlightenment” in general and delineates the specifics of “Scottish Enlightenment.” Two major conceptional issues will be discussed: (1) How did the philosophers of Scottish Enlightenment react to the Hobbesian provocation, consisting in the claim of man being a creature guided solely by self-interest, ruthlessly enforcing his interests wherever possible? Hume solved the problem by giving a detailed analysis of human motivations and by distinguishing a close range morality, for which he deemed Hobbes’s analysis to be inappropriate, and a far range morality, which (as Hobbes correctly asserted) must erode without institutional support. (2) The second issue consists in conciliating the individual’s behavior in a market economy with moral demands. Hume and Smith were convinced that the way to modernity, assisted and advanced by Scottish Enlightenment, was no aberration but a possibility, compatible with moral demands, to open up new horizons and to unfold man’s inherent potential for development. In conclusion, this chapter will present Hume’s brilliant anticipation of modern answers to the question of the origins of Europe’s singular historic course, or *sonderweg*.

Introduction

The “Scottish Enlightenment” and the “Scottish Miracle”

This chapter answers the following questions:

- What is the meaning of the concept “Scottish Enlightenment”? Here we can make a distinction between a narrower and a wider definition of the term.

- What does the term “Enlightenment” mean to us?
- What is the difference between Scottish and continental Enlightenment?
- What are the major issues the philosophers of Scottish Enlightenment wanted to solve?
- As a region, it took Scotland a mere century (from around 1700 to 1800) to develop from a backward, agrarian society to an economic and intellectual leader in Europe. Following economic historian Eric L. Jones [25], we can speak of a “Scottish Miracle” and ask: How was this development possible? In preparation for the answer given in section “[David Hume and the “Scottish Miracle”](#),” this section provides some information about Scotland’s geography and history.

“Scottish Enlightenment”: Concept and Figures

In a larger sense, the term “Scottish Enlightenment” describes the period between 1726 (when Francis Hutcheson’s *“Inquiry into the Origin of Our Ideas of Beauty and Virtue”* was first published) and 1816, when Adam Ferguson died. In a narrower sense, this period is marked by two famous main works of Scottish Enlightenment, namely by David Hume’s *“A Treatise of Human Nature,”* published in 1739/1740 [19] and Adam Smith’s *“An Inquiry into the Nature and Causes of the Wealth of Nations,”* ([49]) published in 1776 [48]. The following are considered to be the main representatives of Scottish Enlightenment:

Gershom Carmichael (1672–1729)

Bernard Mandeville (1670–1733)

Francis Hutcheson (1694–1746)

Henry Home (1696–1782)

David Hume (1711–1776)

Adam Smith (1723–1790)

Alexander Gerard (1728–1795)

Thomas Reid (1710–1796)

George Campbell (1719–1796)

Adam Ferguson (1723–1816)

Dugald Stewart (1753–1828)

Hume will be dealt with in section “[David Hume: The Key Figure of the Scottish Enlightenment](#),” Carmichael and Hutcheson in section “[Francis Hutcheson \(1694–1746\) and the “Moral Sense”](#),” and Adam Smith in section “[Hume and Adam Smith \(1723–1790\): Ethics and Economics](#).”

David Hume is a key figure of Scottish Enlightenment. He was the most comprehensive, most thorough, most versatile, and therefore most influential thinker Scottish Enlightenment brought forth. This assessment was already shared by his contemporaries: “Standing head and shoulders above them all was David Hume, pivot (center of rotation, G.E.) and provocation to the group” ([8], p. 2). Hume’s ideas are therefore at the heart of this article.

During the century between 1720 and 1820, Scotland made its way from a poorly developed agrarian nation with geographical and climatic handicaps to an

economical, technological, and intellectual leader – not only compared to England but also to the rest of Europe. The afore-mentioned philosophers of Scottish Enlightenment have accompanied this transformation intellectually, interpreted it, and also advanced it with their insights.

What were the new developments during this century? Essentially, a new way to look at the world and acquire knowledge about it. We can exemplify this claim by considering the changed meaning of the term “Moral Philosophy.” Numerous representatives of Scottish Enlightenment held chairs for “Moral Philosophy.” This term’s meaning in the eighteenth century, however, was quite different from today’s. Isaac Newton published his theories on physics under the Latin title *Philosophiae Naturalis Principia Mathematica*, or *Mathematical Principles of Natural Philosophy*. The term “Natural Philosophy” was therefore equivalent to what we now know as (*Natural*) *Science*: the empirical, scientific study of nature. Accordingly, “Moral Philosophy” in its eighteenth-century meaning was the empirical, scientific study of *man* and *society*. *Experience* takes on a key role in both cases: Just like those of nature, the secrets of man and society cannot be revealed by falling back on higher authorities (such as the bible or the *Corpus Aristotelicum*) but only through *empiricism*, through the methodical quest for experiential knowledge.

The *Scottish moral philosopher’s* studies, however, also included philosophical issues in today’s sense: Scottish Enlightenment philosophers would have regarded the distinction of (empirical) social sciences and (normative) social philosophy and theory, which continental philosophers would later assert, as a fundamentally faulty effort to reasonably arrange human coexistence in society – and precisely, this task can be considered Enlightenment’s main goal and final purpose.

The Meaning of “Enlightenment”

Before we discuss the specifics of Scottish Enlightenment, we will first clarify the concept of “Enlightenment” itself.

1. First of all, “Enlightenment” is the name of an *epoch*. It denotes the time between 1680 and 1830 ([39], p. 31–32) and especially the eighteenth century’s efforts – independent from control by traditional authorities like church, theology, and secular leadership – of understanding the natural and social conditions we live in. Enlightenment therefore *also* always implies criticism of church and religion.
2. Secondly, “Enlightenment” is a *program* meant to help these efforts attain their goal. Part of this program was to make the growing knowledge about nature and society available to everyone. This was the intention of Denis Diderot and the French encyclopédistes, as well as of the authors of the *Encyclopædia Britannica*, published in 1820 by Adam and Charles Black in Edinburgh after having been worked on since 1768 (the French *Encyclopédie* is being worked on to this day). Furthermore, authorities were being put under pressure to justify themselves, fundamental questions about nature and society were being asked, and there was a general effort to correct falsities and errors by relying on

individual experience. All the European Enlightenment philosophers were united in this program of “error elimination” through the method of experience, but it was first and foremost to be found in England and Scotland. Briefly put, in the opinion of the philosophers of Enlightenment, how the world *really* works cannot be understood by reading old books but must, in nearly every case, be clarified by means of experience. At the same time, people in the Age of Enlightenment were increasingly convinced of living in a fundamentally new and better time, even compared to Renaissance humanism, which aimed to surpass Christian and Aristotelian tradition by way of a recourse to classical antiquity.

3. Thirdly, the concept of “Enlightenment” is linked to an *individual attitude*, which can be found in Kant’s famous definition: “*Enlightenment is man’s emergence from his self-incurred immaturity*. Immaturity is the inability to use one’s own understanding without the guidance of another. This immaturity is *self-incurred* if its cause is not lack of understanding, but lack of resolution and courage to use it without the guidance of another. The motto of enlightenment is therefore: Sapere aude! Have courage to use your *own* understanding!” ([26], p. 53) Enlightenment is thus the always risky effort to think for oneself, instead of letting someone else do it.

Three aspects of Kant’s definition are particularly interesting:

- Enlightenment always entails an *individual* learning process. Kant speaks of the *individual* man. Only through one’s personal willingness to free oneself from the “Gängelwagen” ([26], p. 54) (leading-strings), collective learning processes and socially successful Enlightenment become possible.
- Enlightenment is *risky*. People resist new ideas or critical inquiry; they are all too prone to influence the competition of ideas in their favor by seeking (definitory) power, and they neglect, obstruct, or even suppress the free exchange of ideas. Kant’s appeal to the Enlightenment philosophers’ courage and willingness to take risks is therefore no mere pathos.
- Enlightenment requires other people (the scientific community, or the “public,” in the Kantian sense), on whose criticism we depend even in our own learning processes. Enlightenment is a *group* effort in the sociopsychological sense [14]. Individuals play an important role in it, to be sure. But if they do not want to violate one of the most elementary rules of Enlightenment, they must not be impervious to other people’s arguments: *Enlightenment is discursive* – therefore, it conceptionally depends on other people. In this point, too, Scottish Enlightenment is a particularly fine example of Enlightenment thinking, as we will see in sections “[Scottish Moral Philosophy Before Hume: Carmichael and Hutcheson](#),” “[David Hume: His Life and His Works: An Overview](#),” and “[Hume and Adam Smith \(1723–1790\): Ethics and Economics](#).”

Enlightenment is thus the common pursuit of improved knowledge, to the end of an improved life for everyone. All of this, however, would have neither been possible nor fertile, had eighteenth-century Scotland not been able to draw practical consequences from the opinions revised through such discussion and criticism.

Features of "Scottish" Enlightenment"

Just like everywhere else in Europe, Enlightenment philosophers in Scotland also criticized traditional theological views (and therefore their normative effects); on the basis of the new philosophy of nature, we associate with the names of Francis Bacon, John Locke, and Isaac Newton. And, also like everywhere else, the Scots thought about the preconditions and consequences of the sudden explosion of knowledge about nature and society and tried to put this newly gained knowledge into effect in their society. These similarities with continental Enlightenment aside, however, Scottish Enlightenment also developed a number of particularities.

1. All criticism of Christian theology, of Catholic and Protestant clergy notwithstanding, England and Scotland did not experience the development of such an uncompromising and later (after 1789) even violent opposition to Christianity as it has been the case in France, for example: "While it represented a secularization of thought and feeling, as the Enlightenment did everywhere, that is a breach with an essentially theological mentality and a change outlook upon religion, it did not take on, to any marked extent, as did its counterpart in France, for example, an anti-clerical, anti-church, or even a anti-religious character" ([29], p. XII).
2. The Scots avoided metaphysical controversies about the "essence of things" in favor of an *empirical* approach to reality. They therefore considered questions such as: What are the (observable) properties of an object? How does it behave? How does it change when subjected to certain influences? This empiricist attitude had particularly significant effects on the debate on moral questions, as the willingness to include empirical knowledge into the discussion of political and moral questions was (and still is) particularly poorly developed, due to tradition, peer pressure, and old habit.
3. Although the Scottish Enlightenment philosophers were indeed *political* thinkers and thus thought about ways to expand the citizens' freedoms, they were no radical social critics after the French model: "... a demand for a radical reform of society and the state, such as characterized such of their English followers as Price and Goodwin, was seldom heard here" ([29], p. XII; cf. [10]). Demands for improvement were thus of pragmatic, not of ideological nature: There was no interest in revolution but in changes of the rules in everybody's interest.
4. All of science and philosophy, yes, just about every thinking effort had to be useful for the improvement of living conditions ("Human Improvement"). The title of Adam Smith's famous opus magnum *An Inquiry into the Nature and Causes of the Wealth of Nations* is thus quite programmatic.
5. The Scottish Enlightenment philosophers were cautiously optimistic regarding the question whether mankind was capable of progress: "... while Scottish thinkers made much of the idea of progress in the sense of evolutionary naturalism, their belief in progress seldom if ever took on the character of an unrestrained optimism like that of a Condorcet, for example" ([29], p. XIII). This means that according to the Scottish Enlightenment philosophers, there might

not be a *law* of progress, bringing about an improvement of human living conditions independently from human behavior – “behind their backs,” if you will. There is, however, an *option* of progress, as long as people are ready and willing to rigorously base the design of rules for human coexistence on clear thinking and empirical knowledge.

Let us now turn to the question of the ideological and social preconditions that made this project possible.

Two Main Conceptional Problems of Scottish Enlightenment

1. One of the main conceptional issues of Scottish Enlightenment in dealing with morality and politics consisted in conciliating the solutions for the basic problems of human coexistence suggested by Thomas Hobbes (1588–1679) with everyday experience. Hobbes, in the seventeenth century, had drawn first consequences from the contradictions of moral theory and observation, arising from the biblical and Aristotelian theoretical tradition on the one hand and his observations during the British Civil Wars in the first half of the seventeenth century on the other. Hobbes’s philosophy was thus an effort to intellectually deal with the British Civil Wars, which he understood to be paradigmatic for civil war as such. To sum up Hobbes’s question: How can peaceful coexistence be possible, if people know no limits when trying to assert their interests? If they believe totally different things, have different values, different opinions on what is good and bad, sin or no sin, what we should aspire to – in short, if they disagree about what they should *be allowed* to do?

The grim and brutal conflicts between the factions of the civil war showed Hobbes three things:

- (a) Christianity’s moral messages (such as peacefulness and altruism) were obviously not strong enough to significantly direct human behavior in conflict situations.
- (b) Religion is peace building only to a very small extent. In fact, and to the contrary, it is itself a major source of conflict: differences of opinion regarding the “true” way to salvation can turn into bloody conflicts surprisingly fast.
- (c) Neither did the philosophical tradition since Aristotle provide any satisfying theoretical models with which what happened in the English Civil War could be comprehended. Aristotle had described man as a creature hardwired for cooperation “by nature” ([1], 1253a). Hobbes, however, saw man, in the “state of nature,” as acting under conditions in which they could, *as a rule*, not rely on their fellow men to cooperate and honor their contractual obligations. As Hobbes had to observe, cooperation was frequently and radically terminated during the civil war, whenever people hoped to profit from it.

Hobbes thus did not believe in human behavior being fundamentally governed by benevolence’. In reality, Hobbes asserted, we do not live in a “natural” society of

cooperation, without any need for special institutional requirements but rather in a latent “war . . . of every man against every man” ([17], p. 77), which can only be restrained by governmental coercion. As soon as control over man by his neighbors, custom, morality, and tradition dwindles, Hobbes does not deem him a precondition for his fellow man’s realization of “good life” in the Aristotelian sense, but in the worst case, a deadly threat: “*Lupus est homo homini, non homo, quom qualis sit, non novit.*” – “Man to Man is an arrant Wolfe” – these are the famous phrases in “*De Cive*,” Hobbes has been both lauded and reprimanded for ([18], p. 2). They mean, without rules and a governing sovereign capable of enforcing them, we would all find ourselves not in a peaceful state “appropriate for us,” but in the primal state of *war of everyone against everyone*. And the problem aggravates as the population grows and traditional face-to-face relationships are being substituted by anonymous contacts in a large society. In short, he who cannot be sure his counterpart feels bound by rules will easily behave inhumanly toward him. In his “*Leviathan*,” Hobbes writes: “. . .if any two men desire the same thing, which nevertheless they cannot both enjoy, they become enemies; and in the way to their end (which is principally their own conservation, and sometimes their delectation only) endeavour to destroy or subdue one another” ([17], p. 76).

To many Scottish Enlightenment philosophers, this image of man and politics painted by Hobbes was unacceptable. They primarily criticized his hypothesis of man being *fundamentally* egoistic and of there being no natural resources for socialization. At first glance, the “experience” Scottish Enlightenment philosophers relied on even seemed to prove them right. Is not the hypothesis of everyone looking after his own interest first, strategically using his reason to snatch as many of the rare available resources (forcefully if necessary), contradicted by everyday “experience”? Do we not see examples of benevolence and “altruism” every single day? We will later see that not all of the Scottish Enlightenment philosophers were able to draw productive conclusions from this contradiction between theory and “experience.” Among the few exceptions is David Hume, with his distinction between natural and artificial virtues (cf. section “[A Treatise of Human Nature, Book III: Of Morals](#)” (1740)).

2. The second conceptual problem arose from the difficulties in morally evaluating the slow change from a static to a dynamic economy in eighteenth-century Scotland. In a static economy, in which the amount of goods virtually does not change, the condition of the poor can only be improved *at the expense* of the wealthy: Economically, *caritas* is a zero sum game. This is why individual willingness to unconditionally offer up parts of one’s own goods for the benefit of the needy was held in high moral regard. In a dynamic economy, however, fundamentally different mechanisms for the betterment of the poor become conceivable: Instead of *donating* money, one can *invest* it, in order to use the profit to provide needed goods for the poor. Under certain conditions, economy can thus also be a *positive sum game*.

The rise of industrial society thus led to new theoretical, political, and moral challenges. The beginning economic dynamics did, of course, not only bring

about positive effects, such as larger bundles of goods, but also negative ones. While the lords of former times fulfilled a certain sociopolitical function in being responsible for the old and the poor in their area of influence, the capital accumulation in industry and agriculture led to a growing army of uprooted poor. While those lords were increasingly weakened economically by mismanagement and the growing importance of trade and industry, to a point where they could no longer fulfill their traditional sociopolitical functions, the usually far-away investors in agriculture, trade, and industry did no longer feel responsible for the well-being of their employees. This resulted in subsequent theoretical and moral issues, which had to be solved *simultaneously*. The subsequent theoretical issue consisted in specifying the conditions under which the economy can become a positive sum game. The subsequent moral issue was: How should traditional morals deal with the challenges of the dawning new era? How can the economical dynamics and its negative consequences be reconciled with Christian morality and philosophical tradition? Can it be an act of charity or altruism to close down a factory or to sacrifice agricultural land for industrial expansion and thus to leave the people concerned to an uncertain fate? And, given that there surely were *also* positive consequences of industrialization and capital accumulation, the further question arose: What “morality” was to be valid now? What is “morality”? What can morality be based upon, how can it be justified? Some Scottish Enlightenment philosophers, such as David Hume and Adam Smith, then went past these very fundamental questions and asked the decisive one: *Might it be possible to show that the rising market economy and industrial society are particularly adequate to certain moral demands?* Sections “[Hume’s Moral Philosophy](#)” to “[David Hume and the “Scottish Miracle”](#)” and “[Hume and Adam Smith \(1723–1790\): Ethics and Economics](#)” will discuss their answers to this question.

Some Remarks on the Geography and History of Scotland

How was the “Scottish Miracle” possible? In preparation of an answer to this initial question, let us first look at Scotland’s geography and history ([11, 51], Ch. 1).

1. Scotland is made up of three geographical regions (see [Fig. 12.1](#) below): (a) In the North, there are the inaccessible, inhospitable *Highlands*, where mountains of up to 1,350 m tower over a land that can only be put to limited agricultural use. (b) In the Center, there are the *Central Lowlands*; a fertile belt crossed by rivers (Clyde, Forth, Tay, Tweed), already densely populated in the eighteenth century and surrounding the big cities of Glasgow, Edinburgh, Dundee, and Aberdeen. The region is rich in natural resources (coal in particular), playing a key role in Scotland’s industrial boom. (c) The *Southern Uplands*, a rolling hill country in the South, separate Scotland from the rest of Britain.

One of the *Highlands’* geographical particularities is the deep canyons, running from east to west. They are the result of the local gneiss’s erosion. This erosion, aided by Scotland’s rough weather, also formed the jagged coastline of Scotland’s North, featuring numerous bays, fjords, and offshore islands.

Fig. 12.1 Geography of Scotland. Internet: <http://en.wikipedia.org/wiki/File:Scotland%28Location%29Named%28HR%29.png> © Rab Knight

Under the circumstances of the time, this geography made for two natural advantages. In case of a *war*, it offered a hard-to-conquer space for retreat in which one could easily survive for some time on a diet of seafood and mountain water. In *peace*, however, its 3,500 km of shoreline offered plenty of possibilities for fishing, shipping, and trade.

2. Already in antiquity, Scottish geography was an obstacle to the enforcement of claims to power. While the Romans were able to conquer great parts of Western Europe and even England, they never managed to penetrate the Scottish Highlands and eliminate the pockets of resistance there. Britain's North thus became the center of resistance against the Romans and a safe haven for all those who did not want to bow to their power, possibly a precondition of some importance for the "Scottish Miracle."

From the fifth century onward, Ireland and Scotland were being Christianized. In the second half of the sixteenth century, the relative stability based on religion

ended with the introduction of reformation to Scotland. Under the leadership of John Knox (ca. 1514–1572), the Scottish Calvinists rose up against the Catholic reign of Maria Stuart (1542–1587). More than 130 years of sometimes very brutal conflict ensued, with Scotland being additionally weakened by a series of weather-related crop failures at the end of the seventeenth century. Around 1700, it became clear that Scotland could only survive economically and politically by giving up its sovereign statehood. After long parliamentary debates, Scotland finally took its place under Great Britain’s political roof.

Although the country lost its statehood in 1707, we can name a couple of factors which advanced the now beginning “Scottish Miracle” and turned the country into Europe’s driving force within a century.

- (a) Scotland gained access to the English colonial trade because its western ports were much closer to the American colonies than London, for example. This circumstance advanced the tobacco and cotton trade, which in turn advanced the development of factories.
- (b) The Scots came to know English liberal and literary ideas, as well as a moderate form of Protestantism; this helped entrepreneurs and scholars to gain prestige and influence.
- (c) Calvinism, being a strictly systematic religion, advanced systematic thought: People were used to painstakingly scrutinize controversial issues.
- (d) Scottish Calvinism interpreted the bible as asserting that only labor makes it possible to lead a life agreeable to God. As John Knox famously wrote: “He that laboureth not, let him not eat” ([27], p. 419). Although this phrasing differs from Paulus’s Second Epistle to the Thessalonians (3, 7-9; Paulus talks about the *willingness* to work, calling on people not to be a burden to others), it still clearly demonstrates the ideological connection between Calvinism and capitalism Max Weber would later analyze.
- (e) And finally, part of John Knox’s ambivalent heritage is a comparatively democratic educational system. Calvinist doctrine favored the alphabetization of large parts of the population out of religious reasons. The individual man was to be enabled to find his own way to God through his *own* reading of the Scripture. This ability to read, however, naturally was not only helpful in the quest for salvation but could also be put to other profitable uses.

Thus, at the beginning of the eighteenth century, the stage was set for the “Scottish Miracle.”

Scottish Moral Philosophy Before Hume: Carmichael and Hutcheson

Gershom Carmichael (1672–1729) and the Individual Duties

Gershom Carmichael (cf. [7]; [50]) studied in Edinburgh from 1687–1691 and then began an academic career. He taught at the University of St. Andrews from 1693–1694 and afterward went on to teach in Glasgow until the end of his life.

In 1718, his main work “*Supplements and Observations upon the two books of the distinguished Samuel Pufendorf’s On the Duty of Man and Citizen*” was published in Glasgow; in 1725, it was reprinted in an expanded version, in which Carmichael presented a fully developed deontology. His relevance to the further Scottish Enlightenment especially lies in the strong influence he had on his student Francis Hutcheson (see section “[Francis Hutcheson \(1694–1746\) and the “Moral Sense”](#)”).

His basic idea was: We cannot live as we want to, for we would then harm ourselves or attract the others’ resentment or even the wrath of God. Man therefore has certain “natural” duties, following from the fact of God’s existence, the laws of nature, and the “moral” laws of coexistence, duties that are not the result of instrumental reasoning but spring from an intuitive understanding of the *conditio humana*. These duties are:

- (a) The immediate *duties toward God*. They cannot be derived from other duties but are justified through the following reasoning: Because God expressed his love of mankind by creating it, it is man’s duty to worship him and to present him with signs of this worship, for example, in prayer and good moral conduct.
- (b) The mediate *duties toward ourselves*. They follow from the immediate duties: If we are God’s creatures, we should behave accordingly and prove ourselves worthy of him; we must, for example, not physically harm or even kill ourselves nor burden our conscience with violations of God’s commandments.
- (c) The mediate *duties toward society*. For the same reason as the duties under (b), we also have duties toward our fellow men. They, too, are God’s creatures; therefore, we should not be a burden to them but do everything within our power in order not to harm them, or even to improve their situation. The accordance of property rights must be measured by this moral criterion: “Each man should promote, so far as it is in his power, the common good of the whole human race, and, so far as this allows, the private good of individuals” ([34], p. 48).

Carmichael thus still stands in the tradition of natural law: Our duties follow objectively (as opposed to arbitrarily, subjectively, or individually) from observation of nature – taking into account its creator.

Francis Hutcheson (1694–1746) and the “Moral Sense”

Carmichael’s student Francis Hutcheson discarded the idea of moral principles deriving from “natural laws.” An Anglican theologian, Hutcheson, began to build a seminary in Dublin in 1719 and then accepted a professorship for moral philosophy in Glasgow in 1729, which he held until the end of his life. Among his most important works are the *Inquiry into the origin of our ideas of beauty and virtue* (London 1725), the *Essay on the Nature and Conduct of the Passions with Illustrations on the Moral Sense* (London 1728), and the posthumous work *A System of Moral Philosophy*, first published in 1755 in Glasgow. Hutcheson argues against Hobbes that we all have a “moral sense,” enabling us to be benevolent and generous, to discern good from bad, and to empathize with others. This assumption of it being *ourselves* who can discern good from bad brought Hutcheson in conflict with theologians.

Hutcheson can be called the benevolent optimist among Scottish Enlightenment philosophers. He did not realize, however, that some individuals not only do not share widely accepted moral ideals but also break rules ruthlessly and without regard for others; apparently, they have no or just a reduced “moral sense.” As we have seen in section [“Two Main Conceptional Problems of Scottish Enlightenment,”](#) Hobbes was more realistic regarding this point: If rule breakers are not effectively sanctioned, even the most benevolent person has to take self-defense measures: *morality can erode, if it is not supported by sanctions*. Hutcheson asserts, though: *We do not feel well, if we do not act morally* – that is the basically stoic principle he followed.

Furthermore, and this makes him interesting as a preliminary to Hume, Hutchinson was the first to have the vision of a “free society” ([16], pp. 79–81). He was the first liberal in the classical sense, “. . . a believer in maximising personal liberty in the social, economic and intellectual spheres, as well as the political. But the ultimate goal of this liberty was . . . happiness – which Hutcheson always defined as resulting from helping others to be happy” ([16], p. 80).

But Hutcheson did not only leave the question unanswered how such a free society was to be constructed, if Hobbes’s idea of man should prove to be realistic; he could not even explain why society works *at all*: “If those desires are really so universal, why do so many societies deny people those very things? Why, given the variety of political and social systems in history, have there been so few that have delivered on Hutcheson’s vision of a free society?” Differently put: Why have there not been many more “Scottish Miracles”? When Hutcheson died in 1746, he left no answer ([16], p. 81).

It was David Hume who first came up with a more satisfactory solution for these issues. Therefore, we now turn our attention to him.

David Hume: The Key Figure of the Scottish Enlightenment

Hume is urging nothing less than the total reform of philosophy. William Edward Morris [35]

In David Hume, we meet with the intellectual center of Scottish Enlightenment. He was extraordinarily versatile, had a keen mind, and uncompromisingly kept on thinking until he arrived at those assumptions he held to be solely tenable in the light of reason and experience.

Hume is a prominent representative of “empiricism”; the philosophical theory stating that all our knowledge is derived from experience and that all our beliefs must prove their worth in the light of our experiences. “Experience,” however, must be both broad and methodical, if it is supposed to be convincing. His judgments thus received their authority only through his wide scientific, philosophical, economic, and historical knowledge. Furthermore, Hume can be counted among the eighteenth century’s most innovative philosophers in the field of ethics and economics.

In section [“David Hume: His Life and His Works: An Overview,”](#) we will deal both with Hume as a person and with his epistemology, as far as it is relevant to his

moral philosophy. Section “[Hume’s Moral Philosophy](#)” then deals with his moral philosophy. Section “[Politics, Ethics and Economics](#)” will take a look at some of his groundbreaking economic ideas, and Section “[David Hume and the “Scottish Miracle”](#)” will return to the idea of a “Scottish Miracle.” There, I will show that Hume already expressed assumptions about the causes of this “miracle” that anticipate much of the twentieth century.

David Hume: His Life and His Works: An Overview

David Hume, was born the son of Joseph Home, advocate, and his wife Katherine, in Edinburgh, on May 7, 1711 ([52], Ch. 2–5). He soon proved to be interested in moral questions. He drew up detailed personal “lists of sins,” for example, in order to find out whether his own life was reconcilable with the rules of Calvinist theology. In school, he became acquainted with the texts of classical authors (Cicero, Virgil, and Tacitus) and with teachers beginning to question the dominant dogmas of theology and moral philosophy. Following his parents’ advice, Hume began to study law in 1726 but discontinued his studies after 3 years and slipped into a severe life crisis. He then decided to become a philosopher – to the horror of his mother, who would have preferred to see her son become a successful advocate in Edinburgh.

The life crisis between 1729 and 1734 also had two intellectual reasons. One of them could be called *Loss of Certainty*: After intense skeptical doubts, Hume brought himself to accept the belief that our *knowledge can never be certain*, and that, based on our past experience, we can only predict future events with some probability. But, just like animals, we may – and do – trust our instincts and experiences in practical matters. The other reason can be called *Understanding of the Inadequate Foundation of our Convictions in Experience*. According to Hume, most of what we think we know proves to be insufficiently grounded in experience; much too quickly we content ourselves with *inventions*, instead of consulting experience.

In 1739/1740, the three volumes of the *Treatise On Human Nature* were published, in which Hume elaborated his thoughts on epistemology (Volume I), psychological anthropology (Vol. II), and moral philosophy (Vol. III), as far as he had developed them at the time. His work, however, was ripped to pieces by reviewers failing to understand it. Hume himself called it a stillborn child [24]. Only in 1748, 8 years later, did he once more recapitulate his ideas of the *Treatise* in his *Enquiry Concerning Human Understanding* [21].

At the end of the *Enquiry*, he formulates his empiricist and antimetaphysical principle, with the famous words: “When we go through libraries, convinced of these principles, what havoc must we make? If we take in our hand any volume – of divinity or school metaphysics, for instance – let us ask: Does it contain any abstract reasoning about quantity or number? No. Does it contain any experiential reasoning about matters of fact and existence? No. Then throw it in the fire, for it can contain nothing but sophistry and illusion” ([20], p. 165).

Following the failure of the *Treatise*, Hume addressed political and economic topics. He wrote essays, planning to publish them in the form of a weekly journal, but ultimately published them in the two volumes of *Essays: Moral and Political* (1741/1742) – anonymously, for he did not want to be identified as the author of the badly reviewed *Treatise*. Finally, he received public recognition; the demand for the *Essays* soon made a second edition necessary. The essays are thematically diverse and do not show any coherence; they are, however, particularly innovative. We will therefore deal with some of those works in sections “[Politics, Ethics and Economics](#)” and “[David Hume and the “Scottish Miracle”](#).”

Numerous subsequent efforts to get a professorship all failed. Hume thus became the travel companion of noblemen and officers – an employment which would take him to the courts of Vienna and Turin, among other places. In 1751, his *Inquiry Concerning the Principles of Morals* was published; a detailed discussion of Calvinist ethics and Hobbes’s anthropology, which, as we have seen, assumed a self-interested individual, not restrainable by subjective authorities like conscience or empathy but only through (state) power (see section “[An Enquiry Concerning the Principles of Morals \(1751\)](#)”).

The year 1752 saw the publication of his *Political Discourses*. This book’s importance to this paper’s issues can hardly be overestimated. Based on this book, some authors hold that Hume is the founder of modern economics; an assumption that is further emphasized by Adam Smith’s speaking about the “Discourses” before the members of Glasgow’s *Literary Society* on January 23, 1752, just a couple of days after it was first published ([52], p. 702). Brady Bryson on this productive period in Hume’s life: “In whatever field one undertook to write after the middle of the century, Hume was almost certain to have been there first, if only with a essay” ([8], p. 215).

In 1754, Hume began his work on a six-volume *History of England*, which would finally make him both famous and financially independent. In it, he proved himself to be a master of historiography, prosaic, well-balanced, and (as far as possible) impartial.

In 1757, the last important work still published during his lifetime was released as part of a collection (*Four Dissertations*): *The Natural History of Religion*. Hume subsequently entered diplomatic service, became undersecretary of state in London, and retired from public life in 1769, in order to devote himself to the revision of his works.

On August 25, 1776, Hume, the great innovator, died happily and calmly from an incurable gastric disease.

Hume’s Moral Philosophy

One of the Enlightenment’s basic concerns was the reintroduction of the *senses*, of human sensitivity to philosophical reasoning. This can be seen in the works on the *moral sense* or on *taste* (as the capability of esthetic judgment), quickly appearing in the aftermath of Shaftesbury’s seminal works around 1700 (*An Inquiry*

Concerning Virtue or Merit, 1699; and *Sensus Communis. An Essay on the Freedom of Wit and Humor*, 1709) [31]. While *stoic tradition* derives the rules we must abide by from *external nature*, from the *world order*, we can see Enlightenment as a turn to the *Epicurean tradition*. According to this tradition, the afore-mentioned rules can be derived from the *internal nature* of man. Hume comes up with a *synthesis* of both approaches: We must have detailed knowledge both of man's internal nature and of the inherent laws of the social systems man functions and acts in.

The essence of Hume's moral philosophy can be found in two of his works: In the *Treatise Of Human Nature, Book III* ("Morals," 1740), and in the *Enquiry Concerning the Principles of Morals* (1751). The *Essays Moral and Political* also includes passages relevant to moral philosophy; as those are, however, closely linked with sociophilosophical, political, and economic observations, we will save their discussion for section "[Politics, Ethics and Economics](#)."

"A Treatise of Human Nature, Book III: Of Morals" (1740)

Norms and Values do not follow from facts. This is *Hume's Law*, sometimes called *Hume's guillotine*, which is highly influential to this day. [5] With every work on moral philosophy Hume ever read, he came to a point where ". . . I am surpriz'd to find, that instead of the usual copulations of propositions, is, and is not, I meet with no proposition that is not connected with an ought, or an ought not. This change is imperceptible; but is however, of the last consequence" ([19], p. 241).

This position is widely accepted in contemporary philosophy (with Searle being one of the exceptions [46]): The transition from *is* to *ought* is not only held to be "imperceptible" but even to be "logically impossible" [53]. If facts, however, are not a sufficient foundation for norms and values, ethical rationalism ("Virtue is nothing but conformity to reason" ([19], p. 234)) must be false as well. Hume's major objection to it is: *Reason alone cannot motivate action* ([51], p. 187–190). Even though practical decisions may be determined by cognitive conviction as well as by moral *reasoning*, the latter alone does not suffice to produce the specific *sentiment* qualifying an action as morally good: "It is therefore more correct to speak of moral feelings than of moral judgments" ([19], p. 242).

This does not mean that moral feelings only have subjective validity. One can *develop the moral sense* – much like a judge learns, during his education, to judge an issue as *intersubjectively* as possible, or like an art connoisseur is trained to refine his given esthetic taste through studies. How can we develop our *moral sense*, though, if it is primarily focused on the realization of our own interest? Hume's answer is: By communicating with each other, and thus through the integration of other positions and points of view into our own reasoning. Hume's concept of *sympathy* thus means more than simple *commiseration* (or joint suffering) and much more than a warm, fuzzy feeling: The important part is the *constitution of morals and rules through the effort of methodically putting oneself in the position of somebody else*. One's own interests are not abandoned in this process but are being methodically included. For if others demand this principle's validity in *their* own interest, they must also respect *ours* – this is the argument's point. One is tempted to

think that Hume, the critic of religion, here presents a generalized version of the well-understood Christian law of love “Thou shalt love thy neighbor *as thyself*” (Leviticus 19,18; Matthew 22,37–39): “Thus the original motive for the establishment of a system of justice is *self-interest*; but what attaches moral approval to justice is *sympathy with the public interest*” ([19], p. 259; italics by Hume).

Where does this *sympathy with the public interest* come from, this individual interest in the existence of rules that also bind other people? According to Hume, not only can man not exist alone, but his wealth increases through his dealings with others – with others he does not know. *Socialization brings benefit* [6]. Spontaneous, *natural* sympathy, however, is only felt toward our next of kin. As the distance from the primary groups *family* and *clan* gets greater, we therefore need *two things*: Firstly, we need a *legal system*, rendering safe our cooperation with strangers; secondly, we also need special *virtues* Hume calls “artificial virtues” ([19], p. 300). These virtues, especially adherence to the law and to contracts, cannot be considered given but only develop in the interplay with an institutionally and legally secured environment, and they do so both through the *understanding* of the fact that all concerned parties benefit from the existence of such rules and through the *experience* that in a complex society, every stranger could potentially become a close acquaintance who benefits from our natural virtue of benevolence.

If we put the *Treatise* in the context of Scottish Enlightenment, and thus in the context of the intellectual confrontation with Thomas Hobbes, we can summarize: Regarding the close social sphere of family and clan, Hume believed Shaftesbury and Ferguson’s image of man to be convincing. It is based on spontaneous sympathy and natural virtues (honesty, reliability). In the larger sphere, however, we require a legal system, which, as Hobbes had realized, must stabilize our interactions and functionally depends on the *artificial virtues* of adherence to law and contracts. The *Treatise* thus represents a *productive synthesis* of the respective positions and, therefore, a solution to one of the two fundamental conceptional issues of Scottish Enlightenment.

“An Enquiry Concerning the Principles of Morals” (1751)

On the last page of the “Treatise,” Hume announces the argumentative direction a further, “separate work” on moral philosophy would take: In it, the “peace” (of mind) and “*inward* satisfaction” springing from adherence to rules were to be focused on “. . . because no mind can bear to look at itself if it hasn’t been relating as it should to mankind and society” ([19], p. 320). From a Hobbesian point of view, one might therefore consider the *Enquiry* a *setback*, as Hume obviously valorizes the stabilizing function of virtue at the expense of rules.

Hume himself, however, considered his work (written 10 years after the *Treatise*) his “legacy to posterity” ([52], p. 299; originally in German): He spent the last days of his life revising a new edition. What are the reasons for this change in the way of posing his moral philosophical question?

Hume starts out from the observation that people do by no means always only care about their own interests. We see some people (one might call them “moral

pioneers”) being capable of judging with universal fairness and general benevolence. *Experience* thus seems to show “. . . a thousand . . . examples are signs of a general benevolence in human nature in situations where no real self-interest binds us to the object” – or, as we would say today, in morally *low-cost situations* [43].

Hume’s moral philosophical reasoning shows a remarkable, underlying optimism. Transferred to contemporary conditions, one might say: Man is not overburdened by globalization. In the course of time and through the contact with others, people will *learn* to outgrow the horizon of their short-term interests and recognize the long-term benefits of global cooperation. We are talking about *individual* learning processes, mind you, not about institutional ones. And, in this point, we can even call Hume a humanist: He shared “the Renaissance’s assumption, that man, as a noble being, is destined to realize himself in his commitment to the common welfare” ([52], p. 307; [12]; originally in German). We might be better able to understand this argument, if we take into account that Hume also pursued a strategic goal with it: The critic of Christianity looking to invalidate *otherworldly* punishment in hell must offer a *worldly* substitute.

Is Hume’s optimism regarding the *individuals’* aptitude for moral learning justified, however? There is reason to doubt this: We do not want to categorically reject the possibility of “moral pioneers” wanting to promote common welfare, not only their own. But, firstly, Hume does not make clear where the limits of individual and *common welfare* are ([52], p. 304); secondly, it is not always clear what this *common welfare* consists of; and thirdly, Hume overlooks the fact that Hobbes’s assumption of self-interest is linked with a heuristics: We are to analyze a given social situation *theoretically assuming* man acts according to self-interest and then verify to what extent such an assumption proves its scientific and practical worth. The common sense experiences Hume refers to are not enough to define the empirical coverage of Hobbes’s theory. And more: Even a common sense empiricist like Hume might have quantitatively overestimated the circle of people to whom “a virtuous life is its own reward” and who consequently do not require any incentives or rules. Be that as it may, it is highly remarkable that Hume, in the last revision of his favorite work, asked his publisher to scratch the words “that there is something like benevolence inherent in human nature” ([52], pp. 565–566; originally in German). What had happened?

In the last weeks of his life, Hume asked his friend of many years, Adam Smith, to publish the previously unpublished “*Dialogues Concerning Natural Religion*.” To Hume’s great disappointment, Smith refused to do so – out of reasons probably dictated both by philosophical reservations ([3], pp. 87–89) and by concerns regarding Smith’s own academic career. This incident proves Hobbes right, against Hume: When it comes to important matters, we pursue our own interest, in spite of all moral learning processes (and who would deny Smith had undergone them?), and we are prepared to (sometimes abruptly) reduce the circle of people benefiting from our “benevolence.” That this is not necessarily a moral flaw has been shown by none other than Adam Smith.

Politics, Ethics, and Economics

Hume's thoughts on political economy and on business ethics are available in the "*Essays Moral and Political*" (two volumes: Edinburgh, 1741 and 1742) and in the "*Political Discourses*" (Edinburgh, 1752; extended edition 1758). With these treatises, Hume founded political economy; that is, the study of the interdependencies of economy and society.

The "*Political Discourses*" in particular enjoyed a sweeping success. This book, not Adam Smith's "*The Wealth of Nations*," has with some right been considered the actual cradle of economics. As soon as 1920, the sociologist Harold J. Laski asserted: "The theory of utility enables Hume to see the scope of economics – the word itself he did not know – win a more generous perspective than at any previous time. . . . The *Wealth of Nations* would less easily have made its way had not the insight of Hume prepared the road for its reception" ([28], pp. 154–155; cf. [13]).

The *Discourses* and *Essays* have no thematical order; the scope of their topics reaches from economic psychology to the moral characteristics of entrepreneurs, from questions of tax, interest, and monetary policy to freedom of press, state debt, demographical development, criticism of mercantilism, and to fundamental issues such as the best kind of government or the causes and essence of cultural progress. Roughly put, in all these works, Hume tried to find an answer to the question: "In what ways are trade and capitalism useful to society?" ([52], p. 330, originally in German) Due to this topical heterogeneity, we can do no more than discuss his main ideas based on a couple of select examples. (cf. Section "[David Hume and the Scottish Miracle](#)").

Hume's Economic Psychology

Hume's ideas on economic psychology (that is, on the motivations of entrepreneurial activity) are not available in a single, particular essay but can be found in various parts of his *Political Discourses*. They therefore lend themselves to a comprehensive presentation in this paper ([52], p. 330–332).

According to Hume, the businessman is motivated by four incentives: the striving for activity, for amusement and diversion, for leisure and calmness, and for profit. The first three incentives (activity, amusement, and calmness) are constants of human nature: *No* human being can be happy without finding the social conditions allowing for an *alternating* satisfaction of these needs – even though people may well differ regarding the intensity of these needs.

Hume, however, deems the need for activity to be the most important one. That means being forced to idleness is worse for people than being forced to activity; amusement becomes a burden more quickly than activity. Man is thus, according to Hume, an *active being*.

Under these anthropological preconditions, politics are about a double task: Firstly, it must provide conditions promoting human activity and allowing them to take an efficient and goal-oriented course. Secondly, it must raise awareness of the fact that only economic, profit-oriented activity can create the individual and social conditions for leisure and more sophisticated amusements. Foreign trade,

Hume asserts, plays a key role in this: “If we consult history, we shall find that in most nations foreign trade has preceded any refinement in home manufactures, and given birth to domestic luxury. . . . Thus men become acquainted with the pleasures of luxury and the profits of commerce; and their delicacy and industry, being once awakened, carry them to farther improvements in every branch of domestic as well as foreign trade. And this perhaps is the chief advantage which arises from a commerce with strangers. It rouses men from their indolence; and presenting the gayer and more opulent part of the nation with objects of luxury, which they never before dreamed of, raises in them a desire of a more splendid way of life than what their ancestors enjoyed . . .” ([23], p. 11).

Under these circumstances, the entrepreneur must decide in what way he will put the profit he made to personal use. According to Hume, he can use the fruit of his labor to enjoy more leisure and amusement or he can find joy in increasing his profit even more. Hume does not regard this process of “profit maximization” (to use Marx’s words) as being negative. In fact, increased economical activity is satisfying in itself to some people, produces goods and services that satisfy the needs and wants of others (a frequently forgotten insight, especially nowadays), and it limits “the interest in less harmless amusements” ([52], p. 332; originally in German).

In short, also in his thoughts on economic psychology, Hume demonstrates how to avoid moralizing. It can be avoided by focusing on three questions: (1) What are the facts? (2) What are their effective interdependencies? (3) What do people think of the result? His *own* value judgment (What *should* be the facts? What *should* people think of the result?) is of little importance to the empiricist, as he is fundamentally different from a propagandist.

Free Trade and the Criticism of Mercantilism

In *Of the Jealousy of Trade* (1758) ([23], pp. 67–70), just as in his 1752 essay *On Commerce* ([23], pp. 1–14), Hume takes position for the *free trade doctrine*, which is still rather controversial today [57].

He criticizes protectionist policies of import limitation and rejects the mercantilist concern that one country can only improve its position at the expense of another. From today’s point of view, Hume’s argument is remarkable not only because of his correct opinions on free trade but also because of his utilization of methodological individualism, reconstructing social facts from individual actions: “the increase of domestic industry lays the foundation of foreign commerce. Where a great number of commodities are raised and perfected for the home-market there will always be found some which can be exported with advantage. But if our neighbours have no art nor cultivation, they cannot take them, because they will have nothing to give in exchange. In this respect, states are in the same condition as individuals. A single man can scarce be industrious where all his fellow-citizens are idle. The riches of the several members of a community contribute to increase any riches, whatever profession I may follow” ([23], p. 68).

Exchange means profit for both sides – even if an individual or a society could manufacture every product better and cheaper than the competition

([30], Ch. 9; [56]). *One* precondition for participation in profitable exchanges must be given, however: the “spirit of industry” ([23], p. 69). Whoever does not have it and can therefore not offer anything on the market, whoever takes his leave from the general exchange network in order to supposedly protect his wealth will sink into poverty. Not the facts or side effects of market exchange are responsible for this, however, but a lack of individual motivation and performance: “Were our narrow and malignant politics to meet with success, we should reduce all our neighbouring nations to the same state of sloth and ignorance that prevails in Morocco and the coast of Barbary (Africa). But what would be the consequence? They could send us no commodities, they could take none from us. Our domestic commerce itself would languish for want of emulation, example, and instruction; and we ourselves should soon fall into the same abject condition to which we had reduced them” ([23], p. 70).

The point of the argument is the plea for free trade is not the result of a normative judgment but of historical research: “If we consult history, we shall find that in most nations foreign trade has preceded any refinement in home manufactures, and given birth to domestic luxury” ([23], p. 11). Indeed, “There is probably no better plea for free trade than *this* essay by David Hume” ([51], p. 473; italics by Streminger; originally in German).

David Hume and the “Scottish Miracle”

Let us return to our initial question (see section “[Some Remarks on the Geography and History of Scotland](#)”) of how it was possible for Scotland to experience such an enormous boom in the century between 1720 and 1820. Hume can teach us to understand the answer to this question as a particular instance of the question regarding the European *sonderweg*, as well as the Enlightenment and prosperity in ancient Greece.

In his sociology of religion (1922) [55], Max Weber posed the question: Why were Northwestern Europe and Northern America the first to develop a capitalist economy, and why have countries like India or China remained so economically backward, despite impressive initial successes? How was it possible that the world, in a few centuries and starting from a geographically fraid out region on the Western rim of the Asian landmass, where almost all of the people lived in poverty, ignorance, and political oppression, suddenly developed the known economic, technological, scientific, artistic, and political modernity?

Ever since Max Weber raised these questions, generations of historians, economists, and anthropologists have been trying to come up with answers to them [33, 36–38, 40, 41, 45, 47]. Here are some of the more recent researches’ numerous answers:

- (a) As opposed to Asia, Europe has not seen the development of a large empire but of a *system of states*, in which different rulers competed. This was an effect of geographical causes: Natural obstacles like mountain ranges, rivers, or waterways hindered the enforcement of centralized power [25].

- (b) Heterogeneous, small-area *landscapes* and the existence of numerous rivers allowed for inexpensive transportation of mass goods like wood or grain. This promoted the development of appropriate means of transportation and provided an incentive for the rulers to guarantee legal security. This was an effect of economic causes: While the confiscation of luxury goods may be profitable, the confiscation of mass goods is rather self-damaging, if alternative routes are available.
- (c) Badly governed subjects of small-area states have a higher *possibility of emigration*. States securing personal and property rights could therefore gain economic and military power, while badly governed states had to fear the emigration of the most productive parts of their population. Hume's pertinent argument in his criticism of theories of social contract, asserting that people's acceptance of a state's existing rules cannot be concluded from their remaining in that state ([23], pp. 174–191), loses empirical value in smaller states with a higher possibility of emigration.
- (d) Reformation advanced the population's *alphabetization* and therefore its education and economic productivity (see section "[Some Remarks on the Geography and History of Scotland](#)").
- (e) Due to geographical reasons, and as opposed to the empires of Asia and the Middle East, Europe's agriculture had to face the problem of *drainage*, not of *irrigation* [32]. This fact advanced the development of mill technology and consequently of mining, metallurgy, and the metal-working industry. The use of metal in turn advanced the durability and efficiency of capital investment.

Even though he himself witnessed the beginning industrialization (and therefore the European *sonderweg*), and even though historians do not consider contemporary witnesses to be very discerning observers of their own era, Hume, due to his outstanding historical knowledge, recognized the striking similarities (geographical and otherwise) between Europe, Scotland, and ancient Greece. This led him to *surmise that the European, Scottish, and Greek Enlightenment have some identical causes*. In much the same way, Europe is the geographically fraid out Northwestern rim of the Asian landmass, Scotland can be considered the British Island's fraid out Northwestern rim, and Greece can be regarded as Europe's fraid out Southeastern rim; with its many islands, peninsulas, mountain ranges, and waterways already promoting the development of various small city states and their productive competition in antiquity. In his essay *Of the Rise and Progress of the Arts and Sciences*, Hume writes: "Greece was a cluster of little principalities, which soon became republics; and being united both by their near neighbourhood, and by the ties of the same language and interest, they entered into the closest intercourse of commerce and learning." Then he draws the decisive parallel: "... mankind, having at length thrown off this yoke, affairs are now returned nearly to the same situation as before, and Europe is at present a copy at large, of what Greece was formerly a pattern in miniature" ([22], p. 84). We can now add, Scotland, in this sense, is a copy of Greece and a miniature copy of Europe.

From this point of view, it is no longer surprising how clearly Hume anticipated the results of today's economists' and historians' research on the European

sonderweg. Hume already knew limited authority and control of power promote the progress of knowledge: “. . . the divisions into small states are favourable to learning, by stopping the progress of *authority* as well as that of *power*” ([22], p. 83). Small states put their rulers under performance pressure: “Those who rule their country worse than their neighbors first lose influence, and may later lose their independence or even their power” ([56], p. 45; originally in German). Conversely, better-governed states can profit from the knowledge and abilities of the other states’ refugees. This makes for a gradual acceleration of the progress of knowledge and for the respective innovations’ diffusion (cf. [4]). Although England and Scotland were politically unified in 1707, the Crown had much less influence on the local economic policy than the French king had in France, for example: Courts did not or only partially enforce granted privileges, monopolistic practices could be circumvented in various ways. Furthermore, the majority of regulations passed after 1700 only pertained to old forms of industry, allowing the newly founded ones to ignore them.

Hume already knew that China, being a large area, centrally governed empire, lost its temporary lead in technology and science because it effectively repressed innovation at times and because there were few possibilities of emigration from the gigantic, geographically isolated empire: “In China, there seems to be a pretty considerable stock of politeness and science, which, in the course of so many centuries, might naturally be expected to ripen into something more perfect and finished, than what has yet arisen from them. But China is one vast empire, speaking one language, governed by one law, and sympathizing in the same manners. The authority of any teacher, such as Confucius, was propagated easily from one corner of the empire to the other. None had courage to resist the torrent of popular opinion. And posterity was not bold enough to dispute what had been universally received by their ancestors. This seems to be one natural reason, why the sciences have made so slow a progress in that mighty empire” ([22], pp. 84–85).

Among his contemporaries, Hume was famous for his historical works. From today’s point of view, we can say that in the end, Hume was not a historian but a philosopher, but his reasoning powers as a philosopher and political economist were crucially boosted by his work as a historian. We therefore owe to him an extraordinarily clear-sighted sketch of an explanation of the European *sonderweg* and thus an early theory of modernity, as well as a number of astute observations on the meaning of capitalism for civilization, and on the advancement of morality through well-organized competition.

Hume and Adam Smith (1723–1790): Ethics and Economics

Smith Versus Smith?

Adam Smith’s eighteenth-century fame did not come from his book *The Wealth of Nations*, for which he is famous today, but from his *Theory of Moral Sentiments*, which appeared nearly 20 years earlier. It was published in 1759, 8 years after

Smith became professor of moral philosophy at the University of Glasgow, and just a couple of years after he came to know and admire David Hume. In 1776, the year Hume died, the book that was to make Smith famous to this day was published: *An Inquiry into the Nature and Causes of the Wealth of Nations* [49].

Before we can address Smith's relation to Hume, we must, if you will, clarify Smith's relation to Smith. More to the point, we must briefly discuss the question whether Smith's two major works do contain a consistent moral philosophy or if the "Inquiry" rather takes back the moral philosophical positions Smith held in the *Theory*. This problem is known as the "Adam Smith Problem" in scientific literature [15], [42], [54]. In this literature, we can distinguish the representatives of a "consistency approach" from those of a "turnaround approach." The advocates of consistency [44] assume that Smith's positions have not fundamentally changed between 1759 and 1776. At the most, they have been accentuated, differ only in details, and otherwise pay much closer attention to the institutional frame people act in. The advocates of a turnaround, however, are of the opinion that Smith took a fundamentally new moral philosophical approach in his work from 1776, emphasizing *selfishness* as central motivation of human activity, instead of *sympathy* and *benevolence*. This reading takes the *Inquiry* to be a treatise on human egoism, which can, however, combine the selfish actions of people to a socially acceptable result through the benedictory influences of the "invisible hand."

This "Adam Smith Problem," however, is deemed to have been solved in the sense of the consistency approach throughout the more recent literature: "Self-interest lives side by side with benevolence. They are not incompatible; each has its part to play at the appropriate time; and exclusively to concentrate upon one dimension of life is seriously to distort the whole" ([58], p. 99). Here are a couple of arguments supporting this position:

- (a) The later editions of the *Theory* would have had to be revised in the sense of the turnaround approach. This, however, has not happened ([9], p. XXXVIII).
- (b) The "*Lectures of Jurisprudence*" (1763) are widely consistent with the positions held in the *Inquiry*. If the turnaround approach was right, Smith would have taken back his own opinion only a couple of years after the publication of the *Theory*.
- (c) Both of Smith's main works were subject of his 1776 lecture on moral philosophy. It is hardly believable that he would have presented contradictory concepts to his listeners.
- (d) The term *sympathy* in the *Theory* does not denote a positive or even altruistic emotion, from which the *Inquiry* would have had to distance itself later on but merely the *disposition* of being able to put oneself into somebody else's position. This disposition must not be mixed up with an altruistic attitude.
- (e) In the end, the leeway we allow for self-interested economic activity in society must be justified before the "impartial spectator" ([2], pp. 69–74).

Briefly put: "The so-called 'Adam-Smith-Problem' was a pseudo-problem based on ignorance and misunderstanding" ([44], p. 29).

With the *Inquiry*, Smith has therefore not written a treatise on the fundamentally beneficial effects of *egoism* but an analysis (enriched by historical and economic

knowledge) of the *conditio humana*, of which, as Hume had already realized, self-interest is *also* a part. The point is, therefore, to institutionally canalize self-interest in a way that can bring about effects that are morally harmless in the eyes of the “impartial spectator.” Kathryn Sutherland is thus correct in writing in her introduction to the *Inquiry*: “An enquiry in five books, the *Wealth of Nations* sites economic activity within a framework of a wide-ranging discussion of social institutions und human propensities. The effect of its extended description is to complicate and problematize economic analysis by driving the economic impulses deeper into the recesses of human personality as the natural basis of our psychological and social existence” (54, p. xi).

Hume and Smith

Hume and Smith agree in many points of their moral philosophy:

- They both take a mediating position between Hobbes and Hutcheson: Man is a social being, who is both self-interested and has traits that simplify and render his life in a community possible.
- Positive moral judgments do not follow from the existence of particular motivations but arise from the judgment of an impartial spectator; a judgment made possible by *sympathy* and taking all sides into account.
- Both of them know that reason alone cannot motivate action.
- And they both know about the constitution of morality by emotions without which we would be morally blind.

Furthermore, they are united in their appraisal of free trade: According to them, it leads to theoretical and practical innovations and takes the concerned societies to higher cultural and economic levels.

Nevertheless, there is an important difference between Hume and Smith. According to Hume, we value a virtue or action with regard to its usefulness for society. According to Smith ([48], Part IV), however, the usefulness of rules and virtues is often not even being realized before they have grown to be old habits. Their usefulness can thus not be the first source of our approval or disapproval. It is not even their most important source: “. . .the sentiment of approbation always involves in it a sense of propriety quite distinct from the perception of utility” ([48], p. 207). In short: “Utility considerations are . . . (to Smith) neither the specific object nor the original motivation of moral judgments, although they often accompany them as reinforcing motivations” ([3], p. 85; originally in German).

In the first part of this paper, we have formulated two major issues of Scottish Enlightenment (Section “[Two Main Conceptual Problems of Scottish Enlightenment](#)”):

1. How can the Hobbesian image of man be reconciled with the experiences we make every day as moral subjects?
2. Under what conditions can the social subsystem *economy* become an approvable positive sum game?

Hume particularly contributed to the first problem's solution, by grounding moral philosophy on a descriptive pluralism and on an observation of the consequences of moral virtues and actions. Smith mainly solved the second problem: He studied the incentive conditions people in a modern economy act in more closely than Hume, and he put more emphasis than him on the mechanisms of self-organization we can utilize in order to take morally approvable paths of development with their help. Both thinkers, however, were deeply convinced that the way to modernity, accompanied and promoted by Scottish Enlightenment, was not a folly but represented the chance to move on to pastures new and to free the potential for development inherent in man.

Conclusion

The Scottish moral philosophers, and David Hume very much in particular, are characterized by a new way of asking questions. Instead of deducing rules of coexistence from tradition or nature, the philosophers of Scottish Enlightenment taught us to move descriptive questions to the foreground: What are the facts? How do people judge moral controversies? What are the interdependencies in economy and society? How do people value the results of different institutional arrangements? Personal value judgment is thus less relevant than the clarification of empirical questions. This does not mean, however, that moral questions are of no importance: With the utilitarian evaluation of rules (Hume), and with the authority of an impartial spectator (Smith), the protagonists of Scottish Enlightenment suggested moral criteria for judgment which are still interesting today. Furthermore, David Hume's political economy proves particularly compatible with the modern discussion because he – as far as I can see – was the first to develop a brilliant assumption regarding the causes of the European *sonderweg*, an assumption foreshadowing much of the twentieth century.

Abstract

Adam Smith is respected as the father of contemporary economics for his work on systemizing classical economics as an independent field of study in *The Wealth of Nations*. But he was also a significant moral philosopher of the Scottish Enlightenment, with its characteristic concern for integrating sentiments and rationality. This chapter considers Adam Smith as a key moral philosopher of commercial society whose critical reflection upon the particular ethical challenges posed by the new pressures and possibilities of commercial society remains relevant today. The discussion has three parts. First, I address the artificial separation between self-interest and morality often attributed to Smith, in which his work on economics is stripped of its ethical context. Second, I outline Smith's ethical approach to economics, focusing on his vigorous but qualified defense of commercial society for its contributions to prosperity, justice, and freedom. Third, I outline Smith's moral philosophy proper as combining a naturalistic account of moral psychology with a virtue ethics based on propriety in commercial society.

Introduction

These days, Adam Smith is most familiar to us as an economist and specifically as the defender of the famous invisible hand of free-market economics, wherein the private self-interested actions of private individuals, mediated through free markets, generate results that are good for all. The market system comprehends the true level of demand for any good and provides the appropriate

incentives – profits – for producers to adjust their output to match. No external intervention or guidance is necessary. A great deal of contemporary (neoclassical) economics can be understood in terms of translating Smith’s invisible hand metaphor into a systematic theoretical form, with a particular emphasis on the economic efficiency of perfectly competitive markets.

However, the popular view of Smith that has resulted from this emphasis is twice distorted. Firstly, it is based on the narrow foundations of a few select quotations from *The Wealth of Nations* (WN) that are taken in isolation as summing up his work, and secondly, these quotations have been analyzed in a particularly narrow way. As Amartya Sen puts it, “While some men are born small and some achieve smallness, it is clear that Adam Smith has had much smallness thrust upon him” ([10], p. 54). In order to understand and assess Smith’s importance as a moral philosopher of commercial society, it is first necessary to remove the artificial limitations which have been placed upon our reading of him ([Part I: Private Vices and Public Virtue](#)).

On turning to the full *Wealth of Nations*, one finds an economics discussed and justified in explicitly moral terms, in which markets, and the division of labor they allow, are shown to both depend upon and produce not only prosperity but also justice and freedom, particularly for the poor. Unsurprisingly, Smith was a staunch and vehement critic of those particularly grotesque sins associated with early capitalism, European empires, and the slave trade. Smith’s commitment to a realistic liberalism led him to endorse commercial society over any previous socioeconomic system as a social order in which the most people possible could live decent lives. Nonetheless, while the structural features of commercial society set the terms of its main opportunities and challenges, they did not determine the outcome. Commercial society was for Smith an ethical project whose greatest potential benefits had to be struggled for and which could and should be much better than it was ([Part II Smith’s Defence of Capitalism: for Prosperity, Justice, and Freedom](#)).

Smith’s other great work, *The Theory of Moral Sentiments* (TMS), was the book that first made his reputation while he was still professor of moral philosophy at the University of Glasgow. It was greatly influenced by his close friend and colleague, David Hume, and elaborated successfully on Hume’s own account of moral psychology in its analysis of sympathy and the impartial spectator. Smith’s analysis culminated in a *virtue ethics* based on propriety and thus shaped by the social context of commercial society in its choice and understanding of the major virtues: prudence, justice, benevolence, and self-command. Smith was perhaps the last philosopher to consider prudence a proper virtue, rather than mere cleverness at best ([2], p. 204). Doing so allowed him to distinguish the morally praiseworthy disposition to properly understand and further one’s self-interest from the vice of selfishness. But he also resisted reducing all motives to self-interest and considered man a fundamentally social being, motivated to seek the approval of others and to help those dear to him. Smith’s ethics was concerned with explaining how individuals become decent moral agents and how a sustainable moral order can evolve without central direction or coercion. In doing so, it also described and promoted

ethical ambition and excellence, though only a few might attain it ([Part III: The Bourgeois Virtues: How to Live Well in Commercial Society](#)).

Part I: Private Vices and Public Virtue

George Stigler is reported to have started his banquet speech at the bicentennial of the original publication of *The Wealth of Nations* by declaiming, “I bring you greetings from Adam Smith, who is alive and well and living in Chicago.” By this, he meant that Chicago (neoclassical) economists were fulfilling Smith’s legacy by producing mathematical representations of the “invisible hand”: how individuals acting from private self-interest can nevertheless make society as a whole better off.

This narrow reading of Smith’s economics stems from a narrow reading of select lines from WN. Notably, such famous remarks as,

It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest. ([12], I.ii.2)

and Smith’s (single) reference to the invisible hand,

...by directing that industry in such a manner as its produce may be of the greatest value, he intends only his own gain, and he is in this, as in many other cases, led by an invisible hand to promote an end which was no part of his intention. Nor is it always the worse for the society that it was no part of it. By pursuing his own interest he frequently promotes that of the society more effectually than when he really intends to promote it. I have never known much good done by those who affected to trade for the public good. ([12], IV.ii.9)

are first plucked from their local context in the surrounding text and their wider context in Smith’s methodology and concerns and then inflated to the status of stylized facts about Smith’s whole economics, not only concerning exchange but also of all aspects of production, distribution, and consumption. This stylized account presents Smith in a crudely Mandevillian sense: as arguing that public benefits depend on private vices. It has the pernicious effect of deflecting interest in Smith away from his supposedly primitive and unoriginal ethics and back toward his real achievements in economic theory. The Mandevillian interpretation works further harm since Mandeville, unlike Smith, reduced all motivations to self-interest and all self-interest to the vice of selfishness [5]. Smith is thus presented as promoting not even an amoral but an antimoral economics and one that is conveniently compatible with the selfish utility maximizing *homo economicus* of contemporary orthodox economic theory.

This popular interpretation of Smith’s economic ethics is of course very difficult to sustain on any close reading of WN, and it certainly clashes mightily with the ethical system Smith laid out in TMS. Its perniciousness rests partly on an understandable desire by most modern readers to sum up Smith’s contribution in modern terms and without having to read him in full. But the origins and legitimacy of this particular stylized Smith relate to an entrenched, though long thoroughly discredited, academic thesis that both separates Smith’s two books and

distorts their individual interpretation. The core of this so-called Adam Smith problem is the claim that there is a severe discontinuity in Smith's ethics between his two main works.¹ In TMS, actors are said to be motivated by "sympathy," while in WN, they are motivated by "selfishness." The most extreme version sees Smith as changing his mind between publishing TMS (1759) and the later WN (1776), with the implication that WN's endorsement of individual greed represented Smith's mature thinking about ethics and trumped whatever he had previously said.

The first problem with the thesis is that Smith published multiple editions of both books, with substantial revisions, right up until the end of his life. Thus, the fundamental change of mind attributed to him must have been more of a continuous violent oscillation than a considered judgment. There is also plentiful evidence from drafts, correspondence, and student notes from his lectures in moral philosophy at Glasgow that Smith had been developing the main lines of the analysis that would appear in WN even before the first publication of TMS. Smith appears to have had an entire system of thought in mind, of which the only books he completed occupied quite different branches of moral philosophy: ethics (TMS) and natural jurisprudence (of which WN addressed one subbranch, concerning "police, revenue, and arms, and whatever else is the subject of the law") ([2], pp. 29–39). It should not be surprising that two books about different subjects have a rather different emphasis.

The second problem is that WN and TMS do not seem to contradict each other as the thesis claims (though there are tensions, as I discuss below). Smith in WN is of course particularly concerned with the motivation of self-interest (or the desire to better one's condition), but this is not the same as selfishness, of which he was rather caustic. Self-interest is also positively defended in TMS as natural and morally praiseworthy, in its proper place (under the virtue of prudence) and as one among other motives. In this, Smith placed himself against those, like his teacher Francis Hutcheson, who saw benevolence as the only virtuous motivation for behavior and those cynics, like Bernard Mandeville, who saw self-interest likewise always as a vice (selfishness) but a publicly beneficial one. Nor is it correct to say that in TMS, actors are motivated by sympathy. For Smith, "sympathy" is the technical term for a complex mechanism in our moral psychology responsible for moral judgment. It does not motivate us directly, nor should it be confused with selflessness or the disposition to be nice to other people that the word sympathy nowadays evokes. The reason Smith talks about sympathy a lot in TMS, rather than WN, is because his sophisticated (and original) analysis of how sympathy works is the core of his system of moral philosophy.

To read Smith through the narrow conventional lens of economics vs. morality, or selfishness versus altruism, may serve certain rhetorical purposes well, but it reduces a great thinker to a caricature and makes Smith appear a stumbling block to business ethics rather than a valuable resource. Once one sets this artificially limited perspective aside, one can begin to get to grips with the real insights and challenges of this quintessential moral philosopher of commercial society.

Part II Smith's Defense of Capitalism: For Prosperity, Justice, and Freedom

Smith's defense of capitalism (or, in his terminology, "commercial society") is unambiguous but qualified. There is no inconsistency here. Reconciliation with imperfection was central to the thought of this particularly pragmatic and self-reflective thinker and can be seen in Smith's anthropological attention to human frailties, the modesty of his goals, and his forceful rejection of abstract theoretical systems as the basis of moral philosophy or political economy. Smith was optimistic about the achievements, and even greater possibilities, of commercial society in allowing more people than ever before to live decent lives characterized by material prosperity, justice, and freedom. But he was no blind zealot for the market. Smith was acutely aware of the possible ethical shortcomings of commercial society and, for example, carefully read and responded to Rousseau's powerful critiques of its materialism, inequality, and inauthenticity [3, 9].

The enlightenment concern for perfecting social order was both the background to Smith's thinking and a goal Smith eschewed. As Rousseau put it in *The Social Contract*,

The problem is to find a form of association which will defend and protect with the whole common force the person and goods of each associate, and in which each, while uniting himself with all, may still obey himself alone, and remain as free as before. ([8], I.6)

While Rousseau sought a perfect and absolute solution to the problem through his famous social contract, Smith can be understood as arguing, in both his ethics and political economics, for a society's ability to endogenously produce a decent social order for coordinating moral and economic conduct without centralized direction or coercive moral policing by religious or secular authorities. For morality, the sociological mechanism is sympathy (which we will return to), while for economics it is market exchange. Smith was not interested in what a perfect society might look like but rather with understanding the world as it is and how it might be improved. What Smith described and analyzed so well was the appearance of *commercial society* characterized by an enormously increased division of labor, dependence on strangers, formal property rights, and individual mobility.

Smith noted (following a number of previous writers in political economy) that a European peasant was now materially better off than an African king, but he attributed this not to innate European superiority but to changes in the political economy. The recent increase in the wealth of certain nations was due to the increasing role of markets in their economies, which made possible and rewarded the technical innovations and efficient organization of labor that dramatically increase the productivity of labor. That benefits the ordinary citizens of a country – i.e., the poor – in two ways. Firstly, when producers compete fairly and freely with each other to supply the public with cheaper (and better) products, there is a natural tendency for the market price to fall toward the actual cost of production, meaning less profits for producers and cheaper products for consumers. Secondly, at the

other end, the rise in labor productivity means that wage laborers (the bulk of the population) can exchange their labor for a greater command of those goods. The wealth of the nation – the ability of its citizens to command goods to satisfy their wants – is increased. It was particularly important to Smith that the poor benefit from this process:

No society can surely be flourishing and happy, of which the far greater part of the members are poor and miserable. It is but equity, besides, that they who feed, cloath and lodge the whole body of the people, should have such a share of the produce of their own labour as to be themselves tolerably well fed, cloathed and lodged. ([12], I.viii.36)

That concern for fairness over and above economic efficiency was behind the vehemence of Smith's opposition to mercantilist (business-friendly) arguments for policies that would protect producer profits. Smith saw such arguments, whether for direct subsidies or competition-restricting regulations, as an intellectually bankrupt, and often morally corrupt, rhetorical veil for what were actually taxes upon the poor. Although Smith's concept of justice was concerned only with acts of commission, it still had bite. Such "taxes" are unjust because they violate fair play both in the deceptive rhetoric by which they are advanced and by harming the interests of one group in society to further the interests of another. As Smith put it, "To hurt in any degree the interest of any one order of citizens, for no other purpose but to promote that of some other, is evidently contrary to that justice and equality of treatment which the sovereign owes to all the different orders of his subject" ([12], IV.viii.30).

Such injustice is not only formal. There is an outrageous degree of iniquity in the rich and powerful classes choosing to place such burdens on the poor and powerless. Justice was central to Smith's critique of contemporary mercantilist commercial society and to his alternative proposal of a "system of natural liberty." While mercantilism had achieved a great deal, it still fell far short of creating the level playing field and commitment to fair play that Smith argued a civilized society should realize in its positive jurisprudence and institutions. In terms of a level playing field, Smith excoriated the efforts of the politically connected to write rules that suited themselves. The mercantilist system had nationalized the corporation model of the towns in the feudal system, but in doing so, it had also nationalized the "underling" ethics of monopolist tradesmen and manufacturers, who preferred to lobby collectively for self-serving rights and privileges at the political level than to compete on equal terms with others in the market. The "impertinent jealousy of merchants and manufacturers" led to ridiculous but pervasive and onerous economic regulations, but at the political level, it also promoted an invidious zero-sum view of trade that led to seeing the prosperity of other nations as your loss ([12], IV.iii.c.9).² Likewise, fair play was routinely violated by price- and wage-fixing cartels among merchants and manufacturers, while workers' combinations were the subject of severe laws and hyperbolic moral denunciation ([12], I.viii.13). It is worth noting that Smith was acutely aware of who the likely readers of WN might be and supplemented such arguments for the moral priority of justice with hard-nosed utilitarian arguments about its constitutive role in social order and economic

development. When people gain equality before the law and thus security from the predations of the powerful, they have the security they need to make the investments that increase productivity.

Freedom from constraints, freedom from domination, and the freedom of autonomy were also central to Smith's economics. Smith is most associated with the first of these, also called classical or negative liberty, because of his famous endorsement of the "natural system of liberty" (so-called *laissez-faire* economics) in which, "Every man, as long as he does not violate the laws of justice, is left perfectly free to pursue his own interest his own way, and to bring both his industry and capital into competition with those of any other man, or order of men" ([12], IV.ix.51).³ A great deal of WN is concerned with identifying and criticizing the artificial and unjustified obstacles placed in the path of ordinary people trying to get on with their own lives and better their condition. Smith argued forcefully, and in great econometric detail, that England had become richer in spite of and not because of the government's mercantilist policies (the hard-nosed utilitarian argument).

But such mercantilist regulations were wrong not only because they reduced economic efficiency by reducing and distorting competition. They were also wrong because of the insufferable impertinence of a government (or any other body) taking it upon itself to manage people's affairs on their behalf. This was not only a matter of the freedom of great merchants to engage in high international trade. Smith was particularly exercised about the eighteenth-century English laws that deprived wage laborers, whose only means of subsistence was to sell their labor, of the right to change occupations, negotiate wages, or even move around the country. Of course, that produced an inefficient allocation of economic resources (not enough wheelwrights in one place, too many in another), but even more importantly, it disrespected the right of ordinary people to make decisions on matters of the greatest concern to them, which were no-one else's proper business, and about which they best placed to judge. These policies, justified by chimerical arguments about the public good, reduced and distorted the options available to ordinary people to help themselves and through such artificial helplessness induced real hardship and destitution.

One should note that liberty was a maxim for Smith rather than a dogma, and he was in favor of regulations properly justified by the public good. For example, he argued for banking regulations which though "in some respect a violation of natural liberty" upon a few individuals were justified by the government's duty to protect "the security of the whole society" ([12], II.ii.94). And he argued for fixing the rate of interest at a relatively low level (just above the prime market rate) in order to prevent imprudent "prodigals" (subprime borrowers) and "projectors" (speculators with crazy South Sea Bubble type schemes) from getting access to credit and diverting it from prudent investment.⁴ In contrast to many contemporary economists, Smith saw prudence as a more cautious than an enterprising virtue and trusted markets to school it but not to substitute for it.

Smith also argued that commercial society produced freedom from domination (or "Republican freedom" in modern terminology). The feudal system that Smith

describes as preceding commercial society (and whose traces could still be seen in his own time in parts of Scotland) was a society characterized by direct relationships of dependence, a world of great landowners with the power of lords over their tenant farmer subjects and retainers. Such a social order caters to a pernicious human vice – pride – that all too easily becomes a vicious institution.

The pride of man makes him love to domineer, and nothing mortifies him so much as to be obliged to condescend to persuade his inferiors. Wherever the law allows it, and the nature of the work can afford it, therefore, he will generally prefer the service of slaves to that of freemen. ([12], III.ii.10)

The appearance of commercial society changed all that. In commercial society, informal webs of mutual obligation are transformed into formal consensual relationships between independent agents because these are far more economically productive. The division of labor mediated by extensive markets replaces closed relationships of direct dependence, in which some must subordinate themselves to the whims of their masters and curry favor to survive, with open networks of interdependence spread among the thousands of people involved in producing and bringing to market the most ordinary essentials of life.⁵ On the production side, this liberates workers to sell their labor without having to sell themselves. If people find the working conditions in one employment oppressive, they are free to take their labor elsewhere. In markets themselves, the very fact that people interact as relative strangers, and therefore appeal to each other's self-interest rather than their benevolence (as beggars must), means that they meet in conditions of relative equality where they must endeavor to persuade others of the qualities of their goods by the gentle arts of persuasion.⁶

Smith also believed that personal autonomy – self-determination – could flourish in commercial society, particularly through its scope for moral self-development. Increased wealth and the security that followed a proper administration of justice allowed ordinary people to reflect about matters beyond their daily subsistence. Freedom from artificial constraints and domination allowed them to control important aspects of their own lives, from religion to employment, while taking greater responsibility for how they lived. Markets themselves could be schools for certain virtues. For example, people who worked for themselves would be more industrious and temperate; people who interacted through markets would be more honest than when trapped in sycophantic relationships with masters. As a result, Smith considered commercial society compatible with the moral autonomy of its ordinary citizens and believed that such societies would exhibit more moral decency, though less moral greatness, than either classical or contemporary “savage” societies.

Nevertheless, Smith was careful to acknowledge the particular problems and limitations that life in commercial society posed for autonomy and, after extolling the benefits of free markets at great length, spent book V of WN laying out in great detail partial institutional correctives for its deleterious consequences. He noted, for example, that the division of labor could have deleterious effects on the physical, mental, and moral capacities of workers performing simple repetitive rote tasks, as in the famous pin factory. They could all too easily become “pinheads” “as stupid

and ignorant as it is possible for a human creature to become. . . incapable . . . of conceiving any generous, noble, or tender sentiment” ([12], V.i.f.50). Smith argued that a public education system could mitigate such consequences. He also worried that the anonymity of city life might diminish ordinary people’s ability to hold themselves to moral standards, since they would no longer be under the disciplinary gaze of others as they would be in a small country village ([12], V.i.g.12). When no one else attends to your conduct, Smith thought, it was less likely that you would scrutinize your behavior as you should. He worried too that religious zealotry would flourish in cities by providing a crutch for personal identity – the members of small sects tend to care very much about each other’s conduct. But though sectarian membership might head off the danger of dissipated morality and hold people to high moral standards, it was all too often based on a hubristic moral righteousness that Smith considered a travesty of real moral autonomy and, through its tendency to political factionalism, a threat to social order. This danger might be mitigated, noncoercively of course, through the official encouragement of those antidotes to superstition and gloom – the study of science and philosophy and public entertainments (such as painting, poetry, music, dancing, or drama) ([12], V.i.g.12–15).

Smith was a true “friend of commerce,” supporting the project because of its achievements and its even greater potential but constructively critical about both the shortcomings of the mercantilist society he lived in and commerce in general. His “economic” analysis is saturated with moral values. He justified commercial society for its tremendous contribution to the prosperity, justice, and freedom of its members, and most particularly for the poor and powerless in society. But he was no naive ideologue for free markets and profits. He criticized the moral character of the very merchants and manufacturers who, he acknowledged, were driving economic development and not only told them they should act better but also argued for institutional measures to restrict their worst influences (particularly by getting government out of the business of economic micromanagement). Though its promise was great, commercial society also meant the loss of valuable old ways and posed new challenges of its own. Its success was not predetermined but had to be worked for. That spirit of optimistic pragmatism contrasts markedly with contemporary critics of commercial society like Rousseau, who saw things in more absolute terms.

Part III: The Bourgeois Virtues: How to Live Well in Commercial Society

Smith’s moral philosophy was addressed to two distinct questions, which appear in different forms throughout TMS. The normative question: “Wherein does virtue consist? Or what is the tone of temper, and tenour of conduct, which constitutes the excellent and praise-worthy character, the character which is the natural object of esteem, honor, and approbation?” And what he called the “philosopher’s question”: “By what power or faculty in the mind is it, that this character, whatever it be, is recommended to us?” Or, in other words, “How and by what means does it come to

pass, that the mind prefers one tenour of conduct to another, denominates the one right and the other wrong; considers the one as the object of approbation, honor, and reward, and the other of blame, censure, and punishment?" ([11], VII.i.2). Smith's answer to the first was a virtue ethics based on propriety like classical accounts but updated for life in a commercial society. His answer to the second, which we will turn to first, was a sophisticated model of moral psychology based on sympathy.

Smith built up his account of moral psychology from an anthropological study of how ordinary people go about their moral lives. His motivations for doing so were to be true to the phenomena in question. Firstly, he had little patience for those who tried to squeeze actual moral phenomena into distorted shapes to fit an elegant conceptual system, for example, on the aesthetically pleasing principle of accounting for everything with as few principles as possible ([11], VII.ii.2.14). Secondly, Smith wanted to save the agent's perspective in morality and conducts a running battle in TMS with those, such as Mandeville and Hume, who considered the ultimate (utilitarian) causes of morality more relevant to the understanding of moral thinking than ordinary first-order moral perceptions. Smith argues that ethics is irreducibly phenomenological and that the theorist is mistaken to believe that an analysis of causes can displace the agent's point of view ([2], pp. 53–4).

That moral phenomenology was structured around an emotional economy mediated by sympathy and oriented toward harmony. Smith, in the sentimentalist tradition of the Scottish Enlightenment, understood emotions as having cognitive and normative content, incorporating actors' general beliefs and concepts and their specific (determinate) judgments of particular situations. That cognitive content could be vicariously grasped and evaluated by a critically engaged spectator who (1) considers the emotions expressed by an actor (from their expressions, talk, and actions), (2) considers how she would feel in the actor's position (sympathy), and (3) brings this together and evaluates whether the actor's emotions are more or less appropriate for the situation as she understands it.

In this account, sympathy should be understood adverbially, as applying to an emotion felt *sympathetically*, according to the spectator's own feelings when imaginatively transposing herself into an actor's position. Sympathy is thus not necessarily a concordance of feelings between actor and spectator because their assessments of the relevant situation may vary, and it is the situation that generates the spectator's sympathetic feelings, which she then uses to evaluate the propriety of the actor's behavior. Mutual sympathy, or "fellow feeling," occurs when both actor and spectator feel the same emotion (although of course even a spectator of great sensibility will not feel it to the same extent) and the concordance generates an additional pleasure, whatever the emotion in question. Smith's account of sympathy is thus more complex than Hume's, which firstly understood the transmission system in terms of direct emotional contagion rather than imaginative reconstruction and secondly limited sympathetic approval to those emotions that were beneficial to society.

Sympathy depends on what Smith considered a natural human capacity, as fundamentally social creatures, for imagining ourselves in another's situation, combined with a natural human disposition to seek harmony (also seen in our

propensity to “truck, barter, and exchange”). Of course, this power of imagination is limited in that the spectator can never entirely leave herself behind but always remains aware of her detachment from the real actor, which in Smith’s terminology is a “fortunate design” for otherwise the spectator might break the liberal principle of respecting the actor’s internal autonomy. But that separation is also an epistemic resource because the spectator is able to bring her own knowledge and sense of propriety with her to the assessment of this new perspective.

Of course, judgments about the propriety of other people’s displays of grief, joy, anger, or gratitude require an existing understanding of how the world and people work and what standards should apply. Smith argues that this too comes about through sympathy. People have a natural desire for the approval of others and an aversion to their disapproval ([11], III.i.13). Not only is the spectator capable of imagining herself in an actor’s situation but actors too can imagine how they appear to others, since all of us are continually switching between both roles. From childhood, we learn to see ourselves as others see us, to understand what others approve of and what they are unwilling to go along with, and through such discipline and direction, we gradually come to understand and internalize the prevailing moral norms of propriety in terms of what the representative disinterested bystander – any *impartial spectator* – would go along with, even if no such spectator is physically present. Smith’s anthropological approach reveals asymmetries in this system passed over by previous philosophers. For example, spectators are more reluctant to sympathize with some emotions than others, even when they are justified. They will go along with an excess of joy far more than an excess of grief or anger, because joy is more pleasant. As a result, and in a manner generally beneficial for social order, people will particularly tend to self-censor their less pleasant or unsocial passions, to lower their pitch to the level the impartial spectator can go along with.

This produces an ethics of conventional propriety that is important for social order and an important stage in moral education but not its final goal: virtue. Smith argues that as well as desiring praise, people want to be objectively worthy of praise ([11], III.i.8). They want to achieve real virtue and not merely its appearance, and this requires wisdom as well as love of virtue. As Smith puts it,

The wise and virtuous man directs his principal attention to the first standard; the idea of exact propriety and perfection. There exists in the mind of every man, an idea of this kind, gradually formed from his observations upon the character and conduct both of himself and of other people. It is the slow, gradual, and progressive work of the great demigod within the breast, the great judge and arbiter of conduct. . . . Every day some feature is improved; every day some blemish is corrected. ([11], VI.iii.25)

The impartial spectator is the “great demigod,” the device by which people can try to bridge the gap between conventional propriety and an understanding of true virtue (though always imperfectly). It provides a tool for identifying subtle dissonances between appearances and reality that goes beyond the basic reality check that social norms provide to our self-rationalizing passions and interests. It has the character of an internal Socratic dialogue, of demanding continuous critical reflection and interpretation of what we think we know, such as by rigorously testing and

sifting the quality and coherence of the values that society espouses. Smith, for example, used the European condemnation of Chinese foot-binding practices as a mirror to reveal the parallel injustice of the unexamined European custom that compelled women to wear physically disfiguring corsets ([11], V.i.8). The impartial spectator can thus operate like a ratchet to generate a more transcendent “objective” understanding of morality out of the base materials of our conventional proprieties. Smith saw moral development as an ongoing project in every individual’s life that all could in principle aspire to, even if most stopped at the level of common decency and were more focused on wealth and success than identifying and pursuing true excellence ([11], I.iii.3.2). In any case, true virtue – excellence – required moral autonomy for it depended on the development of an aesthetic sensibility for true propriety rather than the following of moral rules (except in the case of justice).⁷

Smith has been called “the last of the former virtue ethicists” [7], but his was a virtue ethics adapted to life in a commercial society and to enlightenment values of liberal individualism, and this gives it a striking demotic character: incorporating equality, accessibility, frailty, and the mundane. Smith considered that a society’s political economy, through the character of its institutions and social interactions, affected the understanding and arrangement of the virtues it endorsed. Thus, definitions of virtues such as prudence could shift and border between virtues blur, while some virtues would rise in significance and others would recede (as was the fate of courage and magnanimity in commercial society). Smith’s bourgeois virtue ethics has four major virtues, as well as such minor ones as civility, industriousness, and temperance. Prudence is the virtue concerning the proper pursuit of one’s own interests; justice and benevolence concern our relations to others; self-command concerns propriety.⁸

Prudence concerns the bettering of one’s condition and is motivated fundamentally by the desire to acquire the respect of one’s peers. It combines the “superior reasoning and understanding” of the “remote consequences of all our actions” for our interests with the self-command to resist immediate temptations ([11], IV.i.17). Thus, the prudent person has a proper concern for her health, fortune, reputation, and happiness and is cautious not to expose these to unnecessary hazard and, for example, chooses her friends carefully. She studies situations and her actions with the critical distance of the impartial spectator. She is apolitical, industrious, and frugal and thus a “public benefactor” in Smith’s economic analysis, who merits “cold esteem” from others though not ardent love or admiration. It is worth noting that although Smith’s insistence that prudence is a virtue in its own right gives it a “classical flavor,” it differs from its Aristotelian counterpart (*phronesis*) in two ways: it is tied to self-approbation (via the impartial spectator) rather than self-perfection, and it requires judgment and a sense of propriety but no great wisdom ([2], pp. 204–205).

Justice concerns governing our actions affecting others according to a “sacred regard” for the general rules of natural jurisprudence. It is a peculiar virtue in Smith’s system, a necessary foundation for any society to persist – even one upheld merely by the “mercenary exchange of good offices according to an agreed valuation,” but insufficient for a happy and flourishing society. On the one hand, it can

be seen as having a strikingly narrow remit as a “negative virtue” in which excellence is impossible because it concerns strict compliance in one’s actions with fixed rules. As Smith puts it,

Mere justice is, upon most occasions, but a negative virtue, and only hinders us from hurting our neighbour. The man who barely abstains from violating either the person, or the estate, or the reputation of his neighbours, has surely very little positive merit. He fulfils, however, all the rules of what is peculiarly called justice, and does every thing which his equals can with propriety force him to do, or which they can punish him for not doing. We may often fulfil all the rules of justice by sitting still and doing nothing. ([11], II.ii.9)

On the other hand, justice can be seen as playing a much more extensive and demanding role in moral life both in the fundamental orientation to others that it prescribes and the actions it proscribes. Justice prescribes a foundational commitment to impartiality and equality between ourselves and others that follows, Smith hoped, from the humbling recognition we come to have in the course of our moral development that “we are but one of the multitude, in no respect better than any other in it” ([11], III.3.4). The proscriptive conclusion follows that to harm others to further our interests or to violate fair play by jostling or tripping one’s competitors in the “race for wealth, and honours, and preferments” is to behave in ways that not only one’s victims but all of mankind would find abhorrent (recall Smith’s criticism of mercantilist “taxation” of the poor for private gain) ([11], II.ii.2.1).

Benevolence concerns how we should care about and attend to others. It is the second major virtue concerned with how we should behave to others and unlike justice consists of the unjuridicable, loosely defined, and contingent moral responsibilities that one owes to particular others depending on one’s relationship to them. Smith agrees with the stoics (a strong influence on his moral philosophy) that it is a brute fact about human nature that our concern for others depends upon the closeness of our relationship to them (*oikeiōsis*). But he rejects as unnaturally severe their cosmopolitan conclusion that morality requires collapsing this affective distance, so that one cares for oneself only as much as one cares for distant others. So although Smith draws the standard stoic expanding concentric circles of decreasing intimacy and concern around the moral agent – from family to community to political state to humanity in general – he argues that this natural order is also the proper order for our benevolence ([11], VI.ii Chap. 1–3).⁹

Smith’s analysis is based on the naturally declining affective concern for and information about others as one moves further from the spectatorial center. He argues that, “What is called affection, is in reality nothing but habitual sympathy” ([11], VI.ii.1.7). That is, it depends upon our ability to understand others. When one is intimately connected with others, for example, by living closely with them, one gets better and better at understanding their character and circumstances, and one’s ability to sympathize with them – to put oneself in their place and consider all the relevant circumstances – becomes more fluent and accurate until “it approaches. . .to what (the spectator) feels for himself” ([11], VI.ii.1.2). Of course, the reverse is also true, and people further away become more abstract and less knowable to the spectator. In any case, beyond the confines of one’s political state, it is not possible (at least in Smith’s time) to help them in any way. At that distance,

strangers deserve only our “good wishes,” anything more would be implausible, emotionally exhausting, and fruitless ([11], III.3.9).

Self-command concerns following propriety and has strong stoic overtones, for example, in measuring its praiseworthiness by the strength of the passions and temptations it must overcome. It is an element of every other virtue because all require checking self-love to the degree required by propriety – as represented by the impartial spectator. Yet it is also a particular character trait and thus a suitable candidate for analyzing as a virtue. For example, to subdue one’s anger because one recognizes its impropriety is to act virtuously. To check one’s anger from fear is not only less than admirable because unmotivated by propriety – the impartial spectator would not approve – but it is also incomplete, since the anger may continue to fester unaddressed ([11], VI.iii.10).

In summing up Smith’s bourgeois ethics, it is worth touching on one of the deepest tensions in his account, between excellence and decency, and how it relates to another tension, between the true interests of the individual (virtue) and the good order and prosperity of society. As Smith put it,

To deserve, to acquire, and to enjoy the respect and admiration of mankind, are the great objects of ambition and emulation. Two different roads are presented to us, equally leading to the attainment of this so much desired object; the one, by the study of wisdom and the practice of virtue; the other, by the acquisition of wealth and greatness. ([11], I.iii.3.2)

While more people in commercial society would be able to pursue truly virtuous lives than ever before, Smith expected that few would do so. That followed from the fundamental asymmetry in our moral psychology mentioned above. Because as spectators, we are disposed to sympathize more with joy than with sorrow, so as actors, “we make parade of our riches and conceal our poverty” ([11], I.iii.2.1). For Smith, it is this economy of attention that drives the “real” economy. People pursue riches, Smith argued, because wealth draws the attention and sympathetic admiration of others, who *enjoy* imagining how nice it must be to live such a life and want to emulate it. Fame and fortune thus provide a convincing and seductive simulacrum of a successful life. In contrast, the wise and virtuous, whose perception is undistorted, live a humble and frugal life that draws no such attention, though it is in reality the truly excellent path.

That effect will be particularly marked in a commercial society, where people are free to pursue fame and fortune even though that is not in their true interest. In his parable of “The poor man’s son, whom heaven in its anger has visited with ambition” Smith lays out how the desire to emulate the imagined comfort and tranquility of the rich can lead to a lifetime of extraordinary industriousness ([11], IV.1.8). Not only is such endless industriousness incompatible with the goal of tranquility but its pursuit comes at the cost of the real tranquility that is always within the grasp of anyone, poor or not. Nevertheless, from the perspective of society, this tendency is beneficial, since “It is this deception which rouses and keeps in continual motion the industry of mankind. It is this which first prompted them to cultivate the ground, to build houses, to found cities and commonwealths, and to invent and improve all the sciences and arts, which ennoble and embellish human life” ([11], IV.1.10).

Conclusion

For a quite considerable time, Adam Smith's moral philosophy has been neglected even by those who thought they knew him. The overwhelming popularity of Smith's economics, which was rightly celebrated as the foundation of a new discipline, overshadowed his moral philosophy which had to compete for the attention of the modern reader with such contemporary luminaries as Rousseau, Hume, and Kant. Over the last 20 years, that unjust obscurity has been eroded by a steady stream of excellent analysis and commentary by philosophers and historians of ideas (only some of whom I have been able to refer to in this short chapter). Their work suggests that Smith's moral philosophy, particularly his original analysis of sympathy and the impartial spectator, is an achievement comparable with his economics and of much more than historical interest.

Bringing out the moral philosopher in Smith also improves our understanding of his economics. In particular, it allows us to see the benefits and challenges of commercial society from Smith's perspective, which went considerably beyond the cold utilitarian efficiency of the ghostly invisible hand to look at how the new social order affected social interactions, values, and moral life. It also allows us to open up the question of morality and self-interest by moving past the simple dichotomy it evokes and looking instead, as Smith himself did, at its more subtle tensions and challenges, such as between moral decency and excellence or between the ethics appropriate to market competition and other settings such as the household or the firm.

6. In his *Lectures on Jurisprudence* (according to his students' notes), Smith suggested a direct correspondence between the human propensity to "truck, barter, and exchange" in argument and in the market. "The offering of a shilling, which to us appears to have so plain and simple a meaning, is in reality offering an argument to persuade one to do so and so as it is for his interest" ([13], vi.56). As the eminent Smithian scholar Charles Griswold puts it, "Life in a market society is an ongoing exercise in rhetoric" ([2], p. 297).
7. Rules do play an important role in Smith's account, but they have the character of action guiding maxims rather than themselves being reasons on which to base moral conclusions. They are produced by reflection on our experiences and observations (enhanced by encountering and thinking through the moral issues portrayed in drama and literature) and, as commitments, can help us to keep to what the impartial spectator would approve of at times when it would be easy to allow momentary temptations and passions to distort our judgment.
8. The hierarchy of Smith's virtues is contended. For example, Deirdre McCloskey considers *prudence* Smith's central virtue [6], Patricia Werhane considers it to be *justice* [14], Ryan Hanley *beneficence* (active benevolence) [4], and Raphael and Macfie take the stoical interpretation that it is *self command* [11].

Abstract

This chapter offers a concise discussion of classic utilitarianism which is the prototypical moral doctrine of the utilitarian family. It starts with an analysis of the classic utilitarian criterion of rightness, gives an overview over its virtues and vices, and suggests an overall assessment of its adequacy as a theory of morality. Furthermore, it briefly discusses whether classic utilitarianism holds promise as a philosophy for doing business.

Introduction

This chapter addresses two questions: Firstly, is utilitarianism adequate as a theory of morality? Secondly, may utilitarianism be an appropriate philosophy for doing business? Given the scope of the chapter, we will have to restrict ourselves to the prototypical moral doctrine of the utilitarian family: classic utilitarianism.¹ At the end, though, we shall draw a tentative lesson about utilitarianism in general. Throughout, we shall attempt to conduct the discussion in such a way as to avoid a problem rightly lamented by Fred Feldman. He complains that “philosophers have set out to defend (or attack) certain doctrines without first discovering precisely *what* doctrine they desire to defend (or attack)” [1]. We shall thus proceed as follows: In the next section, we shall carefully delineate classic utilitarianism by way of an analysis of its criterion of rightness. This will make explicit the doctrine’s fundamental moral claims. After that, we shall proceed to the question whether utilitarianism is adequate as a moral conception. Armed with a list of evaluative criteria for moral theories, we shall look at its virtues and vices. Then, we shall discuss whether classic utilitarianism may be a reasonable ethical guide for doing

business. In the last section, we shall sum up and conclude that utilitarianism ought to be rejected as a general moral theory, though it may be a reasonable moral outlook for doing business, provided it is applied within a regulatory framework which countervails its severe moral problems.

Classic Utilitarianism: The Nature of the Beast

The purport of classic utilitarianism is commonly stated either as a thesis about moral rightness or as a thesis about moral obligation. An act is right, according to classic utilitarianism, if and only if it maximizes the sum total of happiness or utility of all sentient creatures. It is obligatory if and only if it *uniquely* maximizes total happiness, that is, if there is no alternative which produces at least the same amount of happiness. This apparently simple doctrine involves a number of distinct moral commitments, to wit, consequentialism, maximization, hedonism, summation, equal treatment, and universalism.

First, let us categorize these components. The cognoscenti of moral philosophy know that “[t]he two main concepts of ethics are those of the right and the good” and that “[t]he structure of an ethical theory is (...) largely determined by how it defines and connects these two basic notions” ([2], p. 21). The components of classic utilitarianism can, hence, be classed as belonging either to the concept of right or to the concept of good. Consequentialism and maximization belong to the former (cf., e.g., [3]). Hedonism, summation, equal treatment, and universalism belong to the latter.

As a moral thesis, consequentialism (or “teleology,” as it is sometimes called) is the claim that the rightness of an act depends solely on the moral good that it brings about. Maximization specifies this dependency. It says that an act is right if and only if it *maximizes* the moral good.

The *moral* good is the good as seen from an *impersonal* perspective. What does that mean? When we consider the good from an impersonal perspective, we do not ask the *nonmoral* question “What is good from the perspective of a particular person?” Rather, we ask the moral question “What is good from a perspective which adequately takes into account and weighs the good of all morally relevant individuals?” The impersonal perspective is specified, then, by answering the following four questions. Firstly, what is good for the individual? That is, what constitutes his or her well-being? Secondly, how do we give adequate consideration to the well-being of all morally relevant individuals? Thirdly, what is an adequate method for weighing the well-being of the individuals relative to one another? Fourthly, who is morally relevant? Classic utilitarianism answers these questions in the following way.

Its answer to the first question is hedonism which claims that the well-being of an individual is to be determined by his or her mental state. A person is better off (worse off) the more (less) utility or happiness he or she experiences, where the terms “utility” and “happiness” refer to the balance of pleasurable sensations over unpleasant sensations.

The answer to the second question is summation. It says that the well-being of each morally relevant individual is adequately taken into account if it is taken to be a part of a sum of properly weighted individual well-beings.

Equal treatment is the classic utilitarian answer to the third question. It claims that the same weight should be given to the well-being of each morally relevant subject. To use a phrase attributed to the famous utilitarian thinker, Jeremy Bentham, each is “to count for one, nobody for more than one” [4].

Universalism pertains to the fourth and last question. It claims that *all* individuals whose well-being we may conceivably affect by our actions ought to be given moral consideration. Note that this formulation of universalism draws on the notion of well-being. Since in classic utilitarianism this notion is specified by hedonism, universalism takes the form of “universalistic hedonism” ([5], p. 411) which holds that the sphere of morally relevant subjects is, as Henry Sidgwick has put it, the “innumerable multitude of sentient beings” ([5], p. 404).

Taken together, hedonism, summation, equal treatment, and universalism claim that the moral good is the sum total of happiness of all sentient creatures. Maximization and consequentialism claim, jointly, that an act is right if and only if it maximizes the moral good. These theses, taken together, add up to the claim that an act is right if and only if it maximizes the sum total of happiness of all sentient creatures.

Evaluation

The evaluation of a moral doctrine requires (albeit implicitly) a set of evaluative criteria. Before we consider the virtues and vices of classic utilitarianism we should, therefore, lay bare the criteria which we shall use in our discussion. Note that at least some of them are rather controversial, as is the field of moral evaluation in general.

Evaluative Criteria

In the following, we shall assume that a moral doctrine ought to fit our moral intuitions about moral principles and moral cases (intuitive fit), avoid contradiction (consistency), class every moral act as either right or wrong (completeness), class at least one act in every choice situation as right (moral dilemmas), use only intelligible notions (conceptual clarity), make economic use of basic notions (simplicity), establish logical connections between its logical components and basic notions as well as its moral principles and case judgments (systematicity).

Virtues

In view of these criteria, how well does classic utilitarianism do as a theory of morality? First, how well does it fit our moral intuitions?

Its first component, consequentialism, appears to be quite an intuitive claim. Some authors even go as far as to maintain that it is *the* one feature of classic utilitarianism that we are most taken in by. Christine Korsgaard, for example, explains that utilitarian moral doctrines have such a strong grip on us because many of us believe that “the business of morality is to *bring something about*” [6]. Other authors have put forward similar views (cf., e.g., [7, 8]).

Maximization seems to have “a deep intuitive appeal” as well, as John Rawls remarks. He thinks that this is so because it appears to “embody the idea of rationality.” “It is natural,” Rawls says, “to think that rationality is maximizing something and that in morals it must be maximizing the good” ([2], p. 22). Similar claims can be found elsewhere in the literature (cf., e.g., [7, 9]).

As Roger Crisp notes, hedonism, too, has “long seemed an obviously plausible view” [10]. A simple line of thought developed by John Stuart Mill suggests why this may be so. Assume, firstly, that something is good for us if and only if we desire it. After all, “[t]he only proof capable of being given that an object is visible, is that people actually see it. The only proof that a sound is audible, is that people hear it (. . .). In like manner (. . .) the sole evidence it is possible to produce that anything is desirable, is that people do actually desire it” [11]. Now it is undoubtedly true that we desire our own happiness. So happiness is a good for us. Of course, this does not establish hedonism. For we desire a host of things besides happiness – money, music, friendship, and what have you. However, it is not wildly implausible to maintain, secondly, that we desire all these things merely because they make us happy. This, then, establishes the hedonist claim that, ultimately, happiness is the only thing which matters in life.

What about summation? This principle is certainly intuitive, since it is “the most familiar operation” [12] to calculate the impersonal good. As in the case of maximization, there is an analogy with rationality which lends it some credibility. If you want to find out whether act A or act B is the better choice, it seems rational for you to take stock of your gains and losses in each case and balance them off against one another. The better choice option is the one which is more beneficial to you *in sum*. In a moral choice problem, it seems, you should proceed analogously. To work out whether A or B is the morally better choice, you should look at their respective gains and losses from all the relevant personal perspectives and add them up. The morally better option is then the one with the more beneficial balance of gains over losses.

Finally, what about universalism and equal treatment? It makes sense to look at them in conjunction, since they are closely connected with each other. Universalism requires that, in calculating the moral good, we take all sentient creatures into account whose well-being we may conceivably affect. Equal treatment demands that we weight their well-being equally. Both claims seem to embody the idea of impartiality. This ties them together and makes them appear very attractive from the moral point of view [13].

Let us move on, then, to the issue of consistency. It is generally believed that it is among the practical virtues of classic utilitarianism that it “will never entail that we ought to do something and we ought to refrain from doing it” ([14], p. 23). Consider a choice between two mutually exclusive acts, A and B. Classic utilitarianism will

either tell you to do A rather than B, if A produces more well-being than B, or B rather than A if the reverse is true. Or it will give you a choice between A and B if both are equally conducive to general happiness. In all possible scenarios, the doctrine's judgments are perfectly consistent. And there is no further possibility. So it seems that classic utilitarianism is, indeed, logically consistent.

Furthermore, it seems that the prescriptions of classic utilitarianism also fulfill the criterion of completeness. The doctrine appears to class *all* acts as either right or wrong. It may demand that you do A, if A produces more happiness than B. In that case, doing A is right and doing B is wrong. Or it may demand that you do B, if B produces more happiness than A. In that case, doing B is right and doing A is wrong. Or it may give you a choice between A and B, if they produce the exact same amount of utility. In that case, it is right to do either one and no option is wrong.

A further plus of classic utilitarianism is that it is apparently free of moral dilemmas (cf., e.g., [15–17]). The doctrine, it seems, will never judge that in a choice between A and B, both options are wrong. Either A is morally better than B, in which case it is right to do A. Or the reverse is true, in which case we ought to do B. Or A is as good as B, in which case we may do both. (It is sometimes said that if A and B both bring about very bad results, even classic utilitarianism must acknowledge a moral dilemma. After all, if all options produce bad results, there will only be wrong options available to the agent which means that there will be a dilemma. Note that this reasoning confuses a moral dilemma with a “tragic choice.” As much as any serious moral theory, classic utilitarianism acknowledges that in certain situations, the agent has to choose between the devil and the deep blue sea. But it holds that even in these cases, there is at least one option which, though it may be bad in absolute terms, is best in comparison and, hence, right.)

Classic utilitarianism seems to do well with regard to conceptual clarity and simplicity, too. It is very economical in terms of basic notions. After all, general happiness is the only key concept. That makes it very simple. Arguably, this should also make it conceptually clearer than other doctrines. In focusing *only* on general happiness, classic utilitarianism avoids elusive notions other moral doctrines rely on, for example, “desert,” “need,” or “justice.”

Finally, classic utilitarianism appears to exhibit a high degree of systematicity. It construes the right as maximizing the good and thus establishes a logical connection between the two main concepts of ethics. Furthermore, the components of the classic utilitarian notion of the good are internally connected. Universalism links up with hedonism. Equal treatment and universalism are united through their connection with impartiality. Lastly, all moral verdicts in classic utilitarianism are united by the fact that they follow from one simple standard of right and wrong.

Vices

In what follows, we shall look at classic utilitarianism from a more critical angle, reconsidering some of the above points. Let us start, as we did above, with intuitive fit.

Consequentialism, we said, is intuitively plausible, because it captures our intuition that the business of morality is to “*bring something about*” [6]. Its drawback is that it is very counterintuitive in other respects. In claiming that rightness depends *only* on goodness, it neglects other “normative factors” [18] which we intuitively acknowledge (cf., e.g., [19, 20]). Assume, for example, that you have a choice between A and B. Both promote the moral good to the same extent. However, while A involves the killing of an innocent person, B does not. It seems that this non-consequentialist consideration should at least break ties in favor of B. Another problem with consequentialism is that it apparently misinterprets the sphere of morality. Most of us believe that this sphere is limited and that not all acts are moral acts. Some acts, we think, are amoral. They are neither right nor wrong. (It is very plausible, e.g., to conceptualize moral questions as questions about “what we owe to each other” [21]). According to consequentialism, though, all acts are moral acts. For in every situation, you have a choice between alternatives, some of which have consequences – for better or worse – on someone’s well-being! Instead of going to work today, you could, for example, go to a retirement home to read to the elderly. Instead of going to play squash tomorrow, you could, for example, help your neighbor run some errands and so on. There is always an alternative which impacts on the well-being of someone!

Maximization, we said above, is plausible because it appears rational. A lot of philosophers have attacked this justification, however (cf., e.g., [22, 23]). They have argued that rationality and morality do not always go hand in hand. This criticism seems to make sense. Practical rationality is standardly interpreted as “instrumental rationality” which “instructs agents to take those means that are necessary in relation to their given ends” [24]. In contrast, in morality, the question whether the ends justify the means is a very contested one. Note, however, that this criticism is itself problematic, as it assumes that practical rationality and morality are disconnected. A different strategy to critique maximization which avoids such a “Dualism of the Practical Reason” ([5], p. xii) is to offer a unified, non-maximizing account of practical reason, as Julian Nida-Rümelin does (cf. [25]).

A number of points can be added to positively undermine maximization. To start with, it obliterates moral freedom. If an act is wrong unless it *maximizes* the impersonal good, the number of “moral options” [26] which constitute moral freedom is usually reduced to a single act (the notable exception being the case where two or more options tie for first place). As a consequence, supererogatory acts fall by the wayside. Such acts are morally desirable, but not required, since they involve substantial self-sacrifices which, intuitively speaking, go well beyond the call of duty. If there is no moral freedom, though, no brownie points can be earned by doing an especially *good* act. The best we can do is always “just good enough.” This implies, for example, that Mahatma Gandhi, Martin Luther King Jr., or Sophie Scholl did nothing especially laudable.

It seems, then, that maximization is out of touch with common-sense morality when it comes to the issue of self-sacrifice. It fails to recognize that self-sacrificing acts are laudable. But this is only part of the problem. Maximization may also *require* self-sacrifices to an unreasonable extent. Suppose you donate a kidney in

order to save a person's life. Not only will a maximizing moral doctrine like classic utilitarianism fail to see that this is an exceptionally virtuous deed. Worse yet, it will probably require that you give up your second kidney too – and thereby your life! After all, there are always people who need kidneys and some of them will be able to “use” them better than you, since they have higher life expectancies (or a more exciting life). Donating your second kidney would, thus, promote overall well-being and would, accordingly, be required by a maximizing moral conception. This is counterintuitive enough, but there is more. Suppose now you *want* to give a dear friend a kidney, though you know that this will shorten your life expectancy more than it will extend his. Maximization forbids this, since it decreases total well-being. It, thus, conflicts with our conviction that we always have “agent-sacrificing permissions” [27] to immolate our own good for the sake of helping others.

What about the classic utilitarian notion of the impersonal good? Above we reproduced Mill's justification of hedonism. On closer examination, it turns out as bogus. Mill assumes that an analogy can be drawn between the way it is proven that a sound is audible and the way it is proven that an object is desirable. But this is false. The fact that a sound is audible is proven by the fact that people hear it, because this is what it *means* for a sound to be audible. In contrast, the fact that people desire a thing is *not* what it means for that thing to be desirable. (Think, e.g., about drug addicts who desire their daily fix.) Desirability is a normative property. As such, its meaning cannot be fixed in terms of observable properties. In fact, the very attempt to do this has become known as the “naturalistic fallacy” [28]. The second part of the argument seems to be flawed too. Mill assumes psychological hedonism which claims that people are solely motivated by their own happiness. But this seems wrong. For example, parents and spouses buy term life insurances to protect their loved ones financially. Such an insurance only pays if the buyer of the policy has died, at a point in time, that is, when she is unable to feel anything. Plausibly, then, the motivation for buying such a policy cannot lie in the anticipation of increased happiness. The buyer, it seems, pursues a goal which is independent of the goal to be happy. (It may be argued, contrary to this, that the buying of the policy may make the buyer happy *now* and that this may be seen as his or her motivation for doing it. But this seems hardly plausible. To be sure, this is not to deny that the buyer will feel good about having bought the policy. It is to deny, rather, that this can be seen as the *ultimate* motivation that drives the act. It makes much more sense to say that the ultimate goal of the buyer is to protect his or her loved ones and that his or her being happy is merely a side effect of having achieved this goal.) Another well-recognized criticism of psychological hedonism is that it does not square up with classic utilitarianism as a whole. Assume, contrary to what we have just said, that individuals are, in fact, only motivated by their own happiness. It would then follow that it is psychologically impossible for them to adhere to the demands of classic utilitarianism which requires them, as we have seen, to sacrifice their own happiness for the sake of others. Psychological hedonism in conjunction with classic utilitarianism seems to violate, hence, the deontic principle “ought implies can.”

In the past few decades, many moral philosophers have proposed further arguments to discredit hedonism as a theory of value. A classic objection has been put

forward by Robert Nozick (cf. [29]). He asks us to imagine that neuroscientists have invented an “experience machine” which can stimulate people’s brains. If you plug in, you are guaranteed experiences which give you utmost pleasure – much more than you could expect from real life. According to hedonism, happiness is the only thing that counts. So you should prefer to spend your life hooked up to the machine. Many people find this counterintuitive, since it matters to them whether the experiences which make them happy are real or fake. (Larry and Andi Wachowski’s movie trilogy *The Matrix* masterfully illustrates the strength of this intuition. It revolves around the protagonists’ struggle to break free from a simulated reality.)

Hedonism can be criticized, furthermore, because it is an entirely subjective criterion of well-being. It may be seen as implausible, because “the criteria of well-being that we actually employ in making moral judgments are objective” [30] or, at least, not entirely subjective. The problem is this: “If a starving wreck, ravished by famine, buffeted by disease, is made happy through some mental conditioning (say, via the “opium” of religion), the person will be seen as doing well on this mental-state perspective, but that would be quite scandalous” [31].

Finally, hedonism assumes a questionable symmetry between pleasure and pain. It supposes that pleasures and pains of equal magnitude offset each other. Since this is so, the moral goodness of a state of affairs does not change if suffering is added, provided the same amount of happiness is added, too. This holds even in cases in which the amount of pain and suffering is enormous. Karl Popper has pointed out that this seems wrong, since there is “from the ethical point of view, no symmetry between suffering and happiness, or between pain and pleasure” [32]. Intuitively, the alleviation of suffering seems to be of much greater ethical concern than the promotion of happiness. Hedonism, however, does not acknowledge this.

Like maximization, summation can be made plausible via an analogy between rationality and morality. This analogy, though, seems again unwarranted. To recap, we said that in a self-interested choice between two options for acting, A and B, it seems rational to look at their respective gains and losses, balance them off against one another, and choose the one which is more beneficial in sum. Analogously, in a moral choice between A and B, it seems reasonable to calculate the respective gains and losses of each option from all the relevant personal perspectives and balance them against one another, the morally best option being the one with the most favorable total. Given the aforementioned asymmetry of pleasures and pains, this is untenable. It is plain, though, that there is a further problem. The analogy just does not hold. There is an obvious moral difference between the two cases. In a rational choice, the relevant perspective is that of a single individual. Balancing gains and losses is perfectly fine for that one person, since “each man in realizing his own interests is certainly free to balance *his own* losses against *his own* gains” ([2], p. 21). After all, every loss that is suffered is compensated for by an even larger gain *to the same person*. In contrast, in a moral choice problem involving more than one person, the balancing of gains and losses is more problematic. One person’s loss may be balanced against another person’s gain. Thus, summation can be criticized for not taking seriously “the distinction between persons” ([2], p. 24).

A further problem about summation is that it ignores how gains (or losses) are distributed. This has two morally problematic consequences. Firstly, summation is “supremely unconcerned with (...) interpersonal distribution” [33] and, hence, entirely indifferent to concerns of distributive justice. A situation in which my well-being is 10 units and so is yours is morally just as good as a situation in which my well-being is 20 units and yours is 0. Secondly, summation may give rise to a “repugnant conclusion” ([34], p. 387), as Derek Parfit has called it. Since it does not care how goodness is distributed throughout individuals, it does not care whether one person has 10 units of well-being or two persons 5 units or 100 persons 0.1 units. It may conceivably judge that the morally best state of affairs is one in which a 100 billion people “have lives that are barely worth living” ([34], p. 388), since total well-being may be maximal in this state. It should be noted that one way of getting rid of this problem is to depart from total well-being as a measure of the moral good. Instead, we may look at the well-being per capita. This “average utilitarianism,” of course, solves the repugnant conclusion. But it leads to another problem. “[A]verage utility could also be increased by killing the worst off” [35].

Equal treatment and universalism, we said, appear plausible, since they express impartiality. Two points can be made against this justification. Firstly, the idea that the connection between impartiality and morality is ever so close can be rejected (cf., e.g., [36]). Secondly, one may acquiesce in the idea that this connection is close, but argue that universalism and equal treatment actually (dis)favor certain individuals instead of treating everyone equally (cf., e.g., [37]).

As for the first line of critique, imagine that a friend of yours is in danger and needs your help. He or she is in a burning building, say, trapped together with other people. In this situation, should you attach the same weight to his or her well-being as to everyone else’s? It seems that you should not. In fact, it appears that you *ought*, morally, to be partial to your friend, because the two of you share a special relationship which you do not share with the others. This relationship gives you a “special obligation” to care more for him or her [38]. But special obligations are not the only justification for partialities. Arguably, we have a moral reason to be partial to those who have suffered historic injustice. And we have a moral reason, it seems, to give special treatment to those who are especially deserving, because they have done much good for us or for others in the past. Impartiality seems, therefore, not always to be a moral virtue. Hence, it cannot justify universalism and equal treatment.

The second line of critique consists in showing that the equal treatment of everyone’s interests may, paradoxically, lead to morally objectionable partialities. “If I have disabilities and you do not, then I might well get less benefit from a stock of material goods than you get from the very same stock. Now suppose you and I have exactly equal stocks of material goods. Because you are in effect a more efficient converter of material goods into personal benefit, utility will be increased here if material goods are transferred from me to you” [39]. This seems to favor you and disfavor me, though. Now, in and of itself, this may not be a problem. For, as we have just seen, there seem to be unobjectionable forms of partiality. But this particular one seems rather dubious. It turns upside down the intuitive principle that

“[b]enefiting people matters more the worse off these people are” [40]. I am worse off than you. If anything, then, I should be favored. Let us conclude, therefore, that the reasoning for equal treatment and universalism seems to be lacking a foundation. In fact, the conjunction of these two claims leads to unacceptable moral implications. It seems, however, that the blame for this is to be put entirely on equal treatment. There is nothing wrong with taking everyone’s perspective into account, as universalism commands. The mistake lies in the equal weighting of well-being. This is incompatible with special obligations and a priority of those who are badly off.

In the section above, we observed that classic utilitarianism appears to be free from contradiction. Lars Bergström and Hector-Neri Castaneda, however, point out that there may be a problem regarding its consistency when reasonable deontic principles are added to the picture [41, 42]. Assume that A is the uniquely happiness maximizing act for you in some choice situation S. It produces more well-being than any alternative act. It is, hence, right by classic utilitarian standards. Assume further that A is a complex act which consists of A' and A'', each of which can be done independently of one another. They are, then, alternatives to A in S. That is, the agent may do A' or A'' instead of A. Since A is the uniquely happiness maximizing act, A' and A'' must be wrong. Now stipulate the following deontic principle, D: If all parts of a complex act are wrong, the complex act itself is wrong. It follows from this principle that A is wrong, since both of its parts, A' and A'', are wrong. According to the classic utilitarian criterion of rightness, however, A is right. There is, hence, a contradiction.

One way to get rid of this problem is to modify the classic utilitarian criterion of rightness so that A comes out as wrong. We can do this by augmenting its criterion of rightness with D so that it says that following: An act is right if and only if it maximizes general happiness *and* not all its parts are wrong. This removes the inconsistency. Instead, we get a moral dilemma, because under this criterion, every act comes out as wrong. This shows, contrary to the prevailing view, that it is possible for classic utilitarianism to produce a formal dilemma – at least if it is combined with seemingly weak assumptions about deontic logic.

Note that a number of authors have proposed different solutions to the consistency problem which do not lead to a dilemma (cf., e.g., [43–45]). Some, however, may lead to incompleteness, as for example Erik Carlson’s proposal. It is easy to reproduce the result. To avoid the dilemma, we stipulate that alternative acts must be mutually exclusive. Since A' and A'' are included in A, they cannot be alternatives to A. Rather, A' & non-A'' and non-A' & A'' are alternatives to A, since they are incompatible with A. This removes the moral dilemma, since A' & non-A'' and non-A' & A'' are not parts of A. As a result of restricting the notion of an alternative, A comes out as right and this does not produce a contradiction. But now some acts, to wit, A' and A'', lack moral status.²

What about simplicity? Above we said that classic utilitarianism involves only one key concept – general happiness – and is therefore very simple. Many moral philosophers, however, have refused to count this as an advantage. Bernard Williams, for example, urges that “the desirability of a system of social choice can

be considered only relative to what it can reasonably be asked to do” [47]. Classic utilitarianism ignores, as we have seen, moral constraints, special obligations, moral freedom, distributive justice, and so on. If we believe, as most ethicists do, that a moral doctrine can reasonably be required to accommodate these things, we may come to share Williams’s view that “the simplicity of utilitarianism in this respect is no virtue” [47].

We also said that classic utilitarianism appears to involve a higher degree of conceptual clarity than other moral doctrines, since it draws only on one key notion – general happiness – and thus avoids notoriously unclear concepts like “justice,” “need,” and so on. But this, by itself, does not make it clear. For, as it turns out, the notion of general happiness on which the doctrine exclusively relies is itself quite unclear. Firstly, it is hard to explain how quantities of happiness can be measured and intrapersonally compared. Secondly, it is hard to make sense of the notion of a utility *sum*, since this requires interpersonal comparisons. With regard to the first problem, Jeremy Bentham suggested that the amount of pleasure (or pain) that an individual experiences should be seen as the product of intensity and duration. (Bentham’s proposal is actually more complex. In addition to intensity and duration, he mentions the certainty or uncertainty of a pleasurable sensation, as well as its propinquity or remoteness, its fecundity and its purity [48]. For our purposes, however, intensity and duration suffice to make the point.) Does this explanation help? Duration is undoubtedly a clear notion. But intensity is not (cf., e.g., [49]). How would you, for example, rate the intensity of the pleasure that you get from tasting your favorite sort of ice cream relative to the intensity of the pleasure that you get from listening to your favorite piece of music? It is hard to express this in numerical values, because the respective experiences are very different. A related problem is hinted at by Henry Sidgwick ([5], p. 127). Since our sensations are so heterogeneous, it is hard even to figure out which sensations count as instances of pleasure and which sensations count as instances of pain. For example, why do we consider both eating ice cr me and listening to music as pleasurable? What do they have in common? The notion of individual happiness, then, is in dire need of explanation. But even if this complication could effectively be addressed, a second problem would remain. How do we make sense of an interpersonal utility *sum*? As Jeremy Bentham himself conceded, in summing utilities we are adding up totally distinct entities. There is no such thing as our collective utility. There is only *my* utility and *yours*. Instead of adding them, we might as well “pretend to add 20 apples to 20 pears” [50].³

Systematicity is the last item on the list. Above we said that classic utilitarianism appears to be a very systematic doctrine and there is indeed not much to add to this. A minor point is that it appears unsystematic in at least one way. It demands to give moral consideration to all sentient beings. At the same time though, it cannot be morally binding upon all sentient beings, since some of them act only on impulse and do not have the cognitive resources to apply the doctrine. Kantianism, for example, possesses the highest degree of theoretical unity in this respect. The rationality of a being is the source of its moral obligations. At the same time, it is the reason why it is owed moral consideration.

Classic Utilitarianism and Business Ethics

Let us now turn to the second question. May classic utilitarianism be an appropriate philosophy for doing business? As we have seen above, it seems to be defective as a general theory of morality, since it focuses all too narrowly on general happiness and disregards, thereby, important moral concerns. Is it then possible that classic utilitarianism may be a reasonable moral code for business? Somewhat surprisingly, it might be, provided an adequate legal framework exists which restricts its morally problematic tendencies. The justification of classic utilitarianism as a philosophy of business is analogous to the justification of self-interested behavior. The idea is as follows: We write up a system of moral standards which is properly administered and sanctioned, so that everyone will follow it. This legal framework will ensure that moral boundaries are not transgressed. That is, it will remove certain options for actions which are morally intolerable. If economic agents choose among their remaining options in a way that promotes general well-being, this will no longer be morally objectionable.⁴

Here is an example of how this might work. Consider Sally. She is a manager who is committed to promoting general well-being. In and of itself, this is not a bad thing, so long as Sally does not transgress any moral boundaries. One day, however, she ponders whether it would promote general well-being if she had her workers beaten. She reasons that this would make them more productive, thus promoting total well-being. In order to prevent her from doing this, we have to set up the legal rules in such a way that the beating of the workers would not increase aggregate well-being. We can do this, for example, by imposing a penalty on a business practice like this which eats up any increase in utility. Taking this penalty into account, Sally would conclude that she ought not to have her workers beaten.

The suggestion to use classic utilitarianism as a philosophy of business has, however, an obvious Achilles heel. It may involve an implementation problem. As we have seen above, the fact that the doctrine transgresses moral constraints is not the only problem it has. Another problem is that it may, at times, demand enormous moral sacrifices. This, it may be claimed, is not only morally questionable. It is also incompatible with the imperative of a business environment which is to make profits (cf., e.g., [51], p. 25). After all, if a business does not make sufficient profits, it may be forced to leave the market. The worry is, then, that a classic utilitarian business ethic is impossible to implement in a market environment, since its demands may clash with the need of businesses to make profits. Whether this criticism applies depends on what the doctrine will actually demand. The answer to this question is a priori unclear and should be investigated by further research in applied ethics. It depends, roughly, on whether the “shareholder theory” or the “stakeholder theory” is correct. “[U]tilitarians favouring the shareholder theory argue that maximizing shareholder interests (. . .) will (. . .) tend to maximize overall utility. (. . .) Advocates of the stakeholder theory argue that all stakeholders (shareholders, employees, customers, suppliers, society, etc.) should be taken into consideration directly in the utilitarian calculation” [52]. If the shareholder theory is correct, the demands of a classic utilitarian business ethic may be sufficiently

aligned with the imperative of a market economy. If, on the other hand, the stakeholder theory is correct, classic utilitarianism may regularly demand that businesses sacrifice their profits in order to benefit stakeholders. In that case, a classic utilitarian business ethic would, indeed, face a severe implementation problem in a market economy. Putting this question aside, let us conclude, merely, that classic utilitarianism may be a candidate for a reasonable philosophy of business if it is applied against the background of an adequate legal system. However, we must not conclude that this exculpates classic utilitarianism from the problems we have identified above. The reason why it seems to be unobjectionable as a morality for business is that, by assumption, “elsewhere in the social system the necessary corrections (. . .) are being made” [53] on the basis of non-utilitarian moral considerations.

Conclusion

Let us recap and conclude then. We started our discussion of classic utilitarianism with an analysis of its criterion of rightness which says that an act is right if and only if it maximizes the sum total of happiness of all sentient creatures. Logically speaking, this claim is the result of combining consequentialism, maximization, hedonism, summation, equal treatment, and universalism. In the next step, we analyzed the classic utilitarian doctrine in view of its correspondence with our intuitive moral judgments, its consistency, its completeness and its potential moral dilemmas as well as its conceptual clarity, simplicity, and systematicity. *Prima vista*, we found that classic utilitarianism had something to be said in its favor on all counts. At second glance though, we had to revise this judgment. Many of the arguments supporting classic utilitarianism are unsound or, at least, questionable. In addition, there are many considerations which positively undermine the doctrine. This holds particularly with regard to its intuitive fit. Overall, then, I suggest that classic utilitarianism should be rejected as a general theory of morality. All of its components, except universalism, yield implications which are (sometimes wildly) at odds with our moral sense. However, classic utilitarianism may be a reasonable philosophy for doing business, provided it is applied within a framework of rules which incorporates non-utilitarian moral concerns and thereby countervails its severe moral problems.

Above I said that our discussion of classic utilitarianism will enable us to make a tentative pronouncement about the family of utilitarian doctrines in general. So how do we generalize our conclusion? To see this, let us look at some non-classic versions of utilitarianism. Take, for example, *preference* utilitarianism. It rejects hedonism in favor of a preference-based view of well-being, but keeps the other components of the classic doctrine on board. It may, then, conceivably avoid the flaws of hedonism. But it will inherit all the other problems associated with classic utilitarianism. The same holds for *average* utilitarianism. It rejects plain summation and avoids, thus, some of its problems (e.g., the “repugnant conclusion”). But it inherits all the other flaws of classic utilitarianism. The same holds for other versions of utilitarianism that modify certain aspects. Therefore, I suggest, cautiously, that we ought to reject as

theories of morality all forms of utilitarianism which are sufficiently similar to the prototypical case, since most problems carry over.

Admittedly, this conclusion does not come as a surprise. For quite some time, it has been a commonplace in moral philosophy to pronounce utilitarianism dead. In this connection, a famous conjecture by Bernard Williams comes to mind. He claimed that “the day cannot be too far off in which we hear no more of it” [54]. Curiously, though, it seems that the demise of utilitarianism has been greatly exaggerated. It is still “alive and kicking” ([14], p. 2), as some believe. At any rate, it is remarkably resilient in the face of severe moral complications. And it “tends to haunt even those of us who will not believe in it” [7]. Why is this so? How does utilitarianism survive, given that it is so objectionable a doctrine? I suspect that its resilience can be explained by our psychological disposition to mistake a strong “*pro tanto* reason” for a “*sweeping* reason” [55]. If an act promotes general well-being, this is certainly a consideration which, to a considerable extent, counts in favor of it. It is certainly a *pro tanto* reason. From a logical point of view, this observation is, of course, worlds apart from the utilitarian claim that considerations of general well-being are sweeping reasons. Psychologically, however, the two propositions appear to be quite close, so that a move from the one to the other seems to be only a small step which appears “so short and looks so innocent” [22]. In order not to fall into the trapdoor of utilitarianism we should, therefore, remind ourselves, as Amartya Sen urges, that “[i]t is one thing to see utility as important, which it must be, but (. . .) quite another to insist that nothing else matters” [56].⁵

Notes

1. Note that the term “classic utilitarianism” does not refer to the doctrines held by classic utilitarians (Bentham, Mill and Sidgwick). It refers, rather, to a stylized moral system which involves *paradigmatic* elements of utilitarian moral philosophy.
2. This incompleteness may not be found problematic, as the following example shows: “Jones is driving through a tunnel behind a slow-moving truck. It is illegal to change lanes in the tunnel, and Jones’s doing so would disrupt the traffic. Nevertheless, she is going to change lanes (. . .). If she changes lanes without accelerating, traffic will be disrupted more severely than if she accelerates. If she accelerates without changing lanes, her car will collide with the back of a truck” [46]. Eric Carlson has pointed out that in this situation the act of (not) changing lanes arguably lacks moral status. The best Jones can do is not to change lanes and not to accelerate. So, if Jones does not accelerate, it is right for her not to change lanes. However, if she

accelerates, it is right for her to change lanes, because if she does not, she will crash into the truck in front of her. In and of itself, it is therefore unclear whether the act of (not) changing lanes is right or wrong.

3. Note that this point about interpersonal comparison is confined to hedonism which supposes that “utility” has an objective referent. Modern-day economics has dropped this assumption and has developed ways of comparing utilities, for example, on the basis of a scaling procedure: “It is, of course, possible to define a metric on utility characteristics so that each person’s utility scale is coordinated with everyone else’s in a way that equal social importance is simply ‘scaled’ as equal marginal utility. If interpersonal comparisons of utility are taken to have no descriptive content, then this can indeed be thought to be a natural approach” [37].
4. This suggestion combines two ideas. I take from Rawls the idea of a “constrained utilitarianism” which maximizes utility within certain bounds ([2], p. 281). And I use Homann’s idea that the legal framework is to be used to ensure moral standards (cf. e.g. [51]).

Biological and Experimental Perspectives on Self-Interest: Reciprocal Altruism and Genetic Egoism

15

Hannes Rusch and Ulrich Frey

Abstract

The question how the diverse forms of cooperative behavior in humans and nonhuman animals could have evolved under the pressure of natural selection has been a challenge for evolutionary biology ever since Darwin himself. In this chapter, we briefly review and summarize results from the last 50 years of research on human and nonhuman cooperativeness from a theoretical (biology) and an experimental perspective (experimental economics). The first section presents six concepts from theoretical biology able to explain a variety of forms of cooperativeness which evolved in many different species. These are kin selection, mutualism, reciprocity, green-bearded altruism, costly signaling, and cultural group selection. These considerations are complemented by two short examples of evolved cooperative behavior, one from microbiology and one from ethology. The second main section focuses on recent experimental research on human cooperativeness. We present a brief review of factors known to impact individual human decision-making in social dilemmas, most prominently communication, punishment, reputation, and assortment. Our conclusion then draws attention to tasks for further research in this area.

Introduction

Human Altruism and Ultrasociality

“Are humans egoists or altruists?” “What is their motivation for cooperation with other humans?” “Do they always pursue their selfish interests, or are they, at least sometimes, considerate of other people’s needs?”

These questions have been a challenge for philosophers of all times. Prominent answers are Hobbes’ pessimistic view on the state of nature: “a war [...] of every man against every man” [1] – the exact opposite of cooperation. Locke on the other hand argued that the state of nature is governed by reason, which should always lead us to realize that we are God’s children and therefore should not harm each other, as this meant that we harmed God’s own belongings [2]. Locke’s Christian stance was later opposed by Rousseau who hypothesized that in the state of nature, humans would evade each other most of the time and were only forced to live together in modern societies. This leads to envy and pride because humans start comparing themselves to others as soon as they live too closely together [3]. Hume, finally, claimed that humans cannot be understood but as social beings [4]. The state of nature, he claims, is that of groups of rational human beings having to solve problems of coordination and cooperation for which they developed, step-by-step, institutions such as law and justice.

In the following, we present contemporary approaches to the question of why humans cooperate so frequently. We restrict our view to two major domains: evolutionary biology and experimental (or behavioral) economy. These disciplines provide us with empirically informed perspectives on how human cooperativeness might have evolved and in which forms it appears in modern humans.

Today, countless empirical studies show that humans – unlike other animals [5] – cooperate willingly in various different situations. Sometimes, they even give when they can expect no reward whatsoever. Among the most prominent experimental settings in which humans display altruism – i.e., behavior with a negative net balance for the acting person – are dictator and ultimatum games.

In a dictator game, a first subject – the dictator – is given an amount of money and told that there is a second person – the receiver – to whom they can give any fraction of the money they just received. The receiver will be informed of the dictator’s decision, but has no possibility of reacting to that decision at all. Dictators are informed that the receiver will not be given any other information – particularly not about who the dictator is – so that there is absolutely no possibility of reciprocation.

Theories which understand humans as rational utility maximizers – such as the classical homo *economicus* approach (see e.g., [6, 7]) – predict that in this situation, the only rational option for dictators is to keep the money entirely for themselves because any amount they give to the receiver is lost, with no prospect of any possible future gain resulting from their benevolence.

And yet, people of all kinds of cultural backgrounds readily share some of the money they received as dictators with anonymous, unknown, and absent receivers [8].

Although the proportion of money shared varies with different cultural backgrounds, the phenomenon of altruistic sharing seems ubiquitous.

Ultimatum games are set up like the dictator game differing only in the receiver's option to either accept or reject the fraction of money offered. If they accept, the money is split in exactly the way the first person offered. If they reject the offer, both subjects receive nothing. Here again, rational choice theories predict different behavior than is actually observed. It would be rational for the second person to accept any offer greater than zero because "a bird in the hand is better than two in the bush" – meaning receiving any amount greater than zero is better than getting nothing, which is the only other option.

Yet again, throughout all cultures studied, many subjects reject offers they perceive as too low [8]. In western cultures, for example, these are offers below a margin of about 25%. By rejecting, subjects altruistically punish those who make offers below a threshold of what is perceived as fair. The exact value of this threshold again varies between cultures and individuals [9].

It is our everyday experience that those people we have anonymous one-shot interactions with usually do not try to betray or overreach us. Instead, we frequently observe acts of kindness and generosity. We are used to this, although costly acts of genuine altruism still tend to astonish us. From a theoretical point of view, altruism is even more astounding. Many theorists during the ages have conceived of our world – for human and nonhuman animals alike – as an endless competition for resources (e.g., [1, 10, 11]). Whoever manages to attain stable, exclusive, and secure access to more valuable goods, services, resources, mates, etc. than others is able to actively form the future of the group, i.e., to spread ideas, norms, values, and – most importantly in the long run – genes.

Biological Perspectives

The measure of success from an evolutionary perspective is fitness. Genes that frequently increase the fitness of their carrier in comparison to the carrier's competitors are – on average (!) – copied more frequently into the next generation and thus slowly spread through the population. Note that fitness is always a relative measure: fitness of X in comparison to Y under circumstances Z. Therefore, we can speak of adaptive, nonadaptive, and dysfunctional (genetic) traits. Trait X may well be an adaptive solution to a problem posed by circumstances Z1 while being nonadaptive (neutral to fitness) or even dysfunctional (fitness reducing) under circumstances Z2 or Z3. Keeping this in mind, we easily understand that behavioral traits promoted by natural selection will seldom be inflexible. Instead, behavioral adaptations – just like all other genetically heritable traits – mostly come as norms of reaction to certain frequently encountered problems posed by a species' environment of evolutionary adaptedness (EEA).

Now, why is altruistic behavior astonishing from the evolutionary perspective? In many situations where two unrelated organisms could cooperate for a common benefit, they face a classical prisoner's dilemma: they could create fitness benefits

for both of them if they cooperated, but each of them could gain even greater fitness benefits by defecting if the other cooperated. In game theoretical terms, defection represents the dominant strategy in the prisoner's dilemma. Even if somehow a population of cooperators appeared, this group would quickly be invaded by defectors if only one individual switched to a defective strategy, for example, by a small genetic mutation. Unconditional cooperation does not represent an evolutionary stable strategy (ESS; [12]). Evolution, it seems, imposes restrictions that promote "genetic egoism" – i.e., defective strategies for fitness relevant, competitive situations of a prisoner's dilemma structure.

Kin Selection

Of course, this is only one part of the evolutionary picture. There are several ways in which different sorts of cooperative strategies can evolve even under the restrictions of genetic egoism.

First, genetically related individuals have been excluded from our short account above. Hamilton ([13–15]) and others ([16]) pointed out that if an individual's fitness is calculated, not only that particular individual's reproductive success (its direct or Darwin fitness) has to be included but also the reproductive success of its genetic relatives (its indirect fitness). This is achieved by defining *inclusive fitness = direct fitness + indirect fitness*. Direct fitness equals the reproductive success of an individual. Indirect fitness is given by the reproductive success of its genetic relatives multiplied by the respective coefficient of relatedness r , which, for example, is 0.5 for parent-offspring relationships or full siblings, 0.25 for grandparent-grandchild relationships or half siblings, etc. Thus, we get (Fig. 15.1).

$$fit(X) = R_X + \sum_i r_i \cdot R_i$$

Fig. 15.1 The inclusive fitness of individual X is given as the reproductive success of X (R_X) plus the weighted sum of the reproductive success of X 's relatives (R_i)

This definition of fitness as inclusive fitness explains why seemingly altruistic acts among relatives can be understood as selfish acts from the genes' point of view. A strategy can promote an individual's fitness by increasing its direct or its indirect fitness. Whenever a strategy leads to a gain in indirect fitness that is greater than its costs (its reduction of direct fitness), natural selection will favor that strategy. This relation is expressed in Hamilton's famous inequation (Fig. 15.2).

$$B > r \cdot C$$

Fig. 15.2 Hamilton's rule. B is the benefit a strategy yields for an individual's kin, r is the coefficient of relatedness, and C is the cost of the strategy to the individual

Whenever this inequation is satisfied, kin selection may guide an evolutionary process. A prominent example of a strategy which evolved in this manner is the

so-called “helper at the nest” behavior. In meager times, in many species, some of the offspring stay with the parents to help raise their siblings while never reproducing themselves. This behavior, obviously, is very costly in terms of direct fitness for the helpers, but since their siblings, who usually carry about half of the helper’s genes, go on to reproduce, it is adaptive, nevertheless. They “make the best out of a bad situation.” In richer times though, when the helpers have good chances to achieve a higher fitness by reproducing on their own, their behavior changes, just as Hamilton’s rule predicts [17].

Hamilton’s concept of kin selection can explain cooperation and even altruism between genetically related individuals by reducing it to individual fitness calculations. At least in the human case, however, we observe ampler forms of cooperation than just that. So are there evolutionary scenarios in which not only relatives but also genetically unrelated individuals can individually benefit from cooperation? This question is especially interesting in the human case because current demographic results from anthropology lead to the conclusion that our ancestral subsistence groups of hunter-gatherers indeed cooperated extensively among nonkin [18]. Long-term reciprocity within groups composed of kin and nonkin is the rule, not the exception. Since humans very likely lived as hunter-gatherers most of the (evolutionarily relevant) time, these results are highly relevant for all explanations of cooperative behavior.

Mutualism

The most obvious scenario in which cooperation can evolve is when cooperation yields greater benefits than defection. Defection is not always the dominant strategy. Cooperation can be dominant in situations which do not have the structure of a prisoner’s dilemma. In game theory, these are called “win-win games” (see, e.g., [19]). Here both interaction partners benefit from (unconditional) cooperation in terms of direct fitness simply because defection would be costlier than cooperation. This form of cooperation is called mutualism [20]. A simple example for such situations among nonhuman animals is the formation of groups and herds: in a herd, every individual reduces its average risk of predation. Another example are lion males which form small collaborative groups for conquering prides of lion females. Every male in such a coalition increases its chance of reproduction by cooperation, none of them would be better off on its own.

Despite such clear-cut situations in which no one can achieve a benefit by defecting, there are more intricate scenarios which can lead to cooperation among nonrelatives. One class of such scenarios is represented by biological markets. Here, although both parties can benefit from cooperation, both parties also have incentives for defection and even deception. In game theoretical terms, these would be “trust games,” “stag hunts,” and other coordination games. Biological markets exist where individuals can choose from a group of potential social or sexual interaction partners. Adaptations for nontrivial problems posed by such freedom of choice encompass abilities to assess potential partners and one’s own “current

market value” and capabilities of calculating a comparison balance between current options and future prospects [20]. Examples for biological markets [21] include the relationship of cleaner fish and reef fish [22], chimpanzees’ exchange of grooming and other services [23], and of course many aspects of the various systems of mating – bonobos, for example, trade food for sex [24].

To sum up, mutualism can evolve rather easily, and has indeed evolved frequently, because all interaction partners benefit from unconditional cooperative strategies. On biological markets, cooperation can evolve when problems of coordination are solved. To achieve this, strategies are needed, which use mechanisms and heuristics for the detection and analysis of both risks and opportunities of cooperation. A huge variety of such strategies has evolved in nonhuman animals.

Reciprocity

When the appropriate game theoretical model for social interactions changes from coordination games to the class of genuine dilemmas, called “tragic games” [19], cooperative strategies still – at least theoretically – have a chance to evolve. Trivers [25] proposed a model of reciprocally altruistic strategies which can achieve a net fitness benefit in a “society” of strategies similar to themselves. Probably, the most prominent theoretical study on this issue is Axelrod’s computer-based tournament in which various different strategies for playing the repeated prisoner’s dilemma competed with each other [26]. The striking result was that tit-for-tat (TFT), a clear-cut, simple, and cooperative strategy, outcompeted all its rivals, although most rival strategies were noncooperative, hence presenting an unfavorable environment for “nice” strategies. TFT always cooperates in its first move with a new interaction partner. During the following encounters, it simply mirrors the partner’s choice of their previous interaction. In this manner, TFT “rewards” cooperation by continuing cooperation and “punishes” defection by defecting on the next occasion. TFT’s main advantages are: (1) it cannot be exploited by defective strategies, and (2) whenever two instances of TFT or any other cooperative strategies meet, they reap the cooperative optima. Thus, TFT can thrive in a variety of social environments and may even become evolutionarily stable. This means that no strategy can invade a population of TFTs under certain circumstances (see [26] for details and proofs).

Although there are strong theoretical arguments underlining the power of TFT (and some improved versions of TFT, e.g., “contrite tit-for-tat”; [27]), there is still little evidence that reciprocal altruism actually has evolved in nonhuman animals [20]. TFT-like strategies are cognitively demanding. They require at least the capacities to (1) recognize interaction partners, (2) remember the behavior of interaction partners over time, and (3) control momentarily affective impulses in order to achieve a later goal (see also [28]). In addition, TFT can only flourish when the probability of meeting interaction partners again is sufficiently high. These conditions, so it seems, are not met frequently in nature. A simpler conditional strategy, “Pavlov,” which partially overcomes these problems of TFT, has been

investigated by Nowak and Sigmund [29]. Pavlov, or “win-stay lose-shift,” continues to play one option as long as it leads to success and switches to alternative options as soon as “unsatisfactory” results, i.e., low payoffs, are obtained. This strategy is very robust and even able to outcompete TFT because it can exploit unconditional cooperators and does not run into defective “dead ends” like TFT if one interaction partner accidentally defects.

The major constraint on the evolution of reciprocally cooperative strategies is that they require a sufficiently high probability of encountering their interaction partners again. It can be proved that this probability must be greater than the cost-to-benefit ratio of cooperating in order for direct reciprocity to have an evolutionary chance – see [30]. For modern human societies, this requirement is not met frequently: we commonly face so-called “one-shot anonymous” encounters, but behave cooperatively in these as well. Therefore, direct reciprocity can only be regarded as a partial solution to the puzzle of human cooperativeness.

Green-Beard Altruism

Another explanation of the evolution of altruistic behavior uses slightly more intricate preconditions than the TFT-reciprocity approach. Imagine a population in which altruists have the ability to recognize other altruists and regularly band together with them for cooperative enterprises which benefit all members of those subgroups dominated by altruism. Dawkins labeled such a mechanism of self-recognition and self-preferential treatment of genetic traits in different phenotypes “green-beard effect” [31]. An additional assumption is that members of these altruist groups reap higher fitness benefits than the members of groups in which there is a majority of individuals acting selfishly. Under these circumstances, the proportion of altruists in a population can grow to a fairly high level, although altruists are regularly exploited when they meet nonaltruists. This scenario has been proposed by Sober and Wilson [32] and has received much criticism ever since, mostly because they claimed to have made a case for the existence of a group selection mechanism.

But, as Gildenhuis [33] clarifies, if we understand the ability to form groups of biased composition by recognizing others with similar prosocial tendencies as an individual-level trait – which it is – then we can use this model to understand how altruism can stabilize on the population level while being exploited on the individual level. As long as bands of altruists regroup from time to time and have much higher rates of reproductive success than other groups, altruistic traits can spread in a population – even if in the altruist-biased groups, a minority of egoists free rides on the altruists’ expense so that the proportion of altruists in that group slowly decreases.

Since we do not know whether the preconditions for this evolutionary path are met in our species or in others (see, “[Assortment](#)”), green-beard altruism remains a theoretically possible explanation for the evolution of human cooperativeness. One of the most important preconditions is that defectors must be unable to grow convincing imitations of these green beards (the recognizable indicators for the

altruistic trait) and thus invade cooperative groups. In consequence, green beards must be forgery-proof, honest signals in order to guide the evolution of cooperativeness.

Handicap Altruism/Costly Signaling

Another evolutionary mechanism, considering signals, may play an important role [34]: altruistic behavior might not be directly fitness enhancing itself. Rather, it might be a publicly displayed signal for a hidden quality (e.g., parental skills) of those individuals, the senders, who act altruistically.

The classical example for the logic of the handicap principle is the peacock's tail [35]. Darwin himself explained its evolution through sexual selection – stating increased female preference for males with impressive tails as the proximate cause – but could not give an ultimate explanation for this choice of the hens. Almost exactly 100 years later, Zahavi argued that impressive, brilliant tail plumes pose a self-inflicted handicap for males, thus being a costly and honest signal for their genetic quality, making it ultimately profitable for females to use them as a criterion for mate choice: only parasite-free peacocks are able to produce such splendid colors, which is an indicator for a good immune system, which in turn is an indicator for health and thus fitness.

Costly signals show that the sender can afford their costs – they pose a self-inflicted handicap. The signal indicates clearly that the sender has a surplus of resources. Applied to cooperation, this logic results in the simple conclusion that you can only afford to give if you have enough to give. Giving and sharing in this sense are both costly and forgery-proof or “honest.” These honest signals then benefit their senders indirectly because they become more attractive future interaction partners for those receiving the signals. Thus, the senders indirectly enhance their fitness through publicly displayed altruistic behavior because they can calculate on reaping future benefits from increased attractiveness as social partners and mates.

A thorough theoretical application of the handicap principle to cooperativeness has been carried out by Gintis et al. [34]. They provide a detailed game theoretical analysis of the relatively broad conditions under which handicap altruism can prosper and stabilize in a population. It is remarkable that – to our knowledge – the potential explanatory power of this approach has not led to more experimental investigation in this direction. One of the few commonly stated observations of a possible influence of signaling on cooperativeness is the increased willingness to give when others are watching (e.g., [36]; see also, “[Reputation](#),” and [37]).

Cultural Group Selection

Yet another evolutionary approach to human cooperativeness puts forward the idea that humans' unique level of prosociality is a consequence of humans' unique

cultural abilities. Such a level of prosociality is only paralleled by eusocial animals like bees, ants, and naked mole rats. However, all of them, unlike humans, live in genetically closely related populations. Henrich [38] presents his line of argument of this approach as follows: Altruistic individuals are beneficial for their group, but every member of that group always has an incentive to free ride on the altruists' expenses rather than reciprocating their efforts. Therefore, even if groups purely consisting of altruists existed, they would always be vulnerable to invasion by free riders although possessing a higher fitness than mixed groups or groups consisting purely of free riders. According to Henrich [38], genetically anchored altruistic traits can never stabilize, but will always be selected against by natural selection, because of the rather dynamic flow of individuals between groups in human populations. In technical terms, without further mechanisms in place, within-group selection is always (much) stronger than between-group selection (see [16, 39]). This condition prevents the evolutionary spread of group-beneficial traits. Given this, every approach to explaining human prosociality must state how humans could overcome this evolutionary barrier. Henrich and others (e.g., [40]) argue that the most viable solution to this problem is given by cultural group selection. Cultural group selection must not be misunderstood as a mechanism equivalent to natural selection. Rather, cultural group selection for cooperativeness means that groups in which altruistic behavioral traits are prevalent reap higher fitness benefits than groups without these traits, and thus, these groups grow faster than the latter. "Extinction" of groups in cultural group selection does not necessarily mean that all individuals in that group die. Instead, these individuals could also disperse into other groups or adopt other behavioral traits.

Now, how does this approach solve the within-group/between-group selection problem? The spread of behavioral traits via cultural transmission has, Henrich argues, one crucial property: it is biased towards within-group conformity. It is a well-known phenomenon that humans – but also many other species – adapt their behavior to what they perceive as the common behavior in their group. Humans, though, do this in a manner unparalleled by any other species [41]. Combined with the evolution of a punishment mechanism for those who do not conform to group behavior (e.g., "shunning"), between-group selection can become stronger than within-group selection because within-group differences are mostly leveled out by the combination of these mechanisms [42]. Punishment of nonconformist behavior has evolutionary benefits apart from the stabilization of altruistic traits, mainly through solving coordination problems, so it might have evolved before the spread of genuine prosocial behavior [43]. According to Henrich [38], the combination of punishment of nonconformist behavior and the preferential cultural learning of behavior common in a group then constitute an environment stable enough to enable the spread of genetic prosocial traits.

Unlike the other approaches outlined above, cultural group selection models specify reasons why human prosociality is unparalleled in other species. It is also supported by the finding that prosociality in humans significantly varies between

cultures (see e.g., [44–46]), which it does not in other species [38]. On the other hand, this approach relies on assumptions about the strength of cultural learning mechanisms which need further empirical investigation.

Examples of Cooperation in Primates and in Bacteria

Before we concentrate exclusively on human cooperation in Sect. 3, we will discuss two examples from the animal kingdom – biofilm production in bacteria and cooperative hunting in chimpanzees. Both are particularly interesting because bacteria show cooperation on a very basic level, whereas chimpanzees are the closest living relatives to humans.

In general, we should expect bacteria to have high levels of cooperativeness since they reproduce asexually. In consequence, their degree of kinship is very high, sometimes up to $r = 1$. In contrast to humans and chimpanzees, however, bacteria, of course, have no cognitive abilities, no social networks, and no goals in a superordinate sense.

One interesting feature of most bacteria (99%) is the production of biofilms. Advantages of biofilms include high resistance against antibiotics, physical forces, and the opening up of new ecological niches [47, 48]. However, biofilms are expensive both resource- and energywise [48]. The more individuals contribute to the biofilm, the stronger it gets. Individuals who do not contribute to the production, i.e., free riders, reap the benefits, but do not share the costs. Thus, biofilm production is a common-pool resource problem.

How is this very basic form of cooperation sustained? One important prerequisite is the spatial separation of cooperating populations and free riders. Separation can be partly the effect of the biofilm itself since it creates a new niche but also the effect of active resistance by cooperators [49]. If the exclusion of free-riding bacteria cannot be sustained, biofilm production will quickly deteriorate – the so-called tragedy of the commons – since free riders have clear fitness advantages [50, 51].

What can be learned of that? First, cooperation does not necessarily depend on complex cognitive abilities. Second, selection can favor cooperation if spatial separation (i.e., working exclusion of free riders) and few mutants are given. Third, although free riders do have lower costs in direct comparison, individuals in a cooperative group will usually outperform them. In conclusion, cooperation exists even on a very basic level without elaborate preconditions.

Chimpanzees, on the other hand, do possess highly developed cognitive skills and social networks. Some groups are successful cooperative hunters, while others seem unable to coordinate such complex behavior. In general, cooperative hunting is rare in the animal kingdom since it is not an evolutionary stable strategy under most circumstances because free riders constantly threaten to destroy the common-pool resource (the cooperative hunting activity) by not hunting, but taking their share of the prey afterwards.

In chimpanzees, the motivation to engage in hunting is egoistic since chimpanzees seem to be neither altruistic nor mutualistic [52]. Preconditions for the forming

of a group include a common history of food sharing [53], not too large differences in age and dominance and strong kinship relations [54]. It does play a role which individuals are in a group and which habitat the group lives in since these factors determine (among others) the cost-benefit ratio for each individual [55–57].

The hunt itself is an extremely complex 3-D coordination game where experienced hunters take key roles. It takes up to 20 years to become a proficient hunter, to anticipate possible escape routes of the prey, and to know which role to play. The contribution of each individual during the hunt is duly noted and is accounted for when the prey is distributed [58].

Again, what can be learned from cooperative hunting in chimpanzees? Complex social rules, roles, and proportional fairness are not unique to humans. It takes years and considerable cognitive abilities to solve such notoriously hard coordination problems. Solutions like that are instable – as soon as one greedy and dominant individual reverts to snatching more than its share, other skilled hunters stop hunting in the group and hunt on their own [58]. Thus, one of the key elements for cooperation to come into existence is an advantageous individual cost-benefit ratio.

These insights about cooperation in nonhuman creatures and the above theoretical explanations take us to the question on what human cooperation really depends. The field of experimental economics has shed much light on this question during the past decades. We will now turn to that evidence.

Experimental Perspectives

Today, there is a veritable “industry” of conducting experiments on cooperation-related questions. Virtually thousands of different experiments have been done. Although they have shed much light on many questions, a consensus or a theoretical model of cooperation able to explain cooperation generally under diverse circumstances is not to be expected soon. However, there are some robust results that occur again and again, even in very different settings and cultures. This section focuses on these results, particularly those known to reliably enhance cooperation in humans.

One “work horse” of experimental game theory is the public goods game (PGG). These games are repeated *n*-person prisoners’ dilemmas. Here, in a group of subjects, subjects each receive an endowment of tokens and may either keep them for themselves (private pool) or invest parts or even all of it in a public pool. The experimenter usually doubles the amount paid into the public pool (to simulate the enhanced efficiency of cooperation in a group) and pays back an equal share of that amount to all subjects irrespective of their contribution. One extreme outcome is that all players behave egoistically (i.e., invest nothing in the common pool); therefore, no public good is produced. The other extreme consists in all players behaving altruistically by investing everything into the pool which means that the social optimum is reached. The social optimum always remains susceptible to free riding, whereas the all-egoistic extreme is the Nash equilibrium predicted by game theory. Although there are other famous games like the dictator and ultimatum games [59, 60], we will focus on PGG in the next sections.

Flexible Strategies of Humans

The first interesting aspect of human cooperative behavior is that it seems to be very adaptable – according to circumstances. Although there seem to be recurring types of players (“pure altruists,” “pure defectors,” “conditional cooperators,” [61]), humans switch strategies swiftly if settings change [62]. Twenty-seven percent of complete free riders (i.e., subjects who do not contribute anything to the public good in PGGs) in one study switch to full cooperation when they change from an institution without punishment to one with it. Moreover, 70% of all subjects who switch from a punishment institution to one without reduce their contributions. Strategic changes are also dependent on the perception of others (“How altruistic are they?” “Can they be trusted?”), the settings (“Is the setting fair to all or asymmetrical?”), and the motivation. Conditional cooperators, in particular, make their contributions dependent on the contributions of others (more on conditional cooperators, e.g., [61, 63, 64]).

However, it is far from easy to identify the respective strategies of subjects. One reason is that subjects, when asked, are often unable to produce a coherent strategy. In addition, introspective reports are notoriously unreliable. In consequence, only actual contributions may be used to deduce the strategy behind them.

Let us begin with one of the most robust results in PGG. On average, almost worldwide subjects contribute around 50% of the endowment to the public pool in the first period (see Fig. 15.3 below). This surprisingly high mean contribution decays rapidly to 0–20% in the last period. Usually, the last period shows an additional sharp decline since players are very much aware of the fact that they cannot lose future benefits by defecting in that last period.

Parameters Influencing Cooperation Levels

There has been much research on measures that influence cooperation. Less research has been done on the effects of age, gender, educational level, and socioeconomic background. The evidence concerning them is sparse and conflicting. However, increasing age seems to have a slight correlation with higher cooperation levels [66–68].

Furthermore, group size does not have a negative influence on cooperation levels [69], although this has been repeatedly posited theoretically (e.g., [70]). Anonymous cooperation, however, does have a clearly negative effect [71] (see Section “Reputation”).

There is evidence that humans do not learn from failed cooperation [69] and that the amount of possible earnings (in some settings, up to three monthly wages may be earned for a few hours of play) does not influence altruistic behavior [72].

It is unclear why important social variables like gender or educational level have no or little influence on cooperative behavior. However, the fact that there are only few clear indications may be simply due to missing data. The result that the possibility of very high earnings does not alter behavior substantially is even more surprising. Cultural influences, in contrast, do change cooperative behavior [73].

Fig. 15.3 Typical decay of contributions in public goods games (Data with permission from [65], our chart)

Communication

The largest increase in cooperative levels can be achieved by introducing the possibility of communication in laboratory experiments. Throughout many studies, cooperation is boosted by allowing individuals to communicate with others (see, e.g., the surveys of [74, 75], and [66]). Contribution levels of up to 98% of the endowment can be reached compared to 47% without communication [76]. If the settings are more realistic, e.g., in common-pool resource games, the difference is even greater: in a study by Ostrom [77], for example, efficiency reaches the social optimum – which is an increase of 65% compared to the baseline with no communication. The advantage of communication is that it has almost no costs, compared to mechanisms like punishment (see, “Punishment”).

This has important consequences for economic theory since even promises which cannot be enforced by any sanctions – so-called cheap talk – are often kept and are meant sincerely in about 80% of cases in such and similar situations [78].

When communicating, subjects first focus on what is the best strategy for the group, that is, they try to figure out what situation they are in. Depending on the settings, this seems to be surprisingly hard for many of them. In consequence, one person in the group able to explain the best strategy may foster cooperation just by pointing out the social optimum to the others. Second, subjects in fact try to agree on a strategy – which in most treatments is difficult, since the actual strategic choice is independent of previous promises. Nonetheless, people do get emotional when

defectors undercut their efforts to cooperate. A notable problem with communication is that subjects have substantially more problems to come to an unanimous agreement than just a majority vote [77] which may lead to suboptimal outcomes in some groups.

Punishment

Punishment is another important mechanism to increase cooperation. Not only is it ubiquitous in our societies (courts, police, etc.), but it has also been researched extensively in laboratory settings.

Punishment means that subjects receive the option to invest part of their endowment to impose fines on other subjects. The typical ratio used is one token cost for three tokens fine. That means, if, for example, three tokens are invested in a fine, the punished subject loses nine tokens. Figure 15.4 below shows that punishment can lead to high and stable contributions, whereas without it, the typical decay sets in.

It is remarkable to what extent the possibility to punish defectors increases contributions – bringing it close to the social optimum (see also [80]). However, there are a few points complicating such results. First, sanctions depend on their effectiveness, i.e., “How much do I have to invest to punish another player?” [80–82]. Second, free riders are not the only ones who are punished, but there is a significant amount of punishment against high contributors, the so-called antisocial punishment ([83]). Moreover, there is counter-punishment ([84]), i.e., people who punish are punished by the punished as a kind of revenge. Both, of course, are highly detrimental to efficiency, i.e., the amount of money remaining when all costs (investments in punishment and punishment costs) are subtracted.

Taken together, efficiency in punishment treatments is often smaller than in treatments without punishment (e.g., [65, 82]) since there are costs for both the punisher and the punished, which have to be subtracted from the overall earnings, thus lowering efficiency considerably.

However, efficiency may be better in the long run since expenditures for punishment decrease drastically from the first round to later rounds (Fig. 15.5, [85]). This can be seen in common-pool resource systems, too. Punishment is not only delegated from one individual to a group (a council, the local jurisdiction, etc.), but sanctions are typically graduated. The first violation of group norms often results in a very mild disciplinary measure or even a reprimand only. Repeated offenses are then dealt with sanctions increasing in severity.

Reputation

Reputation is another very effective way to increase cooperation levels. The image of a person, a company, or a nation is an important asset. Again, reputation building is ubiquitous in our societies – see, for example, Amazon, eBay, or any other

Fig. 15.4 Comparison of average contributions in a PGG with punishment and without punishment (pun); subjects in *protocol A* played the treatment with punishment first and then the treatment without; *protocol B* vice versa (Data with permission from [79], our chart)

Fig. 15.5 Comparison of earnings in treatments with (*P*) and without punishment (*N*) in short- (10 periods) and long-term (50 periods) PGG (Data with permission from [85], our chart)

Internet platform, where reputation is a decisive factor for sales. For companies, the right image can be worth billions of dollars – think of Apple versus BP. In the laboratory, cooperation levels remain high (95% against 53% of endowment in the baseline [71]) if subjects are allowed to build up reputation by giving

generously in reciprocity games (see also [86]). Results from other experiments and real-world data suggest that persons behave in a more cooperative way with less rule breaking and defection when they know or suspect that they are observed [36]. The cues for this can be very subtle – for example, an ornamental eye on a box.

Reputation is especially important in situations where the other party is unknown, hence its importance in trade and on the Internet in particular. To build up a good reputation is time-consuming, costly, and a long-term effort. A reputation for being a trustworthy and reliable cooperative partner is probably a costly signal (see [87]). On the other hand, it could be used to attract other cooperators and thus be useful in the long run.

Assortment

Assortment refers to individuals actively searching out other high cooperators and avoiding free riders. This presupposes the ability to discriminate between cooperators and free riders: suppose cooperativeness is a stable disposition in individuals' behavioral repertoires, do humans possess the ability to reliably discriminate between potential cooperators and defectors?

Indeed, Frank et al. [88] found that subjects were able to predict their interaction partners' decisions in a prisoner's dilemma game better than chance when they were allowed to interact with them for 30 min before the actual game was played. In a study by Fetchenhauer et al. [89], subjects achieved a comparable quality of predictions when they were presented 20-s silent video clips of target persons and asked to assess how these would decide in a dictator game.

The general problems of assortment approaches are that (1) recognition of cooperativeness must be reliably better than chance and (2) defectors who mimic signals of cooperativeness must be ruled out (see [90]). As long as defectors are somehow able to sneak into cooperative groups, they will reap higher benefits and flourish, thus leading to the decay of cooperation.

In humans, assortment with other cooperative persons might be a mechanism readily used by subjects when the possibility for it exists. In a study by Page [91], subjects have to pay a little fee to be allowed to switch groups. After every third round, subjects could decide to rank their fellow group members. The first rank indicated the most preferred partner in future interactions. Correct information about all contributions of all individuals in the past rounds was available. Subjects frequently used this option: 94% of all subjects ranked at least once, and a surprisingly high 79% of all subjects took part in each ranking round. In consequence, free riders ended up in groups with other free riders and little payoff. On the other end, the most sought-after cooperators played in highly profitable groups which played near the social optimum. On average, contributions rose by around 30% compared to a baseline without this combination of assortment and reputation building mechanisms.

Apart from the mechanisms discussed above, there is a host of other parameters known to influence cooperation significantly as well.

Framing Effects

It is well known that humans are sensitive to context. There is an extensive literature in cognitive psychology about framing effects (see e.g., [92, 93]). Most heuristics are suited only for a certain, specific environment [94]. It is therefore no surprise that even very subtle manipulations in the wording of instructions in experimental games, for example, mentioning the word “fair,” increase contributions by about 20% [75]! Other studies find large differences just by switching “someone” to “matched partner” in the instructions [95].

In real settings, this effect has been demonstrated for a substantial number of subjects (32,961) [96]. Students at the University of Zürich have to re-register each semester. On the respective form, there are two checkboxes for donations to two public funds at their university – one for foreign students and one for students in financial difficulties. Until 1998, the situation was as follows:

Before the winter semester of 1998, students received two invoices and had to choose between the two; one with the amount of the compulsory tuition fee on it, and the other with the amount of the tuition fee plus the amount due for contributions to both Funds.

After the year 1998, the text changed so that students:

[...] have to tick boxes to decide if they want to donate money to one or the other Fund, to both or to neither of the Funds. 1 month later, they receive an invoice with the compulsory tuition fee plus the chosen amount for the Social Funds. ([96], p. 77)

From an economic standpoint, these two decisions are completely identical. The results, however, are not: students' contributions to both funds rose from 44% to 62%.

If framing indeed plays a major role, then all laboratory experimental settings are deficient in some way. Since they are not real and subjects know that they are being tested in an artificial setting, their behavior could deviate significantly from their usual choice in the real world. This suspicion is supported by the few studies that link experimental rigidity to real-world environments [77, 97, 98]. Some researchers even found completely divergent behavior [99].

Another aspect that has to be taken into account is that humans seem to have an appreciation for fairness. It seems to be important that – whatever subjects perceive as fair (in most cultures a division of 50:50) – strategies have to be fair in some way. Worldwide around 71% of all subjects offer between 40% and 50% of the endowment in ultimatum games; only about 4% offer less than 20% [60, 100]. The importance of fairness can also be supported from modern political philosophy where fairness is one of the central concepts [101].

Additional Influences

Besides the mechanisms and parameters mentioned, there are lots of other factors influencing cooperation levels to be considered. We will restrict ourselves to two important ones. The first factor is known as marginal per capita return (MPCR).

This simply means as follows: how much of their investment into the public pool do players get back? Not surprisingly, the higher the return, the higher the willingness to contribute in the first place [66, 69, 102, 103]. In addition, the percentage of free riders is lower with a higher MPCr.

The second factor has been described as “integration to markets” or “level of globalization.” There is a high correlation between being near to markets and experienced in trading goods and trusting strangers in market transactions and the willingness to contribute to public goods [59, 104]. One study found that the probability to contribute to the public pool (the global pool in this particular experiment) of the “most globalized” individuals is 77% (from the USA); the probability for the “least globalized” is only 17% (Iran) [104].

There is one further very important result from [89] whose relevancy for game theory has apparently been underestimated. This study used an iterated prisoner’s dilemma game, but tested a sequential version as well. Sequential means that the decision of the first player (A) was known to the second player (B). Now, the prediction is clear – if a subject knows that player A cooperates, then defection is clearly the best option. However, quite surprisingly, 61% of American, 73% of Korean, and 75% of Japanese subjects (players B) cooperated as well after A cooperated! This is not due to confusion since 88% of Japanese and 100% of American and Korean subjects defected as a reaction to a prior defection.

It is difficult to interpret these results, but one suggestion from the authors is that humans have a cognitive mechanism they call “social exchange heuristic”: “The SEH is a robust psychological mechanism which makes people seek mutual cooperation in social exchange.” ([96], p. 87). This, of course, does not answer the question of why and how this mechanism could evolve in the first place.

Conclusion

The question as to why humans are such a cooperative species, unparalleled in nonhuman animals, has been under interdisciplinary investigation for more than two decades. The formal toolbox of evolutionary game theory enabled researchers to map possible pathways along which cooperative strategies might have evolved. This area of research is very much alive and constantly expands in numerous directions. Models and simulations of evolutionary effects of different mechanisms for amplifying and sustaining cooperation abound. For recent reviews and classifications of this vast literature, see [30] and [105]. Literature on theoretical pathways for the evolution of cooperation is complemented by experimental economics. For overviews, see, for example, [63] and [80]. In our article, we tried to review the most general and well-established findings of both fields. (Side note: it is encouraging to see how fruitful and successful interdisciplinary research can be. Cooperation research is propelled by results from such diverse disciplines as theoretical and evolutionary biology, experimental economics, behavioral ecology, evolutionary psychology and anthropology, philosophy and others.)

However, a synthesis of generally acknowledged results is still lacking in cooperation research. Many possible pathways for the evolution of cooperation

have been widely accepted, yet no consensus has been reached which way human evolution actually took. In addition, no consensus has been established on the ranking, scope, logic, and ultimate ends of the psychological mechanisms which make humans act altruistically in the experiments mentioned above.

Another very prominent open question in cooperation research is: “What exactly started human cooperativeness?” There is a good understanding of the developmental paths along which a critical mass of conditional cooperators could have thrived and stabilized at high rates in ancestral human populations, but theories diverge on the question where this critical mass came from. Suggestions here encompass cultural group selection [38, 80], cooperative breeding [106], and side effects of shared intentionality [107] to name but the most prominent. While some problems continue to puzzle researchers, others have been solved and have given rise to new, more specific questions.

Kantian and Hegelian Thoughts on Modern Economics

Karsten M. Thiel

Abstract

This chapter is an introduction to the categorical imperative and its application. The categorical imperative is applied in order to find out about the moral worth of a particular action. However, Kant does not apply the categorical imperative to actions immediately. In fact, he evaluates actions by reflecting on the maxim inherent to an action. It is important to realize, first, that the fact that a particular action has moral worth does not imply that this action ought to be accomplished. Second, an action with no moral worth is not immoral, at least not necessarily. This chapter focuses on the most difficult case of actions, which Kant calls action in conformity with duty. Most interpreters argue that Kant is a purist and a rigorist for whom an action in conformity with duty cannot have moral worth. This chapter, however, questions this view.

Introduction

Kant's ethics is prominent in business ethics, even more than virtue ethics, and it is the categorical imperative that provides a major resource for many business ethicists ([1], p. 57). Most Kantians might be astonished about this situation as they think of business and ethics as two separate domains which have little in common because, for Kantians, actions are either profit-oriented or moral. In their view, the very idea of business ethics is a contradictory one. Do business ethicists who refer to the categorical imperative misinterpret Kant? Or is it the traditional Kantians who are wrong? Those familiar with Kant might assume that neither of them is

wrong, for they know by experience that Kant often is much less clear about things as it seems to be. This gives reason to reconsider whether and, if yes, how the categorical imperative goes together with profit orientation.

It should be noted that any approach that centers on the categorical imperative is very selective with regard to Kant's ethics. Kant introduces and discusses the categorical imperative in his *Groundwork of the Metaphysics of Morals* of 1785. It is not the only subject of the *Groundwork*, maybe not even the most important. Moreover, the *Groundwork* is not Kant's only contribution to moral philosophy. It is followed by his second critique, the *Critique of Practical Reason*, in 1788 and by his *Metaphysics of Morals* in 1797. If it were mainly the categorical imperative that were dealt with in business ethics, then a great deal of Kant's ethics would still left to be discovered for business ethics. Interestingly enough, the later *Critique of Practical Reason* (1788) and the *Metaphysics of Morals* (1797), although they are no less important for Kant's ethics, play a minor part not only in business ethics but in almost any current interpretation of Kant's ethics. The focus on the *Groundwork* thus is not specific to this chapter.

A close reading of the first two sections of the *Groundwork* will make evident what the categorical imperative is about. On this basis, it will have to be decided whether profit orientation has, or can have, any moral worth and whether there even is, or can be, an obligation to increase profits. This means to apply the categorical imperative in order to evaluate the fundamental principle of business, if it is correct that the business of business is to increase profits, as Friedman ([4], p. 178) famously put it. Business ethics is no homogenous discipline, and evaluation is a task that is alien to some approaches to business ethics. Some business ethicists therefore might be uncomfortable with the idea of the fundamental principle of business being evaluated. With respect to business ethics, the approach of this chapter thus is not neutral then.

According to the many approaches to business ethics, there is no unrivaled definition of business ethics. For some business ethicists, business ethics is a branch of applied ethics, and applied ethics is itself often understood in contrast to ethical theory ([1], p. 47). This understanding is common since there are numerous branches of applied ethics. It rests on the idea of ethical theory being applied to some specific domain like business, sports, and medicine. The idea of application suggests, or even implies, that there is a primacy of ethical theory and that several varieties of applied ethics all are derived from ethical theory. From a historical point of view, however, there is no such primacy as can be learned from the history of business ethics. In the USA, business ethics emerged from management theory, not from ethical theory ([5], pp. 21–22). Initially, it was not called business ethics but became well known as the stakeholder approach to management, in contrast to the then established shareholder approach [3]. Like all management theory, the stakeholder approach is decision-oriented. As by now, business ethics has become a discipline independent of management theory, it is not strictly decision-oriented any longer. It is this shift away from orientation toward decisions that prepares the ground for an understanding of business ethics which allows evaluating the fundamental principle of business. This kind of business

ethics encompasses evaluation, justification, or critique of market systems, regulation of markets and firms, self-regulations of firms, and the activities of businesses or individuals working for, or in interaction with, businesses. This broad understanding of business ethics reaches far beyond the domain of applied ethics and ethical theory, and, in consequence, political philosophy becomes more and more important for business ethics ([6], p. 428).

Within the German tradition, business ethics as a discipline of evaluation, justification, and critique of markets and market-related institutions is called *Wirtschaftsethik*, whereas business ethics as a decision-oriented discipline is called *Unternehmensethik*. Yet the German concept of *Wirtschaftsethik* is ambiguous. In its original meaning, it refers to all kinds of rational organization of life relevant to economic performance. For Max Weber, who was one of the first to use this notion, it is religion and, in more secular ages, ethics that have the strongest impact on rational organization of life. Originally, however, Weber's concern was to understand why capitalism became immensely productive among protestant sects. Insofar, his approach is a hermeneutic one. Hermeneutics still is prominent in business ethics: Sen, for instance, insists that only business ethics can help understand how business actually works in practice and that "it is not adequate to concentrate only on the motivation that makes people *seek* doing business" ([16], p. 47). Business ethics of this kind is not evaluative and might therefore be unable to adopt the idea of the fundamental principle of business being evaluated.

What Is the Categorical Imperative About?

The question what the categorical imperative is about inevitably involves the more fundamental question what the *Groundwork* is about. In his preface, Kant explains that it is the aim of his *Groundwork* to search and establish the supreme principle of morality (IV 392).¹ It is important to note that Kant thinks that there is exactly *one* such principle. Kant does not defend this claim although it indicates a shift in his way of thinking. Until his *Groundwork*, Kant thought that there are two principles of morality and not one ([13], p. 22). Yet the *Groundwork* is important not because it inaugurates the idea of a single principle of morality. In fact, for Kant, an investigation into the principle of morality is important because it has some positive impact on practical issues. The benefit results from the fact that "morals themselves remain subject to all sorts of corruption as long as we are without that clue [*Leitfaden*] and supreme norm by which to appraise them correctly" (IV 390). Kant thus thinks that morals are constantly deteriorating and that they need to be kept up. Yet a standard is needed in order to reestablish them according to an original plan, as it were. It seems that he compares morals to an old building that is subject to weathering and decay. He then tries to find the plan of the building in order to keep it up and restore those parts that have been lost. Morality, however, is not like an old building. Although it is ramified similar to old buildings that are often mazy, morality does not require a manifold of floor plans and other sketches as is the case with buildings and, in particular, old buildings.

Morality, by contrast, requires nothing but a supreme principle in order to be restored. This makes evident how ambitious Kant's project actually is.

If Kant wants to be able to restore morals according to a supreme principle, this principle cannot be gained from an empirical analysis of morals. To be precise here, analyzing morals can yield a supreme principle, and this principle can correctly be called supreme principle of morals. Such a principle would be inapt for Kant's purpose, however. If there were some morals that did not conform to this norm, it would be impossible to decide whether it is the norm that is wrong or the respective morals that need to be restored. A supreme principle derived from morals as they are would therefore be inappropriate for appraising morals. But this is exactly what Kant wants. He thus cannot gain the principle in question from empirical analysis of morals. In consequence, he has to start from somewhere else. Those familiar with Kant's philosophy will not be surprised that Kant thinks that the norm can be found in reason. Kant concludes that it is "indispensably necessary [. . .] for investigating the source of the practical basic principles that lie a priori in our reason" (IV 389–90).

So far, it has been made clear that Kant seeks a supreme principle of morality in order to appraise morals, and the categorical imperative will turn out to be this principle. It has also been made clear that Kant thinks that the practical basic principle lies a priori in reason. Nevertheless, Kant does not begin with reason but with "common rational moral cognition" (IV 393). Common rational moral cognition does not know about the categorical imperative, at least not immediately. Two other concepts are central to common rational moral cognition, namely the good will and duty. If there is anything that common rational moral cognition can think of as good without limitation, then it is a good will (IV 393). Kant provides no precise definition of a good will. He clearly does not mean a morally restrained will that is not good originally but has been made good. In fact, he thinks of a will that is originally good ([15], p. 34f). The concept of duty, then, "contains that of a good will though under certain subjective limitations and hindrances, which, however, far from concealing it and making it unrecognizable, rather bring it out by contrast and make it shine forth all the more brightly" (IV 397). Which are these limitations and hindrances that make the good will shine forth all the more brightly? Actually, there is but one, namely, inclination. According to Kant, action can be motivated by inclination. But other kinds of motivation are possible. There also is action from duty, as Kant puts it. In this case, however, it would be improper to say that such action is motivated by duty. And, at last, there is action in conformity with duty, as Kant puts it. (IV 397–9) The most simple of these three cases is that of an action that can be traced back to inclination and the respective action is motivated by inclination. How, then, is an action from duty motivated? Kant claims that "*duty is the necessity of an action from respect for law*. For an object as the effect of my proposed action I can indeed have *inclination* but *never respect*, just because it is merely an effect and not activity of a will" (IV 400). An action from duty is thus motivated by respect for the law, and, moreover, this respect for the law is an activity of a will. Duty thus exhibits an activity of a will instead of inclination. This will is no other than the good will. The good will thus turns out to be the negation of inclination. As its negation, it is contrasted with inclination which indeed makes it

“shine forth all the more brightly.” Despite of the strict conceptual distinction of inclination from the good will, actions can be motivated by both and be in conformity with duty, as Kant puts it. Kant might have in mind cases like that of a person who seeks to help other people because it makes them feel better and not because of altruism. It thus is inclination that motivates such a person to help other people. At the same time, however, the person is obliged to help other people and might have this in mind, too, when helping other people. The motivation is thus mixed. As there is inclination involved, the person does not act from duty, but in conformity with duty.

But does inclination really limit and inhibit the good will, as Kant says? This has to do with the fact that the concept of action from duty is hard to apply. It is impossible to show that no inclination is involved and, in consequence, to decide whether an action is an action from duty or an action in conformity with duty. Even the acting person cannot be sure that no inclination is involved. He might refuse that inclination is involved, not with levity but after the most scrupulous self-examination. Yet it is possible that inclination is involved, and he just does not realize it for some reason. In short, there is no way to verify that an action is an action from duty. Kant concedes that no evidence of an action from duty can be given (IV 407). For Kant, this shows that the concept of an action from duty is not taken from experience (IV 406), which is important for him because he wants to get through to a priori principles – and a priori principles cannot be found in experience. But it seems that actions from duty and the good will are fiction rather than reality. If this were true, then there would be no morality either because, for Kant, there is no moral worth other than that earned by actions from duty (IV 397–8). For this reason, Kant has to show that the idea of action from duty is no fiction. He thus proceeds to the principles that guide action or to maxims. His first thoughts about those principles and maxims are rather unclear. But they lead him toward the categorical imperative (IV 399–402). However, he tries again, and his second approach is more systematic than his first. He now begins with the categorical imperative, which he distinguishes from the hypothetical imperative (IV 414).

For Kant, any imperative expresses what ought to be. It indicates “the relation of an objective law of reason to a will that by its subjective constitution is not necessarily determined by it (a necessitation).” (IV 413) This constitution of the will expresses its capacity to ignore the law or to act in ways other than those prescribed by the law. Hypothetical imperatives, to begin with, “represent the practical necessity of a possible action as a means to achieving something else that one wills” (IV 414). In more modern terms, hypothetical imperatives are the same as instrumental reason ([12], pp. 215–216). The hypothetical imperative thus refers to action that is “good merely as a means *to something else*.” The categorical imperative, by contrast, refers to an action which is “represented as *in itself good*” (IV 414). From a conceptual point of view, the distinction of hypothetical imperatives from the categorical imperative is strict. Yet it is easy to imagine an action that is good in itself and, at the same time, good as a means to something else. Actions like this are called overdetermined actions ([8], p. 42). How does Kant handle actions of this kind? It seems that he does not dispute that actions of this kind

are possible. But are actions of this kind covered by the hypothetical imperative or by the categorical imperative? With a hypothetical imperative, as mentioned before, an action is merely good for something else. This implies that overdetermined actions cannot be covered by the hypothetical imperative. With the categorical imperative, however, an action is good in itself, but it does not need to be good in itself only. Overdetermined actions thus would be covered by the categorical imperative.

Interestingly enough, Kant discusses overdetermined actions. He calls them actions in conformity with duty. If overdetermined actions are identified with actions in conformity with duty, it is possible to pinpoint action in conformity with duty within the classification of imperatives. Otherwise, the classification of imperatives would be incomplete or actions in conformity with duty would be nonsense either. The same conclusion can be drawn from Kant's thoughts about the motivation to act from duty. For Kant, the motivation to act from duty cannot be explained by the intended effect of an action. It can only be explained by the principle of volition. Actions from duty are motivated by respect for the law instead of inclination. It is this respect for the law which alone gives them *moral worth*. As a result, actions motivated by inclination have no moral worth. (IV 399–401) Actions in conformity with duty are actions that, at the same time, can be seen as actions from duty and as actions motivated by inclination. There are two ways to make sense of actions of this kind. Firstly, they are motivated either by respect for the law or by inclination, although they can be seen in both ways. This view implies that the way actions appear can differ from the way they are. If this has to do with the fact that there is no certainty about the true character of an action from duty, then the problem is purely epistemic. In consequence, there would not be any actions in conformity with duty. There would only be actions motivated by inclination, and the rest, which, for epistemological reasons, could not be classified with certainty. If this were the case, it would be under- rather than overdetermination. If there are actions in conformity, they have to be motivated by both respect for the law and inclination. They can only be overdetermined therefore. As actions motivated by respect for the law as well as by inclination, they might even have moral worth. At least, it seems, they are eligible to have moral worth.

With regard to Kant's distinction of the hypothetical imperative from the categorical imperative, it should be added that he introduces one further distinction. For Kant, there are two kinds of the hypothetical imperative. An action can be "good for some *possible* or *actual* purpose." In the first case, the imperative is a problematically practical principle, and in the second, it is an assertorically practical principle. (IV 414–5) The categorical imperative, by contrast, commands "without being based upon and having as its condition [*als Bedingung zum Grunde zu legen*] any other purpose to be attained by certain conduct" (IV 416). This does not mean that there can never be any such purpose. Absence of any purpose to be attained by certain conduct is no necessary condition for an imperative to be categorical. Nor is it a necessary condition for an imperative to command categorically. Yet an imperative commands categorically only insofar as no purpose to be attained by certain conduct is involved.

Kant calls the categorical imperative the imperative of morality (IV 416). This might appear arbitrary. Earlier passages in the text will help to understand Kant. For Kant, an action has moral worth not because of an “effect expected from it”; its moral worth “does not lie in any principle of action that needs to borrow its motive from this expected effect.” He concludes that “nothing other than the *representation of the law* in itself, *which can of course occur only in a rational being*, insofar as it and not the hoped-for effect is the determining ground for the will, can constitute the preeminent good we call moral” (IV 401). The categorical imperative seems to be such a law (IV 420). Not just in this context is it worth noting that Kant does not contend that an action has moral worth if it is motivated only by representation of the law. He does say, however, that an action has moral worth insofar as it is motivated *only* by representation of the law. Hence, the moral worth of an action results from the fact that it is motivated by representation of the law. Yet it does not matter whether it is motivated by representation of the law in its entirety or to some extent only.

Kant is now able to couch the categorical imperative: “[W]hen I think of a *categorical* imperative I know at once what it contains. For, since the imperative contains, beyond the law, only the necessity that the maxim be in conformity with this law, while the law contains no condition to which it would be limited, nothing is left with which the maxim of action is to conform but the universality of a law as such; and this conformity alone is what the imperative properly represents as necessary. There is, therefore, only a single categorical imperative and it is this: *act only in accordance with that maxim through which you can at the same time will that it become a universal law.*” (IV 420–1) This is not the only formula of the categorical imperative. Kant will provide another four formulas, i.e., five in total. Nevertheless, he once mentions that there are “three ways of representing the principle of morality” (IV 436); later on in the text he notes that, if “one also wants to provide *access* for the moral law, it is very useful to bring one and the same action under the *three* concepts mentioned above and thereby, as far as possible, bring it closer to intuition.” (IV 437; the second emphasis is mine). Paton tried to investigate relations between all five formulas of the categorical imperative in order to make evident that there are no more than exactly three formulas ([15]: 129–30). Kant scholarship has discussed this matter at length. However, the debate did not shed any new light on the categorical imperative, and this is why there is no point in reporting on it here.

An important question with regard to the categorical imperative, however, is the question concerning its reality. This echoes the earlier question with regard to the reality of actions from duty. When it comes to questions of reality, Kant normally relies on a method he calls transcendental deduction. This method is highly complex and well discussed. Those debates must be omitted here, but not because they are difficult: Again, they do not help in understanding the categorical imperative better. This holds true for the initial question about the categorical imperative and how it goes together with profit orientation. Those interested in these questions will find more material in the literature [17].

The results of this first section are important in respect to the initial question concerning the categorical imperative and how it goes together with profit orientation. In the first place, it should be mentioned that, for Kant, actions can be overdetermined. An action is overdetermined if it is good not only in itself but also for something else. This means that an action motivated by the desire to increase profits, i.e., an action that is good for something else, can, at the same time, be good in itself. Secondly, it should be mentioned that overdetermined actions are covered by the categorical imperative. Thus, they do not necessarily contradict the categorical imperative. In fact, an action motivated by the wish to increase profits is covered by the categorical imperative if, to some extent, it also is good in itself. In sum, profit orientation can go hand in hand with the categorical imperative, and those denying this either ignore that overdetermined action is possible for Kant or that the categorical imperative covers actions that are overdetermined.

On the Moral Worth of Increasing Profits

As, for Kant, overdetermined action is possible and covered by the categorical imperative, it has to be asked whether they have, or can have, moral worth. It has already been mentioned that the moral worth depends on whether an action is motivated by respect for the law. More precisely, an action has moral worth insofar as it is motivated by duty instead of inclination. This defines a criterion for moral worth which can be applied to overdetermined action. For this task, it is pivotal to know how to apply the criterion. This can be learned from Kant who examines several cases in order to find out whether they meet the standard for an action from duty. Interestingly enough, Kant begins with a case taken from business ethics. He presents the following situation: “For example, it certainly conforms with duty that a shopkeeper not overcharge an inexperienced customer, and where there is a good deal of trade a prudent merchant does not overcharge but keeps a fixed general price for everyone, so that a child can buy from him as well as everyone else. People are thus served *honestly*; but this is not nearly enough for us to believe that the merchant acted in this way from duty and basic principles of honesty; his advantage required it; it cannot be assumed here that he had, besides, an immediate inclination toward his customers, so as from love, as it were, to give no one preference over another in the matter of price. Thus, the action was done neither from duty nor from immediate inclination but merely for purposes of self-interest.” (IV 397). For Kant, then, the action of the merchant neither is immoral nor has it moral worth. Yet it might be surprising that Kant does not detect any moral worth in the merchant’s action. How does this opinion fit with earlier statements that an action can have moral worth even if it is overdetermined? Does not an overdetermined action have double worth, earned from respect for the law as well as from the intended effect of the action?

These questions justify highlighting an aspect that will help to escape incoherence. It is important to see that an action has moral worth not because of conformity

with duty. An action has moral worth only if it is motivated by respect for the law, and respect for the law appears when no inclination is involved (IV 399–401). By definition, an overdetermined action is good in itself and good for something else, and it therefore might have a double worth but, it seems, no *moral* worth. It does not have any moral worth, it seems, because inclination is involved and, in consequence, no respect for the law which is required for an action to have moral worth. There is no incoherence in this view, but it seems that, for Kant, profit orientation cannot have moral worth because it is motivated by inclination. If this were true, then morality and business would indeed be two different domains which have nothing in common. Yet there is more to come.

The previous argument suggests that, for Kant, an action has moral worth only if it is *entirely* motivated by respect for the law. Some interpreters call this Kant's purism ([2], p. 125). But Kant is no purist. It might be worth noting that, for Kant, "nothing other than the *representation of the law* in itself, which can of course occur only in a rational being, insofar as it and not the hoped-for effect is the determining ground for the will, can constitute the preeminent good we call moral" (IV 401). Kant could not be much clearer, but things are not as simple as some interpreters think. He says that an action has moral worth only because of the respect for the law. He does not claim, however, that it is a necessary condition for an action to have moral worth that respect for the law is the only "determining ground for the will," as he puts it. In fact, he explicitly says that an action has moral worth insofar as it is respect for the law that determines the will. This allows inclination also being involved. Although an action cannot have moral worth insofar as it is motivated by inclination, this does not mean that an action that is motivated by inclination cannot have any moral worth at all. There are more passages which confirm this reading: "Only what is connected with my will merely as ground and never as effect, what does not serve my inclination but outweighs it or at least excludes it altogether from calculations in making a choice [*von deren Überschlage bei der Wahl*] – hence the mere law for itself – can be an object of respect and so a command." (IV 400) Kant requires that respect for the law outweighs inclination and explains that it is sufficient if there is something which cannot be explained by inclination. If Kant were a purist, how could it be possible to outweigh inclination? In short, if Kant was a purist, then the passage previously quoted would in parts be nonsense. Immediately after that passage, Kant mentions that "an action from duty is to put aside entirely [*ganz absondern*] the influence of inclination" (IV 400). It should be noted that to put aside does not mean to eliminate. This passage therefore does not exhibit the demand to abstain from inclination. In fact, it exhibits Kant's method of isolation, as Paton put it ([15], p. 47). In his *Groundwork*, Kant wants "to work out for once a pure moral philosophy, completely cleansed of everything that may be only empirical and that belongs to anthropology" (IV 389). This idea implies that Kant starts from experience and isolates, step by step, everything that is not empirical. This means not to stop unless everything empirical has been removed. This exhibits some purism, and this purism is specific to Kant's moral philosophy, maybe even to his entire philosophy. Nevertheless, Kant's purism is purely *methodological* ([9], p. 133).

Those insisting on Kant's purism might refer to the conclusion of the previously quoted passage. It goes as follows: "[T]here is left for the will nothing that could determine it except objectively the *law* and subjectively *pure respect* for this practical law, and so the maxim of complying with such a law even if it infringes upon all my inclinations." (IV 400-1) It seems that Kant insists on ruthlessness toward one's inclinations. Yet this ruthlessness exhibits rigorism rather than purism. Firstly, this rigorism is unjustified ([14], [9], p. 148, [17]). Secondly, rigorism does not imply purism. Rigorism applies to inclinations which are incompatible with duty. It does not apply to any inclination, and this is why rigorism cannot be interpreted as purism.

All this is important if it comes to decide upon the moral worth of an action and of overdetermined action in particular. Overdetermined action requires calculating the moral worth, as it were. If respect for the law is stronger, as it were, than inclination, the action has moral worth; otherwise it does not. In case it is not possible to calculate, an action has moral worth if it cannot be explained only by inclination. Otherwise it has no moral worth. Kant proceeds in exactly this way in his example of the merchant. The merchant's way of acting can be explained completely by inclination or self-interest. There is nothing about his behavior which cannot be explained by inclination or self-interest, and this is why his action has no moral worth.

Most of Kant's examples are not well chosen; some even are unfortunate insofar as, in most cases, he omits action in conformity with duty. He thus leaves out the most interesting case with regard to moral worth. Immediately after the example about the merchant, Kant discusses the duty to preserve one's life, and he presents the case as an extreme case, contrasting action from duty with action motivated by inclination. People normally preserve their lives by inclination, not by respect for the law. Those weary of life, however, preserve their lives not by inclination, but from duty. As they preserve their lives from duty, their action has moral worth. (IV 397–8) Kant here seems to assume that those weary of life have lost all interest in their life. Otherwise he could not claim that they do not preserve their life by inclination. He thus construes his example in such a way that it does not exhibit an interesting case. It would be more interesting, and more realistic, if it would be about someone who is weary of life, yet still has some interest in his life.

Kant's next example is about the philanthropist. If he is a benefactor from reasons of vanity or because it pleases him, then there is nothing about his action that would indicate respect for the law so that, in the end, his behavior would have no moral worth. Kant then compares him to a benefactor without sympathy for anybody and guesses that such a person no longer is incited to be beneficent "by any inclination, he nevertheless tears himself out of his deadly insensibility and does the action without any inclination, simply from duty; then the action first has its genuine [*ächt*] moral worth" (IV 398). It is this conclusion in particular that indicates that the benefactor's action has moral worth only because all inclination is taken away from him. This is not the case, however. Kant says that the benefactor's action has "genuine moral duty" as he "does the action without any inclination [. . .], simply from duty" (IV 398). The English word "genuine" stands for the German

“ächt” which means unadulterated. This helps to understand Kant's conclusion correctly. For Kant, the benefactor's behavior has unadulterated moral worth because no inclination is involved. If inclination were involved, then his behavior would still have moral worth, although it would not be unadulterated moral worth any longer. This again makes evident that, for Kant, it is essential for an action to have moral worth to be motivated by respect for the law. It is irrelevant whether inclination is also involved.

Kant concludes with the duty to assure one's own happiness. This example is well chosen insofar as it explicitly confirms the position presented here. Most people seek to assure their own happiness by inclination. Happiness does not mean, however, to accommodate every inclination without making any concession. In fact, it is impossible to accommodate every inclination. As a result, the quest for happiness is motivated by inclination. Nevertheless, it cannot be explained only by inclination because it requires abstaining from some inclinations. This is why, for Kant, respect for the law must be involved. In consequence, the quest for happiness has moral worth despite of inclination being involved. (IV 399)

In sum, Kant discusses some actions that have moral worth. Most of them, however, are actions from duty and not in conformity with duty. So why is it impossible to provide an example for an action from duty? Kant says: “In fact, it is absolutely impossible by means of experience to make out with complete certainty a single case in which the maxim of an action otherwise in conformity with duty rested simply on moral grounds and on the representation of one's duty” (IV 407). The difficulty is not that actions from duty are rarely possible. The difficulty is epistemic. It is hard, even impossible, to find cases of actions from duty which can be verified as cases of action from duty. Falsification is always possible, but not verification. How is that possible? Kant explains: “It is indeed sometimes the case that with the keenest self-examination we find nothing besides the moral ground of duty that could have been powerful enough to move us to this or that good action and to so great sacrifice; but from this it cannot be inferred with certainty that no covert impulse of self-love, under the mere pretense of that idea, was not actually the real determining cause of the will; for we like to flatter ourselves by falsely attributing to ourselves a nobler motive, whereas in fact we can never, even by the most strenuous self-examination, get entirely behind our covert incentives, since, when moral worth is at issue, what counts is not actions, which one sees, but those inner principles of action that one does not see.” (IV 407)

This section has brought to light that, for Kant, overdetermined action can have moral worth. This is important with regard to profit-oriented action, which, if it is *also* good in itself, can have moral worth, then. Otherwise, overdetermined action and profit-oriented action could not possibly have moral worth, and, in consequence, business and morality would be two domains which have nothing in common. Yet there is one limitation. The moral worth of overdetermined action results only from that part which cannot be traced back to inclination or which can be traced back only to respect to the law. Although overdetermined action can have moral worth, it does so only insofar as it is not motivated by inclination.

On the Moral Obligation of Increasing Profits

It seems that, for Kant, profit orientation is compatible with morality although it has no moral worth by itself. This might contradict the self-concept of most managers and business people who claim that their job has moral worth. Those managers and business people feel obliged to increase profits ([2], p. 142). Kant did not elaborate on this matter, although he discussed a couple of maxims. More precisely, he tested four maxims with regard to whether they are eligible as duty. Analogous to the test of these four maxims, it might be able to decide whether there is an obligation to increase profits. If this were the case, it would be possible that profit orientation had moral worth by itself.

Kant's examples cannot be understood unless the first reformulation of the categorical imperative has been considered. The first and the second formula of the categorical imperative differ very little ([15], pp. 129–130). The first formula goes as follows: “[A]ct *only in accordance with that maxim through which you can at the same time will that it become a universal law.*” Kant now wants to understand better “the universality of law in accordance with which effects take place” and contends that it is “properly called *nature* in the most general sense (as regards its form) – that is, the existence of things insofar as it is determined in accordance with universal laws.” The categorical imperative therefore can be reformulated as follows: “[A]ct *as if the maxim of your action were to become by your will a universal law of nature*” (IV 421). From this formula, Kant gains criteria which enable him to test maxims. These are, firstly: “We must *be able to will* that a maxim of our action become a universal law: this is the canon of moral appraisal of action in general” (IV 424). Kant provides two examples which show that this first criterion has been applied. Kant's examples also make evident, and this is the second criterion, that some maxims “cannot even be *thought* without contradiction as a universal law of nature, far less could one *will* that it *should* become such.” (IV 424) Those maxims that cannot be thought as universal law without contradiction are “opposed to strict or narrower (unremitting) duty.” If, in addition, it is impossible to will that a maxim is raised to the universality of a law of nature, the maxim is opposed “to wide (meritorious) duty” (IV 424). Hence, Kant here identifies necessary and sufficient condition for a maxim to count as duty. This means that two criteria have to be met if the maxim to increase profits can count as duty. Firstly, it has to be tested whether it can be thought of as a universal law. If the maxim passes this test, it then has to be tested whether it is possible to want this maxim to be raised to the universality of a law of nature.

With his first two examples, Kant discusses maxims that cannot be thought of as universal law of nature. By coincidence, it seems that these two examples exhibit cases of duties to ourselves or perfect duties, whereas the other two examples exhibit cases of duties to other human beings or imperfect duties (IV 421), for there is no reason to believe that Kant wants to suggest that, unlike imperfect duties, perfect duties can never be thought of as universal laws of nature. The way Kant proceeds is remarkable not only in this respect. He begins with discussing two maxims that do not meet the necessary condition and continues with two different

maxims that meet the necessary, but not the sufficient condition. While discussing the two maxims that do not meet the sufficient condition, he does not make evident why and how they meet the necessary condition. He thus discusses maxims that do not meet the criteria but none that meet them. His examples therefore leave some questions open.

Kant gets back to an example discussed previously. Someone is weary of life and expects more displeasure than pleasure and therefore contemplates suicide. This suicide would be based on the following maxim, Kant says: “[F]rom self-love I make it my principle to shorten my life when its longer duration threatens more troubles than it promises agreeableness” (IV 422). The second example is about a person who is urged to lend money. He knows that he will not be able to pay the money back but that he will have to promise to pay back the money and now asks whether he is allowed to give a promise he knows he will not be able to keep. Is it possible, then, to think as a universal law of nature to promise if one knows that there is no chance in keeping it. For Kant, both maxims cannot be thought of as universal laws of nature, and, hence, the necessary condition is not met in both cases. More precisely, the maxims cannot be thought of as universal laws of nature without contradiction. It cannot become a universal law of nature to commit suicide with reference to the principle of self-love. This means to see this principle, which is meant to “impel on the furtherance of life,” as the principle to destroy life at the same time (IV 422). Kant here ignores the difference between life in general and the individual life. It is a natural law, for instance, that animals hunt and kill other animals and no contradiction is involved here. The second maxim, Kant goes on, also “must necessarily contradict itself” because it “could never hold as a universal law of nature and be consistent with itself.” Kant’s explication is more consistent this time: “[T]he universality of a law,” he says, “that everyone, when he believes himself to be in need, could promise whatever he pleases with the intention of not keeping it would make the promise and the end one might have in it itself impossible, since no one would believe what was promised him but would laugh at all such expressions as vain pretenses.” (IV 422) Contradiction thus occurs because the maxim is about an action which is possible only if the maxim is no universal law of nature.

The examples Kant refers to in order demonstrate why a maxim cannot be thought of as universal law differ quite a lot from the maxim to increase profits. Yet it is evident that this maxim can be regarded as a universal law of nature if this means that, as universal law of nature, it does not involve any contradiction. It is possible to increase profits if it is a universal law to increase profits, and, thus, no contradiction occurs. This claim rests on the premise that the profit of one party does not represent the loss of another party. This premise is defensible as can be made evident from an interaction paradigmatic for all business, the case of selling a good. Both the seller and the buyer voluntarily agree to exchange goods, or a good, for money because each of them makes a profit. The seller is better off with the money, the buyer is better off with the good. Economics call this situation Pareto superiority; management theory speaks of a win/win situation.

It seems that a maxim can be thought of as universal law of nature, and thereby, the necessary condition for duty is met as soon as it does not violate the principle of

consistency. This is true for the first two examples, and it holds true for the next two. The first of the two following examples is about a person who does not exploit her talents. With regard to the question whether the corresponding maxim can be thought of as universal law, Kant considers it to be evident that the person “sees that a nature could indeed always subsist with such a universal law, although (as with the South Sea Islanders) the human being should let his talents rust and be concerned with devoting his life merely to idleness, amusement, procreation – in a word, to enjoyment” (IV 423). Thus, the third example does not offer anything new and neither does the last example. Kant presents us someone “for whom things are going well while he sees that others (whom he could very well help) have to contend with great hardships.” This person “thinks: what is it to me? let each be as happy as heaven wills or as he can make himself; I shall take nothing from him nor even envy him; only I do not care to contribute anything to his welfare or to his assistance in need!” For Kant, it is again evident that “if such a way of thinking were to become a universal law the human race could admittedly very well subsist, no doubt even better than when everyone prates about sympathy and benevolence and even exerts himself to practice them occasionally, but on the other hand also cheats where he can, sells the right of human beings or otherwise infringes upon it.” (IV 423). Likewise, there is nothing contradictory about thinking the maxim to increase profits as universal law of nature. If it were to become a universal law of nature to increase profits, the human race could subsist. This maxim, hence, meets the necessary condition for being a duty.

It can now be tested whether it also meets the sufficient condition for a maxim to express a duty. With respect to the sufficient condition, Kant presents two examples with maxims, both of which do not meet the sufficient condition. The person who does not exploit his talents “cannot possibly **will** that this become a universal law or be put in us as such by means of natural instinct. For, as a rational being he necessarily wills that all the capacities in him be developed, since they serve him and are given to him for all sorts of possible purposes.” (IV 423) Kant contends that, as rational being, one cannot will to leave one’s own talents unemployed. To be precise, one can leave one’s own talents unemployed, but one cannot will that. Kant is probably right here. As one cannot will to leave one’s own skills unemployed, one cannot will that it becomes a universal law of nature to leave one’s own skills unemployed. This conclusion might be counterintuitive, but it is defensible. In the case of the last example, Kant discusses the maxim not to assist other people. For Kant, it is evident that “a will that decided this would conflict with itself, since many cases could occur in which one would need the love and sympathy [*Teilnehmung*] of others and in which, by such a law of nature arisen from his own will, he would rob himself of all hope of the assistance he wishes for himself.” Kant assumes that everyone in trouble expects other people to help, even those who do not want to help other people. Only if this is true, it is “impossible to **will** that such a principle hold everywhere as a law of nature” (IV 423). If Kant is wrong and those who do not want to help people in trouble do not expect other people to help them when they are in trouble, then it is possible to will a world without assistance. Similarly, it is possible to will to increase profits and, moreover, it is possible to will that this maxim becomes a universal law of nature.

Even further, the more people there are who want to make profits, the easier it is to find business partners and to increase profits. Insofar, the maxim to increase profits also meets the sufficient condition for being a duty.

Is there an obligation to increase profits, and does it have moral worth to increase profits then? This question makes evident that Kant's way of testing falls far short. He does not provide any criterion which would help to decide whether a maxim expresses an obligation. The criteria he provides only help to identify maxims that do not express an obligation. Insofar, there is no Kantian answer to the question whether the maxim to increase profits expresses an obligation and whether it has moral worth to increase profits. Yet it is evident that there is no reason to reject that this maxim expresses an obligation because it meets both conditions that Kant establishes.

Conclusion

To sum up, there is no answer to the question whether there is an obligation to increase profits. This is because Kant defines criteria to identify those maxims that do not express an obligation. He even defines criteria to identify maxims eligible to express an obligation. According to those criteria, the maxim to increase profits is eligible to express an obligation and, thus, to have moral worth. As Kant does not define criteria to identify maxims that express an obligation, however, it is not possible to decide whether the maxim to increase profits does express an obligation. Although this result is unsatisfying, it exceeds all expectations as for purists among interpreters of Kant's ethics, it is unthinkable that profit-oriented action can have moral worth. Those purists are wrong, however. It escapes their attention that, for Kant, profit-oriented action is covered by the categorical imperative as soon as it is also based on respect for the law and, thus, represents an action in conformity with duty. This might be news to most interpreters of Kant's ethics, as many of them do not even consider that, for Kant, overdetermined actions are possible – although Kant discusses them at large as actions in conformity with duty.

Abstract

This essay focuses on the figure of “rivalry” in Kantian anthropological writings, which are mostly not considered in ethical concerns. Even if for Kant “rivalry” does not have the meaning of market competition, it is still *structurally* the same interaction-based figure – comparable to Smith’s “invisible hand” or Hegel’s “cunning of reason.” Thus, although one cannot discuss Kantian analysis of economic acting or doing business, it is possible to discuss the *figure* and *function* of “rivalry” (or competition) in relation to the achievement of earthly morality. To make its systematic role visible, this essay distinguishes strictly – and in accordance with Kant – between the moral “discourse of reason” and the given “conditions of application.” Thus, one can see that Kant was, apart from being a thinker led by principles, also a pragmatic thinker when it came to concrete (political) situations and the question of what to do and what to allow. This essay develops this perspective in three steps, which are followed by a few terse comments for the business ethics debate. First, it outlines the theoretical difference between the a priori justification discourse and the application discourse, which has to consider empirical conditions. Second, it reconstructs the definition of “rivalry” as a consequence of a natural characteristic: it is seen to be a means of nature by which it promotes arts and culture but also coestablishes right. Against this background, it provides a development model which can serve as a dynamic paradigm for application questions. It ends with some comments for the business ethics discourse¹.

Introduction

Immanuel Kant (1724–1804), probably one of the most important theorists of the Enlightenment, rarely mentioned questions belonging to the real economy. The economy does not play a role either in his so-called critical philosophy – i.e., above all *The Critique of Pure Reason* (1781/1787) [1],² *Groundwork of the Metaphysics of Morals* (1783) [2], *Critique of Practical Reason* (1785) and *Critique of the Power of Judgment* (1799) – or within his non-critical writings, where he comments on anthropological and contemporary political themes. Along with better known essays (so called “*Kleine Schriften*”), published mainly in *Berlinischen Monatsschrift* from 1784, such as *An Answer of the Question: What Is Enlightenment* (1784) [3], also significant are *Ideal for a Universal History with a Cosmopolitan Purpose* (1784) [4] and *On the Old Saw: That May Be Right in Theory, but It Won't Work in Practice* (1793) [5]. There are also the large-scale postcritical studies *Religion Within the Limits of Mere Reason* (1792) [6], *Perpetual Peace* (1795) [7], *Metaphysics of Morals* (1997) [8] and *Anthropology from a Pragmatic Point of View* (1798) [9]. Within all these writings one can hardly find a philosophically systematic discussion of the activities or structures of economic activity, besides the substantial submissions on the status of property in *Metaphysical Foundations of the Theory of Law* and in the *Metaphysics of Morals* (see the contribution by A. Eckl within this section). Consequently one can almost find in Kantian writings nothing that today qualifies as “business ethics.”

However, Kant is assigned a unique position in the current discussion on business ethics. Kantian ethics can be summarized – as action theorists argue – as follows: economic rationality must be clearly limited by morality. In any case, Kant’s ethics are identified with the duty to follow rather the *categorical imperative* than one’s own interests ([10], pp. 1–38, 28, 30). Thus, the various actors from business are called to (also) pursue and enforce ethical goals such as environmental protection, abolition of poverty and child labor laws. Therefore, Kant’s practical philosophy is seen as an instrument to force companies and global players to support the realization of common ethical goals of humankind – even though they operate in a competitive global arena.

Theory strategy here consists of transferring parts of the Kantian ethical discourse of reason (*Begründungsdiskurs*) on empirical *application* problems. Kant’s model should therefore produce specific rules for corporate actions [11]. Recourse to Kant – the defender of modern liberalism *and* modern ethics, which are founded on reason – thus completely legitimates the derived moral rules. In my view this strategy is problematic for at least two reasons. One is that there is a discussion of whether Kant himself took the categorical imperative as a model to directly generate rules to govern any *action* situation and constellation. That seems to be met with scepticism, because Kant insisted on adding an analysis of *general* empirical, i.e., *structural*, conditions to the justification discourse if the question was about *specific* action directives [12–14]. The second issue is that there is no uniform interpretation of how to apply the categorical imperative and also

because there are different formulations, which are purely *formal*. Moreover, it is not quite clear what this position entails: can concrete requirements be justified, or is it instead a model of what *form* rules have to have to *claim* universal validity?

In any case – as said above – economic practices *were not* an object of Kantian criticism, neither in the so-called critical writings of foundation of practical philosophy or ethics nor in the anthropological and political analysis. Although Kant refers in some places by way of example to the behavior of the “respectable businessman” or simply to “businessmen,” there are no passages in which Kant would reject “commercial spirit” or “commercial sense” as immoral. In *Groundwork of the Metaphysics of Morals*, he distinguishes on the basis of the businessman between acting obligatorily (*pflichtgemäß*) and acting because of obligation (*aus Pflicht*) ([2], p. 397). Thereby, he introduces the difference between *reasons* for acting, but not between practices. On the contrary, at one point one can find the following fundamentally positive statement: “Referring to the quality of a human being as being subjected by one’s own reason to certain obligations [...] everyone is a business man” ([5], p. 288). All in all, Kant was probably not concerned with economics as a way of acting or as a practice which forms society because he did not deem either as being destructive for morals or society; indeed, he was well acquainted with Adam Smith’s *Wealth of Nations* (1776), which was published some years before the first edition of *The Critique of Pure Reason* in 1781 [15].

If one does not want to simply apply the Kantian model of reason to empirical issues as outlined above as “applied ethics” and thus imply what Kant would have recommended from a pure reason-led point of view, one has to widen the application discourse to also include an analysis of contemporary empirical conditions. In terms of current *economic* discussions that means, however, taking into account the general situation of competition, which is one specific characteristic of a market economy. Additionally, there is another problem with simply applying Kantian theory to modern economics: namely, if specific actions are demanded for moral reasons, even though these actions might lead to counteractive *effects*. For instance, in a competitive market, business actors who are willing to act in favor of environmental protection could be driven from the market because of the higher costs. The positive effect would then be short-lived or, in the long run, even reversed because actors investing in environmental protection might fall into the worst position of being incapable of acting at all [16].

Thus, the question arises of whether in *economic* contexts the recourse to unconditional compliance with certain imperatives for individual actors is indeed desirable. And if it is not, *in the long run* it is much more appropriate to make common goals reality by not stating them as action-guiding maxims directly, but instead by creating a more sophisticated model governing the market, a model being more differentiated because it includes *systematically current* empirical conditions, although or perhaps because they are still not in accordance with the ideal state. To do so one can use the Kantian oeuvre more often than is commonly thought. To accomplish this, Kant can be consulted not only as a reasoning ethicist (*Begründungsethiker*), but also as a social theorist who seriously contemplates the conditions of application and the enforcement of ethical

principles. This is because he distinguishes between empirical conditions humankind has available – this means, in a broader sense, regulatory concerns – and those to which we are exposed because of our *general nature*, such as “natural human presuppositions.” Kant says human thinking (and hence subsequently human actions) is never determined completely by nature, because there will always be a space by which *thinking* can escape the causality of (human) nature.

Nevertheless, when it comes to the empirical development of humankind, Kant refers to nature in form of “rivalry” between humans and between states as playing an, if not *the*, essential role.³ This figure of “rivalry” is found in various contexts which refer without exception to situations in which Kant analyses them as a specific structure of human interactions. This concerns, first, common “natural human presuppositions” which lead to more or less generally encountered behavior patterns of individuals in interactions with others. Second, this specific structure emerges concerning possible socio-historical changes or ones that have already occurred and that affect humankind. Kant interprets these changes as positive development, as progress, whose “natural” engine is seen by him in this pattern of interaction called “rivalry.”

The interpretation presented will not turn Kant into an economist and certainly not into a business ethicist as it is found, for example, in some recent publications from the USA which compare and relate him above all to Adam Smith [15, 17, 18]. However, the idea of rereading Kant from an ordonomic–ethical perspective seems to me very useful [19]. Without criticizing therefore the point of view of named interpretations, this essay will instead draw attention to the proximity to the fundamental Hegelian idea of development and dismisses Kant – at least in part – from a purely unhistorically understood ethical position. Additionally, it makes clear why it is also necessary to consult Kant’s anthropological writings if questions concerning business ethics are posed, instead of only reading the so-called groundwork for the pure moral philosophy. By focusing on the social theorist Kant who is arguing empirically, the purely individualized, acting-centered perspective moves into the background, leaving room for an expanded, more nuanced perspective, which also involves interaction structures. Nevertheless, this does not agree with the theory-guiding premise according to which possible options for action have always been inevitably determined by social and economic reality. Instead, with this perspective the critical and pragmatic approach of Kant in relation to issues concerning questions of “empirical implementation strategies” for a moral world might become clear. That would be a world which comes closer and closer or more and more similar to the Kantian idea of an endless process of realizing human freedom. As such, the Kantian ideas can be fruitful for business ethics as well.

A Priori Reason Versus Empirical Conditions of Use

Kant strictly distinguishes between moral philosophy based on *theological or empirical reason*, and an *a priori reason*, which derives only from *terms of reason* (*Vernunftbegriffe*). From his point of view, the arguments for an act or social order

should not be dogmatic, empirical or pragmatic, but should be founded only in the concept of freedom or practical reason itself [14]. This implies, moreover, a strict distinction between empirically gained knowledge as a starting point for moral reason – which Kant rejects without exception – and the empirical reality as an area for the *application* of moral principles.

Thus, the factual socio-cultural and socio-historical reality is completely irrelevant when it comes to pure moral philosophy. *Pure* moral philosophy bases morality and morals on the fact that both are consistently thinkable. In a chapter entitled "Methodology" at the end of *The Critique of Pure Reason*, one reads that the philosophy of pure reason is critical philosophy. That is, first, an inquiry into the powers of reason "in regard to pure a priori cognition," or, second, it is called metaphysics as "the system of pure reason – a science containing the systematic presentation of the whole body of philosophical knowledge [...] given by pure reason" ([1], A p. 841/B p. 869). Using "metaphysics," Kant goes on, could also mean the whole system of pure philosophy "and may designate the investigation into the sources of possibility of a priori cognition" ([1], A p. 841/B p. 869), which is *different* from all mathematical or empirical use of reason. The metaphysics of morals, he adds, contains "the principles which determine and necessitate a priori all of one's doings. Now moral philosophy alone contains a code of laws – for the regulation of our actions – which are deduced entirely from a priori principles. Hence the metaphysic of morals is the only pure moral philosophy, as it is not based upon anthropological considerations (empirical conditions)" ([1], A p. 841/B p. 869).

Kant forces us, therefore, to strictly distinguish in theory between the pure, a priori derivable moral philosophy and the empirically derivable anthropology or social theory. The former asks, from a theoretical and logical perspective, for the *reason* and the theoretically consistent *derivation* of the pure moral philosophy from the a priori *concept of freedom*. The latter asks, from an empirical and practical perspective, for the actual conditions of *using* moral philosophy in the light of concrete empirical situations. Therefore, Kant forbids any interference from "outside" when it comes to *reasoning* in moral philosophy. All kinds of laws that do not originate from reason itself (implying that they are *not* born *autonomously*) are called heteronomous and are therefore invalid for the ethical discourse of reason. In *Groundwork of the Metaphysics of Morals*, Kant explains the *concept of duty* which can be expressed only by means of a *categorical imperative*:

And now philosophy seems placed in a very perilous situation, since she is allowed no peg either in heaven or in earth from which to suspend her principles. Now she has to show her integrity, as self-upholder of her own laws, not as the herald of those which some innate sense or guardian nature had whispered in her ear, and which, though better than nothing, never afford statutes of conduct, ordained by reason from a source altogether *à priori*: statutes which have thence alone their authority to command mankind, to expect nowhat from the solicitations of his sensory, but all from the supremacy of the law and the reverence he owes it, or, if he fail to do so, to hand him over to his own contempt and inward detestation. ([2], p. 425–426)

Against the insistence on a priori purity (which implies that only the concept of duty is relevant), one might argue that people do not base their will on free practical

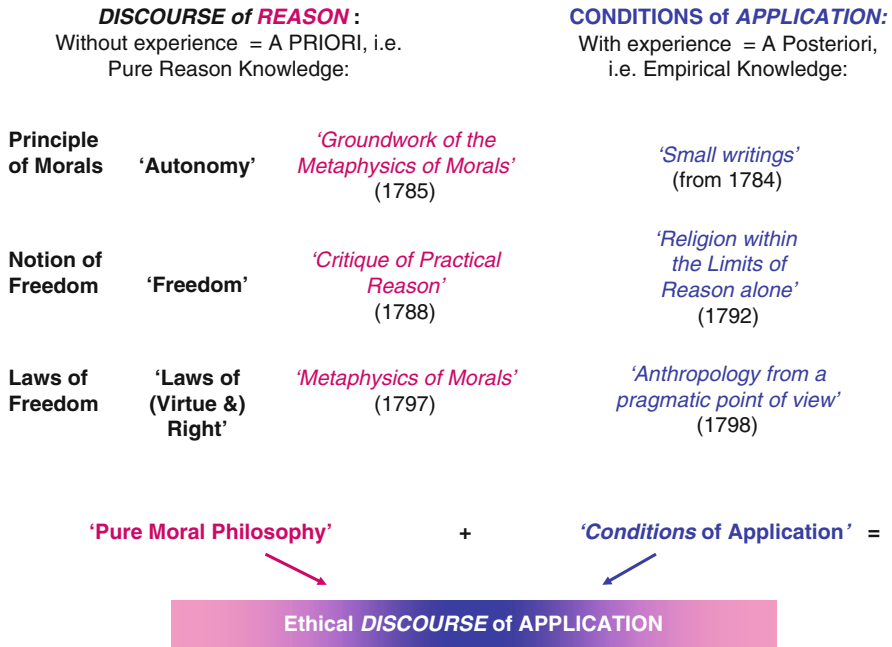

Fig. 17.1 The components of the ethical discourse of application

reason only, but rather on particularistic specific interests, i.e., on inclination. But this is still a *thought experiment* ([12], p. 17), in which Kant investigates whether and how the self-determination of the general rational will, which he designed in the concept of duty, is thinkable! And this is entirely independent of the continuously existing other “determinants” of the will.

The categorical imperative:

excluded from its authority the co-operation of any interest as a spring; an exclusion understood from the very categorical exhibition of it. The imperative was *postulated* as categorical, since without this the idea Duty could not be explained; but that there really are practical sentences containing a categorical commandment, could not yet be proved. (altered from [2], p. 431)

But from Kant’s perspective, to be provable is not even necessary, because it is his intention to show how these sentences are *consistently thinkable* only on the basis of the idea of practical reason or freedom and, according to that, how they might be constructed.

Figure 17.1 shows which of Kant’s writings can be assigned to what kind of knowledge and to what kind of discourse. Furthermore, it shows that the discourse of application has to focus on both sides: on moral philosophy *and* on the conditions of application. Within the domain of reason, practical reason is the only one that is to be questioned. Only in this way is it guaranteed that their laws are actually autonomously

grounded, i.e., derived from the a priori notion of pure freedom, and that humankind itself designs these laws to which it is willing to "submit." At this point, it is therefore irrelevant in what way the a priori reasoning concept of freedom - as well as the law derived autonomously from practical reason (given historically situated people or humankind) - may become at least. Kant asked a different question: namely, how to *justify* morality by *only referring to human reason*. Therefore, he argued against the claims of the Church and of the empiricists. His enemy is not the "empirical" itself, but an empiricist or theological strategy of reasoning.

By distinguishing between pure moral philosophy and analysis of the empirical conditions, Kant insists neither on the power of the a priori over the empirical, nor on a mere reversal of this relationship. Therefore, it would be wrong to say that the conditions of implementation have an effect on the axiomatic status of the law ([20], p. 111). Instead, he insists on their difference and on the causative and orienting function of the former ([2], p. 410). His writings in which the pure moral philosophy is designed have, therefore, a theoretical status different from that of his anthropological and political writings: they do not allow any recourse to empiricism *within the grounds of argument*. This does not mean that empiricism is less important, but only that theoretical reasoning and discourse analysis of the empirical conditions are two different discourses which must be related to each other in an appropriate relationship to constitute the discourse of application. The task is now to determine this kind of relation.

However, the difference between discourse of reason and discourse of application does not correspond to the difference between theory and practice – as Kant emphasizes again and again. Instead, a more constructive step is necessary with regard to the question of how to connect the thinkable with the empirical reality:

Thus not only are moral laws with their principles essentially distinguished from every other kind of practical knowledge in which there is anything empirical [...]. When applied to man, it does not borrow the least thing from the knowledge of man himself (anthropology), but gives laws a priori to him as a rational being. *No doubt these laws require a judgement sharpened by experience, in order on the one hand to distinguish in what cases they are applicable, and on the other to procure for them access to the will of the man and effectual influence on conduct*; since man is acted on by so many inclinations that, though capable of the idea of a practical pure reason, he is not so easily able to make it effective *in concreto* in his life. ([2], p. 389, my emphasis)

But experience includes an analysis of the socio-historical empirical conditions if one wants to know how morality and ethics can be realized. If it is unavoidable, however, to equally consult the current empirical-anthropological present in questions of application; then both of them have to be included within a *model of moral orientation*. Such a model can, in principle, be built on the Kantian discourse of application. It is therefore important to outline empirical conditions which Kant himself observed, and to show how he assessed them. He argues that the empirical conditions also include mechanisms, created by nature, which at least come *close* to what is reasonable in reality. And here, according to Kant, "rivalry" as a pattern of interaction plays a significant role: it is substantially involved in the establishment of empirical social conditions for pursuing one's own purposes and being able to

pursue them in a rational, i.e., free, manner. That needs to be shown, however, in order to be able to outline the development model in the light of this empirical finding.

“Rivalry” in Kant’s Non-critical Writings

One look at the German etymological dictionary of the Grimm brothers tells us that the word “competition” (*Wettbewerb*) is of a younger age: “competition” emerges in the late nineteenth century as a translation of the French “concurrency” and that as a slogan of liberal economic and social teaching. In the 1911 edition, the Grimm brothers defined it as “a struggle of merit in trade and economy, [...] as the relation of such persons to one another, who use any means to aim at an end which cannot be reached by all of them” [21]. In the following years, competition as a social practice gained more and more acceptance in other, not primarily economic social contexts, such as artistic or scientific ones, and in sports, as comparisons of performance or innovations. Currently, “competition” in general has the meaning of achieving a specific purpose or goal, *by several people, ideas or objects* who face each other in a comparative way, with one or a few prevailing as the winner(s), leaving the others behind in relation to the realization of the original purpose. Thus, nowadays, “competition” is by no means limited to standard economic practices. On the contrary, it seems as though the comparison with others has become one of the most common forms of social interaction. Almost everyone is competing with many others to achieve certain purposes in many different areas and contexts. (However, not all parameters that count in competition can be provided by people themselves – competition is also about appearance, origin, gender, etc.)

“Rivalry” as an Empirical “Predisposition to the Good” in the People

In Kant’s anthropological writings, “rivalry” means both diversity and different values, even if not in today’s wide-spun spectrum. The in principle positive, but possibly also negative evaluation of “rivalry” is based on the *quantitative expression* it shows, and which is not bound to those areas where it is desired or allowed. For Kant, “rivalry” belongs to the innate characteristics people come equipped with as members of the human species. In *Religion Within the Limits of Pure Reason* (1792), the section entitled “Concerning the Original Predisposition to Good in Human Nature” distinguishes between three “classes” or “elements” of the determination of human beings: The first is the “predisposition to animality in man, taken as a living being,” the second is the “predisposition to humanity in man, taken as a living *and* at the same time a rational being” and the third is the “predisposition to personality in man, taken as a rational and at the same time an accountable being” ([6], p. 26–27).

The “predisposition to animality” is understood by Kant as “purely mechanical self-love,” which is found in three characteristics: as self-preservation, as breeding and

propagation of the species, as well as for community with other human beings. It requires no reason. Those "predispositions to humanity" which, according to Kant, benefit the development of the species appear as "comparative self-love," in terms of both physics and reason. Here, practical reason is necessary, but not as a driver (for the moral determination of the will), but because the act of comparing itself requires reason. The "predisposition to personality" is defined as the "capacity for respect for the moral law as in itself a sufficient driving force" of the will. Hence, practical reason is required, above all, as the origin and driving force of self-determination.

If we consider the three predispositions named, in terms of the conditions of their possibility, we find that the first requires no reason, the second is based on practical reason, but a reason thereby subservient to other driving forces, while the third alone is rooted in reason which is practical of itself, that is, reason which dictates laws unconditionally. ([6], p. 28)

Onto the first two predispositions can, according to Kant, "be grafted all kinds of vices"; but this does not mean that those vices are innate to the predispositions themselves! Only onto the third one can "absolutely no harm be grafted" ([6], p. 27), because this was the original idea of the moral law and thus the actual personality itself – thus having a quite universal character.

As "rivalry" is an expression of the second predisposition ("comparative self-love"), it can be found as a good expression, i.e., as an inclination, or as a bad expression, i.e., as a vice.

Comparative self-love:

is physical and yet compares (for which reason is required); that is to say, we judge ourselves happy or unhappy only by making comparison with others. Out of this self-love springs the inclination to acquire worth in the opinion of others. This is originally a desire merely for equality, to allow nobody superiority above oneself . . . ([6], p. 27)

However, this sometimes rather peaceful and reflective comparison is "bound with a constant care" that others strive to attain superiority, which implies the unjust desire of wanting to be superior to others. This "unjust desire," which is *caused* by the interaction alone, entails "further hostilities." From a philological point of view, it cannot be decided clearly whether Kant thinks that the initially positively connoted tendency of "rivalry" becomes "jealousy" and "sexual rivalry" *by preventive countermeasures*, or whether "rivalry" itself is already the result of the preventive, anticipatory reaction:

Upon this twin stem of jealousy and rivalry may be grafted the very great vices of secret and open animosity against all whom we look upon as not belonging to us – vices, however, which really do not sprout of themselves from nature as their root; rather are they inclinations, aroused in us by the anxious endeavors of others to attain a hated superiority over us, to attain for ourselves as a measure of precaution and for the sake of safety such a position over others. For nature, indeed, wanted to use the idea of such rivalry (which in itself does not exclude mutual love) only as a spur to culture. Hence the vices which are grafted upon this inclination might be their termed vices of culture; in highest degree of malignancy, as, for example, in envy, ingratitude, spitefulness, etc. they can be called the diabolical vices. ([6], p. 27)

Here, one needs to be clear about which theoretical level Kant places "rivalry" on and which structure he therefore connotes positively: "mutual love" suggests

that “rivalry” can be found on the level of “comparative self-love,” which aims only at the recognition of *equivalence among* others. The order of the sentence and the word “*of such*” indicate, however, that “rivalry” is interpreted as the result of the preventive countermeasure, which aims at *superiority* because of the anxious endeavor of others to attain superiority over us. This would correspond to the game-theoretic model of the *prisoners’ dilemma*, in which defecting is the dominant strategy because of *preemptive* rational considerations [22].

If one tries to clarify this matter by looking at Kant’s other writings, there are indications to be found for both readings: In §71 of *Anthropology from a Pragmatic Point of View*, Kant writes about the “rivalry in fashion things,” another area where people try “to outrival the other.” In §72, “exuberance” is evaluated: if it is tasteful, it is called “luxury,” if not, it is called “gluttony.” Kant initially seems to consider both as unnecessary and bad for society; however, he assesses their respective effects on “welfare” and finds that luxury “is compatible with the progressive culture of people (in art and science)” ([9], p. 249–250) – in contrast to “gluttony.” He also suggests that it is easier for a government to govern its people if it does not use sumptuary law (*Aufwandsgesetze*) to regulate or forbid luxury.

Since opulence can be criticised only in public life, not in domestic life, it must be concluded that the relation of the citizen to the commonwealth as far as the freedom of competition {Wetteifer} is concerned as to the adornment of one’s own person or possession (at feasts, weddings, funerals, and on down to well-mannered behaviour) can only with difficulty, for the sake of the anticipation of the useful, be burdened by sumptuary law. This should be so because opulence still offers the advantage of animating the arts, thereby returning to the commonwealth those expenses which such luxuries may have incurred. ([9], p. 250)

Again “competition” or “rivalry” appears in the context of culture – here, specifically, in relation to fine arts – and it is “rivalry” which is responsible for their vitalisation, even if the price is a luxury granted by the government. Moreover, in *Anthropology from a Pragmatic Point of View*, Kant adds another type of “rivalry”: a type which “is presented by females in order to gain advantage and favor in men” ([9], p. 305). When it comes to the character of women, their property to dispute constantly with each other seems to be a mere result of named “rivalry,” whereas women get on very well with the other sex, i.e., with men. But as Kant regards the tendency to dominate as the ultimate goal of all human beings, this type of female “rivalry” seems to be a means for achieving that goal.

However, for Kant, all these objectives are subjective goals of actual human beings – not objective goals of humankind or of reason. They have been purposefully established by nature to be pursued by individuals. To cite an example, Kant assigns human woman the tasks of conservation, cultivation, and refinement of society, “though this makes it not to morality itself but to what its dress is it, to the civilized decency that is the preparation and recommendation to it” ([9], p. 306). Therefore, pursuing these objectives does not interfere with morality; on the contrary, Kant seems to think that this behavior provides a moral glow which at least helps in preparing real morality ([9], p. 151–152).⁴

Although the lines quoted do not permit one to decide clearly whether Kant differentiates between a good and a bad *goal* for the competitors – the desire for

equality versus the desire for one's betterment in comparison with others – it can be maintained, in any case, that "rivalry" has a *positive connotation* within anthropological contexts. To sum up, "rivalry" is primarily characterized as an idea and as an interactive manner, which is used by *human* nature in the process of cultivating itself. Although it is required to be moderate in order to prevent vices which might arise and prevail in the wake of the "rivalry," "rivalry" nevertheless serves also as a motor of development and advancement – and it is therefore employed to realize the Good as such. In the so called, the sketched predispositions (self-preservation, comparison with others and moral personality) are called to be predispositions to install the Good or to *advance* it:

All of these predispositions are not only good in negative fashion (in fact they do not contradict the moral law); they are also predispositions toward Good (they enjoy the observance of the law). They are original, for they are bound up with the possibility of human nature. ([6], p. 28)

To be "not only good in negative fashion" means, first, that such predispositions do *not* contradict the moral law and do not act against it. Second, this relation is not just one of indifference but instead, each of the predispositions even serves the moral law in its own way, promoting compliance with it as long as the predispositions are used in an appropriate manner. The first, or the "presupposition to animality," because it ensures the preservation of humankind, which therefore (and trivially) is a necessary condition for the possibility of the historical development of morality. The second, or the "presupposition for humanity," serves the moral law because it makes use of "rivalry" to establish a constitutive order of society. Finally, the third, or the "predisposition to personality," serves the moral law because here the idea and basic requirement for any morality, i.e., free reason, can become practical – as free-will-orientating and therefore determining the actions in the sense of freedom.

Thus, "rivalry" as an empirical competitive behavior seems to be not only unproblematic for Kant, but instead even useful when it comes to the production of the Good. In *The Critique of Pure Reason*, Kant distinguishes between the terminology of the "Good" and that of "happiness," the former being an object of pure reason ([1], A p. 548/B p. 576). But in his discussion of the "Highest Good," Kant brings both ends together again. For that "Highest Good" corresponds to the idea that a human being is happy in the same degree in which he or she is acting morally, i.e., in the degree she or he determines her or his acting by pure practical reason ([1], A p. 801/B p. 837, 28, pp. 72–76). The "Good" is therefore *conceivable* for the consistent implementation of morality *and* happiness, which means that acting on purely rational grounds or on grounds of freedom *and* the satisfaction of all our inclinations ([1], A p. 806/B p. 834) is *equally* possible. From an anthropological point of view, "rivalry" is an inborn pattern of interaction within humankind which should not be stopped. It is thus, according to Kant, *convenient*.

What kind of functional role "rivalry" holds in the process of achieving freedom becomes even more apparent when looking at the other incidents of "rivalry" in the non-critical, so-called small writings, where human development

is in question. However, it appears here no longer only as an instrument to add something to private, individual moments of happiness, but as an instrument which is essentially involved in the establishment of a social order based on practical freedom laws. This is, of course, always important for individuals as well, because the social order is at the same time part of their concrete conditions of life and acting. Thus, people are determined by it in large parts of their lives – be it positively or negatively.

“Rivalry” as the Engine of the Progressive Development of Humankind

In *Idea for a Universal History with a Cosmopolitan Purpose* (1784), Kant proposes interpreting the historical course of humankind as rational, purposeful and therefore progressive. With such a “guide *a priori*” – as he calls his proposal – could be given:

a consoling view of the future [. . .] in which there will be exhibited in the distance how the human race finally achieves the condition in which all the seeds planted in it by Nature can fully develop and in which the destiny of the race can be fulfilled here on earth. Such a *justification* of Nature – or, better, of Providence – is no unimportant reason for choosing a standpoint toward world history. ([4], p. 30)⁵

Again, “rivalry” is assigned a systematic function of being necessarily involved in this progress because of codetermining it. First, Kant distinguishes between a general, rational and natural intent on the one hand and potentially unreasonable, particularistic, action-determining intents on the other hand: The “*means employed by nature to bring about the development of all capacities of men is their antagonism in society, so far as this is, in the end, the cause [!] of lawful order among men*”([4], p. 20). The problem of man is that “being in society he wants to have everything only according to his intentions” and thus people expect resistance everywhere – just as they themselves are also inclined to “resistance against others.”

This opposition it is which awakens all his powers, brings him to conquer his inclination to laziness and, propelled by vainglory, lust for power, and avarice, to achieve a rank among his fellows [. . .]. Thus are taken the first true steps from barbarism to culture. ([4], p. 21)

After a short polemic against Rousseau, a conclusion follows: “Thanks be to Nature, then, for the incompatibility, for heartless competitive vanity, for the insatiable desire to possess and to rule! Without them, all the excellent natural capacities of humanity would forever sleep, undeveloped” ([4], p. 21). Kant is thankful to “human nature,” which is understood here as a natural disposition of certain empirically observable behaviors such as “rivalry,” discord and antagonism. These patterns of behavior arise from the wish to dominate others. Moreover, Kant thanks nature because he *considers* this behavior *to be essential* for the progress of humankind. The *empirical* goal of this progress lies in the establishment of a social order founded on freedom. This is what Kant sees as the greatest challenge for all

human beings: to transform society in such a way that it provides the conditions for as much freedom as possible (even for the antagonism!), yet as rigid as necessary by following the rule of Right:

Such a society is one in which there is mutual opposition among the members, together with the most exact definition of freedom and fixing of its limits so that it may be consistent with the freedom of others. Nature demands that humankind should itself achieve this goal like all its other destined goals. Thus a society in which *freedom under external laws* is associated in the highest degree with irresistible power, i.e., a *perfectly just civic constitution*, is the highest problem Nature assigns to the human race [. . .]. All culture, art which adorns mankind, and the finest social order are fruits of unsociableness, which forces itself to discipline itself and so, by a contrived art, to develop the natural seeds to perfection. ([4], p. 22)

Hence, for Kant "rivalry" does not only participate instrumentally in the production of culture and art, it also serves the development of humankind because one of its "fruits" is the social order itself. The civil constitution and the "rivalry" do not appear as enemies, fighting against each other. Instead, the "unsociableness" arising from the knowledge of one's own resistance or that of others is, at the same time, the "cause" forcing itself to constitute a civil constitution as it were to support itself! Thus, for Kant, the just civil constitution and "rivalry" do not only realize *hand in hand* the *telos* of humankind, i.e., practical freedom, but the former appears as an effect of "rivalry" and even depends on it. Of course, Kant speaks of a necessary condition only, and he says nothing about whether he could imagine other ways of realization. But that is not his topic here, because he focuses on the empirical reality which he believes we observe, and on assessing it in relation to the progress of humankind.

In Kant's analysis of intergovernmental politics, which is concerned with the possibilities and conditions of peace (a quite achievable goal for Kant), one can find the same notion of the primary "rivalry." Within this context, it is also called "necessary." In *Perpetual Peace*, "rivalry" appears in the form of war, i.e., as a de facto evil, yet a clearly positive role is attributed to it. In the first supplement, Kant asks for a guarantee of perpetual peace – and finds it again in the artist called nature, which "is capable to create human harmony even against the will of the people and by discord" ([7], p. 360). Against the argument, that world peace could be protected by only *one* ruling government (with a despotic monarch as the lead), Kant turns again to nature, "which wants things the other way round." Although hatred and a tendency for war belong equally to nature, it still does not bring peace by despotic oppression, i.e., "by weakening all forces, but by their balance in the most lively 'rivalry'" ([7], p. 367) and protects it also that way! More specifically, nature unites peoples in the course of human development "through mutual self-interest. [. . .] This is the way of nature to guarantee by the natural mechanism in human nature itself perpetual peace" ([7], p. 368). That does not imply peace with sufficient certainty, but implies peace at least to the extent that everybody is committed to *participation* by nature, as Kant adds.

Kant asks neither for a unique and single common will (which therefore could not be represented by a "good dictator") nor for a common goal of all people.

On the contrary, in order to achieve the goal or the purpose of humankind, not every person should make this goal his or her own purpose, but should in fact continue to pursue his or her own goals, even against each other, shaping more and more the general purpose of “peace” (by “freedom”) *in this way*. Thus, for Kant, not even a common concrete will for peace or freedom is needed to establish it practically: the progress of humankind is not promoted by the fact that we all pursue the same rational purpose of a good will, but obviously by the fact that we compete with each other and fall into dispute:

But now nature comes to the aid of the universal, reason-derived will which, much as we honor it, *is in practice powerless*. And this she does, by means of these very selfseeking propensities, so that it only depends and so much lies within the power of man-on a good organization of the state for their forces to be so pitted against one another, that the one may check the destructive activity of the other or neutralize its effect. And hence, from the standpoint of reason, the result will be the same as if both forces did not exist, and each individual is compelled to be, if not a morally good man, yet at least a good citizen. ([7], p. 366, my emphasis)

This can be interpreted in the sense that the state has to provide the institutional conditions for people to compete against each other – and to not direct their forces against others in a fight. As a result, it looks as if reason alone has prevailed – even if it actually drew and still draws on “rivalry’s” services.

To sum up, “rivalry” is important in two practical respects. First, as an expression of the second “predisposition for the Good,” which belongs to the character structures of individuals and becomes visible within comparative human interaction. Here, “rivalry” plays an essential role in the development of art and culture, both of which can therefore be called effects of these empirically observable predispositions in human nature. Second, another effect of “rivalry” lies in its contribution in relation to the achievement of political order. For it is this structure of interaction that forces people to submit to legal laws of liberty, because this is the only way to hold on to their particular goals and thus benefit indirectly from each other. Thus, “rivalry” leads, in the form of social justice and peace, to a result that was not intended by the individuals acting in the interaction situation called “rivalry.” Thus, it induces not only indirectly culture and arts, but also serves to establish a social order within the laws of freedom.

In conclusion, Kant unequivocally regards “rivalry” as the engine of the development of humankind on its path to a better world – whatever “better” means. “Rivalry” appears as an interaction pattern in which the individuals direct little in their concrete objectives in accord with the a priori moral law, because they have their own advantages in mind when comparing each other – if only not to be at the bottom end. Thus, they indirectly contribute, in a significant way, to implementing morals as a part of the “last end.” Therefore, humanity develops in a positive direction, because the individual, concrete human beings (or states, which Kant designs analogously) compete with each other in pursuing their antagonistic purposes. And only by fighting for equality or superiority do they move to the pragmatic realization that the best way to do so (and to go on with it) is to legislate

reasonable peace laws. Their establishment is based *in effect* on plotlines which have little to do with the action-directing form of the categorical imperative.

Taking these findings as a basis, how can we then understand the relation between "rivalry" and the pure concept of freedom, on the one hand, and its realization as a constitutional order, on the other hand?

Constitutional and Legal Order as an Effect and Condition of "Rivalry"

The suggested aim of the nature of humankind to realize reason or freedom seems to be impossible to reach empirically or directly. Instead, it proves to be rather an unintended result of antagonistic interaction patterns by which various participants are not only sceptical about each other but also about this result. In *On the Old Saw: That May Be right in theory, but It Won't Work in Practice* (1793), Kant explicitly mentions the difference between life plans (and goals) of individuals and of humankind:

If we ask, then, by what means we might maintain and possibly accelerate this perpetual progress for the better, we soon see that this immeasurable success will depend not so much on what *we* do [. . .]. Instead it will depend upon what human *nature* will do in and with us to *force* us onto a track to which we would not easily accommodate ourselves on our own. For we can look only to nature [. . .] for a success that will affect the whole and thence the parts, while on the contrary, the *projects* {Entwürfe} of men start with the parts, if indeed they do not stop there. [. . .] They can extend their ideas to [the whole], but not their influence, chiefly since the project of one man will repel another, so that they would hardly reach agreement on a project of their own free intention. ([5], p. 310)

The "rivalry" or antagonism leads to a situation in which people give themselves laws, but the discrepancy between what they directly want and self-legislation still remains: people do not want to hold on to the law directly, but eventually do so because they realize that this is the only way to pursue their goals. Thus, the rational insight is that people are forcing themselves *to* better pursue their own purposes – here Kant argues pragmatically and not from the standpoint of moral philosophy!

People are giving themselves pragmatically the Right in form of the principle of law. This principle controls the "outer use of freedom," i.e., it formulates the first principle, according to which the maximal freedom of the individual together with others is attainable. From a pragmatic point of view, people submit to it, *enabling* and *protecting* the external use "of their own freedom." "Right [. . .] comprehends the whole of the conditions under which the voluntary actions of any one Person can be harmonized in reality with the voluntary actions of every other Person, according to a universal Law of Freedom" ([8], p. 230, see also [2], p. 430–431). In other words, Kant believes that this principle is needed so that people can use their freedom well. They give it to themselves and they submit to it in order to be, under the condition of their plurality, maximally free. "To be free" implies, in terms of Right, "independence of the compulsory will of another" ([8], p. 237).

Moreover, this empirically well corroborated explanation can be called pragmatic because it is thought of with the *general* goal to be achieved in mind. This implies the pragmatic question of how to realize it in the fastest and most sustainable way, even if it repudiates one's *own particularist objectives*. And here, "rivalry" appears as the best means to achieve the general objective or purpose. And aiming to achieve that objective can – again in a pragmatic way – be justified by the fact that it is itself a condition for making one's own objectives to the fullest extent realizable: people submit to "coercive laws" (of freedom) in order to make themselves able to realize their own goals in a better way. For freedom just means allowing anyone to pursue their interests as long as this does not go against the legal principle, which is *a condition of the concrete realization of every particular project*:

No man can compel me to be happy after his fashion [. . .]. Instead, everybody may pursue his happiness in the manner that seems best to him, provided he does not infringe on other people's freedom to pursue similar ends, i.e., on another's right to so whatever can coexist with every man's freedom under a possible universal law. ([5], p. 290) (see also p. 298 in [5] and p. 230 in the *locus classicus* [8])

But as the antagonistic forces implied by "rivalry" have the benefit of cooperating in the progressive development of humankind, the institutional establishment of the Right appears *at the same time* as its *result as well as its condition* – if "rivalry" should continue to be productive in relation to the development of humankind. In this way, the Right constrains *and* requires "rivalry" which is supposed to take place within the limits of the principle of Right, and should (even must) participate in the progressive development of freedom. "Rivalry" is therefore a concept which in fact *establishes* the reasonable Right, but which empirically also *depends* on it. Nevertheless, the individual actors have a more sceptical relationship with the Right, because "rivalry" involves goals other than *equality*. Equality, however, constitutes the core of the rule of Right, for Right means *to grant the same* to everybody in the sense of adjudging everybody formal equality of *condition* at the level of action:

The civil state, viewed purely as a legal state, is thus based a priori upon the following principles: 1. The *freedom* of each member of society as a *human being*; 2. The *equality* of each member with every other member as a *subject of state*; [. . .]. These principles are not laws given by a state already established, but they are the only laws that make it possible to found a state in accordance with pure rational principles of external human law as such. ([5], p. 290)

The fact that, by their interactive behavior, all people are working together for the reasonable progress of humankind could be interpreted as a jointly produced positive side effect, which none of them intended. Therefore, it is the non-obvious, but still conceivable natural goal of *humankind*, often lying behind the visible, opposing individual actions ([4–6, 8], pp. 310, 371, 378). Thus, Kant gives an obvious answer to the question of how what is ideally and possibly thinkable for humankind will evolve, considering the concrete empirical anthropological "facts": the observable

agent or means is "rivalry." This also indicates that Kant does *not* couple the progress of humankind with the *intention* of improving the world; progress does not necessarily have to be combined with a good individual intention. Instead, he assigns a functional role to ambition and to desire for domination in world affairs, a role which he nevertheless denies both concepts within the discourse of reasoning.

Freedom and equality turn out to be not just a result and condition of empirical "rivalry" – and therefore of the empirical objectives of the people involved – but at the same time, they provide the only possible a priori *reason* of Right. The a priori practical reason of humankind occurs again as the first and last instance in the discourse. It alone legitimizes civil rights, i.e., it justifies the social order, which can be conceptualized consistently and derived from a priori practical reason – as it is freedom.⁶ Hence, there exist, in Kant's thought, both an a priori *and* a legal-empirical freedom and equality: some as pure concepts, the others as empirical results and conditions. According to Kant, empirical observations are not allowed to be used in the reasoning of moral philosophy. However, when used as pragmatic reasons, they seem to be useful assistants for establishing the Right and therefore morals. Thus, "rivalry" systematically lies beyond the reasoning of moral philosophy, and in the core of the practical establishment of the rational: it is its effect and provides its best condition. Practical reason serves the people as well as the development of humankind, by *thinking, designing* and *constructing* (itself as) the idea of freedom, deriving and justifying laws. But when it comes to implementation, the antagonistic "rivalry" takes the lead: it appears as practical reason's empirical instrument, i.e., dedicated by nature to achieve its goals. This does not mean, for Kant, that at some point practical reason as the sole power or the idea of freedom could be "accomplished" empirically. Instead, he designed an asymptotic model in which reality approximates the "purpose of humankind" ever closer without the possibility of reaching it – for systematic reasons.

In the beginning, I drew a parallel to Hegel's system, which can now be articulated better. Kant clearly thinks along teleological lines when reflecting (with an anthropological interest) on the changes, developments and future possibilities of humankind. He classified these changes as a process of increasing the realization of freedom [14], which he thinks will develop "on her own" because nature has given appropriate presuppositions to human beings – in almost the same way as Hegel did some years later. Yet he holds fast to a potential reason, which presents nature with the unattainable goal. Hegel will be the one to reply to Kant, at this point, that he could only *think* the a priori, because his (Kant's) reason was – at this very moment in history – developed adequately to do so. Unlike Hegel, however, Kant held the opinion that the progressive development does not necessarily find the right direction all by itself. That is why he does not simply add reason to empiricism or to human nature, but also opposes them: reason has the task of providing guidance to the development, and it must do more than just reflect or reconstruct its way during its flight at dusk. Therefore, Kant needs to have an answer or at least a different answer when asked how to bond together the two components of the application of discourse – history and the rational ideal – to yield a model for specific applications.

The Idea of Freedom as a Founding Orientation and Limiting Condition of Its Endless Realization

In writing on the *empirical opportunities of the realization* of freedom, equality and peace, Kant distinguishes between the specific objectives of individuals and the purpose of all humankind and places them on two different theoretical levels. The latter is produced *by* the former through the interactive game of “rivalry,” and is realized by way of institutions – as the principle of Right, as civil constitution or international law (which can all be derived from the rational laws of freedom). But at the same time, the institutions also protect the ability of individuals to continue to set and pursue their particular goals. Therefore, one might say that they are established *in order to* make “rivalry” and all other particularistic goals possible. *Empirically*, “rivalry” as a pattern of interaction causes (owing to the nature of humankind) the development of the purpose of humankind as a whole. In this way, Kant mediates between the particular and the general objectives realizing the “idea of freedom” – almost all by itself and without having the whole picture in mind. Does that not seem cynical? For Kant it does not, when one carefully considers the conditions under which the antagonistic interplay of forces can take place. To do so, the theoretical considerations have to be balanced appropriately.

The Difference Between Reality and a Conceivable Rational Ideal

Kant formulates the question of the relation of empirical nature and morals with regard to the achievement of social peace and freedom as follows:

The representation to ourselves of the relation and agreement of these formations of nature to the moral purpose for which they were made and which reason directly prescribes to us, is an Idea [. . .], which is in theory superfluous; but in practice it is dogmatic (e.g. in relation to the concept of duty of perpetual peace using named mechanism of nature), and its objective reality is well established. ([7], p. 362)

Here, the “agreement of nature and reason” itself appears as an “idea” which is called “pragmatic” in practical terms, which means something like “in relation to reality.” “Dogmatic” has the meaning of being “strictly proved from sure principles a priori” ([1], B p. 35) *and* well founded, that is, empirically detectable. Thus, the “ideas” which originally derive from theoretical reason all serve ultimately, according to Kant, “the completion of the empirical employment of reason” ([1], A p. 565/B p. 593), i.e., they describe what the case *might* be if people used perfectly their reason and if their actions were only conducted by reason. Since this will never be entirely the case, because people in fact do not determine their practice only by pure reason, the “perfect use of reason itself” remains “a never-executed, yet-to-follow idea” ([1], A p. 565/B p. 593), even for Kant. Therefore, the notion of a consistent interaction between the purpose of nature and the idea of reason are, for Kant too, included in this type of idea: it may be called the *idea of distance*.

The asymptotic difference between ideal and reality is, however, justified not only with regard to the lack of empirical use of reason by the people, but also systematically. And here it receives a very different quality, as found in *The Critique of Pure Reason* (with recourse to Plato's *Republic*):

A constitution allowing the greatest possible human freedom in accordance with laws by which the freedom of each is made to *be consistent with that of all others* [...] is at any rate a necessary idea, which must be taken as fundamental not only in first projecting a constitution but in all its laws. [...] The more legislation and government are brought into harmony with the above idea, the rarer would punishments become, and it is therefore quite rational to maintain, as Plato does, that in a perfect state no punishments whatsoever would be required. This perfect state may never, indeed, come into being; none the less this does not affect the rightfulness of the idea, which, in order to bring the legal organisation of mankind ever nearer to its greatest possible perfection, advances this maximum as an archetype. For what the highest degree may be at which mankind may have to come to a stand, and how great a gulf may still have to be left between the idea and its realisation, are questions which no one can, or ought to, answer. For the issue depends on freedom; and it is in the power of freedom to pass beyond any and every specified limit. ([1], A p. 316–317/B p. 373–374)

According to Kant, we have to think an irreconcilable distance between what is consistently thinkable and what becomes real, even if this distance does not correspond to a fixed distance. But in addition, this infinitely small distance is also insurmountable, because realized freedom is *by definition* without closure. Freedom is not an achievable state which can be described by a definitional or fixing limit, but it is the becoming itself, which may "pass beyond every specified limit"! Therefore the relationship between idea and reality is not characterized by a forever-enshrined distance. By contrast, this relationship features an asymptotic approximation of the real to the reasonably thinkable in the course of execution through history. Thus, it approximates a freedom that is just not foreseeable, that cannot be limited or caught. For this reason, Kant formulates an imperative that invites one to follow the idea of freedom oriented as a "regulative idea," as an indicator of direction for the empirical people of today in their perpetual process of rapprochement – even if it remains an unattainable point, as presupposed. The given moral reality is an expression of this procedural approach to the moral idea of freedom, which itself is *not* derived empirically. Instead, it only signals to humankind the never-fixable opportunities in and through the rational, i.e., in a practical context: freedom of thought.

But social and individual freedom is, according to Kant, limited by the other human beings, who, during the process of becoming, are not allowed to consider themselves or others as being nothing but a means to an end. Instead, it appeals to submit to the "laws of freedom" *in order to participate in this continuing process by shaping it*. Thus, it is to design a model of interaction that expresses its inner dynamics by which, given the socio-historical conditions, the "greatest human freedom according to laws" will be realized. This model of interaction may, however, *not be meant to be* an easy transfer of fixed rules of moral philosophy to current situations, so the categorical imperative merely formulates the rule encompassing all practical issues.⁷ The distance between ideal orientating reason and the concrete conditions of use cannot and should not be "overcome through assimilation." Rather, this distance is to be obtained within the model, so the

statement of grounds also indicates the direction in which the development should go. Therefore, the analysis of general, structural and empirical conditions has to be interpreted as an extension, and as a request to design a *development model* that just does not try to directly identify both sides, i.e., the current reality and the thinkable ideal. In this way, the question of how to apply Kant's moral philosophy gets a completely different quality than outlined initially. What can such a model look like?

A Dynamic Development Model

As mentioned already, the realization according to the idea of freedom was itself called an *idea*, which is a regulative and orientating idea, in the shape of the Good. In addition, achieving freedom is, for Kant, a never-ending process that can be taken as an imaginary basis of the never-ending story of human development and history. It seems necessary to focus again on the relationship between the idea of freedom and actual reality to point out the *preliminary* and *regulatory character* of the idea of freedom. At the same time, this idea acts as the (at least thinkable) general purpose of the nature of humankind – a goal which becomes unintentionally real through competition – *and* also as an orienting limit for determining the actions of all people. The latter implies, for example, the orientation of the basic structural equality of all people or the “claim on the respect of others” ([12], p. 286), which basically has to orient actions. As a rule of law, this idea describes in a formal way the conditions enabling interaction to take place as a concrete means to realize the process. In this way, law regulates the interactions between people, and it also formulates and provides the institutional conditions of free self-determination.

The relationship between empiricism and the a priori concept of freedom relates to at least two different applications: “freedom” forms the ideological as well as the ideal value, which the empirical progress of, first, the individual (ontogeny) and, second, the human race (phylogeny) asymptotically approaches. The necessary, unbridgeable distance between the idea of freedom and reality is found clearly in both areas, so far as both open up a space between the idea of freedom, the realization of which is thinkable under the conditions of pure reason, and its *actual* realization, which approaches that possibility continuously and empirically. In other words, according to Kant, the gap is to be seen between what practical reason entrusts as a task, namely to think *freely*, because this is its genuine possibility, and the empirical becoming as a convergent relation of distance. But this should be seen in such a way that, on the one hand, the empirical is simultaneously grounded on, limited by and oriented through the thinkable. On the other hand, a constant distance must be maintained which in no way implies conflation. In this sense, one can speak of a distance model, which holds on to the unbridgeable between the idea/ideal and reality (see Fig. 17.2).

Both sides, idea and reality, are thought to be in both respects – ontogenetically and phylogenetically – converging but not congruent, because the latter would contradict systematically the idea of freedom. This is not just because people are always determined in other than reasonable ways, but because there is *by definition* no state in which the maximum freedom would be “reached,” and which therefore

Fig. 17.2 The model of distance between the idea of freedom and the empirical reality

would permit more changes. Exactly in this sense, freedom is not a concept of *understanding* (*Verstandesbegriff*), but is a concept or an idea of *reason* (*Vernunftsbegriff*), denoting the human, wild and illimitable potential of thinking which lies in reason – without aiming at fixing or even defining it. If the term “freedom” is meant to describe an open process, it must be understood procedurally itself – a “property” language normally makes invisible. The conditions for its maximum development, i.e., its maximum determining potential for the design of human existence, however, lie, with respect to society, in the Right and, with respect to the actions of individuals, in the orientation of the idea itself.

Figure 17.3 attempts to dynamize the model of distance which is specified by the dimension of time and which involves “rivalry” as a means of realization. The idea of freedom orients action and interactions by providing the top determining principle. In consequence, the actions can ultimately serve its achievement. This applies to “rivalry” because it promotes the arts and cultivates habits. It may even occur in the form of physical strength contributing to the institutional establishment of the idea of freedom as Right. This does not mean that war can be justified in principle, as a means to progress, let alone as its only means. But it shows that Kant at least did not, from an anthropological perspective, deny the good effects of even the worst “combination” of the forces, although no one intended them.

In terms of time, the idea of freedom orientates us from an ideal standpoint in the thinkable future which humankind is approaching asymptotically. However, it is

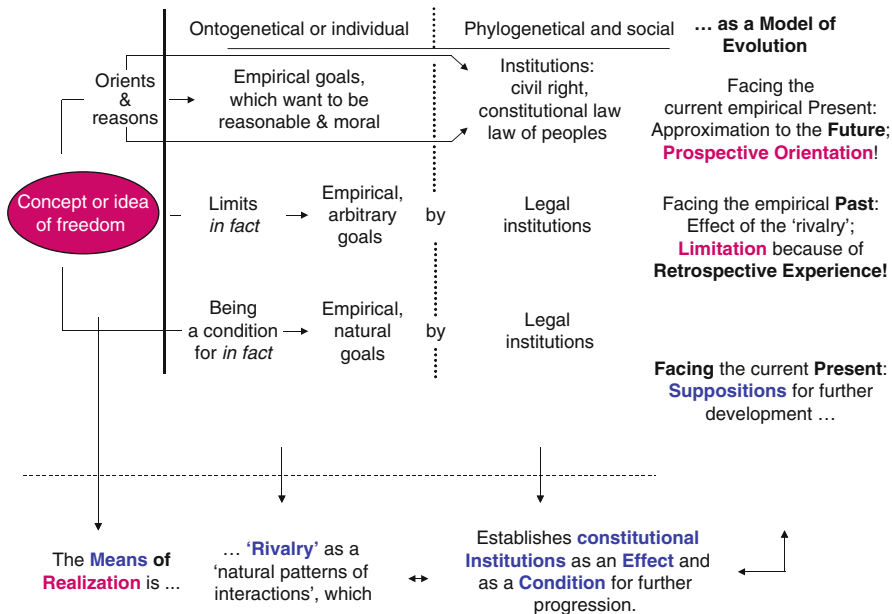

Fig. 17.3 The dynamic model of distance

only “available“ in so far as freedom realizes itself in no other way than by having to escape again and again the present or current reality:

One age cannot bind itself, and thus conspire, to place a succeeding one in a condition whereby it would be impossible for the later age to expand its knowledge [. . .], to rid itself of errors, and generally to increase its enlightenment. That would be a crime against human nature, whose essential destiny lies precisely in such progress; subsequent generations are thus completely justified in dismissing such agreements as unauthorized and criminal. ([3], p. 39)

This can be interpreted in the following way. According to Kant, only a society that has learnt not to hold on to its institutional achievements, but to beat them back continuously, can be called a freedom-actualizing society. In this sense, Kant calls his own age, using a participial construction, the “age of enlighting” (*Aufklärung*) and not an “enlightened age” ([3], p. 40). The idea of freedom is on the one hand the one which orients; and on the other hand the one which realizes itself ‘using’ institutions as means, by formulating constraints to allow maximum social and individual freedom. As a helpful means to establish them, Kant again sees mainly “rivalry” at work. Thus, with respect to war, one can speak of a restriction which had been won from a retrospective point of view owing to existing experiences. Finally, the institutional laws of freedom form the conditions for further development, which will lead to new experiences and therefore to freedom, because of further inventions and achievements.

Perhaps Kant sought to express that thought and the interplay of human beings could be understood rather as an infinite potential and an opportunity, and less as an

annoying limitation of supposed private possibilities. It should be noted also that the "comparative self-love," which expresses itself in "rivalry," depends on others: without a partner, one can hardly make comparisons. Moreover, the "true freedom" lies in its inaccessibility, the constant delay, in the enabling of the New by institutions, and not in its codification and adherence to traditional, possibly obsolete ways of thinking and laws. So that is how Kant can be read as having formulated an imperative to allow reasonable freedom, which implies the fact to be part of humankind. Its telos is, however, the very fact to become more and more free *through* the freedom of thought – and that means to *search for* the distance between ideal and reality and to *invent* the way through the space opened by this difference first – and incessantly.

To gain an idea of the implications this model of distance has in practice, Kant's *Perpetual Peace* can be used as an example.

Model and Practice

In Appendix I, two theoretical sentences are distinguished: "Honesty is the best policy" and "Honesty is better than any policy," the latter of which "is exalted high above every possible objection" ([7], p. 370). Honesty is better than any policy because it represents the ideal to which it is to orient itself, whereas policy is the mere instrument, which is to be employed to get closer to the thinkable. The passage continues:

The Terminus of morals does not yield to Jupiter (the Terminus of force); for the latter remains beneath the sway of Fate. In other words, reason is not sufficiently enlightened to survey the series of predetermining causes which would make it possible for us to predict with certainty the good or bad results of human action, as they follow from the mechanical laws of nature. ([7], p. 370)

As reason *cannot know* what will happen in practice, it should be focused on what is surely known, and that is what reason can only know from itself, *without* the need of empirical knowledge. It would be wrong – according to Kant – to orient oneself on empiricism, *because it is thought possible to lose* the thinkable and make free thought nearly a slave of nature. In particular, one would no longer believe in the possibility of humankind living together peacefully and free. This would also gamble away the chance of a rapprochement – a kind of fatalistic victory of justifying pragmatism, which denies thinking ideals and thus denies exceeding the boundaries of the current reality. Even if the beginning is in fact based on war, it is still better to be geared to the idea of freedom than to submit to empirical laws:

Hence, in the practical realisation of that idea, no other beginning of a law-governed society can be counted upon than one that is brought about by force: upon this force, too, public law afterwards rests. This state of things certainly prepares us to meet considerable deviation in actual experience from the theoretical idea. ([7], p. 371)

Kant makes this difference clear with regard to two concepts which he calls "moral politician" or "despotic moralist," on the one hand, and "moralizing politician" or "political moralist," on the other hand: If there are unavoidable "defects in the political constitution," moral politicians are obliged "to apply their whole

energy to correcting them as soon as possible, and to bringing the constitution and political relations on these points into conformity with the Law of Nature, as it is held up as a model before us in the idea of reason; and this they should do even at a sacrifice of their own interest" ([7], p. 372). But in no case should they insist on *changing everything at once*, because that would be "against any political acumen according to morality." Instead, "at the same time, it may be required of a ruler at least that he should earnestly keep the maxim in mind which points to the necessity of such a change; so that he may go on constantly approaching the end to be realized" ([7], p. 372). In this note, Kant explains the so-called permissive law of reason (*Erlaubnisgesetze der Vernunft*), which permits one to wait for coming changes until the right moment, in particular, when quitting the institutional status quo could result in (self-) destruction. Nevertheless, the postponement is only legitimate if the ideal is to be focused on and not lost. It determines the direction of change and the changes to be achieved. Here, wise action means to decide in accordance with the situation, the actual and ideal way to target resources which can be taken along – this would be the Kantian notion of "sustainability." At the same time, it becomes very clear why Kant was an advocate of reform rather than of revolution: actual changes in social structure and in the (reflective) thinking take time and therefore require reduced speed. This implies patience, but might avoid much suffering.

On the other hand, we find the "moralizing politicians" who speak about the not-right and the not-ideal status quo in a euphemistic way, claiming that people are not able to approach the rational ideal. Thus, they "do all they can to make moral improvement impossible and to perpetuate violations of law, by extenuating political principles which are antagonistic to the idea of right" ([7], p. 373). Not only that, they stick to that position even against their own intention, which is to bring morals and policy in line. Moreover, this example shows that Kant was neither an idealistic revolutionary who believed in direct and immediate changes which were to be implemented because of possible insights of reason, nor an advocate of cementing the status quo as the best of all possible worlds. Kant did not choose between all or nothing, but expressed the need for both: the ideal of free use of reason is *always* to be kept as a track for orientation for any type of law and maxims – even if it is just an infinitely progressive development.

This implies, in practice, not surrendering to reality, but working on it constantly to the point of renewal and development, without losing focus. Thereby Kant is and remains, of course, one of the apologetic representatives of modernity, thus characterized by having raised her own progressive dynamization to necessity and "rivalry" to the natural resource of this process. And here it was his aim to make clear what all the institutional laws and concrete actions must focus on constantly: Do they ultimately contribute to the achievement of greater freedom for all people – or not? But the account of the current status quo and our experience is a necessary condition when the design of specific legislation in the ongoing and never-ending process of change is at stake.

What suggestions can be formulated following that model derived from the writings of Kant for the specific application of business ethics discourse? What can we learn from this idea with regard to ongoing development and with reference to the idea of freedom? And has this still anything to do with a popular ethical self-understanding that counts on conservation and restraining the free forces?

Comments on the Business Ethics Discourse: Do Not Mind the Gap: Develop It!

What do you think changes more easily:

A stone or your opinion about it? (Bertolt Brecht)

In relation to the discussions in business ethics, the dynamized distance model outlined seems to me adaptable at a very basic level: it can be used to structure the relatively new idea and therefore the concept of "*sustainability*" which is still being determined. But before a link can be made between the proposed model and the concept of "sustainability," we need some preliminary observations. At the beginning, poverty, child labor and environmental protection were identified as ethical problems of the economy. At least since Karl Marx, economic theory has responded to these questions – each in an updated form – and has introduced concepts which should help to eliminate these kinds of social problems. Usually, ethicists of different professions do not pose the question of whether to agree with the objectives in principle, but rather pose the question of what means should be used to achieve them. They discuss as ever-promising the means fundamentally creating the economic system, which should serve the world population to achieve these objectives: such different measures as intra- or interstate redistribution, competitive market with or without governmental or state regulation, globalization versus regionalization, economic cycles and other similar topics. Although the experience of the twentieth century has reduced the range of models seriously discussed by economists (a planned economy is no longer seen as a real alternative), major disagreement exists at a very basic level when the *means* of achieving common goals is at stake.

In my view, this dispute is based *also* on another, perhaps sometimes metaphysically driven perspective on the recent development to the present. Thus, in addition to the central question concerning adequate means, a second, more fundamental question can be identified: it is whether the development of humanity *in relation to these goals* should be reconstructed as a historical progression or as a decline, or whether absolutely no development can be reconstructed, but only permanent, non-directional changes. Certainly, these changes are always to be understood in relation to their immediate predecessors, but not as following a single principle ([24], pp. 7–16). If, according to the sketched reconstruction, Kant had been asked the

second question, he would probably have answered without hesitation, at the end of the eighteenth century: it makes sense *to regard* history as a progression – even if we ultimately cannot really know if the world’s course is aligned teleologically.

In relation to the first question, Kant writes that our only available resources to achieve a better world are human reason *and* the natural human predispositions – the latter of which also lead to the interaction patterns of “rivalry.” The economic system is not part of his analysis, yet there is a hint that peace follows empirically not only as a consequence of war, but also because of wish to trade: “The commercial spirit cannot co-exist with war, and sooner or later it takes possession of every nation” ([7], p. 368, also p. 364). This suggests that Kant regarded the “commercial spirit” as another empirical means for improving the state of the world, although he did not consider competition among merchants. Here, war means war between two states which involves restricting or breaking off trade.

Both generally positive assessments of the historical development are taken as premises for the following considerations. They can still be called into question in philosophical discourse, as Kant would claim himself; he turned against characterizing empirical findings and metaphysical interpretations as *unchangeable*. But this means just that these premises have the status of merely arbitrary assumptions, because there are good *empirical reasons* backing them, for instance looking at the number of people who now live in relative affluence compared with the number of some 100 or 150 years ago. Kant would say these assumptions can be accepted when looking at experience and will continue to be accepted until humankind produces better means to achieve its goals, and/or until different interpretations of history prevail. In this sense, even the Kantian model has to be reflected in the philosophical discourse by questioning critically its own effects. However, in the domain of business ethics, it is appropriate to take the status quo seriously as a condition to which thinking and acting always relate. Therefore, it is assumed here that the competitive market economy *serves* in principle as a means of achieving common ethical objectives and does not impede them. After the disclosure of its premises, the much-requested “sustainability” can be linked conceptually to the model of dynamized distance (for “sustainability” in terms of economic issues, see [19, 25, 26]).⁸

The term “sustainability” implies a temporal dynamic dimension, since it seeks to assess the current situation from the imaginary standpoint of a cogenerated tomorrow. It is therefore a self-referential “processuality,” in which the present conditions of thinking and the actions of the future will be the effects of today. As such, they are anticipated, making them a part of the current conditions at the same time. In this *renvoi* game between the present and the future, the question arises how to measure “sustainability”: Is its most important criterion the maximum preservation of that what can still be preserved today? Or is “sustainability” an invitation to codesign what will come? If we compare the verb *to sustain*, as taken from the English concept of “sustainability,” with the German concept of *Nachhaltigkeit* it is obvious, first, that the German concept misappropriates its diversity. Besides “giving power,” “supporting” and “secure,” the English verb

also means "maintaining," "standing up," "substantiating," "bearing" and "suffering" (a loss). At first glance, the English verb seems to identify, as a common denominator of this diversity, the ability to make something or someone persistent, *protecting* him, her or it against injustice or attacks. From this perspective, the focus lies on the continuation of *something* or *someone*; it seems as if the goals are conservation and adherence to what *is* the need to be protected against changes. This can be interpreted as an attempt to produce substantial permanence by defeating changes, and this gave "sustainability" the meaning of conservation by stoppage: its criteria were its ability to preserve.

But if durability is interpreted not as the continuation of *something* that itself is not subjected to changes, but simply as a change, then maintenance would not lead to stoppage, but would only account for the lasting *change*. From this perspective, the meaning of "sustainability" is replaced by one which lies in the paradoxical demand *only he who converts stays true to himself or herself*, commonly ascribed to Hermann Hesse. Given the experience that our world is subject to continual changes, it seems more obvious to interpret "sustainability" in this second sense. With regard to the economy – but also to institutions and philosophical concepts – this implies *continuous innovation*. According to Kant, the concept of "sustainability" may not only imply pure processuality that would accept renewal and development for its own sake, but it must be understood as a teleologically driven development oriented towards the "end of humankind," i.e., enabling freedom for all people. This means that changes should be assessed whether they *serve* or *harm* the improvement of the *conditions* of people, and whether they expand the variety of ways of being human.

These considerations imply the invitation to reflect *permanently*, from the anticipating point of view of tomorrow, on the here and now, and to ask whether the direction is (still) right. In this sense, "sustainability" is to be understood less as a normative concept, but rather as a call for constructiveness, because it is always to design constructively the gap between the ideal and the empirical presence – in the sense of the ideal. To do so, thinking requires time *and* – according to Kant – the incentive to compete for having the best ideas. Here again, "rivalry" (*through* cooperation) serves indirectly the achievement of common goals. The call for permanent reflection, however, implies an impact assessment – whether of theories or of technical or social achievements – and can thus contribute to slowing down a little, since innovations must first be checked in relation to their contribution to the achievement of the ideal before they be put into production.

A conclusion for business ethics can now proceed in the following direction: if the action-guiding maxim is to never abandon the never-ending process of improving, then there is no moment in principle when inventions are perfect. This is valid at least as long as they cannot be said to be used *without problems* by all people in the world. "Sustainability," which focuses on innovation, is thus a call for ongoing reflection on the quality of an invention under the principal point of general readiness to service. Based on the production processes (in a broad sense), such

a concept of “sustainability” implies also that participating employees shall not be degraded to mere means. Work processes must therefore be ideally designed in such a way that everyone can also be considered as an “end in itself” (*Zweck an sich selbst*); if this is not possible immediately, we are to work continually and vigorously on achieving it. This means investing in a very practical sense, for example, in schools, hospitals and the autonomy of employees’ opportunities, and therefore investing steadily in the change, i.e., investing in a change that can help, at best, to reduce the gap between current reality and the ideal.

Finally, from this perspective, companies are assigned the role of *actively* shaping the executive development of the world by using *innovation*. As institutions, they themselves become part of the self-realizing “freedom” and therefore are responsible for the future on the basis of the present. It is therefore a call for *cooperation* with governmental and non-governmental organizations for the innovative design of a future which is and can never be fixed – even if the conditions may limit the scope or extent. This also implies a change in assessment, either because government regulations are no longer perceived as merely *restraining* instruments or the companies are no longer perceived to be restrained: innovations will come about only if they work *together*. It is a question of gaining an enlightened relation to the functional relationships of all actors and of wanting to design the open future from now on. The question companies must ask themselves, like any other institutions, is whether they will remain part of the problem or become part of the solution.

Conclusion

The intention of this essay was to point out that Kantian ethics provides more than just justification which is grounded in pure reason. To do this, it started by sketching the necessity of distinguishing between two kinds of discourse: the a priori justification discourse and an application discourse which has to consider empirical conditions. Subsequently it described the role of “rivalry” in the Kantian anthropological writings, showing that it is understood as a means of nature by which nature promotes arts and culture but also coestablishes the Right and even freedom between peoples. Accordingly (!!!) to that theoretical reconstruction of Kant’s practical writings, a development model was obtained which can serve as a dynamic paradigm for application questions. Using that model, this essay finished with some comments for the business ethics discourse.

To sum up, one can say: To know Kant’s writings in moral philosophy (in a wide sense) is a useful instrument for rethinking again and again the pivotal questions regarding our future. Not only because they postulate an idea of freedom, which consists in being permanently beyond itself, but also because of conceptualizing the inevitable human interdependencies. Human freedom in fact exists in manifold ways. Its imperative says: Establish again and again those conditions which are adequate for the current situation, making plurality and diversity possible and liveable.

4. This “moral glow” is used here for pragmatic reasons, but cannot turn an argument around within the discourse of reason, let alone be used as a justification! See [1], A p. 747/B p. 775.
5. Another short essay shows what such an interpretation of history might look like. In his *Alleged Beginning of Human History* (1786), Kant reconstructs the biblical expulsion from paradise not as a decline, but as the development of the progress of reason. Here, it does not matter systematically whether Kant’s teleological proposals need to be interpreted theologically, because for him, no doctrine of predestination was provable at all. Therefore, he did not ascribe any grounding argument to it (see his rather negative opinion in [7], p. 362).
6. The laws of freedom as the rule of right derive *logically* from the implicit and a priori concept of free reason – being conceivable, rational, organizing principles that will not require empirical grounds ([22], pp. 195–215).
7. Verena Mayer has shown that Kant already saw clearly what Wittgenstein called the “paradox of obeying the rules” (*Regelbefolgungsparadox*). Therefore, the transfer model is to be classified as highly problematic [23].

Abstract

Kant's and Hegel's theories of property formulate the fundamentals of two typical ways of interpreting the right of property. This chapter reconstructs their conceptions as opposite but still equally valid answers to an important problem of today's theory of justice (as long as they are limited to their fundamentals). While Kant's conception tries to give a pure justification of property, without considering the historical and social circumstances and their possible consequences, Hegel's concept of property is embedded in a theory connecting the moral and the juridical perspective – and even offering a special theory of civil society as the concept of property's background. This chapter focuses on the characteristics of both their approaches to legitimate property. As regards Kant, this means the notion that property does not necessarily contradict the requirement of compatibility with the freedom of all and must therefore be permitted – as long as this condition is met and the idea of a common will deciding on the legitimacy of property is taken into account. As regards Hegel, it means the notion that the formal or abstract right is not adequate to legitimate property. On the contrary, reference to it alone leads to unreasonableness or injustice, while a reasonable justification of property depends on the dialectical determination of the relation of idea and reality, meaning that the real relations of the civil society must be taken into consideration and that they must be understood as dispositions of reason ruling over the real constitution of the state and thus compensating for the disintegration of civil society.

Introduction

Throughout history, the right of property has been at the top (or close to the top) of the agenda of progressive and revolutionary forces. The Magna Charta Libertatum of 1215, for instance, already named a triad of goods that should be granted to free men; a triad which was later put into a well-known phrase by John Locke: life, liberty, and estate.¹ In 1215, these claims were submitted to the Crown and its representatives (by a group of barons taking the side of the people) who apparently decided rather arbitrarily whose life, liberty, and property they wanted to take as a whole or in parts. The “Representatives of the United States of America” who signed the Declaration of Independence in 1776 made reference to “certain unalienable rights” and named “life, liberty, and the pursuit of happiness” among them.² A closer inspection of the detailed list of “injuries” the declaration accused “the King of Great Britain” of clearly shows that the “pursuit of happiness” must be understood as a certain right being actively denied by the King’s expropriation of the colonists property: “He has erected a multitude of New Offices, and sent hither swarms of Officers to harass our people, and eat out their substance.”³ “Pursuit of happiness” was thus probably supposed to mean the right of free citizens to acquire property and safely enjoy the fruits of their labor.⁴

Similar intentions and experiences must have guided the French authors of the “Declaration des droits de l’homme et du citoyen” in 1791, during the French Revolution, when they chose the right of property to be one of the four main rights the republic government of Citoyens has to grant (article II, right after the declaration that men are free and equal before the law): “la liberté, la propriété, la sûreté et la résistance à l’oppression” (liberty, property, safety, and resistance against oppression).⁵ The French Constitution even asserts the right of property in an outstanding position, namely, at the end of the text. According to its last article, property is supposed to be “un droit inviolable et sacré” (an inviolable and *holy* right, italics by A.E.). The proprietor can of course still be expropriated in conformity with this right but only in case of proven common necessity and under the condition of an adequate compensation.⁶

The “Universal Declaration of Human Rights” of 1948, on the other hand, no longer assigns such an extraordinary priority to the right of property. The Second World War’s example of injustice and barbarous acts being committed against individuals by a dictator and his aggressive subordinates (respectively some dictators) let the granting of other human rights appear to be a more urgent issue. It is therefore almost surprising that the right of property still has a place among the fundamental human rights. Article 17 says: “(1) Everyone has the right to own property alone as well as in association with others, (2) No one shall be arbitrarily deprived of his property.”⁷ The recent expropriation of the Jewish people by the Nazis might have been the immediate reason for this assertion of the right of property, but the claim also had its effect in favor of the anti-imperialistic liberation movements (which were not yet fully successful).

Each time the right of property was proclaimed, it was explicitly or implicitly accompanied by a justification explaining why a proprietor should be protected

against the aggression of a have-not wanting to deprive him of his property. This is where philosophical theories come in. Philosophical theories provide reasons for the establishment of a certain status, and they propose norms political actors can refer to. As regards the right of property, it is easy to see that this normative justification can also be used by conservative forces requiring a justification to defend their property against the claims of progressive and revolutionary forces striving for a better (and better justified) distribution of goods. In this case, the philosophical theories take on a special, ideological function, as they serve to legitimate the status quo of property distribution. No philosophical justification of property is immune from being instrumentalized by the “wrong” political actors. But, in the best case, a philosophical inquiry can clarify and determine the right to property, thus determining the conditions under which we can speak of a legitimated property at a given time and in a given society, so that political forces bringing more justice to this society (and, in the end, to the whole world) can rely on these determinations.

Before we take a detailed look at the philosophical theories of property Kant and Hegel developed, let us concentrate on some points where the question “what is legitimate property” urgently needs an answer today.

It is a well-known fact that, in the world of today, the rich become richer and the poor become poorer. This process has been going on for a long time. Even Hegel is already acquainted with it ([12], p. 389, resp.; [10], p. 220f). The people of today thus have to decide whether they let it go on, try to stop it, or even turn it around, by judging under which circumstances the acquisition and possession of property is just – and when it is not. Is it enough to prove that the property was gained in compliance with the current laws? Or are there reasons or rights transcending the laws of a certain country or state, asserting the justness of compensating for the growing inequalities – and the injustice of not doing so? Meaning that the institution we installed to represent us has to take away some of the *beati possidentes*’ (the lucky owners and winners on the marketplace) property and give it to the less lucky? Quite obviously, we need some kind of “Theory of Justice.” That is why John Rawls’ book received that much attention and even renewed political philosophy. The concept of property must be developed from the standpoint of a theory of justice. Rawls’ focus on the ethical side of the theory of justice, however, prevented him from arriving at a juridical concept of property. It is evident, however, that the theory of justice must be able to say what property can be in a juridical sense, and under which circumstances property can be legitimated (and legitimately defended against the have-not) by the state’s juridical and executive forces. If, on the other hand, someone tried to offer a purely juridical concept of property, a concept not embedded in a theory of justice, the result would be a cynical pseudo-legitimation of the status quo, rendering the well-known and increasing difference between the rich and the poor juridically untouchable. The suspicion of ideology would arise, and the reentry of the question of what is just and unjust could not be avoided.

Another presently pertinent issue is the question of intellectual property. The more the Internet determines the ways of trade, presentation, and communication, the more it becomes necessary to distinguish the products published in the

Internet which are supposed to be protected against misuse or unauthorized commercial use, for example. The economical value of information makes it necessary to decide what kind of information should be protected. The development can also be observed when looking at the modifications of the patent law. A new invention these days is often a fixation of information. The patent commission has to decide, for example, is it possible or right to get the deciphering of the DNA patented? In what sense does the DNA belong to the particular human being it has been taken from, in what sense does the information belong to the scientific institutions which made the research on it possible, and in what sense does it exclusively belong to the particular scientist and his laboratory who accomplished the last step of deciphering and now claim the right to economic exploitation?

A last issue to be mentioned here is the shortage of (and increasing need for) natural resources. Is it necessary to question the private property of potable water springs, when the private proprietor tries to make the most of his monopoly? What kind of property rights do human beings have concerning their own organs? Does it make a difference if they are dead or alive? While the economic issues cannot be solved without a theory of justice, the answers to these questions cannot be found without a theory of personal integrity (both intellectual and physical), together with a theory of death and of the rights a dying or dead person still has.

Kant's and Hegel's theories of property cannot be expected to fully match the theoretical requirements of today's issues. But, in a way, they can still serve as points of reference for a modern determination of property. As different (or even opposite) as they may be, they both attain the highest level of justification of their respective types of property theory. Thus, they formulate the fundamentals of two typical ways of interpreting the right of property, while at the same time, demanding a decision for one or the other alternative. While Kant's concept of property tries to give a *pure* justification of property, without considering historical and social circumstances and their possible consequences, Hegel's concept of property is embedded in a theory connecting the moral and the juridical perspective and even offering a special theory of civil society as the concept of property's background. In the course of this chapter, both concepts will be reconstructed, and their characteristics of legitimation will be focused on. As regards Kant, this means the notion that property is not necessarily contradicting the requirement of compatibility with the freedom of all and must therefore be permitted – as long as this condition is met and the idea of a common will deciding on the legitimacy of property is taken into account (cf. Sects. [The "Deduction" of the Concept of "Intelligible Possession"](#) or the [Argumentation for the "Possibility of Having Something External as One's Own"](#) and [Acquisition in the Natural Condition and Possession Ruled by the Idea of a Common Will](#), especially). As regards Hegel, it means the notion that the formal or abstract right is not adequate to legitimate property (cf. Sects. [The Right of Property Within the Abstract Right](#) and [Modifications of the Concept of Property Still Within the Abstract Right](#)). On the contrary, reference to it alone leads to unreasonableness or injustice, while a reasonable justification of property depends on the dialectical determination of the relation of Idea and Reality, meaning that the real relations of the civil society must be taken

into consideration and must be understood as realizations of reason ruling over the real constitution of the state and thus compensating for the disintegration of civil society (Sect. [The Critique of the Abstract Concept of Property Considering the Real Social Relations](#)).

Property Through the Idea of a Common Will (Kant) Versus Property Through a Dialectical Reason Determining the Reality of the State Built over the Disintegrated Civil Society (Hegel)

Introduction to Kant's Theory of Property

Kant's theory of property is contained in his "Metaphysics of Morals," first published in 1797 and therefore one of his later works.⁸ His earlier attempts at developing a conception of property were only preliminaries – the approach he takes in the "Metaphysics of Morals" is a wholly new one.⁹ While he supported a certain kind of labor theory for the determination of property before (the best-known labor theory of property is the one posited by John Locke), he is now convinced that labor invested in an object alone cannot justify its being the laborer's property. That, however, does not mean that Kant changes sides and turns into a follower of the major opposite theory of the time, which justified property by means of simple occupation. His new approach lays the foundations of a different kind of theory, based on the concept of pure reason. Regarding the opposition of the labor and occupation theories, the consequence is this: A certain part of justification derives from first occupation, but these rights are only provisional. In the end, property cannot be justified in any other way than by referring to a reasonable common will: The occupier is being forced to found (or enter into) a civil condition with legal rights, based on such a common will that allows property and demands the constant revision of a given civil society and state's particular distribution of property. According to this conception, the justification of property therefore does not lie in some past or present activity but in the prospective conformity with an ideal common will and its political realization in the world of all the individual states (and their union).¹⁰

In "The Metaphysics of Morals," however, this is not said in a simple way and not only in the form of such an abbreviated summary either. Maybe the text even shows that it took the author a long time and much work to gain his new perspective on the issue and that he attained it only a short time before. The text is definitely a further example of Kant's habit of very concentrated and condensed phrasing, and its editor made its understanding even more difficult by placing some of the paragraphs in the wrong chapter.¹¹ It is therefore necessary to focus on the thinking, to develop the main thoughts out of the short sentences and to look into Kant's other writings, which complete the explanation of the issue (e.g., "Zum ewigen Frieden," Perpetual Peace, 1795).

To get a first orientation, it might be helpful to remember that Kant, in "The Critique of Pure Reason," showed the concept of practical freedom (founded in the

concept of “freedom in the cosmological sense”) not to be contradictory to the supposition rendering all objective knowing of the natural world possible, namely, that all natural processes are determined by natural causes ([18], pp. B 560–562). The “causality . . . (arising) from freedom” (“Kausalität . . . aus Freiheit”) ([18], pp. B 560; cf. [14, 19], p. 221) needs a separate theory of “that which is supersensible but yet belongs to reason” (“vom Übersinnlichen, dennoch aber der Vernunft Zustehenden”) ([14, 19], p. 206.) a theory of practical reason which shows and justifies the rules of determining practical action in accordance with the idea of universal freedom. Two important treatises expose the fundamentals of this theory of practical reason (Kant’s “Groundwork of the Metaphysic of Morals” and “The Critique of Practical Reason”), but they really are restricted to the fundamentals. Kant develops and explains the “Categorical Imperative,” and he offers several formulas of this main idea (e.g., the so-called “Zweck-Formel”: “Act in such a way that you always treat humanity, whether in your own person or in the person of any other, never simply as a means, but always at the same time as an end” (“Handle so, dass du die Menschheit, sowohl in deiner Person, als in der Person eines jeden andern jederzeit zugleich als Zweck, niemals bloß als Mittel brauchst.”) ([16], p. 429; [15], p. 96). And he asserts that the “categorical imperative” discloses to us what the idea of freedom might be (in Kant’s words, the categorical imperative is therefore the “ratio cognoscendi,” that is, the reason of knowing what freedom is) – which is of course the basis of the single moral law expressed in the “categorical imperative” (again in Kant’s words, freedom is therefore the “ratio essendi,” that is, the reason of being, for our ability to determine our will in compliance with the categorical imperative).¹² A theory of property is thus far not included in these fundamental writings.

The “Metaphysics of Morals” first arrives at a concept of property positively, positing the first principles of the supersensible but reasonable world, which are at the same time the first principles of the system (not only the critique) of morals. Starting from these fundamental positive doctrines, the system of morals can be constructed by the addition of concepts and clauses valid in a particular time and society; a task Kant does not busy himself with, however.¹³ Within the framework of this system of morals, Kant distinguishes right and virtue and exposes the first principles of their doctrines. He is convinced that the concept of right and the concept of virtue are two aspects of the concept of morals, united by the idea of freedom: Freedom applied in the external world of action on the one hand and in the internal world of determining the maxims for action on the other. In his presentation of these two aspects, Kant proceeds from the external to the internal realm of freedom (and therefore from a more restricted area to the complete area of morals) because the internal determination of the will also takes effect on the external action.¹⁴ He thus begins with “the universal law of right” (“allgemeinen Rechtsgesetz”) ([14, 19], p. 230f), the “ratio cognoscendi” (reason of knowing) of the freedom of external action. This law is analogous to the “categorical imperative,” the “ratio cognoscendi” of the freedom of internal determination of the will.¹⁵ And (as opposed to the universal law of morals in general, that is, the “categorical imperative”) its formula shows that the ethical determination of action is not taken

into account when the conformity of action with the universal law of right, that is, legality, is considered: “So act externally that the free use of your choice can coexist with the freedom of everyone in accordance with a universal law . . .” (“handle äußerlich so, daß der freie Gebrauch deiner Willkür mit der Freiheit von jedermann nach einem allgemeinen Gesetze zusammen bestehen könne”) ([14, 19], p. 231). The use of the capacity of choice only has to meet the one requirement that the action following from it must be compatible with everyone’s use of their capacity of choice, while everyone remains equally free. The reasons why someone decides to act as he wishes does not make any difference here. In order to guarantee the freedom of all in the external area of action, there must be an effective institution, externally forcing everybody to act according to their duty through “external constraint,”¹⁶ whereas the doing of their moral duty is the individuals’ autonomous, internal responsibility. Property, in Kant’s special sense, is then the first and most important issue “the universal law of right” applies to and which the institutions of external constraint have to secure.

Kant’s surprising focus on the concept of property can only be explained if we take into account that Kant does not think of property as mere property of external things. He does not even speak of property in the beginning but uses another expression, open to take on the usual meaning later on. This expression is “das äußere Mein und Dein,” that “what is externally mine or yours” ([14, 19], p. 245f). The background of this expression is Kant’s understanding of the connection of “what is externally mine or yours” with “what is innately, hence internally, mine or yours” ([14, 19], p. 238). As regards the meaning of “what is internally mine or yours,” the circumscription is easy to decipher. According to Kant, everybody has, “by virtue of his humanity” (“kraft seiner Menschheit”) ([14, 19], p. 238), one – and only one – inner proprium, that is, his or her freedom. And this freedom is not only an abstract quality, but in fact, “the only original right belonging to every man” (“Freiheit . . . ist dieses einzige, ursprüngliche, jedem Menschen, . . ., zustehende Recht”) ([14, 19], p. 238). That means everybody can *claim* that his freedom has to be recognized and secured. Of course, not every kind of freedom can be thus claimed, as Kant immediately asserts: Only the “freedom insofar as it can coexist with the freedom of every other in accordance with a universal law” (“Freiheit, . . ., sofern sie mit jedes anderen Freiheit nach einem allgemeinen Gesetz zusammen bestehen kann”) ([14, 19], p. 238). The connection between internal proprium and external belonging Kant’s circumscriptions suggests makes clear that his theory of justified external acting also views (external) property as a good everybody can claim, regardless of the particular condition or state they live in (i.e., in the sense of a natural law, “by virtue of his humanity”), as long as this claim does not contradict the universal law of right. As we will see, there are some further conditions for justifying the assertion that there must be something that “is externally mine or yours.” But we already understand now why Kant could choose the conception of property as a starting point of his “Doctrine of Right.” “What is internally mine or yours” (freedom) seems to be so important that its importance is transferred to “what is externally mine or yours.” Starting from this point, from the exposition of the “private right,” Kant develops the “public right” and the “right of a state” within

his “Metaphysics of Morals,” instead of doing it the other way round – as Rousseau did in his “Contrat social” (1762), for instance. The justification of the individual’s reasonable freedom is the center of Kant’s thought; the legitimation of the state is derived from it, and the legitimation of property in the sense of natural law depends on it before the state is even considered. That does not mean, however, that the state, realized according to the reasonable concept of it, does not have an important role to play in the assertion of the aforementioned claims.

The Universal Law and the Objects Which Can Be Someone’s Property According to the Universal Law

Right from the start, Kant’s theory of property is essentially a theory of the *conditions* under which it is possible to have property in accordance with the universal law of right. These conditions determine what kinds of objects are comprised in the concept of property. Here, we find another reason why Kant uses a circumscription for property and begins with a clarification of the way “to have something external as one’s own” ([14, 19], p. 245). The common way to have something as one’s own is not the way that can be justified. There is another way, however, which is subject to a set of conditions of natural law. Once these conditions are met, a justification of a particular way of *having something* in a particular time or state can be attained. In order to outline these special conditions, Kant distinguishes the empirical, that is, sensible and immediately perceptible possession of an object in time and space (his examples are the apple in my hand, the land on which I have laid down, cases immediately showing my claim of possession ([14, 19], p. 247f) from another kind of possession. This different kind of possession is not immediately perceptible by others; in fact, it is not perceptible at all but must still be presupposed if we consider the claim’s persistent validity in case of spatial and temporal distance between proprietor and property. We do not believe that the apple and the land cease to be mine when I put the apple down or leave the land. Nor do we believe that the claim on the property, the claim that others aren’t allowed to make use of it as they please (eat the apple and build a house on the land), loses its validity as long as the property is rightfully mine. Kant calls this kind of supersensible possession “intelligible possession,” or “merely rightful possession” ([14, 19], p. 245f), with reference to the distinction of “phenomena” and “noumena” in the “Critique of Pure Reason.”¹⁷ Even though it is not yet justified (or “deduced,” as Kant says), it is already quite obvious that only this kind of noumenal possession and this supersensible concept of property can be of real importance and that only this concept can serve as a basis for resistance against the claim of others trying to restrict my own freedom of using my property.

The special kinds of objects which, according to Kant, meet the requirements of justifiable property according to natural law (or the universal law of right) are particularly useful in explaining the meaning of this supersensible noumenal kind of possession beyond time and space. Kant thinks of three kinds of objects, of which only the first is substantial. It has already been illustrated by the examples “apple”

and “land,” and the continuity of the property relation without any perceptible connection between proprietor and property has been explained.¹⁸ The second kind is abstract in itself: Performances which have not yet been completed but have been promised to another person (or are agreed on by contract) can be possessed by this other person.¹⁹ While the act of transferring the property rights to the performance in question might still be perceptible in a certain sense (maybe it can be heard or read), the obligation established at the same time is already abstract but no less binding. This obligation itself is timeless – the property of the promised performance will end as soon as the promise has been made good on; but as long as it has not been made good on, it exists as property of the other, regardless of time. The third kind Kant names may appear strange to a modern reader. According to his systematical layout, the relation of family members to one another can be a relation of possession, too. In a way, husband and wife “belong” to each other as “what is theirs,” a child belongs to the parents as “what is theirs,” and the servant, too, belongs to the family as “what is theirs.”²⁰ Of course, Kant didn’t try to present all the main characteristics of these relations but only those relevant to the use of choice regarding external action compatible with the freedom of all. That is why he stresses that the relation of possession only means the right of making “direct use of a person *as of* a thing, as a means to my end, but still without infringing upon his personality” (“unmittelbar von dieser Person, *gleich* als von einer Sache, doch ohne Abbruch an ihrer Persönlichkeit, als Mittel zu meinem Zweck, Gebrauch zu machen”) ([14, 19], p. 359). In focusing on what the owner is allowed to do, the universal law of right’s restricting conditions may slip out of sight. The temporary and external use of a person “as of a thing” (during copulation, during education) depends on a free but binding contract; it depends on reasonable regulations guaranteeing the development of reason in a person without full reason. But I admit that I am unable to see how it is possible to consider the relation of family and servant to be compatible with the universal law of right.²¹ As regards our present context, however, this third kind of objects once again illustrates very well what “intelligible possession” is supposed to mean because these relations established by agreement (or assumed agreement) remain what they are, even when there is no physical connection.

The reason why Kant speaks of those three kinds of objects and which leads him to the idea of such a third kind of “rights to persons akin to rights to things”²² – in addition to the well-known sections of “private right,” “property right” (“Sachenrecht”), and “contract right” (“Persönliches Recht”) – is a systematical one. He considers the *relation* between me and a possible external object. This category of “relation” is, according to the “Critique of Pure Reason,” then itself divided into “substance,” “causality,” and “community.” Kant transfers this structure to the particular relation “of myself and the external objects in accordance with laws of freedom”²³ and applies the categorical determinations to characterize the objects. The substance relation then leads to the supposition of a “corporeal” object ([14, 19], p. 247) because of the continual relation of a person to an accidental external physical object. The causality relation leads to the supposition of performances because of the relation of a person disposing of another’s choice, that is, being able to causally determine his choice “to perform a specific deed” ([14, 19], p. 247). And finally, the

community relation leads to the supposition of the family members' choice regarding their "status" in reference to me because of the special relation of reference of me and another's choice, which is unavoidable only when family members are concerned (whose statuses are determined by their relation to the owner of the family members' choice). While we can understand this kind of systematical distinction (and its background), some of the further reflections and considerations in the "Doctrine of Right" do not take full account of the three kinds of objects' differences. The main focus is put on the corporeal objects. Furthermore, the justification of the possibility of having something external as mine uses an argument which presupposes a corporeal object because a corporeal object is the only one for which it is reasonable to consider the possibility of it becoming a "res nullius," an object that "belong(s) to no one" ([14, 19], p. 246; cf. [3], p. S. 185f, 189f; [20], p. 232, n.15). The choice of another person, however, will never become a "res nullius" and neither will the choice of family members.²⁴

The "Deduction" of the Concept of "Intelligible Possession" or the Argumentation for the "Possibility of Having Something External as One's Own"

Kant's justification of the concept of property depends on a single idea, which is at the same time the pinnacle and the most problematic point of the "Doctrine of Right" because the integrity of the whole "Doctrine" depends on its being unquestionable. This idea is classified as a "postulate," which means, firstly, that its content is "incapable of further proof" ("gar keines Beweises weiter fähig") ([14, 19], p. 231). At any rate, there can be no proof in the sense of a proof by theoretical reason referring to the "two pure forms of sensible intuition" ("zwei reine Formen der sinnlichen Anschauung") ([18], p. B 36). And secondly, it means that the content is to be understood as a demand (claim, postulate) of practical reason: A demand that can be met, if a certain process of practical construction is accomplished.²⁵ Here, we are even dealing with *the* "postulate of practical reason with regard to rights" (heading of § 2) ([14, 19], p. 246), saying "that it is a duty of Right to act toward others so that what is external (usable) could also become someone's" ("... , dass es Rechtspflicht sei, gegen Andere so zu handeln, dass das Äußere (Brauchbare) auch das Seine von irgend jemandem werden könne") ([14, 19], p. 252). What this postulate demands is the possibility of "having something external as one's own," and the practical process required is the deliberation on this possibility's realization in accordance with the freedom of all.

There is another version, which is supposed to be equivalent, but in fact is not because the second version is only valid for corporeal external objects, whereas the first version is pertinent to the three kinds of external objects already mentioned.²⁶ Nevertheless, Kant's further argumentation works with and immediately follows this second version, so we have to refer to it first and foremost: "It is possible for me to have any external object of my choice as mine, that is, a maxim by which, if it were to become a law, an object of choice would *in itself* (objectively) have to

belong to no one (res nullius) is contrary to rights” (“Es ist möglich, einen jeden äußeren Gegenstand meiner Willkür als das Meine zu haben; d.i.: eine Maxime, nach welcher, wenn sie Gesetz würde, ein Gegenstand der Willkür *an sich* (objektiv) *herrenlos (res nullius)* werden müßte, ist rechtswidrig.”) ([14, 19], p. 246). This second version already provides a key to the argument Kant is going to make in favor of this postulate.

To prove the hypothesis (of the possibility), he fictitiously assumes its opposite, finds the logical conclusions drawn from it to be absurd or contradictory, and then infers from that result that the opposite of the assumed opposite (i.e., the first hypothesis) must be correct. This kind of proof is called “indirect” or “apagogic” proof. If we apply this sort of proof to our case, it says it is correct to assert that every external object which I (you) want to be mine (yours) can be mine (yours) because the assertion of the opposite would be contradictory in itself. This fictitious opposite is it is not possible that every an external object can be mine or yours. Asserting this would be absurd because it would mean that my use of an object of my choice is rightly forbidden, while the definition of an object of my choice simultaneously declares it to be usable by me ([14, 19], p. 246). In this context, “rightly forbidden” of course means that the action in question, that is, the use of an object of my choice, is incompatible with the freedom of all, while the definition of “object of my choice” is derived from the standpoint of “freedom of choice” (“die Freiheit der Willkür”) ([14, 19], p. 213), that is, the capacity of choice. The absurdity or contradiction can thus also be expressed in this way: “Freedom would be depriving itself of the use of its choice with regard to an object of choice, by putting *usable* objects beyond any possibility of being *used*” (“so würde die Freiheit sich selbst des Gebrauchs ihrer Willkür in Ansehung eines Gegenstandes derselben berauben, dadurch, dass sie *brauchbare* Gegenstände außer aller Möglichkeit des *Gebrauchs* setzte”) ([14, 19], p. 246). As far as corporeal objects are concerned, Kant is able to say that the putting of objects “beyond any possibility of being used” is the same as to “annihilate them in practical respect and make them into *res nullius*” (“diese in praktischer Rücksicht vernicht(en), und zur *res nullius* mach(en)”) ([14, 19], p. 246), that is, to make them an object belonging to no one on principle.

This notion based on the “principle of contradiction” (“Satz vom Widerspruch”)²⁷ is supposed to be sufficient to justify the concept of “intelligible possession” and its “objective reality” (“objektive Realität”)²⁸ in the practical field – which is a reasonable postulate or demand. But, if I correctly understand Kant’s very short exposition, there are two possible objections. The first objection refers to Kant’s own warning against the use of “apagogic” proofs (“apagogische” Beweise) in the field of metaphysics.²⁹ This field, divided into a theoretical and a practical area, is “the domain proper to dialectical illusion” (“innerhalb dem eigentlichen Medium des dialektischen Scheins”) ([18], p. B 820), and here, we cannot “arrive apagogically at knowledge of the truth through refutation of the opposite” (“apagogisch durch die Widerlegung des Gegenteils zur Erkenntnis der Wahrheit gelangen”).³⁰ To avoid the mistakes of Leibniz and Wolff’s ontological rationalism, and to remove any reason for further dialectical illusions produced by antinomies, Kant needs to argue for his “position directly, by a legitimate proof that carries with it a transcendental deduction

of the grounds upon which it is itself made to rest” (“seine Sache vermittelt eines durch transzendente Deduktion der Beweisgründe geführten rechtlichen Beweises, d.i. direct, führen”) ([18], p. B 822). In our case, however, the “transcendental deduction” clearly rests upon a refutation of the opposite.

The second objection is immediately directed at the particular “apagogic” proof described above. This proof is based on the impossibility of turning a thing which is supposed to be usable into a thing that cannot be used on principle (by assuming the opposite of the postulate). This is declared to be absurd and that is why the postulate is supposed to be justified. But if we look at this absurdity more closely, we realize that it only appears if we consider the concerned things abstractly. The rule that a usable thing cannot be unusable (a rule which must hold true for all things that could possibly be owned by someone) is not valid for some things, of which Kant nevertheless claims they could possibly be mine or yours. It is, for instance, not valid for the servant, who must not be a means to the end of the head of a household. The ostensible absurdity is therefore a dialectical illusion in the sense of “The Critique of Pure Reason.” In some cases, things which *can* be used *must not* be used, that is, they should be considered unusable. Every class of possible usable objects must therefore be examined individually. The formal standpoint which does not account for the quality and quantity of the possible objects leads us astray.

Furthermore, we see that the word “freedom” is used twice in the proof’s main part: “If it were nevertheless absolutely not within my *rightful* power to make use of it, that is, if the use of it (object of my choice, A.E.) could not coexist with the FREEDOM of everyone in accordance with a universal law (would be wrong), then FREEDOM would be depriving itself of the use of its choice with regard to an object of choice, by putting *usable* objects beyond any possibility of being *used*” (“Sollte es nun doch rechtlich schlechterdings nicht in meiner Macht stehen, d.i. mit der FREIHEIT von jedermann nach einem allgemeinen Gesetz nicht zusammen bestehen können (unrecht sein), Gebrauch von demselben zu machen, so würde die FREIHEIT sich selbst des Gebrauchs ihrer Willkür in Ansehung eines Gegenstandes derselben berauben, dadurch, dass sie *brauchbare* Gegenstände außer aller Möglichkeit des *Gebrauchs* setzte,” italics by Kant, capitals by A.E.) ([14, 19], p. 246). In order to get a contradiction refuting the opposite of the thesis to be proven, these two uses of “freedom” would have to refer to the same idea of freedom because only then “freedom would be depriving *itself*” (italics by A.E.). This, however, is not the case. The first “freedom” is the freedom of “choice which can be determined by *pure reason*” ([14, 19], p. 213) (and in this case, freedom really is determined by “pure reason”), whereas the second “freedom” is the freedom of choice that is solely determined by the selfish ego’s desire to bring external objects in his possession and use them. Should anyone assert that the second freedom is still the same as the first, that is, that the second freedom is reasonable, the objection must be this has to be demonstrated.³¹ The claim (the second freedom is reasonable) would thus be a *petitio principii*. The result of this consideration is there is no contradiction in the “apagogic proof,” and consequently there is no actual proof. The hypothesis has not been verified; it does not even seem plausible any more, regardless of the fact that it might be proven differently.³²

But whatever may be said against these proofs, the goal of Kant's argumentation is unmistakable. He clearly tries to show that an "intelligible possession" must *generally* be possible, according to reason. It must be possible regardless of the qualities and quantities of the respective external objects, regardless of the manner of acquisition and especially regardless of the condition of the society in which this possession takes place. This general permission of the possession is supposed to be valid in a condition of natural law, and it is a consequence of Kant's systematic realization that moral and juridical problems cannot be decided on the basis of the alternative of duty ("Gebot") and prohibition ("Verbot") alone. In another case in accordance with the categorical distinctions of the "Critique of Pure Reason," the permission of actions which are neither forbidden nor required – ruled by the "lex permissiva" ("permissive principle," das "Erlaubnisgesetz") – seems to necessarily take a third position at the side of duty and prohibition, analogous to the introduction of the category of "limitation" at the side of the categories of "reality" and "negation."³³ And this is indeed a precise account of the one-sided imposition connected with the fact of somebody's claim to have something external as his own and to exclude others from the use of this object. This exclusion is a limitation of the (or a certain kind of the) freedom of others and must thus appear to be forbidden at first sight. After the explanation that it is in a certain sense compatible with the freedom of others anyway, however, it must be considered as allowed. Conversely, the obstruction of this possession is to be considered as forbidden. This does not mean, on the other hand, that the permitted action is required.

The strong claim in this consideration is the compatibility with the freedom of others (in a certain sense), which has to be explained. And no matter how we will judge Kant's explanation of this compatibility regarding the natural condition, this claim of the compatibility with the freedom of others is clearly connecting natural law and every version of positive statutory law in a specific civil society because this compatibility is (in Kant's thinking) the main principle of the doctrine of rights including natural *and* positive statutory right. Almost every further justifiable determination concerning the problem of property, especially those referring to the qualities and the quantities of external objects, is thus accomplished by "a collective general (common) and powerful will" (ein "kollektiv-allgemeiner (gemeinsamer) und machthabender Wille") ([14, 19], p. 256) ideally expressing the compatibility in the form of general laws ruling every issue in detail. The only exception is the question of acquisition, which is already (at least provisionally) answered in the natural condition.

Acquisition in the Natural Condition and Possession Ruled by the Idea of a Common Will

Other than Rousseau and similar to Hobbes, Kant does not imagine the natural condition to be paradisiacal or without depravity.³⁴ It is a fictitious state without rights, in which people are expected to behave according to their natural desires and choices, but to nevertheless be capable of following the unwritten rules of their natural

reason, too. In particular, they are expected to acquire external objects, thus excluding others from using them. Because of the principal permission to have something external as mine or yours, this acquisition cannot be objected to, as long as no one else has claimed the same object before, that is, as long as you are the first to claim it and will therefore not harm anyone else by your acquisition. Of course, the possession will be disputed anyway, as will the general distribution of external objects. Thus, the fiction of the natural condition is already sufficiently determined. It is sufficient to clarify the fact that, in the civil condition, most external objects have already been distributed, meaning they already belong to someone. The acquisition had already taken place in the natural condition, but in this condition, the possession is (and will always be) disputed, too, because of the unilateral character of the acquisition. It is therefore neither safe nor legitimate, although there will be physical means to secure it (strength, power etc.) and also means of fragile justification. The only valid justification possible in the natural condition, however, is, as we already know, the conformity with the freedom of others, and the only justified means to secure property does not consist in overwhelming one's opponent but in institutionalizing neutral authorities who can decide possible disputes, establish a status of common reciprocity and are able to enforce their decisions. That is why Kant is able to make use of this fiction a second time and to find in it the reason to leave the natural condition behind and enter into a civil condition or civil constitution.³⁵ The unavoidable dispute over external objects (because of the limited resources) makes it necessary to establish a state (the security of the internal freedom of course will do, too) and transfer a "provisionally rightful possession" ("*provisorisch-rechtlicher Besitz*") into a juridically justified possession called "*peremptorischer Besitz*" ("conclusive possession") ([14, 19], pp. 257, 267). But it might not be superfluous to once again stress the point that not every (always unilateral) acquisition can be transferred into legitimate property but only those which are compatible with the universal principle of right valid independently of time and condition³⁶—or in other words, which are "in conformity with the idea of a possible united *will*" ("*gemäß der Idee eines möglichen vereinigten Willens*") ([14, 19], p. 258).

The kind of external object Kant thinks of here is once again the corporeal object – and even more specifically land. The justification of acquisition of land might, in a historical perspective, be the most important problem of the philosophy of right as regards property (during Kant's lifetime, the issue is pertinent in connection with the American colonies and their western expansion, but the problem already exists in classical Roman and Greek history, for instance). But that is not the reason why Kant is giving priority to this problem. The transcendental standpoint of the analysis of our human conditions leads to the result that, as far as our external freedom is concerned right at the beginning, that is, the moment we are born, our corporeal body takes up and needs a place in time and space – on a planet where such space is limited.³⁷ Therefore, all human beings are constrained to spatial community. Philosophical consideration must account for that, and it must grant everybody the same right to occupy the space and the time he cannot avoid to claim, although there will necessarily be collisions with others who rightfully claim their space and time, too. Practical reason cannot find reasons for birth privileges, so

the limited resource must be distributed in accordance with the equality of men. In consequence, the fiction that even the land that *can be acquired* through occupation belongs to *nobody* is wrong. The right fiction, compatible with practical reason, must in fact say that a distribution of the limited totality of land in accordance with the criteria of equal rights has to be possible. It would thus be correct to imagine that the limited totality belongs to *all men* or, better, belongs to the fictitious instance of practical reason (*communio possessionis originaria*), which distributes parts of this totality, depending on the claims laid in conformity with the freedom of others.³⁸ Occupation of land is therefore acquisition of land from the community, who is its original owner. Although there is a relation between corporeal objects and their proprietors, a relation of obligation only exists between persons. And because you cannot unilaterally oblige anyone to stay away from the object you claim, it is, according to Kant, necessary to assume a community ruled by reciprocal obligations to which one can refer when claiming something as one's own with the consequence of the obligatory exclusion of others. As we can see, this consideration is valid for corporeal objects in general, not only for the acquisition or distribution of land. That is why "the united choice of all who possess it in common" (die "vereinigte Willkür Aller in einem Gesamtbesitz") ([14, 19], p. 261) must be assumed in all cases of property of corporeal external objects³⁹ but of course, not in case of the property of choice of another person. Conversely, the latter case might make it clearer that a community of persons or a unity of will has to be assumed as a presupposition of the property relation.

While the justified acquisition in the natural condition depends on one being the first to claim the external object as one's own, the more important condition is that, already in the natural condition, the acquisition accounts for the fiction (or the idea) of a community of will ruling the distribution and assertion of property in accordance with the freedom of all. Only if these conditions are met, the claims can be transferred to the civil constitution, where they are secured and the "common and powerful will" is installed to decide conflicts and to enforce justified claims. Every unavoidable conflict is a reason to establish a state and a civil constitution—not merely because it is useful but because reason demands the establishment of relational structures of equal right.⁴⁰ As soon as this constitution has been installed, the questions of justification can finally be answered. Furthermore, the problems of quality and quantity of property can also be negotiated and solved only on this level. Although the acquisition already provisionally determines the quantity and quality of the claimed property, the respective justification depends on the conformity with the freedom of all in a specific civil constitution, determining the rules of quantity and quality in accordance with the detailed statutory laws.⁴¹

Consequences

One cannot be quite sure whether today's Kantians should vote or work for a constitution, making it the government's business to limit the quantities and to decide on the qualities of property, in favor of a compensation of inequalities

among the citizens. While Kant himself didn't entrust the state with the task of promoting its citizens happiness and social welfare (only with the guarantee of subsistence)⁴² because the doctrine of right is not concerned with ethical problems and different ideas of a happy and satisfying life, a Kantian standpoint may still be compatible with the political program of establishing equal chances for individual freedom.⁴³ The "Universal Principle of Right" may not be helpful in determining anything with regard to social inequalities as long as the formal equality of external freedom is given, but since "all Right is to proceed from (the united will of the people)" ([14, 19], p. 313), it is possible to politically decide on ideas which may have compensatory social effects. The fact that reason a priori does not come to material (as opposed to formal) determinations leaves it to the sovereign to make up its mind about the necessary enactment of laws improving the chances of freedom for all and to continuously examine the given status' conformity with the freedom of all.

Introduction to Hegel's Concept of "Property"

Other than Kant's theory of property, which still leaves some room to maneuver, Hegel's theory of property eliminates almost every kind of indetermination. Hegel's concept of property, too, is embedded in a theory of right which ends up in a theory of the state. But Hegel's theory of right and state also takes reality into account and considers the historical development and the present status of right and society as the reasonable counterpart of the development and status of reason itself. That is why the necessary moments of historical development, which Hegel reconstructs in order to understand the present, are at the same time the necessary moments of reason determining this development and realizing themselves in it. There is no escape from the realization of reason; it shows itself in every detail and it determines every part of reality. The obvious existence of opposing forces in this reality, of forces trying (and sometimes seemingly managing) to come out on top of each other and of reason, has to be understood as dialectical reason integrating even contradictory ideas into one absolute idea. Any doubts we may have regarding the reasonableness of reality are therefore not appropriate in view of Hegel's conception of reason and its relation to reality. In determining reality (in case of the theory of right, the reality of the state), Hegel's reason integrates the contradictions corresponding with the opposing forces in reality into its own development. And although it might be difficult to understand the concept of this reason, the program leads Hegel to a reasonable explanation of reality which is still convincing in many cases. By means of Hegel's "Philosophy of Right," for instance, it is possible to see the shortcomings of a mere abstract or formal theory of right and property and to realize the relation of right and society a theory of right and property has to account for – and all this not only by means of abstract concepts but with regard to concepts referring to the historical reality of a civil society still valid in our times. Especially the close interior connection between property and personal freedom the civil society of our present time still assumes is well explained by Hegel's Philosophy of Right. But it is not only explained: The theory even goes so far as to criticize the

merely abstract concepts of “property” and “freedom” and states that it will not do to abstract from the real distribution of goods in the civil society nor from the immorality and dissolution of society’s real conditions.

To approach these aspects, it is best to follow the central thread of the “Outlines of the Philosophy of Right” because, as in all of Hegel’s works, it reflects the notion of *development*. But some general remarks may come first. The “Outlines” were published in 1821 (written 1820).⁴⁴ At this time, Hegel had already written his most important books: the “Phenomenology of Spirit” (1807) and the “Science of Logic” (1812/13; 1816). The “Encyclopaedia” followed in 1830. Like the “Encyclopedia,” the “Philosophy of Right” served as a course compendium, in case of the “Philosophy of Right,” for a course on natural right and the science of state. Hegel had already given lectures on this issue during his time as a lecturer in Jena (1801–1807), and he had continued to do so since. The book is therefore well revised, well connected with the other main issues (i.e., based on the “Science of Logic”), and shows Hegel on top of his intellectual development. At this point, he had the most important effect on the intellectual life of the time. These effects far exceeded those of Kant’s “Philosophy of Right.” One reason for this is the fact that Hegel’s analysis of the civil society also convinced the other theorists of the time (or at least goaded them into opposing the necessary steps Hegel took, as Karl Marx did, for example). Only when the dialectical logic and the speculative theory of nature proved to be incompatible with modern natural sciences, Kant’s philosophy regained some influence and could, in the long run, be established as an alternative in the field of practical reason especially.

To go into details, the central thread of the “Outlines” will lead us first to an understanding of the connection between property and freedom. Hegel explains this connection by defining the so-called abstract right. Moving on to “Morals” and “Ethics” (“Sittlichkeit”), the other parts of the “Outlines of the Philosophy of Right,” Hegel’s *critique* of the merely formal and abstract concept of “property” becomes more and more obvious and is explicitly presented in the end. What is kept of the original connection between property and freedom becomes clear in the analysis of the “civil society,” to which we will restrict ourselves here. There, his critique reaches its highest degree of keenness and objectivity.⁴⁵ To be consistent, these thoughts can be evaluated best in a modern theory of property that takes the given conditions of reality, that is, the conditions of the growing inequality in today’s civil society, into account.

The Right of Property Within the Abstract Right

The first definition of “property” can be found in the first part of the “Philosophy of Right,” entitled “The Abstract Right.” According to it, the right of property and its definition are first and foremost abstractions, made from a later, more complex standpoint of higher concretion. This first abstract definition says that everything which has no “(substantial) end in itself” (“substantiellen Zwecke ... in sich selbst”) ([10], p. 60, [12], p. 106) can be considered as “property.” Persons can

give the thing in question such an “essential end” by putting their will into it.⁴⁶ The thing that has thus become a property has essentially been defined until now by the fact that it has been pulled into the “external sphere” of the freedom of a person, in other words: Into that sphere, persons *must* give themselves in order—in Hegel’s words—“to exist as Idea” (“um als Idee zu sein”) ([10], p. 57, [12], p. 102).

The argument supporting the assertion that only a person can have property, or even that a person *necessarily* has property, thus leads us to a special kind of philosophical justification which has its origins in classical philosophy and which is critically reconstructed by Hegel’s objective idealism. The concept of “idea” is located beyond the difference of theoretical and practical reason. More specifically, the idea is a concretion of theoretical and practical reason, which can and must be differentiated (is differentiating itself), because it is reason itself. Hegel calls the sphere and the method of the idea “logical.” When he claims that the idea of a person implies the realization of their freedom in an external sphere, he does so because he sees it as a specific case of the more general “logical” rule of necessity that an idea implies its realization/externalization,⁴⁷ that is, the “absolute idea” has a complement in the form of the finite existence determined in time and space. This relation between “absolute idea” and finite existence is the model of (and the reason for) the relation between a person and the external object this person possesses. According to Hegel, one only has to name the steps of development beginning with the idea of the person and ending with the “absolute idea” in order to justify this reasoning. This logical “deduction” of property is not a sound proof for the assertion at all, though. The imaginary solid basis Hegel refers to is the speculative heart of the *dialectical* logic.⁴⁸ Hegel had already stated that intelligence (“Verstand”) cannot understand this. On this basis, being and ought are no longer separated. One can see what an imposition this is when looking at the well-known distich in the opening words of the “Philosophy of Right”: “What is rational is actual, and what is actual is rational” (“Was vernünftig ist, das ist wirklich, und was wirklich ist, das ist vernünftig”) ([10], p. 14, [12], p. 24). This famous dictum asserts the identity of being and ought deduced by the dialectical logic in the field of practical philosophy and decries any tentative of changing the status quo as unreasonable and irrational.

We shall restrict ourselves to a reconstruction of the way the concept of a person results from an abstraction and of the reasons for persons to have property. To this end, a short glance at Hegel’s “Encyclopaedia of the Philosophical Sciences” is in order. There, the philosophy of right is developed under the title of “objective spirit” (“objektiver Geist”), as if right, morality, and “ethics” (“Sittlichkeit”) were the objective realities of a spirit, of whom one can only think as “subjective,” creates. It is the concept of the “spirit” which connects its highest and most mediate form of being, namely, its being state, with its simplest form of being, namely, its being a natural person. The latter form is “abstract” because it has not yet gotten any generality through mediation of the others.⁴⁹ Everywhere, the *unity* of this spirit guarantees the *unity* of its real and objective forms of being and particularly the *unity* of the state ([10], p. 273, [12], p. 415). If the development of this “spirit” and its legal and practical determinations are to be presented, one has to begin with the

concrete idea of the state and then continuously move backward from this idea, abstracting from the institutions and structures of the society until one reaches the smallest unity, not yet integrated into society, but *determined to be integrated into society and state*: The unity of the person ([10], p. 228, [12], p. 399). Only on this background can one understand the use of the word “subjective” in the introduction of the “Philosophy of Right.” Here, a “will” (a “free will”) of the spirit is mentioned, which realizes itself in the right and its different forms, that is, develops itself into more and more complex forms, up to the complexity and totality of a state.

Given the concept of “person,” one should of course – also according to Hegel – think of a human individual, but of a human individual only as far as its particular individuality does not come into play. A person can thus be regarded as an individual minus its particularity,⁵⁰ the focus being only on its equality with others. Because these abstractions are, in Hegel’s opinion, at the same time presuppositions of a human individual’s legal capacity and possibility of being integrated into the legal community where property of external things is recognized,⁵¹ one should not demand more of a subject who corresponds to the abstract concept of a “person.” In doing so, one will still not abstain from every demand an individual has to meet if it corresponds to the concept of “person.” In the context of the development of the “spirit” as presented by the “Encyclopaedia,” this concept is not the first in the row. That is why the individuals called persons already meet some demands, namely, that they show the first kind of unity of theoretical and practical “spirit” ([9], p. 300f). If the “spirit” is “person,” it has *determined and realized itself as free* with regard to thinking and volition. One should neither demand more nor less of an “abstract” person.

The “Encyclopaedia” thus leads the way to the notion that a free spirit, which is real and equipped with a will to self-realization, *must have property*: The “subjective spirit” (who precedes the “objective spirit” on the way to the development of the “absolute spirit”) already has a particular property which is systematically connected with legal property. As soon as “thinking” understands that the contents it took for given are in fact determined by itself (that means that these contents are its own), it has taken possession of them. By doing so, the self-determining thinking that understands itself as such “becomes free also with regard to the *content*,” and the spirit in the form of thinking thus passes into the spirit in the form of volition.⁵² Defining a purpose – the hallmark of the will – is understood as self-determination of thinking, more exactly of a thinking that is able to autonomously determine its content as purpose, which has to be reached in reality at the end. As soon as the spirit really arrives at the level where its contents are not only determined by itself but also – as purposes – attained in reality, the concept of the spirit’s “subjective property” has changed into the concept of an objective and real property.

From this standpoint, we can explain the above-mentioned definition offered by the “Philosophy of Right” that property has to be understood at first as property of an external thing, qualified by *material immediacy*: The will reducing itself to its self-relation and therefore having an immediate relation to reality makes a fundamental difference between entities who have the ability of self-relation (persons) and entities that do not (things). In the former’s eyes, the latter become the selfless “given world,” and they realize that their freedom is limited by the

immediacy or *immediate* “givenness” of this world, so that the immediate relation between subject and object is not free. Thus, the subject is the only one who could possibly change this relation into a free relation and arrive at a reasonable relation between subjective and objective world. The subject alone is able to act by defining a purpose and by realizing its freedom – for instance, through the action of taking the external selfless being as its purpose, discovering itself in the form of this external thing and then taking it in possession, in the sense of transferring its own being into the thing’s being.

For the record, we can say: According to Hegel, the reason for declaring that even the most simple external object is one’s own property lies in a subjective spirit’s being a person, who has to make itself objective and realize its freedom in its property. With a view to the integration of the individual into the community of right, we have to abstract from every particularity of the person. We also have to uphold the reasonable demand that the primitive form of a spirit’s reflection must be accepted – the one by which it is reflected through an external object, as it finds itself in this object after having put itself into it. As long as the action serves this purpose, the person’s property is justified. On a certain level of the spirit’s development, its reflections need a material matter they can cling to.

In case of decisions a human individual’s spirit makes, one must, of course, not only consider the person’s self-interpretation. Otherwise, there would be no difference between the right of property Goethe could have claimed to rely on when looking at his collection of minerals (as far as he had put some of his spirit into it)⁵³ and the right of property Charles Foster Kane in Orson Welles’ “Citizen Kane” refers to in calling his huge collection of art his own. Only a little while before he is dying (not earlier!), Kane realizes that he cannot compensate for the deficiencies of his personal development by having heaps of external things. Maybe he even realizes then that his excessive richness does not reflect the freedom of his personality but only the lack of freedom.

Modifications of the Concept of Property Still Within the Abstract Right

To Hegel, however, the definitions of the abstract right (and therefore also the already developed definitions of property) are insufficient. Every further step away from these definitions he takes in the next chapters means that the essential truth concerning property has not yet been presented. The retreat from the first definition of property, and from the abstract relation between person and property as determined by the abstract right, indicates a fallacious, unreasonable thinking of freedom, justice, community, and state – a thinking we might, in the words of Karl Marx, well call “ideological.” Accordingly, it would be valid to say: As far as Hegel affirmatively presents the abstract right, he makes himself an agent of this “ideology.” As far as he criticizes the abstract right through the process of development he calls “Aufhebung” (that means “to keep” as well as “to lift up to a higher

level of thinking” and “to cancel”), he unmasks its one-sidedness, and any reduction to the abstract right – after the full development of the legal relations in the whole “Philosophy of Right” – is shown to be “ideology.”

This particular ambivalence can be observed in the text, too. When Hegel infers from the abstract quality of the definitions of the person that “what and how much I possess” (“*was und wieviel Ich besitze*”) ([10], p. 63, [12], p. 112) is accidental, seen from the standpoint of right, he seems to unscrupulously submit a justification – or even *the* one and only justification – of liberal *possessive individualism*. This justification claims that “equality” of persons against the background of law inevitably includes indifference of the law toward richness and poverty. But at the same time, Hegel makes clear that possessive individualism is not “the real thing” by making and underlining the difference between “property” (“Eigentum”) and “possession” (“Besitz”): Even according to the abstract right, there is a reason for the relation between person and property, only if a *free* will sets up a relation to an external thing, so that it can understand itself as a free and reasonable will—and that means, at this point, a will that does not injure others.⁵⁴ In this case, Hegel speaks of “property” and “private property.” “Possession,” on the other hand, is to be spoken of, if an ego takes a thing “as a result of (. . .) natural need, impulse, and caprice” (“aus natürlichem Bedürfnisse, Triebe und der Willkür”)⁵⁵ and thus realizes its personal particular interests, *without* being willing to limit itself to the realization/objectivation of the free part of its essential being. Thus, while Hegel seems to encourage possessive individualism on the one hand, when he declares that the right is not the appropriate authority to deal with the compensation for an unjust distribution of goods, he rejects possessive individualism on the other, when he exposes possession as satisfaction of a *desire* and assigns such satisfaction only to the “civil society” (“Bürgerliche Gesellschaft”). We can already expect that such satisfaction will appear there as realization of a *false* freedom and that it will be limited by the higher instance of realization of freedom in the state. That is because Hegel already asserts within the abstract right that “the Idea of freedom is actual only as *the state*” (“dass die Idee der Freiheit wahrhaft nur als *der Staat* ist”) ([10], p. 71, [12], p. 124). Not even the realization of freedom through property, which is passed off as reasonable within the abstract right, remains unchanged and valid without limitations against the background of the higher reasonableness of the state – because “the specific characteristics pertaining to private property may have to be subordinated to a higher sphere of right (e.g., to society or the state)” (“die Bestimmungen, die das Privateigentum betreffen, können höheren Sphären des Rechts, einem Gemeinwesen, dem Staate untergeordnet werden müssen”) ([10], p. 61, cf. 85, 102f, [12], p. 108, cf. 157f, 190f). As a critic of the abstract right and the civil society, Hegel becomes a protagonist of limitation of private property, after having at first defended the realization as *not* being a possible object of limitation by the *abstract right*.

The same ambivalence must still mark the first modified definition of property—because it is already given within the abstract right—in the following chapter, “The Contract.” Hegel arrives at this definition by moving on a little bit into the direction of the concrete ethical unity of the state. While the spirit as a free will until now realized its freedom only as a single person, and within its isolated relation to an

external thing, it now succeeds in realizing its freedom through the unity of the wills of those persons who are joined by the contract, that is, the unity of wills of persons in the plural. The *mediation* – reached in a contract – between the first person’s will and that of the second results in a “common will” on the basis of mutual recognition. This leads the way to the following: From now on, “objects” which are less material and immediate can be taken into possession. The concept of “property” has to change accordingly. The “object” which remains identical, which is accepted in the contract to stay the same, and to which the contracting parties keep when they exchange the external and real objects of the contract is the *value* of the different objects.⁵⁶ The concept of “property” therefore comprises everything to which we can ascribe a value, including services and performances (in particular mental performances) – every internal thing, as long as something external corresponds to it and can be considered as being of some value.

In these definitions of property, the “Verdinglichung” (“concretization”), the treatment of something internal and mental as if it was an external thing, is qualitatively justified. Insofar as these determinations of the abstract right give rise only to this qualitative view, cause indifference toward the trend to concretize and make use of more and more of the internal districts, and then cause indifference toward a possible real inequality of the contracting parties, they are apologetic with regard to the relations of the civil society. This inequality is nothing unusual – already for Hegel – when you look at the employment contract by which the work of the employee becomes the property of the employer. On the other hand, Hegel prevents abuse in some important fields through other determinations still within the abstract right: The concretization in an employment contract, for instance, it is explicitly limited by the declaration that everything “constitut[ing] my very own person and the universal essence of my self-consciousness,” like “my personality as such, my universal freedom of will, my ethical life, my religion” (“was meine eigenste Person und das allgemeine Wesen meines Selbstbewußtseins ausmach(t), wie meine Persönlichkeit überhaupt, meine allgemeine Willensfreiheit, Sittlichkeit, Religion”) is inalienable ([10], p. 77, [12], p. 141). In consequence, an alienation within the employment contract is allowed only of “single products” (“einzelner Produktionen”), and one can give to someone else only “the use of my abilities for a restricted period” ([10], p. 78, [12], p. 144f). The implicit account of the quantities, which turn into quality at a certain point, makes unmistakably clear that a merely legal view of the formal, abstract side of the contracts is deficient. The abstraction from the social relation of the contracting parties causes a further consolidation of the already stronger party in reality.

The Critique of the Abstract Concept of Property Considering the Real Social Relations

Following this direction, the most interesting point for us is Hegel’s explicit critique of the abstract right and its definitions of property. He articulates this critique by further receding from the abstraction toward an accomplished concretion of right in the ethical state. Not the definitions of this ethical state in particular deserve our

attention, but the fact that on the way of its development, the reality of the social relations is taken into account—with the object of constructing a legally reasonable system of economy and community. Concerning the abstract right, Hegel criticizes, on the one hand, that there is not yet mediation between abstract right and the moral good and on the other hand, that it has not yet been transferred into the positive legislation of a society and therefore is still without effect.⁵⁷ Until now, it is limited to a demand that shall be satisfied by positive legislation, though it is in fact satisfied by the reasonable state – according to Hegel’s postulate of the unity of being and ought. But in the meantime, the transfer appears – even in Hegel’s opinion – as possibly determined by the somewhat unreasonable power structures of the civil society. That is because, according to the “Philosophy of Right,” it is the civil society that gives itself the legal statutes adjusting to the determinations peculiar *to it* and corresponding with *its* relations of power – depending on the structures which rule *in it*.

This civil society is characterized by Hegel as “system of needs” (“System der Bedürfnisse”), where “the *dependence* of people on one another and their reciprocal relation in the satisfaction of their ... needs” is made “necessary” (“die *Abhängigkeit* und die *Wechselbeziehung* der Menschen für die Befriedigung der ... Bedürfnisse zur gänzlichen Notwendigkeit” gemacht worden ist) ([10], p. 191, cf. 186–189, [12], p. 352, cf. 346–349). But we cannot elaborate on that. The presentation is to be taken as a critique of raging capitalism⁵⁸ – moderated only by Hegel’s admiration for the rational efficiency that distinguishes the individual selfishness’ referring to the general selfishness of the community and its making use of the system of general dependence.⁵⁹

Only the structure of Hegel’s system explains the fact that the civil society has been taken into account at all in the third part of the “Philosophy of Right,” “Ethical Life” (“Die Sittlichkeit”), namely, as appearance and negation of this “Ethical Life.”⁶⁰ The negations represent a necessary moment of dialectical logic; the one which, driven to its extreme, causes the transfer to the negation of the negation, that is—in this case—the positive ethics of the state. There, the reflection of the calculating selfish understanding (“Verstand”) shall have been purified and changed into reason. But Hegel gives the responsibility of the *Administration of Justice* (*Die Rechtspflege*) only to this *negative* form of the “objective spirit,” so that the legislation of the “right in itself,” that is, the abstract right, in particular the right of property is transferred into the legal “protection of property.” ([10], p. 197, cf. 207, [12], p. 360, cf. 371f). This way, the “state based on need, the state as the understanding” (der “Not- und Verstandesstaat”), as Hegel calls the civil society ([10], p. 181, [12], p. 340), constitutes at best the laws which understanding considers to be reasonable, that means: Laws, for which the highest norms are the abstract right’s equality of persons⁶¹ and – by that – the indifference toward the real inequalities of the society. Hegel thus reveals to what extent the positive legislation of a society can support and solidify the system of dependences ruling in it.

The protection of private property guaranteed by the legal system of the civil society logically comprises not only the protection of property of an external thing a natural individual uses to become objective. The philosophy of spirit’s development of the free will led to unities of more and more general and mediate kinds and

already assigned the contract's unified will to a more abstract or to speak with Hegel, a more "concrete" property, namely, the *value* of objects and performances. That is why, once again, another kind of property still has to be determined for "the *actual spirit* of a family and a people" ("*wirklichen Geist* einer Familie und eines Volks") ([10], p. 161, [12], p. 305) – a property in which these unities become objective. Concerning the disintegrated civil society, the unity is now the problem. But Hegel finds it in the form of the dissociated spirit's unity, which makes it possible to speak of *one* civil society, of *one* principle effective in it.⁶² This unity is the reason to form *one* concept for the wealth accumulated by all the individuals and the smaller and bigger societies striving for a certain end.⁶³ This way, the protected wealth belonging to a general unity comprises the private property of land⁶⁴ as well as property of funds, in particular on the side of the businessmen, who transferred the former "value" of a contract into the general means of exchange, the "abstract value" of money.

Hegel thus understands that the civil society increases inequality concerning property and possession, as long as it is "in a state of unimpeded activity" ("sich in ungehinderter Wirksamkeit befindet") and is therefore in want of control.⁶⁵ He also understands that this control can only be expected of a "power," a "public power," ([10], p. 216f, cf. 235–239, [12], p. 348f, cf. 406–411) which has been given to higher legal authority. But, significantly, this thought does not lead him to the demand to include the right of control and limitation of power through possession in the abstract right and thus hand it over to the positive legislation. This way, the citizens of a state would have been able to sue their state for this right, however, immediately they should proceed. Instead of that, Hegel relies primarily on the courts, although they can—as Hegel has it—administer justice only according to the already legislated right of property,⁶⁶ on a strong police,⁶⁷ and on the power of integration into the corporations ("Korporationen"), which leads to ethical life. After all, he is thinking of a kind of control exercised by an organism, in such a way that the power of state alone rules over the individual citizens of the state, like the central nervous system rules over its muscles.⁶⁸ The return to immediacy Hegel's system calls for ends in the biological imagination of a monarch, who is the natural reflection of the "personality of state" and who is allowed to claim a "sacrifice" in cases where the "organic whole" loses its capacity of self-control: The sacrifice of property, yes, even of life.⁶⁹

Consequences

To prevent such injustice, a state's system of right has to guarantee and protect the individual's rights against them being taken away by the government (the German history obliged the German system of right to do so in form of the fundamental law, "Grundgesetz"); and the rights of the state against the individuals have to be limited.⁷⁰ Unlike Hegel can put it, the powerful state's possibility to just take away the individual's right of property must be kept under legal control. For instance, it is necessary to be able to make it a condition (like the German fundamental law, article 14, paragraph 3, does) that the dispossession "for the sake of the community" has an explicit legal basis, which necessarily serves as

a rule for compensation. In the same way, it has to be made possible – again in contrast to Hegel’s doctrine – that the state’s seizing the right of property can be caused *by the citizens*, “from below,” by forming the appropriate political will and by legislating the appropriate laws – with reference to a legal basis (the German fundamental law for instance has such a basis in form of article 15, which discloses – built on article 14.I.2 – the possibility of nationalization of the property of “ground, natural resources and means of production”). Therefore, it is important to read Hegel’s Philosophy of Right not because of its theory of state but because of its demonstration of the effective relations between a constitution and its reality. According to that, we cannot shake off the doubt on whether our state institutions and our laws, including the fundamental law, offer sufficient protection against the consequences of a raging market economy. The social “spirit,” or the understanding of social fundamental laws, must prove to be effective. But that will only happen if the political will can enforce it in the economy and the social order – for which the latter once again requires political education. Independently of the organologic end of the state, and independently of the mythological darkness in which Hegel puts an end to world history, Hegel’s Philosophy of Right is worthy of note because it contributes to our knowledge of the interdependences between right, state, and civil society and thus contributes to our political education.

Conclusion

As we have seen, Kant’s theory of property explains the general conditions which have to be fulfilled if property shall be legitimated property. There is an examination to pass. In general, and in every case of a certain state or time, it has to be demonstrated that the laws including the right of property are in conformity with the idea of a common will. The distance between this idea and the particular version of the right of property will not disappear in reality, and thus the idea of a common will will function as a critical instrument regarding the statutory laws, including the right of property. Kant leaves it open to the political decision of a certain society whether the sovereign takes the laws as adequate to rule the distribution of property in a given situation. Hegel’s theory of property, on the other hand, does not leave anything open. The concept of dialectical reason implies the relation of idea and given reality. We are supposed to understand the given distribution of property, the given disintegration of the civil society, and the abstract laws (including the right of property) as reasonable because the dialectical reason takes shape in all these forms. But, on the other hand, dialectical reason may not be reduced to these forms. It must be understood to dispose of the conditions, to be able to call off disintegration and to build a state and constitution in order to dissolve any division/rupture. Although we cannot accept Hegel’s concept of an authoritarian state, the complex idea of a complex reason, elaborated and explained in detail, discloses the effective relations of idea and reality in general and the particular relations of freedom and property with reference to the person and the relations of the institutions in the civil society. We ought to know all this to get an adequate understanding of the

complex structure of our reality and our society. The right of property thus turns out to have its justification not in a formal or abstract sense but with reference to a particular reality. This is important for us, insofar as this particular reality might be taken as ours.

[14, 19], p. 230f. This theory of oppositional forces goes back to the fundamental insights Kant published in the essay of 1763 “Versuch den Begriff der negativen Größen in die Weltweisheit einzuführen.” The concept of “Realrepugnanz” gave Kant the key to reverse the rationalistic ontology of Christian Wolff and later on build his own transcendental Logic, Ethics and Aesthetics.

31. Kant’s Universal Law of Right features the same difference of “freedom of choice” and “everyone’s freedom in accordance with a universal law” ([14, 19], p. 231). It requires that the first “can coexist” with the second, and says that in case it cannot coexist, the special freedom of choice in question is not right. Thus, the Universal Law of Right requires that the conformity or correspondence has to be demonstrated. The ostensible “demonstration” of the “lex permissiva,” however, not only postulates that the first freedom can coexist with the second, but is right from the beginning, based on the identity of both (“freedom would be depriving itself,” [14, 19], p. 246).
32. These objections are directed at Kant’s proof deliberation for the possibility of an “intelligible possession” on principle, and, as far as Kant’s conception of property is based on this possibility, they are directed at this conception, too. Thus, the difference of “intelligible possession” and “property” that has recently been stressed by Rühl, Ulli F. [29], pp. 68–85, does not make these objections irrelevant.

45. This critique was based on the conviction to know the means for getting over the contradictions of the disintegrated Civil Society. Hegel even believed to see these means in his mind’s eye: the constitutional monarchy of the Prussian state during its conservative period (“Restaurationszeit”) should make this reconciliation possible; yes, it should even have made the reconciliation real. That is why there is no use in having a discussion about the last suggestions Hegel hit upon for the solutions of the social conflicts. In most of the cases, they obviously and immediately turn out to be untenable, even dangerous – of course in particular when the powerful state is propagated (cf. [21]).

60. In his interpretation of Hegel’s “Philosophy of Right,” Axel Honneth leaves Hegel’s reference to the “Science of Logic” aside ([13], p. 13). The dialectical basis does not fit the plan to bring the “Philosophy of Right” up to date. To be consistent, Honneth has to find another reason to take the disintegrated civil society into account. The negative moment Hegel assigns to it because of the dialectical development is turned into a positive moment. Honneth explains Hegel’s “System of Needs” to be a system of justified interests ([13], p. 117). In the peculiar area of the civil society, the isolated individuals are supposed to be able to realize their interests and needs, recognizing every other individual as in the same sense interested in the satisfaction of their needs. While this ignorance of Hegel’s speculative basis seems very reasonable to me, the consequence that the critique of the disintegrated civil society becomes weak cannot be very welcome. The status quo of our actual civil society becomes more legitimated, although it requires more critique as it has been “in unimpeded activity” for a long time since Hegel diagnosed its deprivation.

70. According to Hegel, the laws of the state basically are the laws which have been legislated by the Civil Society, except that they are now also known as reasonable. That is why the power of legislation in this state, formed after the model of an organism, is restricted to “fresh and extended determination” (“Fortbestimmung”) of the same laws – cf. [10], p. 284f, [12], p. 465ff. The lack of laws able to limit the force of the power of the state against the individuals must attract attention, particularly when one deals with an author who uncompromisingly calls for legislation of reasonable ends – cf. [10], p. 265f, 231ff (footnote) [12], p. 442f, 402–406 (footnote). The efficiency of the “private estate” (“Privatstand”) effecting on the power of legislation by means of the “Estates, as an element in the legislative power” (cf. [10], p. 291 [12], p. 473), is all Hegel intends for this business. But one cannot compare this at all to the concession of fundamental laws. Concerning the right of property, Hegel has neither a rule for compensation in case of dispossession of the individual by the state nor a right of nationalization of possession.

Abstract

The aim of this chapter is to make use of Hegel's theory about the integral interplay between economics and ethics, which is elaborated in his book *Philosophy of Right* ([1]). Hegel understands the economy to be part of the ideal *ethical state* in which human *freedom* is realized. The chapter focuses on two key aspects of Hegel's understanding: first, Hegel's philosophical interpretation of the economic principles of *needs* and *work* and second, Hegel's ethical criticism of *civil society* (*bürgerliche Gesellschaft*) and of its members (*businessmen* or *bourgeois*) (Hegel talks about economics and uses the term "bürgerliche Gesellschaft," translated into English as "civil society." In this chapter, I use the terms "civil society," "business society," and "business estate" interchangeably.). Hegel's ethical criticism of business men who are only interested in profits and who do not respect social values is more relevant today than ever.

Introduction

Hegel's theoretical project is to preserve the ideals of human freedom in society, and his theories should be read with an understanding of the economic conditions of his time at the beginning of the nineteenth century. Hegel experienced the industrial revolution in England as well as the political revolution in France. These political events changed the social and the economic life in Europe and are still influential today as globalization and economization impact almost all spheres of social life.

Hegel anticipated the impacts and reflected on the ethical consequences of both European revolutions. Therefore, looking back at Hegel's ethical arguments is meaningful for our understanding of social development today.

Reference to Hegel is especially important in modern business ethics. Business ethics sees itself as a modern scientific discipline, concerned with applying philosophical principles to business dilemmas. Business ethics is a broad subject, dealing with issues such as the interplay between moral truths and economic necessities. Searching for philosophical support modern business ethicists refer to the philosophy of Hegel, who uniquely integrated economics and ethics in a modern sense (for a book-length treatment of this problem, see [2]). However, while Hegel's ethical principles provide no answers to current economic and social issues, they offer a horizon for their consideration. This chapter focuses on two key aspects of Hegel's claims: first, Hegel's philosophical interpretation of the economic principles of *needs* and *work* and second, Hegel's ethical criticism of *civil society* (*bürgerliche Gesellschaft*) and of its members (*businessmen* or *bourgeois*). Before these core issues are discussed, I briefly review the basic assumptions of Hegel.

The Basic Idea of Universal Freedom and Morality

The idea of individual and political freedom is expressed in Hegel's conception of the will. The individual is a human being if he instantiates the personal will. An individual is completely determined in all respects: in his arbitrary will, drive, and desire, as well as in relation to the immediate external existence. "I am finite, yet totally pure self-reference, and thus know myself in my finitude as infinite, universal, and free" ([1], Sect. 35). This kind of self-reference implies that the individual is able to distance himself voluntarily from any desires and to understand himself as free from finite limitations. In doing so, the individual sees himself as a part of a higher, metaphysical freedom of the universal, infinite mind. According to Hegel, the infinite mind is an absolute idea: It exists as an objective truth and is transcendent. The structure of the infinite mind is explained in detail in Hegel's metaphysical deduction and logic (for a book-length treatment of this problem, see [3] and [2]). The infinite mind is free and his freedom is the universal freedom. This freedom is an absolute value (*absolute subjectivity*). The idea of universal freedom of the infinite mind is conceived in human thinking. The individual is not capable of capturing the universal freedom, but he can be aware of it. Individuals can refer to the universal freedom and develop their arbitrary and subjective will to the universal free will.

According to Hegel, the individual is not capable of reaching universal freedom alone: The individual refers to himself as a "concrete," finite, particular being with an arbitrary will and, at the same time, as an "abstract," infinite being with universal will.¹ His human will is such that, on the one hand, it aims at the universal good, while on the other hand, it is the particular will of pursuing arbitrary *needs*. The arbitrary is a contradiction in itself, because it is subjective and therefore random. An arbitrary or a particular is the opposite of universal. Thus, there is a conflict

between universal and particular will, and Hegel believes that in the content of the universal will, the individual can find universal *freedom*, happiness, and self-realization. Hegel's ethics is thus a theory of freedom, and it is based on a radical difference between arbitrary and universal freedom. In this struggle, Hegel gives priority to universal freedom, which is an essential assumption in Hegel's conception (see [4]).

But how can the individual refer to the content of the universal will and to his freedom? Hegel suggests that the individual can be aware of universal freedom in a stepwise way: He realizes this freedom as self-knowledge and will, and he goes through an educational development process. In this process, the selfish individual develops a universal moral will without abandoning the subjective particularity of the individual will, according to Hegel. The individual refers free to a universal will without being coerced. The universal will is concretely realized as the spirit that prevails in the community.² In the realization of his own freedom, the individual achieves the universal freedom of the general spirit of the community and both individual and universal spheres are united. They interpenetrate in a lived system of morality, which is speculatively founded and has its real existence in the moral ideal state.

According to Hegel, the idea of *universal morality* exists as a general practice in the community on the one hand and more specifically as self-consciousness of its members on the other. Universal morality is the content of both the general rights and the personal duties in the community. The identity of rights and duties appears as a moral attitude of individuals toward the moral state. It is an individual virtue that motivates the fulfillment of duties for universal purposes. This basic attitude of individuals toward their universal duties is the virtue of *righteousness*, which is the basic principle of Hegel's political virtue ethics. For example, the right of legal possession of property is at the same time the duty to be a legal person and to respect others and their property. The concept of private property is derived from the concept of the personal free will: The person is free to decide which goals to pursue; therefore, he gives himself an external sphere of freedom, which is speculatively justified, and this must consist in private property (see [5], p. 581). Property rights are means of realizing human freedom: Human freedom requires that a person is able to express himself in the external world and to develop an individual life plan.³ Individuals, who respect each other and recognize one another as private owners, do not necessarily maintain market relations to one another. Respecting private property is a virtuous disposition and is not determined by the market and the business advantages from the exchange, but rather by the freedom of the will and its expression.

Summarizing Hegel's assumption of freedom, we can say that Hegel believes universal freedom is concrete and has a real existence in human thinking: It exists as a spirit that prevails in the *ethical state*. In that sense, the ethical state is the objectification of the metaphysical idea of goodness and universal *freedom*. The ethical state is the concrete "reality of the moral idea" ([1], Sect. 257). The general right (e.g., property right) in the state is an objectification of the idea of freedom (*objective spirit*). Hegel's ethics is thus an ideal theory of the moral state, in which

universal morality and subjective freedom are included and realized. One essential part of the ethical state is the economic sphere of needs and work, which is explained in the following section.

The Economy as a Sphere of Needs and Work

In his chapter “The system of *needs*” (PR Sect. 189–208), Hegel explains his understanding of economic relationships in the modern economy of his century. The *needs* are grouped together in a system because they produce a legitimate commonality among otherwise independent individuals, according to Hegel. In the apparent arbitrary *needs*, the economy discovered interestingly valid general rules of behavior. The market allows all individuals to pursue and to achieve all their own interests and desires. Such behavior leads not to chaos, but on the contrary to efficiency. Hegel acknowledges the thoughts of Adam Smith and refers to the modern economics, especially to the basic idea of reproduction and refinement of needs, and the consequent division of *work* for the satisfaction of needs. The result of the division of work as a modern economic principle is an interweaving of the work and needs of different types of people among themselves. The particular need of a particular individual becomes a social need because the public works for his satisfaction (*socialization of needs*). By working for his own needs, one individual works for the needs of all by producing the social product by which one can satisfy his own particular needs. The diversity of products and services for the particular *needs* is only possible if all members of the community work for the needs of all. In this sense, the economy is an essential sphere of social needs and work, and the free market is a social institution that provides benefit to the participating member. It provides interdependence of the pressure of particular needs, and it requires the recognition of the work performance of others.⁴ According to Hegel, such interdependence and recognition are associated with *freedom*, but this kind of freedom in the economy is not sufficient for the highest form of freedom. In the sphere of needs and work, the individual cannot achieve universal freedom. According to Hegel, man is limited first by the external nature and second by the work performance of others. It is to these limitations of the true freedom that I turn now.

The limitation of freedom by external nature is given because natural resources are limited and the needs of individuals are unlimited. The individual believes that the satisfaction of his needs depends only on his own arbitrariness – he is free to do what he wants. But human needs are not only natural needs to support life. In their reproduction and abstraction, needs go on in the unnatural imagination. The man who peruses primarily his natural needs will never be free because he cannot realize the boundary between imaginary and natural needs. On the contrary, because of his infinite desire for luxury, he enlarges his dependence on external things. Adopting the arguments of Rousseau, Hegel criticizes the idea that acquiring unnatural luxury (solely satisfaction of natural needs) can ruin many people financially and spiritually. Hegel recognizes that luxury consumption has a positive economic

consequence as well – it increases the demand for refined products, which can lead to more investment and employment. However, he does not share the optimism of the modern economists of his time and does not believe that the employment effects of the luxury consumption are great. He taunts the reckless extravagance and the artificial dependence on external things because this dependence is the opposite of true and universal freedom.

In addition to the limitation of freedom resulting from human needs, Hegel develops a second line of argumentation: In the economic sphere, the individual is limited by the work performance of others. Hegel discusses *work* as a feature of the modern economy in his papers from 1805 to 1806 and fully elaborates on the idea in the *Philosophy of Right* [1]. According to Hegel, human work is a way to educate oneself and to find self-realization. Education means to understand foreign opinions and go after them. Education through *work* has a theoretical and a practical aspect. On the theoretical level, education consists firstly in the improvement of working methods and the invention of new technologies to simplify and humanize work, an achievement which people can be proud of. Secondly, as the individual weighs the plethora of products and services available to satisfy his interests and needs, he calculates and develops a mental quickness in grasping economic contexts. Practical education consists in the daily learning of skills in society. Through work, people learn to respect nature and other people, and they understand the inherent limitations of their opportunities.

For Hegel, work is more than a subjective habit of occupation; it is a personal development of society – working for social needs (as a result of the division of work), people learn to respect the interests of the public. Only against this background of work as a personal development in society can Hegel partially justify the luxury consumption of the rich, as noted above. He says the rich should not give the poor money, but instead should ask for their work. In this way, the rich open up the education of the poor with work. Working as education and self-realization is a thought that is current today. In their constant repetition of certain work processes, people come up with ideas to improve production. Through such thoughtful and educational work, they help to humanize and facilitate heavy physical work. The machine makes human work easy indeed, but also dull, according to Hegel. Through their own work, individuals cannot create a whole product, overlook the whole power of their work, and fully enjoy their own activity. They lose themselves in mechanical activities. Hegel recognizes the educational and intellectual advantages of the division of work, but he also highlights the ambivalence of the socialization and division of the work: On the one hand, the work is humanized, and on the other hand, it makes people more dependent on others and the work performance of others. According to Hegel, education and self-realization cannot be achieved through mechanical work, but through intellectual self-development that leads to *freedom*.

The economic principles of the satisfaction of needs and the division of work are necessary and worthy of recognition. They are the basic principles of the social institution of the *free market*. Hegel considers the free market to be a human institution where the work and the demand for the purpose of the satisfaction of

needs meet. He sticks to Adam Smith's self-adjusting, natural equilibrium between supply and demand. Recognizing the classical equilibrium of the competitive free market, Hegel insists on the essential role of the *ethical state* as the "reality of the moral idea" ([1], Sect. 257) to guarantee the necessary conditions for the function of business and of social care. Thus, and before the economy can function on its intrinsic dynamics, at least two conditions must be guaranteed by the ethical state: First, every market participant should have confidence in the market and believe that he will not be cheated and can freely participate. Second, the necessary infrastructure should be provided as a basic condition of the economy (e.g., maintenance of roads and communication). Both conditions are tasks of the state and cannot be met by the business itself.

The first condition relates to the administration of justice – the formulation of and compliance with applicable law in the state. Every citizen has the right to stand trial, but also the duty to bring other citizens to justice. The state administration of justice provided by the law in the business estate is a prerequisite because it prevents the market participants from being defrauded and protects the interest of various *estates*, avoids collisions between the interests of different estates, and strengthens public confidence in business. Also creating confidence in the condition of the market is state control of the food sold on the market. The goods are not offered for a single customer but for everyday consumption by the general public. Therefore, a responsible institution is needed. The consideration of the health risks in the marketplace is not limited to economic reasons. It is a lot of *work* for a particular individual to control the goods, and it requires special skills and time to examine the goods themselves, which is why an individual leaves that task to the public institution. The promotion of confidence in business is a function of the state in another aspect as well: The people invest their income in the market, thus increasing demand and securing work, and must be confident that they can achieve a secure long-term income from investing. If by their international trading activities single companies or whole industries destabilize a country's job market, then there must be a parent institution that looks after such tendencies. A particular investor or single consumer cannot oversee and monitor the business activities of whole industries and can therefore be deceived in his confidence.

The state has the general task of protecting market participants from deception, maintaining public goods, and guaranteeing the function and efficiency of the market because all of these conditions are necessary for achieving *freedom*. In this way, the free market is efficient and leads to more interdependence: People are free to pursue their own interests, to satisfy their *needs*, and to develop social skills. The free market provides *freedom* of choice, and such freedom is not the highest form of human freedom according to Hegel. One cannot refer to the free market without referring to its foundation – freedom. The satisfaction of *needs* is not self-sufficient for human freedom, because these needs are arbitrary, ambivalent, infinite, and unstable. Human beings need a higher form of freedom and intellectual reasoning, according to Hegel. They need a higher sphere of social life, where they can achieve the universal form of freedom. This is the sphere that Hegel calls the ethical state as an ethical ideal. From the perspective of the higher

sphere of the *ethical state*, economic principles of needs and *work* can be ethically reflected. They are recognizable, but they are still different from the political principles of the ideal ethical state. Therefore, economic principles should not interfere with the general principles of the moral community.

In considering economics, Hegel prefers the term “*Staatswirtschaft*” (state economics). Including the state in the name emphasizes more strongly Hegel’s project to integrate economics as part of his political ethics. Economics as an empirical science receives an inferior position in Hegel’s conception of the ideal ethical state. Nevertheless, there are two arguments for the importance of economy that make this concept relevant today: First, the role of economics is essential because economics makes concrete empirical groundwork for the conception of the society and the state. Second, state intervention in the economy is strongly restricted: It is allowed only in exceptional cases, namely, when the equilibrium of the market mechanism fails in a collision of interests of producers and consumers and unrestricted demand requires a governmental intervention. This thinking is alien to classical economic theories, such as those of Adam Smith, who argues that the function of the state should be restricted to the “minimal state.” However, Hegel is skeptical about the capability of the market to self-regulate and maintain natural equilibrium. Unlike Adam Smith, Hegel does not consider the market a natural mechanism that would emerge without state intervention. Hegel teaches that the market is primarily a human institution that needs oversight in order to guarantee the freedom of all.

Hegel’s teachings are relevant today and are reflected in the modern neoliberal movement (see [6], pp. 71–88). Instead of maintaining that the market is a natural system of needs, the neoliberals (e.g., Simons, Hayek et al.) argue that the free market is a burdensome, fragile human institution. In the free market, goods are sold at competitive prices according to the equilibrium of supply and demand. This mechanism allows people with power to maximize profits and excludes some people without power. Neoliberal economists advocate the external support of the free market in order to bring it closer to the ideal competitive market, where property, necessary public goods, and the welfare state are ensured. This argumentation demonstrates the modern inherent connection between economics and ethics, which is crucial to Hegel’s understanding of economy.

Hegel develops a second line of argumentation for the integration of the economic sphere on the practical level: He focuses on the attitudes of citizens within the economy, a topic discussed in the following section.

Ethical Criticism of the Business Estate

The ethical criticism of business follows from the idea of *freedom*. The individual realizes his subjective freedom in various spheres of social life: as a caring member of a family, as a working member of *civil society* (business sphere), or as a member of the community (state). In all spheres of social life, individuals *work* to accomplish necessary work, to secure satisfaction of needs and freedom of all.

Working for the community, the particular individuals should be able to rely on the community to ensure equitable treatment. This treatment is not the case in the sphere of business: The business sphere is not in a position to deal with this concern. The social welfare function is contrary to the functional principles of business because business is directed only to increase the private well-being of particular members and the economic gain. Many of the vulnerable members of the business sphere are fully excluded from the socioeconomic life. The result is they are deprived of the opportunity to realize their individual freedom and social recognition through work. Because of these inherent contradictions in terms of freedom and values – Hegel calls it a “dialectic of *civil society*” ([1], Sect. 156) – business will never be rich and wise enough to care for all of its members and to ensure the freedom of all. In business, the subjective freedom of the members cannot be achieved; it can only be realized in the ethical state, according to Hegel. Therefore, business and the ethical state must be distinguished in terms of functions in society and values of individuals.

For Hegel, this designation is not the separation of different groups of people, but rather the assignment of different functional principles, purposes, and virtues of various social groups. What Hegel has in mind is an integration of different spheres of social life to realize the *freedom* of all (see [7], p.193). Individuals, seen not only in terms of their activities and particular *needs*, but also in terms of their moral values toward the community, are distributed among a range of different social functions, denoted in Hegel’s *work* by the term “*Stände*” (*estates*). Estates are groups of individuals who have common purposes, interests, skills, and overall similar characteristics of life, all of which maintain a similar education and culture (see [8]). Hegel’s division into estates takes place in an ethical way and is not determined by economic arguments. He divides people in the community into those who fulfill themselves in the political sphere and achieve true freedom and those who belong to the community only because of their private advantages and particular satisfaction of needs. The latter group of members is not free because they cannot find the free self-fulfillment and freedom in the community. They obey the general customs not freely but only because it increases their profit. They experience the community as limitation of freedom and not as the sphere of freedom. This attitude is specific for the members of the business sphere.

Hegel divides the state in his *Philosophy of Right* ([1]) into three main categories or estates: the estate of the statesmen (*Staatsbürger*), the estate of the peasants, and the estate of the businessman (*Besitzbürger* or *bourgeois*). The estate of the statesmen takes over the tasks of general government of the organized community. The statesmen should serve only the general interests and do not perform their private business affairs to support their lives (see [1], Sect. 205). The statesmen are any responsible citizens, including policemen, judges, and scientists, who fulfill state duties for the public purpose. They are free because they decide to consciously serve the state and in so doing find universal freedom and self-fulfillment. The peasants work for the satisfaction of physical needs and the preservation of the physical life of all members of the community. They are not free because they

serve the general interests only indirectly. Their self-determination toward the state is a naïve, immediate confidence in the community. The estate of the *businessmen* is divided into three sub-estates: the artisan, the manufacturers, and the traders, whose common purpose is gain.

The artisan transforms raw material and adapts it to human needs. Insofar as the artisan experiences independence from nature, he is nevertheless dependent on others who buy his products. The manufacturer primarily uses a machine for his work to facilitate the *work* of his factory workers and to produce larger quantities for larger markets. Today, we would call him entrepreneur. The trader uses money as a medium of exchange for products. He does not aspire to accumulate wealth, but instead to circulate it because he can maximize profit in this way. The win is the indefinite addiction and expanding trade across the national borders. The artisan works for the satisfaction of the needs of his customers, the manufacturers work for more general requirement, and the traders exchange the produced goods for money. The result is an economic network in which each one is dependent on the others (see [1], Sect. 204). This situation mediates their interests: Because everyone cares for himself, he also takes care of others: If someone spends money for his needs, he requires his contractor to be diligent and gives him the possibility of self-realization through work by relying on him.

Based on this commitment, people can maximize their own utility and the utility of others at the same time. This is in line with the classical economy. Hegel argues that this general utility is the case when the virtuous individuals in business fulfill their duty toward business, obey to the formal property rights, and therefore ensure the constituents of the business and society. In exchange, a business has a duty toward its members to ensure their free self-realization through work and to enable them to participate in the socioeconomic life. Hegel believes that this exchange between business and its members is difficult. He argues that the basic principle of mediation of business interests is not stable if it is based on private, random, and arbitrary needs and desires. A business is not reliable because not all members can benefit from the advantages of, for example, the promotion of skills, education, health care, and judicial systems. A business robs many of its members of the self-conscious life and the possibility of self-fulfillment through meaningful work. Left to itself, a business cannot guarantee the intact supply of all members with essential goods and work. On the contrary, a business throws people under its economic principles and polarizes them into rich and poor, according to Hegel. The greed and selfishness of the powerful, rich businessman causes social distress, a division of society into the misery of many and the luxury less. This result prompts a strong ethical criticism. During his lectures on the *Philosophy of Right*, Hegel explained each section, which is briefly summarized here, since they clearly underline the ethical criticism:

The business estate has attained in modern states against the other *estates* a great importance, but it should be appreciated not as high. The business estate is characterized by greed, excess and immensity of the pleasures to be bought by wealth. The assets owned by the citizens are so unsafe against waste that it can't contribute to the general wealth. ([9], p. 520)

Hegel's ethical criticism of the selfish businessman is very strong in his earlier writings in Jena (see [2]). In his *Philosophy of Right* [1] and in his last book, the third edition of the *Encyclopedia* of 1830, Hegel avoids sharply criticizing the selfishness of *businessmen*. He objectively recognizes the necessary role of the economic principle based on selfish purposes in the sphere of the business. He argues that the individual has a space for self-fulfillment in business, but it is too narrow for his full individual self-fulfillment and *freedom*. One example of self-determination is an individual's freedom to choose membership in an estate, even if this choice is often determined by circumstances outside the person's control (see [1], Sects. 206, 299). In principle, the individual is "determined by his own activity, diligence, and skill to be a member of one of the moments of the *civil society*" ([1], Sect. 207).

This self-determination of members to choose an estate and thus to be a part of the society emphasizes the modern aspect in Hegel's conception compared to Plato's (see [10]). Hegel's idea of self-determination is based on the moral conscience or the *righteousness*. The virtue of righteousness is defined as loyalty toward the estate and the state. The members of the business estate take over general obligations toward the estate, which leads to the fulfillment of their professional honor in the estate. Participating in the estate at the same time promotes the common interests of all members and partially distances it from selfish desires. The membership of *businessmen* in the estate has two effects: First, it stimulates the public interests of the otherwise mechanical business society, and second, the selfish individual can find both his subjective satisfaction and honor by fulfilling general duties. This fulfillment is only formal, because it is created without the true moral attitudes of the members. By participating in the estate, businessmen pursue only their private interests, desires, and affairs: They follow their obligations toward others and the estate only for that reason. Nevertheless, Hegel maintains the principle of individuality consistently and addresses his ethical criticism not to selfish individuals (*bourgeois*), but to the business estate as a whole. He requires a public need for power over the business estate to monitor the performance of duty toward their vulnerable members and enforce the law. This requirement takes place in an ethical way because Hegel insists on freedom: The members of the business estate should be able at the same time to confidently realize their freedom as self-fulfillment and the freedom of all in the society through their work.

The business estate, concerned solely with economics principles, does not guarantee this monitoring requirement. Hegel sees the solution to the conflict between universal *freedom* in the *ethical state* and the particular, private interest in the business estate in the creation of social institutions, which promote the freedom of all. This task requires an institution that mediates between the extremes of unrestricted arbitrary selfishness and government regulation of business. The mediator is necessary because extremes can easily turn on one another and thus paralyze market dynamics. Therefore, the market should be neither regulated nor uncontrolled. Hegel calls this mediating institution the *corporation*. The corporation is specific to the business estate. It represents the common interests and welfare

of the individuals in an estate. The purpose of the corporation is not only the formation of a sense of common interests but also the recognition and enforcement of the general interest of the business estate in the state.

The Corporation as a Self-Governing Body of Civil Society

The corporation is in Hegel's conception a way to self-manage the economy, a cooperative that brings together its members in various industries around a common professional purpose. Hegel refers to the term corporation in its original sense as any group of people who joined together for a common purpose. Common parlance now generally reserves the term corporation for profit-making, business organizations. In Hegel's theory, the individual members represent private economic interests, but these have grown into a shared and common interest. To achieve personal recognition and honor, individuals organize themselves into corporations, an undertaking that is contrary to their selfish interests. The notion of the personal respect allows us to understand markets as possible institutionalizations of this specific kind of recognition (see [5]).

In a corporation, *businessmen* in the organized estate can more easily claim their interests against the state; therefore, the corporation provides them an advantage over unorganized members. The corporation represents the professional interests of the businessman in the state. In exchange, the state should treat all individuals as members of various *estates* with respect for the corporation. This thought is current today. Particular individuals should not be at the mercy of the state. The corporation protects individuals from state authority.

The duties of the corporation are the protection of the public and the business itself from the monopoly of business; the limitation and control of production, particularly of food; and the development of infrastructure, among others. However, for Hegel, the main task of the corporation consists of promoting the theoretical and practical education of its members because doing so leads to freedom. The members select the corporation on their own terms, learn trades and skills, and get different privileges and honor. In a corporation, an individual attains a certain status in recognition of his efficiency and also the honor of volunteering to *work* for the disinterested, general purpose. By subordinating private interests under the public interests of the *corporation*, people develop a "corporation spirit" or "*esprit de corps*" ([1], Sect. 289). This corporation spirit is available to any member of the corporation and is independent of the members' personal economic situation. In order to fulfill its duties, the corporation must collect contributions from its members. The rich members should pay a higher amount for the membership than the poor. The corporation promotes not only solidarity among members but also the virtues of *righteousness*, true recognition, and honor. Hegel recognizes that the corporation constrains liberty in the marketplace, but he is convinced that a society based solely on market principles leads to a greater evil. Neither the totalitarian dictatorship of the state over the economy nor a planned economy is an option for Hegel because it does not preserve the subjective interests and freedom of all.

Hegel's solution to the conflict of universal and private interests of business society is the corporation's self-regulating function, which partially takes over duties in a business context and in the moral interest of the state. The corporations should be represented in the state and participate in governance. The delegation of representatives of various economic groups to develop the state governance and legislation is necessary (see [1], Sect. 308).

Hegel does not justify the individual right to participate in all organized groups in society with the democratic constitution of the state, but rather with the supreme duty in his ethical principles, which is the membership in the ideal state and the realization of freedom (see [1], Sect. 258). This obligation is abstract for *businessmen*. They experience membership in a concrete corporation more closely than in an abstract ideal state. They are more likely to fulfill their duties toward a professional corporation than an ideal state. When businessmen engage in the public, they should do this first in the estate, where they are familiar. Because businessmen do not understand the affairs of state, they should not directly participate in the government productively (extreme lobbying), but they are always free to contribute to the shaping of public opinion.

Despite the recognition of the corporation, Hegel bounds its role and function, since it consists of selfish businessmen. The selfish owner-members understand the primacy of general interest indirectly: They are more inclined to connect their public duty with private interests. The corporation is a place of "little passions and imaginations" ([1], Sects. 287, 288, 289), according to Hegel. Therefore, it may be that some *businessmen* involved in the institutions of the estate do not distinguish between private and political interests. Despite his misgivings about the "state capacity" of businessmen, Hegel provides them the opportunity to cooperate in a number of political functions of governance. The *corporation* has to assist the government in controlling violence of state authorities "from below." This control is especially necessary in determining an abuse of positions. This abuse is the case when people pursue private business at the public's expense. The corporation will monitor that statesmen do not isolate themselves like the aristocracy and transform their special status as an instrument of profit and domination over others. Rather, the behavior of statesmen must be a model for how to proceed in dealing with state interests. In addition, the corporation has an advisory role in the legislature. Although the highest state officials are able to determine what is best for people even without this advice, hearing the views of a corporation makes sense in urgent or special cases, since its members are also experts on various sectors and represent a large professional group.

The business, organized for itself and represented by corporations, shows that in this advisory role, a corporation can exhibit goodwill for the general public and that it is not contrary to interests of the government. In fact, corporations are mediators between the *ethical state* and the business estate because they represent moral functions in business without being state institutions. The problem remains, however, as already explained, that people who represent the "private matter" of business and at the same time participate in the legislative process present a conflict of interest because businessmen in general have no direct sense of community.

Hegel would accept modern lobbying and the support of business in general, but he would doubt the self-limiting ability of a business representative. The idea of the participation of the business estate in the legislative affairs of the state is still controversial today. The modern criticism is that businesspeople determine the affairs of the state. Lobbyists perform exceptionally effectively, so that often questionable deals between the government and business result. Other modern aspect of the Hegelian criticism is the social behavior of statesmen, a critical and very relevant point today. Modern members of a parliament receive income from industrial companies, so they are not independent, and mix private and political interests. Furthermore, politicians are engaged to support projects with particular businesses and after their political career receive attractive positions in the same company, a process which is often criticized today. The current statesmen, the politicians, should act in a responsible way to secure the *freedom* of all and not to secure the private interests of a privileged minority.

Conclusion

The economic system requires a normative justification to a higher principle. According to Hegel, the business sphere is a “battlefield of the individual private interest of all against all” ([1], Sect. 289). This conflict explains the necessity of lifting the economic system into a higher, more rational sphere. That this sphere is the *ethical state* follows from Hegel’s philosophy of the *objective spirit*, which is a result of metaphysical logic he develops. The ambivalence and contradictions of the business sphere are justified only because of the theoretical determination of the moral state. Regardless of the metaphysical foundation of Hegel’s moral state, it is hardly reasonable to interpret the consequences of his program for today’s conditions. Hegel’s solution to the ethical relationship between business and state remains controversial. Despite such problems in the Hegelian concept, it serves as a very suitable foil for the criticism of the current field of the business ethics and for gaining new insights in their development (see [2], p. 219).

Today, critics speak of “economic cynicism” ([11], p. 27) when economists claim to establish their own ethical principles and standards for business and to reflect on them. According to Hegel, economic principles are recognizable only in the sphere of *needs* and *work* and should not be applicable in the community in general because they do not secure the *freedom* of all. Hegel’s objection to the modern political economy of his time is not out of fashion today. Hegel does not reject the free market economy and the growth it generates, but he criticizes the growing tendency toward polarization of society into a few rich and countless poor. Hegel does not advocate slowing the general growth trend of an economy through governmental action, but argues those responsible to assume moral responsibility for the consequences of economic expansion. This requirement is in compliance with the ethical duty of a business toward impoverished people in facilitating a dignified, confident, economically secure life. Hegel doubts the voluntary duty of the rich economy because the social duties are contrary to the principle of a business estate, and he therefore calls for state protection.

Institutions as self-governing bodies of a business should protect the interests of all members of the business, including the interests of the impoverished ones. Through recognized *work*, individuals should attain their dignity and self-confidence in business. Education should be supported because it promotes the virtue of *righteousness*. This righteousness is the loyalty to institutions and the social norms as a basic moral attitude of *businessmen*, which motivated them to performance of duty toward the community. Righteousness also means to not blindly follow institutional norms because doing so brings a personal advantage, but to voluntary and actively shape and create a political and economic policy framework in which individuals can move freely. Hegel's demands of social care and the creation of conditions for virtuous education can certainly be addressed to business and key decision makers in the political and social state today.

Hegel's ethical criticism of business men who are only interested in profits and who do not respect social values is more relevant today than ever. The current economic crises are partly attributed to irresponsible and selfish economic actors. Political systems have the difficult task to create institutions that promote socially desirable behavior of economic agents – a modern project, the philosophical foundation of which goes back to Hegel.

1. Some researchers speak about *eudaemonic* will in the same sense (see [6], p. 41).
2. Ver Eecke calls it the paradox of the will and freedom: the will restricts itself to the moment of dissipation and is free at the same time (see [6] p. 40).
3. Hegel's theory also has several shortcomings: The expression of one's self is a relevant moral consideration, but it is not the sole reason for granting property rights with respect to that object (see [12], p. 326).
4. These arguments are elaborated in the writings of the Scottish economists, especially Adam Smith. Hegel based his philosophical reflections on these writings (see [13]).

Hegel and the French: Economical Philosophy Instead of Ethics

Abstract

The reception of Hegel has become decisive for French postwar philosophy. Due to the issues of the time and under the influence of other thinkers such as, first and foremost, Nietzsche, but also of Heidegger, Husserl, and Freud, this reception unearthed some completely new aspects of Hegelian dialectics; aspects so strikingly original, one can virtually speak of a specifically French Hegel. The work on economical questions has been under a strong Marxist influence from the very beginning, but quickly emancipated itself from Marxist presuppositions. Nor did this “philosophy of economy” submit to the mode of functionalist analysis but, just like Hegel himself, pursued its own approaches to a political economy; approaches which, also like Hegel, were less inspired by moral philosophical considerations than by an examination of the “economy of reason.”

Introduction

This chapter begins with a presentation of the main features of Hegel’s philosophical economics, already reflecting the future reception in France in its thematical accentuations. The second part reconstructs Hegel’s effect on French philosophy in the context of its autochthonous, contemporary questions. The object is not so much to set factual or communicative misunderstandings off against each other in order to save a possible true Hegelianism from obscurity but to carve out the lasting creative impulses – and those that still have to be actualized in the future. On the

whole, this Franco-German discourse on economy is more strongly marked by challenges to thinking than by moral ones. The philosophical contribution to an Enlightenment of economy is thus being developed hand in hand with the importance of the economical for the concept of reason.

Hegel and Economy

The Economy of Reason

What and how does Hegel think about economy? In order to clarify this point, one must neither let economics in the tradition of Adam Smith dictate one's concept of economy, nor let moral philosophy determine the forms of critical reflection of a given economical practice's ethical shortcomings. Hegel was not only familiar with the more recent theoretical approaches of his time but also with the traditions of philosophical economics. It was Aristotle's political economy, in particular, that provided essential guidelines for his own thought.

Whoever consults traditions of philosophical thought in search of new ways to change things for the better in the field of economy always does well in not letting ready-made concepts block these ways from the start. This especially holds true for Hegel, who would not let anyone else dictate how he was to conceive economy. The question, what economy actually *is*, is thus automatically raised. Likewise, in searching for an ethos of economy, one must neither presuppose a predetermined concept of economy nor an otherwise consolidated conception of ethical norms or procedures.

For each subject he addresses, Hegel gives an account of how philosophy can deal with it at all – and how it might even be best suited to deal with it. The question of a “philosophy of economy” is therefore at the same time the question of the concept of philosophy as a whole, as well as the question of an “economy of reason.” What is rational? And which form of rationality best fits the specific *nomos* of economy?

Without a doubt, opportunity is the epitome of economical rationality. Aristotle had already remarked, however, that opportunism turns into its opposite, into misuse, in a closed system of instrumental rationality and speculation on utility (cf. [5], NE I, 1 1094 a). He solved this aporia by expanding the concept of opportunism in order to include, for example, a speculation on happiness; a speculation on something useless and purposeless, therefore, which – nonetheless and even precisely for this reason – represents a *conditio sine qua non* of successful social economy (cf. [35]). Opening up this dimension of speculation on opportunity, however, also requires a transcending of the instrumental type of rationality (cf. [5], X, pp. 6–9). Instead of determining a specific type of economical rationality and then trying to remedy the aporias deriving from it by means of moral investments, Aristotle therefore relies on the power of knowledge. He counts on thinking's ability to transcend its limits for the sake of knowledge and to transform itself into a new form of reason where the necessity arises.

Quite similarly, Hegel does not base his concept of economy on a specific, universally valid type of rationality. Confronting formations of reasonableness with themselves in such a way that the aporias and contradictions of those formations become visible, letting emerge a new form of reasonable thinking, acting, and perceiving by way of a reconciliation of reason and unreasonableness – that is precisely what Hegel’s dialectics amounts to. Following Aristotle, Hegel brings into play the *metamorphic* element of an economy of reason, which is an essential trait of the form of his analysis of social economy on the one hand and shapes social economic rationality as such on the other.

The Global Economy

Reason, however, is not only concerned with reason. For Hegel in particular, rationality is not only a question of the correct instrumental use of the powers of understanding. Instead, he holds that there is a more or less successful unity of self-consciousness and the world’s appearance. Reason only embodies its reality as reason of the world, not just in people’s heads. A horizon exceeding a mere social or cultural concept thus opens up to the rationalization of economy. The economical finds its place in the domain of human interaction, market economy, maximization of utility, and appropriation of nature, but also in being as such, for example. Economy is, as it was for Plato (cf. [34], pp. 93–96; [61], *Timaeus* 27d–34b) and later for Bataille [9], not only economy *in* the world but economy *of* the world.

When, for example, Hegel begins his *Science of Logic* with the examination of *being*, which, hardly even mentioned, already starts to dissolve into *nothingness*, when this nothingness then reveals being as everything and ultimately finds itself in *becoming* (cf. [40], I, 1 A–C, pp. 82–115) – who would not see a productive economy of logic being at work there? One could of course try to reconstruct the dialectics of the *Phenomenology of Spirit* in terms of causality. With equal or greater right, however, one could also find an economy at work in it: What does – or doesn’t – the spirit gain, as a realization of perception and action, and in what way does it gain it cf. Chap. 2.7? All of its developments, going from “sense-certainty” ([41], A I, pp. 82–93) to “self-consciousness” ([41], B IV, pp. 137–178) and “reason” ([41], C (AA), V, pp. 178–324) and finally to the “spirit” knowing itself ([41], (BB) VI, pp. 324–495), are the results of successful or unsuccessful speculations on something, on some kind of proceeds, and therefore entail a certain return. What emerges as “world” from all this is not pure objectivism, not only a world in itself, but also a world for those whose world it is.

This is of particular importance for the development of economical reason as well. For Hegel, economical reason is not characterized by a primarily mathematical and causal-mechanical rationality, in which human motivations only appear as functional factors of an autonomous system of rationality – a system operating without regard to the way people think themselves and their relation to *their* economy, and which is consequently nothing but *the economy tout court*. Hegel

does not see the autonomy of economy as definable by a purely functional law but only through the inclusion of that which is currently being sought to integrate into the theory design of economics under the name of behavioral economics.

Due to the global concept of reason, economy can thus not simply be presented as an economy of product allocation, drawing on the price mechanism as its most relevant regulatory instrument. Rather, it also has to take into account a product in many ways defying purely market-based forms of calculations, but which cannot be excluded as simply pre- or an-economical for all that. This product is the world as such, or rather the transformation of a natural supply of being into the emergence of a world. Economy is therefore not only the art of exploitation of natural and worldly resources but at the same time an economy of world creation. Plato, by the way, had already delineated economy in this same cosmopolitical dimension (cf. [61], *Timaeus* 27d–34b).

The Good Person and the Economy of Profit

Aside from those extensive dimensions, economy as economy of the world also features the intensive dimension of an economy of life. In its theoretical models, modern economics systematically presupposes an individualism whose origins are not further reflected upon, because they are of no real relevance for the design of these models. This individualism does have its history, however. It is not a natural property of humankind. Where, for example, people are primarily somebody's subjects, or where all their wishes and wants are firmly and functionally tied to the reproduction of family, tribe, or species, purely self-interested ambition does not have any actual value – neither for themselves nor for the general economical activity.

People's attainment of independence, their becoming free subjects, able to decide for themselves what they want, seems to be owed to the termination of such serfdom as a result of a history of *political* emancipation. According to Hegel, however, this individual freedom already develops by way of a certain *economical* speculation, as a result of which the independent consciousness separates itself from the dependent one. Both, however, initially refer to one another in mutual recognition, each being what it is through the other one, in such a way that "the *menial consciousness* is the independent consciousness's *truth*" ([41], B IV. A, p. 152). But what triggers this dialectics between lordship and servitude? Well, "for servitude, the lord is the essence" ([41], B IV. A, p. 152). The servant thus does not only have an external relation to his lord. Rather, servitude has "*experienced* [this lordship as its] *essence in itself*" ([41], B IV. A, p. 153). "This consciousness was not only anxious about this or that thing, nor about this or that moment, but about its whole essence; it felt the fear of death, the absolute master" ([41], B IV. A, p. 153).

Hegel then goes on to develop how the trembling endurance of this fear of death brings about a liquefaction that already is "the simple essence of self-consciousness" ([41], B IV. A, p. 153). But only "in serving does it *really* accomplish" this dissolution and "sublate its attachment to natural existence in all its *individual* moments" ([41], B IV. A, p. 153). Fear of death ties life to natural existence. Life then means self-assertion, however. It becomes a permanent struggle for survival.

Death is the master of this unfree and menial life. In other words, life is this life's price, at least in the form of the development of autonomous individuality. Only in taking the risk of not only unconsciously submitting to this absolute power but of feeling it in the "fear of the lord" ([41], B IV. A, p. 153) can this life be liberated from such servitude to its conservation. This means, however, abandoning one's self-assertion and risking *this* life, which disappropriates everyone precisely to the extent to which one clings to it. According to Hegel, this happens in the form of labor, but only in as far as this labor is productive and does not itself only consume life (cf. Chap. 2.8). Sovereign individuality thus owes its reality to an elementary economy of life. Only he who thus risks his self-assertion may win *himself* – in a freedom only now endowing him with his life.

This economy before economy, if you will, is not only a kind of backstory, however, becoming irrelevant as soon as it attains the result of sovereign individuality's existence. Firstly, concrete individuation remains a continuous challenge, as it is not a disposable possession. Secondly, where people do not know how to win *themselves*, everything else is lost and vain. Thirdly, the overcoming of the paradigm of self-assertion is crucial for the economical horizon of speculation. As long as all wishing remains subsumed under the norm of self-preservation, economy cannot get beyond the zero-sum game of a purely reproductive order. The possibility for wishing to overcome and sublimate *being* (that which is and has been) in favor of the realization of fantasies about what could be then does not exist. Strictly put, where there is no way for something that does not exist to come about by way of wishing, the above-mentioned freedom does not exist, the freedom whose "reality" is the foundation of both the democratic rule of law and of a modern economy which is not an economy of reproduction but an economy of growth – or, more to the point and according to its own idea, an economy of profit.

What Hegel does in *Phenomenology of Spirit*, particularly in the chapter on "Lordship and Servitude" (which was to become so important for post-Marxist French philosophy), can with some right be read as a discussion of the ways of development of the idea of the *good person*. For in whichever way the spirit unfolds itself for itself and regarding the world, the way man thinks himself is inevitably embedded in it. And Hegel's views on man's development are equally positive and optimistic as those regarding the spirit's self-fulfillment (or self-appropriation, in economic terms) in the world. Contrary to common opinion, the *good person* is, in this phenomenology of its genesis, a moral issue only by way of exception, namely, in the chapters on "The Moral Worldview," "Dissemblance," and "Conscience. The beautiful Soul, Evil and its Forgiveness" ([41], (BB) VI. C a–c, pp. 442–494).

Moral issue or not, however, an economical reading of Hegel here finds the fundamental way in which the realization of the idea of the good person determines what economy is and can be. The possibility of transforming the zero-sum game of a mere economy of redistribution (which cannot be overcome by a reproductive order of life) into an economy of profit depends on it. And what is more, the possibility for an economy in the strict sense of the term to emerge depends on it, too, an economy, which is not only lawless and power-based disposal of resources but functions in accordance with an innate *nomos*.

Ethical Life and Morality

One would thus have to look at Hegel's philosophy as a whole in order to fully extrapolate all the dimensions of his concept of economy. When he decidedly and explicitly addresses the subject of economy, however, it is a very particular kind of economic activity. This takes place in the *Philosophy of Right*, more precisely in its third part, on "*Ethical Life*" ("*Sittlichkeit*," [42], Sect. 142–360). According to Hegel, the existence and historic establishment of legality is the primary systematic condition for the existence of that which has come to be known as *economy* in modern times. He embeds this economy in the interdependency of politics, quite in accordance with the classical model of philosophical economics in the tradition of Aristotle (cf. [4], I, pp. 2–12). Economy therefore appears, eo ipso, as political economy.

For Hegel, this particular form of economical activity is already a form of ethical life, which, as a whole, consists of the family (cf. [42], Sect. 158–181), the civic community (cf. [42], Sect. 182–256), and the state (cf. [42], Sect. 257–329). This ethical life, however, is not the same as morality. Hegel defines ethical life as the "unity of the subjective and objective good in and for itself" ([42], Sect. 141 Addition, p. 290). And this good is "the essential universal of freedom" ([42], Sect. 141, p. 286), meaning it is not any particular kind of moral norm, hierarchically superior to freedom, but rather the successful unfolding of freedom by the people, regarding the people and the world. According to Hegel, then, that which is and must be the point of departure for any ethics is also the meaning, the substance, and the end of any endeavor to achieve the good; for where there is no freedom but only the reign of necessity, the power of fate, or pure causality, an ethics cannot even be conceived of. Freedom itself is "the good," not something else under whose rule it would attain its legitimacy.

In ethical life, the "merely *intended* good and the equally abstract subjectivity merely *intended to be good*" ([42], Sect. 141, p. 286), on the one hand, and the merely objectively universal right on the other mutate to become the concretion of these pretensions. "Neither right nor morality can exist independently. They must have the ethical as a pillar and as a foundation, because right lacks the element of subjectivity, which in turn is the only thing morality has, so that neither has any reality by itself" ([42], Sect. 141 Addition, p. 291). Ethical life therefore begins, where moralizing ends. This, however, is precisely how it helps to bring morality into its own, as long as morality does not insist on playing off the *ought* against *being*. Ethical life, as Hegel understands it, thus is not an ideal, morally valuable state of individual and collective behavior but transformational instead. It is "the *idea of freedom* as the living good, [. . .] – the concept of freedom, that has become the existing world and the nature of self-consciousness" ([42], Sect. 142, p. 292).

Following Hegel, then, any attempt to change the economy for the better, to make it "good," by combining functional rationality and normative business ethics (and therefore by balancing market and morality), must immediately be discarded. But economy as such is a part of *this* ethical life and must neither be described

in merely mathematical terms nor in merely objectively functionalist categories in compliance with a causal logic, but only in terms of the political economy of “ethical life lost in its extremes” ([42], Sect. 184, p. 340).

Desire and the “System of Needs and Wants”

This specific form of economical activity as part of ethical life emerged as the history of mankind had attained a specific way of life; one in which the existence of the *citizen* for the first time ever made it possible to speak of “human beings” in a real sense, as Hegel asserts, following up on Aristotle’s notion of man as *zoon politikon* (cf. [42], Sect. 190, p. 348). This *civic society* organizes itself economically, as a *system of needs and wants*. Its precondition is the replacement of the originally superordinate primary system of the bonds of kinship by the polis (cf. [42], Sect. 182, Addition, p. 339). Where life still takes place in a system of families, tribes, or clans (as was the case in the so-called palace economies of the pre-political Homeric era or at the height of feudalist Europe’s Ancien Régime), there is neither a civic society nor a system of needs and wants.

According to Hegel, the civic economy’s pivotal point in this system is neither the market (even though he does not at all underestimate its historic importance) (cf. [42], Sect. 247, p. 391) nor money, neither lack nor production, but its desire, for one cannot speak of an economy where there can be no wanting or wishing. It appears as an art of desire and its satisfaction. The precondition for human desire to become the reason for civic society (and for satisfaction to become its end) is that it is no longer exclusively integrated as a function of the species’ biological reproduction and no longer subsumed under the necessity of self-preservation (cf. [42], Sect. 181, p. 338). People appreciate it as such. They have discovered its productive force, which greatly exceeds the reproductive function of self-preservation, and no longer fear it. At the same time, this liberation is the precondition for the development of an autonomous economy, following its own immanent laws. In its difference to the *Reich*’s, the *oikos*’ or the *Empire*’s family-dynastic system, this form of economy can only exist in the “state,” in the sense of *polis* or *res publica*, and is therefore a genuinely political economy, an economy of democracy.

In civic society, the freedom of desire takes on the form of needs and wants. Needs and wants are neither the only and authentic form of desire nor a biological trait of human beings. A hungry person, for example, does not experience this hunger, as *having* the need for nourishment. If one *does not hunger*, maybe even to the point of being overcome by apathetic lethargy, but *has* the need to eat, one has already formed a certain *conception* of one’s condition, in which the actual distress has already been somewhat sublimated. Needs and wants are thus an artificial form of appearance of lack, as well as of the nature of man and life.

If desire takes on the form of needs and wants, this implies a certain distancing from themselves on the part of the citizens, who *have* these needs and wants and can therefore deal with their desire as they see fit. At the same time, those needs and wants are also dissociated from the individual and may therefore take on all kinds of

shapes. Thus, they can be created and instrumentalized in order to make a profit (cf. [42], Sect. 191 Addition, p. 349). The fact that the citizen *has* needs and wants is an existing personal wealth in itself, even though they demand work to be done, because they still need and want to be satisfied. And this work can increase infinitely because the needs and wants realize their independence of their master as an uncontrolled multiplication (cf. [42], Sect. 190, p. 347). Desire in the form of needs and wants is thus free to the same extent that it is unfree. And man realizes himself in the satisfaction of his needs and wants to the extent that he alienates himself from himself in it. Therefore, Hegel holds, the reification of desire in needs and wants implies an amalgamation of arbitrariness and necessity, of measure and excess (cf. [42], Sect. 185 Addition, p. 342, Sect. 187, p. 343).

Understanding, Its Discontent and Knowledge

Classical economics as designed by Smith, Say, and Ricardo is considered the science of this civic economy of desire, the science that “in the infinite multitude of details [. . .] finds the simple principles of the matter, the understanding operating in and ruling it” ([42], Sect. 189, p. 347). “This bustling of arbitrariness [. . .], this seemingly dispersed and thoughtless multitude is bound by a necessity that emerges all by itself. Discovering this necessity is the task of economics – a science that honors thinking in finding the laws for a mass of coincidences” ([42], Sect. 189 Addition, p. 347). It thus seems that, in this type of regulative rationalization, the economy is already in the best of scientific hands.

But this “reconciling element,” this “appearance of reasonability, inherent and active in the matter,” is, at the same time, “the field where understanding, marked by subjective ends and moral opinions, vents its discontent and moral fretfulness” ([42], Sect. 189, p. 347). The antagonism of market and morality opening up here, Hegel asserts, is not a factual one. To him, it is rather to be found in economical understanding as such, in an understanding that objectifies itself in the simple principles of the matter on the one hand, and which experiences a subjective discontent with this circumstance on the other. The moral discontent is thus already part of the problem and, to Hegel, even more delegitimized than neutral know-how. It is but an indicator that something is not right. Therefore, he himself does not follow the path of a moral criticism of economy but sticks to the explication of economy (cf. [63], p. 36).

The Philosophy of Economy

What kind of light can the philosopher bring into the matter, however, if economical understanding has already determined the principles, and morality does not count for much? And how should Hegel be read? Firstly, one must take care not to be seduced into a judgmental reading – neither by such concepts as *selfishness* ([42], Sect. 183, p. 340), *excess* ([42], Sect. 185 Addition, p. 342), or *arbitrariness*

([42], Sect. 189 Addition, p. 347) nor by the appearances of bourgeois economical activity, which, from a moral point of view, must seem quite abominable in itself. Hegel speaks of a “spectacle [. . .] of debauchery, of misery and of the physical and ethical corruption shared by both” ([42], Sect. 185, p. 341). He thus takes an esthetical perspective on social economy and interprets it as a drama; for this, ethical corruption has its inherent necessity as part of an economy of salvation, if you will (cf. [42], Sect. 185, p. 341).

Even in the form of an “ethical life lost in its extremes” ([42], Sect. 184, p. 340), the *system of needs and wants* is part of the historic and systematic self-realization of the good and of the development of freedom. In civic society, ethical conventions are no longer just means to peacefully organize a situation (or even to make it more agreeable) based on something else – for example, on nature, family, or just brute force. Instead, and for the first time ever, ethical life becomes civic society’s foundation of existence. Precisely for this reason, its essence manifests itself as economical, and not in the forms of politeness, virtue, personal disposition, and the normative idealism of an ethics wanting to begin only where economic materialism ends. Civic society has to be able to afford itself.

Ethical life is thus a generator of real life at the beginning of the development of civic society’s substantial essence. At the beginning of this process, the ethical presents itself as unethical, and the unethical as ethical. The transformation of the unethical into the ethical *is* ethical. This requires a representation of the unethical that includes the power of its refinement. For what is supposed to be the meaning of an ethical life unable to transform its opposite into itself just because, investing all its power in rigid rejection, it is unable to even recognize it.

What does this mean for the economy essential to ethical life? It means that the economy’s *nomos* can never be realized in simple processes of distribution, transaction, allocation, or maximizing of utility and profit, as they are subject to the paradigm of quantitative increase. Its realization can only succeed in the form of metamorphic transformations.

Hegel himself already takes a first step in outlining civic economy. His account already breaks with bourgeois self-perception. He does not present economy as an externalized, functional, and systematic objectivity but as a human economy, continually making obvious what the society expects itself to endure. If, with more than just a theoretical interest, the civic society was capable of reflecting itself in its *system of wants and needs* as Hegel extrapolates it, it would inevitably be pushed beyond its own limits.

The metamorphic approach becomes systematically visible in the civic rationality’s differentiation into *effective and governing understanding* on the one hand and the *active appearance of reasonability* inherent in it on the other. In light of this differentiation, the conflict between market and morality appears to be a problem of knowledge and thinking that can neither be solved with the instruments of understanding nor with an ethics informed by the stipulations of prudence. Even if the subjective fretfulness of moralizing based on an individualist ethics could overcome the immanence of this system, however, it would probably still shipwreck on the economical force of the system of “all-round entanglement of

mutual dependency” ([42], Sect. 199, p. 353). And there is a further problem: trying to deal with the more alarming economical realities as they appear to theory and practice of economical know-how by adding meta-economical norms means recognizing the validity of “Verstandesdenken” (understanding thought), the prevalent type of rationality in the economy. Behind the back of all good intentions, this kind of economical know-how is thus asserted as being without any alternative. Hegel therefore takes a different approach: Instead of speculating on a normative superstructure, he speculates on a metamorphosis of this way of thinking. “Hegel and Smith are using different concepts of economy” ([63], p. 34).

As much as *understanding* may be able to show how everything is mutually dependent, it will never be able to comprehend the independent element active within. This is the point where it falls back on the famous metaphor of the *invisible hand*, borrowed from religious tradition. It understands causality, but, Hegel writes, it can only see freedom and autonomy as a kind of *necessity that occurs by itself*. Where *reason* enlightens the world of understanding, however, “Verstandesdenken” can be transformed into reason. All that was understood by understanding, and all that was misunderstood in the functional and regulatory abstractions it objectifies itself in, can then be reformulated in another way. Just as Hegel does not describe needs and wants as a natural fact, but as a *social* formation of *desire of desire* (cf. [42], Sect. 194, p. 350, and [33], p. 58) and of its suffering and enduring, an enlightenment of reason does no longer presuppose the facticity of the civic economy’s appearances but reveals each one of them as being founded in a particular notion.

Accordingly, the site of *economy* is not an abstract causal mechanics but world history (cf. [42], Sect. 341–360, p. 503ff). Civic economy is based on various historic preconditions and therefore is in no way history’s last word. “By its own dialectics, civic society is being pushed beyond itself” ([42], Sect. 246, p. 391). Due to its speculative energy, the economical development builds up a *dramatic* dynamic, incomprehensible to a functionalist analysis of its laws. Other than Marx, however, Hegel refrains from making concrete predictions about the civic economy’s future. And wisely so (cf. [42], end of the preface, p. 28), one is tempted to say with today’s benefit of hindsight. Today, we know to what extent the system of needs and wants was then only at the very beginning of its historic unleashing, and its end is further out of sight than ever, as it seems to have absolutely no alternative at all.

Instead, Hegel expands the horizon civic economy exists in beyond the concepts of a purely market-oriented perspective. For example, he leaves open the difference between realization/fulfillment and alienation (cf. [42], Sect. 198, p. 352f). And he takes the contradiction of exponential enrichment and pauperization seriously, instead of one-sidedly counting on the positive effect of either austerity or enrichment. He does not envisage the disappearance of poverty all by itself but expects an “infinite increase of dependency and misery” to go along with the “multiplication and specification of needs and wants, means and pleasures that [. . .] has no limit” ([42], Sect. 195, p. 351). Even if it were possible, then, to mitigate or even eliminate traditional forms of poverty and existential misery by way of a general participation

in the processes of enrichment, this would still continuously conjure up new kinds of lack, of impoverishment of human life, of extortion, and of coercion – as we today know much better than Hegel could have ever predicted.

Additionally, Hegel puts the difference between appearance and truth into play, seeing – just as Luhmann ([53], p. 177ff) would later do – an essential but clandestine trait of economical rationality in it. This difference “hides the [presupposed] strict natural necessity” so that “man positions himself in relation to *his* [necessity], meaning a general opinion and a self-made necessity” ([42], Sect. 194, p. 350, cf. Sect. 190 Addition, p. 348).

The State and the Metamorphosis of Self-Interest

Instrumentally rational economical opportunism finds an additional perspective in Hegel’s specific differentiation of state and society. To him, the state is not an intrinsically an-economical and merely superordinate authority; it is a constitutive element of economical activity. Where states do not exist, neither does the unleashed individual desire whose imaginative power is the foundation of economic freedom’s prosperity, nor does the dynamic unfolding between individual self-interest, multiplication of needs and wants, and the sum of individual activities. For Hegel, the relationship of state and society is not one of subsumption but of development and transformation.

“Civic society is the tremendous power seizing man” so that “everything he is, he is through it, and everything he does, he does by it” ([42], Sect. 238, S. 386). Compared to this tremendous power of all-round entanglement of mutual dependency, it appears to be somewhat “arbitrary [...] to be a member of a state” ([42], Sect. 258, p. 399), while the state appears to be “concerned only with emergencies and meeting the requirements of understanding” ([42], Sect. 183, p. 340). Where “the interest of the individuals as such is the final end to which they are united” ([42], Sect. 258, p. 399), the state only works as an external authority, drawing on nothing but people’s acceptance of its necessity for its legitimacy. It is indispensable because it is needed for the regulation of everyone’s personal realization of freedom. Other than that, it does not mean a thing – or is even, latently or openly, rejected as a foreign, patronizing an intrinsically illegitimate power. Things would be better if it were not necessary and could be dispensed with.

Where the pursuit of egoistic ends turns everything and everyone into an instrument to achieve these ends, Hegel writes, this same selfishness takes on a life of its own as a system – in opposition to everyone else *and* sucking them up at the same time. The individuals’ freedom to make their desire and their most personal affairs their final end can thus not yet get over a mere addiction to itself. And as long as the individuals identify themselves and their desire with this selfishness, this freedom as such cannot be realized. It pairs up with the dependency of everyone from everyone. The ideal of economic success and the richness of successful self-realization is then no longer the satisfaction of wants and needs but the greatest amount of independence and of unhindered enjoyment of such antisocialness.

The state is the reason for this fatal circumstance, not the *empire* or the *imperium*, mind you, but the *res publica*, the *polis*. Only the polis opens up a world beyond the closed sphere of family life marked by patriarchal power, maternal law, and dynastic serfdom, a world that, by means of individual human rights, puts an autonomous ethos into force and puts people in relation to one another in the form of citizens, who are at first just as selfish as they are self-reliant and independent (cf. [42], Sect. 181, p. 338, Sect. 182, p. 339). *Citizens* only exist through each other, in the *polis*, not by way of reproduction of the species in the bosom of the family. Civic society is therefore an effect of the realization of the idea of the state and in no way its cause. And this also holds true for its specific economy, bound by internal laws. Otherwise, the economy would simply be determined by an anomic power of disposal over natural and human resources.

In light of this breakdown of the problem, the state, reduced to an instrument for the regulation of a general framework, does not offer a real solution for society's contradictions. According to Hegel, it rather fulfills itself in a politico-therapeutic process. The civic society's immanent dynamic eventually leads to a point where the "immediate ethical life" is mediated into the state, the *res publica*, as an effect of the "division of civic society," and the state "reveals itself as being its true reason" ([42], Sect. 256, p. 397), for it "is the ethical idea's reality" ([42], Sect. 257, p. 398) and therefore "the reality of concrete freedom" ([42], Sect. 260, p. 406). It has "the will as its principle" ([42], Sect. 258, p. 400). Desire is its original reason and the reason of its development. Accordingly, the state only exists as long as it is desired. Necessity alone is not a sufficient foundation for it. The state is the institutionalization of the desirable's emancipation of that which exists. It is a speculative, not only a regulatory authority, a perennial gamble on its future, on what desire will become.

Hegel does not conceive freedom as being subsumed under the individual citizens, who then make it the instrument of pursuing their selfish ends, thus enslaving and consequently losing it. For Hegel, freedom is free. "Freedom, [. . .] whether man knows it or not, [. . .] realizes itself as an independent force, of which the single individuals are mere aspects" ([42], Sect. 258 Addition, p. 403).

But how can the state's externalization from civic society and the citizens' externalization from their state be sublated? Well, as selfish as the citizens may be in their actions, they always transcend themselves in them as they make use of others. And, according to Hegel, they not only do this out of necessity but want to do it. It is thus a reduction – and an excessive one at that – of individual freedom to realize oneself in nothing but selfishness. Free will is expansive; it wants to "get over itself" and wants to break its own limits. "The will's activity" is "the sublation of the contradiction of subjectivity and objectivity" ([42], Sect. 28, p. 79). And "The idea of the will is *the free will, that wants the free will*" ([42], Sect. 27, p. 79). Or, as Hegel elsewhere puts it: "Self-consciousness achieves its satisfaction only in another self-consciousness" ([41], B IV., p. 144). Hegel thus concludes: "*Unification* as such is itself the true substance and end, and the individuals' purpose is the leading of a universal life; the substantial and universal is the origin and the result of their particular satisfaction, activity and comportment" ([42], Sect. 258, p. 399).

With this integration of the *res publica* into the economical horizon, the social economy – in accordance with its reason, desire – transforms itself into a sort of *political erotology*. While this notion might remain rather latent in Hegel’s own work, it has very instinctively been grasped by his readers in France cf. Chaps. 2.5–2.8. The scope of economical speculation exceeds the necessary or desired maximization of utility and profit to include a dimension of freedom that cannot be comprehended by utilitarian and instrumental thinking. Political economy acquires the chance for a sovereignty of desire in the face of the power of needs and wants. For, where needs and wants utterly dominate those who have them, civic society dissolves into a sort of slavery that will sooner or later create the tyrants it then requires. Additionally, political economy even integrates the possibility for supra-individual and metaphysical/mystical dimensions of happiness into its “product range”: “The state is the spirit that is in the world and realizes itself in it with ‘consciousness,’ whereas it only realizes itself as sleeping spirit in nature. [...] it is God’s way in the world that the state exists; its reason [Grund] is the force of reason realizing itself as will,” as Hegel emphatically puts it ([42], Sect. 258 Addition, p. 403).

With this kind of utopical, metaphysical republicanism, Hegel is far ahead of his times – and probably even ahead of ours, too. He redefines the divine in republican terms. Freedom, as the god of *democratic economy*, may well be an attractive alternative to the apotheosis of an *invisible hand* that, due to irresistible market mechanisms, leads all things toward a good defined by these same market mechanisms. In the forming of the political will modern parliamentarism stands for, and which is not only a means to an end but also the fulfillment of every end’s pursuit (cf. [72]), this *invisible hand* would probably be better off with a head after all. Wherever its contradictions may push civic economy to neither the satisfaction of moral needs and wants nor theoretical efforts of rationalization alone will be of much effect. The common ethos only finds its opportunity in the happiness of being able to make history.

Hegel in France

The Arrival

Hegel made his entrance to the philosophical discourse in France relatively late (cf. [60], p. 7, [3]). When he finally did, however, it was with such a force that the (in some parts groundbreaking) achievements of French thinking could not even be imagined to have happened without Hegelian dialectics. Even the most insistent efforts to “escape Hegel” by overcoming the “Hegelian self-evidence” ([28], p. 369) so as not to be “taken in by Hegelian discourse” ([28], p. 370, cf. [2]) remain indebted to him.

At the beginning, however, the reception of Hegel’s philosophy in France was facing a number of obstacles. While it did have some importance in the nineteenth century’s socialist movement, its influence abruptly ended in the aftermath of the

Paris *commune*'s collapse in May 1871 (cf. [46], p. 37f); the general anti-German sentiment after the defeat in the Franco-Prussian War further contributed to Hegel's image as Prussian state philosopher. This socialist tradition, however, was to be of great importance for the interpretation of Hegel in France later on, and the critical discussion of Marxism is a central theme in the history of French Hegel reception.

As late as 1930, however, Hegel was still widely unknown in France (cf. [50], p. 226). Translations were scarce; writings such as the *Science of Logic*, the *Philosophy of Right*, and the *Phenomenology of Spirit*, which were to be of great importance later on, were not available in French. Furthermore, Hegel's terminology and his systematic linking of logics and history were met with much reservation on the part of an academic discussion strongly oriented at Cartesian and Kantian traditions, as well as on the example of mathematics (cf. [60], p. 7). Hegel soon moved into the spotlight, however, and he did so with lasting effect. Especially, the translations of his earlier writings – the *Phenomenology*, the *Philosophy of Right*, and the *Philosophy of History* in particular – became rather important. In these early writings, French readers saw the possibility to open up the Hegelian system that seemed to be so closed in itself. This crucially helped along Hegel's success in France, to a point where it reached beyond a purely academic discourse of philosophy and its history and also generated some politico-polemical force (cf. [32], pp. 19–31).

Thus, as soon as 1947, Merleau-Ponty could state: "Hegel is at the origin of everything great that philosophy has accomplished during the last century [. . .] – he established the effort to study the irrational and integrate it into an expanded reason, which still is the task of the century" ([58], p. 109f). This did not change after the first generation of Hegel readers' excitement turned into an equally forceful opposition and rejection among the second one (cf. [69], p. 10ff). "I know [. . .] that our whole era is trying to escape Hegel, be it in the fields of logics or of epistemology, be it with Marx or with Nietzsche. [. . .] But in order to really escape Hegel, one has to know [. . .] which parts of our thinking against Hegel might still originate from Hegel; one has to fathom to what extent our attack against him is in fact his own ruse, behind of which he is still lurking," ([38], p. 52) Foucault cautioned in his inaugural lecture at the Collège de France in 1970. His words carried all the more weight, as he himself quite resolutely tried to overcome Hegelian dialectics in *Les mots et le choses* [37] and in *Histoire de la folie* [36].

Epochal Catastrophes and the Problem of Logocentrism

While Marxist criticism of political economy defined the first approach to Hegel, the interpretation of Hegel – and French philosophy in general – after the war was also strongly influenced by Kierkegaard, Husserl, Heidegger, and particularly by Nietzsche's criticism of civilization. Furthermore, the interdisciplinary integration of psychoanalysis, as well as of ethnological and sociological research, became defining for French thinking. Above all, however, two historical factors provided the background for the particular way of thinking in France. The first one consists of

more recent historic developments: On the one hand, there was the more or less consciously witnessed demise of Europe's civilizatorian arrogance in the battles of material and the blood sacrifices of World War I (including the genocide of Armenians) – and, shortly afterward, in the even more traumatic abysses of fascism, World War II, and Holocaust. On the other hand, there were the inhuman horrors of Stalinist gulags and, later on, the catastrophe of the Vietnam War. The end of colonialism, which took a rather fatal course for France in some ways, also played an important role; just think of the wars in Algeria, or of the one in Indochina, which only later became the American Vietnam War. All of this seemed to announce the end of the European universalism of reason and called the habitual euro- and logocentrism of European philosophy and intellectual history into question.

The second historical factor is the collective memory of the French Revolution in 1789, constitutive for the French's image of themselves and the world. It documents the possibility of radically speculating on a fall in the market, in order to find solutions for present problems in epochal change. In light of this memory, it seemed to be within the realm of possibility to expose oneself to an "experience of the absolute difference" ([28], p. 387) and to find one's salvation in the drama of a "sublation of economy" ([9], cf. [28], p. 397ff), instead of continuously investing all forces into the evolutionary development and optimization of given conditions of life.

The catastrophe of civilization in the first half of the last century not only brought about the loss of innocence of politics, morality and economy. It did not only mean the end of the previous certainty regarding the progress of enlightenment and increasing historical humanization. For many French philosophers, writers and artists the European history of reason as a whole was called into question. The European project of rationalization could no longer be continued as before. "Thinking must be buried alive" because it "is devastating," as Bataille suspected ([7], p. 242). Philosophy therefore no longer finds its meaning in efforts for further optimization of rational competence but in the radicality with which it manages to criticize this rationality and really "make a difference." It must "step out of the philosophical logos and think the unthinkable" ([28], p. 402).

Marxist materialism and psychoanalysis (cf. [51]) increased awareness for the bourgeois high culture's *underworld* and the European history of decline, which had been covered up by the bourgeois society's general optimism of profit and growth. The influence of sociological research provoked insights into the latent effects of repression and exclusion generated by the generalization of reason (cf. [36]). Ethnology had acquired a new sense for the archaic and offered the chance to take a virtually naïve and primitive look on modern civilization in order to see what cannot be seen from within it, out of its own perspective (cf. [14, 25, 56]). In order to confront the monsters reason *only* gives birth to in its sleep – as El Greco still thought he could hope – other resources such as the writings of de Sade (cf. e.g. [18]), Cocteau's *Theatre of Cruelty*, and the kind of thinking associated with surrealist art, were also put to use (just like the latter also made use of Hegel: cf. e.g. [65]).

Without sources of this kind, after all, "*the impossible*" ([28], p. 397) could hardly have been made possible; the impossible task, that is, of discovering a new

thinking of thinking, beyond the thinking conditioned by the history of rationalization, down to the core of its logic and efficiency, of its self-regulation and legitimation. For to recognize thinking as such to be a problem and to still want to tackle and solve this problem by way of thinking – this project indeed demonstrates an enormous trust in the possibilities of reflection and knowledge, but is also an aporetic imposition. In a series of methodological revolutions, from *phenomenology* (cf. [54]) and *existentialism* (cf. [67], p. 57), over *structuralism* and *post-structuralism* up to *deconstructivism* and *postmodernism*, French philosophy thus engaged in the intellectual experiment of a savage thinking (cf. [25, 26, 52]) – in order to develop new, dramatic ways of thinking between rationality and irrationality, mind and sensuality, between crime and the good, and finally between *nomos*, rule and order on the one side, and all kinds of anomalies and perversions on the other (cf. [13]).

The Overcoming of Dialectics

In this topically and methodologically provoking environment after World War II, Hegel's philosophy finally began to make a significant but also a very unconventional impact. More than almost anything else, it seemed to hold the answers for the questions of modernity. On this same background, however, it was also subjected to a reading that made previously unstudied aspects and potentials of it visible and productive – even though this reading was rather unscrupulous in its hermeneutics at times (cf. [69], p. 10).

It started with thinkers like Jean Wahl (cf. [20], pp. 77–89; [71]), Maurice Blanchot (cf. [39], pp. 65–76), Jean Hyppolite ([44], cf. [43], pp. 91–104), Alexandre Kojève (cf. [33], pp. 49–31; [48]), Louis Althusser [1], Alexandre Koyré [50], Eric Weil (cf. [6], pp. 105–112), and later Sartre [66–68], who were already dealing with existential questions and were also already more or less cured of any naïve and untarnished optimism of reason due to their work on Nietzsche, Marx, Kierkegaard, Husserl, and/or Heidegger. They were the first to discover the very vital and concrete sense of the drama of happiness *and* unhappiness, reason *and* unreasonableness of real-life hiding behind the façade of Hegel's allegedly abstract and historically optimistic system. Wahl and Hyppolite, for example, found crucial impulses for their ontological diagnoses of existence in the unhappy consciousness's tragic experience of disruption (cf. [45]); for Weil and Kojève, Hegel's concepts of satisfaction and recognition were particularly significant; and Koyré's discussion of the concept of time focused on the primacy of the future as the speculative reason of all efforts to attain satisfaction.

Due to his propagandist and class struggle-oriented verve, as well as due to the glamorous *radical chic* of his circle (cf. [33], p. 49ff), Kojève's approaches most certainly had the most profound impact on the ensuing period. In his reading of Hegel, the internal perspective on the subject's inwardness which particularly marked Wahl's thinking was expanded to include its political dimension. Hyppolite's logic of the unsubtly differential structure of self-consciousness

was transformed into the possibility of historical self-transcending. Kojève saw the key to man's historical emancipation in the dialectics of lordship and servitude, which became downright synonymous with Hegelian philosophy in France (cf. [60], pp. 10–14).

“One cannot read Hegel, unless one does not read him” ([19], cf. [63]). Blanchot's seemingly paradoxical sentence vividly illustrates the kind of intellectual experiment French philosophy engaged in when confronting Hegel. It did not only treat his dialectics of contradictions as an object for thinking but imposed it on itself. These philosophers allowed themselves to be seized by the contradictions of comprehension and noncomprehension, of thinking, and of thoughtlessness. Only through non-comprehension did Hegel seem comprehensible to them. The belief in the disposability of a pre-stabilized intellectual sovereignty, against which nothing in the world could resist and which let absolutely everything seem thinkable, was shattered. On the other hand, however, Blanchot's sentence also documents the emancipatory and nondogmatic encouragement to think for oneself that can arise from Hegel's philosophy. One does not really understand what Hegel has to offer when one submits to his logos word by word. Only in freeing oneself from what there is to read in Hegel's texts through new and original thinking can they be understood. This very point, however, sometimes gives rise to the question whether that which the French think they understand under the name of Hegel is indeed still Hegel or not. But, of course, the philological way of reading is neither the only possible one nor always best suited to understand and make productive what a philosophical writer asks us to think about.

Thirdly, Blanchot's sentence already indicates what was going to come after the first, emphatically affirmative phase of Hegel's reception in France. The second generation, from Sartre and Merleau-Ponty to Foucault, Deleuze, and Derrida, was more and more characterized by efforts to distinguish themselves from Hegel. While for Koyré and Kojève Hegelian dialectics seemed to contain the most stable philosophical foundation for emancipation and freedom (cf. [60], p. 14) possibly conceivable, the next generation saw its pretension of totality to be a perfidious method to annihilate the exact same freedom it promises (cf. [21, 28, 29, 55, 66–68, 71]). Everything it gets hold of is immediately dissolved into the prison of a monistic universe. For, in all of Hegel's differentiations – for example, of consciousness's or spirit's metamorphoses – one thing always remains the same, unshakably unharmed by any of these transformations: dialectics itself. Especially Foucault thus discussed, in *Histoire de la Folie* ([36], cf. [60], pp. 151–305), a dogmatics of reasonability and truth pretending to dialectically integrate madness, unreasonableness, and dreams, while *in truth* excluding and gagging them by forcing on them the categories of a consciousness that is virtually awake all of the time. The success story of dialectics thus simultaneously appears to be one of its decline – increasing knowledge pairs up with an increasing obfuscation (cf. [60], p. 19); the liberation by the forces of reason leads to a prison of this very reason.

Thus, for Foucault, just as for Deleuze and Derrida, the attempt to think the irreducible difference of something wholly other than reason became

paramount – against synthesis, in which they saw less of an actual comprehension than of subjugation, subsumption, and occupying appropriation. Foucault knew, however, that using the concept of difference meant using a concept that was more lastingly effective in Hegel’s philosophy than in almost every other one. And Derrida, to discharge this difference, pronouncedly included – *almost* in the style of Hegel – the possible impossibility of the unthinkable in his deconstructivist systematics (cf. [30]). For Deleuze, on the other hand, the necessity to work through Hegel in order to arrive on the other side seems to be done away with right from the start (cf. [69], p. 16). But as different as his thinking appears to be from Hegel’s, to comprehend, for example, his discussion of myth and schizophrenia of the economy (cf. [25]), few things are better suited than a decent experience in Hegelian thinking. In these developments, then, Hegel seems rather to be liberated from the prison of a certain Hegelianism than rendered obsolete.

On the Relation of Existentialism and Economy

In general, economical considerations are a determining factor of French postwar thinking (cf. on Sartre: e.g. [70]). But just like the economics of Hegelian philosophy largely remains a research desideratum, so does the economics of French philosophy as it developed under the influence of Hegel’s thinking. Even though the research on the *French Hegel* (cf. [16, 31, 47, 60, 69]) does reflect the intrinsic economical aspects of thinking as exposed by Blanchot and others, their relevance for the concept of economy is not being tapped (exceptions: cf. [23, 24, 27, 28, 30, 57, 62]). Other aspects are in the foreground, particularly the concept of philosophy and questions about the constitution of reason and rationality themselves.

And that is so in spite of the fact that the existentialist approach is genuinely economical, no matter if it features Sartre’s or Kojève’s Marxist coloring or not. Existentialism is all about the questions of an “Economy of Life” ([28], p. 380). Therefore, the economical is a characteristic element of Hegel’s reception in France. In confronting aporias of human self-creation with the help of Hegelian concepts like unhappy consciousness, satisfaction, or freedom, one inevitably finds oneself facing an economical provocation. And these aporias seem to arise on a regular basis, whenever the dialectics of gaining self-consciousness is not only abstractly thought about, as if it were but an interesting object of cultivated thinking, but with the intention of *existentially* putting something into the world and into its own with one’s self, something that exists only in the case of success and that can be taken as one’s own (cf. [39], p. 67). This is no longer just a power game for recognition but a speculative investment in the form of abandoning what one believed to already have, in order to win something in which one may possibly have a hard time recognizing oneself.

Blanchot gives a good example when, inspired by the chapter on *Absolute Freedom and Terror* in Hegel’s *Phenomenology* ([41], (BB) VI. B III., pp. 431–441), he remarks about the revolutionaries Robespierre and Saint-Just

that they did not act “like living people among living people [. . .], but like creatures bereaved of their being, like universal thoughts, like pure abstractions, judging and deciding” ([17], p. 310). This depicts a horrible economy of privation, as thinking seizes the power over life, or as the result of an effort to take possession of life by means of thinking. According to Blanchot’s and Hegel’s analysis of the French Revolution, this seizure of power in the name of absolute freedom – and therefore of a freedom trying to escape its economy – costed the lives of many others before its truth was objectively executed as the “freedom of the cut off head” ([17], p. 310), as the “freedom of suicide” ([39], p. 68).

Today, one would surely want to see an effort of coming to terms with some bizarre psychological problem in this interpretation. A coming to terms, moreover, with a distant past, in which the unreasonableness of individual pretension of reasonableness sucked up a whole culture. A coming to terms, however, that does not contribute much to the clarification of an economical formation of rationality. But such a psychologization places the internal economy taking place in the relation of life and its rationalization outside of the ambit of economy. Even though economy is an unconditional part of human self-realization, it thus takes on the form of a rational system, external to individual reason. In the light of an “economy of reason” ([28], p. 382) as developed by Blanchot (following Hegel), one has to wonder, however, if such an externalization of economy, self-evident to the dominant form of contemporary economics, does not systematically operate the *assertion of reality of an abstraction* – just like those described by Blanchot. For in this system conception, the realization of human self-consciousness is simultaneously objectified and obstructed. *Reason*, introduced by Hegel as a transformational expansion of *understanding*, thus turns against *understanding* in Blanchot’s adoption of Hegel’s approach.

Transformations of the Concept of Economy

The economics intrinsic to existentially inspired philosophy (cf. [11] and [67]) lives on in this approach’s ensuing structuralist and post-structuralist transformations, up to Derrida’s deconstructivism. Wherever cultures of rational and transrational or physical-metaphysical relations are addressed, the question of these constellations’ “mode of movement,” of their significations and structures, plays a crucial role. The post-structuralist confrontation of the totalitarianism of discriminating logocentrism and substantializing naturalizing normativisms also puts latent or open equalizations of logics and causality up for discussion. In light of such a problem awareness, it does not seem convincing that it is still customary in the economics to speak of *mechanisms* when talking about the modes of movement and operation of the studied universally valid laws of market transactions. But how can the movement creating and dissolving structures be described, if not as causally mechanic? Deleuze and Guattari, in their examination of *Capitalism and Schizophrenia* [25], and also Derrida in *Donner le temps 1: La fausse monnaie* [30] develop specific economies as an a-mechanistic mode of movement *in nuce* – and

come up with a new concept of economy in the process (cf. [34], p. 83f). Few things are more clearly responsible for the enduring incommensurability of the economics developing in French theory on one side, and Anglo-American mainstream-economics and ordoliberal approaches in Germany on the other. While the latter presuppose certain factual conditions, French thinkers put such factual presuppositions up for discussion (cf. [34]).

The economies often to be found in the developments of French philosophy do not only spring from the confrontation with the dominating economical theory and practice. The economical axioms often derive from totally different questions, having little to do with the political and economical developments of industrial society and its succeeding forms. They were consequences of philosophical thinking's internal conversation itself, of the work on an economy of reason. When expressly addressing questions of social economy, French philosophy accordingly did not submit to the functionalist and causal-analytical standards of contemporary economics. Instead, they preferred to develop their own philosophical conception of economics, including its own paradigmatics. In view of growing doubts regarding the economics' capability (cf. [64]), their results are among the most forward-looking available today. Just like Aristotle, these discourses do not reduce the whole economical field to utilitarian considerations (cf. [28]), monetary economy, and the market. Here, economy is always political economy, in an extensive and intensive cosmopolitical relationship of human development and world creation. And it does not only move about in a pre-stabilized system of rationality but always leaves room for a dialectics of reason and irrationality, logos, and myth, being and nonbeing.

The cultural formation of economy is another feature affecting methodology beyond the contextual horizon of the economical appearance. Thus, in opposition to the causally functionalist paradigm of interpretation, existentialism already introduces the concept of the tragic Foucault would later reincorporate in his own way (cf. [45, 49, 59]; [60], p. 19f, 138ff). In the works of Deleuze/Guattari and Derrida, the drama (cf. [25, 30]) shapes their specific hermeneutics and presentation. And Bataille adopts Nietzsche's model of a *gay science* in order to follow the traces of economical phenomena otherwise remaining in the dark. The logos putting trust in laughter also plays a decisive role in his examination of Hegelianism (cf. Chap. 2.7).

The Humanization of Economy

French philosophy influenced by Hegel does not, however, bother all that much with moral remonstrances regarding the excesses of economy's dominant form. Nonetheless, the economical, in all the various kinds it exists in, is being subjected to a thorough humanization. Modern economy does of course already claim to be humane: in its utility, in the freedom it has made its principle, in the right it grants personal self-interest, and in the general wealth it generates. Dangers to humanity are continuously being corrected by sociopolitical cushioning of unequal participation

possibilities, by environmental policy, ethical codes, etc. It serves people – that is where its humanity lies. Critical minds, on the contrary, see people as being in the economy's service and believe a moral corset to be necessary in order for the economy to live up to its claim. Its still being there, with no end in sight, however, is clear proof of the acceptance it still enjoys, even if this should only be due to the supposed lack of an alternative. Thus, people serve the economy and work with its innate laws, and the economy serves them. This circulation of utility suffices. The more deftly one knows how to make use of it, the larger the advantage that can be gained out of one's own service to it.

In contrast, philosophical humanization consists in leading economical theory and practice out of the abstractions of scientifically objectified rationality and mathematical function analysis of the conditions of production, allocation, and utility maximization and back to the concreteness of its origins in human desire, in human self-realization, and in the self-shaping of reason. It thus no longer appears as a system, theoretically existing in and by itself, in its own rationality, and independent of actual individual participation – as a ready-made system, therefore, in which the individual utility maximizers only then play a part, according to their respective possibilities and decisions. While the universal code of self-interest operates an abstraction from the manifold shapes of human individuality, a philosophical perspective comprehends economy as such as consisting in and arising from human participation in it, and vice versa. In doing so, economy is not being traced back and attributed to forms of conscious or unconscious inwardness. It does, however, no longer appear as an external systematic space with numerous possibilities of personal appropriation but, wholly rearranged, as an economy not of understanding but rather of the soul (modeled after Hegel's concept of the world-soul) – that is, an economy of the self-motion emerging in the interplay of self and world.

In the functionalist perspective, economics shares with business ethics morality, this kind of humanization seems dysfunctional, of little use and impractical in dealing with the hardships of necessity. To someone taking this perspective and concerned with people's needs and legitimate wants to be able to make a reasonable living, to know how to save themselves from losses, and how to successfully get ahead in life, this kind of philosophy of economy might seem to be a cynical luxury for sophisticated elitists who do not have anything else to worry about.

Functionalist analysis, however, knows the difference between the wrong and the right calculation of proven and unproven assertions, and it knows *reality* – it does not know the differentiation of reality in appearance and truth introduced by Hegel. And this difference is hard to avoid for philosophy; even where, in well-founded self-limitation, it shies away from saying anything definitive about “the truth.” Thus, under the paradigm of functionalist calculation, one might distinctly observe economic growth – for example, with regard to the GDP. From the perspective of philosophical enlightenment, however, Baudrillard summarizes that we are “no longer in a period of growth, but in a situation of excesses. We live in an affluent society, where everything keeps growing and can no longer be measured according to its own aims. Excess develops uncontrollably, without

regard for its actual purpose, and its consequences grow larger as its reasons disappear” ([15], p. 38). Everything growth was originally meant to be useful for, now serves the end of growth itself. Functionality and dysfunctionality became indiscernible.

Another good reason to think beyond a functional analysis of economy resulted from the French discussion of Hegel’s dialectics of lordship and servitude. There were not only critical confrontations of existing power relations, and few have lastingly given in to the hope that the proletariat would sooner or later realize this dialectics’ emancipatory effect. The indifference of lordship and servitude, of necessity and freedom, inherent in the logics of functionalist causal analysis, however, was no acceptable solution either. Instead of all this, the concept of sovereignty moved into the center of attention. This is particularly true for Bataille (cf. [28]).

George Bataille’s Concept of General Economy

Bataille is certainly a key figure of French philosophical economics – he opened up crucial perspectives for it. According to his belief, no concept of world economy, understood as general economy (cf. [28], p. 396f), can be obtained from partial and limited business studies or national economics. The basic problem is that “economy is never seen as a ‘general phenomenon’ [. . .] Economics contents itself with the generalization of an isolated phenomenon, it limits its object to actions undertaken with a particular utility in mind, namely the utility for the homo oeconomicus; it never considers the dynamics of energy not limited by any particular end: [. . .] For living matter as a whole, the energy on the earth is always excessive. One always has to reflect this in terms of luxury, every difference is always only a difference in the way of wasting riches” ([9], p. 61).

A difference thus opens up between economics as a social science and the economy of the world – and, as Bataille asserts, the latter cannot be explained with the former. With the opening up of this world’s economical, cosmopolitical horizon, the focus is also put on different concepts; concepts that must seem all but accursed (e.g., “waste”), or at least irrelevant for the constitution of the system (e.g., “excess”), to a partial economy. The concept of luxury plays a crucial role in all this. Excess, otherwise relevant only through advantageous reutilization and reinvestment, finds its true purpose and meaning. This purpose lies precisely in the freedom of purpose of a purpose fulfilled; a freedom of purpose that thus finds itself reintegrated into the horizon for economical speculation. In this way, economy is liberated from the shackles of an otherwise universal utilitarian paradigm. Not only misery, lack, or similar restrictions determine the norms, while all other things are only resources that can be used to turn the misfortune of universal coercion and existential extortion into a more or less profitable economical activity – for this activity could then not promise more than a comforting compensation of the basic ill. It would be but a machine of perpetual reproduction of coercions.

Instead of projecting only the art of permanent, successful dealing with emergencies into the world’s nature, as suggested by evolutionism, Bataille sees the

exuberant expenditure of a creative energy at work in the unfoundedness and freedom of purpose of the world's existence. This notion of the *general economy* of an originally fortunate world also has consequences for his idea of man: "Man is not just an isolated creature, claiming the living world's and other people's part of the sources of energy. The living matter's general procedure of exudation (of waste) also seizes him, and he cannot escape it [. . .]. If he denies this, as suggested time and again by the consciousness of the misery and neediness characterizing the isolated creature (who forever lacks resources, who is constantly being compelled), this denial does not change anything about the general movement of energy: it cannot unlimitedly accumulate productive resources. In the end, it must slip away and be lost to us like the river in the sea" ([9], p. 61).

This extensive side of general economy is complemented by the intensive dimension of an integration of the manyfold erotological internal economies of human suffering and desire (cf. [12]). Bataille takes up the desire Hegel supposed to be the origin of economy in the civic society's *system of needs and wants* and then unfolds and differentiates it into its many shapes. While Adam Smith fixed economy to the rational-utilitarian concept of *homo oeconomicus*, an entire culture of life is being depicted here; a culture that stops at nothing, not at love or sexuality with all its perversions and particularly not at death. Bataille reconstructs the life economical effect of different forms of dealing with mortality. For in the face of this dramatic loss of life, all human self-appropriation regarding the world and one's own life seems to experience its ultimate powerlessness and futility; here, at least for the individual, every effort to gain something out of life seems to be smashed into pieces with metaphysical force. The scope of Bataille's discussion of this phenomenon reaches from tabooization and repression, over sublimation in physical reproduction or ideological eternization (e.g., in systematic constructions of the supra-historically, eternally human, particularly ill suited to comfort the a-dynastical *bourgeois* and citizen), up to murder as an attempt to master death in being the doer instead of the victim – an attempt that can only achieve a delay of the inevitable, however.

This losing bargain of life seems to render all our daily struggles for self-preservation and particularly any form of profit seeking, utterly ridiculous. Instead of advocating a stoic fatalism, or an economy of sullen damage compensation, Bataille seeks the options that might still lie in this fateful power of death, beyond this ultimate mockery reducing all speculations on utility to a mere sweetening of the time preceding the final disappointment. On the one hand, this leads him to make a plea for a life of "*relentless expenditure*" ([28], p. 393), for abandoning the fixation on individual self-assertion against loss. On the other hand, where there is a limit, there is always the possibility of redemptive transgression. He therefore does not one-sidedly subsume all of economy under concepts of appropriation and profit maximization. For him, the (supposed or real) excesses of economic speculation therefore do not trigger any regulative or normative reflexes, but rather provoke a perspective of ecstatic-eschatological delimitations and of the reintegration of metaphysical dimensions into the concept of economy – for example, in the "experience of the sacred" ([28], p. 378). As much as Bataille here, at the latest,

seems to take his leave from economical realism, as much potential is to be found there, both for the comprehension of the concept of speculation and of the “real value” of money. For economical speculation and money both have real meaning for modern societies that exceed their mere instrumental character by far.

“Hegelianism Without Reserve”: Sovereignty

Hegel was not the only influence on Bataille, of course, but he did play an important role. In his famous essay *From restricted to general economy. A Hegelianism without reserve* ([28], pp. 369–407), Derrida retraced the conclusions Bataille arrived at in his “endless discussion with Hegel” ([28], p. 372). At the same time, this essay is somewhat representative of the French Hegel discussion’s general tendency and gives a pretty good idea of Derrida’s own economical approach.

Bataille, too, rather sticks to the *Phenomenology of Spirit*, instead of the “aged Hegel’s” system ([11], p. 524, cf. [28], p. 372). “The system is nullification” ([7], p. 71, cf. [28], p. 372). Following Koyré and Kojève, the dialectics of lordship and servitude is a crucial point of contact, “the central point of Hegelianism, according to Bataille” ([28], p. 374). In presenting this dialectics, Bataille argues, Hegel himself gets caught in a “menial attitude” ([28], p. 384) that does not risk life. This makes dialectics a work on truth (cf. [28], p. 376f), and turns “work” into the “meaning’s meaning” (cf. [22] too; [28], p. 384), consequently robbing work of its meaning by making it an end in itself.

In order not to lose his mind and go crazy (cf. [7], p. 71 and [28], p. 372) out of “fear of an irretrievable expenditure,” Hegel fled into a “submission to the evidence of meaning,” Derrida asserts ([28], p. 377). “The concept of *Aufhebung* (according to Hegel the speculative concept par excellence, and, in its untranslatability, exclusive property of the German language) is ridiculous as it denotes the busyness of a discourse laboring for the reappropriation of all negativity, and doing everything to turn the stake in the game into an investment that is supposed to completely *amortize* the expenses” ([28], p. 377f).

Economy begins in the mind thinking about the economy of the world. And Hegel’s reason, thus the reproach coming from both Bataille and Derrida, refuses to relinquish what it lives from, namely, its having a meaning. Everything else is subjected to dialectics and thus to negativity, to an “ars moriendi” – only reason itself rejects what it imposes on everything else. Neither Bataille nor Derrida, however, would suggest to just abandon reason in the face of such a disaster. On the contrary, it has to be freed from its own logocentrism – and thus saved from making itself lose its mind, from robbing itself of its freedom in misdirected appropriation.

If reason, amortizing its stake in this way, absolutely insists on its self-assertion, “the economy of life restricts itself to preservation [. . .] and reproduction” ([28], p. 376). Thus, “Hegel abolished the stroke of luck” ([8], p. 133, cf. [28], p. 385) and “laughter is absent from the Hegelian system” ([28], p. 377). It is “of no use to a ‘philosophy’ that ‘is work’” ([28], p. 377). Only in the “laughter about the philosophy (of Hegelianism)” ([28], p. 370), in which “meaning entirely

disappears” ([28], p. 377), reason finds its freedom. When reason no longer clings to itself, but wastes itself instead, when the work of reason – or, more to the point, reason as work – ceases, then its true creativity and productivity will unfold. It is then no longer a part of a “restricted economy” ([28], p. 405) but opens it up to become a general and political economy. For then, it introduces sovereignty into the economical game. It manifests in the form of an “energy surplus” which “can only be wasted randomly, without any meaning.” This useless and meaningless waste is “sovereignty” ([7], p. 283). This sovereignty, that Bataille distinguishes from lordship as servitude’s opponent ([28], p. 374) then becomes the reason for work, for all the restricted economies and for democracy. It *is* freedom.

One may doubt whether this “laughter in [Hegel’s] philosophy” is in fact as “out of place” ([28], p. 378) as Bataille assumes; it is clear, however, what Bataille and Derrida are getting at. They are aiming at an art of thinking, capable of transcending the servitude of life and of self-assertion, in order to render essential dimensions accessible to the comprehension of economy – dimensions otherwise remaining inaccessible both theoretically and practically. Bataille knew, however, to what extent even this *overcoming* of the Hegelian economy of thinking remains indebted to Hegel. Hegel “did not know in what extent he was right” ([10], p. 36; cf. [28], p. 382). And Derrida agrees, with similarly iridescent assertions: “Hegel saw this without seeing it, and he showed it by hiding it. One thus has to follow him to the extreme, up to the point where one has to agree with him against himself” ([28], p. 381). And Derrida concludes: “Reason’s sleep may not be reason fallen asleep, but sleep in the form of reason, the vigilance of Hegelian logos” ([28], p. 370).

Conclusion

Pragmatism and the Tragic

Surely, Bataille and Derrida showed and were characterized by an artist’s – possibly even a subversive, surrealist artists (cf. [33], pp. 50, 59, 61) – perspective on economy; much rather than by a pragmatic one, each day facing new problems that must be solved, and having to be able to handle the things it encounters. From such a pragmatic viewpoint, their mental acrobatics might seem impractical – or even the superfluous luxury of frivolous bohemians, scandalous in the face of everyday woes. But the economy of democracy also affects those who are not on the payroll of economical activity. It is also the business of those who do not define themselves through their function in this activity. And they, too, have something to say, and precisely from this perspective they can make an important contribution to the comprehension of the economy they are a part of.

For what has proven its worth to the pragmatic, and seems rational with regard to market economy because it works, can have totally disparate and irrational results in other respects. The necessary pragmatic opportunism and the pressure to keep things running at all costs virtually force one to close one’s eyes to the possibility of all this having long become insufferable, to the possibility that we are only managing a catastrophe and a misery that could

only be corrected by abandoning this kind of pragmatic heroism. Thus, any society having a sufficient number of people blessed with such artistic sense, any society that listens to these people when they actually accept the kind of responsibility *they* have, can count itself lucky. It is not a pragmatic but a tragic responsibility to sharpen the senses for misery and to find the language for the unbearable and the incomprehensible. It is the tragic responsibility to let a desirable future arise from the logics of fear and misery, on the cliffs of whose overpowering sensuality all reason is threatened with shipwreck – even if this future would bring something unheard of.

French philosophy is not fixated on an attempt to create a meta-historical, universal concept of economy, which would make *this* economy's rationality an inescapable prison – and which, to them, would be irrational and totalitarian (cf. [35], p. 112ff). From this spring various forms of epochal differentiation of an economy of economies and of metamorphoses of economical thinking and action's levels of expectations. Cruelties rendered categorically inaccessible and taboo to the circulation of rationality because they have systematically been shifted from their original sphere, into the area of the irrational and the jurisdiction of morality, are to be freed from these same taboos. Instead of aiming at the economical influence's containment from a moral philosophical perspective, those philosophers set out to find the real limits of economy, its beginning and its end, and to find rationality in places where it will shipwreck or has already shipwrecked, the catastrophe being covered up with a camouflage of economical rationality.

What is economy? How can there be economy? Is there any economy? Or is economy really that which we already believe it to be? Where such questions are being asked, a dialectics of economy and non-economy is automatically opened up. Thus, Bataille addresses the sublation of the social economy's instrumentally rational activity in the attained end. For the economy's utility remains unfathomable, where one cannot think the attainment of ends (cf. [9]). In asking for the origin of economy, Derrida, too, encounters the "an-economical" ([30], p. 17). One can hardly seek the economy's origin and primary energy without admitting the possibility that it might not exist at all. Baudrillard examines the consequences of the repression of death in economical systematics and cannot help but suspect that we have established an an-economical illusion of economy in its place (cf. [14]). And when Deleuze and Guattari reconstruct the archaics and genealogy of economical formations, it appears, in method and contents, as if reason, a dreamwalker in the nights of history, releases itself from its usual fixation on the daylight of constant vigilance (cf. [25]). Derrida, once again, endeavors to develop categories for the determination of the economy's *nomos* that would liberate it from its Babylonian imprisonment in mechanist metaphysics. In doing so, he discovers the Dionysian element of "chrematistic delirium" ([30], p. 203) without which there can be no economy – and thus once again comes close to Hegel, namely, to his dictum about the Bacchic delirium of truth, whose every limb is drunken (cf. [41], Preface, p. 46). This does, however, put the general, dominating fixation on causal reconstruction of economical functionality up for discussion.

French philosophy thus does not oppose economy with an ethos. Rather, it develops the economy's real or potential ethos, as well as the economy itself, in light of its ethos – just like Hegel and, before him, Aristotle comprehended economy as the forming of a material and political ethical life. One may not want to accept every idea in Hegel's reception or in economical thinking, but Hegel's differentiation of economical thinking between understanding analysis and enlightenment of reason has doubtlessly been an immense inspiration for the French. This also holds true for the French claim on metamorphosis instead of accumulation, in order to find a way out of *common physical and ethical corruption* (cf. [42], Sect. 185, p. 341). And, conversely, the French have made dimensions of Hegelian dialectics of reason productive for further development of *economical reason* that would still be covered up by darkness were it not for their emphatic confrontation with Hegel's power of persuasion.

Part 5

A Marxist Ethic of Business

J. Angelo Corlett

Abstract

This chapter seeks to clarify the nature of Karl Marx's views on a variety of related concerns, including the matters of rights, responsibility, punishment, compensation, alienation, and exploitation in capitalist societies. In clarifying such matters, it is hoped that what Marx might say about business ethics will come to light.

It is one of the peculiar ironies of history that there are no limits to the misunderstanding and distortion of theories, even in an age when there is unlimited access to the sources; there is no more drastic example of this phenomenon than what has happened to the theory of Karl Marx in the last few decades. There is continuous reference to Marx and Marxism in the press, in the speeches of politicians, in books and articles written by respectable social scientists and philosophers; yet with few exceptions, it seems that the politicians and newspapermen have never as much as glanced at a line written by Marx, and that the social scientists are satisfied with a minimal knowledge of Marx. Apparently they feel safe in acting as experts in this field, since nobody with power and status in the social-research empire challenges their ignorant statements. – Erich Fromm [1].

Marxism sees history as a protracted process of liberation – from the scarcity imposed on humanity by nature, and from the oppression imposed by some people on others. Members of ruling and subject classes share the cost of natural scarcity unequally, and Marxism predicts, and fights for, the disappearance of society's perennial class division. – G. A. Cohen [2].

Marxism is not one theory, but a set of more or less related theories. – G. A. Cohen ([2], p. 155).

The language of moral rights is the language of justice, and whoever takes justice seriously must accept that there exist moral rights. – G. A. Cohen ([2], p. 297).

This chapter is dedicated to Gerald Alan Cohen, whose work on Marx has deeply influenced my thinking on Marx.

Introduction

Given the considerable corpus of Karl Marx's writings, what might one inspired by the writings of Marx think about business, especially business within the framework of a capitalist society? This chapter answers these and related questions by exploring how Marx's and Marxist conceptions of ownership of the means of production, alienation, exploitation, responsibility, punishment, compensation, and environmental responsibility pertain to the arena of business in a capitalist society such as the United States of (North) America.

Some clarification is in order concerning the interpretation of Marx's work. In congruence with the above epigraph from Erich Fromm, the words of Marx have very often been "systematically distorted" [3] "with propaganda of every kind" [4] – both from alleged supporters and detractors of Marx. One thing often overlooked or ignored is the fact that Marx was first and foremost a philosopher in the Socratic sense. His doctoral dissertation at the University of Jena was on ancient Greek philosophy [5]. So it is reasonable to assume that he was well acquainted with the depiction of Socratic dialectic as it is presented in Plato's dialogues [6]. And so it is of little surprise that we find Marx writing in a way that often exhibited some of the trademarks of Socrates' way of doing philosophy [7]. Marx questioned everything pertinent to his inquiries; hence, the title of one of his essays was "For a Ruthless Criticism of Everything Existing" [8]. To Arnold Ruge, he writes of a "*ruthless criticism of all that exists*, ruthless both in the sense of not being afraid of the results it arrives at and in the sense of being just a little afraid of conflict with the powers that be." From this set of claims, Marx reasons that "I am not in favour of raising any dogmatic banner. On the contrary, we must try to help the dogmatists to clarify their propositions for themselves" [9]. He once stated that he was "not a Marxist," implying that he did not think in a way that sought to rigidly systematize his ideas in a way that did not always leave them open to criticism and revision. As G. A. Cohen astutely observes and as quoted in one of the above epigraphs, "Marxism is not one theory, but a set of more or less related theories" ([2], p. 155). Marx was, in short, a fallibilist, epistemically speaking. This may explain why he revised his thinking on numerous occasions. What many of his critics wrongly construe as contradictions in his thought and what several alleged supporters see as Marx's once and for all answers to this or that issue fail to understand that Marx was not a thinker who sought to provide a kind of doctrinal account of matters social, political, and economic. Rather, he was searching for the best answers to certain important problems. "And since philosophy of the analytical kind is particularly good at correcting misconstrual, . . . it follows that it can be a potent solvent of at least some ideological illusions. It can be used to expose conceptual misapprehensions which strengthen the *status quo*" ([2], p. 291). It is with this in mind that I offer herein a Marxist account of various issues related to business. Marx's critique of capitalist business enterprise is moral in content. Contrary to what some have argued, [10] most of what Marx writes about capitalism just does constitute a moral critique of capitalism at its very core.¹

Marx engaged himself in the analytical philosophical enterprise of normative ethics, for he sought answers to the questions of how we ought to live our lives, and why.

One example of how badly Marx has been misunderstood pertains to his discussion of rights. It is commonly thought that Marx's critique of capitalism was so radical that it rejected rights *per se*.² Much of the basis of this interpretation of Marx and rights is found in *The Jewish Question* and in *The Holy Family* wherein Marx writes:

...the so-called *rights of man*, the *droits de l'homme* as distinct from the *droits du citoyen*, are nothing but the rights of a *member of civil society*, i.e., the rights of egoistic man, of man separated from other men and from the community...

Liberty, therefore, is the right to do everything that harms no one else. ... It is a question of the liberty of man as an isolated monad, withdrawn unto himself.

But the right of man to liberty is based not on the association of man with man, but on the separation of man from man. ...

The practical application of man's right to liberty is man's right to *private property*.

None of the so-called rights of man, therefore, go beyond egoistic man, beyond man as a member of civil society, that is, an individual withdrawn into himself, into the confines of his private interests and private caprice, and separated from the community, ([9], pp. 162–164)

...the universal rights of man...are nothing but the recognition of the *egoistic civil individual* ... that the *rights of man* do not, therefore, free man from religion, but give him *freedom of religion*; that they do not free him from property, but procure for him *freedom of property*. [16]

Curiously, both detractors and proponents of Marxism share this interpretation of Marx on rights, perhaps explaining why it has been challenged only once in recent years [15]. Law is, on Marx's view, what confers rights on those who have them, including the rights that empower capitalists to gain and remain in power over the means of production. And it is the state that controls the law. Thus, it is by legal right that capitalists possess and wield their economic power, and what flows from it.³ Opponents of Marx's critique of rights argue that Marx's rejection of rights demonstrates the inadequacy of Marxism given the importance of rights, while most Marxists adopt such a stance on rights because they believe it is the proper "Marxist" position on rights in light of some of the critical comments Marx makes about certain rights, namely, the "rights of man." This doctrine about Marx on rights has been so widely accepted by both opponents of Marx and his supporters alike that it has become common to distinguish between capitalist and Marxist political theories and societies as being those which support rights, in the former case, and those which reject rights, in the latter case. Perhaps Cohen's words about ideologically driven interpretations and reasoning are pertinent here:

...the truth is that class interest generates ideology precisely by instilling a propensity to errors of reasoning about ideologically sensitive issues. Class interest could not in fact be the immediate source of the ideological illusions from which even reflective thinking suffers, for an illusion will not gain a grip on a reflective mind in the absence of some form of intellectual malfunctioning. ([2], p. 290)

However, this common misconception about Marx and rights must be exposed and rejected in favor of a charitable reading of Marx on rights. In short, Marx's

critique of capitalism in general and even of certain rights in particular themselves implies a set of rights – both individual and collective. ([15], Chaps. 5 and 6, see also [2], p. 297). And it is precisely these rights that form the basis of the Marxist thoughts on the ethics of business contained in this chapter. Furthermore, Marx himself made statements that cannot reasonably be interpreted as a denouncing of rights. For instance, in *The Holy Family*, he and Engels write that while the “rights of man” are not intrinsic to humans, “Fourier’s assertion that the right to fish, to hunt, etc., are inborn rights of men is one of genius” ([16], p. 88). Moreover, in his *Critique of the Gotha Programme*, Marx clarifies that it is notions such as civil right in capitalist society that is problematic as “obsolete verbal rubbish” and “ideological nonsense” [17]. But this hardly condemns all rights on Marx’s account. In fact, there is very good reason to think that Marx’s critique of capitalism implies rights of certain kinds that distinguish Marxism from capitalism. On this alternative interpretation of Marx and rights, Marx implicitly supports negative rights such as the right to not be exploited, alienated, and the right to not be forced to sell one’s labor power or to have one’s labor value taken from them without voluntary consent [15]. For those who are incessant and even unbending in their clinging to the notion that Marx condemns rights per se, there are passages such as those found in his discussions of the right to freedom of self-knowledge and of the press:

The first essential condition of freedom, however, is self-knowledge, and self-knowledge is an impossibility without self-confession. ([18], p. 132)

What a difference there is between a judge and a censor!

... The judge judges my act according to a definite law; the censor not only punishes the crime, he *makes* it. If I am brought before the court, I am accused of disobeying an existing law, and for a new law to be violated it must indeed exist. Where there is no press law there is no law which can be violated by the press. The censorship does not accuse me of violating an existing law. It condemns my opinion because it is not the opinion of the censor and his superiors. My openly performed act, which is willing to submit itself to the world and its judgment, to the state and its law, has sentence passed on it by a hidden, purely negative power, which cannot give itself the form of law, which shuns the light of day, and which is not bound by any general principles.

A censorship law is an impossibility because it seeks to punish not offences but opinions, because it cannot be anything but a *formula for the censor*, because no state has the courage to put in general legal terms what it can carry out in practice through the agency of the censor.⁴

Accordingly, these Marxist thoughts on the ethics of business shall discuss what Marx or a Marxist might or should say about business within capitalist societies. Marxian concepts of exploitation and alienation are explored insofar as they illuminate a Marxist perspective on business, including what ought to be done with regard to severe harmful wrongdoing in the business sphere. While it is not the purpose of this chapter to address whether or not the moralist perspective on Marx’s critique of capitalism is more plausible than a nonmoralist reading, it is assumed herein that Marx’s critique of capitalist is precisely moralistic and that it provides the basis for a moralistic stance that a Marxist might reasonably adopt concerning business.

Prior to addressing the various major concerns of this chapter, it is important to outline what in general a Marxist approach to business ethics would look like, and

why. First, given the plausibility of at least much of Marx's criticism of capitalism, it would seem to follow that a purportedly adequate and comprehensive approach to business ethics which fails to take into account at least some of what is foundational to Marx's philosophy can hardly be taken seriously. For it would demonstrate a fundamental ignorance of certain well-respected principles of political philosophy that cut to the core of capitalism. An approach to business ethics that unintentionally omits a significant consideration of Marx's critique of capitalism is simply incomplete. But an approach that knowingly does so is not only incomplete but represents the height of philosophical and ethical arrogance! What business ethics needs is not more of the ethicist's new philosophical clothes, presented in the biased, cold-war garb of anti-Marxist assumptions heaped one upon another. There is no room for theoretical presumptuousness in serious discussions of business ethics.

But given the importance of a Marxist approach to business ethics, to what precisely would such an approach amount? There are several points to be made here which demarcate a Marxist approach to business ethics from other major competing approaches. First, a Marxist approach would not require the elimination of all forms of business enterprise in favor of some antibusiness utopian social ideal. Marx himself deplored utopianism, as we know from his harsh criticism of the "critical utopian" socialists and communists [19]. However, Marx did not reject as morally problematic businesses per se. While his blistering critique of capitalism was descriptive of many of the sorts of ways in which capitalist businesses functioned, it was normative in the manner in which it suggested to us how business ought not to be conducted. Thus, in general, Marx's critique of capitalism serves as a moral challenge to capitalist business practices. And a Marxist approach to business ethics will seek to accurately describe various workplace contexts in order to then provide a moral critique of uniquely capitalist forms of business. So while capitalist claims to superiority reign supreme in countries such as the United States of North America, a Marxist approach to business ethics will seek to undermine such claims by exposing the basic flaws in the ways in which capitalist business enterprises tend to operate. In this manner, a Marxist approach to business ethics serves as a moral gadfly to capitalism.

A Moral Critique of Capitalism: A Class-Based Condemnation of Use of Workers as Mere Means to Capitalist Ends: Exploitation and Alienation

As Cohen states, "Marx defined the proletariat as the producer who has (literally or in effect) nothing to sell but his own labour power. He inferred that the worker is *forced* to sell his labour power (on pain of starvation)."⁵ According to Marx, ". . . the energies and faculties the worker uses when laboring" are her "labor power." Moreover, "the value produced by the worker over and above that represented by variable capital is called *surplus value*. The ratio of surplus value to variable capital is called *the rate of exploitation*."⁶ It is commonly Marxist to argue that Marx's

critique of capitalism includes the basic idea that capitalist forces of production (privately owned and controlled by the capitalist class) force workers to sell their labor power from which the capitalist class extracts a portion of labor value (*surplus labor value*) which properly belongs to workers. Furthermore, “For Marx, the central episode in the genesis of capitalism is a dual severance of the labourer from his means of production. Gone are his intimate control of and by them, and his rights over, and duties to, them.”⁷ Under capitalism, moreover, the worker’s labor power confronts her as something foreign to her because it is possessed by the capitalism who has extracted surplus labor value from the worker’s labor power. The worker’s labor power is not fully one’s own as it was under precapitalist economic structures. As Marx argues:

...the capitalist is merely capital personified and functions in the process of production solely as the agent of capital – in its corresponding social process of production, pumps a definite quantity of surplus labour out of the direct producers, or labourers; capital obtains this surplus labour without an equivalent, and in essence it always remains forced labour – no matter how much it may seem to result from free contractual agreement.⁸

For the proletarians, on the other hand, the condition of their life, labour, and with it all the conditions of existence of modern society, have become something extraneous, something over which they, as separate individuals, have no control, and over which no *social* organization can give them control. ... ([20], p. 79)

Capital is increased as workers are homogenized across production lines, and increased levels and kinds and amounts of surplus labor value are extracted from workers’ labor power. As Cohen puts it: “Capital steals and shrinks each person’s laboring power” ([2], p. 198). In the process, the specialization and hence special value and need of each worker are reduced – even eliminated – so that workers are easily replaceable and expendable. However, as Cohen incisively points out: “People want belonging *and* freedom, integration *and* independence, community *and* individuality, and when capitalism sacrifices the first member of these and like pairs, it concurrently enfranchises the second” ([2], p. 197). He continues:

It is a familiar social criticism of capitalism that it fosters production for production’s sake, not for the satisfaction of human need. Yet it is an equally familiar social ideal that labour should be performed as an end in itself, not as a mere means to acquiring goods external to it. ... Under capitalism’s production for production’s sake, people produce only for rewards enjoyed outside the production process. Under communism’s production servicing human needs, they find productive activity itself rewarding.⁹

On the other hand, in a Marxist society, what each person does is something she wishes to do, and she is thoroughly engaged in what she is doing and enjoys doing it.¹⁰

This is the heart of the charge of capitalist exploitation of workers’ labor power and value. And it is precisely this exploitation that eventuates in workers’ alienation from the product of their labor, from one another, and from themselves. And it is furthermore morally unjustified that the forces of capitalism exploit and alienate workers, as such treatment uses them as mere means to the ends of capitalist profits. This implies, in a Kantian manner, that if it were the case that capitalism would use workers as means, but not as mere means, to capitalist profits that such productivity

enjoys at least a Kantian support, morally speaking. But then, it is incumbent on one to show how it is possible that business might use workers but not as mere means. I believe that this is precisely what Marx's critique of capitalism has in mind. For it is not business enterprises per se that Marx condemns, but the manners in which capitalist ones exploit and alienate workers to such an extent that they are used as means only, rather than as ends in themselves consonant with Immanuel Kant's "end in itself" or "humanity maxim" version of the Categorical Imperative.¹¹ This is not to say that Marx explicitly argues in a Kantian fashion, but that Marx's ethic of business implies a Kantian one in at least this limited respect.

But Marxism also charges capitalism with destroying human creative potential, whereas communist society encourages human flourishing, "in which the free expression of the powers inside each person harmonizes with the free expression of the powers of all."¹² This idea is found in *The German Ideology* wherein Marx states that in a communist society, there are no painters but those who engage in painting among other activities. Yet communism's reduction of the interests of the self to the interests of others seems problematic for the same reasons that utilitarianisms in one way or another wrongly subsume individual interests under considerations of social utility [23]. This in turn violates the moral wisdom regarding the separateness of persons, a long-standing objection to utilitarianisms ([23], pp. 23–27, also see [24]).

Collective, not Private, Ownership of Means of Production

While there has been much debate about the particulars of Marx's ideas of the labor theory of value, exploitation, etc., one thing remains clear: "Marxists and quasi-Marxists should address themselves to the crucial question, which is whether or not private ownership of capital is morally legitimate."¹³ It is a well-known idea of Marxism that Marx repeatedly condemned the capitalist or private ownership of the means of production. And since capitalist business enterprise is based on such privatization, it would appear that Marx must, as he does, condemn capitalism at its base. However, what is perhaps less understood is Marx's reason for the privatization of the means of production. A lesser-known passage from Marx reveals that he respected the indigenous rights to land and its resources. In Part VIII of *Capital* ("The So-Called Primitive Accumulation"), Marx writes:

We have seen how money is changed into capital; how through capital surplus-value is made, and from surplus-value more capital. But the accumulation of capital pre-supposes surplus-value; surplus-value pre-supposes capitalist production; capitalist production pre-supposes the preexistence of considerable masses of capital and of labour-power in the hands of producers of commodities. The whole movement, therefore, seems to turn in a vicious circle, out of which we can only get by supposing a primitive accumulation (previous accumulation of Adam Smith) preceding capitalist accumulation; an accumulation not the result of the capitalist mode of production, but its starting point.

...The capitalist system pre-supposes the complete separation of the labourers from all property in the means by which they can realize their labour. ...The process, therefore, that clears the way for the capitalist system, can be none other than the process which takes

away from the labourer the possession of his means of production; . . . The so-called primitive accumulation, therefore, is nothing else than the historical process of divorcing the producer from the means of production.

. . . these new freedmen became sellers of themselves only after they had been robbed of all their own means of production, and of all the guarantees of existence afforded by the old feudal arrangements. And the history of this, their expropriation, is written in the annals of mankind in letters of blood and fire.

. . . The expropriation of the agricultural producer, of the peasant, from the soil, is the basis of the whole process [of so-called primitive accumulation].¹⁴

These passages from Marx challenge the moral foundations of capitalism insofar as capitalism such as that found in the USA is based from the start on immoral expropriation of lands from their indigenous peoples. How, under such circumstances, can the capitalist means of production be justified given that it is based on the violent theft of land and minerals which form the foundation of capitalist wealth and the capitalist means of production? Thus, the very idea that capitalism is founded on some notion of primitive accumulation is a farce.

Cohen's discussion of original acquisition of private property under capitalism is telling here. Whereas Robert Nozick famously argued that private property is held justly insofar as it came into being justly and insofar as it has been transferred justly from each holder of it until the present day [26]. Thus, it is the moral pedigree of a holding that makes private property, in any particular case, morally just. Yet Cohen raises doubts concerning whether or not private property actually arises in capitalist societies in congruence with the Nozickian principle of just acquisitions, transfers, and rectification. For the probable fact of the matter is that, under capitalism, private property was either initially taken by force or fraud, or at least the chain of transfers involved fraudulent or violent takings of private property from another, such that capitalism is unlikely to be founded on a morally just acquisition or transfer of private property ([2], pp. 253–254).

But what is true of capitalist private property in general seems very much the case regarding various specific instances of capitalism. Consider US capitalism. If it is true that capitalist privatization of means of production somehow (in this way or that) violated, say, indigenous rights to territory and its resources, then this would imply that capitalist ownership of the means of production that is located on such lands and making use of such resources lacks a moral foundation because it is a form of theft in violation of the principle of morally just acquisitions and transfers [27, 28]. But of course, this same reasoning would apply to any form of ownership of the means of production, as collectivist forms of ownership of the means of production enjoy no special exemption from the stated principle should they violate it. Similar reasoning condemns British capitalism, of course ([2], p. 302).

Note that this line of argument differs from Cohen's in that while he in the end faults capitalism because it violates the notion that ". . . property is theft, theft of what morally speaking belongs to us all in common,"¹⁵ my argument does not make this collectivist assumption. For Cohen's claim would violate the claim that, say, indigenous peoples have rights to their lands over against any other peoples' claims to it, which implies at least a kind of meaningful control over the resources on and in the land that might serve as a means of existence for peoples. Indeed, Cohen's view

would end up in effect asserting nonindigenous rights to indigenous lands by way of the Lockean proviso, so long as such lands were shared in peace and harmony. But my indigenous Marxist view recognizes and respects indigenous rights to their lands in light of the principle of morally just acquisitions and transfers.

While it is not logically impossible that capitalism be founded on the illegitimate acquisition or transfer of lands in order to build its wealth,¹⁶ history demonstrates that it is typically the case that capitalism does not exist absent such illicit takings. And it is land that is necessary for capitalism to begin and then to flourish. Without it, capitalism has no access to the cornucopia of natural resources required to build and sustain capital. Moreover, it is capital that makes it possible to extract labor value from workers, workers who are, on Marx's view, coerced to sell their labor power which creates the value of their labor. Thus, the extraction by capitalism of workers' unfreely sold labor power and the value that results therefrom is dependent on capitalism's source(s) of illicitly acquired land. But the acquisition of such land, as we see, is typically gained by the capitalist illicitly, thereby morally tainting it and raising questions of whether or not capitalists have acquired such land, the basis of their wealth, in morally appropriate ways.

So the basic Marxist response to capitalism is (or ought to be) that it permits the private ownership of the means of existence which no one has a moral right to own. Thus, capitalism rests on an unjust foundation. So Marx advocates the righting of wrongs in a socialist state. As Cohen puts it: "it is rectifying violations of rights, violations inherent in the structure of private property" ([2], p. 299).

Responsibility, Punishment, and Compensation for Harmful Wrongdoing

It is one thing for a Marxist to criticize capitalism from the standpoint of the socioeconomic classes that are created by a system that exploits workers and forces them into deeply alienated lives. But a more thorough Marxist approach to business ethics will be one that is fundamentally political in the sense that it will seek to provide thoroughgoing criticisms of how capitalist business enterprises, say, in the USA, constantly engage in exploitative and otherwise wrongful behavior both domestically and globally. For instance, US imperialism has become widespread during the past century or so, and this leads to analyses of the USA that render it highly morally problematic, whether it concerns the incessant assassination attempts (and some successes!) of independent heads of state such as Fidel Castro or covert military operations in various regions of Central and South America, invasion of sovereign nations such as Iraq and Afghanistan, the support of Israel knowing that Israel oppresses Palestinians, morally questionable military involvement in Vietnam, [29]. Korea, Colombia, Nicaragua, etc.; these and various other actions of the USA and or some of its US supported businesses such as Halliburton and Occidental Petroleum, while they serve in various and sundry ways certain economic interests of its overall capitalist system, do not enjoy the support of venerable principles of just war.

In significant part, terrorism against the USA and its allies has arisen to combat US imperialism, and the USA perceives that it is then forced to defend its capitalist interests against an increasingly powerful foe that seeks to destroy the USA in large part for the substantial harms that it has wrongfully wrought on others.

Equally vital is a Marxist approach to business ethics' exposure of how capitalism tends to reduce or eliminate human responsibility to the extent that persons are not able to be held accountable for their actions, inactions, or attempted harmful wrongdoings. Assumed here is that a morally viable socioeconomic structure will maintain and strengthen the free activities of humans. But when exploitation and alienation run rampant throughout a system of living, such factors can and often do reduce or even eliminate legitimate expectations that count toward a person's moral accountability for her harmful wrongdoings. This is because determinism, whether social, economic, political, etc., vitiates claims to liability responsibility. And what is required of a good and decent society is that its adult constituents be morally responsible agents, ones that can in general be legitimately held accountable for their harmful wrongdoings and for their good actions as well.

Marx's words on punishment are not many, but as with his words on rights, they must be taken in context so as not to be stripped of their context and made into doctrines that do not represent his considered judgments on matters. Although Marx states that:

From the point of view of abstract right, there is only one theory of punishment which recognizes human dignity in the abstract, and that is the theory of Kant. . . . This theory, considering punishment as the result of the criminal's own will, is only a metaphysical expression of the old *jus talionis*; eye against eye, tooth against tooth, blood against blood. . . . [30]

He questions whether Immanuel Kant has it right in assuming that criminals truly act out of freedom of the will *in a capitalist society*. If they do not, then punishment of them is unjustified. Since on Marx's view sufficient unfreedom exists in capitalist society, criminals who act under such conditions should not be punished, given that punishment is only justified to the extent that criminals act freely in doing what they do to wrongfully harm others. While the Marxian argument here might be extended to apply to all societies, this one limits its application to capitalist ones only. Thus, a Marxist approach to the ethics of business would seriously consider the unfreedom that exists throughout capitalist societies and argue that this unfreedom vitiates ascriptions of voluntariness to criminals such that they ought not to be punished. At the very least, such criminals ought to have their punishments mitigated in proportion to the actual voluntariness that accompanies their criminal activities [31].

But more might be said of a Marxian position on punishment for crimes in a capitalist society. If it is true that capitalists, or those who own the means of production, sometimes also commit crimes, it is unclear that they generally lack voluntariness sufficient to mitigate or excuse their criminal actions, omissions, or attempted crimes. If this is true, then a Marxist ought not to condemn punishment

per se, just as she ought not to condemn rights per se. Rather, punishment is reserved in a capitalist society for those who sufficiently¹⁷ satisfy the conditions of criminal liability sufficient to punish them in proportion to their harmful wrongdoings. And such punishments might range from a few years in prison and all that genuine incarceration (hard treatment) entails, to execution for crimes that illicitly take the lives of others – perhaps even nonhumans and in cases of massive environmental damage.

Moreover, insofar as capitalist enterprises are supported by their governments (and vice versa), government officials should not be permitted to evade punishment insofar as they are responsible for harmful wrongdoings. For instance, those public officials responsible for starting and continuing an unjust war or invasion and occupation of a sovereign nation wherein significant killings of humans transpires must be punished in proportion to their levels of responsibility for those war crimes [32].

A Marxist Approach to Business: Environmental Concerns

Environmentalism seems not to have been a major concern of most in Marx's day. Thus, it is no surprise that Marx had nothing significant to argue about such matters. But this hardly suggests that one cannot tease from his writings something of a Marxist ethic of the environment. Whether it is the Exxon oil spill disaster in Prince William Sound, Alaska, in 1989, or the British Petroleum oil explosion and spewing of oil into the Gulf of Mexico in 2010, a Marxist can have much to say about who or what ought to be held accountable for such disasters, and why. In either case, such an approach must grapple with the problem of whether or not collective responsibility for such environmental disasters is local or global, that is, delimited to those most directly responsible for the disasters, or broadened more generally to include the populace who in some sense create the demand for the "oil rush." Of course, a Marxist will want to delve more deeply into the matter and ask whether or not the forces of capitalism have themselves created in people the perceived need for oil, or whether or not the need is not only perceived, but actual – emanating from the people themselves. For, it is answers to these sorts of questions that lay the beginnings of legitimate ascriptions of responsibility for environmental disasters. Is the moral liability delimited to those executives making decisions about how to maximize profits that in turns endanger the environments in which they function? Or is a shared responsibility [33] for such damages? Is it only individual actions, omissions, and attempted actions that are to be held accountable, or is there a collective responsibility [34] for such harmful wrongdoings?

Furthermore, a Marxist approach to the ethics of business might well address human overpopulation as it relates to the idea of equality. And on this point, Cohen is again of rather critical assistance. "Starving people," Cohen argues, "are not necessarily people who have produced what starving people need; and if what

people produce belongs by right to them¹⁸; . . . then starving people who have *not* produced it have no claim on it” [36]. Now as Cohen ingeniously explains, this:

. . . forces a choice between the principle of a right to the product of one’s labor embedded in the doctrine of exploitation and the principle of equality of benefits and burdens which negates the right to the product of one’s own labor and which is required to defend support for very needy people who are not producers and who are, *a fortiori*, not exploited. ([36], p. 108)

When those who suffer dire need can be conceived as those coinciding with, or as a subset of, the exploited working class, then the socialist doctrine of exploitation does not cause much difficulty for the socialist principle of distribution according to need. But once the really needy and the exploited producers no longer coincide, then the inherited doctrine of exploitation is flagrantly incongruent with even the minimal principle of the welfare state. ([36], pp. 110–111)

And what Cohen reveals about these Marxist principles, seemingly assumed or even adopted explicitly by many cosmopolitan liberals, concerning states appears to apply globally. Given the various global environmental crises, it is far from obvious that material consumption will be matched by material production such that cosmopolitan ideals of global equality can be realized without posing serious problems for the deservedly well-off. This poses the problem of good Samaritanism which states that there are duties of assistance to endangered strangers, but that such duties hold only to the point at which those assisting others are themselves placed at genuine risk of their own well-being [37, 38]. And it is an empirical question as to how much worse off the better off must become for the cosmopolitan ideal of global equality and redistributive justice to be deemed unreasonable. Cohen states the difficulty in cautionary terms:

When aggregate wealth is increasing, the condition of those at the bottom of society, and in the world, can improve, even while the distance between them and the better off does not diminish, or even grows. Where such improvement occurs (and it has occurred, on a substantial scale, for many disadvantaged groups), egalitarian justice does not cease to demand equality, but that demand can seem shrill, and even dangerous, if the worse off are steadily growing better off, even though they are not catching up with those above them. When, however, progress must give way to regress, when average material living standards must fall, then poor people and poor nations can no longer hope to approach the levels of amenity which are now enjoyed by the world’s well off. Sharply falling standards mean that settling for limitless improvement, instead of equality, ceases to be an option, and huge disparities of wealth become correspondingly more intolerable, from a moral point of view. [36], pp. 113–114

In the end, the demand for equality is fraught with complexities that cannot be plausibly solved by the presumption of pretheoretical intuitions about the injustice of the acquisition of wealth *per se*. For many of those who are well-off are such largely because of their own hard work and have not become well-off at the expense of others, undeservedly. Thus, to insist as many cosmopolitan liberals do that the well-off have a moral duty to the poor or needy to relieve their poverty or need is itself presumptuous absent a sound argument in favor of the idea that the well-off indeed have a duty that corresponds to the right of the worst off to make them better off. This is true especially in light of the fact that moral intuitions vary greatly on this matter. Thus, sound argumentation must win the day rather than mere intuition.

Objections to a Marxist Approach to Business, and Replies

There might be several concerns raised about the Marxist ethic of business that has been portrayed herein. While some might issue from a Marxist perspective, others might be raised from a standpoint critical of Marxism in general. I shall consider those most germane to the narrower task of this chapter, as such matters have larger implications for political philosophy more generally. Nonetheless, I shall consider some of the most pertinent concerns that might arise for this Marxist ethic of business without treading too far into the terrain of political philosophy more generally wherein such matters have been taken up with far more rigor.

First, it might be argued that the moralistic conception of Marx's words against capitalism is itself mistaken, as is the above understanding of Marx's critique of rights. Rights, according to Marx, are grounded in law which is that system which protects the power of the bourgeoisie have over proletarians. Thus, rather than serving as protections of persons, rights actually oppress them under capitalist rule. So the appeal to rights as a particularly Marxist concept is wrongheaded and misunderstands the radicality of Marx's critique of capitalism.

In reply to this standard Marxist construal of Marx's attitude toward morality and rights, it might be argued that it ignores several considerations that point in the direction of the interpretation of Marx on morality and rights set forth above. To repeat, Marx condemns morality that protects the illegitimate interests of the capitalist class insofar as such interests oppress workers. Likewise, he condemns what are referred to as "rights" insofar as such so-called rights oppress workers. For any system, legal or moral, that would eventuate in the oppression of workers is morally unjustified. Yet not all claims or interests that are said to amount to rights are oppressive of workers. And it is precisely those rights that Marx would and does support, either explicitly or implicitly in his critique of capitalism.

Second, it is common to associate unionization of workers with Marxism in that Marx was a founder of the very first working persons' union: the International. Yet the history of unionization in the USA at least is rife with problems. Not only are unions often corrupt, but they often promote mediocrity, underproductivity, and slothfulness among workers. Public employee unions, for instance, have also been accused of greed in their seeking what is good for themselves while city, state, and federal coffers run dry, helping to cause economic disasters throughout the USA in particular. Hence, it might be argued, Marxism is problematic to the extent that it inspires unionization of workers and this sort of result.

In reply to this criticism of Marxism, it must be emphasized that nowhere in Marx's works does he excuse or promote underproductivity and anything akin to it, and he certainly does not support corruption of any kind. Indeed, in a letter to Arnold Ruge on July 9, 1842, Marx writes that "Mediocrity should no longer enjoy the privilege of immunity" ([18], p. 390). That unions have often developed into corrupt organization that promote and almost espouse underproductivity does nothing to refute the relatively honorable origins of some such organizations. For they were necessary in order to combat extreme cases of exploitation of workers who had no benefits and no workplace rights, very low wages, etc.

Indeed, Engels graphically captures the plight of workers in nineteenth-century England when he writes:

... Murder has also been committed if society places hundreds of workers in such a position that they inevitably come to premature and unnatural ends. The death is as violent as if they had been stabbed or shot. Murder has been committed if thousands of workers have been deprived of the necessities of life or if they had been forced into a situation in which it is impossible for them to survive.¹⁹

Practically speaking, it seemed that unions were required to combat certain excesses of capitalism. But this hardly justifies saddling Marx with the corruption of unions or any other faults they might have. There is nothing that prevents unions from being organized and functioning in morally legitimate ways that promote hard work, efficient and high levels of productivity, while punishing laziness, corruption, and other forms of abuse among management and workers. And this is certainly not incongruent with Marx's critique of capitalism. For among other things, Marx espoused both rights and responsibility of workers.

Third, I have eluded to the idea that a Marxist can hold to the idea that it is not logically impossible that capitalism be founded on the illegitimate acquisition or transfer of lands in order to build its wealth. This is not the same thing as stating that a Marxist would approve of such capitalism. Rather, it is to admit that it is not logically impossible for capitalism to be founded on a system that does not exploit others, alienate them, and violate the principle of morally just acquisitions and transfers. And it is here where my version of Marxism differs from the typical interpretation of Marx's critique of capitalism.

Even if it were true that Marx explicitly endorses the idea that it is logically impossible for capitalism to have a morally just foundation, that would in no way demonstrate the truth of the proposition in question. The fact is that it is easily imaginable that capitalism of one recognizable form or another to be founded on the free relinquishing of workers' labor power in order to achieve a common good, such as social solidarity, and that capitalism would indeed provide such workers with other viable and available options in order to prevent worker unfreedom. And this is true even if it is assumed that "... private ownership by one person presupposes non-ownership on the part of other persons"²⁰ One key philosophical issue here is how "capitalism" is defined. Is it defined in terms that make it intrinsically morally problematic? Or, is it defined in a more morally neutral way? If the former, then the definition begs the moral question against capitalism. Yet this would appear to conflate the question of the definition of "capitalism" with the question of its moral status. So it would seem that the more appropriate manner by which to define "capitalism" is in a way that leaves open the question of its moral status. This implies that even if it were true that every form of capitalism to date is morally problematic, it is still possible, under some scenario, that a form of capitalism satisfies the conditions both necessary and jointly sufficient to render it morally acceptable at least to some meaningful degree. The idea here is that there might, for all we know and being sensitive to Marx's critique of actual capitalisms, be a form of capitalism that is not

founded on the inappropriate acquisition or transfer of the means of production or land, does not necessarily exploit workers, alienate them, or create and sustain conditions of worker unfreedom. But precisely, what are the conditions that, to the extent that they are satisfied, would make capitalism morally justified?

Conclusion

In sum, Marx's critique of capitalism has been subjected to various interpretations, not all of which are charitable or responsible. His critique can be seen as one that has clear moral content either explicitly or implicitly, respects moral and some legal rights, and might even allow for the possibility of a form of capitalism that escapes his blistering criticisms. This of course begs the question of what sort of capitalism, if any, might be able to evade the Marxian critique?

First, it could be a capitalist socioeconomic system that is not founded on an immoral taking, acquisition, or transfer of land. Or, if it is such a capitalism, it would also be one that provides reparations for such takings to those from whom the lands are illicitly or their heirs, compensation that is in proportion to the actual values of the lands and resources therein along with the values of the lives illicitly taken in the process of taking the lands.²¹ Second, it is one that disallows workers' being exploited and alienated in the senses described above. Third, it is one that respects the moral rights that workers have qua workers. Fourth, it could be a capitalist system that disallows wars to be fought when they are driven by private capitalists' interests. If private business seeks to war with other countries or nations, then they themselves must fund those wars without assistance from the government or the people, unless the latter groups willingly and freely contract with capitalists to do so. It must never be the case that private capital would both have a finger in starting a war because it stands to profit from the war and have the war effort funded by public funds, and then reap any profits from the war efforts. If proletarians are to fight in the war, they must be paid well by capitalist monies if capitalists are starting and sustaining the war for their own profits. It must never be the case, as is often the case with US wars, that the working class both funds and fights wars of capitalist aggression.

Whether or not Cohen and others are correct in thinking that it is a necessary condition of a Marxism that it stand against a class-based society, it might still be an open question of whether a Marxism can embrace a form of capitalism that satisfies these conditions, along with it being a class-based society. In other words, can a class-based society exist "from the ground up" insofar as it does not violate workers' rights as valid claims or interests? Or, is it a necessary condition of capitalism that it functions as Marx describes?

2. Buchanan [14]. For a critique of Buchanan's interpretation of Marx and rights, see [15].
3. Cohen ([2], p. 9), where G. A. Cohen also states of Marx's view: "...that the given capitalist enjoys the stated right because it belongs to a structure of rights, a structure which obtains because it sustains an analogous structure of economic power."
4. Marx and Engels ([18], p. 166). Also see pp. 349–351 for Marx's further explicit support of freedom of the press, and p. 327 for his explicit support of individual freedom of expression. In case Buchanan and others who still think that Marx condemns rights per se, perhaps they ought to consider Marx's statements that "The press is the most general way by which individuals can communicate their intellectual being. It knows no respect for persons, but only respect for intelligence. . . . Everyone must *have the right* to read and write" (p. 177). For those who require more evidence that Marx does not condemn rights per se as Buchanan argues, it is wise to consider Marx's words on "Communal Reform and the *KÖLNISCHE ZEITUNG*" wherein he argues that the very separation of town and country implies an inequality of rights, which is bad, implying that Marx believes in the equality of rights at least in such contexts (pp. 266–273). It is helpful to read Marx carefully without a biased, ideological eye that would uncharitably turn his complex and sophisticated arguments and analyses into straw.
5. Cohen ([2], p. 255). Moreover, he writes: "Let me then propose that a worker is forced to sell his labour power in the presently required sense if and only if the constraint is a result of standard exercises of the powers constituting relations of production" (p. 258). And while there is an objective sense, Cohen argues, in which workers under capitalism are forced to sell their labor power, ". . . *each is free only on condition that the others do not exercise their similarly conditioned freedom*. Not more than one can exercise the liberty they all have. If, moreover, any one were to exercise it, then, because of the structure of the situation, all the others would lose it" (p. 263). Cohen refers to this as workers' "collective unfreedom" under capitalism (p. 264). So Marx's concept of capitalist exploitation derives its negative moral content from the fact that there is collective unfreedom of workers in capitalism in which workers are forced because of circumstance to sell their labor power to one capitalist or another, as the case may be (p. 265). So while some individual workers can escape the proletarian class, not all can no matter how hard they try, which results in collective unfreedom for the workers as a class (p. 265). Also see pp. 267 f. Thus, "If it is plausible to say that capitalism *makes* most workers incapable of being anything else, then it is false that most workers are free, *in sensu diviso*, not to be proletarians" (p. 279).

11. Kant I ([22], p. 429): "Act in such a way that you treat humanity, whether in your own person or in the person of another, always at the same time as an end and never simply as a means."

12. Cohen ([2], p. 137). Cohen adds that in its exclusive emphasis on the creative aspect of human nature, Marx neglects “a whole domain of human need and aspiration. . . he failed to do justice to the self’s irreducible interest in a definition of itself, and to the social manifestations of that interest” (pp. 137–138). See also pp. 139–141.
13. Cohen ([2], p. 238). Cohen also states: “. . . capitalism is just if and only if capitalists have the right to own the means of production they do, for it is their ownership of means of production which enables them to make profit out of labour, and if that ownership is legitimate, then so too is making profit out of labor. The key question, then, is whether capitalist private property is morally defensible.” Yet “. . . all, or virtually all, capitalist private property either r is, or is made of, something which was once no one’s private property, since (virtually) all physical private property comes immediately or ultimately from the land, which was there before any people, hence before any private owners of it, were” (p. 301).
14. Marx [25], pp. 667–669. Also see Chap. XXVII where Marx discusses the forcible expropriation of peoples from their lands and their means of production by capitalism. The moral implication here is obvious, namely, that Marx believes it is morally wrong for capitalism to expropriate means of production and their material bases from those to whom they belong, and that this appears to be part and parcel of capitalism’s *modus operandi*.
15. Cohen ([2], p. 302). Cohen also states that “. . . the socialist objection of justice to the market economy is that it allows private ownership of means of existence which no one has the right to own privately, and therefore rests upon an unjust foundation” (p. 298).
16. This claim runs counter to a strict Marxist view, which admits that “. . . Marxists do not believe merely that this or that capitalist society, or even every capitalist society, is unjust because of its particular origin. Marxists believe that capitalism as such is unjust, that, therefore, there could not be a just formation of capitalist private property, and that thesis requires moral rather than historical argument” (p. 302). Cohen is correct that such a strong Marxist claim about the logical impossibility of a morally just founding of capitalist private property: it requires a special defense as neither the claim nor its defense is found in the writings of Marx.
17. “Sufficiently” in that responsibility and its constituent conditions admit of degrees.

**Contemporary Continental Philosophy and
Business Ethics**

Mollie Painter-Morland

Abstract

Business ethics has made great strides in terms of studying ethical decision-making in corporate contexts, but questions could be raised regarding its ability to ask critical questions about the ontological assumptions upon which many of its theories and initiatives are built. Ontology is about the nature of existence, and as such, it has to do with how we live and understand “life.” In this chapter I draw on the perspectives of certain Continental philosophers to propose that “life” can be understood as material forces and flows. Such an understanding of life has specific implications for speaking about “ethics.” In order to understand these implications, we have to embark upon an ontological interrogation of our understanding of identity, agency, and organisation, all of which are central issues in the field of business ethics.

Introduction

Over the past 30 years, business ethics has evolved as an academic field of much substance and significance [22]. While some researchers focus on explaining the ethical dimensions of business organizations, others are more interested in providing guidance on how to stimulate moral development of those within organizations, and controlling behavior. While ethical control is just one of the perspectives on business ethics, it could be argued that, in recent years, it has become one of the most prominent. The need to correct moral failures, or to prevent them from happening in the first place, have become the predominant concern of many business ethicists. In fact, multiple ethical failures in the business and corporate governance realm in recent years prompted more stringent control measures in many countries.

The question that has to be posed is whether business ethics has diagnosed the problem correctly, and chosen the right approach to address these problems. The kind of research that is interested in providing those in business practitioners with ethical guidance, or stimulating the ethical development, focuses on the individual decision-makers involved, rather than on trying to understand the nature of capitalism, and the broader impact of business on our lives as such. Part of the problem may be that capitalist business practices inevitably imply or support a very specific conception of life, but this is hardly ever made explicit. We shall see that within business, specific assumptions are made about human motivation, well-being, behavior, and institutions. In fact, business ethicists are in fact already implicitly addressing ontological questions such as “life,” “existence,” or “being.” In this sense, business ethics is a study of “life.” It is therefore important for business ethicists to critically reflect on how we come to know anything about our world, ourselves, and our business activities in the first place. In trying to understand “life,” certain epistemological questions emerge: can we develop a clear picture of ourselves, our world, and the people and things in it? What resources do we have to explain human motivation and agency? How are we as human beings related to the animate and inanimate entities that are part of what we perceive as “reality”? All these questions may seem abstract, but in fact they lie at the heart of our understanding of ourselves, our capacity for action in the world, and for normative discussions about the kind of life we want to lead.

Continental philosophy can play an important role in acknowledging and challenging at least some of the assumptions that lie hidden in the way business ethicists address the above questions. In the first place, Continental philosophers emphasize the fact that “ethics” always involves a critical questioning of practices. Therefore, instead of attempting to improve the status quo, the insights of Continental philosophers can help us understand and challenge the implications of those assumptions that are embedded within accepted business practices. Secondly, Continental philosophers offer a critique of an overreliance on science’s capacity to procure objective truth. Within business ethics, this may allow us to critically evaluate the preoccupation with the quantitative methodologies that have come to dominate the business ethics literature. A third and very central contribution that Continental philosophy makes to our understanding of business organisations is the way in which it allows us to identify and engage with the dynamics of power and influence that are inherently part of all institutions. This allows us to reconsider assertions around agency and freedom that are often uncritically accepted within business ethics literature. A number of twentieth century and contemporary continental philosophers, especially those drawing on the insights of Friedrich Nietzsche, consider the body and its various forms of vitality as central to understanding human agency, instead of relying on the rational pretensions of the disembodied transcendental subject. Continental philosophy therefore significantly broadens our understanding of “life.”

In this chapter, I argue that an alternative understanding of “life” as material forces and flows opens new possibilities for speaking about “ethics.” On an ontological level, it helps us to better understand identity, agency, and organisation.

Within the field of business ethics, it sheds new light on central topics within the field, such as moral decision-making, “ethics management,” “corporate governance,” and “sustainability.”

The Relationship Between Capitalism, Agency, and “Life”

Within much of business ethics, there is an interest in research that could help us understand how individuals make moral decisions, and beyond that, how we could enhance their moral development or moral imagination. In fact, in his survey of business ethics as an academic field, Rossouw [22] points out that the purpose of business ethics teaching is to enhance cognitive, behavioral, and managerial competences. He plots many of the presuppositions of these competences, and it becomes clear that though it has many advantages, it also falls short in certain areas, especially when it comes to the interplay between tacit organizational influences and individual responses to moral dilemmas. The reason for this limitation may be found in the assumptions around individual moral agency upon which some business ethics research still rely. Many business ethicists often assume an isolated rational decision-maker who has the time, resources, and inclination to step out of the messiness of organizational life to weigh options and take the best rational course of action, which also accords with this person’s commitment to moral principles. The question that needs to be posed is: does this kind of decision-maker in fact exist?

Within the twentieth century Continental philosophy, there have been multiple attempts to deal with the disillusionment in the transcendental subject of Enlightenment thought. The view of human beings that emerged as ideal within Enlightenment thought privileged rational, principled thought and behavior. During and after the two World Wars, many philosophers were preoccupied with understanding how these “rational” human beings could have perpetrated the evils that occurred in the first four decades of the twentieth century. A number of alternative views of human agency emerged, and though I will not go into too much detail here, it is important to consider how these perspectives informed our thinking about ethics in general, and business ethics in particular. The various perspectives on our human agency can be briefly described as phenomenological, existentialist, psychoanalytic, and poststructuralist. These perspectives are all in some way related to one another, yet display slightly different ontological and epistemological assumptions.

From the phenomenological perspective on agency and epistemology, philosophers argued that the structures of our human consciousness determine how we come to understand and engage with the world. These structures, which Edmund Husserl called eidetic structures, give us a kind of direct access to the world. From this perspective, though “life” is something that each one of us grasps independently, recognizable structures of consciousness that we share with others emerge. The insight that each one of us has a very specific access to the world relates to another important school of thought. Though existentialism has its roots in earlier periods of Western thought, it gained momentum in the twentieth century when

there was a specific interest in the protection of individuality and freedom. From an existentialist perspective, the individual's capacity to give shape to his/her own individual life is what is important. Here, Jean Paul Sartre was one of the most important exponents. Over the years, certain misinterpretations of existentialism led to a kind of individualist preoccupation with shaping one's own "life." We see remnants of this in the self-help culture that persists in many contemporary societies, and the self-disciplining that takes place within many institutions [1].

What however became apparent in the fields of psychology and sociology is that human beings are often unaware of the forces that shape their individual paths. The discovery of the unconscious and subconscious factors that influence us led to the psychoanalytic approach to agency, in which Freud and Lacan are central figures. The unconscious and subconscious were however not the only factors to consider in understanding ourselves and our relation to the world. Poststructuralist philosophers, such as Jacques Derrida [11], made us more aware of the way in which our use of language shapes our capacity to make sense of the world. Poststructuralists urge us to recognize the fact that we cannot assume a strict correspondence between the words we use and ideas we have, and things and events in the world. All concepts are shaped in relation to one another and to the time and space within which they are employed. This "linguistic turn" in the twentieth century was very influential, both in the Analytic and Continental traditions, but soon, critics started arguing that in this preoccupation with language structures and speech acts, something important is lost, namely, our embodied existence in the world, which goes far beyond nominalism.

Until recently, these insights had not made significant inroads into business ethics (as pointed out by [4, 12, 18]). Many business ethicists operate on the assumption that the self-serving, rational, *homo economicus* is still alive and well, but some authors, like Pirson and Turnbull ([20], p. 103), have recently argued that a different perspective on human beings emerges from science. They argue that we should understand the individual as a *zoon politicon*, a relational (wo)man, who materializes freedom through human values. In the light of this contention, Pirson and Turnbull ([20], p. 103) argue we may do well to revisit our assumptions about "rational agency" and decisions based on utility. It is in this respect that the late twentieth-century continental thought is very helpful.

In this chapter, I focus on the contributions of Gilles Deleuze and Felix Guattari. These two authors stand in a close relationship to the phenomenological, psychoanalytic, and poststructuralist thinkers of the twentieth century, but also depart from them in important ways, specifically when it comes to Deleuze and Guattari's insistence on acknowledging the importance of the material aspects of our existence. Some critical management theorists (see the work of Linstead and Brewis [14]; Thanem [24]; Lawley [13]; Sorenson [23] and Linstead and Pullen [15]), have explored the implications that Deleuze's thinking could have for organizational thought, but its implications for business ethics have not been explored in depth. In what follows, we hope to further this interrogation.

Capitalism from Deleuze and Guattari's Perspective

It would not have surprised Karl Marx and Friedrich Engels that capitalism is, and will most likely remain, in a state of crisis. In the *Communist Manifesto* Marx and Engels warned: "All that is solid melts into air, all that is holy is profaned, and man is at last compelled to face with sober senses, his real conditions of life, and his relations with his kind." In fact, one may even contend that "crisis" is an inevitable side-product of the "melting" and sublimation that takes place through capitalism's endless invention, reinvention, and abstraction of value. From Deleuze and Guattari's perspective, this could be explained by understanding what they call "desiring-production." They use the neologism "desiring-production" to denote this concept of desire infused with production, which creates and sustains social practices and institutions. Moving away from the psychoanalytic preoccupation with desire as a response to lack, Deleuze and Guattari insist that we should reconceive desire as a productive force, which constitutes all reality, including social reality.

Within the process of desiring-production, social orders, or "territories," are formed and reformed on a continual basis. Another way to describe this process is in terms of territorialization, deterritorialization, and reterritorialization, all of which always presuppose each other ([10], p. 244). Deterritorialization is the possibility of change and transformation that is an inherent part of any territory. From Deleuze and Guattari's perspective, we can witness the effect of capitalism's deterritorialization of social value, and its decoding and recoding of valuation in the pursuit of endless growth and a useful reappropriation of surplus. For example, due to the reckless behavior of financial organizations, we nowadays witness the deterritorialization of social values such as trust or authority. The erosion of trust is undoubtedly one of the reasons why so many people have joined the "Occupy" movements in New York, Chicago, San Francisco, London, or elsewhere.

It is important to understand that deterritorialization is always at work in capitalism. How does this play itself out? To say that capitalism is characterized by "constant deterritorialization" would mean that capitalism typically disrupts some of the coded societal orders upon which our sense of self and security has been built. Some examples that Deleuze and Guattari mention are: the deterritorialization of wealth through monetary abstraction, the decoding of the flows of production through merchant capital, and the decoding of States through financial capital and public debts. As such, it would seem that capitalism frees up our coded existence and creates new possibilities. However, this is not where the process ends. Capitalism replaces "codes" with "axioms." This axiomatization empties flows of the specific social meaning that codes conveyed, and replaces it with a structure within which everything can be made equivalent based on its monetary value. The example of prohibitions around sex can be used to explain this. Within a socially coded system, the prohibition on sex before marriage is something that signifies the stability of family life and procreation in society. Within a capitalist system, sex becomes a commodity to be sold or to be used to sell other commodities or services.

Industrial capital leads to the conjunction of all the decoded and deterritorialized flows in taking control of production and driving it toward creating a surplus value. This surplus has to be sold and this can only happen if our desire can be directed at some new kind of “value.” The problem is that production of surplus value leads to a system in which “money begets money” ([10], p. 227). The belief that profit is valuable in and of itself starts to function as an axiomatic universal truth, which structures everyone and everything in its path to perpetuate this truth. In this process, “value” no longer refers to any actual valuable “thing,” but becomes something with a substance, life, and motion all of its own. “Value” no longer designates the worth of commodities, but enters into relations with itself. Under these conditions, capitalism functions as a diachronic machine, that is, a machine operating over time, that organizes all the decoded flows for its own purposes. In the process, some of this coding becomes axiomatic and the functioning of the system mechanistic. The profitability of the firm and its relationship to the market and with commercial and financial capital requires more and more surplus value to fuel its pursuit of value for the sake of value. In this process, both physical labor and “knowledge capital” (specialized education and information) become part of capitalism’s operations.

The implication of all of this for corporations is that it is precisely capitalism’s facility for decoding and unleashing flows, and its tendency to pursue value for the sake of value, that put the corporate entity itself at a constant risk. Because the criteria for anything of value is more value, entities that were created for the purposes of value generation, like corporations, have no inherent right to existence. In fact, since these “entities” have been produced merely as a means to an end, they can easily be replaced. As Ian Buchanan explains, Deleuze and Guattari’s analysis of the life of capital allows us to appreciate the precariousness of corporate entities. By seeking out more profitable investment vehicles and lucrative opportunities elsewhere, capital thrives even when giant companies like Microsoft do not ([3], p. 57). What we have to understand to get a sense of the precariousness of entities in a world characterized by advanced capitalism is that the kind of connections that are made to facilitate desiring production can be largely virtual in nature. There is no need for a real product, or even for real people producing something, in order for value to be created. Companies such as Facebook and YouTube trade on their “cultural value” and do not seem to need mediation through commodity production. There of course comes a time when these start-up companies are bought by larger corporations, making their owners substantial profits, but as such, this merely starts the cycle of seeking surplus value all over again.

Could this view of corporations as dispensable profit-making machines have underpinned the downfall of big corporations like Enron and the broader global financial crisis a number of years later? Their executives did seem to be driven more by the need to uphold the perception of profit-making capacity than with the creation of real commodity value. But even if one did believe that corporations are mere profit-generating machines with no value in and of themselves, they do have implications for real human beings. Within business ethics, there has recently been more acknowledgment of the interdependence between corporations and

the individuals that are linked to them. The financial crisis that erupted in 2008 brought capitalism's inherent contradictions into sharp relief – in its preoccupation with creating more and more surplus value, that which is in fact valuable to “life,” such as jobs, lifesavings, and stability, were lost. What we need to acknowledge is that ironically, capitalism will inevitably fail to contain and productively direct the flows that its “melting” of value perpetuates. Hence, capitalist organisations will always inevitably be leaking, oozing, secreting. In response, more managers are produced, that is, selected, trained, remunerated, and eventually replaced to contain and direct the flows. In the process, a certain kind of subjectivity emerges, but not the kind of human subject who can creatively question or ethically challenge evils. Instead, it is unfortunately the kind of person who passively perpetuates the axiomatic truths upon which capitalism's continual melting processes depend.

Agency from Deleuze and Guattari's Perspective

Drawing on Deleuze and Guattari [9], we have come to understand capitalist “life” as flows on a plane of immanence. It is important to understand that immanence here refers to the multiple different ways of being that one encounters in one's material interactions with other entities, whether they be human, animate, or inanimate, in the world. “Life” is therefore not something grounded in some unshakeable foundation, nor is it explicable on the basis of some kind of essence. Instead, the forms, structures, and concepts that make up our reality are the emergent products of couplings with people, objects, and institutions. “Life” does not operate according to hierarchical structures or clear-cut categories, even though these attempts at control are bound to remain part of our reality. Life's movement is fluid, and hence unpredictable, unmanageable in terms of traditional “management theory” or “ethics management” initiatives. In what follows, I look into what it means for the typical research projects and interventions that we encounter within business ethics, especially in its preoccupation with influencing human moral agency.

Deleuze and Guattari offer us another perspective on who/what human agency is. In Deleuze's description of the individual, the notion of an “integrated, unitary self” is brought into question. It is only through a thousand little witnesses that contemplate within us that the self can become an “I” ([7], p. 75). In Deleuze and Guattari's description, agency is the side-product of the couplings that are part of our desiring production. Deleuze and Guattari ([9], p. 90) describe “agencement” as follows: “We think the material or machinic aspect of an assemblage relates not to the production of goods but rather to a precise state of intermingling of bodies in a society, including all the attractions and repulsions, sympathies and antipathies, alterations, amalgamations, penetrations, and expansions that affect bodies of all kinds in their relations to one another.”

It is in his “Postscript,” that Deleuze [6] draws out the conclusions of capitalism for our subjectivity. As subjects, our bodies are tied to capitalism's machinery. While

capital is free and independent, material flesh and blood bodies are not. The instrumental, organismic functioning of individual bodies within this mechanistic environment is inevitable. This is facilitated by increased abstraction that characterizes capitalism, also in terms of the importance that “intellectual capital” has gained salience within contemporary knowledge economies. We see that even social capital has become virtualized. All these processes lead to a dematerialization and disembodiment within capitalist society. In his “Postscript,” Deleuze describes the emergence of DIVIDUALS instead of individuals. The notion of the dividual refers to an embodied subject who is endlessly divisible through capitalist codes, patterned modes of operation, samples, and data representations, all of which characterize modern technologies of control. Since the embodied subject couples with certain technologies, he/she can be guided through various modulations. Capitalist organizations are designed to move the dividual successfully through its various modulations: training, self-improvement, salary, and reward based on merit. Another important characteristic of DIVIDUALS is that they are pitted against one another, which makes coupling with others impossible, and as such, makes *agencing* impossible. Deleuze explains that the man of control is undulatory. Deleuze [6] explains that the woman/man of control is undulatory, she/he is always surfing, going with the flow.

What seems clear is that we are always in the process of organizing and being organized in our interactions with each other, and with the animate and inanimate world. As such, we need to develop a different perspective on “organisations.” We may have to rethink “organisations” in terms of the “organising” that is always already at work. Our focus on “organisations” as entities often glosses over the fact that institutional life is in fact the result of ongoing processes of organising, division, and formation. This understanding places notions such as “organisational structure,” “control mechanisms” into a new perspective. Through organisational controls and information technologies, we are changed in a way that may foreclose important capacities for agency. We are again faced with a paradox: in an attempt to control people’s behavior, or prevent unethical behavior, we may be robbing them of the capacity for ethical questioning and moral responsiveness. This has been a critique that some business ethicists who draw on the continental tradition have launched against codes of conduct and other ethics initiatives in organisations (See in this regard [2, 17]).

Deleuze and Guattari use biological concepts to make a distinction between two ways of looking at the world: from the perspective of the “arboreal root-tree,” linear cause and effect relationships and dialectical structures provide a neatly organized perspective on the world, whereas from the perspective of the “rhizome,” entities and events are more intricately related. In fact, Deleuze and Guattari’s description of the rhizome provides an account for the fact that there are strange connections between events, people, and objects. From Deleuze and Guattari’s point of view, root-tree structures and rhizomes always coexist within any given social order. As such, there remains room for hierarchy, even though Deleuze and Guattari would caution against the axiomatic overcoding that capitalism tends toward ([10], p. 227). If overcoding sets in, human beings, as well as the animate and

inanimate world becomes tied into mechanistic processes, which undermine the productive and creative flows, or life-affirming forces.

Deleuze and Guattari help us understand how social orders come into being and how our agency is shaped in and through it. The ongoing organizing that is taking place within societal structures, and therefore in all organisations, makes “morality” a moving target, to be approximated through rhizomatic tracing rather than accurate mappings. In terms of ethical decision-making, this robs us of transcendental principles or rational protocols by which to procure sound ethical decisions. As such, it challenges business ethicists to reconsider their main interests in shaping individual moral decision-making, or at least urges them to substantially retool in order to successfully pursue this agenda.

Redefining Ethics as a Revaluation of What is Life-Affirming

As the discussion of territorialization and deterritorialization above indicates, Deleuze and Guattari draws our attention to the fluidity of our world, and the fact that our reality is constantly being produced and reproduced. There is therefore no foundational structure that underpins our thinking about and interactions with the world. Though Michel Foucault ([10] p. xiii) called *Anti-Oedipus* a book of ethics, Deleuze and Guattari can hardly be described as traditional ethicists who offer us moral guidelines or methodologies. Instead, they see ethics as a response to the world that is not based on any transcendental force or set of abstract principles, but rather involves a very practical engagement with empirical relationships. From this perspective, our moral decisions are not based on some abstract principles or some foundational truths, but instead on an ongoing evaluation of material concerns. Drawing on Nietzsche, Deleuze [8] insists on the importance of ongoing revaluation in order to embrace what is life-affirming. No one definition of what is “life-affirming” exists. Instead, it requires constant rearticulation by all those involved. However, this is not an argument for relativism. When we embrace the relational constraints that emerge out of the couplings of which we are part, the “life-affirming” criteria can function as a very powerful force for ethical questioning and action.

Following Nietzsche and Spinoza, Deleuze encourages us to reject the “sad passions” and experiment with the kind of relations that create life-affirming possibilities. In fact, it is in Deleuze’s own texts on Nietzsche (Nietzsche & Philosophy) and Spinoza’s Ethics [5] that we find the clearest articulation of what Deleuzian “ethics” looks like. Nietzsche was clear in his insistence that all valuation is a response to our embodied existence in the world. In fact, by making the embodied roots of our moral concepts clear, Nietzsche was also an inspiration to the later poststructuralists. Deleuze draws on Nietzsche to make it clear that our “moral agency” is an unconscious response to our embodied practices and preoccupations. Similarly, in drawing on Spinoza, Deleuze steers clear of any transcendental inspirations for an ethics. His kind of ethics entails an immersion in life, where “good” and “bad” are assessed in relation to specific bodies in interaction with one

another. From this perspective, there is in fact no longer any distinction between “ethics” and life ([5], p. 130). In his discussion of Spinoza’s *Ethics*, Deleuze ([5], p. 33) explains that “there are always relations that agree with one another.” There is no evil (in itself), but there is something that is bad for me in relation to someone or something. An object that decomposes my body, is bad, and one whose relation agrees with me, is good. The example that Deleuze uses is the effect of poison on the body – it is quite clearly life-denying, and therefore bad. This may seem like quite relativistic criteria for good and evil, but in fact, it involves quite firm relational constraints. One can clearly see how the environmental damage that a corporation can create can have life-denying effects on a variety of stakeholders with whom it is in interaction. But in order to understand other “life-denying” effects, we could also consider the kind of couplings that individuals enter into at work. Could some of these relationships have a poisoning, or life-denying effect? In what follows, this perspective may allow us to rethink the concern for social and environmental responsibility and sustainability within business ethics.

The “Life” of the Inanimate World

A common misconception is to define the inanimate world as lifeless. In terms of Deleuze’s geophilosophy, we can argue that the inanimate world displays very specific forms of agency that we have to take into account in our consideration of environmental responsibility and sustainability, more broadly construed. Too often, the inanimate world is portrayed as the passive object of man’s activities. This in turn gives rise to instrumental thinking, as is evident in the preoccupation with developing the “business case for sustainability” within the field of business ethics. From this perspective, environmental responsibility, sustainability, and corporate social responsibility must always be motivated by illustrating how these initiatives will enhance the profitability of corporations. The intrinsic value of the environment, of human beings, and of animals, are therefore decoded and recoded in terms of its profit-generating capacity. What Deleuze and Guattari help us see is that the inanimate entities within our environment clearly have the capacity for agency. A steep rock-cliff that plummets hundreds of meters into the ocean clearly communicates to anyone standing on its precipice: “Go no further!” The dead-blind-mute tick can quite clearly detect the source of its food as it moves past its body and quite accurately launches itself in the right direction. This clearly disrupts the typical hierarchical structure that the distinctions between man, animals, and plants often imply and allow us to think about all entities, and ourselves, on a plane of immanence, where different possibilities can emerge. In our everyday life, we are involved in couplings with other human beings, but we are also in interaction with inanimate and animate entities that can have an equally profound effect on the “ageing” capacities that we have. In fact, Deleuze and Guattari would argue that the best way to experience life in all of its immanence is to experiment with different kinds of “becomings.” In their analysis of “becoming-animal,” they do

not suggest that we mimic animal behavior, or try to cerebrally understand animals. Instead, they suggest that we allow ourselves to be affected in the way that animals may be affected. In fact, “life” becomes the capacity to affect and be affected. This would mean that environmental responsibility and “sustainability” are not some initiatives that we decide upon in relation to nature as an object, but instead the co-contamination of affects between us and nature. It changes the way in which we perceive the world, the way we understand ourselves in relation to it, and our capacities for living in interaction with it. In fact, the notion of “environment” as something external to and separate from us disappears, and we become capable of a more affective interrelationship with nature and with other human beings.

Conclusion

From the perspective of the twentieth century continental thought, “life’s” materiality shapes who we become as agents in the world. If we therefore want to understand “ethics,” we need to understand who and what we interact with, and the social orders that are created in the process. Within the context of business ethics, this precipitates a critical questioning of the capitalist practices that we participate in, and an understanding of how the coding and recoding of value in and through these practices also change us as human beings. We also have to stop thinking about ourselves as entirely separate from the animate and inanimate world, as it is through our interactions with these entities that “life” as we know it emerges.

This may allow us to reconsider new buzz-words such as environmental responsibility and sustainability from a more integrated perspective – we are who and what we are as human beings because of our interactions with all other entities, whether they be human, animate, or inanimate. This may increase our motivation to take good care of all of them.

Abstract

In this chapter the main point will be to indicate the contribution continental philosophy offers to the practice of ethics. Here I will consider the potentially abstract sounding concept of “the other,” which has been particularly important in continental philosophy in recent years.

Introduction

As most people have some preconceived ideas about what it means to speak about “the other,” and in order to clearly present the case for looking at the Other reasonably, I will attempt to provide a clear, if necessarily limited, introductory picture. I first establish what this term “the other” represents in the tradition of orthodox Western thinking, and what we may consider for this chapter to be conventional business ethics. I then review some Continental thinkers based mainly in phenomenology, who suggest that consciousness is experienced in the first person and not as a purely objective or quasi-scientific rational experience. In particular I consider strands of the work that has developed from Kant through Husserl and Heidegger to Sartre. I then introduce the radical interruption suggested in the work of Emmanuel Levinas, and offer some considerations what business ethics can learn from Levinas. I finally consider some consequences for conventional business and ethics following on from Levinas’s radical and controversial approach applied to three well-known theories from business ethics.

Conventional Business Ethics

Philosophy from the analytic tradition overwhelmingly informs the mainstream orthodoxy of business ethics. Indeed, in beginning with such an analytic perspective, I am suggesting a natural starting point for understanding the subsequent development of objections based on continental philosophy, and in particular that of Levinas. These objections lead to a confrontation, or at least offer a number of potentially constructive challenges to the legitimacy of globalized business, with which I conclude the chapter. I take the term “analytic” to name this approach on the basis that traditional Western philosophy may be characterized as an approach which seeks to insure – for example, in knowing what may be right or wrong, good or bad – that any process of reasoning is correct or certain in determining whether a statement is or can be reliably true.

In this pursuit of reasonable truth, Aristotelian logic and the laws of thought are generally invoked as establishing what something is: its identity, or its ipseity. That is to say – tautologically of course – that something is what it is [2]. In Plato, we find clear strands of rationalization for alternative claims about being and not being; about that which is me as a discrete individual, and that which is not me or is other than me, and the two entities are completely separate and distinct [22]. Such are the building blocks of what develops, in the analytic tradition, as the problem of the self as a rational individual among other rational individuals. This apparently reasonable binary of what is “me” and what is other or “not me,” creates an epistemological and conceptual paradox for analytic philosophy that continues to flourish under the exigent spotlight of reason. Such is exemplified, if not determined and foreclosed, in Wittgenstein’s consideration of the basis of one person’s potential for knowledge about another person’s experience [30], or in Nagel’s exploration of the incompleteness of objective reality under what he sees as the force of realism [20]. In these reasonable circumstances, what can I actually know with certainty about the impact on another person of one of my particular actions?

One clear signature event of such paradox arises in a *Discourse on Method* [4]. I choose this example as it is continuously critically scrutinized in the phenomenological work that we will consider in the next section. Descartes’ so-called Cogito offers a perfect speech act of self-referenced, analytic knowledge: I think/I doubt, therefore I am. No outside, “other” reference is apparently necessary or sufficient to this rational orthodoxy. “I am” is a conclusion based on a single predicate, so is not even logical by the aforementioned Aristotelian rules which require two, consistent predicate claims in order to develop a third claim according to logic or reason. Nonetheless the Cogito is held by some to be a founding metaphysical principle of modern philosophy. While Descartes asserts the individual subject as a possibility after centuries of scholasticism, his subject, or self, constructs its own reality for itself. Anything other – anything outside of me – is merely an object outside the subjective self. In such a paradigm, “the other” – anything beyond the mental sense processes of the self is the categorical object of my subjectivity. The analytic self only ever employs self-referencing reason or rationalizations to understand, reduce to meaningfulness, or make sense of, all the sense-data it encounters from the objects outside the apparent control of its own mind.

Even by analytic standards, this leads to an essential if limited mode of reasonable understanding. In promoting the mind/body, subject/object dichotomy or binary, so memorably and so effectively, Descartes bequeaths us a set of oppositions in endless conflict. Such a framework, for all its rational, logical sympathy, leads only to continuing structural problems for Reason. It is entirely possible that such may be one of its purposes, although Descartes only alludes to such a seemingly perverse possibility in passing. Otherwise, and notwithstanding, the Cogito has since its origin prompted almost uninterrupted and inconclusive discussion.

When it comes to mainstream business ethics this binary- or dichotomy-laden structure seems to lead to no less confusion than it might elsewhere. Robert Solomon [28] suggests that in the context of business we are offered two broad approaches to dealing with others. In either case we can be informed by a wide range of opening positions: a sense of social justice, clear religious principles, or simple economic determinism concerning the objective other. For Solomon, we tend to take a principled approach and would thus be likely to follow a set of ethical rules, such as proposed in the UN Global Compact, which determine how we behave ethically in respect of “the other(s).” Alternatively, we take rather a consequentialist approach based on the ethical utility of our actions with “the other(s).” According to Solomon, this leads to business ethics as a field – indeed, as all other such fields of human activity such as sports, the law etc. – which is reasonably adjudicated for ethical behavior either deontologically, or on the basis of an ethical principle, in advance of an action; or consequentially, which is to say on the basis of the outcome of the action and after the event. Such a structure of rational judgments applied either in advance of an action being taken and/or after an action leads to some categorical shortcomings as implied toward the end of the preceding paragraph. How may we certainly say what is right or not without being “in” the phenomena of the moment when an action occurred?

Continental Perspectives on the Other

The continental position is generally agreed to start in the work of Immanuel Kant, who has much to say about others. In particular, indeed categorically, for Kant we should treat others always as an end in themselves, and never as a means to an end only [13]. But this treatment is still something that we – as individual subjects – can achieve through the use of our own reason alone. Later continentals take on Descartes directly and appear to be more concerned than he was with the human subject, with identity, and with the experiences of self and others. This is an approach that considers our capacity to make sense of our experiences of phenomena. Husserl [11] proposes that our experience of the world is simultaneously an experience of others and that such experience of “the other” cannot be verified. For Husserl this problem of an irreconcilable other is not about the truth, as for the analytics and Descartes in particular, but rather a problem concerning all knowledge about the world.

From this problematization of subjective being and the other, Heidegger proposes a constitutional understanding of otherness and others by casting being as primordially, being-along-with “the other.”

Understanding of Being already implies the understanding of Others. This understanding, like any understanding, is not an acquaintance derived from knowledge about them, but a primordially existential kind of Being, which, more than anything else, makes such knowledge and acquaintance possible. ([10], p. 161)

Sartre also sets out from the Cogito. Basing his theorization on an extensive discussion and critique of “the other” in the work of Husserl and Heidegger, Sartre presents “the other” as necessary to our knowledge of ourselves: “an indispensable mediator between myself and me...I recognise that I am as the Other sees me” ([26]; p. 246). Deconstructing this inescapable relation with “the other,” Sartre asserts further that it is understandable as “a relation which I call being-seen-by-another. . . .the Other is on principle the one who looks at me” ([26], p. 281). For Sartre, this “look” points to a profound problem. Despite this rational and attractive theoretical innovation, “the look of the other” becomes marooned on the reef of a self-referential and unverifiable subjectivism.

On the basis of the above characterization of traditional and analytic approaches to “the other,” further argumentation is provisionally brought to a close. In the analytic tradition “the other” is seen alternately as a real object or as an other mind. Thus, by the terms of analytic philosophy, it is unknowable, because not least, it cannot be empirically verified. From a continental perspective, while the problems are considered to be different the use of reason leads to a similar nullity.

It would seem to be conventional for Western philosophy or knowledge to take the view that when a well-established theory is shown to be wrong there is something wrong with the world, as Thomas Kuhn suggests [14]. Here I will try to keep an open mind about the world and rather seek to indicate some problems with rationalism and its dualisms as the basis of all this theorizing. Such has been implicated in organization studies:

Since the Enlightenment, thinkers have progressively differentiated humanity from the rest of nature and have separated objective truth from subjective morality. . . .The organic, biotic, and intersubjective moral bases of organizational existence, we submit, have been neglected or repressed in the greater portion of modern management theory. This exclusion has resulted in theory which is at best limited and at worst pathological. ([8], p. 896)

A pathological distrust of rationalism is a feature of critical approaches to “the other” leading to an effective separation. This separation is a structural fallacy in mainstream business and the ethics that are associated with it:

Isolating “social issues” as separate from the economic impact which they have, and conversely isolating economic issues as if they had no social effect misses the mark both managerially and intellectually. ([6], p. 80)

It is only as the result of successive and repeated failures of economic market models that we have even begun to voice a challenge to the ideology of financial market capitalism.

The Ethics of Emmanuel Levinas

For Levinas this type of fallacy is fundamentally a problem for the entire Western tradition of knowledge. Levinas offers a radically different take on the solipsistic or self-referring “problem” for analytic, and indeed much continental philosophy. He sees it as a reductive and tautological practice. Where the Cogito so clearly places the subject at the center of a self-referential, rational process, this relies upon “the essential self-sufficiency of the same, its identification in ipseity, its egoism. Philosophy is an egology” ([19], p. 44), egology being knowledge based on the explicitly individualist process of personal understanding, or reasonable thinking.

For Levinas “the other” is neither a object bestowed with blunt reality, nor another subject that I can encounter phenomenologically. It is presented, or presents itself to me, in the form of the “face” of the Other. This face of the Other “transcends all phenomenality and beingness and is, in this sense, invisible.” ([21], p. xi). Knowledge of the Other cannot be reduced or totalized to a theme or a referent. Such a practice is the project of rationalist ontology, in which the alterity of the Other is destroyed or reduced to “the Same.”

Levinas offers us a way of sidestepping or overstepping this reduction, and suggests adopting an affective, engaging, and sensual approach to the Other. He “invites us...to phenomenological contemplation of the greeting, the face (more particularly the gaze or the smile), the caress or sexuality” ([3], p. 210).

There are some points of proximity with strands of Heidegger and Sartre, for example, such as the indispensability of the Other. But this Other is not an object of contemplation or reflection. In Levinas the Other is presented imperiously, and irreducibly as the beginning of being:

I am not merely the origin of myself, but I am disturbed by the Other. Not judged by the Other, but condemned without being able to speak, persecuted. ([15], p. 94)

Equally, and more importantly for our considerations here, the Other is what calls me to responsibility and, moreover assists me to escape from the prison of my individual selfhood [18]. Responsibility for the Other comes before my personal freedom. This responsibility is not irreducible, that is, the “good” cannot be reduced to a categorical generality: “the Good does not give itself to freedom: it has chosen me before I have chosen it. No one is good voluntarily...no one is enslaved to the Good” ([16], p. 117).

For Levinas, the Other exacts my passivity, in which my prior self-assurance and certainty is shaken off. The Other requires my act or my gesture of substitution. The Other overwhelms me; demands that I take the place of the Other, that I rescue the Other.

I am responsible for the Other without waiting for reciprocity, were I to die for it. Reciprocity is his affair. It is precisely insofar as the relationship between the Other and me is not reciprocal that I am subjected to the Other; and I am ‘subject’ essentially in this sense. ([17], pp. 98–99)

In the context of such a simple presentation, the Other becomes the origin of all my spontaneous and phenomenological moral action. The effect of such radical remodeling of epistemology is to completely undermine the mainstream view of business ethics. The orthodox, deliberate, and rationalized morals of Western philosophy become alternately insignificant or vacuous. In a confrontation with the Levinasian Other, mainstream business ethics becomes a tautological reduction or theme – a commercial capture of ethics.

Business Ethics with Levinas

A number of scholars have identified business ethics issues based on Levinas's Other which raise problems both for the mainstream project of conventional business ethics and for business itself. For example:

It makes no sense for me to 'choose' to respond ethically to the Other. The ethical is that which opens me to the Other, which goes beyond avoidance of the Other or recognition of the Other as the Same. The ethical exceeds calculation of advantage, of expectation of reciprocity and of reasons for its existence. ([12], p. 227/228)

In such a construction of the Other, how can the responsibility to others (a range of business stakeholders) be construed outside of any direct face-to-face encounter? The bleak response of John Roberts is that in such a position, the Other is categorically occluded from economic relations and that thus "corporate ethics can be seen as no more than an empty, if productive, construction of ethical appearances" ([25], p. 251). More extensively argued and considering the phenomenological Other, business ethics becomes "an essentially self-preoccupied concern with being seen to be being ethical" ([24], p. 125). Such concerns for appearances may be managed at the level of corporate appearances and presentation "leaving corporate conduct completely untouched, save perhaps for a more easy identification of staff with the now 'ethical' corporation." ([24], p. 125). Formally and definitively "the corporation, conceived as an entity, is a purely imaginary phenomenon; it has no sensibility and in this sense is incapable of responsibility." ([24], p. 125).

Teri Shearer [27] reconsiders the epistemological consequences of Levinas. She argues that "economic theory creates a social world in which alterity is discursively erased; in the economic social world there is only one subject position, and a world of objects on which the subject acts" ([27], p. 558). Within the discourse of mainstream business and economics, she argues, accountability toward the Other is eliminated and instead replaced with the economic agent seeking to maximize their self-interest. Against this, Shearer concludes, Levinas's grounding of ethics in the encounter with the Other repudiates the imperialism of economic theory for two reasons:

First, in Levinas's metaphysics, the Other confronts the self as a non-reciprocal subjectivity whose very being forbids the commodification and objectification of the economic relationship. Second, this non-reciprocity instates an asymmetry in the self-other relationship that subordinates the self to the Other and hence permits the Other to make claims on the self.

This latter consequence is crucial because it disrupts the self-interested intentionality that defines the very being of the economic subject, and supplants it with a compulsion or imperative that is irreducible to the instrumental motives of economic man. ([27], p. 570)

Translating the possible consequences of such an interpretation we are heading in the direction where neoliberally rationalized markets – the paradigm of *pax mercatoria* in which contemporary business ethics discourses take place – are a regime of irresponsible enslavement for all actors. Business ethics as such is not reducible to a code or an instruction to behave ethically to the Other. Business ethics constructed around the analytic epistemology of the self-oriented individual, whether based on idealizations of duty, utility, freedom, or equality is not ethical at all.

Other commentators have translated such meaninglessness, arising from the individual nature of responsibility for the Other, to render the corporation constitutionally impotent in regard to responsibility:

Levinasian ethics is an ethics of endless responsibility for the Other and for justice. Our . . . claim is correspondingly that such a responsibility cannot be contemplated by a corporation. Corporations lack the bodily subjectivity that is the precondition of a Levinasian approach to the Other; only humans can act ethically and because corporations are not humans, it is impossible to speak of corporate ethics ([3], p. 217)

Elsewhere, in more recent theoretical deconstructions of Levinas's responsibility, Dag Aasland [1] offers to accommodate the Other within the traditional libertarian maxim. As Aasland explains it, "To Levinas both freedom and the dream of freedom is something that is experienced within the frame of the restraint it implies to be responsible for the other" ([1], p. 39).

To the extent that *pax mercatoria* is about to make the unfortunate errors that (other) totalitarian regimes have made previously, Aasland concludes that Levinas does not propose a means of applying ethics, only a means of understanding it through the Other. He directs us to Burggraeve, who also finds that economic freedom presumes a self-centered understanding of reality.

Business ethics, in the sense of ethics *for* business, illustrates this: its perspective is that of an 'enlightened self-interest' where the constraints that are put on the individual, thanks to the ability to see the unfortunate consequences for oneself, postpone the 'war', in a direct or metaphoric sense of the word. . . This enlightened self-interest forms the base not only of the market economy, but also of a social organization and manifestation of human rights, and even of some ethical theories. It is a calculated and voluntary renunciation of one's own freedom in order to obtain in return security and other common goals. ([1], p. 88/89)

Aasland concludes that academics and managers tend to be caught up in structures of power which make us violate others despite our wishes. Citing Levinas, he reasons that this is

exactly why the only way to put ethics into practice requires that these consistent structures are revealed as serving the interests of the self and then, after being called by the Other, to make efforts to change these structures, if not more than just a little bit, in the direction of always more justice ([1], p. 90)

Naud Van der Ven [29], following an exhaustive discussion of Levinas's epistemology, revealing the structural shame of rationalism, and considering the

primacy of the encounter with the Other, suggests that this critical Other must be accepted “as the final basis of truth and meaning” ([29], p. 109).

Levinas’s Challenge

This line of argumentation might then authorize what I will reassert is Levinas’s fundamental challenge to orthodox positivist determinism or rationalism as a single epistemological basis for the “rightness” or legitimacy of contemporary commerce.

Turning to the operable potential in the field of business ethics for this phenomenological Other, Levinas offers very little by way of practical direction. To reflect on this for a moment, the intense consideration or awareness of responsibility to others is not conducive to most multinational business. Most corporate managers would find somewhat wanting an “after you, Sir” attitude as the sole basis of a program of global business ethics or corporate governance. It is on this entirely reasonable basis – the lack of a performative set of instructions required by those who operate the gulag of positivism – that most practitioners, as well as many mainstream business ethics scholars, will dismiss Levinas and the inconvenient consideration of other people’s needs.

Let us conclude by briefly addressing three theories considered to be among mainstream orthodox business ethics from an analytic or reasonable perspective. I am thinking of those of Milton Friedman, R. Edward Freeman and John Rawls. Each author has suggested a way of coming to terms with a legitimate (if conflicting) way of mediating the world of business.

Necessarily painting with a broad brush here – and as each author has provoked a wide array of commentary already – I will categorize the world of Milton Friedman [7] to take no consideration whatever of others in a Levinasian or even continental sense. For Friedman, the world – which either is, or should be, entirely free (within reason) – is made up only of other individuals all of whom have been given the chance to optimize the profits of some commercial venture within the rules of the game. It would not be possible, ethically, to even consider others as objects: let alone reduce or totalize them to categories such as managers and owners.

In the case of Freeman [6] and his voluntary pluralist stakeholder paradigm, this is already much more open to others on the face of things. Indeed on the basis that this is a dangerous socialist concept, Friedman condemns Freeman for undermining the principles of freedom with the idea that a manager should consider others. I do not seek to repeat the various individualist versus pluralist arguments here; the point is that even the norms of stakeholder theory are accessible by analytic reason, and not by reference to a radical phenomenological responsibility to the other. What would it be like to have infinite responsibility to the stakeholder as Other?

Finally, in Rawls [23] we find a genuine rational attempt to bring liberty and equality together on the basis of principle rather than mere utility, through the application of a regime of consensual social justice. For Levinas, this would again result in an unethical totalization of all others as a bland similitude – how

could we ever reasonably know what would be fair, even with such rules? What plethora of individual other exceptions would there be?

But howsoever these three conventional approaches may inform ethics and the ethics of our organizations, they would each be likely to be more rather than less complex. This, at least on the face of it, is a failure for phenomenology from the analytic perspective. From the perspective of a phenomenologist this failure is reflected in the incompleteness of business ethics and management to appear to be ethical.

The anomalies that continuously arise may be characterized in the following surreal reassurance from Mr Ian Greenwood (Chair of the Trustees of the West Yorkshire Pension Fund, a UK institution managing some £9billion in assets), when he said: “Trustees would be failing in their primary role if they allow issues of ethics to cloud their investment decisions” [9]. Can this person mean what he is saying? Or whatever does he mean by such a claim? While we may by now be thinking that phenomenology has challenges for conventional business ethics, so – surely on this basis – does the behavior of institutional shareholders?

In this situation, as someone who believes that continental philosophy and phenomenology have something to contribute to every individual manager in today’s complex and precarious world, I venture to suggest that the propositional nature of Levinas’s revelation of the Other requires only a tentative tone in the direction of a practice of ethics at work. Such a tentative approach proposes a strong contrast to the strident tone adopted by the standards of mainstream business ethics as found in such normative formulations as the highly regarded standard of the UN Global Compact. Levinas offers us perhaps only a single idea of ethics, “the idea that it is possible to do otherwise than setting oneself before others” ([1], p. 80).

Imagine, as a manager, how such a focus would change your outlook on the needs of each of your employees or coworkers; your apperception of the Other as a competitor or a supplier (or an employee of a supplier); your responsibility to the Other as an individual consumer? Such particular, other-focusing – leaving aside irrelevant totalized considerations such as time or the demands of economic performance – would surely completely change the careless nature of barbarous global commerce?

Each of the commentators in the section above makes observations, which have consequences for business ethics – or, at least, for the ethics of business. These consequences suggest either remedial or radical change in the relationship between business and society, based on responding to the needs (or demands) of the Other: for more transparency in corporate reporting; for a complete rethink of market economics; for more personal and directly interactive human relations; for greater and more particular responsibility from each and every individual manager. Rarely does a commentator offer any direct practical experience with the Other – by way of example or insight into using this Levinassian idea of ethics – as the basis of seeing or imagining how work might be different. To go beyond this – in the terms of the epistemology revealed – may be to reduce business ethics once again to a self-defeating theme as revealed by authors as distinctly mainstream as Peter Drucker with the assertion that “there is neither a separate ethics of business nor is one needed” ([5], p. 200).

Conclusion

Most business ethics, whether as the complacent nihilism enacted by Mr Greenwood above, or otherwise, can obtain enormous value from the concept of the Other. By entertaining the possibility that their distant practical actions can and do have an ethical effect on the Other; by being open to the possibility that the Other will demand consideration, individual and in particular self-interested managers may find the moral strength to adjust or vary their otherwise entirely self-referenced, economically determined behavior. From Levinas' exposition of the nature of our individual responsibility to the Other we find the beginnings of an argument which invariably undermines the fundamental legitimacy of business as upheld to be correct by twentieth century free-market idealists in general and by Western democratic neoconservatives in particular. This is of huge potential significance to those far-sighted individuals searching for an alternative or diversely focused market logic.

The phenomenology of the Other makes it possible to challenge selfish modes of industrialization. For example, one could challenge in an evidently resource-challenged world the utterly reckless and irresponsible use of something as inherently valuable to life as water and power without any constraint; one could challenge plans to push up unsustainable cities or produce pointless carbonated drinks. Just because there is an outdated, intellectually flawed, constitutional, or common-law basis for so doing does not need to mean it is responsible, nor that it reflects any ethical relation to or with the Other.

Abstract

In this chapter, the notion of “purpose” is discussed. It is shown that it has a long tradition in Western philosophy and that it also plays a crucial role in business ethics. Without “purpose,” or concomitant, notions such as “goal” or “result,” human rationality seems to be at risk. This, however, is not to suggest that we cannot be critical about the way this notion functions in philosophy and society.

Introduction

The word “purpose” stems from the old-French “*porpos*” (aim, intention). “*Por*” means “forth” or “forward,” and “*pos*” stems from “*poser*,” which means “to put” or “to place.” This etymology suggests that whenever a subject has a purpose, something is placed *for* him or her. Here, we have to take the preposition “for” in the temporal rather than spatial sense. The purposive subject thinks of the “something” that seems to be waiting in the future as a possibility that might occur. This “something,” which did not happen yet, is somehow believed to be capable of determining the subject’s actions. From the fifteenth century onward, people begin to use the expression “*on purpose*” to indicate that a *person* might have done something “by design.” Whenever people do something on purpose or by design we have unshakeable proof of their intelligence. Since animals are not considered to be intelligent or, what amounts to the same, to have personhood, people have been very reluctant to ascribe to them the capacity of design. This is not to say, as we will see, that people do not ascribe purpose to nature. On the contrary, in a variety of traditions throughout history – most notably, the Greek and Christian tradition – the purposiveness of everything in the world is

taken for granted. However, it is not related to human beings, but rather to divine intelligence or to some other supra-natural transcendence. In the Greek and Christian tradition, human beings are oftentimes seen as the only mortal species capable of having an impact on that “something” that is placed for them or, perhaps better, that they actively place for themselves. An ass or a flower will always mature in ways that are more or less like any other member of their species. Human animals, however, are believed to be capable of escaping such a fixed “destiny.” Conscious design is believed to offer such an escape.

In other words, we are the most purposive animals in the world. Unlike other animals, we have our own “ends,” “aims,” or “goals.” Not to have these defies our intelligence and personhood, it defies what it means to be human. In fact, this seems to be so obvious that hardly anybody feels the need to ask anymore what purpose really means or represents. But what does it really mean to place something in front of you? What does it mean to have a purpose, to be purposive? In this chapter, a brief overview is provided of what philosophers such as Aristotle or Kant had to say about these questions. In this sense, the chapter resonates with the other chapters on these philosophers in this volume. Yet, some critical questions will be asked about the necessity of purpose. The central question in this chapter is whether we can conceive of a business ethics that does not abide to the logic of purposiveness.

On Purpose in Business Ethics and Purpose of Business Ethics

The questions asked above resonate in a variety of ways with business ethics. Its researchers are *interested* in a world which claims to be result-driven or result oriented. The end or goal in this particular world is to achieve “satisfactory” or even “excellent” results. Indeed, to this world applies what the French philosopher Michel Serres [1] not long ago referred to as the fundamental “narcotic” question of our time: *Qui va gagner?* Who will win?

Arguably, business ethicists are stunned by this question as well. They quite rightly take it for granted that business is a result-oriented activity and that the desired result is generally something referred to as “profit” or “shareholder value maximization.” The *goal* or *purpose* of the business ethicist is then to help business practitioners to focus on different, less economically inclined or money-driven goals. Hence, business ethics imposes rules where money seems to be the only ruler. The discussion business ethicists want to start is not about whether goals are necessary, but about what kind of goals are necessary. Sometimes this discussion is taken as a criticism of what is argued to be the narrow-minded focus on money in international business. It can also be taken as a criticism of the idea of economy as such. After all, what would be the purpose of economy if money is not the sole ruler? For some commentators, economy should provide people with the opportunity to become wealthy; for others, economy should provide protection for as many people as possible. But no matter what kind of goals you phrase, economy cannot evade the idea of a monetary result. If business ethics would really push through the idea that money cannot be the sole ruler, they would lose any credibility in the business world. Most of them know only too well that

they can only survive economy's result-driven world if they surreptitiously or even openly accept what they seem to criticize: financial results. In the end, they must succumb to the temptation of hard results and hence they start claiming that ethics will pay too. The logic of purpose inevitably drives them into this direction. Not to have a financial purpose is ridiculous and senseless in the economic world. It is the single most important goal. It is the goal overarching all other goals. This is why, ultimately, business ethics is compelled to make the argument that goodness pays or that profitability is good. If one, as business ethicists usually do, accepts the idea that economy or business has a purpose one cannot but accept the irrefutability of this logic.

To put it differently and perhaps also somewhat more provocatively, what would a business ethics look like if it jettisons not just the idea of profitability (something which cannot do it if it accepts the logic of purpose in the world of business) but the idea of purpose as such? What if purpose or purposiveness is a concept that undermines rather than reinforces moral behavior? What if we would, like Serres, call for a cold turkey that allows us to evade this stunning idea of purpose? This is the admittedly outrageous question we will take up in the present contribution, but it is a question that we will only approach very obliquely, that is to say, not so goal oriented.

On the Nebulous Origin of Optimism in Business Ethics

The injunction to think without purpose or result is so provocative for it apparently invites us to defy reason. To see why this is the case we need to discuss the concept of “teleology” (“telos” = goal, purpose; “logos” = knowledge, doctrine). An explanation for a person's behavior is teleological when it refers to the goal of this behavior. This goal is seen as something which explains this behavior in the sense that it is believed to cause it. For example, if a man's goal is to lose weight, this goal might be said to cause the fact that he is racing on his cycle now. If a business man is obsessed by making a profit, this might be said to cause the fact that he did not abide by the law or that he turned out to be a bully for his employees. Whether the causal link is as clear in the second case as it is in the first case is difficult to tell since this depends on what we know about the particular situation.

The learned term philosophers have used to describe the type of cause we have just discussed is “*causa finalis*,” which is commonly translated as “final cause.” Philosophers who believe that there are final causes in nature and that such causes are not just the figments of the human mind are referred to as “*finalists*.” The first philosopher who explicitly adheres to a form of teleology is Diogenes of Appolonia (fifth century B.C.) who we should not confuse with his more notorious namesake Diogenes of Sinope who lived and died a 100 years later. In a fragment delivered to us by Simplicius, the man from Appolonia writes the following:

... [I]t would not be possible without intelligence (*noièsias*) for [the underlying substance, i.e. air] so to be divided up that it has measures (*metra*) of all things – of winter and summer, of night and day and rains and winds and fair weather. The other things, too, if one wishes to consider them, one would find disposed in the best possible way. (*quoted in: Kirk and Raven, p. 440*)

In what seems to be a perfect anticipation of Leibniz's theory that we live in the best of all possible worlds, Diogenes argues that the basic substance (*archè*) of reality – in his case it was air, but that should not really concern us here – must contain intelligence, perhaps even a divine intelligence. Without such an agent, Diogenes argues, we cannot explain why things are so neatly divided as summer and winter, night and day, or rain and wind and fair weather. It must have been the regularities of the seasons that impressed the philosopher. Whence the idea of *measures*, an idea already important to Heraclite who did not, however, go so far as to explain *all* events by the presence of intelligence. Diogenes did. Kirk and Raven observe that for him “every natural event was evidently due directly to the intelligence of the pure form of the basic substance; and thus occasional local anomalies, which were permitted in the systems of Anaximander and Heraclitus, providing they were eventually corrected and counterbalanced, should not really take place.” (Kirk and Raven, p. 441) We submit that this ancient, half-forgotten fragment already evidences what drives the teleological *Weltanschauung*: a concern with regularity, a concern with measurability, a concern with plan and design, but also a concern with symmetry and beauty. Teleology's proclivity to aesthetics, Nietzsche [2] would argue many years later, is the basis of its unflinching optimism, a point to which we will have to come back. No matter how many anomalies appear, the supporter of teleology will dismiss them as exceptions which lack purpose. No matter how strong the irregular winds of chance (*tuchè*) are, he or she will always fervidly retain hope that they might be thwarted by proper measurements and intelligence.

On Why Business People Are So Prone to Line Their Pockets

Socrates is the first philosopher who tried to phrase a coherent argumentation around what Diogenes only intuited. In Plato's dialogue *Phaedo* ([3], pp. 100b–102), he makes an apparently straightforward distinction between mechanistic and final explanations, a distinction that would fatally determine all intellectual and academic endeavors in the Greek-Christian millennia to come. Mechanistic explanations merely try to explain phenomena by describing matter, movement, and the laws governing both. Final explanations, on the other hand, generally involve the notion of a “form” or “idea” which explains why certain phenomena do or do not occur. Socrates' example is very confusing or complicated even though he presents it as something which is pretty much self-explicatory: the fact that one man is taller than the other is related to the fact that he participates in the idea of “tallness.” Similarly, the smaller man participates in the idea of “smallness.” So, the idea or form of tallness and smallness causes the differences between both men. The idea functions as a final explanation for a particular matter of fact. The problem is, of course, that A may be taller than B but smaller than C, an objection Socrates shoves under the carpet by arguing that A may be simultaneously participating in both tallness and smallness. It just depends on the situation in which he finds himself. And here again, we bump into a complexity that we, for the sake clarity, want to avoid.

However, for us, it is important to understand that Plato comes up with a causal explanation that we nowadays would not easily accept. The classic example of mechanistic causality is the billiard ball which moves because it has been pushed by another billiard ball. Would he have known billiards, Socrates would no doubt reject this and would make us believe that the movement is caused by the pocket in which the balls are supposed to end. It is as if the pockets mysteriously – that is to say, nonmechanistically – cause the movements on the baize. This not what many people nowadays would like to believe. We have now come to appreciate mechanistic causes more than final ones, at least when we are talking about fairly nondescript and organic objects such as billiard balls. When we are talking about a human realm such as business, however, many people are perfectly willing to argue that refillable *pockets* are causing certain behaviors. Yet, they seem reluctant to accept that those who have these kind of goals are just like billiard balls.

On the Notion of “for the Sake of Which”

Even though we should not assume that Aristotle knew more about billiards than Socrates did, he is generally believed to have given a decisive twist to the discussion about teleology. There must be some force in nature which takes care that everything will be arranged in a good way. This force is not in some ideational realm as Socrates or Plato believed, but in the nature of things themselves. In other words, things try to achieve particular aims that are given with their own nature. Biological organisms, for example, are naturally inclined to develop themselves to maturity or adulthood. This mature or adult state is the aim or “*telos*” of their development. More precisely, it is that “for the sake of which” (*to hou heneka*) the organism developed in a particular kind of way. Aristotle argued that this “*telos*” is needed as an explanation for the development of these organisms. Even though Aristotle is at pains to show that mechanical causes are necessary, he agrees with Socrates that final causes are much more important. “The origin of something is nature and not its matter,” he explicitly writes in *De Partibus Animalium* ([4], p. 642a17). It is crucially important to understand that for Aristotle this “*telos*” has a place in nature. It is the essence of each single organism, and he adds that if scholars do not give a place to this end or goal in their explanations of why living creatures developed in a particular kind of way, “they do not say anything about nature at all” ([4], p. 642a16). Not to talk in terms of *telos* is, for the Aristotelian mindset, just as much as for the contemporary business man, simply unreasonable. We need goals in order to make sense of the world.

However, the notion *to hou heneka* seems to be defying reason for another, more paradoxical and complicated reason. To see what is at stake here, it is important to understand that the maturity “for the sake of which” an organism is progressing to its final “form” is both that to which the process is directed and that which directs the process. (Analogously, profit can be seen as that to which organizational processes are directed and that which directs them.) The reasonability (*logos*) and goodness (*agathon*) of this *to hou heneka* is precisely the mystery that a mature

plant is somehow in the seed and that an adult man is somehow in the infant. Maturity and adulthood are therefore not emergent properties but are, right from the outset, steering the entire process. They make the process intelligible for intelligent people. (Again, following this logic: the possibility of profitable results is all that is needed to render the very idea of a corporation intelligible.)

In the *Nicomachean Ethics*, it becomes clear that the “*telos*” of a human being consists in rational activity for it is reason that sets him apart from all the other living creatures. *Theoria* or rational contemplation is the highest goal for human beings ([5], p. 1177b20), but Aristotle is clever enough to point out that such is not available for all human beings. The *bios theoretikos* or *vita contemplativa* is understood by Aristotle as what engenders happiness, but for most people *bios praktikos* or *vita activa* is all that is possible. Nevertheless, Aristotle has great expectations of intelligence and in order to give it its central place, the world as such is rendered intelligible by bestowing it with an all-encompassing purposiveness. In other words, the *telos* that is the end of the process and that steers the process works as an intelligent force. For Aristotle, this force is an immanent finality, but the Christian tradition after him posited a transcendent intelligence behind this immanent finality.

The irony of history is that, in modern times, people became again much more interested in mechanical causes than in final causes. The danger that lurks behind this shift is that the world may become a place of chance and contingency, something referred to by Aristotle as “*tuchè*.” Perhaps this threat is why so many scientists and academics could in the end not resist the temptation to assume that there was an intelligence behind the mechanical world even though that intelligence did not work as a final cause. The theory of immanent finality developed by Aristotle was thus rejected and replaced by a transcendent finality (sometimes referred to as the “clockmaker,” “God,” or “benevolent genius”). Yet, even nowadays, the Aristotelian worldview has not entirely disappeared. In biology, one might argue that the very idea of the genome or DNA seems to assume some sort of immanent finality. But again, this is an issue that does not concern us here.

On Purposiveness Without Purpose

The temptation behind all teleology is that entities in the world – organisms, objects, and organizations alike – can only be explained by some end they should have. What counts for the entity as such also counts for individual behavior. Living and nonliving entities are designed, either by a transcendent or an immanent finality, in order to achieve this end. If there is no end, the world becomes incomprehensible. Immanuel Kant has provided us with what is widely seen as the most extensive and coherent discussion of teleology in modern philosophy. He did this in a book about aesthetics called *Critique of Judgment* (1790). In this text, Kant wants to reconcile teleological explanations with mechanical explanations. He clearly does not jettison teleology as such. He actually argues that organisms can only be understood by human beings from a teleological perspective, but unlike Socrates and even Aristotle he does not privilege

teleological explanations over mechanical ones. Here again, we will not go into this discussion at any length, but we will go into some detail when it comes to Kant's very specific understanding of purpose or end.

In section 10, entitled *On Purposiveness in General*, Kant [6] defines an end (*Zweck*) as "an object of a concept in so far as the concept is seen as the cause of this object." Purposiveness (*Zweckmäßigkeit*) is the "causality of a *concept* with respect to its *object*." These definitions are not easy to understand and this problem is aggravated by Kant's apparently incoherent or paradoxical use of words like *Zweck* or *Zweckmäßigkeit*. What is clear, however, is that Kant understands end and purposiveness in terms of concepts. He makes it clear, right from the outset, that his definitions are transcendental, that is, not empirical. Here, this means that end and purposiveness are in our mind as concepts, and not somewhere else (e.g., in the true nature of things). We "think" ("*denken*") of ends, and we do it as soon as we think the object itself as a consequence of what we are thinking. Here, you can easily imagine an artifact such as a painting: the artist thinks of what she wants to create, makes a concept of it, and this becomes her end. It is the end that she wants. She desires it. More generally, *will* is the ability to act according to the representation of an end.

What we learn here is that ends are not only related to concepts, but also to will and desire. Indeed, it is extremely difficult to think of a painting without thinking of the artist's will and desire. However, Kant opens up the possibility to think of purposiveness without a will, a purposiveness that escapes concept and thought. When we judge something as good, we clearly have a concept in mind of what it means to be good. When we judge an organism as healthy and mature, we have a concept in mind of what it means for this particular organism to be healthy and mature. But what happens when we judge the beauty of, for example, the artist's painting? Do we have a concept in mind when we enjoy a painting, a particular kind of music, or a landscape that we see while walking? Do we need such a concept in order to judge whether what we perceive is beautiful? Reasons and principles, Kant [6] points out, will not help us to form a judgment about whether a piece of garment, a house, or a flower are beautiful or not.

On the one hand, our judgment seems to be entirely dependent on how we see the object, as if our pleasure in seeing a thing of beauty depends on our senses and nothing but our senses; on the other hand, when we finally judge that an object is beautiful, it is as if we feel supported by what Kant refers to as "a general voice" and we subsequently expect nothing less than the support of everyone. So, if a person tells a friend that Bach is beautiful, he will feel insulted if this friend would not acknowledge this. The point here is that this would hold even when this person cannot exactly define a rule or criterion why Bach is so excellent. Kant claims that even though our judgment of beauty is without concept, this does not entail that we refrain from making a general claim on the general validity of this judgment. Since it is without concept and since ends are clearly linked to concepts, the question then becomes what beauty is. After all, we saw that in our tradition the idea of of purposelessness does not seem to make any sense at all.

According to Kant, we cannot dispense with teleology when we are discussing nature or ethics. Without the assumption that there are ends, science and ethics

would be completely unreasonable. However, this does not seem to hold for aesthetics. Somehow, it seems to be very difficult to link beauty to teleology. Beauty, Kant famously declares, is “purposiveness without purpose” (*Zweckmäßigkeit ohne Zweck*). This definition, however, has led to many misunderstandings. It is as if Kant wants to safeguard the domain of aesthetics from means-end schemes, from result-driven orientations, and so on. But it is also clear that there is still the idea of purposiveness. Does he want to have his cake and eat it?

On the Idea of Free Beauty

To disentangle the paradox here, Kant makes a distinction between objective and subjective ends. Objective ends can be phrased as concepts and hence formulated in terms of rules of guidance. When business ethicists urge managers to write down a code of conduct, then they can follow some well-defined steps that will allow them to create such a code. This is not the case with subjective ends. An example of a subjective end is pleasure or happiness. So, if the same business ethicist urges managers to feel pleasure or to become happy, then it will be much more difficult to formulate rules of guidance. Why would that be the case? The answer here is disarmingly simple: with respect to pleasure or happiness, people do not have the same opinion about what these notions might amount to, but with respect to “codes of conduct” people do have more or less the same idea. We can ask a musician to play Bach for us and then she will work according to some concept in her mind, but when we ask her to create pleasure or happiness among her audience, things will become much more difficult.

Now, Kant adds to his definition of beauty that it is purposiveness without objective or subjective ends (purposes). It is not objective since it creates feelings of pleasure and even lust, but these feelings somehow transcend the subjective too since we hear (according to Kant at least) this “general voice” whispering in our ears that others should experience the same pleasure or lust as well. In the sense that it has an effect on us, we might argue that beauty transforms us – but we hate it to see that others are not transformed in a similar kind of way, that others do not have the same taste as we do.

While this explains why beauty is without purpose, it does not yet explain why Kant still clings to the idea of purposiveness (*Zweckmäßigkeit*) when it comes to beauty. He clearly believes that there is something that beauty should do: it should bring pleasure to our senses, our reason, our imagination. This can be seen as an end, of course, but it is an end which is completely vague and general in the sense that it can be achieved in many different kind of ways. There is a difference between the task to create a pleasurable garden and the task to create a garden and a particular kind of style. In the latter case, one needs to abide by certain rules that will help you to create such a garden; in the former case, however, you are free to do whatever you like. In this way, and this is the crucial point here, Kant [6] allows for some sort of imagination. Somehow, beauty should be free from rules, restraint, and so on. So, not only parrots and birds of paradise, but also the foliage

on wall-paper or on painting frames and most music do not allow to be subordinated to a concept and are therefore denying the idea of work, task, or assignment. That is, they deny the idea of purpose.

On the Morality of Purposelessness

Why didn't Kant allow for a free morality analogously to his idea of free beauty? In section 87 of *Critique of Judgment* [6], he advocates the idea of a moral teleology. What we find in the world, he claims, is a physical teleology, but what we find in ourselves is a moral teleology which is a priori given. Here, Kant grapples with the relationship between laws and rules on the one hand and freedom on the other. Happiness (*Glückseligkeit*), he argues, is the highest good we can aim for, but in achieving it, we are restricted by "the objective condition of the correspondence of man with the law of morality (*Sittlichkeit*)". In other words, it is the law that provides us not only with an objective goal, but also with the dignity (*Würdigkeit*) that is needed to achieve it. Indeed, to live without a goal is not only unreasonable, but also without dignity.

Nietzsche believed that, on the level of organic life, Kant is right in the sense that he makes clear that purposiveness only lies in *our* idea of the world. It is not in the world as such. He may be wrong, however, when it comes to phrasing the kind of purpose *for the sake of which* everything lives. Life as such does not have a purpose. That is, if it has a purpose it is the most elementary of all: bare survival. But for human beings such a kind of purpose does not have, at least not from a Kantian point of view, any value or dignity. In the twentieth century, philosophers like Hans Jonas [7] would contest this idea: for him, survival *is* the ultimate value. For Jonas, to allow for this is the only way to bridge the perennial gap between "*is*" and "*ought*," or between ontology and ethics.

Nietzsche is adamantly clear that purpose as such is a fake concept. Neither did he believe in the distinctions such as mechanical and teleological, or subjective and objective goals. Such distinctions just tell us something about how *we* want to organize the world. On the other hand, he is clearly of the opinion that for a human being to be without purpose is simply stupid. In other words, we should face the idea that life is stupid and that our brains which allow us to endow it with some purposiveness are perhaps the stupidest entities in the world. This, however, is not to say that we should not have a purpose. No matter how illusory any purpose is, it may not be unwise to have them. Purposiveness presupposes intelligence. Nietzsche does not object, but he would add that intelligence is probably the greatest illusion.

So, in the end he believes in purposes, but in purposes that are completely illusory. Great purposes, he argues, will and *should* in the end lead to a person's own downfall. This is perhaps what only true men of genius can strive for. They never think in terms of consequences, calculations, or results. The only thing they care for is change, innovation, and transformation. These words indicate the boundaries of *their* morality. A moral person does not think in terms of consequences or teleology. He shies away from dignity and purpose. This is not

to say that his acts are inconsequential, it is rather to say that he chooses to *not think in terms of consequences*. This is his dignity. To be sure, such a dignity can be dangerous and stupid, but it is what morality, purposeless morality at least, implies. No law, no rule, no project, no Kantian issues at all here: just allow for the fact that your actions may have outcomes that cannot be anticipated at all. This entails an entirely different, non-teleological, imaginative, and perhaps even a reckless kind of optimism.

Conclusion

Where do all these reflections leave the above considerations on happiness? Should we really aim for it albeit within the boundaries of human dignity and reasonability? We are not going to answer these questions here, but wonder how they might resonate in the field of business ethics. Is profitability in business what is happiness in Kantian ethics? That is to say, is it what firms should aim for albeit with some dignity? Can we interpret the entire endeavor of business ethics as a way to bring dignity into a field that has so many difficulties to uphold its indelible illusiveness? It is tempting to think this. It would provide business ethics with a more or less robust *raison d'être*: what we do teach to managers and CEOs is to become profitable and yet not to lose dignity. But what we do not teach them is the morality of purposelessness, the morality of those who do resist the narcotic idea of victory and profitability, or the morality of aesthetics if you like.

Abstract

In this chapter we explore the relationship between business ethics and faith. We show how business ethics is largely motivated by a now shattered faith in the capitalist entrepreneur. But this does not mean that business ethics is faithless. The shattered faith in the capitalist entrepreneur has made way for a number of newly created figures and concepts, including social entrepreneurship, corporate social responsibility, and responsible leadership. The belief is that these figures and concepts are capable of correcting business' dark sides, without disrupting the faith in business itself.

Introduction

The field of business ethics has a growing interest in continental philosophy [15] and continental philosophy has a growing interest in faith ([1]; [10]; [27]). However, this does not mean that business ethics has taken an interest in the topic of faith as discussed in contemporary continental philosophy. We will argue that this is unjustified.

Business ethics is rooted in various forms of faith and continental philosophy is a valuable resource in showing how faith operates within business ethics. In particular, the birth of business ethics as a discipline is motivated by a shattered faith in capitalism and its personification in the figure of the entrepreneur. With the

development of the field of business ethics, faith today resurfaces in different ways in order to restore faith in the redemptive possibilities of business. These forms of faith are visible in pleas for corporate social responsibility, corporate citizenship, ethical leadership, and other important themes within business ethics.

Walter Benjamin highlighted the role of faith in historical materialism (Marxism, at the time) in his “Theses on the Philosophy of History” [6]. Benjamin gives us the image of a puppet that appeared to be able to play chess. A system of mirrors and strings concealed the fact that a small hunchback, who was an excellent chess player, sat beneath the table and guided the puppet’s hand:

One can imagine a philosophical counterpart to this device. The puppet called “historical materialism” is to win all the time. It can easily be a match for anyone if it enlists the services of theology, which today, as we know, is wizened and has to keep out of sight. ([5], p. 245)

Here Benjamin lets historical materialism be defended by theology in disguise. In this chapter, we will let the reader recognize hidden dwarfs as important, yet mostly unrecognized, players in business ethics, and we claim that business ethics can only be properly understood by taking the hidden roles of faith into account.

Within contemporary continental philosophy, theology is no more a hidden dwarf, but rather a rising giant to the extent that one can talk of a “theological turn” in contemporary continental philosophy. This turn has been debated in the social sciences and in cultural studies in the last decade, driven by prominent thinkers like Giorgio Agamben [1], Alain Badiou [2], Jacques Derrida [11], Jürgen Habermas [4], Peter Sloterdijk [19], Gianni Vattimo [24] and Slavoj Žižek [27].

Business ethics has, under the impression of the last four decades of scandals and crisis induced by a raving capitalism, lost its faith in the figure of the entrepreneur as being capable of ensuring the best of all possible worlds. Business ethics as a field now seeks to restore the possibility of believing in business by putting faith into newly created figures and concepts including corporate social responsibility, responsible leadership, and social entrepreneurship.

The Political Economy of the Market and the Rise of the Capitalist Entrepreneur

The German political philosopher Carl Schmitt has his own version of Benjamin’s puppet image, when he famously claims that “All significant concepts of the modern theory of the state are secularized theological concepts” ([18], p. 36). According to this thesis, even the most enlightened and liberated concepts from political theory would be haunted by a theological dwarf: secularization only removes theological motives from sight. This insight is also largely valid for management and organization studies (see [22]). For example, Martin Parker [16] has traced modern organizational hierarchies back to the hierarchy of the angels, as described in the late fifth century theologian Pseudo-Dionysius’ book *Celestial*

Hierarchy. In a similar vein, the Italian philosopher Giorgio Agamben points to angelology as the antecedent to all theories of management:

Long before the terminology of civil administration and government was developed and fixed, it was already firmly constituted in angelology. Not only the concept of hierarchy but also that of ministry and of mission are... first systematized in a highly articulated way precisely in relation to angelic activities. ([1], p. 158)

While the connection between angels and bureaucracy may appear abstract, it is part of a system with important political, philosophical, and religious implications. In this system, an important relationship is established between the theological notion of God and the economic notion of the market (and its protagonist, the entrepreneur) to which we will now turn.

The relation between faith-based institutions and the economy has always been a central matter of dispute, struggle, and war. In early Christianity, Jesus famously exempted the shopkeepers from the temple square. A related, pivotal moment in this history came about under the European reformations, centered on the Protestant reformer Martin Luther. Luther's hatred of merchants and bankers was severe, as he did not see much of a distinction between how the Catholic Church had corrupted the believers and how emerging capitalism was corrupting the same believers, now as economic agents, by dragging them away from God. The Church had been turned into a market, in which you could buy yourself out of damnation through indulgence, and Luther saw profiteering as nothing else than a systematization of this practice.

Two and a half centuries later, in 1776, Adam Smith, a Christian philosopher and economist, published *The Wealth of Nations*, in which the capitalist market is described in ways quite like the ways Luther would describe God: as a beautiful, balanced being, capable of distributing goods and providing for its actors [20]. The difference between Luther and Smith is partly inspired by another reformer, one who had a lasting impact on the Scottish enlightenment and on Smith, John Calvin (1509–1564), who intercepted the tradition and redefined Luther's less urbanized interpretation of Christianity. While Luther mistrusted the upcoming bourgeoisie, Calvin saw in it a coming stronghold for the gospel, and allowed Christians to lend money and take interests. One paradoxical product of this is that faith in the providence and faith in the market become isomorphic. In Benjamin's words, "Capitalism has developed as a parasite of Christianity in the West... until it reaches the point where Christianity's history is essentially that of its parasite – that is to say, of capitalism" ([6], p. 289).

This, of course, is far from what Calvin had intended. Calvin's theology implies an idea of God as a constant re-creator of the world, which brings with it the doctrine of providence. The world is a beautiful system, through which God's creative power constantly shines. It shines, however, in a way that does not allow us humans to see, perhaps even fathom it; God's actions are hidden. This is the first injunction of what Smith was to later make into a powerful concept, the concept of the invisible hand. When Smith picks up this notion it allows him to conceive of the world, that is, specifically, the market, as a beautiful machine which turns all the

individual vices into a collective virtue. This construction was firmly based on Calvin's theology and, moreover, allowed the believers to enter the market with a clear goal. On the market it would, according to Calvinism, be revealed, but not decided, who was redeemed. This decision lay safely, following the doctrine of predestination, with God. However, success on the market signaled that you were one of God's chosen, a motivational force famously explored and analyzed by Weber in *The Protestant Ethic and the Spirit of Capitalism* [25] in which he identifies the Calvinist spirit of capitalism as the driver behind the Northern European rational pursuit of gain in wealth. This progressive political theology opens a new vista for the most decisive figure in the modern West, that is, the entrepreneur. While faith in the transcendent deity is transformed into faith in the invisible hand and its encompassing wisdom, the entrepreneur is the figure that both draws on this faith personally, but also comes to represent and embody the object of that faith.

This move can be seen in the field of entrepreneurship studies, which has constructed a narrative around the entrepreneur that bears a deep resemblance to the way the creator operates in early Semitic and, later, Christian mythology. The discourse on entrepreneurship is not just dominated by fairy tale constructions, but indeed installs the entrepreneur as a savior of the world [21]. Not only is the entrepreneur installed as "our" savior, but it is argued that the act of saving rests on the act of creation. That is to say, the entrepreneur is kept alive through our faith in his creative powers. The entrepreneur emerges, as does God in Luther's theology, as a *deus absconditus*, that is, a hidden God. The entrepreneur now embodies, on the one hand, the Judeo-Christian myth of creation where creativity is a mystical gift from above and, on the other hand, the figure of Goethe's Faust, who sees no limit to the expansion of his knowledge even when it costs him his soul. This endows the entrepreneur not only with exceptional and superhuman powers, but also with the qualities of a vexed and potentially totalitarian version of Nietzsche's superman, a term which actually originates from Goethe's Faust: an ability to set one's own rules (values), different from the rules of ordinary people.

Popular management literature, bearing titles such as *First, Break All The Rules* [7] frequently builds upon this image. The list of these especially gifted persons who transgress moral and bourgeois boundaries is long. It might begin with the CEOs of Enron, of Union Carbide, of British Petroleum and it may end deep within our own, hidden dream of becoming that eminent cosmological exception to human fragility and mortality that finally will relieve our anxiety.

This way we eventually lost our faith in the character who took over God's place in the social imaginary. With Faust, the perfect figure for capitalism had finally come into being – the ruthless, self-legislating, and endlessly competitive social character, the Citizen Kane of modernity, the entrepreneur. However mythical, this character produces quite real and evident actions. But his powers, the mystery of his creative genius, are veiled. The entrepreneur is the savior of the moderns, yet they do not know how they are saved. He actually often appears in guises that resonate with his theological forebears. Sir Richard Branson's Virgin Airlines fleet in the air is connected to his venture capital organization also named Virgin. This gigantic company gives birth to numerous companies each year, signaling an immaculate

conception of novelty surpassed, perhaps, only by the Immaculate One, Mary, herself. All of these effects may be measured, modeled, and so on. Yet, the source of this brilliance is hidden from our sight, and we do not become Sir Richard just by reading his autobiographies – aptly named *Losing My Virginity* and *Screw It, Let's Do It* – just as we do not become gods by contemplating holy scriptures. But by recognizing the glory of the entrepreneur, we uphold the theological dwarf, namely, the savior, whom he embodies.

Business ethicists do not embrace this image of the capitalist entrepreneur. Indeed, the development of the field of business ethics is largely motivated by a shattered faith in this character, following a range of corporate scandals in which bankers, accountants, and other organizational figures demonstrated their entrepreneurial skills in less beautiful ways. The field of business ethics, despite its diversity, is bent on the construction of alternative faiths that offer a remedy to the loss of faith in the entrepreneur.

Responses to the Shattered Faith in the Entrepreneur

Business ethics has responded in three ways to the shattered faith in the capitalist entrepreneur. The first is a continued effort to celebrate the entrepreneur by making the case that the entrepreneur is essentially a moral character. To the extent that we have witnessed unethical business practices, entrepreneurship cannot be blamed for the simple reason that morality comes with the character or deeds of the entrepreneur. In this response, the role of faith remains unchanged. We keep believing in the miraculous powers of the market through the figure of the, now morally grounded, capitalist entrepreneur.

This first response claims that there is something about the figure of the entrepreneur that makes it an inherently moral character, or more generally, that there is something in business that ensures its morality. We see this in the idea that there is something about the rule-breaking behavior of the entrepreneur that implies moral qualities. Teal and Carroll, for example, have tested the hypothesis that the entrepreneur “may exhibit higher levels of moral reasoning” since he breaks with the norms of society ([23], p. 229). In a similar vein, Clarke and Holt conclude that “what is ethical in entrepreneurship is . . . preserving the capacity for self-legislation” against orthodoxy or the norms of community ([9], p. 328). In both examples, the potential dangers of rule-breaking or transgressive behaviors are turned into an ethical principle that seeks to restore our faith in the entrepreneur as we know him.

A somewhat different version of the same position is Carr’s suggestion that “enterprise is by its very nature ethical” ([8], p. 7). For Carr, it is not so much the rule-breaking nature of the entrepreneur that makes him ethical, but a “manner of living” that is needed to make small business successful – a way of living that was, according to this writer, promoted by Margaret Thatcher’s “profoundly ethical” reforms in the 1970s and 1980s ([8], p. 14).

Here faith in business and the capitalist entrepreneur is continued, but now with a more explicit argumentation for the inherent ethical nature of business. The business scandals of the 1990s and 2000s, or the financial and ecological crisis,

are not waved away as a threat to our faith in business as personified in the capitalist entrepreneur. None of this can be his fault, as his character or his enterprise guarantees “ethical business.”

The second response to the shattered faith in the capitalist entrepreneur does not see the entrepreneur as an ethical character or business as having sufficient redeeming resources in itself. On the contrary, it recognizes that the market, if left alone, has undesirable consequences. For this reason, business and entrepreneurship must be infused with an ethics from the outside. This, therefore, is the task of business ethics: to correct the “natural” course of the market by bringing in ethics. In this perspective, the capitalist entrepreneur is not to be dispelled with; he is here to stay, but he does need help from some metaphysical friends. In other words, business ethics now puts its faith in, often well-established, metaphysical systems that the ideology of the capitalist entrepreneur claimed to be able to live without.

A variety of these metaphysical friends have been proposed. Well-established ethical theories, such as virtue ethics and deontology, are frequently brought in as useful helpers within business ethics. Bass and Steidlmeier [3], for example, have argued that leadership must be infused with Western ethics, including deontology and utilitarianism, so that it can save us from contemporary organizational and societal problems. In other cases, scholars argue for the importance of grounding business in Christian or communitarian values. One study that explicitly seeks to add external morality to the capitalist entrepreneur is Post [17], arguing that entrepreneurship can only live up to its potential if it is based upon “the philosophy of global corporate citizenship,” which is defined as a philosophy in which concern for the community comes before concern for the corporation. By infusing such a “noble” philosophy into enterprise, entrepreneurs transcend the utilitarian logic that is promoted in a capitalism that lacks a metaphysical friend. With a sense of higher purpose, however, we can become like the bricklayer who thought themselves to be building a cathedral instead of just a wall ([17], p. 148). Here, belief is the defining difference that recreates the wall (i.e., business as usual) as a cathedral (i.e., a religious/cosmological whole which is much larger than the sum of its parts).

As indicated earlier, the entrepreneur has not only become identified with a certain belief system, but emerged at the same time as the figure that should finally relieve the downsides of this system, firstly economic scarcity. Yet, as it becomes evident that the created wealth is distributed via a set game that creates more and more inequality and environmental disaster, the role of the entrepreneur is, in the third and final response to the lack of faith in the entrepreneur, transformed. The “social entrepreneur” must overcome capitalism, at least symbolically, and even become a new messianic figure. As Murtola aptly puts it, entrepreneurship is then “seen as the good that has fallen and that needs to be restored to its proper place (society, not economy)” ([13], p. 129). This faith in the entrepreneur amounts to a vision of capitalism absorbing – if not absolving – itself in the process, as it does not replace capitalism with something else, but incorporates it into a much larger vision of virtue and societal redemption.

One example is 2006 Nobel Peace Prize laureate Mohammad Yunus who, in his acceptance speech, expressed his unhappiness about the “one-dimensional” conception of entrepreneurship that postulates profit making as its single driving force.

Such a conception, Yunus argued, is not just a simplification needed to grasp complex social reality; it also lies at the root of legal frameworks and practices which “insulates the entrepreneurs from all political, emotional, social, spiritual, and environmental dimensions of their lives” [26]. By reconceptualizing entrepreneurship in a broader way, Yunus sees an opportunity to “change the character of capitalism radically, and solve many of the unresolved social and economic problems.” The not so happy continuation of Yunus’ entrepreneurial endeavor, following alleged malpractices around Grameen Bank’s microcredits, confirms rather than annuls the thesis of the ethical entrepreneur as savior. It is, as Girard [12] has explored, necessary to regularly symbolically sacrifice the one that was elevated to a godly level, in order to restore society’s central structures.

The social entrepreneur is not the only figure who is elevated to this position of savior within the field of business ethics. One can also observe it in the frequent, but rarely explicit, assumption that “responsible” or “value-driven” leaders are capable of saving us from any kind of problem, or in the celebration of whistleblowers who are also valued for their messianic qualities.

Conclusion

In Žižek’s view, religion has in the current global order two possible roles: “therapeutic or critical”: “It either helps individuals to function better in the existing order, or it tries to assert itself as a critical agency articulating what is wrong with this order as such, a space for the voices of discontent – in this second case, religion as such tends toward assuming the role of heresy” ([27], p. 3). One may speculate that faith in business ethics predominantly plays the role of, staying with Žižek’s terminology, the therapeutic: it soothes the real functioning of business with various idealized conceptions of it.

This role of faith in business ethics is akin to what Nietzsche saw as a quite modern version of faith, not in a transcendent and furious God, but in a God that, “when a people [or a scientific field like business ethics] is on the road to ruin; when it feels its belief in a future, its hope of freedom vanishing forever” has to “modify himself” ([14], p. 19). This God then becomes “forever moralising, he crawls into the heart of every private virtue, becomes a God for everybody, he retires from active service and becomes a Cosmopolitan” ([14], p. 19).

We see a likeness to the immanent God of business ethics: a privatized, benign, moralizing character, shaped and molded along the ideals of human cosmopolitanism and methodological individualism: loved by all, feared by none. Business ethics has proven to be a revolution to business, but a revolution that has come with an outdated theology, namely, a weak, humanistic version, a “secularized” – and mostly impotent – theology.

Rather than contemplating corrective figures such as the responsible corporation, the ethical leader, the courageous whistleblower, and the social entrepreneur, the future of business ethics may be more promising if it could give form to the second, “critical,” deployment of religion that Žižek talks about – a heresy within and against the present soothing faiths of business ethics. In this direction, contemporary continental philosophy may offer an important source for

inspiration. Many contemporary philosophers such as Agamben and Badiou have recently begun to point out how “theology,” for example, the theology of Paul, may become a much stronger ally than one that just offers cultural soothing of a business logic like that in the financial system. Following this trajectory, business ethics may come as a revolution with a reformation, that is, a reformation of what it considers to be true. Instead of offering a partly reconstructed belief bearing on humanist/communitarian values to the shattered belief in business itself, business ethics may be able to turn theological insights against the different forms of faith that at present dominate the field of business ethics.

Discourse Ethics and Business

Katja Thierjung

Abstract

In formulating a critical social theory, Jürgen Habermas endeavors to find a framework for evaluating the problems of a modern, globalized society and finding a substantial opportunity to overcome them. That framework also addresses, of course, questions relating to business and problems in business ethics. In this chapter, the building blocks of the critical social theory will be converged with the help of Habermas's works. As a basis, Habermas developed the *Theory of Communicative Action*. It serves as the foundation for developing his discourse ethics, which in turn are enhanced and implemented using the legal philosophy in discourse theory. The implementation possibilities of discourse ethics will finally be evaluated with the help of two fundamental paradigms from interaction economics.

Introduction

In formulating a critical social theory, Jürgen Habermas endeavors to find a framework for evaluating the problems of a modern, globalized society and finding a substantial opportunity to overcome them. That framework also addresses, of course, questions relating to business and problems in business ethics. In this chapter, the building blocks of the critical social theory will be converged with the help of Habermas's works: The first section will begin with a reconstruction of the Theory of Communicative Action and the social concept built upon it in order to explore Habermas's critical approach to social theory. The second section follows with a presentation of discourse ethics. With regard to his moral theory, Habermas views himself as having two tasks: On the one hand, philosophical theory must

release its claim to what is, ultimately, metaphysically founded knowledge. Ethics are therefore no longer a matter of strict knowledge that is binding to all. On the other hand, Habermas simultaneously does not want to fall into relativism. In discourse ethics, Habermas believes to have found an alternative to cognitivism and relativism. The third section centers on the implementation of discourse ethics. This concretely deals with the application of norms and with the implementation of norms within a modern social context. Habermas develops for this a two-level society concept, which is intended to be tailored to modern circumstances by linking paradigms of communicative actions and systemic functional relationships. His link is the rule of law intended to mediate between lifeworlds and the social subsystems of capitalism and modern government machinery. In the interest of proposing a solution, he reconstructs the principles of a democratic state with the rule of law using concepts from discourse theory. Finally, the fourth section will make an initial analytical evaluation of the implementation possibilities of discourse ethics with the help of two fundamental paradigms from interaction economics.

The Foundations of Discourse Ethics: Communicative Action

Habermas's aim is to use the "Theory of Communicative Action" to win a moment of critical unconditionality against relativism without falling into the problems of traditional metaphysics in its continental manifestation. To do so, he hopes to build upon an immanent rationality he sees formed in empirically founded knowledge from contemporary theories. When doing so, Habermas assumes that a significant degree of rationality has already materialized in the world (see [1]). Reconstruction of this rationality is assessed according to coherent viewpoints of coherence and can claim neither exclusivity nor ultimate justification (see [2]). Simultaneously, Habermas disputes the fundamental assumptions of ethical relativism.

In order to immanently justify a comprehensive rationality concept, Habermas refers to, above all, Speech Act Theory: What is decisive for him is the experience that argumentative speech has in unifying consensus-creating power without having to revert to physical force. This moment of consensus via discourse and without violence is the fundamental building block of all of his philosophical endeavors. Habermas references the works of Ludwig Wittgenstein and his concept of rationality: Every act of speech implies one or multiple claims to validity that have to be justified using arguments. These arguments and their consensus-creating function are, for Habermas, evidence of a rationality that is anchored in the essence of normal speech. The Theory of Communicative Rationality focuses on the nature of this rationality. Also, the Theory of Communicative Rationality investigates the formal properties of methods for justifying claims of validity that agents capable of speech and action use in their speech (see [1], p. 28).

Since linguistic processes for agreement are an opportunity for action coordination, Habermas recognizes the ability of subjects to come to an agreement as being a significant element for a society to function (see [2], p. 68). Claims to validity

made during verbal negotiations are based on an evaluation of the situation. When pertaining to the order of interpersonal relations, statements are made with a claim to correctness. Statements of this kind express a norm, i.e., a certain imperative. The criterion for decidability is acceptance of the validity and/or justification. Statements of this kind are based on the mutual social world as the totality of legitimately regulated interpersonal relations (see [3]). This consent to or denial of the claims of validity presented in the discussion constitutes the basis for an agreement to a situational interpretation and therefore the possibility of cooperative action. Habermas then states that there are two possibilities for attaining consent to claim to validity.

There is teleological or “strategic action” (see [1], p. 131): Teleological action is performed by an agent that, above all else, is attempting to realize an objective that has already been sufficiently defined with precision. Thus, agreement motivates the interlocutor, empirically, i.e., with a threat of sanctions or with a perspective for reward, to initiate mutual action toward an objective that has already been indicated. Coordinating action under these circumstances depends merely on the interests of those involved, i.e., on the question of whether the benefit calculations of the individual agents match or not (see [2], p. 144).

By contrast, the objective of “communicative action” is an entirely different mechanism of action coordination. The opponent is rationally motivated to consummate a subsequent action. The objective is rationally based agreement in the assessment of situations and the expected consequences from actions, such that there can be internal coordination of action plans. According to Habermas, this happens due to the force of the illocutionary binding effect of a speech-act offer. Habermas traces this binding force to an internal relationship between claims to validity and grounds. If an agent enters into an agreement and takes a position toward the claims to validity of a speech act offer, then this position will fundamentally have “*a moment of insight*” (see [4]) in the eyes of the subject, as claims to validity cannot be accepted or denied in agreement-oriented actions without grounds. Habermas also calls the “moment of insight” the “forceless force of the better argument” or also “affection via grounds” which strongly shows the “rational side” to Habermas’ theory (see [5]). However, this moment, i.e., the rationally motivated acceptance of a speech-act offer, is not based on the actual validity of what was said but rather on the guarantee that the speaker assumes for his statement. In the event of statements with a claim to truth or correctness, the speaker will indicate grounds that will assume a guarantee for the statement. In these two cases, claims to validity can be submitted discursively (see [2], p. 69).

Habermas further states that communicative understanding is largely based on having a mutual lifeworld. This makes it possible for participants to revert to mutual background knowledge in their communication. Most arguments intended as a foundation for claims to validity in discourse are generated from this background knowledge. Each communication participant is a member of the lifeworld that is subconsciously present for him for the current setting. If the communication partners share a similar lifeworld, then most of the communication processes will be unproblematic as they can revert to the same patterns of interpretation. Thus, it is

not necessary for each individual situation to be renegotiated in full detail. Should, however, an argument be rejected by an interlocutor as being invalid, then the horizon in which that argument is embedded becomes problematic. This questions the claim to validity, and the grounds for its foundation are requested. In such cases, there is need for agreement with regard to current possibilities for action. However, it is not the entire lifeworld that is questioned here, but rather only a section relevant to the situation. The content of the lifeworld can never be entirely comprehended by the actor anyway. The content is not conscious, but rather, it is merely an unproblematic background that can become relevant in sections depending on the situation. If the same lifeworld is shared, then action coordination will be more successful. Thus, the lifeworld plays a large role when individual subjects are intended to be socially integrated into a society (see [4], p. 189).

Discourse Ethics: The Process of Moral Argumentation

In his works *Moral Consciousness and Communicative Action* and *Remarks on Discourse Ethics*, Habermas explains the methodology for transcendental argumentation and the foundations for discourse ethics. In doing so, Habermas assumes that rational agreement is based on certain requisite conditions. These conditions have already been set before any act of communication and must be accepted exactly when a human, a speaking entity, enters into a communication process with another speaking entity in the interest of action coordination. Since this objective is inevitable for every entity capable of speech and action, there is a “transcendental necessity” [6]. *Transcendental* does not mean that the general pragmatic preconditions for communication represent obligations in the moral sense of natural law: A transcendental argumentation always refers to the requisite conditions for the possibility of something. Thus, Habermas is always searching for the “general preconditions (...) under which our daily communicative practice *has always* taken place (...)” ([2], p. 141). With transcendental argumentation, Habermas embeds practical discourse as a form of agreement into the interrelations of communicative action. He bases this on communicative reason, which he believes can be easily presupposed to the extent that we, as speaking entities, are reliant upon verbal agreement in general. This transcendental necessity simply does not allow any discourse participant a choice other than to accept the conditions of communicative action a priori. Whether they are actually observed, from an empirical point of view, does not play a role. Indeed, Habermas is not naive in this point and is very critical toward the potential ability to realize a rational agreement process. However, there is a legitimacy in supposing a rational outcome if the conditions are nearly fulfilled (see [2], p. 162, [7]). If one engages in communication, one must assume that there is at least a possibility for rational agreement in order to act coherently. Thus, the argument of transcendental necessity is based on the coherence of a speaking entity with the conditions of its nature. In this manner, Habermas circumvents the burden of proof of ultimate justification for basic ethical norms and avoids the problems that an ethical cognitivist has when

wanting to deductively justify basic ethical norms. Habermas executes this argumentation chain with reference to Karl-Otto Apel. But in contrast to Habermas, Apel does, however, attempt to maintain a claim to ultimate justification using transcendental pragmatics. While Habermas does build upon Apel's conception, he wants to liberate the approach from its heavily cognitive content. To do so, he refers to the change from the paradigm of the philosophy of consciousness to the philosophy of language. According to Habermas, one cannot identify statement truths on the analytical level of language pragmatics (see [2], p. 90ff).

Habermas relies on the "weaker assumption of a claim to validity *analogous to truth* (. . .), ([2], p. 66)" which only inquires about the form of arguments that can claim validity as justifications for norms. Claims to correctness are therefore no longer reduced to claims to truth. With this concept, Habermas can avoid an anticipatory judgment of the credibility of diverse claims to validity and leave judgment to the respective interlocutor. There is no longer a duty to assess the content of good grounds. Habermas does not anticipate the outcome of rational discourse. The discursive submission of claims to validity alone determines the view of the world (see [6], p. 130ff).

However, Habermas formulates the legitimacy procedure for testing action norms. These can only claim legitimacy among those affected after submitting the claim to validity in discourse under transcendental rules. The "normative" content of discourse rules may not be equated to the obligatory content of interaction norms. The general pragmatic prerequisites to legitimate discourse are not a part of an ethical program for determining action obligations. Rather, the pragmatic prerequisites merely spell out the exterior framework for an argumentation practice in which the moral rules of human action can be tested. The normative orientation is a matter of the discourse; discourse ethics only explicate the formal rules for the dispute. The results of a practical discourse are therefore rationally motivated and can be suggested as the expression of a justified and well-founded consensus. Thus, Habermas shows himself opposed to the view of relativism. As such, Habermas is skeptical of the view that moral questions can be rationally decided at all. It is not, however, the philosopher who makes the decision, but rather the respective discourse that is governed by rules of argumentation. Habermas's principle of discourse ethics is as follows: "Every valid norm would meet with the approval of all concerned if they could take part in a practical discourse" ([6], p. 12).

To spell out rules of discourse, Habermas deliberates the conversational situation that would have to exist in order for the forceless force of the better argument to come into consideration, i.e., in order for communicative action to be conducive. These unavoidable general argumentation prerequisites, which have to be pragmatically assumed by the participants prior to entering discourse, are, above all, based on the principle that all participants are viewed as "free and equal in a cooperative search for truth" ([6], p. 61). The underlying concept is based on the symmetry conditions and reciprocity expectations of communicative action in general. This includes, for example, the principles of openness, of equal participation, of truthfulness, and of unconstraint. The path to demonstrating performative self-contradictions shows that each one of these conditions is unavoidable in attaining

the communicative action's objective of agreement via good grounds and only via the force of the better argument. Thomas McCarthy interprets the discourse preconditions as the exclusion of deception and self-deception, of consciously strategic action and subconscious communication contortions. In any case, those wishing to justify norms must accept these procedural conditions. This means that the unavoidable argumentation prerequisites are not met if, firstly, certain participants, topics, or contributions are not admitted or, secondly, when consent or denial is forced due to sanctions or suggestions (see [6], p. 161ff).

These rules can be bundled into Habermas's *Universalization Principle*: "Every valid norm must satisfy the condition that the consequences and side effects that foreseeably occur from its general compliance can be accepted unforcefully by all who are affected to satisfy the interest of every individual" ([6], p. 12). The Discourse Ethics Principle stipulates that norms can be justified. The universalization principle handles exactly this prerequisite. Therefore, it does not stipulate any normative content for the respective argumentation; rather, it sets the framework conditions for the exchange of claims to validity during discourse (see [2], pp. 76, 103).

Habermas characterizes the moral viewpoint of discourse ethics consistently with tradition as being the standpoint from which an especially high degree of impartiality in judgment, and therefore justice, can be guaranteed. However, he contradicts tradition by opposing the construction of a neutral observer and perspective distance. For Habermas, all moral phenomena are allowed into a daily practice to which we only have access as participants. Thus, the philosopher does not have exclusive access to reason. Rational decisions can only be made in discourse through discursive submission of claims to validity. Therefore, it is not possible for an individual to replace discourse with a monolog or with a dialog with an ideal discourse partner. By contrast, discourse opens up the opportunity to test the ability to generalize action norms by truly addressing all conflicting needs and interests of all discourse participants. This makes it possible to make mutual criticisms on interpretation perspectives in action situations and on the appropriateness of articulating needs. According to Habermas, moral conflicts cannot be solved "in everyone's interest," i.e., abstractly and without actually integrating the participants. Therefore, discourse transferred to the inside can serve a substitution function but cannot be an equivalent for real discourse. All who are affected must participate in order to rationally decide whether it meets mutual interest. Thus, Habermas also provides his universalization principle with a setting that guarantees the integration of all participants; in this manner, monological application is barred. The impartiality of the judgment is ensured from the viewpoint of the participants themselves (see [2], p. 156, [6], p. 76ff).

Habermas justifies this procedure using the lifeworld concept: Moral values are a part of a horizon of subconscious knowledge to which nonparticipating third parties cannot find hermeneutic access. As a result, the construction of a neutral observer falls short of its objective, as the observer does not have access to the lifeworld moral concepts of those affected. In discourse, it is possible for an individual to break through the limits of that individual's own concrete lifeworld and relate to a mutual "moral point of view" ([2], p. 174) with the others. In the

general pragmatic prerequisites for argumentative communication, Habermas finds a viewpoint that interaction participants always assume if they act communicatively at all. This is based on the structure of communication itself and not on a contextual principle that could be found independently of the individual communicative process. Therefore, a moral viewpoint can be accepted even if the discourse participants have deviating value concepts. Discourse ethics thus search for a point with precedence over all controversies, and all subjects have to accept this when acting communicatively. Habermas believes to have found this point in the reciprocity arising from free acceptance in coming to an agreement. Habermas supports this line of thought using above all else the works of Theodor W. Adorno on “intact intersubjectivity” and George Herbert Mead’s concept of “ideal role assumption” (see [1], p. 523f).

An ideal form of reciprocity requires the concept of a universally imagined, rationally motivated mutual understanding as reference point. The discursive testing of norms therefore continues to correspond to the intuition that moral statements not only claim validity for individual persons but also imply a sense of “self-transgression” ([6], p. 157). In discourse, the limits of a particular lifeworld are penetrated, be it in a family, a city, or a nation. Thus, validity is not put on level with social acceptance. Impartial judgment of the interests of all affected cannot be reduced to an equally distributed chance to assert their own interests. In order to avoid acceptance and power claims becoming identical, norm acceptance may not be robbed of its cognitive meaning. Habermas does not place consideration of this meaning into the hands of philosophers, but rather refers to “a *discursively* ascertainable, i.e., *cognitively* tangible interest visible from the participant perspective (...)” ([2], p. 84). The “validity” of moral principles is ensured mildly by the respective mutual acceptance of good grounds. The construction of a universal, rationally motivated understanding in turn requires an ideal communication community incorporating all subjects capable of speech and action that aims to attain that understanding in rational discourse. This conceptualized liberalization of restrictions in social space and in historical time is intended to serve as a guide for a discourse that does not exclude any participants, topics, or contributions. If followed, then it can be conjectured that a rational decision will be reached. The meaning of this ideal entirely corresponds to the Kantian “Idee” in the sense of constant convergence. Like Kant, Habermas refers to the example of physics, which also works with a contrafactual assumption that one can come as close as one prefers to ideal sizes. Even if this concept remains purely regulative, the claim to absoluteness in ethical norms in traditional universal ethical theories is ultimately replaced without, however, simultaneously falling into relativism (see [6], p. 155ff).

The result can claim the assumption of rationality, but no more than that. Furthermore, a selective, discursive agreement on norms in coexistence implies a time and knowledge index. Even if all argumentation prerequisites could be fulfilled, there can be no certainty that the result will withstand every future criticism. That is why the formulation of rights and obligations cannot claim “absolute validity” as the result of nonviolent discourse. Habermas dubs this the “fallibilism” integrated into discourse theory.

A further significant element of the ethics conception in Habermas's discourse theory is the differentiation between ethical and moral questions or norms and values that he lays down in *Remarks on Discourse Ethics* and then further develops in his work *Between Facts and Norms*. Habermas differentiates between two potential perspectives. While ethical questions implement the individual answers for attaining a good life, ethics factor this out completely and focus on the aspects of justice. In *Between Facts and Norms*, Habermas assigns to the two perspectives their own discourse type by applying the discourse principle to the respective subject matter, thereby inferring the matching argumentation rules (see [8]).

1. Values incorporate questions of identity and self-image, i.e., ethical questions cannot generally be answered in a manner that is obligatory to everyone. The self-image of a person or a community as a whole is shaped with the help of strong evaluations. The perspective of ethical questions is egocentric for the single individual or ethnocentric with regard to a culture. The mutual lifeworld constitutes the horizon within which new mutual action possibilities are elicited for the future. Decisions of this kind not only lead to actions but also affirm our identity and form the foundation for the lifestyle shared between agents. This does not, however, mean that rational answers for these questions would be impossible or that they would not be accessible to any kind of objective observation: The conscious decision of who I want to be can be measured against the benchmark of an authentic lifestyle. However, the validity of an ethical statement in relation to the specific life plan must be relativized and can claim binding force only toward persons of a specific origin. While cultural values and ideals do carry a claim to intersubjective validity, they do so only within the same culture group. Feats of abstraction in this area are also not at all possible in their totality. Only individual norms and actions that have become problematic can be questioned within the self-evident context of the respective lifeworld. A socialized subject cannot question the life form in which its identity has been formed in its totality (see [6], p. 35ff).

Ethnic-political questions are answered in ethical discourse. Today, in our life form, the respective answers are expressed within the legal framework of a modern life form. In this case, the "democracy principle" intervenes, which above all else is intended to avoid violent conflict by establishing a procedure for legitimate legislation. This principle is based on a viewpoint different than that of ethical discourse. The legality of the rules is inquired. In these discourses, the justification for rules is based on the identity of a surrounded community. This justification needs only to be recognized by the respective members, as they are based on shared traditions and strong valuations (see [8], p. 198). Should these ideals and strong evaluations themselves be questioned, then the arguments brought forth in discourse can only be based on historically derived clarifications from one's own self-image or on claims to an authentic lifestyle. Uncircumventable differences in interests can only fall back on rational equalization, which, however, has to materialize under fair negotiation conditions. These fair compromises should be able to secure "the integrity and equal coexistence of life forms and world interpretations" ([6], p. 166). Here, the democracy

principle indicates how the formation of opinions and of will should be institutionalized, namely, via a system of laws securing equal participation in the process of legislation. To do so, the democracy principle explicates the conditions for equal participation in discursive formation of opinions and will, i.e., the external institutionalization.

2. According to Habermas, the question of norms is categorically different. The universalization principle spares questions of good life and is only applicable to practical questions that can be debated rationally, specifically with a chance for consensus. Moral questions do not concern preference but rather the grounds for the intended validity of action norms. The objective of moral considerations are to think about norms according to which we want to coexist and through which action conflicts can be regulated in the mutual interest of all. This question separates itself from the horizon of an ethical lifestyle and demands a judgment under the viewpoint of what *everybody* could want mutually. The moral viewpoint is based on impartiality above all else, which should rule in assessing questions of justice.

Moral questions are decided using the moral principle as an argumentation rule in moral discourses. Here, the discourse principle assumes the form of a universalization principle: The normative viewpoint expresses itself in the aspiration to have coexistence regulated in the interest of all. While, according to Habermas, moral questions can only be decided upon in a discourse that actually happens, all discourse participants do have to project a communication community without borders if they want to claim validity and rationally justify that claim in discourse. The reference is always humanity and/or “presumed republic of world citizens” ([8], p. 139). This moment, which transcends experience, is decided by the moral justification practice of social conventions. In order to secure an impartial judgment, it can no longer refer solely to the context of the respective life form (see [6], p. 124).

The Implementation of Discourse Ethics

Habermas works in detail on the implementation of discourse ethics in a modern society. As a foundation, Habermas’s statements on the individual implementation difficulties in discourse ethics with regard to cognitive and motivational problems should be discussed first (see [1], pp. 225–366, [2], p. 127ff). Both problem forms originate from the application of abstract norms on distinct individuals in different situations. Since individuals are overwhelmed with solving the consequential problems alone, they have to be solved via a social order. To do so, the conditions of a modern society according to Habermas are stated. They are decisive for designing a social order with regard to the assertion of moral consensus. Responsible for this are rationalization processes, which lead to a redesigning of society and allow the difference between a modern and premodern society to emerge. Finally, Habermas’s ideas on the relationship between ethics and law based on the lifeworld circumstances of a modern society will be presented.

In a lifeworld in which justice questions are not separated from the questions of good life, moral judgments are only made in concrete contexts. This can be drawn from the certainties of a given life form. This means they have the advantage of a direct action-motivating force. If, however, the questions of justice are separated from the ideas of a good life, then distance from the concrete context is introduced and, therefore, distance from the corresponding lifeworld background. Moral questions aim at general answers distanced from the individual case that can be solved using the background knowledge of the lifeworld. As a result of the practical deficit, a difficult mediation problem generated between general and formal principles on the one side and morality on the other (see [6], p. 42). There are two problems relevant to the implementation question: cognitive and motivational.

The *cognitive* problem originates from the application problem of norms and action forms that have been legitimately grounded according to the procedure of discourse ethics. Here, the limits to discourse ethics can be seen, as they do not directly stipulate what the correct action decision in an individual case under given circumstances. The logical argumentation role of the universalization theorem is restricted to justification discourse. In order to determine the correct form of action in an individual case, it becomes necessary to bar a further argumentation step after the first of the norm justifications, namely, the question of application. To do so, the distance from the context must be reversed again. Even if the universalization principle has already been set aside as an argumentation rule for the results and consequences of general norm compliance for the benefit of each individual, it is impossible for all consequences of potential applications of a norm to be taken into consideration in justification discourse. Neither time nor knowledge is such that all situations could flow into the justification. In order to legitimately apply a norm, another discourse has to be held, namely, application discourse. In it, the norms and obligations, which are initially an unquestioned part of lifeworld knowledge, play the role of grounds. The principle of appropriateness assumes the role of the universalization principle. It cannot be assumed that the idea of impartiality has been satisfied until both discourses have been held, and therefore, both principles have been applied. In application discourse, it is no longer the general validity of the norm that is of significance for each individual and its interests, but rather the effects from general compliance with the norm in a certain situation. The situational circumstances give the norms' implementation concrete form (see [6], p. 139).

In the case of a norm collision, the relationship and, above all, the differences between abstract justification and concrete application discourses become particularly clear. In application discourse, what counts are the circumstances of the situation to which a certain norm is being applied. They determine the consequences of general compliance or noncompliance with the norm in this specific situation. These consequences are then illuminated from the perspective of those affected and their interests. However, the other norms that fall behind the norm being applied to the specific situation do not per se lose their general validity which can only be questioned in justification discourse. Observing the individual situations and application discourse makes it possible to give a certain form to the disordered batch of applicable norms justified during justification discourse.

By following the principle of appropriateness, Habermas is hoping for a coherent order, which, of course, experiences a change in relations with each new situation.

The *motivational* problem is found when justification questions are detached from context and answers then lose the action-motivating force previously yielded from the self-evidence of the lifeworld. There is merely a chance to generate rational insight into the morally “right” action and to hope that it is followed. Habermas knows that, above all, the question of motivation is a decisive point in moral theory as this motivational problem of anchoring moral insights includes the question of the ability to implement ethics. In order to solve the problem, rationally motivating insights have to be remerged with empirical stances. Habermas attempts to solve this problem by connecting an interest-based perspective with a moral perspective. McCarthy interprets this as locating the objective of discourse in a consensus on the interests that can be generalized. The model does not intend to exclude individual desires, needs, wishes, and interests; rather, it intends to subject them to rational aspects during discourse. Discourse therefore ensures, on the one hand, that all affected interests are integrated. Individual interest is accounted for by the nonreplaceable consent of each individual. On the other hand, the egocentric perspective has to be overcome via discourse and the universalization rule in order to attain violence-free agreement as the objective of agreement. By connecting the consent and integrating the others in the discursive process, it becomes possible to attain agreement reflecting the interests of each individual without renouncing social relationships. A moral that is stipulated abstractly and without a reference to the empirical world cannot emerge at all (see [6], p. 72, [7], p. 372).

When an ethical principle has been accepted by all participants in discourse, discourse ethics do not claim that this ethical principle has action-regulating force. Habermas even establishes that the requirements placed on the discourse participants are extremely high. The following question is posed: How might moral insights and empirical interests fit together? With Habermas, the problem of weakness of will refers to a broad field of external conditions that must be fulfilled before it becomes “reasonable” ([6], p. 136) to adhere to valid moral judgments. For Habermas, “ethical” means “generally reasonable” anyway. If a certain situation demands a decision that will have a sacrifice regardless, then that sacrifice is not ethically made according to Habermas, but rather voluntarily provided by the discourse participants. Habermas also bases this on there being no interest in dilemma situations of this kind that could be generalized. Therefore, there is also no corresponding norm that everyone would consent to in rational discourse. That is why the weakness of will should not be understood as a negative attribute in the traditional sense (see [8], p. 148). In this context, he also refers to the relationship with socialization processes, identities, institutions, and normative contexts. For when the social context is such that motivation usually places the actor in opposition to his own interests on good grounds, then it cannot be expected of him to give preference to insight. This reasonability condition ensures that compliance with moral commandments is not only of mutual interest but that they also do not demand an unreasonable sacrifice from the moral actor. Habermas knows about the impossibility of lastingly positioning the force of moral insight against

empirical interests. If the conditions named are not fulfilled, then the procedure of discourse ethics can only ensure that the principle accepted in the discourse can only play the legitimate role of justification for a certain action in an action conflict.

The subjects are ultimately overwhelmed alone with the two consequential problems of distancing in reason-based ethics. Therefore, structures must be available in the lifeworld that ensure the social and moral integration of individuals. Habermas therefore drafts a societal concept for implementing discursive ethics in a modern society with the paradigm of rule of law as its objective. In order to justify this, he clarifies the conditions for modern societies. Habermas described the progression from a premodern to a modern society in the "Theory of Communicative Action" as a rationalization procedure. This leads to new conditions under which a mutual understanding of ethics can be developed. Modern societies, namely, show the characteristic that ethical background knowledge is increasingly questioned rationally and negotiated via communicative processes. Individuals, however, are overwhelmed with the resulting tedious communicative coordination work. Therefore, an additional mechanism has formed in modern societies intended to relieve communicative processes. This mechanism ensures the coordination of systemic action consequences. Habermas develops a two-level society concept with that basis. He conceptualizes modern society as a lifeworld and a system simultaneously. The socially integrated lifeworld is responsible for symbolic reproduction, while the functionally coordinated system and its subsystems from capitalism and the modern state apparatus are responsible for material reproduction (see [1], p.198, [4]).

As a result of the two different social integration principles, two subsystems stand in irresolvable tension: Democracy is reliant upon legitimization of political objectives by the collective, thereby remaining dependent upon the lifeworld context and agreement-oriented negotiation. The coordination principle for determining aims is built upon the social integration mechanism. Since, however, capitalism can be entirely decoupled from the lifeworld using the symbolic medium of money, action coordination is performed solely via systemic relations and strategic action dominates in order to guarantee the success of indicated objectives. Based on the principles of democracy, modern societies claim primacy of socially integrated action areas over objective system relationships. Lifeworld members confirm or correct values consensus in social discourse. The state should assert this value consensus against business. This task is based on, above all, market failures qualified as such by the lifeworld. The states should hinder or mitigate crises and compensate for undesired side effects on the lifeworld. Here, Habermas refers, above all, to the equalization of economic inequalities and the arrangement of labor and social laws (social safety net and compensation for disadvantages from structurally weaker market positions, such as employees, tenants, and customers). The authorization of functional necessities of systemically integrated action areas should be questioned via agreement-oriented action of lifeworld members. Capitalistic momentum can only be implemented to the extent it is accepted by lifeworld deliberations. Against this background, we can understand Habermas's description of fundamental tendencies within advanced capitalism and his criticism of the consequential disempowerment of democratic institutions and processes (see [4], p. 505ff, [9]).

However, Habermas also establishes that systemic structures have an evolutionary entitlement, particularly when involving material reproduction. Lifeworld considerations therefore should also not intervene in systemic relationships: The economy, for example, may not be controlled via the symbolic medium of power. Above all, Habermas sees the precedence of private investments as an important element in the independence of an economic system. State control should only cover the framework conditions governing economic transactions between private companies. The organizational form of the capitalistic economic system must remain untouched. Furthermore, the structure of this economic form may not be changed: While social policy should compensate the extremely disadvantaged and dampen uncertainties, it may not touch “the structurally unequal property, income, and dependency circumstances (. . .)” ([4], p. 511).

The exchange relationships between system and lifeworld, however, are not, according to Habermas, compromised by the processes of bureaucratization and monetarization’s intervention in the lifeworld. The purely perfunctionary action is no longer limited to subsystems alone but rather stretches to cover public and private areas of life. According to Habermas’ evaluation, the increasing expansion of perfunctionary action orientations beyond the borders of subsystems affects undesirable developments. Pathologies are triggered by replacing communicative action with systemic control mechanisms in symbolic reproduction (socialization, cultural reproduction, and social integration). Specifically, in relation to the symbolic medium of money, there is a monetary renaming of objectives, relationships, and services. Life areas cannot be “technically reorganized” without consequences, i.e., subjected to perfunctionary action. These functions can, at most, be technologically expanded with regard to communication, organizationally mediated or rationalized. The expansion of the “monetary-bureaucratic complex” ([4], p. 516) becomes a hazard for agreement potential and consensus chances in the private and public spheres. Habermas calls the penetration of system-integrative mechanisms into communicative action areas the *colonialization* of the lifeworld or the *Technical Reorganization of the Lifeworld*. Habermas takes this concept from Niklas Luhmann who notes that the rational interior structure of agreement cannot be reproduced in an exchange process with symbolic media, as experiences and actions will not be verbalized or understood [4, 10].

Since there is entitlement for both integration mechanisms in a modern society, although they compete with one another, the task arises to assess the balance between the requirements of a lifeworld’s moral consensus and the subsystems’ functionalistic imperatives in a modern society (see [4], p. 350). In order to establish a compromise, Habermas searches for a communication medium that allows mediation between the system’s claims and those of the lifeworld. In his work *Between Facts and Norms*, he attempts to reconstruct the right to a medium of this kind (see [8]). Resolution of tension becomes possible because this right has a distinct compulsory and simultaneously binding moment. Furthermore, law receives its legitimization via a discursive practice in which the members of a society agree upon the fundamental questions of coexistence. Discourse connects the legal code to the medium of common speech, thereby connecting it to the

lifeworld. The simultaneous threat of external sanctions and the supposed legitimization of a rationally motivated agreement make legitimate implementation possible. This gives law an expectation-stabilizing effect, and it can assume the function of securing social solidarity when social rules can no longer secure integration via communicative processes. On the other hand, law is what makes it possible for the controlling media of money and power to set up markets and organize a state authority, as the operations in these areas are realized in forms of law. As a result of this function, law must place the messages of the lifeworld into a form that remains understandable for the specialized codes of the controlling media of money and power.

The historical rationalization process that elevates modern society from premodern society has made rule of law both possible and necessary. With legal discourse, the moral consensus for the legal community can be adjusted and placed into a form for institutionalization. Rule of law is also a model for how humans can legitimately govern their coexistence using law as the foundation.

Critical Appraisal and Suggestions by Interaction Economics

Considering the effects from international functional interconnections, such as international financial and commercial crises, and also global risks, such as climate change, worldwide migration, and epidemics, a justified question poses itself regarding the extent to which discourse ethics represent a theoretical concept that helps to counteract global challenges. This particularly applies with regard to a sustainable future perspective for global business ethics. Karl Homann's interaction economics should help here to illuminate certain theoretical modules.

One significant element of interaction economics is the differentiation between framework rules of action and actions within framework rules. This relationship can be clarified using modern economic processes. The starting point for deliberation is the competition in a market economy. An individual cannot, against the background of competition, be forced to allow himself to be exploited due to his own ethical conduct. If ethical concepts are not (yet) anchored in framework rules, then competitors are not subject to the same action restrictions. In a case like this, it is expected that society finds framework rules under which an individual does not constantly have to infringe upon his own interests in order to maintain ethical norms. Homann expands this concept to the systemic forces of capitalistic rules. For its implementation, ethical norms must be imposed upon all actors via action restrictions. The state must also ensure that ethical behavior does not lead to the economic ruin of a company. Ergo, the implementation of ethical norms should mainly occur by creating mutual (legal) rules. If no tribute is paid to this insight on systemic forces, then the conditions of a modern society are continuously ignored. In this context, Homann calls for the omission of appeals for ethical behavior if that behavior leads to systematic disadvantages for individuals. Ethical rules that "should" be adhered to can only be implemented if action restrictions are adjusted correspondingly. However, actors are called to collaborate in creating the

framework rules. According to Homann, an individual has a moral responsibility not only to follow the framework rules but also to participate in creating those rules (see [11, 12]).

In a second step, Homann applies this concept to social interactions as a whole. The underlying method for this is the *prisoner dilemma* and, in a more general sense, the concept of dilemma structures. The individual constellations of interests and the resulting outcome are reconstructed from game theory. The prisoner dilemma explicates the situation that interests are such that none of the benefits calculated by the participants could be fulfilled optimally. Under the stipulation of teleological action, the prisoner dilemma cannot be overcome without changing the framework conditions (see among others [13]). With the help of this concept, the structures of interactions can be analyzed. All interactions can be represented in dilemma structures if one assumes that each action situation has mutual and conflicting interests simultaneously. If there are no effective behavior conceptions, and therefore no stable behavior expectations, then dilemma structures will lead to a “social trap” [14]. Joint cooperation will not occur due to rational fear of exploitation. The dilemma consists in this event being Pareto efficient for all participants. The sole chance for overcoming or rather suspending these dilemmas is for institutions to create a reliable behavior obligation via incentives and sanctions. Setting up institutions of this kind is a task for policymakers according to Homann. In this manner, dilemma structures can be specifically implemented and resolved. For Homann, these interaction patterns are a decisive instrument for implementing ethics. The question of implementation thereby becomes a decisive moment in the process of justifying norms.

The systemic forces in the subsystem of economy constitute a part of the theory of communicative action. Habermas also explicitly emphasizes that the systemic integration mechanism can no longer be circumvented. The material reproduction of a modern society is reliant upon systemic integration. The reconstruction of the medium of law as the mediator between systemic and social integration can be understood as an attempt to move the legal rules of interaction relationships into the foreground. This means that Habermas’s theory has nothing against emphasizing framework rules as a significant component for implementing ethics as long as the claims of ethical action rules are rationally tested via legal discourse in the lifeworld society and then rational consensus is met. Focusing on framework rules even offers an opportunity to deliver a framework for mediating between systemic and social integration. These framework rules should be created using the template of ethical norms that would have to be resolved rationally by life forms in moral and ethical discourse. Implementing rules that “should” be followed and resolved via discourse could therefore focus on creating institutions that can overcome mutual dilemma structures. In this way, ethical action rules could be tailored to the empirical circumstances and the state of international relations of the times. Additionally, there is a chance to integrate concepts of ethics implementation other than criminal law, such as the concepts from institutional economics, which has the objective of placing incentives (see [15]).

In his definition of legal discourse, Habermas accepts that the question of implementing a norm and its consequences plays a decisive role (see [7]). However, it cannot be overlooked here that Habermas, contrary to Homann, directs discourse ethics toward knowledge of ethical norms. Even if this can never be secured, there is indeed the presumption of a rational result in the foreground. The moment of rational insight differentiates him from the advantage/disadvantage calculations in Homann's conceptualization.

Discourse ethics' efficiency in relation to opening up future perspectives depends, in any case, on the discourse, on actor integration, on equal participation, and on forceless insight into good grounds. In this context, Habermas himself does not express clear reservations toward the system forces of the capitalistic economic system. Even if there is an indispensable place in material reproduction assigned to systemic integration, Habermas still warns of a "colonization of the lifeworld." Power and/or economic interests have a falsifying effect on discourse the moment in which an agreement is forced with their help. In cases like this, both the commandments of rational agreement and the demands of a symmetric relationship among discourse participants are broken: Circumventing linguistic consensus processes using the money or power code signifies a contradiction to the reciprocity expectations of transcendental argumentation preconditions and the opposite of rational agreement, according to Habermas.

These considerations against falsifying discourse using economic and power interests must be made when dealing with the design of framework rules, particularly in a global context. This is reinforced by the consideration that the pluralism of ethics concepts represents a further set of problems for discourse (see [16]). While discourse ethics do provide the theoretical groundwork for a solution, there are still grave problems for implementation.

For Habermas, this partially leads to unnecessary polemics against the modern market economy, which appears to obstruct a perspective for discourse ethics. If the modern economic system truly is uncircumventable, then paths must be found to deal with the demands of the capitalistic system. However, Habermas's reservations lead him to a "dualism" [17] of business and lifeworld, which makes it many times more difficult to find and implement consensual ethics. If both integration mechanisms of lifeworld and system have authority, then there is "only" the question of in which situation should integration mechanisms have primacy. With Habermas, this question is resolved using the medium of law. Legal discourse decides how law and framework rules should look. It appears to be imperative that actors acting in the subsystems of systemic integration represent and justify their interests in legal discourse. While this primarily implies "force-means-considerations" based on the logic of capitalistic market economics, it does not result in exclusion from legal discourse which shows Homann's statements on the moral quality of the market economy as an integration mechanism for societies (see [13], p. 49). Economic viewpoints, on the other hand, would be permissible in discourse as grounds even if they are not significant. Their claims and their authorization must be tested in rational discourse. Furthermore, it appears to be counterproductive to rigorously exclude the actors of a market economy from

designing these rules. The capitalistic economic system is dependent upon the medium of law as a tool for designing market rules, and its actors would therefore have an interest in collaborating in legal discourse. If empirical factors can be presented as grounds in legal discourse, then those participating in the economy must also be authorized to show the significance of systemic forces for material security. The competition between the claims of systemic and those of social integration would have to be contented rationally and discursively. Only in this manner can it be guaranteed that the consequences of implementing ethical norms flow into justification discourse. The potential for integrating business into designing law is therefore not only recommendable but also necessary (see [15]). For this purpose, Ulrich Beck even sketches out a model of shared sovereignty between states and global economic actors [18].

However, discourse ethics does not obey any consequentialistic principle. In contrast to the ethics of conviction, it does allow for orientation toward consequences in discourse, but the rules that indicate the framework for testing claims to validity solely obey the principle of reciprocity. The pragmatic preconditions in communicative action cannot be restricted in the name of considering overall benefit, as the sense behind violence-free argumentation would otherwise be destroyed (see [6]). Thomas McCarthy attributes therefore to discourse the task of accounting for all relevant evidence of ethical action rules. They, in turn, are independent of the consequences of implementation (see [7], p. 355).

It becomes clear that the problem with legal discourses is securing reciprocity. Inequalities can appear quite quickly, which undermines the rationality of discourse. A prime example of this is the dominant role that multinational companies have in the process of globalization. When they control politics and are not democratically monitored, it represents an infringement upon the principle of discourse ethics of not decoupling systemic forces from lifeworld apprehensions. Here, discourse ethics at least provide an orientation when it comes to designing discourse. An autonomous public that works for reciprocal discourse and considers grounds rationally is of decisive importance for the success of (nearly) rational discourse. It remains to be seen whether this foundation is sufficient for solving global problems.

Conclusion

In conclusion, it can be stated that Habermas awards primacy to (discursive) ethics in the form of communicative action in relation to the subsystem of economy. It ultimately represents the framework for demarcation of the exchange between communicatively structured spheres of life on the one hand and the subsystem on the other. The regulative concept for testing ethical norms consists in undominated discourse emancipated from systemic forces, i.e., a general, unrestricted, and rational discussion between lifeworld members. However, the functional interrelations in the subsystem economy have evolutionary authorization, particularly when involving material reproduction for modern society. They must be acknowledged and evince the limits to lifeworld considerations. Habermas endeavors to use law to create the requisite reflection

and controlling potential, which includes not only the lifeworld conditions in legal discourse but also systemic forces. The intention is to create a supplemental relationship between an autonomous public on the one hand and spheres of action controlled via money and power on the other hand. Discourse ethics provides orientation when dealing with processes for creating framework rules for (global) economies. It remains to be seen, however, whether the process indicated by discourse ethics is sufficiently robust and forward-looking in order to counter global challenges.

Abstract

It is a relatively common assertion today that globalization is leading to a change in the role of the corporation. While globalization exposes the limited ability of nation-states to develop effective systems of global regulation, concurrently, we witness privatization of areas that formerly were the responsibility of the state. The combination of a global governance deficit, increasingly influenced by corporate responses such as self-regulation and/or involvement in global institutions, combined with a greater involvement of corporations in delivering roles formerly assigned to state governments, has led to proposals that we need a new paradigm for CSR. It is suggested, by Scherer and Palazzo, that this paradigm needs to recognize the more politically active role of business in today's evolving post-Westphalian global order. This "political CSR" needs to acknowledge that the old presumptions of liberal democratic theory, in which there is a strict separation of the political and economic spheres, no longer applies. Instead, Scherer and Palazzo argue that, for pragmatic reasons, the theory of "political CSR" should be informed by Habermas's theory of deliberative democracy.

In this chapter, we first outline the arguments made both for "political CSR" and for its linking to deliberative democracy. We argue that by presenting deliberative democracy as a pragmatic and procedural approach to questions of the political, Scherer and Palazzo overlook and sidestep the importance of also understanding the philosophical underpinnings of Habermas's theory. Exploring those philosophical issues more directly, we expose the limitations and the hidden depoliticizing normativity of "political CSR" – illustrating this

empirically with a critique of the Forest Stewardship Council, Scherer and Palazzo's exemplar for "political CSR" and deliberative democracy. As a corrective, we confront directly the philosophical issues raised by Habermas's development of critical theory. By situating his work in the context of philosophical debates in critical theory, both before and since Habermas, we show how critical theory has persistently failed to identify universal philosophical foundations from which to derive normative positions. In contrast to this problematic search for grounding universals, we argue that "political CSR" needs to be developed through political theory that recognizes that the core of the political is always difference, contestation, and undecidability. We propose therefore that "political CSR" ought to be developed with much more reference to post-foundational political philosophy and suggest that a more appropriate political theory to turn to would be Laclau and Mouffe's social theory of hegemony and the radical democratic perspective that this leads to.

Introduction

A highly respected CSR (corporate social responsibility) scholar (Tom Donaldson) has recently suggested that "we are in the most critical phase of an almost two-century-old realignment of values and business; that we are witnessing a permanent shift in the tectonic plates underlying modern industrial society" such that "we are undergoing a deep transformation in the logic of modern capitalism," a transformation that will require an "epic, social realignment of business" [1]. Why is that? In Donaldson's view, it is because "social responsibility and environmental issues" are now entering the picture. This change, understood by Donaldson as an evolution of democratic capitalism in which the gap between morality and markets progressively closes, is presented as a two-stage process. The first stage, now well advanced, has involved the creation of effective laws and regulations to legitimize, harness, and facilitate the powerful operation of markets. The second stage, which is seen to be in "its early, critical evolution," is one in which we are living today, and this involves "the transformation of private attitudes, mores, practices, and institutions."

Donaldson's analysis is doubtless contestable on a number of counts, not least of which, in the light of the unevenness of economic development and the presence of frequently oligopolistic markets, is the question of who counts as "we" and whether it is morality or even democratic pressures, rather than enlightened self-interest by elites, that has produced the current highly imperfect system of global regulation of markets. These questions have been debated extensively elsewhere. What we want to draw attention to here, in contrast, is the suggestion that, to date, advanced capitalist societies have established a somewhat effective *procedural* system for the regulation of markets and the values of business and that the further development of ethical business now requires a transformation of the "attitudes, mores (norms), and practices" of individuals and dominant social institutions. Donaldson does not explicitly say

it, but we understand him to imply that the “epic social realignment of business” and the “deep transformation” of capitalism’s logic are inseparable from a radical change of *identities and social institutions* (Donaldson explicitly refers to a needed “revolution in social attitudes and economic life” [1]). In short, if we are to accomplish the second stage of the “transformation of modern capitalism,” this will involve not just more or better *regulation* of existing identities and institutions but will require the development of a different way of *making sense* of who we are and a transformation of the society in which we live.

It is the prospect, and arguably the necessity, of momentous transformation that makes the topic of CSR and business ethics an especially profound issue and the development of a relevant understanding of CSR a daunting challenge. Donaldson’s reference to a “deep transformation in the logic of modern capitalism” implies an extension and perhaps a reinvention of CSR that moves far beyond questions of how to develop effective social regulation of business, or even whether responsible businesses are more profitable or sustainable than less responsible competitors, or indeed questions of what should count as “responsible” business practices. Far beyond these issues, Donaldson’s talk of “deep transformation” and “epic, social realignment” of business implies a radical and questioning reformulation of the role of business in society, how this relates to the logics and practices of our late-modern or postmodern globalized society, and how we understand processes of social change and their relationship to the transformation of identity.

It is this expansive vision of, and associated challenge to, the identity of “business ethics,” and CSR more specifically, that we address in this chapter. We do so by considering what, to date, is perhaps the most developed and influential attempt to rethink CSR: Scherer and Palazzo’s “political CSR.” A paradigm shift is needed in the theory and practice of CSR, Scherer and Palazzo [2] contend, in order to recognize and attend adequately to how transnational corporations (TNCs) are taking on roles previously ascribed to, or performed by, the state. These “roles,” as we understand them, include assuming some degree of responsibility for the “social responsibility and environmental issues” to which Donaldson alludes. More generally, these changing roles and responsibilities of the firm, occurring in parallel with the “transformation of private attitudes, mores, practices, and institutions,” [1] imply the need for a new theory of the firm less in thrall to liberal democratic thinking.

In liberal democratic theory, legitimacy derives from a depoliticization of the economic sphere: The economic activities of firms are conceived to exist separately from other spheres of activity, such as those of morality or politics. Firms are understood to preserve their legitimacy as long as they operate within the regulatory framework developed within the political sphere. Scherer and Palazzo do not question this understanding but argue that it no longer holds in a situation where the morality of business, as distinct from its legality, is being directly questioned and where firms are increasingly taking over functions from governments, partly as a consequence of deep privatization (including military services and prisons) but also in response to criticisms of their morality (e.g., with respect to their support and

use of NGOs that certify the sustainable and/or fair trade sourcing of raw materials). As they put it, “political CSR” offers:

a new understanding of global politics where private actors such as corporations and civil society organizations play an active role in the democratic regulation and control of market transactions. These insights may enrich the theory of the firm with a more balanced view on political and economic responsibilities in a globalized world. ([3], p. 901)

Scherer and Palazzo’s “political CSR” favors an alternative theory of the firm in which there is a dedifferentiation of the spheres of economy and morality, such that morality or “business ethics” becomes pivotal and the firm is thereby “repoliticized.” Our reading of Scherer and Palazzo’s advocacy of “political CSR” is that it is primarily oriented to the managerial question of how businesses and their senior executives can retain legitimacy when acting as overtly “political” actors. The principle objective, it seems, is to construct an alternative perspective and associated framework for assisting corporate managers in remedying a growing legitimacy deficit with regard to “environmental damages (and) human and labour rights abuses” ([3], p. 903) and thereby restoring or strengthening the legitimacy of business. As Scherer and Palazzo conclude their article, “The theory of the firm needs to be developed further for managerial decision-making in extremely difficult regulatory contexts” ([3], p. 922).

In principle, however, the model of deliberative democracy that underpins the advocacy of “political CSR” is not confined to the question of how to restore legitimacy to rapacious global business or a privileged elite of corporate executives (and above or behind them an upper echelon of financiers). For the process of deliberative democracy can, in principle, be applied to question the legitimacy of business itself – with regard, for example, to its complicity in global injustice, huge differentials of pay, environmental disasters, global warming, and so on [4, 5]. If business is to change radically, as commended by Donaldson, then it undoubtedly requires a postliberal theory of the firm and, with it, a very different conception of CSR. Scherer and Palazzo propose a notion of “political CSR” that is inspired by Habermas’s theory of deliberative democracy, which is forged from his normative theory of discourse ethics (see also ► [Chap. 26, “Fundamentals of Discourse Ethics”](#)). Their diagnosis, for which “political CSR” is their prescription, valuably highlights the growing crisis of legitimacy for business and offers some pointers for making sense of how business is responding to “social responsibility and environmental issues” [1]. But we are not persuaded that “political CSR” based upon Habermasian deliberative democracy provides the only, or even the most relevant and valuable, resource for addressing these concerns.

Our aim in this chapter is to appreciate and appraise Scherer and Palazzo’s proposition and then to outline an alternative perspective – in the form of radical democracy – that, in our view, is relevant when contemplating what Donaldson anticipates as an “epic, social realignment of business” [1]. To do this, we first consider why globalization may be leading to an increasingly overt political role for business and hence invite a shift of analytical orientation in the direction of Scherer and Palazzo’s “political CSR.” We then outline their case for engaging Habermas’s deliberative democracy as

a useful supplement to CSR theory. In doing so, we find that Scherer and Palazzo are remarkably reticent on the question of the philosophical pedigree of deliberative democracy and, in particular, are silent on the key issue of the implications that this may have for our understanding of social change and the defensibility of the normative values implicit in their proposals. Accordingly, we seek to tease out the philosophical and, more specifically, the ontological basis of deliberative democracy, exploring its origins in and relationship with Habermas's discourse ethics.

Our reading of the philosophical proclivities of "political CSR" gives us cause for concern about the role that deliberative democracy can and might play in promoting the scale of social and identity transformation which, if we follow Donaldson, should be central to CSR theory today. We illustrate these concerns with reference to the Forest Stewardship Council, an organization which Scherer and Palazzo propose as an exemplar of deliberative democracy and "political CSR." This leads us to consider a number of alternative philosophical understandings which, while they share the post-Hegelian and critical theory lineage in which Habermas locates his thinking, may prove equally fruitful as a basis from which to develop a theoretical orientation to CSR sufficiently radical to take up the challenge identified by Donaldson. By exposing the philosophical orientations which underpin these various alternatives, we suggest that a post-foundational ontology may offer a more fruitful, and less normatively driven, basis for understanding social change. We therefore conclude that radical democratic theory, which is derived from a post-foundational understanding of discourse and ethics, may be a more appropriate supplement to "political CSR" than is Habermasian deliberative democracy. Nevertheless, we conclude that there might be a role for a rhetoric of "political CSR" aligned with deliberative democracy to play in helping to promote major social change, although we remain very ambivalent about this because of the evidence that such a rhetoric is too readily co-opted to conservative agendas.

Globalization and Political CSR

"With globalization," Scherer and Palazzo contend, "a *paradigm shift* is necessary in the debate on [Corporate Social Responsibility (CSR)]" ([2], p. 414). For them, "globalization" is a process of intensification of cross-border social and material interactions which is producing a "post-Westphalian world order" or a "post-national constellation" ([3], p. 901, The latter term is drawn from Jürgen Habermas, *The Postnational Constellation* [Cambridge, MA: MIT Press, 2001]). In this new order, the old alignment of state authority and responsibility, national cultures, and geographic borders is being replaced by a "fragmentation of authority, the increasing ambiguity of borders and jurisdictions; and the blurring of the lines between the public and private sphere" [6]. In this rapidly developing context, nation-states do not become impotent to regulate business, but the globalization of business, concurrent with the growing influence of civil society organizations (e.g., NGOs, single issue pressure groups, etc.), presents the contemporary challenge of addressing regulatory issues internationally. Notwithstanding that nation-states were never

able to regulate fully activities in their own geographical borders, so that there have always been regulation gaps and implementation deficits, it is argued that globalization has substantively shifted the balance between corporations and states. The rapid rise in numbers and spread of transnational corporations (TNCs) able to manage their exposure to national legislation weakens the ability of national governments to define systems of effective regulation of business. Concurrently, an emergent, heterogeneous global governance system is seen to be struggling to formulate and enforce effective global regulation even as there is an attempt to accommodate and enroll other (i.e., nonstate) actors in the delivery of public goods and in processes of registering social concerns and populating systems of regulation.

In this post-Westphalian order, Scherer and Palazzo argue, it becomes less and less defensible to retain the liberal democratic view that corporations are only private, economic actors. Leaving aside the question of whether it ever made sense, except ideologically, to regard firms as primarily economic, rather than politico-economic, entities, the shift from a national to a global focus for, and form of, governance invites the ascription of new roles to corporations – for example, as private contractors in the provision of public goods or, and perhaps more significantly, as key actors in formulation of global regulation (see, for example, the ActionAid report which “highlights many examples of privileged corporate access to, and excessive influence over, the WTO policy-making process”: [7]). In the post-Westphalian order, the regulatory vacuum is being filled by a shift from “hard,” statutory legislation to “soft” forms of regulation, in the guise of self-regulation. A focus on compliance with legal liability is increasingly supplanted by principles of social connectedness as a basis for assessing where responsibility lies. In such a plural, heterogeneous, and deregulated social environment, it is no longer effective to seek legitimacy by reference to nationally defined laws or even by reference to widely accepted rules or customs. Where “no universal criteria of ethical behaviour are available” ([3], p. 906), legitimacy becomes more tenuous and so needs to be created, and constantly recreated, through proactive discursive and political engagement. To this end, a process of deliberative democracy is commended as a way forward that prioritizes (democratic) deliberation, to establish a historically and culturally contingent consensus on ethical behavior, over philosophical efforts to identify a universal ethics.

The effects of globalization, then, are apparently responsible for a situation in which the established “paradigm” of CSR – in which “responsible firms operate within a more or less properly working political framework of rules and regulations which are defined by governmental authorities” ([2], p. 414) – is discredited. In its place is emerging a fragile, incomplete, and unevenly applied global framework of rules and regulations. Partly as a consequence of the regulatory vacuum, business is seen to be encountering new and increased demands to be socially responsible ([2], p. 414). National laws continue to set out a minimum standard of business’s responsibility to society, but frequently the system or the scope of law is incomplete or the apparatus for its enforcement is ineffective. Having offered this diagnosis of the contemporary conjuncture and exposed the limits of the

orthodox paradigm of CSR for addressing its ills, Scherer and Palazzo contend that the “regulation gaps and implementation deficits . . . have to be filled by diligent managers with pro-social behaviour and an aspiration to the common good” ([2], p. 414).

To facilitate this remedy, Scherer and Palazzo propose a new perspective, in the form of “political CSR” that is based upon “an extended model of governance with business firms contributing to global regulation and providing public goods (and where) private actors such as corporations and civil society organizations play an active role in the democratic regulation and control of market transactions” ([3], p. 901). For Scherer and Palazzo, firms not only are increasingly engaged in responding, whether reactively or with strategic foresight, to regulations or even to stakeholder pressures but also, and crucially, are becoming active, influential, and constructive participants “in the overarching processes of (national and transnational) public will formation and these processes’ contribution to solving global environmental and social challenges” ([8], p. 1108).

Democracy or Philosophy?

This situation leads Scherer and Palazzo to propose that in order to understand the role of the firm today, we need to move away from outdated models of liberal democracy, which see corporations as private actors, and instead adopt models which better recognize the role of corporations as political actors. To do this, they propose that a theory of “political CSR” should be based on Habermas’s theory of deliberative democracy as “an alternative model which seems to be better equipped to deal with the post-national constellation and to address the democratic deficit” ([3], p. 907). Scherer and Palazzo’s call for “political CSR” informed by deliberative democracy is based upon two propositions. First, it is claimed that their model of the firm and its “social responsibilities” is better equipped (at least compared to existing liberal democratic models) to illuminate the current conjecture of a post-Westphalian order. In this respect, it appears to be a call for a nominally descriptive, rather than normative, theory of (political) CSR. Its claim is to understand better what *is* happening rather than what *ought* to happen. Second, it is commended for avoiding an appeal to some universal, normative ethics in favor of an ethics that is historically and culturally contingent upon necessarily open-ended processes of deliberation. This *procedural* understanding of deliberative democracy, it is argued, provides “a *less idealistic* and *more pragmatic* approach that narrows the gap between the *actual practice of political decision making* and the *theoretical purity of ethical discourses*” ([8], p. 1107, original emphasis)."

We find this position confusing because, in our view, the proposal that Habermas’s theory of deliberative democracy should be used to inform our understandings of “political CSR” is itself normative and not least because it presumes that we *ought* to prefer the deliberative democracy model to any other democratic model, whether that model be liberal or radical. The concern, central to deliberative democracy, to narrow the gap between the practice of political decision-making and

the purity of ethical discourses is not neutral or self-evident but normative. Furthermore, even if this is denied (e.g., by emphasizing deliberative democracy's focus on procedure rather than content), we question whether any theory can ever be devoid of normative presuppositions. "Description" is always selective, and the basis of this selectivity is inescapably normative in the sense of being based upon particular value-laden assumptions. If Scherer and Palazzo's "political CSR" is to make a useful contribution to the field (and we believe that it has the potential to do so), then it is relevant to expose and challenge, rather than hide or mystify, its normative underpinnings.

Given the philosophical focus of this handbook, it is appropriate to consider the normative impact of the turn to deliberative democracy. The issue of normativity (how we *ought* to live our lives) is, of course, a core concern of much philosophy, and it is one with which Kant, in particular, repeatedly wrestled both directly and indirectly. Indeed, as Crichtley argues, in modern philosophy the work of Kant forms both a cornerstone and a point of cleavage for two very different schools of philosophy: "much of the difference between (Anglo-American) analytic philosophy and Continental philosophy simply turns on *how* one reads Kant and *how much* Kant one reads" ([9], p. 17, original emphasis). Anglo-American analytic philosophy has developed in the shadow of Kant's first critique, the *Critique of Pure Reason* [10], to argue that even though our ideas about the world can never fully replicate the empirical world in which we find ourselves; nevertheless, those ideas (our consciousness of the world) do represent the world in a manner that is sufficient for us to have knowledge of nature and therefore to be able to reason logically and deductively about the world. Continental philosophy, in contrast, resonates with Kant's third critique, the *Critique of Judgement* [11], as it endeavors to "bridge between the faculties of the understanding (the domain of epistemology whose concern is knowledge of nature) and reason (the domain of ethics whose concern is freedom), through a critique of judgement" ([9], p. 19).

When following the first critique, ethics comes to be seen as a matter of analysis of situations in order to develop defensible and robust, albeit still possibly fallible, views (moralistic positions) about what is right and wrong – "the philosophical search for universal rules," as Scherer and Palazzo characterize it ([3], p. 905). If, however, one follows the third critique, then ethics is inherently a matter of difficult judgment in the terrain between theory and practice or knowledge and action [12]. In the first, ethics becomes reduced to often sterile and formulaic prescriptions about how to act (exemplified for example in the tick-box activities of CSR certification schemes and audit trails). In the second, ethics is not about establishing and/or applying a moral benchmark but, rather, exists in process – in the ongoing struggles and crises of conscience about how to act in a world where action can never be wholly determined by logical reasoning as there is no definitive basis for justifying or grounding the ethics of action.

While it would be a mistake to draw too sharp or rigid a distinction between the traditions of analytic and Continental philosophy, Habermas's thinking is in the tradition of Continental philosophy to which it makes a significant contribution. It is the contemporary incarnation of a lineage that runs from Kant, through

Hegel and Marx and more recently Nietzsche and Heidegger to the critical theory of Horkheimer and Adorno as well as to contemporary exponents of post-structuralism, notably Derrida (and a more bashful Foucault). Habermas is widely regarded as the prime exponent of second-generation critical theory, so it might be expected that a proposal to develop a conception of CSR informed directly by his discourse ethics and deliberative democracy would incorporate some close consideration of the philosophical foundations, justifications, and implications of such a move. This expectation is confounded as Scherer and Palazzo display a remarkable reticence on questions of philosophy, even to the extent of making a virtue of their silence. This virtue is paraded by arguing that their approach “emphasizes a priority of democracy to philosophy” ([3], p. 906) a priority that apparently excuses all consideration of the philosophical foundations of deliberative democracy. In effect, Scherer and Palazzo (unconvincingly) sidestep the question of how an understanding of philosophy may valuably be kept in focus as efforts are made to explore how deliberative democracy theory may play a role in reshaping the relationship of business to society in the future. The maneuver is unconvincing because it misleadingly equates *all* of philosophy with the *particular* analytical tradition of Kant’s first critique – where the preoccupation is with the development of defensible and robust, yet still falsifiable, benchmarks (moralistic positions) about what is right and wrong. Because Scherer and Palazzo equate and reduce “philosophy” to this analytical tradition, they can conveniently conclude that it has no further contribution to make – but in doing so, they allow themselves to ignore major debates in the field of Continental philosophy, which is rather perverse as Habermas’s work resides in this field.

Scherer and Palazzo are, in our view, quite right to reject the philosophical search for universal moralistic rules from which to derive a normative ethics for business. There is, as they compellingly argue, “no ‘view from nowhere’ from which a-historical and a-contextual (i.e., universal and transcendent, PE/HW) ethical norms could be deduced.” As a consequence, they plausibly observe, “the question remains of how the legitimacy of corporate activities can be normatively accessed when no universal criteria of ethical behaviour are available in a post-modern and post-national world” ([3], p. 906). Scherer and Palazzo explicitly distance their stance from the orthodox paradigm of CSR/business ethics which is populated by economic, instrumental, or empirical approaches to CSR (e.g., corporate social performance, the business case for CSR, instrumental or strategic stakeholder theory) and realist constructivist approaches (business ethics, normative stakeholder theory, social contract theory) (see, for example, Table 1 in [8], p. 1113). In our terms, this move amounts to a rejection of the analytical philosophical approach in favor of Continental philosophy, a move which we welcome and which we would applaud if the move had been explicitly and consistently made.

Unfortunately, instead of recognizing its philosophical underpinnings in Continental philosophy, deliberative democracy is justified on the basis of its political pragmatism rather than its philosophical pedigree. In our view, it is this positioning of “political CSR” that renders it vulnerable to displacement by approaches which make the easy claim to be (even) “more pragmatic.” The invocation of pragmatism

and politics – in the form of an empiricist/descriptivist ambition to “embed the CSR debate in the context of the changing order of political institutions” ([3], 906) – represents for us a too rapid dismissal of major philosophical debates in Continental philosophy, not least debates between Habermas and post-structuralism but also debates within critical theory by Habermas’s own students. We therefore believe that, rather than sidelining these issues in the name of pragmatism and an associated call for the “priority of democracy to philosophy” legitimized by Rorty (a political liberal), it is important to pay attention to the philosophical foundations of deliberative democracy. The benefit of doing so, we will argue, is that it reveals how, by relying on Habermas’s deliberative democracy, Scherer and Palazzo’s formulation of “political CSR” retains (but obscures) the tendency to a universalizing utopianism found in Habermas’s earlier work. Notwithstanding both that Scherer and Palazzo tend to present deliberative democracy as a pragmatic turn away from Habermas’s earlier utopianism (see, e.g., [8], p. 1108) and that this appeal to pragmatism is not an uncommon interpretation of deliberative democracy; nevertheless, we consider that such readings misrepresent how much deliberative democracy continues to rely on the utopianism of Habermas’s earlier theory of communicative action.

Political CSR and Democracy

In order to explicate the position that underpins Scherer and Palazzo’s “political CSR” and its advocacy of deliberative democracy, we take up another critique of their work which, although very different to our own, is helpful in elucidating their position. Willke and Willke’s [13] critique of “Palazzo/Scherer’s Communicative Framework” (the subtitle of their paper) is written from the perspective of *systems theory* and liberal democratic theory. They broadly agree with Scherer and Palazzo’s diagnosis of the effects of globalization in respect of its promotion of diverse factors, forces, and constraints without an encompassing global regime of democratic legitimacy. Within national contexts, they argue, democratic legislatures still function to provide collectively binding decisions on behalf of society that (among other things) restrict and regulate corporate activity. Corporations are conceived to exist within a subsystem that is driven by a purely economic logic, and to experience externally imposed restrictions on their profit maximizing pursuits as legitimate when they arise out of a political subsystem, through processes of representative democracy, that operates to identify and aggregate citizens’ preferences into laws backed by sanctions. In this systems theoretic modeling of modern societies, differentiation into functionally distinct subsystems (economic, political, etc.) ensures the preservation of the logic of the economic subsystem which relies on legally enshrined property rights that are aligned with the political subsystem’s logic of individuals as rational actors each with different individual interests but with equal and universalized rights to pursue those interests.

Crucially, for Willke and Willke, this differentiation of society into functionally distinct but mutually supportive subsystems is the hallmark of modern societies.

Whereas the logic of organization of modern societies is functional, the organization of society in premodern systems is hierarchical (e.g., king, knight, serf, etc.) or segmental (e.g., tribe, clan, etc.). “The point [and distinctive advantage, PE/HW] of functional differentiation as a structural principle of organizing society. . . is exactly to de-politicize all spheres of society except politics” ([13], p. 32). The claim of modern liberal societies, as exemplified in systems theory, is that, in contrast to premodern societies where politics is endemic to all aspects of society, “politics” is confined to the political subsystem. “Liberal democracy,” it is claimed, “rests on the assumption that all spheres of society (except for the political system) must be liberated from the influence of politics so they are able to pursue their own logics, rationalities and goals” ([13], p. 32). Notably, in modern societies, moral authorities (e.g., the Church) are understood to play no legitimate role in shaping, integrating, or regulating public subsystems, as, for example, by using religion to establish a common framework of duties and roles. In modern (secular, complex, and functionally differentiated) societies, this function is legitimately fulfilled exclusively by the political subsystem whose legitimacy rests upon democratic accountability. “Morality and ethics are no longer needed to keep (modern) society going. Law suffices. . . The unique legitimizing force of positive law as a modern medium of governance is its *procedural* rationality. It refrains from positing eternal truths or final solutions and instead adopts provisional models and temporary concepts that may be revised at the discretion of a different majority at a later point in time” ([25], p. 33).

The embeddedness of liberal democratic thinking in this idealized functional differentiation helps us to understand why proposals such as “political CSR,” which seek to repoliticize the economic sphere by reopening it to the influence of questions of morality from directions other than those legitimized through the functioning of the political subsystem and the laws it produces, are found difficult to grasp and/or attract vehement opposition. For believers in the virtues ascribed to liberal democracy, such thinking represents not a welcome contribution to the development of modernity but a dangerous regression to a premodern order. At the margins, it might nonetheless be argued, or conceded, that in circumstances where political procedures have yet to be fully established to secure fully fledged global laws and legislative legitimacy equivalent to those developed within liberal democratic social systems, it may be necessary, at least temporarily, to accommodate some degree of intrusion of premodern elements, in the form of morality, into the economic subsystem as an expedient, regrettable, and transient measure. From this standpoint, Scherer and Palazzo’s “political CSR” is, at best, a “presently necessary regression to past moralities” ([13], p. 37) as a stopgap while we evolve an effective modern system for global society.

Needless to say, Habermas’s diagnosis of the situation is very different (see also ► [Chap. 26, “Fundamentals of Discourse Ethics”](#)). In line with Kant’s third critique, he argues that ethical action can never be reduced to instrumental systematic knowledge. What counts as ethical, he contends, is not universal or ahistorical but is created, developed, and recreated through rational critical discourse in society. He therefore draws a distinction between the system and the lifeworld while

recognizing that society needs to be understood as the integration of system and lifeworld. The lifeworld is a symbolically structured realm of culture, personality, and meaning in which agents seek mutual understanding through substantive reason embodied in speech and action. The system, on the other hand, is a realm of instrumental rationality characterized by sedimented structures and established patterns of instrumental action mediated through money and administrative power [14, 15]. Since ethical positions are produced in processes of social communication, they arise in the lifeworld and then need somehow to become integrated into the instrumentality of the system. For Habermas, this requires the development of a thriving public sphere not just so that alternative views and associated ethics can be openly debated but also so that they actively guide the application of instrumental rationality. Habermas traces the origins of this public sphere to eighteenth- and nineteenth-century bourgeois cultural institutions such as coffee houses and salons where, informed by the spread of books and the press, the middle class could gather openly to discuss public issues. In the twentieth century, as modern industrial societies became bigger and more complex, Habermas notes how the public sphere becomes displaced by the power of money and bureaucracy (see [16]).

This distinction that Habermas makes between the instrumental rationality of “systems” of bureaucracy and money and the processes of public will formation that occur within the “lifeworld” resides at the heart of his thinking. It is a key philosophical distinction which supports his communication theory of society and discourse ethics, and it is reasserted in his later work on deliberative democracy where there is a renewed emphasis on the role of the public sphere. We might also add that it is central to Scherer and Palazzo’s attentiveness to the role of civil society in processes of legitimation in political CSR. Rather than enabling us to sidestep philosophical issues in favor of a primacy of democracy, we therefore seem to find ourselves thrown back onto a requirement to be alert to philosophical foundations.

Proposing to link deliberative democracy with “political CSR” is a normative act since deliberative democracy, just as much as liberal democracy or indeed the radical democracy that we would advocate, is embedded in particular value-based assumptions and preferences. In Habermas’s case, it is possible to elucidate these assumptions by reflecting on how he understands the formation of morality. For Habermas, morality arises in the lifeworld through processes of communication. Since subjects are formed through the medium of discursive communication in the lifeworld, it is in that medium that Habermas invites us to look when seeking to locate and appreciate the source of intersubjective solidarity. For Habermas, the source, or philosophical foundation, of morality resides in a mutual respect that is implicit in all communication. Whenever we communicate, we presume a capacity to understand each other, and so, a condition of all intersubjective communication, Habermas argues, is an implicit respect for the integrity of the other. This expectation is conceived to be prior to communication and so it forms a pretheoretical point of genesis for all the rest of his theory. By identifying a genesis in the

consensualism of mutual understanding and intersubjective solidarity, Habermas is proposing an ideal-type “counterfactual” against which the morality of specific actions and norms can be critiqued and thereby transformed.

Habermas captures this reliance on a genesis in mutual understanding and consensus in the, somewhat abstract, discourse principle (D) which states that “Just those action norms are valid to which all possibly affected persons could agree as participants in rational discourses.” When the discourse principle is expressed in the context of informal face-to-face relations, it becomes the universal principle (U) which states that a norm is valid only if “All affected can accept the consequences and the side effects its general observance can be anticipated to have for the satisfaction of everyone’s interests (and these consequences are preferred to those of known alternative possibilities for regulation).” When, on the other hand, the discourse principle is expressed with respect to the formation, through formal political procedures, of legal norms which regulate relations between bearers of rights (i.e., to the formation of statutes and regulations), then it leads to the “democracy principle” which states that “Only those statutes may claim legitimacy that can meet with the assent of all citizens in a discursive process of legislation that in turn has been legally constituted” (see [17, 18]).

Habermas’s thinking can be understood therefore as a philosophy of praxis, where praxis is understood as action oriented to enabling liberating practical change. In other words, theory is developed that aims to expose and analyze societal contradictions (transgressions of the discourse principle, contextualized either through the universal principle or through the democracy principle) with the intent of overcoming or mitigating those contradictions by integrating practice with theoretical insight (where insightful praxis is understood to be action that promotes the realization of the discourse principle). This orientation displaces a search for value-free transcendent truths in favor of contextualized insights that are rich in practical, emancipatory consequences. In other words, such thinking aims at being not just a political philosophy but a politicized philosophy in that it tries to analyze the *is* in order to develop an action orientation toward a particular sense of the *ought*.

We recognize that it is common to understand deliberative democracy as a shift, from what is represented as the demanding universal principle of Habermas’s earlier work on discourse ethics to the (supposedly) less idealistic democracy principle. In this view, Scherer and Palazzo assert, the universal principle ascribed to an ethics for intersubjective discourse which “analyzes the ethical quality of a specific decision via a list of demanding discourse criteria (ideal speech situation)” whereas, “in contrast, the concept of deliberative democracy . . . shifts the focus to the macro level of the procedural design of political institutions” ([8], p. 1107). A focus on procedure supposedly replaces the utopianism of the universal principle with a more pragmatic preoccupation with establishing procedures that can promote democratic deliberation. These procedures, it is observed, are not necessarily oriented to achieving a (utopian) ideal in which all citizens participate in all public decisions. Instead, these procedures are informed by

a recognition of how the “civil society associations and movements that map, filter, amplify, bundle, and transmit private problems, needs, and values are the core actors in the process of democratic will formation” ([8], p. 1107).

A “key assumption” of “political CSR,” as Scherer and Palazzo put it ([3], p. 918), is that “politics” or “public will formation” is not confined to governmental institutions but, rather, “starts already at the level of deliberating civil society associations,” a contention that mirrors the primacy ascribed to the “lifeworld” and relies upon assumptions built into the communication theory of society and its discourse ethics. With direct reference to “political CSR,” and the broader dynamic of transformation involving the dedifferentiation of spheres prized by system-theoretic models of liberal democracy, Scherer and Palazzo contend that “Corporations thereby become *politicized* in two ways: they operate with an enlarged understanding of responsibility; and help to solve political problems in cooperation with state actors and civil society actors” ([3], p. 918).

Such a claim presents deliberative democracy as a “fix” for the precarious and diminishing legitimacy of corporations. This more pragmatic focus on procedure, which involves an instrumental turn away from the demanding criteria of the Habermasian communication theory of society and its counterfactual grounding in the “ideal speech situation,” marginalizes two key issues. Firstly, the justification for deliberative democracy, and for its attention to processes of public discourse, still derives from and depends on the system-lifeworld distinction and the pretheoretical genesis in communicative solidarity and respect. For us, a significant outcome of Scherer and Palazzo’s argument for giving the political primacy over the philosophical is a sidestepping and obscuring of these philosophical foundations of deliberative democracy. Secondly, a more practical implication of obscuring these foundations is that, for Habermas, the concept of deliberative democracy and its focus on public procedures of discourse is justifiable when the procedures directly facilitate a movement toward the realization of the ideal speech situation (as outlined in the discourse principle and the universal principle). The intent of deliberative democracy is not to circumvent the difficult idealism of Habermas’s earlier work but, rather, to facilitate praxis that aims at the more effective realization of a discourse principle that is conceived to be a foundational condition of possibility of communication. Deliberative democracy is therefore defensible on its own terms only when it promotes the realization of the discourse principle and the universal principle. A more consistent application of Habermas’s thinking to CSR would, we suggest, explicate its foundations before considering how it might be articulated into the world of business and markets.

For us, in contrast, the most important contribution of Habermas’s thinking is its stimulus to locate contemporary reflections upon business ethics and CSR in the crisis of modernity and to reflect critically upon how, philosophically, proposed remedies for this crisis may be grounded. More specifically, a Habermasian orientation can be of assistance in exposing and forcing us to worry away at the aporias that, in our view, “political CSR” unhelpfully occludes as a consequence of its lofty ambition to resolve differences through processes of deliberation.

Forest Stewardship Council: Deliberative Democracy in Practice?

We can illustrate what we view as the limitations, or blind spots, of “political CSR” by reference to the myopia which creeps in when Scherer and Palazzo offer examples of its practical operation. Notably, they repeatedly refer to the work of the Forest Stewardship Council (FSC). The FSC is identified as an exemplar of a deliberative democracy approach to “political CSR” through “corporate embeddedness in processes of democratic will formation and problem solving in a transnational context of political governance” ([8], p. 1110). More recently, Scherer and Palazzo commend the FSC as an example of an NGO that provides “structural measures to avoid an imbalance between participants from the North and participants from the South” ([3], p. 917). The focus on procedures, rather than political action, we now argue, exposes the vulnerability of Habermas’s ideas to a reading that identifies the operation of the FSC with even their partial actualization (our critique of the FSC example was first set out in [19] from which parts of this section are adapted).

The FSC was established in 1993 as a collaborative venture between NGOs and major corporations such as IKEA, Home Depot, and B&Q with the objective of promoting the responsible management of the world’s forests. According to the FSC website:

FSC is a pioneer forum where the global consensus on responsible forest management convenes and through democratic process effects solutions to the pressures facing the world’s forests and forest-dependent communities. Within this forum, voices from the Global North and South, from organizations big and small, assemble to define environmentally appropriate, socially beneficial and economically viable forest management and identify the tools and resources that will effect positive, lasting change. As a multi-stakeholder organization, FSC applies the directive of its membership to develop forest management and chain of custody standards, deliver trademark assurance and provide accreditation services to a global network of committed businesses, organizations and communities. FSC certification provides a credible link between responsible production and consumption of forest products, enabling consumers and businesses to make purchasing decisions that benefit people and the environment as well as providing ongoing business value. [20]

Ten years after the establishment of FSC and 4 years before Scherer and Palazzo’s Academy of Management Review article, the Rainforest Foundation (RF) conducted a detailed (160 page) report [21] on the FSC’s activities to which Scherer and Palazzo ([8], p. 1110) refer directly. Yet, despite its pertinence for their thesis, they mention only the RF report’s criticism of the FSC’s fast growth strategy that is linked to the certification of noncomplying companies. This selectivity is perhaps unsurprising as the full RF report makes uncomfortable reading for advocates of deliberative democracy. Specifically, it illustrates in detail the vulnerability of its principles and results – such as its claim to “provide a credible link between responsible production and consumption of forest products, enabling consumers and businesses to make purchasing decisions that benefit people and the environment” – to capture and subversion. The RF report is highly critical of the

transparency of the FSC and the lack of democratic accountability. A flavor of the problems is given in the Executive Summary where it is noted:

Key stakeholders are effectively excluded from many FSC processes . . . Whilst legitimate forest stakeholders, such as local communities and indigenous people, remain marginalized in FSC's decision-making processes, the influence of other stakeholders – such as certification bodies and their commercial clients – has grown . . . The FSC's complaints procedures concerning certifiers and their certifications are essentially non-functioning. They are cumbersome and onerous, discriminatory against weaker stakeholders, and biased in favour of the certifiers and their commercial clients. There is therefore no effective means of redress for many stakeholders in the event of dispute . . . There has been a serious lack of transparency or "democracy of knowledge." Key FSC processes have been undertaken without proper information being available to the membership and the wider public. This has undermined accountability of the organization . . . ([21], p. 7)

In short, according to the RF, the operation of the FSC privileged certification bodies and commercial clients as it marginalized the voice of local communities and indigenous people who were unable to obtain redress from the FSC as a consequence of a cumbersome complaints procedure. Of course, we readily acknowledge that this imbalance may have been corrected since the publication of the RF report although the recent resignation of the Dutch not-for-profit organization FERN from FSC (June 2011) [22] and the many posts to the site "FSC-Watch" [23] would suggest otherwise. The resignation of FERN followed a joint assessment in 2008 by a number of NGOs (Greenpeace, the Inter-African Forest Industry Association [IFIA], Precious Woods, Swedish Society for Nature Conservation [SSNC] and Tropical Forest Trust [TFT]) that "problems with FSC are so severe that supporting FSC threatens their own organisations' credibility" [24]. Three key areas of concern were identified, including the complaints mechanism, where the FSC system required substantial improvements. Specifically, in 2009, FERN issued a statement saying that it would resign its FSC membership if "the revision of the FSC Principles and Criteria and the inclusion of the recommendations of the Plantations Review do not result in a reversal of FSC's current practise of certifying large-scale monoculture fast-growing plantations" [25]. The resignation of FERN in 2011 followed a review of the available information and concluded that "progress towards achieving the changes requested in 2008 has been insufficient" [22].

This privileging of commercial clients and marginalization of local communities was also evident when we visited the FSC website in 2007 and came across an endorsement quote from the business manager of B&Q, a market-leading hardware store. This quote, selected and showcased by the FSC, passed comment only on the benefit of FSC membership in securing a competitive advantage over other suppliers of equivalent products by demonstrating how certain B&Q wood products are traceable from the store back to the forest. Revealingly, no mention was made of this service to customers being an integral part of any broader commitment to educating either its employees or the public about the importance of sustainability in relation to the example of forestry stewardship, and thereby to reducing the numerous detrimental impacts of corporate activity on the environment [26].

Although Scherer and Palazzo [8] make reference to part of the RF report, they are silent on its significance for shining light on their exemplar of deliberative democracy. Despite the findings of the RF report, Scherer and Palazzo offer the unqualified view that “the FSC can be considered one of the most advanced concepts in the sense of our proposed political CSR” ([8], p. 1110). This dubious assessment can perhaps be forgiven as no academic piece of work, any more than the organizations to which they refer, is without imperfections. What we find more difficult to understand is Scherer and Palazzo’s continued silence on major shortcomings of the FSC that have been exposed in previous commentaries [19] on “political CSR” to which Scherer and Palazzo ([3], p. 919) make reference while simultaneously affirming their commendation of the FSC as an exemplar of deliberative democracy. To us, it is strange but also instructive that advocates of deliberative democracy seem so disinclined to acknowledge and engage with such issues, even when exposed by critical but broadly sympathetic interlocutors – whether these are critics of the FSC or critics of “political CSR.”

As we have noted, no organization is without significant imperfections. Continuing to identify the FSC example as a relatively unproblematic example of deliberative democracy in action in the face of readily accessible and mounting evidence to the contrary does, however, fuel our concerns about the application of Habermas’s theory. We detect here a triumph of system, in the form of an investment in the democratic principles and procedures to which the FSC is formally committed, over the lifeworld – a triumph that is legitimized by a discourse of deliberative democracy where the emphasis is placed upon how “The FSC is designed around deliberative criteria such as broad participation, the attempt to exclude corporate power as a decision criterion . . .” ([8], p. 1110).

In our view, the critical intent of Habermas’s attentiveness to the procedures of deliberative democracy is to operationalize discourse ethics. The measure of success for any exemplar of deliberative democracy, however imperfect, is its provision of support for discursive processes that encourage participants to develop the awareness and behaviors that bring closer the realization of these ethics. With regard to the FSC, a congruent form of research would involve an assessment of whether the procedures of the FSC enable or impede progress with regard to this critical intent. This is difficult to ascertain robustly from the available evidence, but *prima facie*, the apparent nonfunctioning of complaints procedures, lack of transparency, low democratization of knowledge, etc., seem to point to a highly imperfect process that is working to marginalize and silence dissent rather than bringing it center stage. In other words, the application of the principles and associated procedures of deliberative democracy, as exemplified by the FSC which Scherer and Palazzo continue to hold up as a shining example of the operation of “political CSR,” would seem to occlude the *aporia* between system and lifeworld, rather than exposing it and thereby forcing participants to confront it.

The FSC case draws attention to a fundamental difficulty when trying to apply Habermas’s work in practice. There is a risk that principles and structures are established which formally approximate to ideals of deliberative democracy but the substantive, everyday practices of organizing then fail to respect and nurture

such lofty ideals. So, and to be rather crass, a superficial tick-box audit may show that the relevant procedures are “in place,” but it is only when attention is given to the outcomes of specific practices that significant doubt is cast on their ability to promote the conditions of ethical discourse.

What Alternatives Are There?

Our analysis to this point suggests some benefits of being alert to the philosophical indebtedness of any theorization of CSR, including “political CSR,” as opposed to marginalizing or sidestepping philosophical issues by, for example, arguing for the primacy of democracy over philosophical clarification. How, then, might attentiveness to, and excavation of, philosophical issues further help us to interrogate the concept of political CSR?

It is worth recalling that Habermas’s theory is located in the lineage of Continental philosophy inspired by Kant’s third critique (see earlier) as this invites consideration of other potentially relevant directions developed within this tradition. To explore this possibility, it can be instructive initially to reflect upon the philosophical inspiration of Habermas’s second-generation critical theory. Habermas’s thinking developed (dialectically) from an engagement and disillusionment with the work of Horkheimer and Adorno who, as first-generation critical theorists, had critiqued what they identified as deterministic tendencies in Marxian analysis. Of most relevance to our discussion, Adorno’s *Negative Dialectics* [27] shares Hegel’s focus upon how human beings construct speculative identities in which subjects and objects and rhetorics and realities become fused, but, contra Hegel, he questions whether such identities are achieved positively and, instead, contends that a sense of unity is imposed upon these objects which effectively displaces differences and diversity.

Marx’s left Hegelian demolition of the pretensions and self-deceptions of liberalism retains Hegel’s positive ontology as he attacks the very philosophical grounding of liberalism and, in particular, challenges its assumption that individual interests (and motivations) are prepolitical. From the perspective of Marx’s Historical Materialism, subjects’ interests are not given by “human nature” but arise (positively) from their position in society and, more specifically, from their social location (as ciphers of capital and labor) in the structure of production relations. Human beings are understood to exercise reason and thereby make choices, but their reasoning is in relation to, and therefore conditioned or perhaps determined by, their position in society – which is not of their choice. Far from being prepolitical, the “interests” of individuals as occupants of social positions are regarded as the product of a social order that is inescapably political in its formation and reproduction.

Exponents of first-generation critical theorists were inclined to read Marx’s Historical Materialism as having a pretheoretical genesis in the historically contingent material distributions and their supporting social structures which determine, and necessarily politicize, individual interests and opportunities. Accordingly, Horkheimer, together with his contemporaries in the “Frankfurt School,” advocated

a (radically humanistic) revision of Marx's left Hegelianism that we now know as critical theory. Marx's thinking was seen to slide too easily into economic determinism and reductionism – a form of unreflexive structuralism that invited totalitarianism based upon the (philosophical) understanding that subjects are a product of their circumstances and that powers of reason and reflection are of little consequence or indeed operate only to impede the destiny of socialism. To counter this tendency, first-generation critical theorists promoted a more dialectical understanding of materialism in which the objective (material, historical) socioeconomic conditions are still seen to condition the constitution of subjects, but, equally, subjects are understood to play an active and unpredictable role in constituting and responding to those objective conditions. In Horkheimer's formulation, critical theory "has as its object men as producers of their own historical way of life in its totality" ([28], p. 222) where the aim of critical thinking is to "transcend the tension and to abolish the opposition between the individual's purposiveness, spontaneity and rationality, and those work-process relationships on which society is built" ([28], p. 220). In this regard, critical theory "never aims simply at an increase of knowledge as such. Its goal is man's emancipation from slavery" ([28], p. 224).

Thought, culture, and other phenomena, which the scientific Marx was inclined to theorize as a "superstructure" determined by a materialist "base," are recast in dialectical materialism as having relative autonomy from the base. With its emphasis upon relative autonomy, critical theory prompts consideration of a multiplicity of dialectically related phenomena that are a medium and outcome of processes of reproduction and transformation. An obvious problem ascribed to this position – especially by those who hanker after a distinctive (e.g., class) agent of emancipation equivalent to the proletariat who are identified by Historical Materialism as occupants of a subordinate exploited position within capitalist relations of production – is that it harbors an unacceptable degree of indeterminacy about history and, more specifically, the catalyst of revolutionary change. As we show in the next section of the chapter, we favor a full recognition, rather than a denial or repression, of this indeterminacy. More specifically, we advocate a "postfoundationalist" conception of a politicized CSR in which diverse discourses and identities, with associated antagonisms and dislocations, are understood to arise from the aporia situated in the space between knowledge and action or theory and practice identified in Kant's third critique (see above). In considering this position, one might say that, in abandoning any authoritative, normative basis for intervening in the world, it admits multiple philosophical foundations and multiple normativities or indeed that it fails to provide any definitive basis for adjudicating a plurality of dialectically related normativities. Clearly, Habermas favored the latter diagnosis and has sought to provide a remedy for it. An alternative is to embrace postfoundationalism by considering the value of what it lacks, rather than viewing it as something to be remedied.

As the principal proponent of second-generation critical theory, Habermas inherited an approach that had failed to find a convincing replacement for the emancipatory role ascribed to the proletariat by Marx. Despite heroic efforts, notably by Marcuse, to identify such a group, the dominant trend was diagnosed as one of increasing colonization of lived human experience ("the lifeworld") by an

instrumental rationality (“the system”), resulting in intensifying unfreedom (and reflected in Habermas’s recurrent concern about the growing domination by the system of the lifeworld). At the same time, the normative foundation of critique proposed by Habermas is distanced philosophically from a radical humanist focus upon alienation in the form of attentiveness to mundane lived experience. Habermas addresses the problem of the lack, in first-generation critical theory, of a universal pretheoretical basis for adjudicating between competing normativities by turning away from the experience of subjects and arguing instead that solidarity and respect are counterfactually implicit in intersubjective communication. Habermas privileges agreement over dissent as he presumes a universal reason (rationality) that all participants share. Even if Habermas’s claims about the conditions of communication are accepted, his theory assumes a “telos of consensus” [29] which, for us, is not only implausible but inconsistent with a commitment to democracy, since the very lifeblood of democracy is dissent.

Among the third generation of critical theory, Axel Honneth, Habermas’s student, is the most prominent member. Honneth turns away from Habermasian proceduralism as he attends to “the moral grammar of social conflicts” (this phrase is taken from the subtitle of Axel Honneth [30]). Two words are key: “social conflicts” and “moral(ity).” Honneth’s point of departure is “the moral infrastructure of society” ([30], p. 257). Whatever normative principles are evoked to provide a theory with its moral impulse and justification, Honneth argues, it should be “understandable as moral claims that are already valid within our social order” ([30], p. 257). By emphasizing the “moral infrastructure” and the resonance of critique with its distinctive claims, Honneth signals his skepticism about the Habermasian appeal to the presuppositions of a communication theory of society, the invocation of an “ideal speech situation,” and, by implication, the coherence and emancipatory purchase of deliberative democracy.

In an effort to set Habermas’s thinking “back on its feet” ([30], p. 242) while continuing his normative quest for a benchmark for critique, Honneth endeavors to find within mundane human existence a pretheoretical emancipatory source whose existence can be demonstrated empirically and which can thereby secure a foothold for critique (and hence a basis for ethics). In doing so, Honneth somewhat mirrors Adorno’s earlier attempt to reinstate a foundation for critical theory. Confronted with the growing pessimism that critical theory seemed to be leading to in his work with Horkheimer on the *Dialectic of Enlightenment* [31], Adorno became increasingly concerned to identify a pretheoretical basis for critique (i.e., a basis that exists prior to any of the normativity or values that are implicit in notions of the free vs. the unfree which underlie emancipatory ideals). Adorno attempted to locate this, ultimately rather unconvincingly, in the human sensibility for art and the aesthetic [32]. It is this failure to identify a convincing pretheoretical basis (or foundation) for adjudicating between norms which defines the problematic that Habermas attempts to resolve by identifying communicative reason as a route to normative adjudication.

Similarly, Honneth contends that critical theory “must be confident of identifying empirical experiences and attitudes which already indicate at a pre-theoretical level that its normative standpoints are not without basis in social reality”

([33], p. 327). However, Habermas's location of the normative potential of social interaction with the linguistic conditions of reaching understanding free from domination is found wanting by Honneth as it is seen to rely upon social processes that unfold behind the backs of subjects – processes that neither are directed by human intentions nor, crucially, are capable of being grasped empirically by the consciousness of subjects. Since subjects and the intersubjective are, for Honneth, correlative (see below), he is concerned that Habermas fails to identify the correlate of the intersubjective moment in the lived experiences of human subjects as moral states of affairs or as existing experiences of social injustice.

For Honneth, the empirical pretheoretical experience which motivates emancipatory action does not arise from a drive toward domination-free communication but, rather, from experience of social recognition on which the development of human identity is understood to depend. Influenced by Mead as well as Hegel, Honneth's focus is upon the "positive relation to self" that is understood to "increase with each new form of recognition that individuals are able to apply to themselves as subjects" ([30], p. 173). The "relation to self," which may be negative as well as positive, is seen to develop through an intersubjectively mediated process involving a continuous struggle for recognition which may be affirmed or negated. A "positive relation to self," Honneth contends, is expressed in "the experience of love, the prospect of self-respect. . .and finally the prospect of self-esteem, in the experience of solidarity" ([30], p. 173). Honneth's focus, then, is upon the lived experience of such a positive relation to self that, for him, is (1) a precondition of "freedom" as it overcomes "inner barriers as well as psychological inhibition and fears" ([30], p. 174) and (2) a product of intersubjective recognition as it depends upon "prerequisites that human subjects do not have at their disposal, since they can only acquire this freedom with the help of their interaction partners" ([30], p. 174). Honneth's argument is that the potential of such freedom to be realized is implicit in the structure (and struggle) of recognition. A more "just social order" is desired not because it best exemplifies, say, the principles attributed to the ideal speech situation, but because "it is only under these conditions (i.e., in a "just social order") that subjects can attain the most undamaged possible self-relation, and thus individual autonomy" ([34], p. 259).

Following Hegel, gaining recognition is understood to assume a recognition of the other from whom recognition is sought. Where it is accepted that such reciprocity is built into the process of seeking recognition, this process is conceived as a struggle to fulfill the normative potential inherent in social interaction. Accordingly, human history is regarded as an ongoing struggle to address – for example, accommodate or challenge – experiences of "relation to self," notably those of disrespect and humiliation ([34], p. 245), efforts that are played or fought out through the prevailing "epoch-specific grammar of social justice" ([34], p. 250). As Honneth summarizes his position:

Essentially, my idea amounts to the hypothesis that all social integration depends on reliable forms of mutual recognition, whose insufficiencies and deficits are always tied to feelings of misrecognition – which, in turn, can be regarded as the engine of social change. ([34], p. 245)

Specifically, in the contemporary “epoch” of capitalism, Honneth observes that “the degree of cooperation, security and innovation” ([34], p. 256) required for the distinctive process for allocating resources is dependent upon “general norms” and that so-called capitalist imperatives rely upon “normative expectations” that condition the “social negotiations about the scope of the imperatives” ([34], p. 256). Such “general norms” are understood to include inter alia “an egalitarian concept of justice” ([34], p. 262) that presents a corrosive “surplus validity” ([34], p. 263) in relation to established, socially disrespectful, and exclusive institutions and practices. What is meant by “surplus validity” is that these moral norms go beyond the quiescent confirmation of the status quo insofar as they are able to show “with good reasons” that principles endorsed by the status quo “possess a constitutive ‘surplus’ of normative significance: moral claims concerning the just organization of social relations are broader or more demanding than what has already been realized in social reality” ([34], p. 258).

The pretheoretical emancipatory drive is conceived to arise in conditions of its negation in the form of disrespect and humiliation (understood as a denial of recognition): “If the conditions of interaction are damaged by denying people the recognition they deserve, they generally react with those moral feelings that accompany the experience of disrespect – that is with shame, anger or indignation” ([33], p. 330). For us, Honneth’s key point is that the Habermasian focus on the properties of communication tends to marginalize or displace an appreciation of how, in practice, the motivation for emancipatory change arises in the emotionality accompanying disrespect that is provoked by the denial of recognition as defined within the “epoch-specific grammar of social justice” ([34], p. 250). When reviewed in this light, the vulnerability of Habermas’s deliberative democracy to becoming colonized by instrumentalism may be associated with, if not directly attributed to, a misidentification of the foundations of critique, and so obscures and obstructs, rather than promotes, the conditions for recognition and thus for meaningful participation in processes of deliberative democracy. In our earlier examination of the Rainforest Foundation (RF) report on the Forest Stewardship Council (FSC), we illustrated how an attentiveness to procedures may mask disrespect and obstruct the more difficult task of facilitating meaningful domination-free recognition.

Postfoundationalism and Radical Democracy

From this brief outline of the genesis of critical theory – from Horkheimer to Honneth – we now draw out three elements and associated insights: Adorno’s suggestion that we value negativity, in the form of a negative ontology, rather than constantly search for a positive content to fill the pretheoretical space; from Habermas, that we appreciate the importance of the discursive construction of identity; and from Honneth, that issues of antagonism and emotionality require incorporation into our analysis. A philosophical orientation that brings together these elements is Laclau and Mouffe’s social theory of hegemony (STH) [35].

Their *radical democratic* orientation, we submit, may enable us to theorize what Scherer and Palazzo identify as “political CSR” in a manner that more adequately addresses criticisms directed at it and is less vulnerable to instrumental appropriation than deliberative democracy. In doing so, we will be emphasizing the postfoundationalism of Laclau and Mouffe’s position, rather than the antifoundationalism of post-structuralist analysis. We acknowledge, however, that the philosophical leanings of radical democracy may make it less commonsensically accessible and therefore more demanding than ideas of deliberative democracy. For that reason, we conclude that there may be pragmatic merit in developing “political CSR” via deliberative democracy, but, noting that deliberative democracy is more readily translated and degraded into the familiar framework of liberal democracy, we propose that this would need to be done in a manner that is attentive to its limitations and so minimizes the risk of a telos of consensualism and its easy appropriation by forms of instrumentalism.

We can begin by considering the responses of Habermas and Honneth to the negativity of Adorno. Habermas conjectures a unifying ground, or foundation, in discursive reason that is the condition of possibility for the communication process. Honneth accepts that there is no subjectivity without the intersubjective but strives to remedy what he regards as Habermas’s subordination of the subject to the intersubjective. Honneth recenters the subject by locating discursive reason in an emotional response to the denial of recognition but without denying its intersubjective formation. For Honneth, the context and meanings through which this denial arises are socially contingent (and therefore intersubjective), but the underlying condition of possibility (the subject’s recognition of the other’s denial of recognition) is pre-given in the impetus for recognition that is a defining feature of the human condition. What Habermas’s and Honneth’s different responses to negativity share is the assumption that the basis for avoiding the unjustified privileging of freedom and associated political pessimism in Horkheimer and Adorno’s early formulations of critical theory resides in the identification of a positive ground, or foundation, from which to originate and justify critique. Each rely on human beings having the capacity – whether “intersubjective” or “subjective” – to discern the difference between right and wrong or good and bad. So, in Honneth’s case, there is a presumption that “the subjects for whose sake just social relations are to be established *are aware* that their autonomy depends on the autonomy of their partners in interaction” ([34], p. 259 emphasis added).

An alternative to some version of foundationalism, which claims to circumvent negativity by identifying a positive foundation for critique, is the adoption of a nonfoundational philosophy which acknowledges negativity, or an absence of foundations, as its starting point. This places the uncertainty of the aporia at the center of our understanding of the human condition. That is to say, it makes the assumption or claim that whenever we try to identify a foundation beyond the realm of meaning, we will always encounter an absence – an unknowable, undecidable core that we can never pin down or articulate fully. Instead of trying to excise negativity by inserting a normative presumption (such as discursive reason or disrespect), a nonfoundational philosophy accepts that negativity, and hence

uncertainty, lies at the root of the human condition. In short, a nonfoundational philosophy is based on the recognition of radical negativity as the starting point for all theory and experience.

Once a nonfoundational philosophy is accepted, there are two main directions in which to develop theory. The first direction allows that we can never escape difference and that therefore there are no pretheoretical bases from which to develop theory. Instead, heterogeneity (plurality and relativism) are acknowledged to be the hallmarks of the human condition. The political is then always a matter of difference, power, and contestation (and therefore Habermas's telos of consensus, e.g., is rejected). This is the route taken by much of what is loosely referred to as post-structuralism. In our view, there is much to be learned and gained from pursuing this line of analysis but it courts the danger of a (directionless or self-absorbed) celebration of carnival and relativism that risks sliding into nihilism.

A second direction asks how, if the human condition originates in the radical negativity of nonfoundationalism, it can be that we find ourselves in a world of comparatively stable and persistent meaning(s). This postfoundational orientation, [36] provides a distinctive response to the question of how radical negativity can possibly be the condition of possibility for a world of order and meaning. Rejecting any universal grounding in pretheoretical foundations, and hence also any universal normative basis for our ethics, postfoundationalism conceives of grounding as a contingent, hegemonically accomplished process of stabilizing meaning and sedimenting order as difference is suppressed and diversity is domesticated or occluded. When taking this second, postfoundationalist direction:

grounding is no longer to refer something back to a foundation which would act as a principle of derivation but, instead, to reinscribe that something within the terrain of the undecidables (iteration, re-mark, difference, etcetera) that makes its emergence possible. So, . . . it is no longer a question of finding a ground from which an ethical injunction should be *derived* (even less to make such a ground of undecidability itself). We live as *bricoleurs* in a plural world, having to take decisions within incomplete systems of rules (incompletion here means undecidability), and some of these rules are ethical ones. ([37], p. 79, original emphasis)

In other words, any system of meaningful social relations is not stabilized or institutionalized by reference to pretheoretical foundations. Rather, stability is produced by conditions arising solely from within that system's own discourses. An inherently precarious stability is accomplished through the operation of power relations which are themselves inherently vulnerable to contestation, including the challenges to "power" by currently available "ethical rules," as was demonstrated earlier with regard to the challenge posed to the FSC by its critics. By discourse is meant not just forms of linguistic communication in speech and text but also the numerous practices (implicit social rules and aligned individual behaviors) which serve to reproduce the stability. So, for example, within the current discourse of business, we can see that Freeman's idea of stakeholder management [38, 39] arose as a description of how managers do manage (the *is*) but it also serves to communicate, influence, or reinforce the ways that managers understand what behaviors they *ought* to adopt. In this example, the process of describing practices and thereby

influencing expectations leads to a performative, iterative integration and alignment of ideas and actions (i.e., specific social rules and behaviors). This integrated system of meaningfulness is what, for the postfoundational perspective, is meant by discourse.

Laclau and Mouffe's social theory of hegemony (STH) explores the implications of postfoundationalism for reconstructing the political (and the ethical). In STH, the stabilization or sedimentation of any meaningful system relies on the hegemonic occlusion of radical negativity that is inherently precarious and so subject to challenge. Radical negativity implies that difference and dissent are unavoidable. Because we can never ultimately resolve or definitively arbitrate between difference, the only way that a social order can become stabilized and sedimented is by (temporarily) occluding and obscuring difference. Whereas Habermas derives a political philosophy from an originary normative moment of reason and consensus, STH identifies the originary moment as an intrinsically political one in which difference is hidden and silenced.

In this moment, the antagonism of contestation and dissent are at least partially eclipsed and/or devalued as an immanent and contingent order (an order of concepts and ideas aligned with subjectivities, behaviors, and practices that are nonetheless no less contingent upon that order than are the concepts and ideas which express it symbolically) becomes so widely accepted (hegemonic) that it appears to be natural, universal, and transcendent. What counts as ethical is therefore always a contingent product of our location in hegemonic discourses. There are no prepolitical interests or prior ethico-normative starting points. Instead, "the distinction between the ethical and the political is blurred" ([37], p. 81) until they become a unity. In this ethico-political moment of instantiation, the discourses we live by become called into question and, because our subjectivity is itself a product of those discourses, our sense of identity is called into question.

In this respect, the postfoundationalism of STH partially overlaps with other understandings of ethics from antifoundational, or post-structural, perspectives. Levinas, for example, sees ethics as a question of calling one's self into question. For Derrida, ethics always involves an experience of not knowing what to do, while for Agamben it is a matter of endless openness and difficulty ([4], p. 8). What distinguishes STH from these perspectives is its attentiveness to how discourses in which we locate, and therefore also construct, our subjectivity and sense of identity are stabilized by an occlusion of undecidability. In other words, our own emotional investment in our sense of identity is coterminous with the occlusion of undecidability in the discourses of our lifeworld. When Honneth identifies recognition/disrespect as the pretheoretical foundation of the subjective and the inter-subjective, he valuably appreciates how the ethico-political moment of origin is a moment of emotional challenge to the sense of identity. Where Honneth errs, when considered from a postfoundational perspective, is in failing to appreciate how disrespect is already bound up in particular discourse(s) to which Honneth is inclined to attribute an equivalence. For Honneth, the ethical moment hinges around the denial of recognition irrespective of what (sense of identity) is being "disrespected." To take an example drawn from CSR, one might consider the case

of a corporation (e.g., Shell) or an NGO (e.g., FSC discussed earlier) that reacts to “disrespectful” commentaries on its CSR record by “pulling back from imaginary possibilities (against which critics such as RF assess its performance) to the actually possible” [40]. By such “pulling back,” we mean whatever protects their growth (e.g., in the case of FSC, into the certification of forest carbon, issuing of FSC certificates concurrently or jointly with carbon credits and/or aligning or partnering with voluntary carbon standards (see [41]) and/or profitability).

We are minded here of Foucault’s understanding that conflict and struggle are inescapable and, indeed, critical for subverting power-infused occlusions of the contingency and precariousness of particular regimes of truth. While Foucault, in common with postfoundationalists such as Laclau, is prepared to provide extensive justifications of his thinking, he refuses to present his analyses and critiques as anything more than a situated engagement with a particular conjecture. Analysis, such as that which we have presented in this chapter, involves careful research and informed judgment but its outcome cannot be warranted either by an appeal to science or to some normative framework. For postfoundationalists, the ethico-political moment hinges upon how, by identifying emotionally with the need for respect and recognition, the subject misrecognizes and disguises a radical undecidability at the core of their subjectivity and so disregards the implications that this may have for the contingency of their identity and hence also of their normativity. This shifts consideration of the ethical from the issue of “what is the right thing to do?” to the more challenging far-reaching question of “what is this ‘me’?” From a postfoundationalist standpoint, this ethico-political moment is a moment of confrontation with the emptiness that lies behind our sense of identity. It is an emotional moment that occurs where reason fails us and anxiety and disorientation rise up. Potentially, this is deeply disruptive of the ways that, through identification with discourses, we allow them to “grip” us so as to preserve the “me,” projected in the form of the corporation or the NGO in which the reproduction of the “me” has become invested, by sparing it from radical deconstruction [42].

The social theory of hegemony (STH) therefore gives us a very different understanding of the political and the ethical than those provided by liberal democracy or deliberative democracy. From Laclau and Mouffe’s radical democratic perspective, neither liberal democracy nor even deliberative democracy can ever amount to a truly political approach because their normative foci, on aggregation of interests and the construction of consensus, respectively, decenter or sidestep the problems of difference, undecidability, negativity, and antagonism. Rather than seeing consensus or the aggregation of interests as the measure of success for politicization, radical democracy implies that we should look to the ways that a political process not only helps to expose difference and dissent but also, in doing so, leads us to confront, as problematic and in need of revision, our own self-identifications and understandings of the world. For this confrontation to be meaningful, in the sense that it can lead to changes in identification, then it has to disrupt the subject’s lifeworld – which we might clarify as their conscious and unconscious mental models and understandings of the world and their location, role, purpose,

and identity within that world and not as separate from it but, rather, as integral and intimate reproducers/transformers of it. Such disruptions or “reality disjunctures” [43] may be confined to a cognitive or intellectual understanding of postfoundationalism as a plausible idea, but, to be consistent, it must be lived – that is, directly experienced in an emotional way – and not simply “known.” The emotional charge associated with such disruption is likely to take the form of angst, uncertainty, and a loss of faith in old understandings and rationalities which, if not suppressed, subsequently is transformed into a difficult and constantly challenging search for a way forward with others.

Laclau and Mouffe illustrate their reconstruction of the political by mobilizing a distinction between logics of equivalence and difference. In a logic of equivalence, the political process “constructs a chain of equivalential identities among different elements that are seen as expressing a certain sameness” ([44], p. 301). Laclau and Mouffe illustrate this with the example of colonization:

In a colonized country, the presence of the dominant power is every day made evident through a variety of contents: differences of dress, of language, of skin colour, of custom. Since each of these contents is equivalent to the others in terms of their common differentiation from the colonized people, it loses its condition of differential moment, and acquires the floating character of an element. Thus, equivalence creates a second meaning which, though parasitic on the first, subverts it: the differences cancel one other out insofar as they are used to express something identical underlying them all. ([35], p. 127)

In order to draw differences together into a logic that brings them into equivalence, it is necessary to articulate them around concepts and ideas (e.g., “fairness”) that are taken to be meaningful by many or all parties yet, which when examined more carefully, are found to be largely hollowed out of any consistent or shared meaning in a manner that precisely makes possible widespread subscription to such concepts and ideas. Such signifiers (which are aptly termed empty signifiers in STH) are nonetheless potent as they operate to stabilize discourse by inviting our emotional investment in, for example, the good, the right, or the ethical. That investment serves to orient our identification with certain discourses and makes it difficult to challenge those concepts and thereby expose their vacuity and deflate their power and appeal. Examples can be found readily in the field of CSR where deeply held, but often largely unrecognized, normative commitments form the basis of established positions.

Consider, for example, a central claim of mainstream “strategic CSR”: Porter and Kramer [45] commend the idea of “win win” in which securing corporate profitability is conceived as perfectly compatible with social development and the reduction of inequity. This grounding presumption of much “strategic CSR” is clearly contestable. Yet, as almost anyone who has taught business ethics, whether to executives or business students, will confirm, it is very difficult to call this notion into question without encountering defensive vehemence and ridicule provoked by any challenge to this sacred cow. In liberal democracy, the idea that different interests can be aggregated is a fiction and yet is so central to liberal democratic thinking that doubting this possibility elicits vigorous, and at times acerbic, defense (as evidenced in Willke and Willke’s [13] dogmatic critique of Scherer and

Palazzo's turn to deliberative democracy). An equivalent fiction, we submit, is present in deliberative democracy where a normative investment, or identification, with the idea of consensus enables the fictitious nature of the grounding of this discourse to be obscured through claims that deliberative democracy is a pragmatic turn to democracy over philosophy.

STH and radical democracy raise an alarm whenever a perspective is presented as commonsense, as "pragmatic" or as "just being realistic." It warns us that we are approaching the locus of signification where difference and undecidability are hidden and the discourse is stabilized through hegemonic practices involving emotional investment. The point, we suggest, is well illustrated by Willke and Willke's revealingly excessive and patronizing commentary on "Palazzo/Scherer's" refutation of the relevance of the liberal democratic model where they opine that "it seems unwise to call for a politicization of the corporation in view of what is happening in Russia, Venezuela or Bolivia...Have they considered the possible effects of 'democratic accountability' when the 'demos' (are lead [sic] to) believe they should boycott Jewish shops?" ([13], p. 32) (a dispiriting irony here, of course, is that the rise of the oligarchs in Russia and the boycotting of Jewish shops in Germany are both a product of a naïve faith in the essential(ist) virtues ascribed to liberal democracy). It is therefore unsurprising that challenges to commonsense encounter dismissiveness, defensiveness, and even anger. We also detect something of this in how Scherer and Palazzo ([3], p. 919) represent our critique of their position as saying that they do not go far enough with deliberative democracy. Here their defensiveness gets in the way of engaging in constructive deliberation with their interlocutors. How do we justify this view? First, Scherer and Palazzo do not provide any elaboration or explication of what they mean by "do not go far enough." Where, we ask, is the deliberation in this assessment? Second, their representation of our critique implies that we endorse the logic of their stance but are (immoderately) pushing for a more "extreme" form of it. We trust that this chapter has made it plain that neither implication can be drawn from our position.

By contrast to a logic of equivalence, a logic of difference is "A way of relating discursive moments in and through their mutual differences. . . . The differential relations between the discursive moments are constitutive of their very identity" ([44], p. 300). This places at the core of the political the recognition of difference, and continuous struggles to expose difference, and thereby confront the challenge that difference presents to us and to our commonsense rationality and practices. "[T]he logic of equivalence is a logic of the simplification of political space, while the logic of difference is a logic of its expansion and increasing complexity" ([35], p. 130). By placing at its core an attentiveness to difference (rather than consensus) as the locus of (re)politicization, radical democracy aspires to appreciate how the originary moment of discourse, of subjectivity, and of ethics is found in a hegemonic moment of occlusion of difference. It is in this originary moment that we encounter the political, the philosophical, and the ethical as the same. Therefore it is through radical democracy's focus on exposing difference that, we submit, we can come closest to a nonnormative democratic theory through which to inform our alternative understanding of political CSR.

Conclusion

When embracing radical democratic theory, our research is geared to exploring whether and how “political CSR” stimulates and continually sustains confrontation with difference that involves anxiety over identity as well as the problematization of commonsense meanings. What is less clear is whether STH can, at present at least, achieve much traction or influence on practices of CSR. In our view, this “problem” does not reside in the theory but in the conditions of receptiveness to it. If Scherer and Palazzo are unwilling or unable to give it serious consideration, what prospect is there of it appealing to, let alone being adopted by, practitioners? The problem, we suggest, is that despite a convergence of financial, climate, energy, food, and migration crises, there is currently little appetite globally to call into question the hegemonic practices and commonsense logics that underpin our current, market-dominated, socioeconomic order.

We noted earlier how, in the Forest Stewardship Council (FSC), a turn to deliberative democracy had the effect of obscuring, marginalizing, and silencing indigenous dissent and difference, as highlighted by the Rainforest Foundation report. In parallel with this, we see, evidenced in the statement by the B&Q executive [26], that the turn to deliberative democracy, at least as implemented by the FSC and endorsed by Scherer and Palazzo, has done little to call into question such commonsense identifications with the logic of comparative advantage. From a radical democratic perspective, the marginalization of difference and the apparent failure to elicit an increased self-reflexivity and emotional disruption in participating individuals would be prime indicators of a process that was depoliticizing rather than repoliticizing. It is therefore prudent to have rather low expectations about the current receptivity or preparedness of practitioners (as well as academics) to radically scrutinize, rethink, and transform their thinking and practices.

The FSC example shows how at present the function or effect of “political CSR” can be to co-opt or subsume difference in ways that reaffirm rather than disrupt established identities. Nonetheless, it may be that “political CSR” has a role to play in helping to counter this conservatism. When considering this proposal, it is relevant to recall how CSR is just one arena of potential repoliticization in a wider social milieu [46]. If “political CSR” is to develop along more radical democratic lines, then its application must be geared to a wider disruption of the logics of markets which, taken as a whole, can ferment and address a more pervasive environment of anxiety arising from the calling into question of identities across society.

Notwithstanding the continuing fallout from the financial crisis and the prospect of a deepening ecological crisis, it is far from clear that we are approaching a moment of such widespread social disruption where radically different ways of thinking and being become intelligible and desirable. Indeed, where affluent consumerism spreads across the emerging economies, the prospect is for an increasing co-option of alternative identities to a market-driven subjectivity. Within this context, there may nonetheless be benefits from interventions, in

contemporary discourses of today, that are not postfoundational in their philosophical orientations yet may, if they are not diluted or displaced, nevertheless expose difference and promote the disruption of sedimented commonsense identities. In this process, deliberative democracy may facilitate a shift from an understanding of the political as a process of aggregating individual preferences to conceiving of it as a process of debate and public will formation. In this respect, and without withdrawing our earlier criticisms of Scherer and Palazzo's "lite" engagement with the thinking that underpins deliberative democracy, and their associated formulation of "political CSR," we see some merit in aspects of Scherer and Palazzo's "political CSR" so long as its limitations are adequately acknowledged and addressed, including an apparent disinclination to "deliberate" with comparatively friendly critics. As the FSC example instructively shows, it is necessary to develop an alternative approach that directly fosters an alertness to the ways that a deliberative democratic and "political CSR" can rapidly come to obscure difference, and thereby sidestep the deep emotional challenges to established commonsense and identities which a more open understanding of difference would expose. Where "political CSR" produces at least a partial disruption of established dominant liberalist and system-dominated discourses, it is to be welcomed, but as a first, not a final, step. Associating this disruption with postliberal political theory, as Scherer and Palazzo commend, may be helpful in promoting a fully postliberal theory and practice of "political CSR" as a mutation occurs from liberalism into a radical democratic perspective. By alerting us to the value and significance of difference, albeit within the confines of "political CSR," deliberative democracy may, potentially, act as something of a "Trojan horse" by creating a receptivity toward a more philosophically (and psychoanalytically) informed and radically remodeled form of "political CSR."

If deliberative democracy were to become central to "political CSR," we anticipate that its claim to offer a pragmatic approach would be increasingly challenged by demands to test its practical impact against the telos of consensus. In this telos, we find the origin, and hence also the limit, of the communication theory of society that lends philosophical credibility to deliberative democracy. STH tells us that it is at the limit of a discourse that we encounter the inescapability of difference and undecidability: It is at the limit of our search for a grounding positivity that we encounter the aporia of the originary negativity. Scherer and Palazzo's appeal to the pragmatism of agreement effectively occludes the radical negativity that is exposed when the philosophical foundations of Habermas's discourse ethics are interrogated. By being alert to the philosophical basis of our postfoundational political theory, we find ourselves at the limit of discourse where the political, the philosophical, and the ethical meet in a moment of radical negativity without foundations. For us, deliberative democracy might open a route toward a radical democratic "political CSR." But, in our view, this prospect will be realized only if we are prepared to question the philosophical foundations of Habermas's theory and, by pushing that questioning to its limits, expose, and address the radical negativity that, we have argued, lies hidden at the core of all ethics and discourse.

Abstract

When managerial decisions are examined, somehow the business context must be included in the analysis. In this chapter, causalities that transcend individuals are promoted as unit of analysis in empirical moral research, namely, discourse. Studying managerial decisions in their discursive context is an interesting way to study the moral side of these decisions. After discussing discourse theory, the conclusion is that discourse theory can help business ethics in many different ways. It is shown what a discourse description or analysis within business ethics could look like. Special attention is paid to stories and metaphors, and to the power effects of international anticorruption discourses.

Introduction

Watson ([89], p. 168) claims that “although increasing academic attention is being paid to business ethics, the ways in which ethical consideration come into activities and decisions of organizational managers have been examined in a very limited way.” This chapter¹ contributes by suggesting an interesting way to study moral managerial decisions is studying these decisions in their discursive context. In the ► [Chap. 27, “Discourse and Normative Business Ethics,”](#) the focus is on the normative side of ethics, here on descriptive ethics. Here I study why and how discourse analysis can aid descriptive business ethics.

In this chapter, first I claim that the internal dynamics within organizations render methodological individualism in business ethics hard to defend. Therefore,

describing the moral side of a company by describing the moral part of managerial decision-making lends just a fragment of the whole picture. Somehow, the business *context* wherein managerial decisions are made also contains important moral information. Causalities that transcend individuals are proposed as a unit of analysis in empirical moral research, namely, discourse. I suggest that an interesting method for describing (moral) decisions of managers is looking at the way managers talk about their reality. After describing what is meant by discourse in this chapter, I suggest how discourse analysis could be used in descriptive business ethics and give the example of bankers' decisions. Special attention will be paid to storylines and metaphors and to the power and consequences of (business) ethics discourse by giving the example of international anticorruption discourses.

Problems with Applying Classic Moral Theories Within Business Ethics

Business Ethics and Classic Moral Theories

According to Van Lwijk and Kimman, well-known business ethicists in the Netherlands, business ethics is an institutionalized discussion about values and norms that should contribute to formulating directions for action [4] or rules [5] for managers [6]. In formulating those directions, classic moral philosophers are often studied. Some scholars within business ethics therefore lean heavily on classic moral theories, such as deontological, utilitarian and virtue "ethical theories."² Peter French: "I am convinced that the primary problem of business ethics is not to identify ways of applying the traditional moral theories and principles in order to evaluate the actions of corporate managers. That, unfortunately, has been the characteristic approach in the field" [7].

Solomon [8] is an example of a scholar using virtue ethics. Scholars who use some sort of integrity approach, such as Kaptein and Wempe [9], usually try to find the right mix between the three classic moral theories. Scholars like Ronald Green [10] take a more deontological approach: They define clear moral guidelines and principles to which companies always have to adhere.³ A theorist like Freeman, with a "fair contracts" approach, reflects the assumptions and methodology of the modern liberal Rawlsian theory of justice and property rights [11]. The stakeholder approach, like the one by Donaldson and Preston, has some affinities with utilitarian notions. Like the utilitarian moral theorists, stakeholder theorists struggle with the following problems: Whom to identify as morally relevant? How to accommodate conflicting interests? And what to do with moral claims that are incomparable? Answers should lead to a situation that is best for all. Contract theorists, such as Donaldson and Dunfee [12], do not so much get their inspiration from the classic moral theories, but make use of other classic philosophers like Hobbes, Locke, and Rousseau.

The Human Agent Versus Organizations: The Problem of Intentionality

Classic ethical theories happen to have in common the assigning of a key role to the human agent. The focus is on questions how *individuals* should act in certain, morally relevant situations. After all, the well-being of persons is the primary consideration of Western ethics; most philosophical ethics is about how to treat other human beings. Concepts like “responsibility” and “blame” play central roles.

Theories like utilitarianism, deontology, and virtue ethics can be, according to Van Willigenburg:

...viewed as systematisations of the moral insights, intuitions and beliefs of all who share basic moral concerns and who, therefore, participate in a common search for answers to questions about how to treat each other, how to organize society and how to lead our lives. Ethical theories try to construct a coherent and illuminative set of principles and rules . . . But clearly, not one of these theories’ systematisations can provide for the whole truth, though they all start from one or another part of folk morality that we find intuitively plausible and fundamental. Each systematic reconstruction will have its blind spots: areas where its principles do not readily apply or even lead to counterintuitive results. This is certainly the case when different levels of analysis are in play. An ethical theory constructed from the perspective of the individual actor will have difficulty accounting for the corporate context. [13].

The moral rules classical ethical theories prescribe can be used to advise individuals when making decisions. But classic moral theories were not designed for the corporate context. As Van Willigenburg notes, in the corporate context, different levels of analysis are in play. An important issue for business ethicists is thus to decide how far they can go in applying philosophical moral theories – meant for individuals – to organizations. In the famous words of Velasquez, “Although we say that organizations ‘exist’ and ‘act’ like individuals, they obviously are not human individuals. Yet our moral categories are designed to deal with individual humans who feel, reason, and deliberate, and who act on the basis of their own feelings, reasoning and deliberations” [14]. According to Velasquez, a corporation cannot be held morally responsible. It does not have autonomy. Velasquez is a so-called *moral* individualist. To him intentionality is essentially tied to consciousness. And the human kind of intentionality is necessary for moral responsibility. A related problem is how to punish organizations. Organizations cannot be put in jail and their souls cannot be damned. Many business ethicists who believe that organizations cannot be held responsible in a moral sense spend their energy on individuals within organizations, mostly the decision makers: the managers. Interesting and wide juridical and managerial literature exists on “who is to blame.”

Whether or not doing something intentionally is essential to being held responsible is an important question. After all, corporations are capable of doing considerable undeserved harm. And our organizations are complex: division of labor and expertise renders every action employees undertake a minor part of the overall task. This leads to problems in business ethics because of the intentionality condition.

“Sin without sinners, crime without criminals, guilt without culprits! Responsibility for the outcome is, so to speak, floating, nowhere finding its natural haven”[15]. There are some arguments that organizations can act intentionally whether or not it is seen as a human form of intentionality. These arguments, however, are not very convincing. There are many cases where the agent (the organization) has caused considerable harm (environmental pollution) that it clearly did not intend – as is required for moral responsibility on the intentionality condition. I am convinced that our ordinary (daily) discourse casts a considerable wider net than those business ethicists who defend moral individualism. *I think that in our daily moral discourse, the fact that harm is done is more important than the intentionality condition and is therefore more appropriate.*

The Outcome of Moral Choices

I argued that many scholars, who believe strongly in using one of the classic moral theories within business ethics, focus on managers and how they should make individual choices. Those business ethicists focus on advising individuals within companies: managers. Implicitly it is assumed that the conscious decisions of managers determine what actions organizations undertake. Society and human behavior are viewed as the outcomes of conscious (moral) decisions; the functioning of organizations is seen as the outcome of (conscious) managerial decisions. Thus, if these managers get good moral advice (and abide by it), the organization will behave in a good moral sense. This gives morality a chance to determine behavior. This is why the part of business ethics that leans heavily on classic philosophical ethical theories has clear affinities with choice-based decision theories. Within choice-based theories, the process of weighing alternatives is based on values, i.e., individual preferences over alternative outcomes.⁴

In most theoretical ethical discourse, the outcome of moral choices is given. The main problem it tries to address is how to choose between different actions and/or outcomes. But, because of the ever growing complexity of organizations, the distance between actions and outcomes is great in both space and time. Anthony Giddens therefore calls our society a risk culture. What is important here are the consequences these problems have for applying classical moral theories in the field of business ethics. Bauman notes:

We can do harm to them (or they may do harm to us) inadvertently, by ignorance rather than design, without anyone in particular wishing ill, acting with malice and be otherwise morally blameworthy . . . It also renders impotent the few, but tested and trustworthy ethical rules we have inherited from the past and are taught to obey. After all, they all tell us how to approach people within our sights and reach, and how to decide which actions are good (and thus ought to be taken) and which are bad (and thus ought to be avoided), depending on their visible and predictable effects on such people. Even if we abide by such rules scrupulously, even if everyone around observed them well, we are far from certain that disastrous consequences will be avoided. Our ethical tools—the code of moral behavior, the assembly of the rules of thumb we follow—have not been, simply, made to measure to the present powers. [15]

Concerns for “Applied Business Ethics”

The point I am trying to establish is that context in ethics is important, especially in applied ethics. Sorrel: “I suggest there is a whole genre of applied ethics—‘armchair applied ethics’—that extends in an objectionable way the method of arguing *a priori* and by abstract counter-example that is justifiable in most of the rest of philosophy. In applied ethics, there is an obvious value to leg-work—leaving one’s armchair and finding out about the actual practice of business, medicine and law, including the questions that seem natural to practitioners, or urgent to them at different times” [11].

Every issue in daily management has its value implications. Managers, however, are often not aware of this – perhaps one of the reasons why applied business ethics as a field is not as evolved as applied legal or medical ethics. Managers in these fields deal daily with issues they *perceive* as morally relevant; naturally they are more prone to turn to philosophical ethics for help [11]. But when a discourse does not perceive an issue as morally relevant, the theoretical moral discourse runs a risk of being misunderstood and giving intractable advice. Even when business people find certain philosophical discussion interesting, they have a hard time relating it to their daily problems. The ethics are too far removed from daily practice. In other words, the discourses are too different. When talking about the same issue, ethicists and business people sometimes use different terms and concepts and talk “past each other.” This point is also important in relation to stakeholder theory. Social constructivists have shown that various actors are likely to hold different perceptions of what the problem “really” is [16]. Even if all the relevant representatives of all the relevant stakes are around a table, the question is whether they perceive and are willing to talk about the same problems, let alone the same solutions. “This does not mean that facts don’t enter the discussion. Ironically, participants seem exclusively preoccupied with getting the facts straight. They accuse each other of misinterpreting or simply ignoring crucial evidence. Many authors contend that these agreements about facts actually mask a conflict underlying ‘belief systems.’ These are sets of causal and normative assumptions about reality” [17]. Both discourses have valid arguments within their own rules, but somehow they differ fundamentally.

In an interesting article, Hoffmaster [18] presents some difficulties he has with “applied ethics.” By the latter, he does not mean the catchall term used to refer to activities such as ethics rounds and consultations, ethics committees, etc. The target is “applied ethics” in the sense of a philosophically based and motivated theory. While his article is about applied ethics in the field of medical ethics, some of his points are relevant in the field of business ethics. Let me briefly list his criticism here. What Hoffmaster calls “criticism,” I see as “special areas of concern” when applying philosophical theories to applied business ethics.

Hoffmaster makes a distinction between two kinds of criticism that can be leveled against “applied” moral philosophy, namely, internal criticism and external criticism. Internal criticism purports to show that moral theory cannot succeed on its own terms. External criticism points out that moral theory cannot account for the phenomena of morality [18].

A first internal difficulty of applied ethics is that many principles within applied ethics are too general and vague to apply determinately to concrete situations, leading to intractable advice; always a concern for any sort of applied ethics. Within applied business ethics, philosophical ethics can play a role. But the philosophical discourse within a field of applied ethics should also be close to daily (business) practices or it will suffer from what Sorell [11] calls the alienation problem: a breach between ethicists and practitioners. As Stark claims, based on his study of the business ethics literature, “Far too many business ethicists have occupied a rarefied moral high ground, removed from the real concerns of and real-world problems of the vast majority of managers. They have been too preoccupied with absolutist notions of what it means for managers to be ethical, with overly general criticisms . . .” [19].

All the major concepts in moral philosophy are heavily under debate. The proper use is never agreed upon.⁵ Which kind of use of a concept is valid in a particular moral dilemma? In the use of the concept “values,” when we study what is meant by “loss of values,” we see that people can mean completely different things. Although an analysis of concepts can clarify confusion around concepts, it can never establish what a concept “really” means, let alone resolve the disputes in which concepts play a role. “In any moral controversy, the question of whether and if so, how, a principle is to be brought to bear upon that dispute is itself contentious . . . Disparity between the abstract semantic formulations of principles and the particular empirical circumstances they supposedly govern is a consequence of the inherently general nature of language” [18].

A second internal difficulty with applied ethics is that a multiplicity of principles is taken to be relevant to moral problems in the corporate context but when principles conflict, applied ethics does not offer a good way to resolve the conflict. This problem is often mentioned: for any one moral problem, several principles can be applied. Unfortunately, there is no accepted way of choosing one principle over another.⁶

A third internal difficulty of applied ethics is that it is not helpful in addressing some crucial moral issues because these issues challenge assumptions upon which the theoretical edifice of applied ethics is erected. The assumptions of moral theories with long traditions make many managerial ethical issues difficult to address. Addressing them would challenge the assumptions of the existing theories. Noticeable in this regard for business ethics is the debate over who belongs to our moral sphere. What, exactly, is the moral status of a cow? Or, what is the moral status of the environment, when a bank director has to decide upon giving a loan to a potentially dangerous chemical conglomerate? A cow and, certainly, the environment are not autonomous moral agents. Of course, that does not necessarily mean that they are thereby excluded from moral considerations, but the moral status of nonhumans complicates moral discussions to such a degree that the new field of environmental philosophy is as of yet not able to do much more than map the problems this constitutes for our longstanding moral philosophies.

Turning to Hoffmaster's external criticism, some theoretical moral theory is, in a number of respects, blind to actual moral phenomena. Therefore, applied ethics runs the danger of not appreciating the dynamic character of morality:

Because 'applied ethics' takes morality to be an autonomous theoretical system under which the flotsam of human experience is subsumed, it cannot account for the flux in that experience. It therefore cannot answer three questions that are central to our understanding of morality: why only certain issues come to be recognized as moral problems; how moral problems get categorized or labeled; and how and why moral change occurs. [18]

Elaborating on this last issue:

What induces and precipitates moral change? The salient moral issues of today are different from those a decade ago, let alone a century ago. 'Applied ethics' nevertheless remains impervious to moral change; it will deal with whatever moral problems are brought before it, assuming that the identification and characterization of moral problems themselves raise no difficulties and that moral problems can be dealt with independently of the contexts in which they arise. Yet, how, when and what issues become 'moral' are vitally important questions. [18]

The fact *that* an ethical question arises within a business is as interesting as *what* the question is; that many ethical questions are *not* asked is interesting as well. How animals are treated within Holland's intensive food industry is a good example. The kinds of (moral) arguments used in favor of and against intensive animal husbandry have been around for as long as these practices have existed. Yet, during the crisis of foot and mouth disease, the arguments against intensive animal husbandry gained importance. Why is that? The philosophical moral grounds concerning animals had not changed. Being able to understand why issues are raised about intensive animal husbandry requires more than just studying classical moral theory. To understand these types of questions, the context of moral questions must be examined. There must be an understanding of the *discourse* in which the question appears. The arguments in the Netherlands about intensive animal husbandry can only be understood against the background of the recent outbreaks of bovine diseases like the foot and mouth virus and swine fever.

How and why moral questions are asked in certain contexts at certain times is important. "Answering that question requires a broader conception of morality than the identification of morality with philosophical moral theory, a conception that situates morality in social, cultural, and historical milieus" [18]. Discourse theory is well equipped to study precisely that context and show the working of ethics in practice. By making organizational discourse analyses, it pays attention to moral practice; it puts moral problems in context. I will elaborate on this in the next sections.

Hoffmaster states, "a theoretically-oriented applied ethics tends to focus on 'big' decisions and portray them in binary terms. By doing so, it ignores pragmatic strategies for responding to moral problems such as abiding time, compromising or cycling through competing values" [18]. When one leans too heavily on theoretical-oriented applied ethics, one's morality runs the risk of being too abstract, of being intractable. On making hard moral decisions, Frohock writes: "Pain and guilt, rather than immorality and irrationality, plague therapy decisions" [20]⁷.

Moral decision-making is situational. When studying moral decisions, the context is of extreme importance. Due to the nature of language, abstract formulations derived from philosophical theories can easily lead to disparity with the circumstances in which a person has to make a decision [18].

Language and Meaning

In recent decades, discussions on the nature of truth have profoundly affected social research. Instead of assuming a given world “out there,” waiting to be discovered, attention is being drawn to the language processes through which the world is represented. The access we have to a reality outside language is highly problematic. Language does not simply report facts; it is not a simple medium for the transport of meaning. The meaning and effect of words depend on the context in which they are spoken or written. Du Gay ([21], p. 47): “The meaning that any object has at any given time is a contingent, historical achievement . . . theorists of discourse argue that the meaning of objects is different from their mere existences, and that people never confront objects as mere existences, in a primal manner; rather these objects are always articulated within particular discursive contexts.” Perhaps it is the case, as some philosophers claim, that what exists in the world is a necessity (independent of human beings or language), but things can only be differentiated through language. The world itself does not give meaning to objects; this is done through language. Stated simply, although things might exist outside language, they get their meanings through language.

This view of language implies the possibility to describe the business context as a discursive construction. The meaning of anything always exists in particular discursive contexts; meaning is always contextual, contingent, and historical. For business studies, language is not just seen as reflective of what goes on in an organization. Discourses and organizations are one in the same. “That is, organizing becomes communicating through the intersection of discourse and text” [22]. Our so-called organizational actions are embedded in discursive fields and are only recognizable as practices through discourse. Organizational discursive practices exist only in the organizational surroundings and practices they are part of.

Discourse

The concept of discourse plays an important role in most post-positivistic research and has many meanings. Of its many interpretations (see [23]), here I define discourse as “a specific ensemble of ideas, concepts and categorizations that are produced, reproduced and transformed in a particular set of practices and through which meaning is given to physical and social realities” ([16], p. 44). For example, psychiatric discourse brought the idea of an unconscious into existence in the nineteenth century (cf. [24], p. 3, [25]). Discourses contain groups of statements

that provide a way of talking and thinking about something, thereby giving meaning to social reality. Discourses are not “out there” between reality and language; they are not just a group of signs. They refer to practices that systematically form the objects we speak of. Discourse is not just a “way of seeing” – a worldview – but is embedded in social practices that reproduce the “way of seeing” as “truth.” Discourses are constitutive of reality [26]. What is and is not true cannot be seen outside discourse; it is internal to it. By looking at what people say and write, we can learn how their world is constructed.

The concept of discourse is often used to overcome oppositions like “action and structure” or “individual and structure.” Since discourses, as used here, institutionalize the way of talking about something, they produce knowledge and thereby shape social practices. Social interactions cannot be understood without the discourses that give them meaning. Discourses function as a structure to behavior; they both enable and constrain it. Since discourses in our context institutionalize the way of talking about something, they produce knowledge and thereby shape social practices. Discourses contain the conditions of possibility of what can and cannot be said. The fact that a question arises in any business context is as interesting as the question asked (and the questions not asked). And every question asked gets some form of an answer (including no answer), which has consequences. Discourses help us understand that a certain question is asked, and give us the spectrum of possible solutions to problems arising from it, i.e., what is or is not seen as a viable solution to a specific problem. A problem’s definition inevitably predisposes certain solutions, and vice versa ([17], p. 6; [27–29]). Compare this with the following quote from Schön and Rein ([30], p. 153):

When participants . . . name and frame the . . . situation in different ways, it is often difficult to discover what they are fighting about. Someone cannot simply say, for example, ‘Let us compare different perspectives for dealing with poverty,’ because each framing of the issue of poverty is likely to select and name different features of the problematic situation. We are no longer able to say that we are comparing different perspectives on “the same problem,” because the problem itself has changed.

Over the last two decades, organization studies have given much attention to language and discourse. Putnam and Fairhurst [31] give a good overview of the developments in the area of discourse theory in organization studies. Alvesson and Kärreman [23] discuss the variety of ways in which the concept of discourse is used in organizations studies. For more on discourse analyses, one could mention Dijk [32] and Titscher et al. [33].

The field of business ethics, however, does not pay much attention to (some form of) discourse theory. Among the exceptions are Parker [34] and Shapiro [35]. Also, Cheney and Christensen [36] discuss corporate rhetoric (not internal discourses, but communication that is directed to outsiders of the organization) on corporate social responsibility from a discursive perspective. Descriptive ethical research in the tradition of Jackall [37], Bird and Waters [38], and Kunda [39], looks at what and how moral issues are an issue in the daily life of managers. How do managers talk about ethics and what moral issues do they encounter?

Discourse and Values

Like meaning, values are immanent features of discourse. When we give meaning to something, we are also valuing it. Even though a Durkheimian view is clearly not endorsed here (our emphasis is on language, not institutions), there is a parallel. To Durkheim social institutions, collective ways of thinking, feeling, and doing are not empty but full of values (values give meaning to relationships). In similar fashion, discursive practices are not empty; they are filled with values. By giving something a name, we highlight certain aspects. But in that same process, all other possible qualities are placed in the background or even ignored. Values, causal assumptions, and problem perceptions affect each other. In our daily lives, we jump so often between normative and factual statements that we do not realize how much our views of facts determine whether we see problems in the first place. But when we study those discussions more carefully, we can see that “is” and “ought” are intertwined. Seemingly technical positions in discourses conceal normative commitments. Discourses make more than claims of reality – they accomplish what Schön and Rein [40] have called the “normative leap,” or the connection between a representation of reality and its consequences for action. Within most versions of discourse theory, the strict dichotomy between facts and values ceases to make sense. Facts and values here are not treated as ontologically different; discourse theory treats them as different sides of the same coin. The “is” and “ought” shape each other in countless ways. Language is thus neither neutral nor static in communicating meaning. The awareness that language does not neutrally describe the world is important to corruption research. Subtle linguistic forms and associated symbolic actions shape our convictions and presuppositions ([41], p. 79).

As discussed, discourses contain the conditions of possibility of what can and cannot be said. The fact *that* a moral question arises in business is as interesting as *what* question is asked; as is the fact that many moral questions are *not* asked. Every question that is asked gets some form of an answer which has consequences. Every (non-) decision of any manager in any company is a social activity and affects people’s lives [42]. In a specific discourse, different moral questions are raised than in others. As soon as managers of soccer clubs start to talk about soccer as a “product” (a relatively new development), a new world opens up around the same old game with new opportunities, managerial problems, and new moral issues [43]. Discourses do not only help us understand that a certain moral question is asked, they also give us the spectrum of possible solutions to moral problems being raised, i.e., what is or is not seen as a viable solution to a specific moral problem. It can be suspected that the framing of moral questions by managers [40] differs from moral questions framed by professional ethicists. Where moral philosophers frame moral questions for managers based on their philosophical discourses, managers (needing a “tractable morality,” see [44]) frame their moral questions on a daily basis.

Although Aristotelians and pragmatics like Dewey [45] intensely consider deliberation and conversation, there are clear differences with the discourse theory as described above. Aristotelian ethicists are usually looking for virtues to be

named, virtues that are good. Most discourse theorists though, want to stay away from anything associated with essentialism. Instead of looking for virtues for individuals, discourse theorists want to problematize the central role of individuals (at least the central role of individuals in research). Individuals are part of organizations; they operate in discursive contexts that determine (at least in great part) their behavior. Discourses thus focus more on context than on individuals and their virtues. The extent to which individuals are influenced by their contexts gives rise to extensive discussions about their autonomy and freedom. These discussions (interesting as they are) are left here aside. What is important is that the behavior of individuals is, at least to a high degree, influenced by the organizational entities in which they work and that affects the morality of managers. Jackall [37] concludes:

... because moral choices are inextricably tied to personal fates, bureaucracy erodes internal and even external standards of morality not only in matters of individual success and failure but in all the issues that managers face in their daily work. Bureaucracy makes its own internal rules and social context the principal moral gauges for action . . . Within such crucibles, managers are continually tested as they continually test others. They turn to each other for moral cues for behavior and come to fashion specific situational moralities for specific significant others in their world.”

Discourse Analysis

How can we transition from an ontological and epistemological stance of meaning that is always historically and socially constructed to a theoretical model useful to empirical ethics research? De Graaf [46] has offered an example from postmodern research where empirical corruption research is conducted based on Pierre Bourdieu’s theory of social action [47–50]. By combining macro and micro factors and everything in between, it is an example of how concrete corruption case studies can be conducted. Contextual research in this way can establish dispositions that *can* lead to corruption. Since dispositions do not always manifest, they cannot be called “causes” in the strict sense of the word. What is important in this type of research is the receptiveness of an individual to corruption, and whether the receptiveness is triggered.

An interesting additional method to traditional ones of describing moral decisions of managers is looking at the way managers talk about and view reality: describing their discourses. Instead of looking at the moral agents or the organization as a moral entity, one can study an organization’s internal discourse. In that sense, individuals are neither central to nor the proposed objects of study (methodological individualism); the object of study is discourses. By describing discourses of managers, moral aspects come to the fore.

How does research with discourse theory work? A researcher conducts discourse descriptions or analyses, the basis of which are texts (the material manifestations of discourses). All verbal and written language can be considered. A discourse analysis shows which discursive objects and subjects emerge in social practices, and which conceptualizations are used. Consequently, what is left out in social practices also emerges. It is not the purpose of discourse analysis to retrieve what authors

meant or felt. Discourse analysis is not a search for meaning in texts, empirical or otherwise. The analysis focuses on the *effects* of the texts on other texts. Hajer ([16], p. 54): “discourse analysis investigates the boundaries between . . . the moral and the efficient, or how a particular framing of the discussion makes certain elements appear fixed or appropriate while other elements appear problematic.”

A discourse analysis inquires into forms of problematization and offers a narrative about the production of problems. Why is something considered a problem (or not)? It does not concentrate on answering the problem at hand. In other words, when doing a discourse analysis, one can establish the limits of what can and cannot be said in a particular context, what Foucault [25] called “the conditions of possibility” of a discourse. A discourse analysis can identify the rules and resources that set the boundaries of what can be said, thought and done in a particular (organizational) context or situation. Mauws ([51], p. 235): “Thus, if we are to comprehend how decisions are made . . . it is by examining the conditions of possibility in relation to which these statements are formulated, that is, the often implicit institutionalized speech practices that guide what is and what is not likely to be said (Bourdieu).” By conducting discourse analyses in the field of business ethics, the contextuality of ethics is taken seriously. It gives content to the vague notion of “putting moral problems into context” [18].

An Example: Bankers’ Decisions

In 2001, in Holland the three largest banks dealing with private businesses were ING, ABN-Amro, and Rabobank. Each of the three banks would argue that they differ from each other. Rabobank, for example, is a cooperative company, not listed on any stock exchange. Therefore it does not have to satisfy shareholders and according to Rabobank this means more than just a different legal way of doing business. Rabobank claims that (partly) because they do not have to make a profit to satisfy shareholders, they treat their clients differently. And they claim to care more about the local economy than their competitors do.

One of the many ways in which the three banks could differ are the decisions they make toward requests for a loan by starting businesses. The problem with a starting business for banks is that they pose a higher risk. Many new companies go bankrupt in the first year of their existence.

By understanding how bankers make their choices with respect to starters, a discourse description can render visible the discursive formation within which bankers speak. It can identify the rules about the limits of what can be said and what cannot within a banker’s discourse. A discourse analysis can first of all try to make clear how the banker sees himself, what his identity is. Then it can try to show how the identity of the banker is matched to a situation in which a loan for a starter is decided. It has good opportunities to find rules that managers apply that are not financial norms, and that the bankers themselves are not consciously aware of. Maybe, the manager sees himself and his business, as something essential to the economic development in his region, which could lead to favorable impressions

of starting businesses. Or maybe he is young and trying to make a fast career within his national bank organization, and is very concerned with avoiding big financial risks for his local bank, because the national bank is judging him very heavily on avoiding “mistakes.” This example would lead to very stringent decision rules for starting businesses. A discourse analysis could also compare banks in that way. What are the similarities and what are the differences between the identities of local bank directors. Rabobank claims that it pays much attention to the region a specific bank office is located in. Is that reflected in the way the local bank directors talk about starters and the decision processes whether to give them a loan?

A discourse analysis by De Graaf [26], a study on bankers’ conceptualizations of their customers concluded that there are five different discourses about customers among Dutch bankers (using Q methodology, see also [52, 53]). These discourses contain many aspects about the job of a banker and conceptualizations of their customers. The discourse descriptions give valuable information about the context of managerial decisions. It is shown how bankers in the discourse of a Rabobank make more favorable decisions toward giving loans to starting businesses: They use a discourse where helping to start a business is seen as a moral question; others do not. The latter will ask themselves moral questions about start-up company loans but look primarily at the financial risk, and ask themselves primarily financial questions.

As stated before, in discourses factual and valuational statements are intertwined. Different ways of looking at the factual world lead to different valuations of it and vice versa. The moral problems managers have are always embedded in a context. Morals are always situational. In talking about values, bank managers from a discourse wherein the relationship with the customer is a commercial one, immediately start to talk about fraud and how to prevent it [26]. Moral issues seen by bankers – the treatment of start-ups, environmental issues, using the bank to improve the region, dealing with sponsor money, having a customer in financial difficulty, whether to treat clients differently, when to be completely honest to customers, how to negotiate with customers, etc. – are indissolubly tied to factual images a banker has of his customers. The moral questions and the factual images are part of the same discourse. By giving the best discourse description possible, the differences in moral stances between discourses become apparent by contrasting them.

Storylines and Metaphors

One way to study how discursive practices are shaped is to look at storylines and metaphors. Our own particular worldviews and discourses position us within discussions in terms of the concepts, metaphors, and stories of that discourse. For business ethics researchers, it is important that a discourse analysis can show how forces in language influence moral positions by looking at the role metaphors and storylines play within a discourse. Discourse analysis can also gain perspectives into the structure, dynamics, and directions of conflicting discourses, like narrative strategies.

Stories play an important role in people's lives; in large part, they give meaning to them [54]. If you want to get to know someone, you ask for a life story. Stories tell about what is important and what is not. Philosophers like Johnson [55] or McIntyre [56] would go so far as to argue that stories are central to creating human understanding: "I can only answer the question 'What am I to do?' If I can answer the prior question, 'Of what story or stories do I find myself a part?'" ([57], p. 304). Fisher ([58], p. xiii) claims that "all forms of human communication need to be seen fundamentally as stories." Many scholars agree that stories are filled with information and are efficient at conveying it ([59], p. 9). Boje ([60], p. 106) argues: "People engage in a dynamic process of incremental refinement of their stories of new events as well as ongoing reinterpretations of culturally sacred story lines"; ([61], p. 1001): "In sum people do not just tell stories, they tell stories to enact an account of themselves and their community." The assumption that meaning is produced in linguistic form fits well with exploring stories, which are simply one type of linguistic form, or elements of a discourse with certain characteristics.

Within stories, "is" and "ought" are closely connected. Even if they seem to give simple factual descriptions, an enormous implicit normative power lies within narratives. Hayden White ([62], p. 26): "What else could narrative closure exist of than the passage of one moral order to another? . . . Where, in any account of reality, narrativity is present, we can be sure that morality or a moralizing impulse is present too." According to White, the events that are recorded in the narrative appear "real" precisely insofar as they belong to an order of moral existence, just as they derive their meaning from their placement in this order. It is because the events described are or are not conducive to the establishment of social order that they find a place in the narrative attesting to their reality ([63], p. 10). A narrative analysis can therefore shed light on how different moral positions relate to each other. It shows how narrative structures (partly) determine moral positions and identities, and how they thereby influence the actions of individuals and organizations. And they show how internal dynamics of a discourse can influence the moral position taken; this can also be used strategically. An example from a study by Bracking ([64], p. 44): "These attempts by members of the political elite to gain political ground relative to one another by attempting to fix the others' behavior as 'corrupt,' entail 'corruption' acting as a signifier of moral detraction in a political discourse that pretends liberal reform but serves authoritarian power. Narratives like these often involve 'illegal' foreign exchange transactions . . . There is also a popular narrative of corruption acting as a moral censure of a rapacious elite."

Scholars have pointed to the moral significance of metaphors in business studies and in many empirical organizational discourse analyses, the role of metaphors has been brought to the fore [65–67]. Weick [68], for example, pointed to the operational consequences of metaphor. Just like stories, metaphors are important to business ethicists because of the (often implicit) moral baggage they carry. Describing metaphors in discursive practices can bring clarity to how metaphors, in part, morally shape discursive practices, i.e., how morality is embedded in discursive practices.

The Power and Consequences of (Business) Ethics Discourse – The Example of International Anticorruption Discourses

When values are an integral part of any discourse, they are an integral part of the business ethics discourse. The thesis that meaning is constructed by and through discourse has implications for the notion of business ethics itself. It is, as Hackley and Kitchen ([42], p. 38) note, “inseparable from ways of talking about and doing ethics and ethical things.” The descriptive ethics of the researcher comprises a moral component; descriptive ethics contains values itself and does not just mirror reality [cf. [69]]. Business ethicists’ studies play a role in what Foucault called “the regime of truth.”

It was often concluded in business studies literature that “independence” and “accountability” of employees were good for a company in a business sense. At the same time, business ethicists concluded they were good in a moral sense. Within companies, it is important who speaks of morals, what their viewpoints are and whose interests are represented. In a nutshell, how is ethics turned into a discourse? How do the forms of problematization of managers fit with forms of problematization of business ethics? The Foucauldian question becomes, to what extent is business ethics used as a power tool to discipline workers? This is what Bauman argues too. He accuses organizations (bureaucracies) in our society of “instrumentalizing” ethics to achieve the goals of the organization rather than ethics being the systematic reflection of the goals of the organization. When opinion within a management discourse is that employees steal too much from the company, they can hire “integrity consultants.” These consultants do not evaluate the goals or the products of the organization, nor do they look at whether employees are treated kindly. Instead, they are used to discipline employees with the use of an ethical discourse.

There is considerable power in structured ways of viewing reality. Power in post-positivistic research is defined relationally rather than an institutional or personal feature. So-called genealogical discourse analyses of business cases and controversies analyze how power and knowledge function, how the rules and resources that set the limits of what can be said are working. By using a grammar in its descriptions that replaces the subject with consciousness by a subject as the receiver of social meaning, static concepts are in genealogy made fluid in a historical process. Within genealogy, Foucault (e.g., [25]) looked for the way forms of problematizations are shaped by other practices. Shapiro ([35], p. 29):

Genealogy is gray, meticulous, and patiently documentary. Committed to inquiry, it seeks endlessly to dissolve the coherence of systems of intelligibility that give individual and collective identities to persons/peoples and to the orders that house them by recreating the process of descent within which subjectivities and objectivities are produced.

Foucault [25, 70] has shown how power works through “subjectification.” A practical example: Bracking ([64], p. 36) argues that “the formal definition of corruption used by international financial institutions ... acts in practice as a strategic resource and signifier within World Bank political discourse, indicating

bad governance, illegitimacy and geopolitical position . . . Rather it is the wider strategic role that the concept plays as a disciplinary governance concept which is critical to donors' attempted management of African politics and societies."

Every discourse claims to talk about reality. In doing so, it classifies what is (not) true permitted, desirable, and so on. Truth and power are closely related. As Foucault ([70], p. 74) stated, "Truth is linked in a circular relation with systems of power which induces and which extend it; a 'regime of truth.'" Power is not just repressive; it is always productive. A genealogical discourse analysis within business ethics can reveal some of the ways power functions in discourse and organization, how the rules and resources that delineate the limits of what can be said are working. It can follow back in history the traces of a discourse and reveal the contingencies of a current discourse.

As an example of genealogical studies, let's examine the evidence of power influences of international corruption discourses. Building partly on the work of Foucault, some have shown how discourses on corruption with their inherent worldviews give some an advantage over others. For example, Roberts et al. [71] have shown how the discourse on governance in the so-called Pacific Plan resulted in a technocratic direction such that a particularly narrow conceptualization of governance dominates. "In a direct reading of the Pacific Plan and the interventions it empowers there is ample evidence that governance (good and bad) is used in a disciplining way" [71]. As a result, most emphasis in the region was laid on institution building (offices of auditing, statisticians, and so on). "The definitions and modes of monitoring governance provide a framework through . . . which Pacific Island elites . . . are able to know and analyze their region As the Pacific comes under the gaze of an expert calculus that frames forms of governing as 'good' or 'bad' the island nations and people are once again defined in terms of lack, with answers proffered by development experts" [71].

To reveal the forces or power of a discourse, genealogy has to go back to the moment in which an interpretation or identity became dominant within a discourse, like the Pacific Plan, in which case many alternatives for the dominant governance discourses are available. In fact, in some cases the alternatives effectively challenge the governance interpretations of the Plan. "The continual remake of governance occurs in several ways as social movements act to make strategic use of the term within the context of the Pacific Plan and beyond it" [71].

In so-called critical corruption studies, questions are asked about the consequences of the international anticorruption measures. Brown and Cloke ([72], p. 281): "Recently, together with several other commentators [73–78] we have been promoting the need for critical academic reflection upon the growing calls for an international 'anticorruption' crusade." Why, then, has there been such an explosion of interest in corruption since the 1990s, and why is there such an apparent political commitment toward tackling the problem [79] when there is no evidence that corrupt behavior has increased? Brown and Cloke [79] argue that an important factor has been shifting geopolitical priorities after the end of the Cold War.

The effects of anticorruption measures turn out to be manifold, and toward much more than simply reducing the levels of corruption. “Despite the evolution of structural adjustment into a kindlier, cuddlier poverty reduction version, within the international financial institutions there is no serious commitment to address the issues of regulation and control so vital to any understanding or control of corruption that debilitates countries of the North, East, West, and South” ([80], p. 318). Once again, the importance of context is emphasized. Consequences of anything will always depend on the particular situation, so it is stressed. Brown and Cloke ([72], p. 282/283):

This lack of detailed, contextualized analysis of the implementation of supposed anti-corruption initiatives is, we would argue, reflected everywhere, rather than having anything to do with any uniqueness of Nicaraguan circumstances. . . . we have also come across a series of major reservations expressed particularly by those whose evaluation of such activities stems from long-term research experience in the country concerned . . . Taken together, these points reflect our concerns that in too many cases what is referred to as corruption has been taken out of the context within which it occurs both globally (in terms of the interactions between North and South, the transforming influence of globalization etc.) and locally (reflecting a tendency to seek for global explanations for and solutions to a monolithic signifier named corruption, rather than more detailed considerations of the complex dynamics of the nature of multiple, interlinked corruptions within individual societies).

Most of the critical corruption studies are not against anticorruption measures *per se*, but what is labeled “corrupt,” what is not, and the effects thereof are critical. A special concern is what the negative consequences will be for the poor (e.g., [72]).

The *intentions* of anticorruption discourses are questioned as well. Some claim, for example, that such discourses reflect a post-Washington consensus seeking to reinvigorate regulatory institutions while maintaining blame for the failure of development in South American governments [81]. Another example: “Policy on corruption is deeply embedded within the wider constructions of global neo-liberal and free market economic governance [79, 82–84], where a clear divide between the political and economic and between the public and private spheres is expected” [64] – remarks similar to Roberts et al. in their study on the Pacific Plan. Kondos focuses on the meaning of favoritism using a set of Nepalese cultural practices, showing that “the favor” and therefore “partiality” as values are in accordance with Hindu cultural values. Yet he also explains how Western intellectuals tend to construct “favoritism” to mean corruption and its motives. As a result an ideological conflict in the field of political ethics arises from Western pressure to adopt the principle of “impartiality” in government [85]. Gupta [86] focuses on discourses of corruption in contemporary India, specifically, practices within the lower echelons of Indian bureaucracy and representations of the state in the mass media. He stresses vigilance toward the imperialism of the Western conceptual apparatus, questioning the Eurocentric distinction between state and civil society and the conceptualization of the state as a unitary entity. Some also see the use of (insincere) anticorruption discourse as a strategic tool to legitimize the invasion of Iraq ([81, 87]).

In some critical corruption studies we find criticism of ideologies, especially neoliberalism. Neoliberalism is not just blamed for promoting the interests of the

elite via anticorruption discourses; some even blame it for *causing* corruption. Whyte [87], for example, states: “Neo-liberalism creates a fertile environment for ‘corrupt’ market transactions to flourish, because it seeks the creation of limited space as a means of promoting entrepreneurialism and the pursuit of self-interests,” once again reminding us of Roberts et al. and the Pacific Plan. Paradoxically, the Enron scandal, which involved falsification of balance sheets, manipulation of accounting practices, and the creation of an image of financial health, showed the pervasive nature of corruption within corporate America – a hotbed of neoliberal thought. [88] states, “corruption is more than a simple, isolated crime committed for personal gain. It is a part of corporate and political, culture – more pervasive and acceptable among elites than we realize. In short, it is *becoming institutionalized*.”

Others are very critical of almost all anticorruption measures – integrity workshops, national integrity system analysis, anticorruption commissions – in the sense that they are seen as parts of wider mendacious practices where people are subjected as supernumeraries to human development: “The anticorruption discourse and donor practice itself can cause perverse effects which aggravate cycles of deteriorating governance (discussed by various authors in Bracking, 2007)” ([64], p. 37). Just as we saw in the Pacific Plan example [71], it is often stated in critical corruption literature that the current dominating anticorruption discourse is too focused on technical solutions and the public-private distinction, resulting in too much attention to the public sector as the major cause of corruption. In short, the “anticorruption crusade needs to be shorn of its antistate bias” ([79], p. 291).

Conclusion

When managerial decisions are examined, somehow the business context must be included in the analysis. First in this chapter, I discussed problems with choice-based theories on managerial decisions. Also, methodological individualism turned out to be problematic. In this chapter, causalities that transcend individuals were the proposed unit of analysis in empirical moral research, namely, discourse. After discussing discourse theory, the conclusion is that (the different forms of) discourse theory can help studying managerial decisions in many ways. I showed what a discourse analysis within business ethics could look like. Special attention was paid to stories and metaphors. There is considerable power in structured ways of viewing reality, with power defined relationally rather than an institutional or personal feature. Most of the critical corruption studies are not against anticorruption measures per se, but what is labeled “corrupt,” what is not, and the effects thereof are critical. A special concern is what the negative consequences will be for the poor.

1. This chapter is largely based on [1–3].
2. I do not mean those scholars who defend the amoral model, like Von Hajek or Friedman, who believe doing business has nothing to do with ethics.
3. One could also consider Badarocco, trying to formulate norms on the basis of defining moments.
4. Facts and values are often clearly separated. Values come into play after the process of information gathering. Prescriptive ethics traditionally focus on this moment. The prevailing notion is that ethics and the non-ethical language that describes and explains situations and events belong to separate domains.
5. See Schermer [90] for a very interesting study on the concept of autonomy in ethical theory and hospital practice.
6. When managers' decisions depend on the conviction that they should treat a person not solely as a means to an end (deontology), or the notion of promoting the greatest good for the greatest number (utilitarianism), what should they do?
7. This raises doubts as to the rationality of moral decisions. When we study moral decisions, we can see that they do not conform to some philosophical ethical theory.

Contractarianism

Wolfgang Kersting

Abstract

This chapter discusses the development and a number of key concepts of the modern social contract tradition. It starts with some reflections on general aspects of moral and political theories with special reference to contractualist theories; then Hobbes's, Locke's, Rousseau's, and Kant's position on the social contract is discussed. In the conclusion, the discussion focuses on the concept of contractualism as derived from justification theory, on Rawls' political contractualism, and on hermeneutic concepts of contractualism.

Introduction

Contract theories comprise conceptions in moral, social, and political philosophy that concern the moral principles of human action, the rational basis of social order, and the requirements for the legitimation of political governance, as based on a hypothetical contract that is concluded among free and equal individuals in a well-defined initial state. They thus see the general acceptability of principles as the fundamental criterion for normative validity. Contract theories – like the closely related Consensus theories – are based on a *proceduralism with regard to justification*. They represent a systematic elaboration of the characteristically modern conviction that the social needs for justification and explanation cannot be satisfied any more by reference to the will of God or to an objective natural world order. Many developments, such as the decline of the theological view of the world, the disappearance of the traditional qualitative concept of nature under the impact of the plain view of modern science that relies exclusively on factual proof, the

decay of the established social order of integrated value under the growing weight of bourgeois values, and the economization of social conditions, made necessary a reorganization of the practice of cultural justification, to make it conform with the newly created intellectual foundations of the world of modernism and correspond to the mutated conditions of the individual self and of the human environment. The objectivist legitimation theories of the tradition, such as stoic-Christian natural law, theological absolutism or a teleological ontology, had all lost their validity and could not be referred to anymore in order to provide a metaphysical background for the social practice of reasoning.

Individualism, Proceduralism, Contractualism

The protagonist of this typically modern subjectivism in justification theory is the autonomous individual, which has fallen out of all given orders of nature, of cosmos and creation, and is now completely on his or her own. This figure has been completely decontextualized and became a metaphor of the “antisocial,” a methodological artifact, appropriate only as a constructivist alternative to the socially embedded communal being of the tradition, comprehensible exclusively by dissociation from all predefined contexts extending from the familiar environment to the all-embracing structure of being. The individual human being does not any longer acquire the good or any form of meaning by integrating himself or herself into overlapping communities that are defined by nature or history. On the contrary: social and political institutions can only be justified if their functions reflect the interests, rights, and perceptions of the happiness of individuals.

This typically modern individualistic foundation of all social and political forms of organization completely overthrows the traditional relation of individual and community. On the one hand, this concept attributes *absoluteness with regard to justification* to the individual, requiring the extraction of the individual from its particular realm and situating it beyond all historically evolved and culturally modeled communality. Only as either a naturalized or universalized individual, as occupant of a pre-social nature or of a commonality of reason beyond the level of society, can this role be assumed, which was assigned to it by a justification theory that has lost all trust in the potential of the traditional objectivist authorities of legitimation but nonetheless intends to adhere to the end of universal validity. Therefore, social and political institutions can solely be considered legitimate if they concur with the general preferences of human nature or with universal normative predispositions of the human character. On the other hand, the individualistic foundation leads to the specification of a legitimation model we may call the *procedural consensus model*. Since human individuals can possess differential normative importance only within predetermined normatively binding hierarchies, which are not taken into account any more by this justification theory, each individual counts as much as any other; each individual has the same right to be heard in the discourse of legitimation. The absolutizing of the individual with

regard to justification necessarily results in *egalitarianism*, and this concept again requires that the due justification be given by *consensus-generating procedures*. This explains the continuing appeal of contractualism in modern practical philosophy, as the contract represents the consensus-generating procedure *kat' exochen*.

Modern normative individualism provides the individual with moral autonomy and substitutes the lawmaking authorities of tradition, God, and nature with the right of any individual only to be restricted in its freedom by laws to which the individual would have agreed on – in a virtual contract – together with all other individuals in fair proceedings and disputes and on the basis of equal participation. As indicated by the application of the subjunctive, the center of the contractualistic argument is formed by an argumentatively sophisticated thought experiment the basic pattern of which is as follows:

X – and X may be: the establishment of public governance, a legal system or a constitution, social institutions and economic systems, principles of social, political, and economic justice, or even moral standards - can be considered legitimized, well-reasoned, justified, whenever X can be explicated in an argumentatively comprehensible way as the outcome of a contract that the individuals concerned would reasonably agree on under certain well-defined and generally accepted circumstances.

Dimensions of the Contract

To understand the logic of the contractualistic argument and to comprehend its strengths and weaknesses as a justification theory, three defining elements of the contractual concept must be clearly distinguished: the normativity of the contract, the morality of the contract, and the rationality of the contract. From the perspective of normativity the internal *obligatory* structure of the contract becomes visible, while the perspective of morality brings into focus the external validity of the contract. The normativity of the contract comprises all that defines the contract as a normative incident, as source of normative effects. It is referred to when the contract is described as the foundation of voluntary, self-imposed obligations, and corresponding rights. In contrast, the morality of the contract comprehends the requirements of validity of the contract, which at the same time form the requirements of its normative efficacy, as the contract must fulfill the requirements of its validity in order for its defining normative characteristics, i.e., being capable of founding new rights and duties, to come into effect at all. The third dimension of the contract deals with its rationality. Here, the motives and expectations of the contracting parties and their strategies for achieving their aims are highlighted; the attention is turned toward the instrumentality of the contract, its purpose and function.

The Normativity of the Contract

If the social coordination of behavior is largely achieved by objective norms, the domain of autonomous organization of social life through individual voluntary commitments is minimized. In contrast, when the network of objective norms becomes thinner, the autonomous coordination of behavior, and thereby the instruments of voluntary self-commitment, become more important. This mutually exclusive relation between normative objectivism and normative voluntarism explains the extraordinary appeal of the contract for the political philosophy of modern times up to the present. To the extent that philosophy lost its traditional confidence in normative objectivism, as it could not root it in the traditional teleological concept of nature or in the idea of God any more, the remaining path to the normative coordination of conduct, the category of voluntary commitment, had to shift into the focus of philosophical attention. If normative objectivism collapses, if the traditional law of nature cannot anymore meet philosophy's demand for justification, philosophy must satisfy this need by resorting to normative voluntarism and assign main role in arguments for justification to the independent individual. If nature and God disqualify as sources of normativity and the earlier account of reality as a blend of the descriptive and the normative yields to a purely descriptive factuality as offered by modern science – and hence if normativity can no longer be observed – it must explicitly be introduced by the people, it must evolve as a creation of the human will. Thus, promise, contract, and agreement become the fundamental normative terms of modern theories of legitimation. The instruments of flexible social coordination, familiar to the modern social life, the institutions of contract, promise, and agreement are promoted to the ranks of defining concepts of social life in general. However, the conception of self-commitment is not in the least suited to bear the burden of reasoning which has been imposed on it by contractualism. Contract theories, which want to resort to the contract as a source of self-imposed commitment, must necessarily start with empirical contracts: only contracts actually concluded, only promises actually given, can bind. Actual contracts and actual promises, however, are contingent incidents that cannot be used as the philosophical basis for something that aspires to be universally valid. These considerations lead to the paradoxical result that it is precisely the normative dimension of contracts that contractualism cannot use for its purpose of argumentation. The contract as an instrument of self-imposed commitment cannot play any role in political philosophy – just as little as the concept of a dog can bark, an imaginary contract can bind.

The Contracts of Contractualism Are Hypothetical

The contracts of contractualism, in both the classical, political version, and the contemporary version in theories of justice, are hypothetical. They take place exclusively in the minds of philosophers. So the crucial question is how hypothetical contracts can generate real obligations. How can contracts that occur

exclusively in thought provide information about the authority of the demands of justice in actual social orders or about the legitimacy of actual political governance? We cannot, after all, find out about the rights and duties that we derived from justified principles by inquiring what rights and duties we *would* have if we had agreed with all the others on certain normative principles of justice in an imaginary situation.

It is not because of the binding character that could be established through a contractual agreement of all people concerned that the idea of a hypothetical contract can serve as a model for the justification of principles of social and political constitution, but only because there are good reasons to assume that the parties involved should have reasonably reached such an agreement and that they should, therefore, regard those principles as originating from that agreement *as if* they had agreed on them. The aim of justification in contractualistic reasoning has nothing to do with the binding effect of contracts, which only comes into being – as is the case with promises – if there is a positively incurred self-commitment. Rather, what matters are the reasons that the theory offers for concluding the contract. The contract is a criterion, a theoretical litmus test; by means of it, generally binding principles of justice can be revealed. For this is precisely the metaethical precept of contractualism: Only such principles are generally binding as people would agree on under certain fair conditions, or in other words which can be publicly justified to anybody by anybody.

The Morality of the Contract

The contract of philosophical contractualism does not exist on its own; it is not self-sustaining and autarkic. Its obligatory character is not independent; it can only become effective if it is integrated into the external framework of obligation based on its moral conditions of validity. We encounter these moral requirements of contractual agreements when we ask whether there can be moral objections to contractual agreements and how these can be justified, if necessary. It becomes evident that we are not at all willing to accept the voluntaristic theme of *volenti non fit iniuria* without any additional moral qualifications, and that we hold specific beliefs about the morality of contracts which contracts must meet in order to exert their inherent normativity. For one thing, there is the requirement of voluntariness. There is certainly no expectation that an accurate and always satisfying demarcation is possible between voluntary consent and involuntary compliance. But it is important to note that the morality of contracts stipulates general terms of reasonableness which must be complied with in the negotiation situation – and in the context of philosophical contractualism this means in the state of nature – for the consent to the contract to be judged voluntary. Their violation – e.g., by coercion or extortion or by an emergency situation that drastically restricts personal freedom and thereby causes an asymmetry in freedom and power among the contracting parties – can legitimize a moral cancellation of the contract. On the other hand, there is the condition of a sufficiently symmetrical starting position of the

contracting parties and of a fair exchange of contractual benefits. Both requirements are derivatives of the principle of reciprocity. They equally articulate the conviction that a morally valid contract has to meet fundamental requirements of justice. The morality of contract not only shapes the contractual agreements in a society and its court rulings on contractual law, but also guides the argumentation of philosophical contractualism. The political philosophy of the social contract must conform to both requirements of the morality of contract; only a contract that meets both conditions can play the role of justification assigned to it by the theory.

The moral dimension of the contract has decisive implications for the argumentative program of philosophical contractualism. The conditions of justice and fairness embodied in the morality of contract, which the contract must fulfill in order to be used as a criterion of knowledge about what is legitimate and just, cannot themselves be justified by means of the contract model. Contractualism is no competent authority for the ultimate justification of morality. The scope of contractualistic justification is thus in principle limited. For what turns contractual agreements into morally permissible agreements cannot itself be derived from contractual agreements. The contract, therefore, is secondary in order of justification. As a philosophical theory of justification philosophical contractualism is constantly in need of external support, be it by a theory of human rights that derives the requirements of equality and fairness directly from the egalitarianism of human rights or by an argument about coherence that deduces the normative requirements of the contract from present moral beliefs.

The Rationality of the Contract

Contracts are social instruments which all contracting parties resort to for the purpose of enhancing their utility. As with any instrument, the employment of contracts is subject to rationality conditions which refer in part to the general context of contractual practice, and in part to the special characteristics of the contract in question, and which are partly formal, and partly concern contents. A person will conclude a contract if the desired advancement of his or her utility cannot be obtained on his or her own initiative and the cooperation of others must be ensured.

The interests of the contracting parties can be identical or – as is usually the case in ordinary life – differ from one another. In the first case, we get a contract of identical interests, in the second case a contract of complementary interests. Contracts of complementary interests provide for an exchange of benefits or resources, contracts of identical interests allow for the accumulation of benefits and the consolidation of resources. The contracts of contractualism are of necessity always contracts of identical interests: they serve neither the accumulation of benefits nor the consolidation of resources, but the justification of universal rules and principles. This justification can then be accomplished by identifying a common interest which serves as the motivating reason for agreement. This common interest invariably manifests itself as the interest of all in an improvement of their

amount of utility: if under the given circumstances the establishment of governance, of institutions, or of rules of conduct prove equally beneficial for everyone, all will reasonably agree to the contract, and governance, institutions, and rules of conduct will be seen by all as desirable from their own point of view – and this simply means legitimate and just.

The evaluation of the rationality of a contract demands an inquiry into its efficiency, which follows the triadic pattern of the general justification of conduct and analyzes the context of the initial situation, the meaning, and the consequences of actions. The efficiency of a contract can only be determined relative to the initial situation of the contracting parties, the subject matter of the contract, and the objectives of the parties. Asking for the rationality of a certain contract means ascertaining if it was or would be reasonable for the parties under the given terms and conditions and with their respective interests and objectives to assent to a contract with the characteristics A, B, C. . . . It further means figuring out whether the contract with its particular specifications gave or would in principle give rise to the expectation to do away with the initial status that is seen as in need of improvement, and bring forth the desired outcome.

The contractualistic argument is based on a complex conditional statement; its general logical form is as follows: If the original state possesses the characteristics A, B, C, then a contract with the properties Q, R, S must be concluded that results in an outcome with the characteristics X, Y, Z. This “must” expresses the character of hypothetical imperatives; it is a “must” of instrumental rationality. The contracts of contractualism take place solely in the minds of the philosophers, but they do not appear from nowhere. In fact, their existence and form logically depend on the requirements, conditions, and contexts which determine the grammar of situations of conflict that are to be consensually mastered and elaborated into the contractualistic arrangement by the theoretician. The contractualistic argument must derive from the constitution of the original position – and these include not only the external living conditions and conditions for action, but also the anthropologic constitution ascribed to human beings by the theoretician, which influences the perception of conflict as well as the ability to solve problems and the psychology of decision making – compelling reasons for the conclusion of a certain contract and so show the resolution toward the contractual agreement in question is rational. Disputes about rationality have thus played a major role in the history of contract theory: both Locke and Rousseau raised the objection of irrationality against the Hobbesian contract; Rousseau in his second discourse on historical philosophy brought up this blame of irrationality against the Lockean version of contract theory as well [1].

The conditional structure of the contractualistic argument indicates that the contractualistic argument in its purest form is of a syllogistic kind. The acceptance of its conclusion, i.e., its justificatory power, depends on the acceptance of the description of the state of nature. The latter comes in two versions: one has to distinguish between the acceptance of *normative* provisions in the state of nature which are meant to guarantee the moral permissibility of the contract and the recognition of *descriptive* provisions of the state of nature which determine

the character of conflict in the starting situation and thereby define both the range of the theoretical problem and the perception of conflict, the nature of the needs, and the psychological setup with regard to taking decisions of the individuals. It is obvious that reasons that are logically independent of one another can be brought forward for the acceptance of the normative and the descriptive elements of the state of nature. Accordingly, the acceptance of the normative constitution of the natural state does by no means entail the acceptance of the empirical assumptions made about the state of nature and vice versa. Consequently, the refusal to accept the alleged justification of certain principles through the contract argument can be based either on a dismissal of the normative provisions embedded in the state of nature or on a rejection of its empirical characteristics. For example, Rawls's design of the original position was strongly criticized for assuming a decision-making behavior among the inhabitants of the original position that only few people in very specific situations will adopt [2].

Evidently, the good reasons that make an agreement appear reasonable are closely connected to the situation in which the agreement is to be reached. Within the contract situation, these reasons can be detected in the form of the characteristics of the situation. Any version of a contractualistic justification of principles has to take the following form: *if the initial situation did not have the characteristics $M1, M2, \dots, Mn$, then there would not be any good reasons to agree on the principles $P1, P2, \dots, Pn$ with the attributes $E1, E2, \dots, En$* . This formula clearly shows that the initial situation moves into the center of attention of contractualistic theories. But it is not the exclusive task of political-philosophical contractualism to provide a plausible theory of the state of nature. Indeed the initial outlines of contractualism as a theory of justification do not possess the vividness of the anarchy-state-dualism, nor the dramatic character of borderline situations; and yet they bear the greatest systematic burden of the whole argumentation in the context of a contract-theoretical justification of principles. Their design determines if the arguments based on it can convince; hence, they must find universal approval first. The normative and descriptive requirements that are going to enter the theory and are interpreted by it must be indisputable, otherwise they do not provide a sustainable basis for a foundation of principles, and will be discarded as arbitrary and as fruitless for further theorizing. A contractualistic theory of justification therefore has to accomplish two things at once: For one thing, it must sketch a generally acceptable initial situation, and then, secondly, determine the principles which all parties would agree on based on this initial situation.

Contract and State of Nature

The contracts of contractualism are not being negotiated, the parties do meet each other halfway, and they do not retain any compromises. They have an epistemic, heuristic function. They are used as means for identifying generally approvable restrictions on freedoms. Contractual arguments, therefore, always build on consensus, but not on a consensus that is reached through deliberation and

discourse, because a consensus of this sort cannot be judged in advance by the theory. The consensus of the contractual arguments is a theoretically deduced, strategic consensus; it rests on a generalized egotism that is embedded in reciprocal instrumentalization. It is reached by a radical homogenization of interests, because a representative decision, comprehensible to anybody (including any reader) and hence a generally approvable outcome, can only be achieved if the interests that are relevant for the decision are the same for everyone. The reduction of the different subjective lists of preferences can be made plausible as a strategy for borderline situations, as Hobbes demonstrates, by pushing the search for what everyone reasonably desires so far that only the transcendental interest of self-preservation remains as the exclusive decision-relevant interest; or it can, as Rawls did, end up with the so-called primary goods, the basic social goods. In both cases, the search for identical interests that ensure consent leads to the transcendental conditions for individual patterns of lifestyle and reveals such interests as the ones everyone needs for leading an individual life and being able to realize diverse interests. In other words, while in actual social life agreements are anything but trivial, the agreements of contractualism are essentially trivial. The whole program of the theory is geared to producing unanimity; the trivialization of the agreements is its overriding task. Not so trivial, however, are the provisions of the contractual setting and the decision-making situation that make the agreement self-evident. They thus move into the center of theoretical and systematic attention. Contract theories, therefore, should be properly named theories of the state of nature.

Political-Philosophical Contractualism

Themes of social contract have already been found in the thinking of the sophists who stood up to the traditional orientation toward *nomos*, and in Epicureanism that turned against Plato and the law of nature and interpreted justice as a convention directed by interests. Even the anti-individualistic medieval ages fell back on the contract motif to illustrate the reciprocal structures of legal practice (on history of the contractual thought, see [3, 4]).

It was not until modern times that the contract was elevated to the ranks of a theoretical concept of legitimation. Its founder is Thomas Hobbes [5, 6]. The concepts and forms of argumentation developed by Hobbes shape all modern political-philosophical thinking; they set up the categorical framework within which reflection took place about governance, law, and the state until the times of Kant and Fichte. In addition, they have been revived in the contemporary political philosophy of liberalism. As in early modern times the internal development of the problems in question and of the positions of individualist political philosophy presents itself mainly as a conceptual-interpretative differentiation of the contractualistic grammar. The essence of early political-philosophical contractualism is the idea of legitimizing authority and governmental power by voluntary self-constraint born out of self-interest under the condition of strict reciprocity. In order to provide a motive for the infinitely free individual to

renounce natural freedom, and thus to attain the theoretical goal of justified governance and sound political obligation born out of self-imposed commitment, the contract theory contrived the theorem of the state of nature. It has to communicate the finding that *exeundum e statu naturali*, by providing evidence that a state without any public regulation and without securing in which everyone pursues his or her interests by all possible means, would inevitably lead to a virtual war of all against all, and thus be equally unbearable for everyone. As a consequence, it would be in everyone's fundamental interest to leave this lawless, pre-political state, to give up the state of being absolutely unattached that led into this aporia, and to establish a political regime with the power to assure a peaceful coexistence. The restrictions on individual freedom necessary for the establishment of the political state, however, can only be accepted under the condition of reciprocity, and therefore are only possible on the basis of a contract by which the occupants of the state of nature mutually engage each other to the renunciation of their natural freedom and to political obedience, and at the same time provide for the institution of a contractual power as guarantor endowed with a monopoly on the use of force.

In this way, political-philosophical contractualism provides legitimation of government in the form of a rational reconstruction of the creation of a state from the joint will of its citizens. The contractual argument consigns the role of the visible hand that founds the state to the contract. The initial situation of contract here features a natural, pre-political situation of anarchy. It is characterized by a potential for conflict that makes it intolerable; this can, as Hobbes put it, be founded in the finiteness of human beings and the scarcity of goods or, as Locke illustrated, be based on problems of the coordination of actions and on the deficiencies in conflict regulation – in any case the state of nature is such that nothing but the establishment of a government promises relief.

Thomas Hobbes

The Hobbesian contract depicts a contract of everyone with everyone else. Its design corresponds exactly to the individualistic conflict structure of the state of nature. As the state of nature represented a state of war of all against all, the contract that puts an end to this state must be a contract of everyone with everyone else. It is at the same time a social contract and the constitution of a state. The erection of civil government by the contract is in the same logical moment the erection of a political government and the construction of a society. This is because a process of socialization and the establishment of a government independent from each other are unthinkable: the contract constitutes the basis for socialization only insofar as it creates at the same time the basis for the establishment of government, and it possesses this rule-establishing function merely as a legal concept associating and mutually binding the individuals. The contractual association contains the project of modern civil society whose persistence ought to be guaranteed by the Leviathan.

The only cause of conflict that is accessible to human alteration is the entitlement of everyone to everything and to everyone else (in the state of nature); human nature as such cannot be modified, just as the predominance of scarcity cannot be thrown off. The unlimited human freedom of action, though, can be subjected to regulations. The first step on the way out of the state of nature must therefore be the mutual abandonment of the *ius in omnia et omnes*.

The reciprocal renunciation of the *ius in omnia et omnes* alone, however, would not yet achieve the desired improvement of the situation. In addition, there must be a power-wielding will that coordinates the use of freedom of the individuals and consolidates the diverging wills of the many in its own will. But how can the act of reciprocal renunciation of rights constitute sovereignty, produce a right to rule, and yield a will that integrates everyone into a political entity? How can a general will vested with monopoly on force emerge from the mutual self-disarmament of all occupants of the state of nature? Hobbes' answer to this question about the basis of legitimacy of public authority is the contractualistic argument about the authorization of the Leviathan:

The only way to erect such a Common Power, as may be able to defend them from the invasion of Forraigners, and the injuries of one another, and thereby to secure them in such sort, as that by their owne industrie, and by the fruites of the Earth, they may nourish themselves and live contentedly; is, to conferre all their power and strength upon one Man, or upon one Assembly of men, that may reduce all their Wills, by plurality of voices, unto one Will: which is as much as to say, to appoint one Man, or Asseembly of men, to beare their Person; and every one to owne, and acknowledge himselfe to be Author of what soever he that so beareth their Person, shall Act, or cause to be Acted, in those things which concerne the Common Peace and Safetie; and therein to submit their Wills, every one to his Will, and their Judgements, to his Judgement. This is more than Consent, or Concord; it is a real Unite of them all, in one and the same Person, made by Covenant of every man with every man, in such manner, as if every man should say to every man, *I Authorise and give up my Right of Governing my selfe, to this Man, or to this Assembly of men, on this condition, that thou give up thy Right to him, and Authorise all his Actions in like manner.* This done, the Multitude so united in one Person, is called a Common-Wealth, in latine Civitas. This is the Generation of that great Leviathan, or rather (to speake more reverently) of that *Mortall God*, to which wee owe under the *Immortal God*, our peace and defence. For by this Authoritie, given him by every particular man in the Common-Wealth, he hath the use of so much Power and Strength conferred on him, that by terror thereof, he is enabled to conforme the wills of them all, to Peace at home, and mutuall ayd against their enimies abroad. And in him consisteth the Essence of the Commonwealth; which (to define is), is *One Person, of whose Acts a great Multitude, by mutuall Covenants once with another, have made themselves every one the Author, to the end he may use the strength and means of them all, as he shall think expedient, for their Peace and Common Defence.* [7]

Through the contractual transfer of the right of self-determination the multitude becomes a political unit represented by the sovereign; or more accurately, by this act of transferring rights and empowering the sovereign it is turned into a political body that is made alive by the sovereign – Hobbes himself called the sovereignty an “artificial soul, [...] giving life and motion to the whole body” in the famous introductory section of the *Leviathan*. The act of authorization is the Fiat of the political world, the inspiration and animation of the political body. The will of the

sovereign governs and directs the political body, just as the individuals in the state of nature controlled their bodies and commanded them to certain actions when exerting their right of self-determination. And each member of the multitude of contractors has, through the act of authorization, turned into the morally responsible author of the acts of the sovereign. A multitude can only become a political unit if a real union of wills occurs. Such a real union of wills can only take place if all individuals either want the same thing or accept that which is intended by one of them as something they have wished themselves. Hobbes' conception of the political unit is based on the second alternative (Rousseau will later resort to the first alternative for his conception of the political unit). By such authorization, each element of the multitude renders itself author of the acts of the sovereign; it thereby provides the foundation for a relation of representation that absorbs the individuals and creates an identity between the one representing and the ones represented. *Rex est populus*.

Hobbes' contract represents the foundation of government, not the limitation of governance. The renunciation of the right to everything, the surrender of natural freedom, and the authorization and transfer of the right of self-determination all mean an unconditional relinquishment that does not retain any freedom or any right on the part of the contracting parties. This contractual concept is unique in the history of contractualism. In the times after Hobbes, the contract has repeatedly been employed for arguing for a *restriction* of governance. Locke's contract, for instance, is concluded on the basis of inalienable, individual rights and only confers the authority to provide for the protection of these fundamental rights, which stand completely beyond his disposition, to the sovereign. For Locke the contract thus explicitly sets up these individual fundamental rights as a boundary for government. For Kant the structure of the contract even turns itself into a constitution that delimits power and authority. Hobbes' contractually based state, however, owns absolute power; its authority to govern is restricted neither by fundamental liberal rights nor by human rights, neither by a constitution of rational law or one of natural law. Hobbes' political philosophy shows the oddly paradoxical picture of a radically individualistic foundation of absolute power, of a legitimation of state absolutism through the unreserved willingness to self-commitment on the side of the individuals.

John Locke

In contrast to Hobbes, the conflicts of the state of nature that call out for the political state are conflicts of law. They reflect the difficulties of establishing the inalienable fundamental rights within an institutionally unconsolidated state. The enforcement of natural law and of the individual rights that are rooted in it demand three things, as does the implementation of positive law: first, an interpretation and legal determination of the natural law that serves as the basis for judgment and reasoning, second, the judicial application of this basis to specific cases and the determination of punishment (the kind of penalty, compensation, or criminal punishment, and the

level of sanctions), third, the execution of the respective judicial decisions. In the state of nature these three tasks of implementation are entrusted to private individuals; everybody is equally entitled to exercise these three indispensable and by their very nature essential tasks at all times, uncoordinated with others, on his own initiative. This distributive strategy for implementing the natural law, however, fails: The deficiency of the state of nature can in fact be described precisely as the result of the distributive strategy for implementing the natural law. To redress the deficiency of the natural regime, the distributive implementation strategy must be replaced by a collective, centralized implementation strategy, i.e., by a strategy within which the implementation of the natural law, which concerns and affects everyone, will not be carried out by every single individual anymore, but by all of them together. This happens when the individuals form a civil society by means of a network of mutual contracts. With this contract a new political unit emerges that acts as a new legal entity. The law governing this political entity does not consist of original law, but of a derived law; it represents the right – transferred by each and every one to the association for the purpose of efficient enforcement – to implement natural law and the protection of fundamental rights.

But because no political society can be, nor subsist, without having in itself the power to preserve the property, and in order thereunto, punish the offences of all those of that society; there, and there only is political society, where every one of the members hath quitted this natural power, resigned it up into the hands of the community in all cases that exclude him not from appealing for protection to the law established by it. And thus all private judgment of every particular member being excluded, the community comes to be umpire, by settled standing rules, indifferent, and the same to all parties; and by men having authority from the community, for the execution of those rules, decides all the differences that may happen between any members of that society concerning any matter of right; and punishes those offences which any member hath committed against the society, with such penalties as the law has established: whereby it is easy to discern, who are, and who are not, in political society together. Those who are united into one body, and have a common established law and judicature to appeal to, with authority to decide controversies between them, and punish offenders, are in civil society one with another. [8]

The deficiencies of the state of nature – no authoritative interpretation and legal validation of the natural law, no impartial judicial authority with general jurisdiction, no central and efficient power to enforce laws and judicial decisions – contain *e contrario* the functional description of the Lockean state. The political government serves to implement natural law, and to protect and realize the pre-state social order made up of free and equal individuals and constituted according to individual rights. For Locke the state essentially represents the organized administration of the fundamental rights, it depicts the well-ordered and efficient cooperation of institutions such as the legislative, the jurisdiction, and the executive. In these, public legislation, by means of which the natural legal system of the individual fundamental rights of freedom, equality, and property is laid down, specified, and legally designated, determines the general rules that are enforced by the unified public jurisdiction. It also determines what is regarded as lawful concerning individual controversial case; and both kinds of decisions, the political laws and the judicial sentences, are enforced by it with uncontested efficacy.

The Lockean contract constitutes a political society as every individual contractually commits to everyone else to the transfer of one's right to privately and independently secure and defend his or her own life, freedom, and possessions, and even one's right to enforce the natural law by exercising penal power, to the association that has been created as a legal entity through this contract: With regard to the right of self-defense and execution, the contractual association follows the uncommitted occupants of the state of nature as legal successor. These rights are the roots of the political power of the association: Through their contractual unification, the association's authority to govern is constituted. The political power does not cede any of these rights, it does not, e.g., confer them upon the ruling instances, the legislative, the judicial, and the executive powers, as part of a second contract. It delegates solely the exercise of these rights – for pragmatic reasons – to appropriate institutions of the legislative, the judiciary, and the police that are installed for this purpose. Whereas, for Hobbes, the Leviathan raises its head and overawes a society that is made up of lawless private people through the absolutist state, Locke brings up the constitutional, governmental, administrative, and political self-organization of civil society on the pragmatic basis of the majority principle that ensures efficiency: the community itself adopts a political form, a constitution, and installs a government in order to provide for legal certainty and legal security. In Hobbes' theory, we encounter a sovereign ruling the society of the contracting parties; Locke, on the other hand, presents a nonruling sovereign and its non-sovereign government. In Locke's account the government figures neither as a contractually empowered sovereign, as Hobbes described it, nor as a contracting party as was held by the double-contract doctrines of the German natural law: It is not integrated into a reciprocal relation of rights and duties; in particular, it is not in the possession of full legal power nor devoid of all duties. Between people and government, Locke finds a kind of trusteeship: The legislator has been entrusted with the people's authority to govern as their trustee. He provisionally administers the political power of the association within the framework of the constitution, but does not have any independent constitutional profile. The constitution determines the form in which the political society handles its authority and its self-composed powers for the guarantee of rights and the enforcement of natural law. The connection between the political society and its government is not a legal relationship founded on natural law and human rights, but a relationship of trust, hence a moral relation. The political society does not renounce any right or abandon at any time any one of the powers that have been transferred upon it by the process of contractual association: It merely arranges their effective exercise by creating competent and functionally apt institutions and by entrusting certain positions with the performance of specific tasks. And if these tasks are not completed in the adequate way, if the legislative, the jurisdiction, and the executive do not prove to be institutions of legal protection and bastions of individual property rights, but abuse their authority and mock the purpose of natural law to secure and enhance the public good welfare, and disregard the natural rights of the citizens, and intrude into the private, intimate spheres of the individuals, and lay hands on their property, then the political society is entitled to offer resistance to the government, to remove it from office, and to oust it from power.

Locke's contract functions as a political rule that is both legitimizing and restricting, it constitutes the political power of the civil society and thus provides a consensual basis for the government of people over people exerted on its behalf. Without explicit or tacit consent, government of individuals over their fellow citizens cannot be exercised; political rule would then have to be considered as disdaining the individual right to freedom and self-determination and the legitimate opposition of the individuals would have to be anticipated. At the same time, the contract confines the government to the freedoms expressly surrendered by the individuals in the terms of the contract, and aligns it to those purposes for the effective enforcement of which the contractual association has been undertaken in the first place. Thereby, the rights *not* handed over by the contract are placed beyond the grasp of the state. The contract ties the exercise of political power to the conditions of the emergence of the *body politick*, and asserts the fundamental purpose of association: legal certainty, the guarantee of property rights, the preservation of the political community. These are the boundaries of government that decide upon its legitimacy. Through the contract, the operations in the name of the public are confined to the law-ascertaining elaboration and institutional protection of the natural legal form of the community in the state of nature. What is called "the state" represents the compensation – desired by the community in the state of nature and beneficial for all – of the deficiencies in stability of the community in the state of nature. Thus, in Locke's original contract the outlines of civil liberalism become manifest, demanding protection for fundamental rights and private rights.

Jean-Jacques Rousseau

Rousseau rejects the contract models proposed by his contractualistic predecessors as insufficient with regard to legitimation. In the focus of his critique, one finds an account of freedom that sees freedom as the essential defining feature of human nature and thereby promotes freedom to the rank of an absolute criterion for a theory of justification. Only that can be considered justified which can be justified by the concept of freedom. Freedom becomes the source, the measure, and the end of the law and the political regime, and contracts that do not include freedom and that do not guarantee freedom are considered illegitimate.

Certainly, in the eyes of Rousseau the right to freedom of the people comprises not only the freedom from forceful, arbitrary intervention by others, not merely general freedom of action, but also an inalienable and nondelegable claim to material self-determination, to self-government. And this dimension of moral autonomy of the right to freedom presents the theory of legitimation with particular difficulties, as it calls, after all, for the foundation of a political, legislating, and power-wielding entity whose members are still free and remain their own masters, so that their legal status does not in the least change as a result of the transition from the *status naturalis* to the *status civilis*. It is apparent that under a political government each member will only then obey exclusively his or her own orders, if he or she also governs himself or herself, if the laws demanding obedience

are self-imposed laws. However, under the prerequisite of such a radical, morally charged concept of freedom, can there be a legitimate government at all? Is not every attempt to resolve this problem of legitimation going to lead to a regulatory paradox? How can one imagine the establishment of rules by a social contract that does not curtail the material self-determination of the individuals?

The answer to this question is provided by Rousseau's version of the social contract:

The clauses of this contract are so determined by the nature of the act that the slightest modification would make them vain and ineffective. . . . These clauses, properly understood, may be reduced to one – the total alienation of each associate, together with all his rights, to the whole community; for, in the first place, as each gives himself absolutely, the conditions are the same for all; and, this being so, no one has any interest in making them burdensome to others. Moreover, the alienation being without reserve, the union is as perfect as it can be, and no associate has anything more to demand: for, if the individuals retained certain rights, as there would be no common superior to decide between them and the public, each, being on one point his own judge, would ask to be so on all; the state of nature would thus continue. . . . Finally, each man, in giving himself to all, gives himself to nobody; and as there is no associate over whom he does not acquire the same right as he yields others over himself, he gains an equivalent for everything he loses, and an increase of force for the preservation of what he has. If then we discard from the social compact what is not of its essence, we shall find that it reduces itself to the following terms. “Each of us puts his person and all his power in common under the supreme direction of the general will, and, in our corporate capacity, we receive each member as an indivisible part of the whole.” [9]

What is the content of this contract? “The total alienation of each associate, together with all his rights, to the whole community.” This may come as a surprise if one considers Rousseau's vehement polemic against contractualistic absolutism, but the contractual doctrine of the *Contrat social* represents an undiminished Hobbesianism with regard to sovereignty. The syntax of the Rousseauian social contract does not distinguish itself from the syntax of the Hobbesian state constitution. In both cases, we are dealing with a contract of alienation by which the occupants of the state of nature promise each other to renounce all freedom, all rights, and all power, and to submit themselves unreservedly to an absolute authority. The rights that the individuals receive from these contractual promises include the right to the absolute political obedience of all other individuals. For both Hobbes and Rousseau, the act of alienation marks the constitutional act of political government, the birth of the sovereign. The addressee and beneficiary of the act of alienation does not exist prior to it. It is a legal construct that – independent of the contractual relations of the individuals from which it originates – does not possess any legal existence.

The particularity of the Rousseauian social contract lies in the fact that only the association of contractors itself can rightfully take over the position of sovereignty. While for Hobbes an absolute position of power and a right to rule has indeed been created, but a material sovereign has not yet been enthroned – as Hobbes does not construct any essential relationship between the absolute competences granted by the right to rule and the material occupancy of the sovereignty position – for Rousseau's social contract, the construction of the absolute position

of government and its material occupancy by the association of contractors itself necessarily coincide with each other.

In the constitutional chemistry of the *Contrat social* the act of alienation has the function of transforming the aggregative, decentrally organized association of contractors into a centralized unit of wills: The aggregate of individuals made up of many particular wills becomes one political unit wielding one uniform general will. *Populus est rex*: The Rousseauian social contract is the symbol of the political self-empowerment of the people. By assigning to everybody the twofold role of a shareholder in power and a subject to power with equal rights and duties before the law, it lays down the legal concept of social self-organization by the rule of law.

Immanuel Kant

The Kantian metaphysics of law brings the argument of the contractualists into a completely novel and peculiar form. The reason for this breach with the tradition can be found in Kant's thesis about the necessity of the state as implied by the law of reason. For Hobbes, Locke, and Rousseau, the state is conditionally necessary for pragmatic reasons: As an anarchic state in which force rule contradicts the fundamental interest of self-preservation and security, thwarts any rational way of life, and does not allow a sensible use of the fundamental right to freedom and property, it is simply a question of consistency and evidence to every prudent egotist that one should bring about a regime under which everyone's life is safe and everyone is able to enjoy his or her fundamental rights without interference. As part of the argument by Hobbes and Locke, the political state figures as an instrument of security grounded on a well-considered evaluation of expediency by the individuals. Prudence, not the binding force of the law, leads the way from the state of nature to the legal state. For Kant, however, the public organization of the law is a command of the reason of law [10]. The legitimacy of the Kantian state is not anchored in the rational will of the individuals but based on the legislation of pure practical reason. As a result of this anti-voluntaristic foundation of the state, the doctrine of the constitution undergoes a modification. In Kant's replacement of the paradigm of instrumental reason – predominant in modern political philosophy – with the orientation toward the concept of practical reasonableness, the contract of contractualism is no longer part of ordinary private law, but becomes a contract *sui generis*, a contract in which the instrumental function and dimension of rationality are completely dispensed with, being “of such peculiar kind, that it essentially distinguishes itself from all others” [11].

For Kant the contract manifests itself in a standard – implied by the reason of law – of organization of the civil state, to be installed in the first place for the sake of the law; its legal necessity is demonstrable independently of any contract. The contract steps up to the rank of a state constitution based on the reason of law, it formulates the internal normative structure of a legal state and is drafted exclusively according to concepts of reason. The contract does not mark the beginning of the existence of the state. The contract does not depict the historical record of the state

but its record of reason. The contractual state reflects “the one form of political state at all, i.e., the state as an idea as it shall exist according to pure principles of law, which serves as guidance (standard) for every true association into a communal being (hence on the inside)” [12].

When Kant talks about the original contract being the standard for every genuine public association, he wants to express that every state in history, no matter how it may have evolved, should adjust its internal organization of government to the model of the contractual state, and organize its government in a way *as if* it originated from the common will of a contractually founded association. With regard to the historical world, the original contract constitutes “guideline, pricipium, example of state constitutional law” [13]; it expresses the “ideal of legislation, government and public justice” ([13], p. R7734). It defines how the historical state shall manifest itself. The contract thereby turns out to be the constitutional counterpart to the categorical imperative, the constitutional principle of universalization. Just as the categorical imperative as moral principle allows the assessment of maxims, the original contract, as a standard of public justice, can be used for determining the legitimacy of positive laws. It gives the citizens a universally valid criterion for the assessment of the degree of justice of their government: only this kind of exercise of power can pass the constitutional judge’s bench of legal reason, the common will of the contractual association, which aims at the enforcement of legitimate laws and so puts into effect the intention of the contract.

We have before us the idea of an “Original Contract” as the only condition upon which a civil and, therefore, wholly rightful, constitution can be founded among men, and as the only basis upon which a State can be established. But this fundamental condition – whether called an “original contract” or a “social compact” – may be viewed as the coalition of all the private and particular wills of a people into one common and public Will, having a purely juridical legislation as its end. But it is not necessary to presuppose this contract or compact, to have been actually a fact; nor indeed is it possible as a fact. We have not to deal with it as if it had first to be proved from history that a people into whose rights and obligations we have entered as their descendants, did actually on a certain occasion execute such a contract, and that a certain evidence or instrument regarding it of an oral or written kind, must have been transmitted so as to constitute an obligation that shall be binding in any existing civil constitution. In short, this idea is merely an idea of Reason; but it has undoubtedly a practical reality. For it ought to bind every legislator by the condition that he shall enact such laws as might have arisen from the united will of a whole people; and it will likewise be binding upon every subject, in so far as he will be a citizen, so that he shall regard the Law as if he had consented to it of his own will. This is the test of the rightfulness of every public law. If the law be of such a nature that it is *impossible* that the whole people could give their assent to it, it is not a just law. An instance of this kind would be a law, enacting that a certain class of subjects should have all the privileges of hereditary rank by mere birth. But if it be merely *possible* that a people could consent to a law, it is a duty to regard it as just, even supposing that the people were at the moment in such a position or mood, that if it were referred to them, their consent to it would probably be refused. ([13], p. 297; [14])

The criterion that guarantees justice or at least indicates injustice is a *logical* criterion and only requires a thought experiment that is analogous to the application

of the categorical imperative. The empirical legislator must simulate democracy in his mind, must reflect on the question of whether every citizen can be a co-legislator of the law in question, whether the citizen can possibly fill this role. Now, a law will necessarily not be able to obtain the approval of all if it leads to a restriction of freedom that does not affect everyone in the same way, or reversely, if it distributes freedoms unevenly and if the freedom that it grants cannot be enjoyed generally and reciprocally. Thus, public laws will necessarily contradict the standard of the contract if they themselves violate the conditions under which the contract could have emerged. These conditions determine the contract as the only possible act of constitution – consistent with the law of reason – of the legal state, and hence the conditions to which civil society is committed when it mandates the realization of these conditions. These are the moments of freedom, equality, and reciprocity.

The categorical imperative forms the operational principle of the universalism of morality; the original contract forms the operational principle of the universalism of the law. Their role as criterion is specified by the epistemological proceduralism that is characteristic of universalism and that considers and resolves questions of practical truth as procedural questions. The practical truth of maxims, standards, and laws turns into a function of an apt procedure of bringing forth these maxims, standards, and laws; the verification of the claim to truth of given maxims, given standards, and given laws is assigned to a procedural criterion that transforms an ideal democratic proceduralism that necessarily meets with general approval into a convenient logical operation of universalization. The discriminatory performance of this operation of universalization can draw exclusively on formal and negative criteria that focus on the aspect of equality. This applies to the cognitive procedure of the categorical imperative as well as to the state-constitutional contract procedure. The categorical imperative marks as morally inadmissible types of conduct that are parasitic on the moral discipline of a sufficiently large part of the community, which can succeed only because the rest of the community willingly abstains from resorting to these types of conduct to attain their own ends. In precise correspondence to this argument, the contractual criterion describes as legally inadmissible laws that do not treat as equal what is considered equal, that do not treat unequally what is found unequal, or that lead to an uneven distribution of benefits and burdens, prohibitions, and permissions.

The contract offers the only way for constituting government that concurs with everyone's right to freedom. For only the laws born out of the public will conform with everyone's right to freedom as a result of the equal participation of all individuals in their formation. And only these laws are just, as each co-legislator is voting on his own behalf as well. Thus all legal restrictions of freedom can be seen as intended by all citizens who are affected by them, and as a treatment cannot be unfair if those who are affected by it have assented to it beforehand – *volenti non fit iniuria* – the laws that emerge in this way must necessarily be fair. The sovereign who is inspired by the reason of law, the legislating contractual will, must inevitably be infallible. It should be noted that this conception of justice, based on unanimity and equal participation of all participants, does not formulate any moral presuppositions; it does not even demand a sense of justice. Those called upon for arriving at a common resolution

are allowed to pursue their own interests. Justice can definitely go together with self-interest, however, it must consider the self-interest of all individuals concerned in the same way. A law proves just and fair if it serves the distributive good and concurs with everyone's interest in the same way. As distributive advantageousness cannot be identified a priori, the legislation that guarantees justice can only be described by means of the determination of a strictly democratic procedure with special focus on the persons who are directly concerned. And this is exactly the *contractus originarius*: The paradigm of a democratic procedure for conciliation and agreement that filters out all non-generalizable interests. In the history of contractualism the Kantian contract theory turns out to be a conception at a historical crossroad, which, on the one hand, dismisses a contractualism that is deduced from political philosophy and that dominated the early modern era and, on the other hand, has sown the seeds for a contractualism that is derived from a theory of justice as it prevails in contemporary philosophy.

Contractualism in Theories of Justice

The contract is a rather flexible instrument of reasoning that can be applied to a vast variety of original positions, presentations of problems, and conflict scenarios. Thus, the program of contractualist theory is not confined to the classical problem of legitimizing and delimiting government. Contemporary practical philosophy illustrates the fact that the contractualist theme – *volenti non fit iniuria*, no wrong can be done to those who have willingly consented from what they have assented to – can be used for addressing even the tasks of the justification of moral principles and institutions, of constituting democracy, and of founding a theory of collective action. If someone concludes a contractual agreement with others, he or she approves of the duties and the correlating rights which will be distributed to this individual and his or her partners on the basis of such an agreement. If the consent was given voluntarily and there were fair contractual negotiations, he or she does not have any right to complain about the normative consequences that result from this contractual agreement and must therefore accept them as binding. The basic idea of *modern contractualism in theories of justice* hence consists in interpreting – in the course of an adequate generalization – the whole society including all its various institutional structures and arrangements as a contractual relation and in ascribing the authority of the social and political institutions, of the social and political constitution, to a universal approval of all members of society as contractual partners. Just as a contract among two individuals under the prerequisite of freedom and equal status on both sides creates the reciprocal normativity of the rights and duties agreed upon, a contractual arrangement that contains the unanimous agreement of all members of society under the condition of equal freedom to a normative regime could bring about the general authority of these constitutions of morality and justice.

The essence of the conflict of the original position, as it is outlined by the version of contractualism in theories of justice that can be traced back to Kant, hinges on the

presentation of the problem that determines the theory program. It can be provoked by distributional problems, as in Rawls, or it can be defined by a moral pluralism, an aspect of which may be a controversy over the proper constitution, over law and justice, or a dispute concerning public morality. The contractual procedure here assumes a heuristic function. Closely related to the thought experiment of the categorical imperative, to the adoption of the *moral point of view*, and to the perspective of the *impartial spectator*, the principles that can be ascertained by it are those that can be publicly justified, by each individual to all others, and which can therefore be useful as the foundation of a public morality, a regime of justice, or an authoritative system of institutions.

John Rawls

Rawls's starting point is the assumption that justified and objectively binding principles of justice must be identical with the principles that free and rational persons, orientated only toward their own interests, would choose if they were in an original position of equality and charged with the definition of the form, the basic structure, and the fundamental principles that should bind all ensuing laws of their future society. Already in its description, this conception of "justice as fairness" reflects exactly the duality of the aim of the contract and the contractual situation that is essential for the contractualistic argument, and the duality of economic rationality and moral rationality. The principles of justice are derived from the outcome of a rational decision that can claim general public validity because it happens under fair conditions.

How does Rawls's original position guarantee a fair agreement? The principles of justice are chosen behind a veil of ignorance. This condition of the veil of ignorance is derived from the following simple and plausible consideration: If someone is to choose the principles of a constitution, yet does not know anything about himself or herself, thus unable to determine what principles of the ones to choose from could be beneficial for himself or herself, this person must perforce make a choice that is based on public arguments. Such a person cannot reflect on what principles of constitution might serve his or her particular interests and dispositions, but only on what principles of constitution may promote the public and formal interests shared by everyone. If the individuals are wrapped in a veil of ignorance in order to guarantee the fair character of the original decision-making situation, so that they cannot know anymore whose self-interest they are supposed to pursue, how can they still come to a rational decision? What principles can they still rely on if their self-interest has been stripped of its subject matter? The de-individualization leads, on the one hand, to a general orientation toward the formal, general conditions for success and advancement that are common to all individual life plans and strategies in the pursuit of happiness, and on the other hand toward the so-called primary social goods, the possession of which determines the quality of life and the future prospects of everyone in the same way. The conception of the primary social goods endows the individuals in the original position with an

instrument for making a rational decision governed by self-interest despite their ignorance, for everyone wants to have more rather than less of these primary goods. These primary goods describe what is common to diverging individual strategies of interest because the primary goods constitute the institutional and material requirements of a successful realization of any one strategy of self-interest, regardless of what this strategy might aim at in particular. Each self-interested individual, regardless of the particular self, desires more rather than less of these goods and will therefore be capable of making a rational choice of among all proposed principles that lay down the fundamental order of society and thus determine the distribution of primary goods. He or she considers the principles of distribution at choice from the perspective of the distribution of primary goods and selects the distribution of primary goods that favors him or her most. This, however, leads to the most beneficial distribution of primary goods for *everyone*, because the veil of ignorance has rendered self-interest anonymous.

It is obvious that the defining element of the original position, the texture of the veil of ignorance, will guarantee the general acceptability of the chosen principles of justice. The original position and the veil of ignorance compose, as it were, an arena of morality. In it, prudence and rational self-interest prevail; this is an ingenious move within the framework of decision theory. Through this construct, economic *rationality* is provided with a moral perspective that goes beyond the horizon of the individual subject, but without thereby having to become moral itself. These moral constraints on rational choice, which the voluntary transcendence of subjectivity that is demanded by moral principles dictates in the guise of the veil of ignorance, are not rationally deduced themselves as principles of constitutional choice – this would lead downright to an infinite regress. The calculation of interests of the individuals behind the veil produces exactly such principles of justice as were already included into the defining characteristics of the situation of choice as a priori moral correctives of the individual pursuit of benefits. The veil of ignorance deindividualizes the parties of the original position; it deindividualizes the bearer of economic rationality so thoroughly that it almost resembles the public subject of moral philosophy. The latter is founded on reason, whose position we all, as reasonable beings, can and must assume in order to gain an impartial, moral perspective for considering our own conduct and the conduct of others.

Economic rationality presupposes an individual that is aware of his or her interests. It thus depends on an input variable that Rawls takes care to conceal – and that he has to conceal for arriving at acceptable principles of justice as the results of choice. Rawls outwits the prudent egotist; he lures him or her into a situation that requires of him or her to act morally without noticing it. The didactic move of the veil of ignorance is the gambit of moral philosophy by which Rawls's theory of justice adopts economic rationality for its own purposes; and the latter is left with no other option but to run the business of justice, although it continues to aim at the maximization of benefits. This leads to the conclusion that the operations of economic rationality represent only an ornament to the argument and are devoid of all logical function. The principles of justice, introduced as results

of the constitutional choice, can thus just as well be deduced in a straightforward way from the normative provisions that are embedded in the construction of the original position, without any detour into decision theory. The conditional model – justice as the result of a rational choice under fairness conditions – could therefore in principle be substituted by a simple model of explication: justice as the explication of conditions of fairness (For detailed presentations of the Rawlsian contract theory, see [15–17]).

Conclusion

Hermeneutic Contractualism

In contexts of a theory of justification, the contract serves as a cognitive procedure of political ethics, as a criterion of justice and of public morality. The contract of theories of justification provides a universal criterion for moral epistemology; it is related to the categorical imperative and the other principles of impartiality that belong to the family of universalistic moral principles. As do these, it describes a testing procedure based on a thought experiment that principles and constitutional precepts have to pass if they should be considered just. The good reasons that substantiate and motivate the hypothetical agreement also represent good reasons for the normative rightness of the principles that are deduced as the imaginary results of this supposed agreement, and therefore they can again be cited as good reasons for accepting those principles and for adopting them as one's own. These good reasons which make approval seem reasonable and which are, of course, always representatively good reasons (i.e., equally good reasons for everyone) are certainly connected closely to the situation in which the imaginary agreement shall be reached. In the contractual situation, reasons can be found in the characteristics of the situation. To each version of the justification of the contractualistic principles hence applies the following formula: If the initial situation did not have the attributes M_1, M_2, \dots, M_n , then there would be no good reason to agree to the principles P_1, P_2, \dots, P_n . For contractualism as a theory of justification, the initial situation must equally shift into the systematic focus of the argumentation. Its configuration determines whether the argument of justification which relies on the former will be able to persuade the audience. If it does not entail compelling reasons for a consensus, or if it does not meet the requirements of a fair process of agreement, it is no acceptable starting point for the foundation of principles. In that case, it must appear as an arbitrary construct that is fruitless for a theory of justification. Accordingly, two things have to be demanded from contractualism as a theory of justification: First, it must propose an initial situation that is generally accepted, and second, it must lay down the principles all parties would agree on based on the presumed initial situation.

It is evident that the contract as a device of a theory of justification cannot overcome the fundamental deficiency of contractualism as theory of argumentation. Its applicability as a criterion of justice depends on normative

prerequisites which it cannot itself control; the normative characteristics of the initial situation, which determine the general acceptability of the course and the outcome of the contractual procedure, cannot, on their part, be justified by a contractualist argument without falling into an argumentative circle. The contract is not capable of standing on its own as part of a theory of justification. But this does not diminish its philosophical meaning. Just as in his day Kant responded to Tittel, a disillusioned member of a church council who expected a moral reform from the philosopher but only received a new moral formula, the formulation of a new, precise criterion of cognition is no small thing to be achieved, and the suitability of the contract as a criterion is beyond dispute. In combination with a conception of the original position that is both morally admissible and sufficiently defined, tailored precisely to the question of justice, the contract is a reliable theoretical instrument for drafting rules of justice that relate to the situation in question and that must meet with the approval of all concerned individuals, if only they accept the normative requirements of the total procedure – just think of the contractual substantiation of an account of intergenerational justice within the morality of ecology and the ethics of the welfare state [18, 16]. At the end of our tour of the history of constructive contractualism, the figure of a new hermeneutic contractualism stands out, which has abandoned all claims to the creation of normativity *ex nihilo* and which, based on the normative grammar of our politico-cultural self-conception, explicates our shared beliefs in values adequately to the problem in question and thereby proves itself as a heuristics of justice.

Abstract

This chapter discusses central strands of the modern social contract tradition. Distinguishing between moral and political theories on the one hand and contractualist and contractarian theories on the other, it presents one example of each of the ensuing categories: Gauthier's moral contractarianism, Buchanan's political contractarianism, Scanlon's moral contractualism, and Rawls' political contractualism. In the conclusion, strengths and weaknesses of social contract theories are discussed.

Introduction

Around the middle of the twentieth century, political philosophy was at a low point. There was some research in intellectual history and consequentialist thought, and there were a number of conservative and libertarian thinkers, but there was no dominant tradition. The revival came with a bundle of theories that can be subsumed under the title of "modern social contract tradition." It is usually said that John Rawls' 1971 *A Theory of Justice* started the movement, although some articles had preceded it. After that, a broad stream of articles and books took up the idea of justifying norms or institutions through the construction of a social contract, sometimes building on Rawls, sometimes criticizing him or looking for alternative foundations. The idea of a social contract is at the core of a liberal

vision of political theory as exploring the principles that free and equal citizens would agree on when thinking critically about questions of moral and political legitimacy and social order.

This chapter presents important strands and figures within this tradition. It categorizes them according to two dividing lines: *moral* versus *political* and *contractarian* versus *contractualist* theories (see Table 30.1). While the former distinction concerns the *subject matter* of theorizing – individual morality versus the structure of a just society – the latter relates to the starting point of theories and in particular the assumptions about human nature an author makes: contractarians see human beings as basically self-interested, in a Hobbesian sense, whereas contractualists start from a picture of human beings as capable of moral reasoning in a Kantian sense (cf. [1]). I discuss one example of each of the resulting four versions of modern social contract theory: David Gauthier, James Buchanan, Thomas Scanlon, and John Rawls. Although the boundaries are not always clear-cut, and some authors of the modern social contract tradition do not fall easily into one field or the other, it is a useful heuristic for a first approach to these different strands of theorizing. In the conclusion, I discuss a number of strengths and weaknesses of the modern social contract theories.

The Modern Social Contract Tradition

The idea of a social contract is an old one, going back at least to sophist thought in ancient Greek (cf. e.g., [2]). It has been made prominent in the early modern era by thinkers like Hobbes, Locke, and Rousseau. While earlier thinkers in this tradition often developed their approaches against a metaphysical – usually Christian – background, contemporary defenders emphasize that it can also get off the ground from relatively weak and unproblematic – “unmetaphysical” – assumptions, which makes it suitable for ethical thought in pluralist societies that are divided on religious and metaphysical issues (cf. [3]), as no references to a divine will or to some ideal of human perfection are needed.¹ The basic idea of contract theories is straightforward: in order to argue for some normative claim, one presents it as the outcome of a contract all concerned parties could have entered into. The persuasive power of such an argument hinges on the insight that a state *without* normative regulations is undesirable and that implementing a set of norms will be profitable for everyone, as it reduces the risk of aggression and opens a space for trustful cooperation. The agreement to such norms does not have to be explicit there does not have to be an *actual* contract; it can as well be *hypothetical*, as a thought experiment about rules people *could* agree to and thus bind themselves. It is usually assumed that the individuals or parties in the original position do not make rational errors (e.g., calculation errors) and are not misinformed or grossly inexperienced; without some such idealizing assumptions, it is questionable whether a determinate result could be achieved at all (cf. [3]). Apart from that, however, the character and the epistemological situation ascribed to the individuals vary in different theories.

Depending on choices about the character of the situation before the contract (which has traditionally been called the “state of nature”), the parties to the contract, the contract itself, and the scope of the principles generated by the contract, a large number of variations of social contract theories are possible. In this chapter, they are categorized along the lines described above (Table 30.1).

Moral Contractarianism

The paradigm example of moral contractarianism is David Gauthier’s book *Morals by Agreement* [2]. He starts from the assumption that individuals are only interested in their own situation, not in that of other people: they are “non-tuists.” This is the weakest assumption one can make as a basis for deriving morality, as hardly anyone would want to deny that people are in some sense interested in their own well-being. This Hobbesian starting point differentiates Gauthier from other contract theorists who from the outset start with some principle of impartiality or practical reason – Gauthier wants to *derive* impartiality through contractual reasoning. His theory thus sets itself a very specific task: it wants to convince the moral skeptic, someone who does not see the point of moral rules, that it is in his or her own interest to obey such rules. In this sense, morality is a subdomain of the theory of rational choice for Gauthier.

It is likely that most of us are no moral skeptics and would not question the legitimacy of the claims morality makes on us, even if we may disagree about particular rules or constraints. Many of us think that man is a social animal and that “[h]ow selfish soever man may be supposed, there are evidently some principles in his nature, which interest him in the fortune of others, and render their happiness necessary to him, though he derives nothing from it except the pleasure of seeing it,” as Adam Smith, the founding father of economics, held [4]. Many philosophers do indeed think that it is impossible to convince a thoroughgoing skeptic of the normative force of morality (cf. e.g., [5]). Gauthier nevertheless attempts this task, while also holding that rational self-interest is not necessarily the *only* reason why someone would want to be moral.²

The interest in one’s own well-being includes the interest in gains from cooperation with others. This is the lever Gauthier uses for unfolding his contractarian program, in which he derives morality as an impartial constraint on the pursuit of one’s self-interest. In his approach the contractual reasoning is purely hypothetical, as a device for justifying normative claims. Gauthier’s assumptions will be familiar to many readers from economic theory: he uses a subjective theory of value in which

value is explained exclusively by the preferences people have. He employs decision theory and in particular game theory, the theory of strategic choices in interaction, in order to develop his account. Individuals are fully informed and rational, and there is no “veil of ignorance” – as in Rawls, see below – or any other device that would screen out certain informations as irrelevant for the decision process.

The foil against which Gauthier develops his moral theory is the scenario of a perfectly competitive free market with no externalities, asymmetries of information, transaction costs, etc. ([2], Chap. 4). In such a situation of “moral anarchy,” everyone fully bears the costs of pursuing his or her interests, all disagreements can be resolved by exchanges, and the resulting distribution is pareto-efficient, that is, nobody’s position can be improved without hurting someone else’s. This is a “morally free zone”: no constraints on the pursuit of individual self-interest are needed. But the world is different from such a perfect market; in particular, there are externalities and constellations where what is rational for every *individual* leads to a suboptimal outcome: the world without morality is a prisoner’s dilemma. This is why moral norms need to be introduced, to prevent free-riding and parasitism.

Gauthier describes the moral contract as the result of a bargaining process over the moral rules that are to be applied. As individuals are self-interested, everyone tries to negotiate rules that lead to the maximal satisfaction of his or her preferences, but knows at the same time that he or she must not drive away the other parties from the bargaining table. The problem is thus to determine the concessions that everyone has to make in order to arrive at an agreement. Gauthier argues that equal and rational individuals will choose the “principle of minimax relative concession,” that is, the rule according to which the greatest concession (as proportion of the total stake a person has in the bargain) is minimized. Under this arrangement, no rational individual would reject participation in the contract. In many situations, it leads to a rule according to which everyone has to make the same concession. Central moral practices like promising or telling the truth, Gauthier holds, can be explained as applications of the rule of “minimax relative concession” ([2], p. 156).

In order to create and maintain a situation in which peaceful cooperation is possible – which is in everyone’s interests – rational individuals will switch from a modus of unconditional utility maximization to a modus of “constrained maximization” *provided* that they can expect the same from others and will not be exploited by them. The profits that they can expect from cooperation will, under plausible circumstances, be greater than the benefits they could reap from exploitative behavior. As it is thus rational to be a “constrained maximizer” rather than a “straightforward maximizer,” individuals will internalize the disposition to comply with the moral rules.

The question is, however, how individuals can be made willing to enter into such a contract and to stick to the rules, and so, to arrive at a *stable* system of norms. In what is maybe the most significant systematic aspect of his theory, Gauthier argues that certain conditions need to be fulfilled to make it rational for an individual to participate in the contract. He argues that the contract can only be successful if the starting position is fair and equal, as the individuals will not comply with the resulting rules otherwise. This is how he pulls a condition of impartiality back into

the contract between purely self-interested individuals. Rather than *assuming* some rule of impartiality or producing it through some device that screens out certain informations, impartiality is thus the *result* of the reasoning process: it turns out to be a condition for a successful contract.

Gauthier formalizes this condition of impartiality and noncoerciveness of the initial situation as a “proviso”: no one must have reached his or her position – from where the bargaining starts – by having made worse someone else’s position. This introduces a structure of personal rights and property rights as the starting point for the bargaining process. Whereas Locke, for example, had justified such rights from the fact that man is created in the image of God, Gauthier explains their necessity *within* his approach, as precondition for a contract that serves the interests of all.

Gauthier’s approach is thus strictly reductionist: he shows why a completely selfish individual would want to stick to impartial constraints on his or her maximizing behavior in order to make possible cooperation that leads to mutual profits. As such, the argument depends on a situation in which there is indeed a potential for mutual gains from cooperation, as Gauthier himself admits ([2], p. 17). Nor is it clear how those who cannot contribute to the cooperative venture – for example, severely mentally handicapped individuals – can be included in the moral community on this rationale. Gauthier describes what morality looks like for free and equal “economic men”; in this sense, it can be understood as specifically tied to a historical and cultural situation in which strongly individualistic ideals dominate.

Gauthier’s approach is thus a strictly rationalist reconstruction of central moral intuitions. Gauthier emphasizes, however, that many people value the fruits of mutual cooperation and find participation in common enterprises intrinsically valuable, so that they can also develop emotional attachments to the rules of morality, which can help to stabilize the normative system. But these are an addendum; the strength of Gauthier’s theory is that it explains why it is rational to be moral even if one is a purely selfish skeptic, a Hobbesian “Foole.”

Moral Contractualism

Thomas Scanlon’s *What We Owe to Each Other*, one of the most famous examples of moral contractualism, starts not from the assumption that one has to show the coincidence of morality and *interest*, but from the assumption that human beings are equal and have a moral status as autonomous agents ([2], Chap. 4). Whereas Gauthier clearly associates his contractarianism with the Hobbesian tradition, Scanlon’s contractualism is closer to Rousseau’s idea of the general will and Kant’s notion of autonomy. In contrast to Kant, however, Scanlon does not use the idea of a “pure moral will,” that is, a will that abstracts from all concrete characteristics of persons and situations, or with any other device for excluding certain considerations from moral reflection. Rather, his contractualism is built around the ideas of mutual respect and justifiability. Instead of a categorical imperative, his central model for the justification of norms is the idea of principles that no one can reasonably reject. While for Gauthier social contract theory is part

of the theory of rational choice, for Scanlon it is part of a broader theory of reasoning and of what constitutes rightness and wrongness.

Whereas Gauthier starts by outlining the contours of rationality in the sense of the modern economic orthodoxy, Scanlon develops a notion of “reasons” – and hence “reasonableness” – that goes beyond instrumental rationality. Scanlon takes “reason” to be a primitive concept that applies over a broad range of areas: there are reasons for belief, for action, for attitudes, etc. Practical reasoning plays a particular role in our lives: it motivates actions. There is nothing metaphysically puzzling about reasons if one understands them from the point of view of “the status of being a reason, that is to say, of counting in favour of some judgment-sensitive attitude” ([5], p. 56). Scanlon rejects the idea that motives are to be explained in terms of desires and in particular the idea that the effects on the well-being of oneself and others is all that matters for the evaluation of moral actions. This is, roughly, the position of utilitarianism, which aggregates the well-being of individuals and holds that one should choose the option that leads to the highest aggregate. Scanlon argues that well-being plays an important role in many moral considerations, but by no means the only one. More basically, it would be wrong to think that value always has to be conceived as “teleological,” that is, as connected to some state of affairs that is to be promoted. “Valuing” friendship, for example, does not imply that one should try to somehow maximize it; rather, it means that one accepts certain reasons for actions, that one cultivates one’s friendships, and wishes other people to have friends as well ([2], Chap. 2). That something is valuable means that it has properties that give us reasons to behave in certain ways with regard to it.

Scanlon’s notion of “reason” is pluralistic: it acknowledges that considerations of different kinds and structures come to bear on moral decisions. It is also substantive rather than formal, as it does not look for a formula by which to deduce what we have reasons to do, but assumes that in weighing different reasons there is always need for some degree of judgment. Finally, it is objective: reasons are “universal” because they are judgments about a situation that apply to everyone.

The basic principle of the Scanlonian contract is straightforward:

An act is wrong if its performance under the circumstances would be disallowed by any set of principles for the general regulation of behaviour that no one could reasonably reject as a basis for informed, unforced, general agreement. ([5], p. 153)

What is at stake is not actual consent, nor consent by rational egoists, but the hypothetical consent by people who are similarly motivated to react to reasons rather than to achieve their aims no matter what. Acting morally thus means to react in the right way to the intrinsic value of other persons. Scanlon takes it that this contractualist account explains both the motivating force of judgments about right and wrong and the importance and priority of moral reasons in comparison to other reasons. Although they do leave room for other values and reasons, moral reasons can often trump others, as they have to do with the most basic relations in which we stand with other people.

Scanlon sees a number of advantages in this contractualist theory that make it superior to what he sees as its main contender, utilitarianism. Not only, as has

already been mentioned, can it take into account reasons of different kinds and structures, not just teleological arguments. It can also solve moral dilemmas in more plausible ways: it can capture the intuition that when we have a choice between rescuing one innocent person or five innocent persons from death, we should go for the five, but it also explains why one must not prefer great harm to a small number to minor harm for a greater number. Consequentialist reasons can thus be taken into account, but not in the reductionist way in which utilitarianism does it (cf. also [6]).

Scanlon is explicit that the everyday usage of the term “morality” may include more than what he calls the realm of “what we owe to each other.” The latter includes, however, core issues of morality and captures our intuitions about the need for moral rules to be general and fair. By focusing on justifiability rather than interest, his account does not have the problem, identified in Gauthier’s account, of including into the scope of morality those with whom we have no ties of interest. It can also do justice to a number of nonpersonal issues via the notion of “trustees” who bring forward the reasons that speak for treating, for example, animals and the natural environment in certain ways. Scanlon’s account is strictly nonreductionist: it does not explain morality in nonmoral terms, but rather starts from a picture of human beings as susceptible to moral reasons, which it elaborates and defends against objections. It is thus much closer to our everyday way of understanding moral issues: it is unlikely to convince a moral skeptic, but those who *aren’t* moral skeptics are likely to find this theory to be closer to what they take morality to be than Gauthier’s account.

Political Contractarianism

Political contract theories ask not about the rules of individual morality, but about the structure of a just society and in particular about the legitimacy of claims of political authority: Why should one obey the state? Political *contractarianism*, as exemplified by James Buchanan’s and Gordon Tullock’s *The Calculus of Consent*, starts with the assumption of the self-interested individual, or, as they call it, with “methodological individualism” [7]. As such, it is closest to the Hobbesian *Leviathan* that also starts with selfish individuals and aims at deriving the legitimacy of political authority. Buchanan and Tullock repeatedly emphasize that not all aspects of political life can be explained by this strategy, but argue that it captures important phenomena that have been overlooked by standard political theory.

Gauthier approaches the question of individual morality from the point of view of individual choice; Buchanan and Tullock approach the question what the *state* ought to be from the perspective of a rational individual confronted with “constitutional choices” of different kinds. Rather than building on any notion of “public interest” or “common good” that individuals would choose for moral reasons, they ask what rules and regulations are in the individuals’ interests. Some basic personal rights and property rights are assumed to be in place for this approach to make sense.

Some agreement on rules is evidently necessary to make possible a peaceful society. Buchanan and Tullock argue that the basic decision to have a constitution must be taken in unanimity, as this is the only way in which every individual can either agree to regulations that are profitable for himself or herself or insist on compensation from those who profit (more) from alternative regulations, without any coercion being involved. The infinite regress of finding rules for finding rules... etc., can thus be avoided.

Buchanan and Tullock discuss the ways in which individuals can find agreements about different aspects of constitutional choice. The innovative move of their approach is to see political decisions as *exchanges* in which individuals can raise their utility if they find ways of “trading” their preferences. General rules for behavior make sense from an individual perspective if they help to avoid external costs or to secure external benefits. But collective decision-making processes also create new costs, as the processes themselves are costly and as rules can *in turn* impose external costs on individuals. It is rational to opt for regulating an activity through collective action if the sum of these costs (what the authors call the “costs of social interdependence”) is smaller than it would be under alternative arrangements, that is, a status quo with no regulation at all *or* some form of voluntary cooperation between individuals. This explains why there is in fact a plethora of difference forms of decision-making in real life: some things are better left to individuals, while others can be addressed by voluntary agreements and yet others need institutional enforcement ([8], Chaps. 7 and 8).

Buchanan and Tullock ask what kind of decision rules rational individuals will choose for what kind of issues. For example, when individuals recognize that a regulation can potentially impose very high costs on them (e.g., when it concerns redefinitions or limitations of basic rights), they will opt for a decision rule that contains protections and provisos, even if this may lead to more complex – and hence more costly – decision processes. If, however, the individual does not expect high costs to be imposed on him or her through some regulation (e.g., if he or she is indifferent between alternative sets of rules), the aspect of minimizing decision costs dominates, which may mean, for example, that such decisions are taken by a small representative assembly rather than the community as a whole. When a series of decisions is made, individuals are able to “trade” their approval for one particular proposal with others, which explains phenomena like “logrolling.” As Buchanan and Tullock show, such “negotiations” can take a wide variety of forms; the simple majority vote, which is often used in democratic processes, is just one of many possible forms that social decision-making can take.³

Buchanan and Tullock discuss, in formalized models, a wide variety of decisions to be taken either *about* the rules to be applied to decide certain issues (the “constitutional” level) or *within* such a framework of rules (the “operational” level). Often, formal decision rules and substantive decisions are intertwined in complex and sometimes unexpected ways. Whether the resulting distributions of benefits and burdens are efficient or not can depend on a wide range of aspects of a model. For example, things look very different if one assumes that everybody’s preferences are equally strong or if one admits preferences with differing strengths

([7], p. 125ff). Buchanan and Tullock also show that practices such as trading of votes can under certain conditions be rational and profitable for everyone, challenging readers who reject such practices as morally wrong from the outset.

In a later companion work to *The Calculus of Consent*, *The Limits of Liberty*, Buchanan expands the rational choice approach to more aspects of political life [8]. He emphasizes the role of law as a “public capital” that serves the good of all but that also needs to be maintained rather than used up. He also discusses in more detail the necessity of limiting the power of the state: although public institutions, in particular the protective function of the state, are necessary to avoid conflicts and external costs of various kinds, there is also a danger that they in turn impose costs on individuals. The self-government that a group of rational individuals could agree on in a social contract needs to be controlled *in turn*, at least when not all decisions are taken in unanimity. Numerous political phenomena can be explained by the interplay between collectivization (which is often more cost-efficient) and the protection of minority rights and interests. All political structures need to find a line “between anarchy and leviathan,” as the subtitle of the book suggests.

Buchanan’s contractarianism works at a level that is less basic than Gauthier’s; for example, he assumes basic personal and property rights rather than deducing them in his theory. He agrees with Gauthier, however, in one basic finding: even if one assumes purely egoistic individuals, it is rational to agree on certain rules and procedures for making possible collective action. This provides a rationale for justifying state institutions, but also a critical tool for evaluating existing institutions that might have developed in dysfunctional ways.

Political Contractualism

John Rawl’s *A Theory of Justice* is a case of political contractualism, that is, a social contract theory that starts from the assumption that people follow practical reason and that deals with political structures [9]. It is the most famous of the modern contract theories; its significance has been compared to classical texts in political theory like Aristotle’s *Politics* or Hobbes’ *Leviathan*. While there are also other political contractualists (e.g., Ronald Dworkin), Rawl’s theory is the one that made it into all undergraduate curricula of political theory and also became known to a wider public.

Rawl’s question is how to conceptualize a just society and, in particular, how to reconcile the principles of liberty and equality. His basic approach is to conceive of “justice as fairness,” in contrast to the utilitarianism that was the dominant current of thought in the 1950s and 1960s. Utilitarianism, by using aggregate values, neglects “the separateness of persons” and their rights and liberties *qua* individuals. It could therefore not be endorsed by individual citizens; a society built on utilitarian principles could not be stable. Questions of justice are prior to questions about the good life, as free and equal citizens could not agree with any violation of the rules of justice for the sake of a particular conception of the good life. A theory of justice explicates and justifies our intuitions about justice and generates principles

on which the members of a society can agree, which is a condition for a society to be “well ordered” and stable. Principles of justice concern the “basic structure” of a society, that is, the system of rules that determines the most important public institutions and thus the distribution of advantages and disadvantages ([9], p. 7). Justice thus is, for Rawls, the “first virtue of social institutions.”

Rawls uses the idea of a social contract in order to derive principles of justice as principles that free and equal citizens could agree on. The central device of Rawls’s theory is the idea of an “original position” in which individuals have a certain knowledge about the structures of a modern society, but do not know which class, religion, ethnicity, or gender they will have within this society, nor how intelligent, strong, etc., they are, or what conception of the good they have. These facts are hidden behind the famous “veil of ignorance” that ensures the impartiality of the contracting parties by making it impossible to tailor the principles of justice to one’s own position. The “veil of ignorance” models the situation of free and equal citizens who want to find principles for the “basic structure” of society that can be endorsed by everyone and thus lead to a stable society.

Rawls’s theory of justice is thus part of a theory of rational decisions, but it includes moral principles from the outset, through the impartiality imposed by the veil of ignorance. The original position is understood as a “procedural interpretation” of the Kantian idea that men are free and equal. The description of the original position expresses “what it means to be a free and equal rational being,” and even “resembles the point of view of noumenal selves” ([9], p. 255f). To see one’s place in society from the point of view of the original position “is to see it *sub specie aeternitatis*” ([9], p. 587).

When reflecting behind the veil of ignorance, the parties in the original position must take into account a number of formal constraints on the principles they can choose: generality, universality in application, publicity, ordering on conflicting claims, and finality ([9], p. 130ff). Rawls argues that the parties will agree on two basic principles of justice:

First: each person is to have an equal right to the most extensive basic liberty compatible with a similar liberty for others.

Second: social and economic inequalities are to be arranged so that they are both (a) reasonably expected to be to everyone’s advantage, and (b) attached to positions and offices open to all ([9], p. 60).

The idea of a social contract is thus used in its hypothetical function as a thought experiment. Rawls argues that these principles are what free and rational persons who are mutually disinterested, that is, not motivated by benevolence or altruism, would agree to when presented with the alternatives of a utilitarian account and an account of “justice as fairness” (for a discussion see also [10]). As utilitarianism might sacrifice the rights and liberties of some citizens to the interests of others or to the public good, the parties behind the veil of ignorance reject it, as they fear ending up in the position of someone whose interest is sacrificed. Giving equal rights and liberties to all citizens and protecting

the position of the worst-off by the difference principle creates, Rawls argues, a basis for trustful cooperation among citizens, as they know that their interests cannot be sacrificed. He holds that a society whose basic structure follows these principles would be stable, because the individuals recognize that these principles protect their basic rights and liberties and give them the opportunity to pursue their own conceptions of the good life.

Basic freedoms like political freedom, freedom of speech, liberty of conscience, etc., are thus equal for everyone; this principle takes lexical priority over the second principle. Within the second principle, which relates to social and economic institutions, the first part takes lexical priority over the second. Inequalities in income and fortune are thus compatible with these principles as long as they serve the position of the worst-off. This last clause has become known as the “maximin” principle. It formalizes the intuition that the rich must not get richer at the expense of the poor (cf. also [11]). The reasons Rawls adduced for the choice of the maximin principle are that it would be unreasonable to use probabilistic calculations from behind the veil of ignorance (hence, expectational values are ruled out), people would not care very much about what can be gained above the minimum, and all alternatives are more problematic, as they impose grave risks on individuals ([9], pp. 154–155). At the same time, positions of power or prestige must be open to everyone; the social class into which a child is born, for example, must not predetermine its chances of attaining a position in the higher percentiles of the income distribution. The metric on which these principles are applied are the so-called primary goods, “things which it is supposed a rational man wants whatever else he wants”; they include “rights and liberties, opportunities and powers, income and wealth” ([9], p. 92).

Starting from these principles, Rawls describes how the “veil of ignorance” is gradually lifted and the principles are applied to the concrete situation of a society, taking into account its cultural and economic features. The imaginary parties develop a constitutional framework and then decide on more detailed laws and policies, which are then applied to concrete cases.

This theory has provoked a large discussion and numerous commentaries and criticisms. Over the course of his life, however, Rawls has considerably modified his account. Most notably, in *Political Liberalism*, he argues that his liberalism is “political, not metaphysical,” holding that it can be agreed to from the point of view of different reasonable “comprehensive doctrines” [12]. In an “overlapping consensus” people agree on certain basic principles for which they adduce different arguments from their different worldviews. For example, a Catholic, Muslim, Hindu, and Atheist can all agree on the importance of basic human rights, although the reasons why they hold this position differ, from the claim that persons are made in the image of God to deep-seated intuitions or pragmatic considerations. In *Justice as Fairness: A Restatement*, Rawls also makes explicit which socioeconomic framework he favors: either a “property owning democracy” in which there is widespread ownership of productive assets, or a “democratic socialism,” where companies are managed by workers [13]. Such societies attempt to improve the position of the working class and to broaden the access to education and training so

that the worst-off do not depend on welfare, but are integrated and recognized as full members of society. Rawls also slightly changed the formulation of the two principles of justice. They now read:

- (a) Each person has the same inalienable claim to a fully adequate scheme of equal basic liberties, which scheme is compatible with the same scheme of liberties for all; and
- (b) Social and economic inequalities are to satisfy two conditions: first, they are to be attached to offices and positions open to all under conditions of fair equality of opportunity; and second, they are to be to the greatest benefit of the least-advantaged members of society (the difference principle) ([13], pp. 42–43).

Conclusion

Contract theories have certain advantages and disadvantages in comparison to other moral and political theories. As a conclusion, let me point out some of these.
